collpadattr	text	-	Collation padding attribute. • **NULL**: not applicable. • **NO PAD**: no padding. • **PAD SPACE**: blank spaces padded at the end.
collisdef	boolean	-	Determines whether the collation is the default collation of the character set.
id	integer	-	Not supported in the current version.

12.2.17.32 PG_CONSTRAINT

PG_CONSTRAINT records check, primary key, unique, and foreign key constraints on tables.

Table 12-96 PG_CONSTRAINT columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of the namespace that contains the constraint.
contype	"char"	• **c**: check constraint. • **p**: primary key constraint. • **u**: unique constraint. • **t**: trigger constraint. • **x**: mutual exclusion constraint. • **f**: foreign key constraint. • **s**: clustering constraint. • **i**: invalid constraint.
condeferrable	Boolean	Specifies whether the constraint is deferrable. • **true**: yes. • **false**: no.
condeferred	Boolean	Specifies whether the constraint can be deferrable by default. • **true**: yes. • **false**: no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
convalidated	Boolean	Specifies whether the constraint is valid. Currently, it can be set to **false** only for foreign key and check constraints. • **true**: valid. • **false**: invalid.
conrelid	oid	Table containing this constraint (**0** if it is not a table constraint).
contypid	oid	Domain containing this constraint (**0** if it is not a domain constraint).
conindid	oid	ID of the index associated with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is **0**.
confupdtype	"char"	Foreign key update action code. • **a**: no action. • **r**: restriction. • **c**: cascading. • **n**: The parameter is set to **null**. • **d**: The default value is used.
confdeltype	"char"	Foreign key deletion action code. • **a**: no action. • **r**: restriction. • **c**: cascading. • **n**: The parameter is set to **null**. • **d**: The default value is used.
confmatchtype	"char"	Foreign key match type. • **f**: full match. • **p**: partial match. • **u**: unspecified. (The NULL value can be matched if **f** is specified.)
conislocal	Boolean	Specifies whether the constraint is defined locally for the relation. • **true**: yes. • **false**: no.
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not **0**, the constraint cannot be deleted or renamed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
connoinherit	Boolean	Specifies whether the constraint can be inherited. • **true**: yes. • **false**: no.
consoft	Boolean	Specifies whether the column indicates an informational constraint. • **true**: yes. • **false**: no.
conopt	Boolean	Specifies whether you can use the informational constraint to optimize the execution plan. • **true**: yes. • **false**: no.
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
conpfeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclop	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
conbin	pg_node_tree	Internal representation of the expression if this column is a check constraint.
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of **INDEX**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- **consrc** is not updated when referenced objects change and does not track new column names. You are advised to use pg_get_constraintdef() to extract the definition of a check constraint.
- **relchecks** in 12.2.15.28 PG_CLASS must agree with the number of check-constraint entries found in the table for each relationship.

12.2.17.33 PG_CONVERSION

PG_CONVERSION describes encoding conversion information.

Table 12-97 PG_CONVERSION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
conname	name	-	Conversion name (unique within a namespace)
connamespace	oid	OID in PG_NAMESPACE	OID of the namespace that contains this conversion
conowner	oid	OID in PG_AUTHID	Owner of the conversion
conforencoding	integer	-	Source encoding ID
contoencoding	integer	-	Destination encoding ID
conproc	regproc	**proname** in PG_PROC	Conversion procedure
condefault	boolean	-	If this is the default conversion, the value is **true**. Otherwise, the value is **false**.

12.2.17.34 PG_DATABASE

PG_DATABASE records information about available databases.

Table 12-98 PG_DATABASE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
datname	name	Database name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
datdba	oid	Owner of the database, usually the user who created it
encoding	integer	Character encoding for the database
datcollate	name	Sequence used by the database
datctype	name	Character type used by the database
datistemplate	boolean	Specifies whether the database can be used as a template database ● **true**: allowed. ● **false**: not allowed.
datallowconn	boolean	This column is used to protect the **template0/templatea** database from being altered. ● **true**: Users can connect to the database. ● **false**: No user can connect to the database.
datconnlimit	integer	Maximum number of concurrent connections allowed on this database. The value **-1** indicates no limit.
datlastsysoid	oid	Last system OID in the database
datfrozenxid	xid32	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound. This column is discarded in the current version. To ensure forward compatibility, this column is reserved. The **datfrozenxid64** column is added to record the information.
dattablespace	oid	Default tablespace of the database
datcompatibility	name	Database compatibility mode Currently, four compatible modes are supported: PG, ORA, MYSQL, and TD.
datacl	aclitem[]	Access permission
datfrozenxid64	xid	Tracks whether the database needs to be vacuumed to prevent transaction ID wraparound.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
datminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the database. This is used to track whether the database needs to be vacuumed in order to prevent transaction IDs wraparound or to allow PG_CLOG to be shrunk. It is the minimum value of **relminmxid** in **12.2.15.28 PG_CLASS** of all tables in the database.
dattimezone	name	Database time zone. The default is PRC.

12.2.17.35 PG_DEPEND

PG_DEPEND records the dependency between database objects. This information allows **DROP** commands to find which other objects must be dropped by **DROP CASCADE** or prevent dropping in the **DROP RESTRICT** case.

See also **PG_SHDEPEND**, which performs a similar function for dependencies involving objects that are shared across a database cluster.

Table 12-99 PG_DEPEND columns

Name	Type	Reference	Description
classid	oid	**PG_CLASS**.oid	OID of the system catalog where a dependent object resides
objid	oid	Any OID column	OID of the dependent object
objsubid	integer	-	Column number for a table column (**objid** and **classid** refer to the table itself); **0** for all other object types
refclassid	oid	**PG_CLASS**.oid	OID of the system catalog where a referenced object resides
refobjid	oid	Any OID column	OID of the referenced object
refobjsubid	integer	-	Column number for a table column (**refobjid** and **refclassid** refer to the table itself); **0** for all other object types
deptype	"char"	-	A code defining the specific semantics of this dependency

In all cases, a PG_DEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DEPENDENCY_NORMAL (n): A normal relationship between separately created objects. The dependent object can be dropped without affecting the referenced object. The referenced object can only be dropped by specifying CASCADE, in which case the dependent object is dropped too. Example: a table column has a normal dependency on its data type.
- DEPENDENCY_AUTO (a): The dependent object can be dropped separately from the referenced object, and should be automatically dropped (regardless of RESTRICT or CASCADE mode) if the referenced object is dropped. Example: a named constraint on a table is made autodependent on the table, so that it will go away if the table is dropped.
- DEPENDENCY_INTERNAL (i): The dependent object was created as part of creation of the referenced object, and is only a part of its internal implementation. A DROP of the dependent object will be disallowed outright (We'll tell the user to issue a DROP against the referenced object, instead). A DROP of the referenced object will be propagated through to drop the dependent object whether CASCADE is specified or not. Example: A trigger created to enforce a foreign-key constraint is made internally dependent on the constraint's **PG_CONSTRAINT** entry.
- DEPENDENCY_EXTENSION (e): The dependent object is a member of the extension of the referenced object (see **PG_EXTENSION**). The dependent object can be dropped only via DROP EXTENSION on the referenced object. Functionally this dependency type acts the same as an internal dependency, but it is kept separate for clarity and to simplify GS_DUMP.

  NOTICE

  The extended function is for internal use only. You are advised not to use it.

- DEPENDENCY_PIN (p): There is no dependent object; this type of entry is a signal that the system itself depends on the referenced object, and so that object must never be deleted. Entries of this type are created only by **initdb**. The columns for the dependent object contain zeroes.

12.2.17.36 PG_DESCRIPTION

PG_DESCRIPTION records optional descriptions (comments) for each database object. Descriptions of many built-in system objects are provided in the initial contents of **PG_DESCRIPTION**.

See also **PG_SHDESCRIPTION**, which provides a similar function for descriptions involving objects that are shared across a database cluster.

Table 12-100 PG_DESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this description pertains to
classoid	oid	**PG_CLASS**.oid	OID of the system catalog where the object appears

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
objsubid	integer	-	Column number for a comment on a table column (**objoid** and **classoid** refer to the table itself); **0** for all other object types
description	text	-	Arbitrary text that serves as the description of the object

12.2.17.37 PG_DIRECTORY

PG_DIRECTORY stores directory objects added by users. You can execute the **CREATE DIRECTORY** statement to add records to this system catalog. When **enable_access_server_directory** is set to **off**, only the initial user can create directory objects. When **enable_access_server_directory** is set to **on**, users with the SYSADMIN permission and users inheriting the built-in role permission gs_role_directory_create can create directory objects. Common users can access this system catalog only after being authorized.

Table 12-101 PG_DIRECTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
dirname	name	Name of a directory object
owner	oid	Owner of a directory object
dirpath	text	Directory path.
diracl	aclitem[]	Access permissions.

12.2.17.38 PG_ENUM

PG_ENUM contains entries showing the values and labels for each enumerated type. The internal representation of a given enumerated value is actually the OID of its associated row in PG_ENUM.

Table 12-102 PG_ENUM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
enumtypid	oid	**oid** in **PG_TYPE**	OID of the **PG_TYPE** entry owning this enumerated value

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
enumsortorder	real	-	Sort position of this enumerated value within its enumerated type
enumlabel	name	-	Textual label for this enumerated value

The OIDs for PG_ENUM rows follow a special rule: even-numbered OIDs are guaranteed to be ordered in the same way as the sort ordering of their enumerated type. If two even OIDs belong to the same enumerated type, the smaller OID must have the smaller **enumsortorder** value. Odd-numbered OID values need bear no relationship to the sort order. This rule allows the enumerated comparison routines to avoid catalog lookups in many common cases. The routines that create and alter enumerated types attempt to assign even OIDs to enumerated values whenever possible.

When an enumerated type is created, its members are assigned sort-order positions from 1 to *n*. However, members added later might be given negative or fractional values of **enumsortorder**. The only requirement on these values is that they be correctly ordered and unique within each enumerated type.

12.2.17.39 PG_EXTENSION

PG_EXTENSION records information about the installed extensions. By default, GaussDB provides the following extensions: plpgsql, DIST_FDW, FILE_FDW, LOG_FDW, GC_FDW, DBLINK_FDW, PACKAGES, ROACH_API, STREAMING, TSDB, DIMSEARCH, GSREDISTRIBUTE, SECURITY_PLUGIN, GSSTAT_PLUGIN, NUMERIC_ENHANCE, PKG_DBE_RAW, PKG_DBE_OUTPUT, PKG_DBE_UTILITY, PKG_DBE_XML, PKG_ILM, PKG_DBE_XMLGEN, and PKG_DBE_DESCRIBE. This system catalog is for internal use only. You are advised not to use it.

NOTE

DIMSEARCH is no longer supported in the current version due to specification changes. Do not use it.

Table 12-103 PG_EXTENSION

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
extname	name	Extension name.
extowner	oid	Owner of the extension.
extnamespace	oid	Namespace containing the extension's exported objects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
extrelocatable	Boolean	Specifies whether the extension can be relocated to another namespace. The value can be **true** (yes) or **false** (no).
extversion	text	Version number of the extension.
extconfig	oid[]	Configuration information about the extension.
extcondition	text[]	Filter conditions for the extension's configuration information.

12.2.17.40 PG_EXTENSION_DATA_SOURCE

PG_EXTENSION_DATA_SOURCE records information about external data sources. An external data source contains information about an external database, such as its password encoding. It is mainly used with Extension Connector. By default, only the sysadmin user can query this system catalog. Due to specification changes, the current version no longer supports this feature. Do not use it.

Table 12-104 PG_EXTENSION_DATA_SOURCE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
srcname	name	-	Name of an external data source.
srcowner	oid	OID in 12.2.11.1 PG_AUTHID	Owner of a foreign data source.
srctype	text	-	Type of an external data source. It is **NULL** by default.
srcversion	text	-	Version of an external data source. It is **NULL** by default.
srcacl	aclitem[]	-	Access permissions.
srcoptions	text[]	-	Option used for foreign data sources, expressed in a string in the format of *keyword*=*value*.

12.2.17.41 PG_FOREIGN_DATA_WRAPPER

PG_FOREIGN_DATA_WRAPPER records foreign-data wrapper definitions. A foreign-data wrapper is the mechanism by which external data, residing on foreign servers, is accessed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-105 PG_FOREIGN_DATA_WRAPPER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
fdwname	name	-	Name of a foreign-data wrapper
fdwowner	oid	PG_AUTHID.oid	Owner of the foreign-data wrapper
fdwhandler	oid	PG_PROC.oid	References a handler function that is responsible for supplying execution routines for the foreign-data wrapper (**0** if no handler is provided)
fdwvalidator	oid	PG_PROC.oid	References a validator function that is responsible for checking the validity of the options given to the foreign-data wrapper, as well as options for foreign servers and user mappings using the foreign-data wrapper. (**0** if no handler is provided)
fdwacl	aclitem[]	-	Access permissions
fdwoptions	text[]	-	Foreign-data wrapper specific option, expressed in a string in the format of keyword=value

12.2.17.42 PG_FOREIGN_SERVER

PG_FOREIGN_SERVER records foreign server definitions. A foreign server describes a source of external data, such as a remote server. Foreign servers are accessed via foreign-data wrappers.

Table 12-106 PG_FOREIGN_SERVER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
srvname	name	-	Name of a foreign server
srvowner	oid	OID in PG_AUTHID	Owner of the foreign server
srvfdw	oid	OID in PG_FOREIGN_DATA_WRAPPER	OID of the foreign-data wrapper of the foreign server

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
srvtype	text	-	Type of the server (optional)
srvversion	text	-	Version of the server (optional)
srvacl	aclitem[]	-	Access permissions
srvoptions	text[]	-	Option used for foreign servers, expressed in a string in the format of keyword=value

12.2.17.43 PG_FOREIGN_TABLE

PG_FOREIGN_TABLE records auxiliary information about foreign tables.

Table 12-107 PG_FOREIGN_TABLE columns

Name	Type	Description
ftrelid	oid	ID of a foreign table.
ftserver	oid	Server where the foreign table is located.
ftwriteonly	boolean	Specifies whether the foreign table is writable. Values are as follows: • **t** (true): yes • **f** (false): no
ftoptions	text[]	Options of a foreign table. For details, see the description of **CREATE FOREIGN TABLE**.

12.2.17.44 PG_HASHBUCKET

PG_HASHBUCKET records hash bucket information.

Table 12-108 PG_HASHBUCKET columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
bucketid	oid	Node group bound to the database where the PG_HASHBUCKET system catalog resides on the CN. This column is empty on the DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketcnt	integer	This parameter is not used on the CN. It indicates the number of buckets owned by the current DN on the DN.
bucketmapsize	integer	This parameter is not used in the current version.
bucketref	integer	Reserved column with **1** as its default value.
bucketvector	oidvector_extend	This parameter is not used on the CN. It indicates the list of buckets owned by the current DN on the DN.
bucketmap	text	Stores the mapping between logical buckets and physical buckets, that is, the mapping between 16384 and 1024.
bucketversion	oidvector_extend	Records the version number of the information that changes during subsequent hash bucket scale-out.
bucketcsn	text	Maximum CSN of each bucket on the source node before hash bucket redistribution, which is used to determine the visibility of the new node.
bucketxid	text	**next_xid** set for bringing a new node online during hash bucket scaling. This parameter is used to check whether the value is within the threshold range.
bucketclogmode	int2	Type of the Clog directory used by a bucket table. If the value is empty, the **pg_clog/bucketid** directory is used. If the value is 1, the **pg_clog/clog_base/dbid/bucketid** directory is used.

12.2.17.45 PG_INDEX

PG_INDEX records part of index information. The rest is mostly recorded in PG_CLASS.

Table 12-109 PG_INDEX columns

Name	Type	Description
indexrelid	oid	OID of the **12.2.15.28 PG_CLASS** entry for the index.
indrelid	oid	OID of the **PG_CLASS** entry for the table that uses the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indnatts	smallint	Number of columns in the index.
indisunique	Boolean	Specifies whether the index is unique. ● **true**: The index is unique. ● **false**: The index is not unique.
indisprimary	Boolean	Specifies whether the index is the primary key of the table. ● **true**: The index is the primary key of the table. **indisunique** should always be **true** when the value of this column is **true**. ● **false**: The index is not the primary key of the table.
indisexclusion	Boolean	Specifies whether the index supports exclusive constraints. ● **true**: The index supports exclusive constraints. ● **false**: The index does not support exclusive constraints.
indimmediate	Boolean	Specifies whether to check the uniqueness of data to be inserted. ● **true**: The uniqueness check is performed immediately when data is inserted. ● **false**: The uniqueness check is not performed when data is inserted.
indisclustered	Boolean	Specifies whether the table is clustered on the index. ● **true**: The table is clustered on the index. ● **false**: The table is not clustered on the index.
indisusable	Boolean	Specifies whether the index is available for insert and select operations. ● **true**: The index is available for insert and select operations. ● **false**: The index is unavailable for insert and select operations.
indisvalid	Boolean	● **true**: The index can be used for query. ● **false**: The index is possibly incomplete and must still be modified by INSERT or UPDATE operations, but it cannot be securely used for queries. If it is a unique index, the uniqueness property is also not **true**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indcheckxmin	Boolean	• **true**: Queries must not use the index until the xmin of this row in PG_INDEX is lower than their **TransactionXmin**, because the table may contain broken HOT chains with incompatible rows that they can see. • **false**: Indexes can be used for query.
indisready	Boolean	• **true**: The index is available for inserting data. • **false**: The index is ignored when data is inserted or modified.
indkey	int2vector	This is an array of **indnatts** values indicating that this index creates table columns. For example, a value of **1 3** indicates that the first and the third columns make up the index key. The value **0** in this array indicates that the corresponding index attribute is an expression over the table columns, rather than a simple column reference.
indcollation	oidvector	OID of the collation corresponding to each index column. For details, see **PG_COLLATION**.
indclass	oidvector	For each column in the index key, this contains the OID of the operator class to use. For details, see section **12.2.15.53 PG_OPCLASS**.
indoption	int2vector	Array of values that store per-column flag bits. The meaning of the bits is defined by the index's access method.
indexprs	pg_node_tree	Expression trees (in **nodeToString()** representation) for index attributes that are not simple column references. It is a list with one element for each zero entry in indkey. The value is null if all index attributes are simple references.
indpred	pg_node_tree	Expression tree (in **nodeToString()** representation) for partial index predicate. If the index is not a partial index, this column is an empty string.
indisreplident	Boolean	Specifies whether the column of this index is a decoded column of logical decoding. • **true**: The column of this index is a decoded column of logical decoding. • **false**: The column of this index is not a decoded column of logical decoding.
indnkeyatts	smallint	Total number of columns in the index. The columns that exceed the value of **indnatts** are not involved in the index query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
indcctmpid	oid	OID of the temporary table when the Ustore builds indexes online.
indisvisible	Boolean	• **true**: The index status is visible, that is, the optimizer can use the index. • **false**: The index is invisible. If the value of **enable_invisible_indexes** is **off**, the optimizer cannot use the index. If the value of **enable_invisible_indexes** is **on**, the optimizer can use the index.

12.2.17.46 PG_INHERITS

PG_INHERITS records information about table inheritance hierarchies. There is one entry for each direct child table in the database. Indirect inheritance can be determined by following chains of entries.

Table 12-110 PG_INHERITS columns

Name	Type	Reference	Description
inhrelid	oid	PG_CLASS.oid	OID of a child table
inhparent	oid	PG_CLASS.oid	OID of a parent table
inhseqno	integer	-	If there is more than one direct parent for a child table (multiple inheritances), this number tells the order in which the inherited columns are to be arranged. The count starts at 1.

12.2.17.47 PG_JOB

PG_JOB records detailed information about jobs created by users. Dedicated threads poll the system catalog PG_JOB and trigger jobs based on scheduled job execution time, and update job status in PG_JOB. This system catalog belongs to the Shared Relation category. All job records are visible to all databases. Common users can access this system catalog only after being authorized.

Table 12-111 PG_JOB columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_id	bigint	Job ID, which is the primary key and is unique (with a unique index).
current_postgres_pid	bigint	If the current job has been executed, the thread ID of this job is recorded. The default value is **-1**, indicating that the job has not yet been executed.
log_user	name	Username of the creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database in which the job will be executed.
node_name	name	CN on which the job will be executed.
job_status	"char"	Execution status of the current task. The default value is **'s'**. The options are as follows: ● **'r'**: running ● **'s'**: successfully finished ● **'f'**: job failed ● **'d'**: disable If a job fails to be executed for 16 consecutive times, **job_status** is automatically set to **'d'**, and no more attempt will be made on this job. Note: When you disable a scheduled job (by setting **job_queue_processes** to **0**), the thread that monitors the job execution is not started, and the job status will not be updated. You can ignore this status. Only when the scheduled job function is enabled (**job_queue_processes** is not set to **0**), the system updates the value of this column based on the real-time job status.
start_date	timestamp without time zone	Start time of the first job execution, accurate to millisecond.
next_run_date	timestamp without time zone	Time when a scheduled task is executed next time. The time is accurate to milliseconds.
failure_count	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
interval	text	Job execution interval.
last_start_date	timestamp without time zone	Start time of the last job execution, accurate to millisecond.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_end_date	timestamp without time zone	End time of the last job execution, accurate to millisecond.
last_suc_date	timestamp without time zone	Start time of the last successful job execution, accurate to millisecond.
this_run_date	timestamp without time zone	Start time of the ongoing job execution, accurate to millisecond.
nspname	name	Name of the schema used for job execution.
job_name	text	Name of the DBE_SCHEDULER scheduled task.
end_date	timestamp without time zone	Expiration time of the DBE_SCHEDULER scheduled task, accurate to millisecond.
enable	Boolean	Enabling status of the DBE_SCHEDULER scheduled job. The options are as follows: • **true**: enabled • **false**: disabled
failure_msg	text	Error information about the latest task execution.

12.2.17.48 PG_JOB_PROC

PG_JOB_PROC records the content of each job in the **PG_JOB** catalog, including the PL/SQL code blocks and anonymous blocks. Storing such information in the system catalog PG_JOB and loading it to the shared memory will result in excessive memory usage. Therefore, such information is stored in a separate table and is retrieved when needed. Common users can access this system catalog only after being authorized.

Table 12-112 PG_JOB_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
job_id	integer	Foreign key, which is associated with **job_id** in **PG_JOB**.
what	text	Job content, which is the program content in the DBE_SCHEDULER scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_name	text	Name of the DBE_SCHEDULER scheduled task or program.

12.2.17.49 PG_LANGUAGE

PG_LANGUAGE registers programming languages. You can use them and interfaces to write functions or stored procedures.

Table 12-113 PG_LANGUAGE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
lanname	name	-	Name of the language.
lanowner	oid	OID in PG_AUTHID	Owner of the language.
lanispl	boolean	-	• **true**: user-defined language. • **false**: internal language, for example, SQL. Currently, gs_dump still uses this column to determine which languages need to be dumped, but this might be replaced by a different mechanism in the future.
lanpltrusted	boolean	-	• **true**: The language is trusted, which means that it is believed not to grant access to anything outside the normal SQL execution environment. • **false**: The language is untrusted. Only the initial user can create functions in untrusted languages.
lanplcallfoid	oid	OID in PG_PROC	For non-internal languages, this column references the language handler, which is a special function responsible for executing all functions that are written in the particular language.
laninline	oid	OID in PG_PROC	This column references a function responsible for executing "inline" anonymous code blocks (DO blocks). The value is **0** if inline blocks are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
lanvalidator	oid	OID in PG_PROC	This column references a language validator function responsible for checking the syntax and validity of new functions when they are created. The value is **0** if no validator is provided.
lanacl	aclitem[]	-	Access permission.

12.2.17.50 PG_LARGEOBJECT

PG_LARGEOBJECT records data making up large objects. A large object is identified by an OID assigned when it is created. Each large object is broken into segments or "pages" small enough to be conveniently stored as rows in PG_LARGEOBJECT. The amount of data per page is defined as **LOBLKSIZE**.

This system catalog is accessible only to system administrators.

Table 12-114 PG_LARGEOBJECT columns

Name	Type	Reference	Description
loid	oid	OID in PG_LARGEOBJECT_METADATA	Identifier of the large object that includes this page.
pageno	integer	-	Page number of this page within its large object (counting from zero).
data	bytea	-	Data stored in the large object. This will never be more than **LOBLKSIZE** bytes and might be less.

Each row of **PG_LARGEOBJECT** holds data for one page of a large object, beginning at byte offset (**pageno * LOBLKSIZE**) within the object. The implementation allows sparse storage: pages might be missing, and might be shorter than **LOBLKSIZE** bytes even if they are not the last page of the object. Missing regions within a large object read as zeroes.

12.2.17.51 PG_LARGEOBJECT_METADATA

PG_LARGEOBJECT_METADATA records metadata associated with large objects. The actual large object data is stored in **PG_LARGEOBJECT**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-115 PG_LARGEOBJECT_METADATA columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
lomowner	oid	PG_AUTHID.oid	Owner of the large object
lomacl	aclitem[]	-	Access permissions

12.2.17.52 PG_NAMESPACE

PG_NAMESPACE records namespaces, that is, schema-related information. If the database object isolation attribute is enabled, users can view only the schema information that they have the permission to access.

Table 12-116 PG_NAMESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
nspname	name	Name of a namespace.
nspowner	oid	Owner of a namespace.
nsptimeline	bigint	Timeline when the namespace is created on the DN. This column is for internal use and valid only on the DN.
nspacl	aclitem[]	Access permission. For details, see **GRANT** and **REVOKE**.
in_redistribution	"char"	Specifies whether the content is in the redistribution state.
nspblockchain	Boolean	Specifies whether the mode is the tamper-proof mode. • **true**: The mode is the tamper-proof mode. • **false**: The mode is not the tamper-proof mode.
nspcollation	oid	Default collation of the namespace (a value may exist only when **sql_compatibility** is set to **'MYSQL'**).

12.2.17.53 PG_OBJECT

PG_OBJECT records the creator, creation time, and last modification time of objects of specified types (ordinary tables, indexes, sequences, views, stored procedures, and functions).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-117 PG_OBJECT columns

Name	Type	Description
object_oid	oid	Object identifier.
object_type	"char"	Object type. ● **r**: ordinary table ● **i**: index ● **s**: sequence ● **v**: view ● **p**: stored procedure and function ● **S**: package header ● **B**: package body
creator	oid	Object owner.
ctime	timestamp with time zone	Creation time of an object.
mtime	timestamp with time zone	Last modification time of an object. The modification operations include **ALTER**, **GRANT**, and **REVOKE**.
createcsn	bigint	CSN when an object is created.
changecsn	bigint	CSN when DDL operations are performed on a table or an index.
valid	Boolean	Validity of an object. **t** indicates valid, and **f** indicates invalid.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Objects created or modified during database initialization (initdb) cannot be recorded. **PG_OBJECT** does not contain these object records.
- A database upgraded to this version cannot record objects created before the upgrade. **PG_OBJECT** does not contain these object records.
- When the preceding two types of objects are modified again, the modification time (**mtime**) is recorded. Because the creation time of the objects cannot be obtained, **ctime** is empty.
- When an object created before the upgrade is modified again, the modification time (specified by **mtime**) is recorded. When DDL operations are performed on a table or an index, the transaction commit sequence number (specified by **changecsn**) of the transaction to which the table or index belongs is recorded. Because the creation time of the object cannot be obtained, **ctime** and **createcsn** are empty.
- The time recorded by **ctime** and **mtime** is the start time of the transaction to which the current operation belongs.
- The time of object modification due to capacity expansion is also recorded.
- **createcsn** and **changecsn** record the transaction commit sequence number of the transaction to which the current operation belongs.
- If the statement for creating an object has an undefined object, or the referenced object is modified or deleted, the object to be created will be invalid.

12.2.17.54 PG_OPCLASS

PG_OPCLASS defines index access method operator classes.

Each operator class defines semantics for index columns of a particular data type and a particular index access method. An operator class essentially specifies that a particular operator family is applicable to a particular indexable column data type. The set of operators from the family that are actually usable with the indexed column are data types that accept the left-hand column.

Table 12-118 PG_OPCLASS columns

Name	Type	Reference	Description
OID	OID	-	Row identifier (hidden attribute, which must be specified)
opcmethod	OID	OID in **PG_AM**	Index access method operator class served by an operator class
opcname	name	-	Name of the operator class
opcnamespace	OID	OID in **PG_NAMESPACE**	Namespace of the operator class
opcowner	OID	OID in **PG_AUTHID**	Owner of the operator class

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
opcfamily	OID	OID in PG_OPFAMILY	Operator family containing the operator class
opcintype	OID	OID in PG_TYPE	Data type that the operator class indexes
opcdefault	Boolean	-	The value is **t** (true) if the operator class is the default for **opcintype**. Otherwise, the value is **f** (false).
opckeytype	OID	OID in PG_TYPE	Type of data stored in index, or zero if same as **opcintype**

An operator class's **opcmethod** must match the **opfmethod** of its containing operator family.

12.2.17.55 PG_OPERATOR

PG_OPERATOR records information about operators.

Table 12-119 PG_OPERATOR columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
oprname	name	-	Name of an operator.
oprnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace that contains the operator.
oprowner	oid	OID in PG_AUTHID	Owner of the operator.
oprkind	"char"	-	• **b**: infix (both sides) • **l**: prefix (left side) • **r**: suffix (right side)
oprcanmerge	boolean	-	Specifies whether the operator supports merge joins. • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
oprcanhash	boolean	-	Specifies whether the operator supports hash joins. • **t** (true): yes • **f** (false): no
oprleft	oid	OID in **PG_TYPE**	Type of the left operand.
oprright	oid	OID in **PG_TYPE**	Type of the right operand.
oprresult	oid	OID in **PG_TYPE**	Type of the result.
oprcom	oid	OID in **PG_OPERATOR**	If it exists, the value is the exchange character of this operator. If it does not exist, the value is **0**.
oprnegate	oid	OID in **PG_OPERATOR**	If it exists, the value is the invertor of this operator. If it does not exist, the value is **0**.
oprcode	regproc	**proname** in **PG_PROC**	Function that implements the operator.
oprrest	regproc	**proname** in **PG_PROC**	Restriction selectivity estimation function for the operator.
oprjoin	regproc	**proname** in **PG_PROC**	Join selectivity estimation function for the operator.

12.2.17.56 PG_OPFAMILY

PG_OPFAMILY defines operator families.

Each operator family is a collection of operators and associated support routines that implement semantics specified for a particular index access method. Furthermore, the operators in a family are all compatible, in a way that is specified by the access method. The operator family allows cross-data-type operators to be used with indexes and to be reasoned about using knowledge of access method semantics.

Table 12-120 PG_OPFAMILY columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
opfmethod	oid	PG_AM.oid	Index access method used by an operator family
opfname	name	-	Name of the operator family
opfnamespace	oid	**oid** in PG_NAMESPACE	Namespace of the operator family
opfowner	oid	OID in PG_AUTHID	Owner of the operator family

The majority of the information defining an operator family is not in its **PG_OPFAMILY** row, but in the associated rows in **PG_AMOP**, **PG_AMPROC**, and **PG_OPCLASS**.

12.2.17.57 PG_PLTEMPLATE

PG_PLTEMPLATE records template information for procedural languages.

Table 12-121 PG_PLTEMPLATE columns

Name	Type	Description
tmplname	name	Name of the language for which this template is used
tmpltrusted	boolean	The value is **true** if the language is considered trusted. Otherwise, the value is **false**.
tmpldbacreate	boolean	The value is **true** if the language is created by the owner of the database. Otherwise, the value is **false**.
tmplhandler	text	Name of the call handler function
tmplinline	text	Name of the anonymous block handler (**NULL** if no name of the block handler exists)
tmplvalidator	text	Name of the verification function (**NULL** if no verification function is available)
tmpllibrary	text	Path of the shared library that implements languages
tmplacl	aclitem[]	Access permissions for template (not yet used)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.17.58 PG_PROC

PG_PROC records information about functions or procedures.

Table 12-122 PG_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
proname	name	Function name.
pronamespace	oid	OID of the namespace that contains the function.
proowner	oid	Owner of the function.
prolang	oid	Implementation language or call API of the function.
procost	real	Estimated execution cost.
prorows	real	Estimated number of rows that are influenced.
provariadic	oid	Data type of parameter element.
protransform	regproc	Simplified call method for the function.
proisagg	Boolean	Specifies whether the function is an aggregate function. ● **t** (true): yes. ● **f** (false): no.
proiswindow	Boolean	Specifies whether the function is a window function. ● **t** (true): yes. ● **f** (false): no.
prosecdef	Boolean	Specifies whether the function is a security definer (or a setuid function). ● **t** (true): yes. ● **f** (false): no.
proleakproof	Boolean	Specifies whether the function has side effects. If no leakproof treatment is provided for parameters, the function throws errors. ● **t** (true): There is no side effect. ● **f** (false): There are side effects.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proisstrict	Boolean	• **t** (true): When this function is used, the function does not call the function and returns null if the input parameter is null. • **f** (false): When this function is used, it is called even if the input parameter is null. Therefore, this function must process null input.
proretset	Boolean	Specifies whether the return value of the function is a set (that is, multiple values of the specified data type). • **true**: The return value of the function is a set. • **false**: The return value of the function is not a set.
provolatile	"char"	Specifies whether the function's result depends only on its input parameters, or is affected by outside factors. • **i**: immutable functions, which always deliver the same result for the same inputs. • **s**: stable functions, whose results (for fixed inputs) do not change within a scan. • **v**: volatile functions, whose results may change at any time. It is also used for functions with side-effects, so that the engine cannot get optimized if volatile functions are called.
pronargs	smallint	Number of parameters.
pronargdefaults	smallint	Number of parameters that have default values.
prorettype	oid	Data type of return values.
proargtypes	oidvector	Array that stores the data types of function parameters. This array includes only input parameters (including **INOUT** parameters), and indicates the call signature (API) of the function.
proallargtypes	oid[]	Array that contains the data types of function parameters. This array includes all parameter types (including **OUT** and **INOUT** parameters); however, if all the parameters are **IN** parameters, this column is null. Note that array indexing is 1-based, whereas for historical reasons, **proargtypes** is indexed from 0.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proargmodes	"char"[]	Array with the modes of the function parameters, encoded as follows: • **i** indicates the **IN** parameter. • **o** indicates the **OUT** parameter. • **b** indicates the **INOUT** parameter. • **v** indicates the **VARIADIC** parameter. If all the parameters are **IN** parameters, this column is null. Note that indexes correspond to positions of **proallargtypes**, not **proargtypes**.
proargnames	text[]	Array that stores the names of the function parameters. Parameters without a name are set to empty strings in the array. If none of the parameters have a name, this column is null. Note that indexes correspond to positions of **proallargtypes**, not **proargtypes**.
proargdefaults	pg_node_tree	Expression tree of the default value. This is the list of **pronargdefaults** elements.
prosrc	text	A definition that describes a function or stored procedure. In an interpreting language, it is the function source code, a connection symbol, a file name, or any body content specified when a function or stored procedure is created, depending on how a language or call is used.
probin	text	Additional information about how to call the function. Again, the interpretation is language-specific.
proconfig	text[]	Function's local settings for run-time configuration variables.
proacl	aclitem[]	Access permissions. For details, see **GRANT** and **REVOKE**.
prodefaultargpos	int2vector	Position of the input parameter of a function with a default value.
fencedmode	Boolean	Execution mode of a function, indicating whether the function is executed in fence or not fence mode. • **true**: fence mode. In this mode, the function is executed in the fork process. • **false**: not fence mode. For built-in functions, **fencedmode** is set to **false**, indicating the not fence mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
proshippable	Boolean	Specifies whether the function can be pushed down to DNs for execution. The default value is **false**. ● Functions of the **IMMUTABLE** type can always be pushed down to DNs. ● Functions of the **STABLE** or **VOLATILE** type can be pushed down to DNs only if their attribute is **SHIPPABLE**.
propackage	Boolean	Specifies whether the function supports overloading. The default value is **false**. ● **t** (true): supported. ● **f** (false): not supported.
prokind	"char"	Specifies whether the object is a function or a stored procedure. ● **'f'**: The object is a function. ● **'p'**: The object is a stored procedure.
proargsrc	text	Describes the parameter input strings of functions or stored procedures that are compatible with ORA syntax, including parameter comments. The default value is **NULL**.
proisprivate	Boolean	Specifies whether a function is a private function in the package. The default value is **false**.
propackageid	oid	OID of the package to which the function belongs. If the function is not in the package, the value is **0**.
proargtypesext	oidvector_extend	Data type array used to store function parameters when there are a large number of function parameters. This array includes only input parameters (including **INOUT** parameters), and indicates the call signature (API) of the function.
prodefaultargposext	int2vector_extend	Position of the input parameter with a default value when the function has a large number of parameters.
allargtypes	oidvector	Array for storing the data types of stored procedure parameters, including all parameters (input parameters, output parameters, and **INOUT** parameters) of the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
allargtypesext	oidvector_extend	Array for storing the data types of stored procedure parameters when the number of function parameters is greater than 666. The array contains all parameters (including input parameters, output parameters, and **INOUT** parameters).

NOTE

When a function is created, data is inserted into the PG_PROC catalog to update the index. When there are a large number of input and output parameters, the index length may exceed one-third of the page length. As a result, the error "Index row size xxx exceeds maximum xxx for index 'pg_proc_proname_all_args_nsp_index'" may be reported as expected. You can reduce the number of parameters to avoid this error.

12.2.17.59 PG_RANGE

PG_RANGE records information about range types, except for records of types in **PG_TYPE**.

Table 12-123 PG_RANGE columns

Name	Type	Reference	Description
rngtypid	oid	OID in **PG_TYPE**	OID of the range type
rngsubtype	oid	OID in **PG_TYPE**	OID of the element type (subtype) of this range type
rngcollation	oid	OID in **PG_COLLATION**	OID of the collation used for range comparisons (**0** if none)
rngsubopc	oid	OID in **PG_OPCLASS**	OID of the subtype's operator class used for range comparisons
rngcanonical	regproc	**proname** in **PG_PROC**	Name of the function to convert a range value into canonical form (**0** if none)
rngsubdiff	regproc	**proname** in **PG_PROC**	Name of the function used to calculate the difference between two elements in a range. The return value of the function is of the double-precision type. If the function does not exist, the value of **rngsubdiff** is **0**.

If the element type is discrete, **rngcanonical** determines the collation used for the range type. If the element type is not collatable, **rngsubopc** determines the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

collation used for the range type. If the element type is collatable, **rngsubopc** and **rngcollation** determine the collation used for the range type.

12.2.17.60 PG_REPLICATION_ORIGIN

PG_REPLICATION_ORIGIN contains all created replication sources and is shared among all databases in a cluster. Each cluster has only one copy of PG_REPLICATION_ORIGIN, not one copy per database instance.

Table 12-124 PG_REPLICATION_ORIGIN columns

Name	Type	Description
roident	oid	Unique replication source identifier within a cluster.
roname	text	External user-defined replication source name.

12.2.17.61 PG_RESOURCE_POOL

PG_RESOURCE_POOL provides information about database resource pools.

Table 12-125 PG_RESOURCE_POOL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
respool_name	name	Name of a resource pool.
mem_percent	integer	Percentage of the memory configuration.
cpu_affinity	bigint	Value of cores bound to the CPU.
control_group	name	Name of the Cgroup where the resource pool is located.
active_statements	integer	Reserved column.
max_dop	integer	Maximum scanning concurrency during data redistribution. This column is used only for scaling.
memory_limit	name	Maximum memory of the resource pool.
parentid	oid	OID of the parent resource pool.
io_limits	integer	Upper limit of IOPS. It is counted by 10,000 per second for row store.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
nodegroup	name	Indicates the name of the node group to which the resource pool belongs.
io_priority	name	I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.
max_worker	integer	Concurrency in a table during data redistribution. This column is used only for scaling.
max_connections	integer	Maximum number of connections that can be used by a resource pool.
max_dynamic_memory	name	Maximum dynamic memory that can be used by a resource pool.
max_shared_memory	name	Maximum shared memory that can be used by a resource pool.
max_concurrency	integer	Maximum number of concurrent requests that can be used by a resource pool.

12.2.17.62 PG_REWRITE

PG_REWRITE records rewrite rules defined for tables and views.

Table 12-126 PG_REWRITE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rulename	name	Name of a rule.
ev_class	oid	Name of the table that uses the rule.
ev_attr	smallint	Column to which this rule applies (always **0** to indicate the entire table).
ev_type	"char"	Event type for the rule. • **1**: SELECT • **2**: UPDATE • **3**: INSERT • **4**: DELETE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ev_enabled	"char"	Controls the mode in which the rule is triggered. • **O**: The rule is triggered in origin and local modes. • **D**: The rule is disabled. • **R**: The rule is triggered in replica mode. • **A**: The rule is always triggered.
is_instead	Boolean	The value is **true** if the rule is of the **INSTEAD** type. Otherwise, the value is **false**.
ev_qual	pg_node_tree	Expression tree (in the form of a nodeToString() representation) for the rule's qualifying condition.
ev_action	pg_node_tree	Query tree (in the form of a nodeToString() representation) for the rule's action.

12.2.17.63 PG_SET

PG_SET records metadata defined by the SET data type.

This function is not supported in the current distributed system.

12.2.17.64 PG_SHDEPEND

PG_SHDEPEND records the dependency between database objects and shared objects, such as roles. Based on this information, GaussDB can ensure that those objects are unreferenced before attempting to delete them.

See also **PG_DEPEND**, which provides a similar function for dependencies involving objects within a single database.

PG_SHDEPEND is shared among all databases of cluster. That is, there is only one PG_SHDEPEND for each cluster, not for each database.

Table 12-127 PG_SHDEPEND columns

Name	Type	Reference	Description
dbid	oid	OID in **PG_DATABASE**	OID of the database where a dependent object is (**0** for a shared object).
classid	oid	OID in **PG_CLASS**	OID of the system catalog where a dependent object resides.
objid	oid	Any OID column	OID of the dependent object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
objsubid	integer	-	Column number of a table column (the table to which the column points can be determined based on **objid** and **classid**). The value is **0** for all other object types.
refclassid	oid	OID in PG_CLASS	OID of the system catalog the referenced object is in (must be a shared catalog).
refobjid	oid	Any OID column	OID of the referenced object.
deptype	"char"	-	Code segment defining the specific semantics of this dependency relationship. The value can be **o**, **a**, **p**, **d**, or **l**.
objfile	text	-	Path of the user-defined C function library file.

In all cases, a PG_SHDEPEND entry indicates that the referenced object cannot be dropped without also dropping the dependent object. However, there are several subflavors identified by **deptype**:

- SHARED_DEPENDENCY_OWNER (o)

  The referenced object (which must be a role) is the owner of the dependent object.
- SHARED_DEPENDENCY_ACL (a)

  The referenced object (which must be a role) is mentioned in the access control list (ACL) of the dependent object. SHARED_DEPENDENCY_ACL is not added to the owner of the object because the owner will have a SHARED_DEPENDENCY_OWNER record.
- SHARED_DEPENDENCY_PIN (p)

  This type of record indicates that the system itself depends on the depended object. Therefore, such an object cannot be deleted. Entries of this type are created only by initdb. The columns for the dependent object contain zeroes.
- SHARED_DEPENDENCY_ DBPRIV(d)

  The referenced object (must be a role) has the ANY permission on the dependent object (the specified OID of the dependent object corresponds to a row in the **12.2.10.1 GS_DB_PRIVILEGE** system catalog).
- SHARED_DEPENDENCY_ SECLABEL(l)

  The referenced object (must be a security label) is applied to the dependent object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.17.65 PG_SHDESCRIPTION

PG_SHDESCRIPTION records optional comments for shared database objects. Descriptions can be manipulated with the **COMMENT** command and viewed with the **\d** command.

See also PG_DESCRIPTION, which provides a similar function for descriptions involving objects within a single database.

PG_SHDESCRIPTION is shared among all databases of cluster. That is, there is only one PG_SHDESCRIPTION for each cluster, not for each database.

Table 12-128 PG_SHDESCRIPTION columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the described object.
classoid	oid	OID in **PG_CLASS**	OID of the system catalog where the object appears.
description	text	-	Description of the object.

12.2.17.66 PG_STATISTIC

PG_STATISTIC stores statistics about tables and index columns in a database. By default, only a system administrator can access the system catalog. Common users can access this system catalog only after being authorized.

Table 12-129 PG_STATISTIC columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.
stadndistinct	real	Number of unique non-null data values in the **DN1** column. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
staextinfo	text	Information about extension statistics. This is reserved.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stastate	"char"	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. Currently, this parameter is meaningless in distributed mode. • **l**: locked • **u**: unlocked

NOTICE

PG_STATISTIC stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG_STATISTIC system catalog to query the sensitive information about the statistical objects.

12.2.17.67 PG_STATISTIC_EXT

PG_STATISTIC_EXT displays extended statistics of tables in a database, such as statistics of multiple columns. Statistics of expressions will be supported later. You can specify the extended statistics to be collected. This system catalog is accessible only to system administrators.

Table 12-130 PG_STATISTIC_EXT columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	char	Type of an object. **'c'** indicates a table, and **'p'** indicates a partition.
stainherit	boolean	Specifies whether to collect statistics for objects that have inheritance relationship. • **t** (true): yes • **f** (false): no
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadistinct	real	Number of distinct, non-null data values in the column for all DNs. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
stadndistinct	real	Number of unique non-null data values in the **DN1** column. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stasource	char	Source of extended statistics: • **'a'**: indicates automatic creation. For details, see the GUC parameter **auto_statistic_ext_columns**. • **'m'**: indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).
stastatus	char	Status of extended statistics: • **'a'**: active and available. • **'d'**: disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.
staextname	name	Alias of the multi-column group of multi-column statistics.
stastate	char	Specifies whether the statistics are locked. If the statistics are locked, they cannot be updated. Currently, this parameter is meaningless in distributed mode. • **l**: locked • **u**: unlocked

NOTICE

PG_STATISTIC_EXT stores sensitive information about statistical objects, such as MCVs. The system administrator and authorized users can access the PG_STATISTIC_EXT system catalog to query the sensitive information about the statistical objects.

12.2.17.68 PG_SYNONYM

PG_SYNONYM records the mapping between synonym object names and other database object names.

Table 12-131 PG_SYNONYM columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
synname	name	Synonym name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
synnamespace	oid	OID of the namespace that contains a synonym. The OID of the PUBLIC synonym namespace is 0.
synowner	oid	Owner of a synonym, usually the OID of the user who created it. The owner of the PUBLIC synonym is 0.
synobjschema	name	Schema name specified by an associated object.
synobjname	name	Name of an associated object.
syndblinkname	name	Database link name.

12.2.17.69 PG_TABLESPACE

PG_TABLESPACE records tablespace information.

Table 12-132 PG_TABLESPACE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
spcname	name	Tablespace name
spcowner	oid	Owner of the tablespace, usually the user who created it
spcacl	aclitem[]	Access permissions. For details, see **GRANT** and **REVOKE**.
spcoptions	text[]	Options of the tablespace
spcmaxsize	text	Maximum size of the available disk space, in bytes
relative	boolean	Whether the storage path specified by the tablespace is a relative path • **t (true)**: yes. • **f (false)**: no.

12.2.17.70 PG_TRIGGER

PG_TRIGGER records trigger information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-133 PG_TRIGGER columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
tgrelid	oid	OID of the table where the trigger is located.
tgname	name	Trigger name.
tgfoid	oid	Function to be invoked by the trigger.
tgtype	smallint	Trigger type.
tgenabled	"char"	• **O**: The trigger is triggered in origin and local modes. • **D**: The trigger is disabled. • **R**: The trigger is triggered in replica mode. • **A**: The trigger is always triggered.
tgisinternal	Boolean	Internal trigger ID. If the value is **true**, it indicates an internal trigger.
tgconstrrelid	oid	Table referenced by the integrity constraint.
tgconstrindid	oid	Index of the integrity constraint.
tgconstraint	oid	OID of the constraint trigger in PG_CONSTRAINT.
tgdeferrable	Boolean	Specifies whether the constraint trigger is of the DEFERRABLE type. • **t** (true): yes • **f** (false): no
tginitdeferred	Boolean	Specifies whether the trigger is of the INITIALLY DEFERRED type. • **t** (true): yes • **f** (false): no
tgnargs	smallint	Number of input parameters of the trigger function.
tgattr	int2vector	Column ID specified by the trigger. If no column is specified, an empty array is used.
tgargs	bytea	Parameter transferred to the trigger.
tgqual	pg_node_tree	WHEN condition of the trigger (**NULL** if the WHEN condition does not exist).
tgowner	oid	Trigger owner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.17.71 PG_TS_CONFIG

PG_TS_CONFIG contains entries representing text search configurations. Each of these configurations contains a list of specific text search parsers and dictionary mappings.

The parser is shown in the PG_TS_CONFIG entry, but the token-to-dictionary mapping is defined by subsidiary entries in **PG_TS_CONFIG_MAP**.

Table 12-134 PG_TS_CONFIG columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
cfgname	name	-	Text search configuration name.
cfgnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the configuration.
cfgowner	oid	OID in **PG_AUTHID**	Owner of the configuration.
cfgparser	oid	OID in **PG_TS_PARSER**	OID of the text search parser for this configuration.
cfoptions	text[]	-	Configuration options.

12.2.17.72 PG_TS_CONFIG_MAP

PG_TS_CONFIG_MAP contains parser symbol mappings for each text search configuration.

Table 12-135 PG_TS_CONFIG_MAP columns

Name	Type	Reference	Description
mapcfg	oid	OID in **PG_TS_CONFIG**	OID of the **PG_TS_CONFIG** entry owning this map entry.
maptokentype	integer	-	Token type generated by the configuration's parser.
mapseqno	integer	-	Sequence number of a token type when the values of **mapcfg** or **maptokentype** are the same.
mapdict	oid	OID in **PG_TS_DICT**	OID of the text search dictionary to consult.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.17.73 PG_TS_DICT

PG_TS_DICT contains entries that define text search dictionaries. A dictionary depends on a text search template, which specifies all the implementation functions needed; the dictionary itself provides values for the user-settable parameters supported by the template.

This division of labor allows dictionaries to be created by unprivileged users. The parameters are specified by a text string **dictinitoption**, whose format and meaning vary depending on the template.

Table 12-136 PG_TS_DICT columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
dictname	name	-	Text search dictionary name
dictnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the dictionary
dictowner	oid	OID in **PG_AUTHID**	Owner of the dictionary
dicttemplate	oid	**PG_TS_TEMPLATE**.oid	OID of the text search template for the dictionary.
dictinitoption	text	-	Initialization option string for the template

12.2.17.74 PG_TS_PARSER

PG_TS_PARSER contains definition of text search parsers. A parser is responsible for splitting input text into lexemes and assigning a token type to each lexeme. Because the parser must be implemented through functions at the C language level, the new parser must be created by the database system administrator.

Table 12-137 PG_TS_PARSER columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
prsname	name	-	Text search parser name.
prsnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace that contains the parser.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
prsstart	regproc	**proname** in PG_PROC	Name of the parser's startup function.
prstoken	regproc	**proname** in PG_PROC	Name of the parser's next-token function.
prsend	regproc	**proname** in PG_PROC	Name of the parser's shutdown function.
prsheadline	regproc	**proname** in PG_PROC	Name of the parser's headline function.
prslextype	regproc	**proname** in PG_PROC	Name of the parser's lextype function.

12.2.17.75 PG_TS_TEMPLATE

PG_TS_TEMPLATE contains entries defining text search templates. A template provides a framework for text search dictionaries. Since a template must be implemented by C-language-level functions, templates can be created only by database administrators.

Table 12-138 PG_TS_TEMPLATE columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified).
tmplname	name	-	Text search template name.
tmplnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace that contains the template.
tmplinit	regproc	**proname** in PG_PROC	Name of the template's initialization function.
tmpllexize	regproc	**proname** in PG_PROC	Name of the template's lexize function.

12.2.17.76 PG_TYPE

PG_TYPE stores information about data types.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-139 PG_TYPE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
typname	name	Data type name.
typnamespace	oid	OID of the namespace that contains the type.
typowner	oid	Owner of the type.
typlen	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. • **-1**: a "varlena" type (one that has a length word). • **-2**: a null-terminated C string.
typbyval	Boolean	• **true**: A value of this type is transferred by value internally. • **false**: A value of this type is transferred by reference internally. If **typlen** of this type is not **1**, **2**, **4**, or **8**, you are advised to transfer a reference value for **typbyval**. You can also transfer a value for **typbyval**. Variable-length types are usually passed by reference or by value.
typtype	"char"	• **b**: basic type. • **c**: composite type (for example, the row type of a table). • **d**: domain type. • **p**: pseudo type. • **r**: range type. • **e**: enumeration type. • **u**: undefined type. • **o**: set type. For details, see **typrelid** and **typbasetype**.
typcategory	"char"	Fuzzy classification of data types, which can be used by parsers as the basis for data conversion.
typispreferred	Boolean	• **true**: Data is converted when it complies with the conversion rule specified by **typcategory**. • **false**: Data is not converted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typisdefined	Boolean	• **true**: The type has been defined. • **false**: The placeholder of an undefined type is used. In this case, there is no reliable information except the name, namespace, and OID of the type.
typdelim	"char"	Character that separates two values of this type when parsing an array input. Note that the delimiter is associated with the array element data type, not the array data type.
typrelid	oid	If this is a composite type (see **typtype**), then this column points to the **12.2.15.28 PG_CLASS** entry that defines the corresponding table. For a free-standing composite type, the PG_CLASS entry does not represent a table, but it is required for the type's **PG_ATTRIBUTE** entries to link to. It is **0** for non-composite type.
typelem	oid	If **typelem** is not **0**, it identifies another row in PG_TYPE. The current type can be described as an array yielding values of type **typelem**. A "true" array type has a variable length (**typlen** = **–1**), but some fixed-length types (**typlen** > **0**) also have non-zero **typelem**, for example **name** and **point**. If a fixed-length type has a **typelem**, its internal representation must be a number of values of the **typelem** data type with no other data. Variable-length array types have a header defined by the array subroutines.
typarray	oid	If the value is not **0**, the corresponding type record is available in PG_TYPE.
typinput	regproc	Input conversion function (text format).
typoutput	regproc	Output conversion function (text format).
typreceive	regproc	Input conversion function (binary format); **0** for non-input conversion function.
typsend	regproc	Output conversion function (binary format); **0** for non-output conversion function.
typmodin	regproc	Input type modifier function; **0** if none.
typmodout	regproc	Output type modifier function; **0** if none.
typanalyze	regproc	Custom ANALYZE function; **0** if the standard function is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typalign	"char"	Alignment required when storing a value of this type. It applies to storage on disks as well as most representations of the value. When multiple values are stored consecutively, such as in the representation of a complete row on disk, padding is inserted before a data of this type so that it begins on the specified boundary. The alignment reference is the beginning of the first datum in the sequence. Possible values are: ● **c**: char alignment, that is, no alignment required. ● **s**: short alignment (2 bytes on most machines). ● **i**: integer alignment (4 bytes on most machines). ● **d**: double alignment (8 bytes on many machines, but by no means all). **NOTICE** For types used in system catalogs, the size and alignment defined in PG_TYPE must agree with the way that the compiler lays out the column in a structure representing a table row.
typstorage	"char"	Data storage mode of a specified column, including the following types: ● **p**: plain storage. Numbers are always stored in a simple way. ● **e**: external storage. Data is stored outside the main table (for example, in the TOAST table). The main table stores references to data form external storage. ● **m**: main storage. Data can be stored compressed inline, which is similar to plain storage. This method is usually used to store types that require customized storage, for example, customized composite types. ● **x**: extended storage. Values may be compressed and/or moved into a level-2 relational table. **x** is usually the storage mode of the TOAST type.
typnotnull	Boolean	Specifies whether the type has a NOT NULL constraint. Currently, it is used for domains only.
typbasetype	oid	If this is a domain (see **typtype**), then **typbasetype** identifies the type that this one is based on. The value is **0** if this type is not a derived type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
typtypmod	integer	Records the **typtypmod** to be applied to domains' base types by domains (the value is **–1** if the base type does not use **typmod**). This is **–1** if this type is not a domain. If the type is array, **typtypmod** indicates the maximum capacity of the array type. If the type is index-by table collection, **typtypmod** indicates the maximum index length of the collection type.
typndims	integer	If a field is an array, **typndims** is the number of array dimensions. This is **0** for types other than domains over array types.
typcollation	oid	Sorting rule of a specified type. For details about the values, see the **PG_COLLATION** system catalog. (**0** if sequencing is not supported.)
typdefaultbin	pg_node_tree	nodeToString() representation of a default expression for the type if the value is non-null. Currently, this column is only used for domains.
typdefault	text	The value is **NULL** if a type has no associated default value. If **typdefaultbin** is not set to **NULL**, **typdefault** must contain a default expression represented by **typdefaultbin**. If **typdefaultbin** is **NULL** and **typdefault** is not, then **typdefault** is the external representation of the type's default value, which can be fed to the type's input converter to produce a constant.
typacl	aclitem[]	Access permission.
typelemmod	integer	• **-1**: **typmod** is not required for the element type corresponding to the set and array types. • Value greater than or equal to 0: **typmod** of the element type corresponding to the set and array types is used. • **NULL**: **typmod** of the element type corresponding to the set and array types is unknown. **typmod** usually refers to the maximum length of a type.

12.2.17.77 PGXC_CLASS

PGXC_CLASS records replicated or distributed information for each table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-140 PGXC_CLASS columns

Name	Type	Description
pcrelid	oid	OID of the table.
pclocatortype	"char"	Locator type. • **H**: Hash • **G**: Range • **L**: List • **M**: Modulo • **N**: Round Robin • **R**: Replication • **U**: MurmurHash
pchashalgorithm	smallint	Distributed tuple using the hash algorithm. • **1**: default hash algorithm. • **2**: MURMURHASH algorithm.
pchashbuckets	smallint	Value of a harsh container.
pgroup	name	Name of a node cluster.
redistributed	"char"	Indicates that a table has been redistributed.
redis_order	integer	Redistribution sequence. Tables whose values are **0** will not be redistributed in this round of redistribution.
pcattnum	int2vector	Column number used as a distributed key.
nodeoids	oidvector_extend	List of distributed table node OIDs.
options	text	Extension status information. This is a reserved column in the system.
diskey	text	Character string of the distribution key expression in the brackets of the DISTRIBUTE BY clause in the SQL table creation statement. Currently, only MURMURHASH distribution is supported.
diskeyexprs	pg_node_tree	Character string information obtained by serializing diskey by using the pack_node_to_string() function.

12.2.17.78 PGXC_GROUP

PGXC_GROUP records information about node groups.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-141 PGXC_GROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
group_name	name	Name of a node group
in_redistribution	"char"	Specifies whether redistribution is required. Valid value: ● **n**: The node group is not redistributed. ● **y**: The source node group is in redistribution. ● **t**: The destination node group is in redistribution.
group_members	oidvector_extend	Node OID list of the node group.
group_buckets	text	Distributed data bucket group.
is_installation	Boolean	Specifies whether to install a sub-cluster. ● **t** (true): yes ● **f** (false): no
group_acl	aclitem[]	Access permission.
group_kind	"char"	Node group type. The options are as follows: ● **i**: installation node group ● **n**: node group in a common cluster. ● **e**: elastic cluster
group_parent	oid	For a child node group, this field indicates the OID of the parent node group. For a parent node group, this field is left blank.
bucket_map	text	Mapping between physical buckets and logical buckets.

12.2.17.79 PGXC_SLICE

PGXC_SLICE is a system catalog created for recording range distribution and list distribution details. Currently, range interval cannot be used to automatically scale out shards. It is reserved in the system catalog.

Table 12-142 PGXC_SLICE columns

Name	Type	Description
relname	name	Table name or shard name, which is distinguished by **type**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type	"char"	• **'t'**: **relname** is the table name. • **'s'**: **relname** is the shard name.
strategy	"char"	• **'r'**: range distributed table. • **'l'**: list distributed table. This value will be extended for subsequent interval shards.
relid	oid	OID of the distributed table to which the tuple belongs.
referenceoid	oid	OID of the referenced distributed table, which is used for slice reference table creation syntax.
sindex	integer	Position of the current boundary in a shard when the table is a list distributed table.
interval	text[]	Reserved column.
transitboundary	text[]	Reserved column.
transitno	integer	Reserved column.
nodeoid	oid	When **relname** is set to a shard name, **nodeoid** indicates the OID of the DN where the shard data is stored.
boundaries	text[]	When **relname** is set to a shard name, this parameter indicates the boundary value of the shard.
specified	boolean	Specifies whether the DN corresponding to the current shard is explicitly specified in the DDL.
sliceorder	integer	User-defined shard sequence.

12.2.17.80 PLAN_TABLE_DATA

PLAN_TABLE_DATA stores plan information collected by EXPLAIN PLAN. Different from the PLAN_TABLE view, the system catalog PLAN_TABLE_DATA stores EXPLAIN PLAN information collected by all sessions and users.

Table 12-143 PLAN_TABLE_DATA columns

Name	Type	Description
session_id	text	Session that inserts the data. Its value consists of a service thread start timestamp and a service thread ID. Values are constrained by **NOT NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
user_id	oid	User who inserts the data. Values are constrained by **NOT NULL**.
statement_id	character varying(30)	Query tag specified by a user
plan_id	bigint	Query plan ID. The ID is automatically generated in the plan generation phase and is used by kernel engineers for debugging.
id	integer	Node ID in a plan.
operation	character varying(30)	Operation description.
options	character varying(255)	Operation action.
object_name	name	Name of an operated object. It is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which an object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.

NOTE

- PLAN_TABLE_DATA records data of all users and sessions on the current node. Only administrators can access all the data. Common users can view their own data in the **PLAN_TABLE** view.
- Data of inactive (exited) sessions is cleaned from PLAN_TABLE_DATA by gs_clean after being stored in this system catalog for a certain period of time (5 minutes by default). You can also manually run **gs_clean -C** to delete inactive session data from the table.
- Data is automatically inserted into PLAN_TABLE_DATA after **EXPLAIN PLAN** is executed. Therefore, do not manually insert data into or update data in PLAN_TABLE_DATA. Otherwise, data in PLAN_TABLE_DATA may be disordered. When you need to delete data from a table, it is recommended that you use the **PLAN_TABLE** view.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.17.81 STATEMENT_HISTORY

Displays information about statements executed on the current node. To query this system catalog, you must have the SYSADMIN permission. The result can be queried only in the system database but cannot be queried in the user database.

The constraints on the query of this system catalog are as follows:

- Data must be queried in the Postgres database. No data exists in other databases.
- This system catalog is controlled by **track_stmt_stat_level**. The default value is **OFF,L0**, where the first part controls full SQL statements, and the second part controls slow SQL statements. For details about the record level of each column, see the following table. To ensure system performance, you are advised to use the SET statement to change the value of this parameter so that the parameter takes effect only for the current session.
- For slow SQL statements, if the value of **track_stmt_stat_level** is not **OFF** and the SQL execution time exceeds the value of **log_min_duration_statement**, the SQL statement is recorded as a slow SQL statement.

Table 12-144 STATEMENT_HISTORY columns

Name	Type	Description	Lowest Record Level
db_name	name	Database name.	L0
schema_name	name	Schema name.	L0
origin_node	integer	Node name.	L0
user_name	name	Username.	L0
application_name	text	Name of the application that sends a request.	L0
client_addr	text	IP address of the client that sends a request.	L0
client_port	integer	Port number of the client that sends a request.	L0
unique_query_id	bigint	ID of the normalized SQL statement.	L0
debug_query_id	bigint	ID of the unique SQL statement. Some statements are not unique. For example, the value of **debug_query_id** in the Parse packet, DCL statements, and TCL statements is **0**.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
query	text	Normalized SQL (available only on CNs). When **track_stmt_parameter** is enabled, complete SQL statements are displayed.	L0
start_time	timestamp with time zone	Time when a statement starts.	L0
finish_time	timestamp with time zone	Time when a statement ends.	L0
slow_sql_threshold	bigint	Standard for slow SQL statement execution.	L0
transaction_id	bigint	Transaction ID.	L0
thread_id	bigint	ID of an execution thread.	L0
session_id	bigint	Session ID of a user.	L0
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.	L0
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.	L0
query_plan	text	Statement execution plan.	L1(Full SQL) L0(Slow SQL)
n_returned_rows	bigint	Number of rows in the result set returned by the **SELECT** statement.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
n_tuples_fetched	bigint	Number of rows randomly scanned.	L0
n_tuples_returned	bigint	Number of rows sequentially scanned.	L0
n_tuples_inserted	bigint	Number of rows inserted.	L0
n_tuples_updated	bigint	Number of rows updated.	L0
n_tuples_deleted	bigint	Number of rows deleted.	L0
n_blocks_fetched	bigint	Number of buffer block access times.	L0
n_blocks_hit	bigint	Number of buffer block hits.	L0
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).	L0
cpu_time	bigint	Time consumed on the CPU (unit: μs).	L0
execution_time	bigint	Execution time in the executor (unit: μs).	L0
parse_time	bigint	SQL parsing time (unit: μs).	L0
plan_time	bigint	SQL plan generation time (unit: μs).	L0
rewrite_time	bigint	SQL rewriting time (unit: μs).	L0
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).	L0
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).	L0
data_io_time	bigint	I/O time (unit: μs).	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with the client, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with the client, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.	L0
lock_count	bigint	Number of locks.	L0
lock_time	bigint	Time required for locking.	L1
lock_wait_count	bigint	Number of lock waits.	L0
lock_wait_time	bigint	Time required for lock waiting.	L1
lock_max_count	bigint	Maximum number of locks.	L0
lwlock_count	bigint	Number of lightweight locks (reserved).	L0
lwlock_wait_count	bigint	Number of lightweight lock waits.	L0
lwlock_time	bigint	Time required for lightweight locking (reserved).	L1
lwlock_wait_time	bigint	Time required for lightweight lock waiting.	L1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
details	bytea	List of wait events and statement lock events. When the value of the record level is greater than or equal to L0, the list of wait events starts to be recorded. It displays statistics about wait events on the current node. For details about key events in the kernel, see **Table 12-453**, **Table 12-454**, **Table 12-455**, and **Table 12-456**. You can also view the list of all events in the system in the **wait_event_info** view. For details about the impact of each transaction lock on services, see **LOCK**. When the value of the record level is **L2**, the list of statement lock events is recorded. The list records events in chronological order. The number of records is affected by the value of the **track_stmt_details_size** parameter. This column is in binary format and needs to be read by using the parsing function pg_catalog.statement_detail_decode. Events include: • Start locking. • Complete locking. • Start lock waiting. • Complete lock waiting. • Start unlocking. • Complete unlocking. • Start lightweight lock waiting. • Complete lightweight lock waiting.	L0/L2
is_slow_sql	Boolean	Specifies whether the SQL statement is a slow SQL statement. • **t** (true): yes. • **f** (false): no.	L0
trace_id	text	Driver-specific trace ID, which is associated with an application request.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Lowest Record Level
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement. **NOTE** • If the statement is executed in SQLBypass mode, there is no risk of slow SQL statements and this column may be missing. You can run the explain command to view the plan. • This column can contain a maximum of 256 characters and the excess part will be truncated. Optimize the SQL statement based on the existing prompt information. • In **advise**, table aliases are displayed as table aliases, and column aliases are displayed as original column names.	L0
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that calls the stored procedure. For statements outside the stored procedure, the value is **0**.	L0
finish_status	text	Statement completion status. • **normal** (default) • **cancelled**: cancellation or termination.	L0
used_memory	integer	Memory usage of a single statement (unit: MB).	L0
sql_hash	integer	Hash value of the current query statement.	L0
plan_hash	integer	Hash value of the current query plan.	L0
plan_hash_prev	integer	For a generic plan, the value is the hash value of the previous plan.	L0

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The record level of the **query_plan** column is L1 for full SQL statements and L0 for slow SQL statements.
- For the **db_time** time model, the time statistics of each dimension in **statement_history** meet the requirement that **db_time** is greater than or equal to **max(cpu_time, parse_time, plan_time, rewrite_time, data_io_time, net_send_info.time, net_recv_info.time, net_stream_send_info.time, net_stream_recv_info.time)**.
- For the **db_time** time model formula, the following dimensions are not included in the statistical accuracy scope:
  1. **execution_time**
  2. **pl_execution_time**
  3. **pl_compilation_time**
- The maximum nesting depth of wait events is **20**. If the nesting depth exceeds 20, a new wait event overwrites the last wait event.

12.2.17.82 STREAMING_STREAM

STREAMING_STREAM records the metadata of all STREAM objects.

Table 12-145 STREAMING_STREAM column

Name	Type	Description
relid	oid	STREAM object ID.
queries	bytea	Bitmap mapping of the CONTVIEW corresponding to the STREAM.

12.2.17.83 STREAMING_CONT_QUERY

STREAMING_CONT_QUERY records the metadata of all CONTVIEW objects.

Table 12-146 STREAMING_CONT_QUERY columns

Name	Type	Description
id	integer	Unique identifier of the CONTVIEW object.
type	"char"	CONTVIEW type. • **'r'**: CONTVIEW is based on the row-store model.
relid	oid	CONTVIEW object ID.
defrelid	oid	ID of the continuous computing rule view corresponding to CONTVIEW.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
active	Boolean	Specifies whether the CONTVIEW is in the continuous computing state. • **t** (true): yes. • **f** (false): no.
streamrelid	oid	ID of STREAM corresponding to CONTVIEW.
matrelid	oid	ID of the materialized table corresponding to CONTVIEW.
lookupidxid	oid	ID of GROUP LOOK UP INDEX corresponding to CONTVIEW. This column is for internal use and is available only in row-store tables.
step_factor	smallint	CONTVIEW step mode. The main values are **0** (no overlapping window) and **1** (sliding window, with one step).
ttl	integer	Value of **ttl_interval** set by CONTVIEW.
ttl_attno	smallint	Number of a time column corresponding to the TTL function set by CONTVIEW.
dictrelid	oid	ID of the dictionary table corresponding to CONTVIEW.
grpnum	smallint	Number of dimension columns in the CONTVIEW continuous computing rule. This column is for internal use.
grpidx	int2vector	Index of the dimension column in TARGET LIST in the CONTVIEW continuous computing rule. This column is for internal use.

12.3 System Views

12.3.1 Partitioned Table

12.3.1.1 ADM_IND_PARTITIONS

ADM_IND_PARTITIONS displays the partition information about local indexes of level-1 partitioned table in the database. Each local index partition of level-1 index partitioned table in the database, if present, has a row of records in ADM_IND_PARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-147 ADM_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	Boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are logged.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.

12.3.1.2 ADM_IND_SUBPARTITIONS

ADM_IND_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table in the database (excluding global indexes on partitioned tables). Each local index partition of level-2 index partitioned table in the database, if present, has a row of records in ADM_IND_SUBPARTITIONS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all fields in this table are set to **NULL**.

Table 12-148 ADM_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. Set it to **NULL**.
index_name	character varying(128)	Not supported. Set it to **NULL**.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
subpartition_name	character varying(128)	Not supported. Set it to **NULL**.
high_value	text	Not supported. Set it to **NULL**.
high_value_length	numeric	Not supported. Set it to **NULL**.
partition_position	numeric	Not supported. Set it to **NULL**.

Name	Type	Description
subpartition_position	numeric	Not supported. Set it to **NULL**.
status	character varying(8)	Not supported. Set it to **NULL**.
tablespace_name	character varying(30)	Not supported. Set it to **NULL**.
pct_free	numeric	Not supported. Set it to **NULL**.
ini_trans	numeric	Not supported. Set it to **NULL**.
max_trans	numeric	Not supported. Set it to **NULL**.
initial_extent	numeric	Not supported. Set it to **NULL**.
next_extent	numeric	Not supported. Set it to **NULL**.
min_extent	numeric	Not supported. Set it to **NULL**.
max_extent	numeric	Not supported. Set it to **NULL**.
max_size	numeric	Not supported. Set it to **NULL**.
pct_increase	numeric	Not supported. Set it to **NULL**.
freelists	numeric	Not supported. Set it to **NULL**.
freelist_groups	numeric	Not supported. Set it to **NULL**.
logging	character varying(7)	Not supported. Set it to **NULL**.
compression	character varying(13)	Not supported. Set it to **NULL**.
blevel	numeric	Not supported. Set it to **NULL**.
leaf_blocks	numeric	Not supported. Set it to **NULL**.
distinct_keys	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_leaf_blocks_per_key	numeric	Not supported. Set it to **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Set it to **NULL**.
clustering_factor	numeric	Not supported. Set it to **NULL**.
num_rows	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	date	Not supported. Set it to **NULL**.
buffer_pool	character varying(7)	Not supported. Set it to **NULL**.
flash_cache	character varying(7)	Not supported. Set it to **NULL**.
cell_flash_cache	character varying(7)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
interval	character varying(3)	Not supported. Set it to **NULL**.
segment_created	character varying(3)	Not supported. Set it to **NULL**.
domidx_opstatus	character varying(6)	Not supported. Set it to **NULL**.
parameters	character varying(1000)	Not supported. Set it to **NULL**.

12.3.1.3 ADM_PART_COL_STATISTICS

ADM_PART_COL_STATISTICS displays the column statistics and histogram information about all table partitions in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-149 ADM_PART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	date	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(63)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.4 ADM_PART_INDEXES

ADM_PART_INDEXES displays information about all partitioned table indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-150 ADM_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Name of the owner of a partitioned table index.
index_name	character varying(64)	Name of the partitioned table index.
partition_count	bigint	Number of index partitions of the partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
schema	character varying(64)	Name of the schema to which the partitioned table index belongs.
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs.

12.3.1.5 ADM_PART_TABLES

ADM_PART_TABLES displays information about all partitioned tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-151 ADM_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partition policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. The distributed system does not support level-2 partitions. Set this parameter to **NONE**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to **0**.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to **0**.
status	character varying(8)	Not supported. Set it to **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Set it to **NULL**.
def_next_extent	character varying(40)	Not supported. Set it to **NULL**.
def_min_extents	character varying(40)	Not supported. Set it to **NULL**.
def_max_extents	character varying(40)	Not supported. Set it to **NULL**.
def_max_size	character varying(40)	Not supported. Set it to **NULL**.
def_pct_increase	character varying(40)	Not supported. Set it to **NULL**.
def_freelists	numeric	Not supported. Set it to **NULL**.
def_freelist_groups	numeric	Not supported. Set it to **NULL**.
def_logging	character varying(7)	Not supported. Set it to **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: • **NONE** • **ENABLED** • **DISABLED**
def_compress_for	character varying(30)	Default compression mode used when a partition is added. **NOTE** For available compression modes and compression levels, see **WITH ({ storage_parameter = value } [, ...])**.
def_buffer_pool	character varying(7)	Not supported. Set it to **DEFAULT**.
def_flash_cache	character varying(7)	Not supported. Set it to **NULL**.
def_cell_flash_cache	character varying(7)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ref_ptn_constraint_name	character varying(128)	Not supported. Set it to **NULL**.
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Set it to **NO**.
interval_subpartition	character varying(1000)	Not supported. Set it to **NULL**.
autolist_subpartition	character varying(3)	Not supported. Set it to **NO**.
is_nested	character varying(3)	Not supported. Set it to **NO**.
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, set it to **YES**.
def_indexing	character varying(3)	Not supported. Set it to **ON**.
def_inmemory	character varying(8)	Not supported. Set it to **NONE**.
def_inmemory_priority	character varying(8)	Not supported. Set it to **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. Set it to **NULL**.
def_inmemory_compression	character varying(17)	Not supported. Set it to **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. Set it to **NULL**.

12.3.1.6 ADM_SUBPART_KEY_COLUMNS

ADM_SUBPART_KEY_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

Table 12-152 ADM_SUBPART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Not supported. The value is **NULL**.
name	character varying(128)	Not supported. The value is **NULL**.
object_type	character varying(128)	Not supported. The value is **NULL**.
column_name	character varying(4000)	Not supported. The value is **NULL**.
column_position	numeric	Not supported. The value is **NULL**.
collated_column_id	numeric	Not supported. The value is **NULL**.

12.3.1.7 ADM_TAB_PARTITIONS

ADM_TAB_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

Table 12-153 ADM_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Relational table name.
partition_name	character varying(64)	Partition name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
high_value	text	Limit of a partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is **NULL**.
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
blocks	numeric	Not supported. Its value is **NULL**.
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is **NULL**.
read_only	character varying(4)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.
inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
inmemory_service_name	character varying(100)	Not supported. Its value is **NULL**.
memoptimize_read	character varying(8)	Not supported. Its value is **NULL**.
memoptimize_write	character varying(8)	Not supported. Its value is **NULL**.

12.3.1.8 DB_IND_PARTITIONS

DB_IND_PARTITIONS displays partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-154 DB_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
index_partition_usable	Boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is **NULL**.

Name	Type	Description
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.

12.3.1.9 DB_IND_SUBPARTITIONS

DB_IND_SUBPARTITIONS displays partition information about local indexes of level-2 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all columns in this table are set to **NULL**.

Table 12-155 DB_IND_SUBPARTITIONS columns

Name	Type	Description
index_owner	character varying(128)	Not supported. The value is **NULL**.
index_name	character varying(128)	Not supported. The value is **NULL**.
partition_name	character varying(128)	Not supported. The value is **NULL**.
subpartition_name	character varying(128)	Not supported. The value is **NULL**.

parameters	character varying(1000)	Not supported. The value is **NULL**.

12.3.1.10 DB_PART_COL_STATISTICS

DB_PART_COL_STATISTICS displays column statistics and histogram information about table partitions accessible to the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-156 DB_PART_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Owner of the partitioned table.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	date	Not supported. Set it to **NULL**.

12.3.1.11 DB_PART_KEY_COLUMNS

DB_PART_KEY_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 12-157 DB_PART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Owner of a partitioned table or index.
name	character varying(128)	Name of a partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.1.12 DB_PART_TABLES

DB_PART_TABLES displays information about partitioned tables accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-158 DB_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partition policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. The distributed system does not support level-2 partitions. Set this parameter to **NONE**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to **0** in the distributed system.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to **0** in the distributed system.
status	character varying(8)	Not supported. Set it to **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. Set it to **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Set it to **NULL**.
def_next_extent	character varying(40)	Not supported. Set it to **NULL**.
def_min_extents	character varying(40)	Not supported. Set it to **NULL**.
def_max_extents	character varying(40)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

def_inmemory_service_name	character varying(1000)	Not supported. Set it to **NULL**.

12.3.1.13 DB_SUBPART_KEY_COLUMNS

DB_SUBPART_KEY_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in both PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

Table 12-159 DB_SUBPART_KEY_COLUMNS columns

Name	Type	Description
owner	character varying(128)	Not supported. Its value is **NULL**.
name	character varying(128)	Not supported. Its value is **NULL**.

column_position	numeric	Not supported. Its value is **NULL**.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.1.14 DB_TAB_PARTITIONS

DB_TAB_PARTITIONS displays information about level-1 partitions (including level-2 partitioned tables) accessible to the current user. It is accessible to all users. This view exists in both PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

Table 12-160 DB_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
blocks	numeric	Not supported. Its value is **NULL**.
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is **NULL**.
read_only	character varying(4)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.

12.3.1.16 MY_IND_PARTITIONS

MY_IND_PARTITIONS displays the partition information about local indexes of level-1 partitioned table accessible to the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-162 MY_IND_PARTITIONS columns

Name	Type	Description
index_owner	character varying(64)	Name of the owner of the partitioned table index to which an index partition belongs.
index_name	character varying(64)	Name of the partitioned table index to which the index partition belongs.
partition_name	character varying(64)	Name of the index partition.
def_tablespace_name	name	Tablespace name of the index partition.
high_value	text	Upper limit of the partition corresponding to the index partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
index_partition_usable	Boolean	Specifies whether an index partition is available. • **t** (true): yes. • **f** (false): no.
schema	character varying(64)	Schema of the partitioned table index to which the index partition belongs.
high_value_length	integer	Character length of the limit of the partition corresponding to an index partition.
composite	character varying(3)	Specifies whether the index is a local index on the level-2 partitioned table. This table does not store level-2 partition information. Therefore, the value is **NO**.
subpartition_count	numeric	Number of level-2 partitions in a partition. This table does not store level-2 partition information. Therefore, the value is **0**.
partition_position	numeric	Position of an index partition in the index.
status	character varying(8)	Specifies whether an index partition is available.
tablespace_name	name	Name of the tablespace that contains the partition.
pct_free	numeric	Percentage of minimum available space in a block.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to an index are logged.
compression	character varying(13)	Specifies whether an index compression is enabled for a partitioned index.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
clustering_factor	numeric	Sequence of a row in the table based on the value of the index. You need to run the **analyze** command to collect statistics.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	date	Last date when the partition was analyzed. Database restart is not supported. Otherwise, data loss will occur.
buffer_pool	character varying(7)	Actual buffer pool of a partition.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
segment_created	character varying(3)	Specifies whether an index partition segment has been created.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.

12.3.1.17 MY_IND_SUBPARTITIONS

MY_IND_SUBPARTITIONS displays the partition information about local indexes of level-2 partitioned table owned by the current user (excluding global indexes of partitioned tables). It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Currently, all fields in this table are set to **NULL**.

segment_created	character varying(3)	Not supported. Set it to **NULL**.
domidx_opstatus	character varying(6)	Not supported. Set it to **NULL**.
parameters	character varying(1000)	Not supported. Set it to **NULL**.

12.3.1.18 MY_PART_COL_STATISTICS

MY_PART_COL_STATISTICS displays column statistics and histogram information about table partitions owned by the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-164 MY_PART_COL_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Table partition name.
column_name	character varying(4000)	Column name.
num_distinct	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
low_value	raw	Not supported. Set it to **NULL**.
high_value	raw	Not supported. Set it to **NULL**.
density	numeric	Not supported. Set it to **NULL**.
num_nulls	numeric	Not supported. Set it to **NULL**.
num_buckets	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Not supported. Set it to **NULL**.
last_analyzed	date	Not supported. Set it to **NULL**.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
notes	character varying(63)	Not supported. Set it to **NULL**.
avg_col_len	numeric	Not supported. Set it to **NULL**.
histogram	character varying(15)	Not supported. Set it to **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.1.19 MY_PART_INDEXES

MY_PART_INDEXES displays information about partitioned table indexes accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-165 MY_PART_INDEXES columns

Name	Type	Description
def_tablespace_name	name	Tablespace name of a partitioned table index.
index_owner	character varying(64)	Name of the owner of a partitioned table index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
index_name	character varying(64)	Name of a partitioned table index.
partition_count	bigint	Number of index partitions of the partitioned table index.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
schema	character varying(64)	Schema of a partitioned table index.
table_name	character varying(64)	Name of the partitioned table to which the partitioned table index belongs.

12.3.1.20 MY_PART_KEY_COLUMNS

MY_PART_KEY_COLUMNS displays information about the partition key columns of partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in both PG_CATALOG and SYS schemas.

Table 12-166 MY_PART_KEY_COLUMNS columns

Name	Type	Description
name	character varying(128)	Name of a partitioned table or index.
object_type	character(5)	Object type. • Its value is **table** for a partitioned table. • Its value is **index** for a partitioned index.
column_name	character varying(4000)	Partition key column name of a partitioned table or index.
column_position	numeric	Position of a column in a partition.
collated_column_id	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.1.21 MY_PART_TABLES

MY_PART_TABLES displays information about partitioned tables accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-167 MY_PART_TABLES columns

Name	Type	Description
table_owner	character varying(64)	Owner name of a partitioned table.
table_name	character varying(64)	Name of a partitioned table.
partitioning_type	text	Partition policy of a partitioned table. **NOTE** For details about the supported partitioning policies of the current partitioned table, see **CREATE TABLE PARTITION**.
partition_count	bigint	Number of partitions of a partitioned table.
partitioning_key_count	integer	Number of partition keys of a partitioned table.
def_tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Schema of a partitioned table.
subpartitioning_type	text	Partition policy of a level-2 partitioned table. If the partitioned table is a level-1 partitioned table, **NONE** is displayed. The distributed system does not support level-2 partitions. Set this parameter to **NONE**.
def_subpartition_count	integer	Default number of level-2 partitions to be created. The value is **1** for a level-2 partitioned table and **0** for a level-1 partitioned table. The distributed system does not support level-2 partitions. Set this parameter to **0**.
subpartitioning_key_count	integer	Number of level-2 partition keys of the partitioned table. The distributed system does not support level-2 partitions. Set this parameter to **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	character varying(8)	Not supported. Set it to **valid**.
def_pct_free	numeric	Default value of **PCTFREE** used when a partition is added.
def_pct_used	numeric	Not supported. Set it to **NULL**.
def_ini_trans	numeric	Default value of **INITRANS** used when a partition is added.
def_max_trans	numeric	Default value of **MAXTRANS** used when a partition is added.
def_initial_extent	character varying(40)	Not supported. Set it to **NULL**.
def_next_extent	character varying(40)	Not supported. Set it to **NULL**.
def_min_extents	character varying(40)	Not supported. Set it to **NULL**.
def_max_extents	character varying(40)	Not supported. Set it to **NULL**.
def_max_size	character varying(40)	Not supported. Set it to **NULL**.
def_pct_increase	character varying(40)	Not supported. Set it to **NULL**.
def_freelists	numeric	Not supported. Set it to **NULL**.
def_freelist_groups	numeric	Not supported. Set it to **NULL**.
def_logging	character varying(7)	Not supported. Set it to **NULL**.
def_compression	character varying(8)	Default compression mode used when a partition is added. The options are as follows: • **NONE** • **ENABLED** • **DISABLED**
def_compress_for	character varying(30)	Default compression mode used when a partition is added. **NOTE** For available compression modes and compression levels, see **WITH ({ storage_parameter = value } [, ...])**.
def_buffer_pool	character varying(7)	Not supported. Set it to **DEFAULT**.
def_flash_cache	character varying(7)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
def_cell_flash_cache	character varying(7)	Not supported. Set it to **NULL**.
ref_ptn_constraint_name	character varying(128)	Not supported. Set it to **NULL**.
interval	character varying(1000)	Interval.
autolist	character varying(3)	Not supported. Set it to **NO**.
interval_subpartition	character varying(1000)	Not supported. Set it to **NULL**.
autolist_subpartition	character varying(3)	Not supported. Set it to **NO**.
is_nested	character varying(3)	Not supported. Set it to **NO**.
def_segment_creation	character varying(4)	Currently, the segment page mode is not supported. When the segment page mode is enabled, set it to **YES**.
def_indexing	character varying(3)	Not supported. Set it to **ON**.
def_inmemory	character varying(8)	Not supported. Set it to **NONE**.
def_inmemory_priority	character varying(8)	Not supported. Set it to **NULL**.
def_inmemory_distribute	character varying(15)	Not supported. Set it to **NULL**.
def_inmemory_compression	character varying(17)	Not supported. Set it to **NULL**.
def_inmemory_duplicate	character varying(13)	Not supported. Set it to **NULL**.
def_read_only	character varying(3)	Not supported. Set it to **NO**.
def_cellmemory	character varying(24)	Not supported. Set it to **NULL**.
def_inmemory_service	character varying(12)	Not supported. Set it to **NULL**.
def_inmemory_service_name	character varying(1000)	Not supported. Set it to **NULL**.

12.3.1.22 MY_SUBPART_KEY_COLUMNS

MY_SUBPART_KEY_COLUMNS displays information about the partition key columns of level-2 partitioned tables or partitioned indexes owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The distributed system does not support level-2 partitioned tables. All columns in this view are set to **NULL**.

Table 12-168 MY_SUBPART_KEY_COLUMNS columns

Name	Type	Description
name	character varying(128)	Not supported. The value is **NULL**.
object_type	character varying(128)	Not supported. The value is **NULL**.
column_name	character varying(4000)	Not supported. The value is **NULL**.
column_position	numeric	Not supported. The value is **NULL**.
collated_column_id	numeric	Not supported. The value is **NULL**.

12.3.1.23 MY_TAB_PARTITIONS

MY_TAB_PARTITIONS displays information about level-1 table partitions accessible to the current user (including level-2 partitioned tables). Each level-1 table partition of a partitioned table accessible to the current user has one record in MY_TAB_PARTITIONS. It is accessible to all users. This view exists in both PG_CATALOG and SYS schemas. The distributed system does not support level-2 partitions. Therefore, this view does not store level-1 partition information of level-2 partitioned tables.

Table 12-169 MY_TAB_PARTITIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
partition_name	character varying(64)	Partition name.
high_value	text	Limit of a partition. • For range partitioning and interval partitioning, the upper limit of each partition is displayed. • For list partitioning, the value list of each partition is displayed. • For hash partitioning, the number of each partition is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tablespace_name	name	Tablespace name of a partitioned table.
schema	character varying(64)	Name of a namespace.
composite	character varying(3)	Specifies whether the table is a level-2 partitioned table.
subpartition_count	numeric	Not supported. Its value is **NULL**.
high_value_length	integer	Length of the partition boundary value expression.
partition_position	numeric	Position of the partition in the table.
pct_free	numeric	Minimum percentage of available space in a block.
pct_used	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Initial number of transactions. The default value is **4**. The value is **NULL** for non-Ustore partitioned tables.
max_trans	numeric	Maximum number of transactions. The default value is **128**. The value is **NULL** for non-Ustore partitioned tables.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extent	numeric	Not supported. Its value is **NULL**.
max_extent	numeric	Not supported. Its value is **NULL**.
max_size	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
logging	character varying(7)	Specifies whether changes to a table are logged.
compression	character varying(8)	Actual compression attribute of a partitioned table.
compress_for	character varying(30)	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
blocks	numeric	Not supported. Its value is **NULL**.
empty_blocks	numeric	Not supported. Its value is **NULL**.
avg_space	numeric	Not supported. Its value is **NULL**.
chain_cnt	numeric	Not supported. Its value is **NULL**.
avg_row_len	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	timestamp with time zone	Last date when the partition was analyzed.
buffer_pool	character varying(7)	Buffer pool allocated to a partitioned block.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
is_nested	character varying(3)	Specifies whether this partitioned table is a nested partitioned table.
parent_table_partition	character varying(128)	Not supported. Its value is **NULL**.
interval	character varying(3)	Specifies whether the partition is a partition in an interval partitioned table. The distributed system does not support interval partitioning. Therefore, the value of this parameter is **NO**.
segment_created	character varying(4)	Specifies whether a table partition has segments created.
indexing	character varying(4)	Not supported. Its value is **NULL**.
read_only	character varying(4)	Not supported. Its value is **NULL**.
inmemory	character varying(8)	Not supported. Its value is **NULL**.
inmemory_priority	character varying(8)	Not supported. Its value is **NULL**.
inmemory_distribute	character varying(15)	Not supported. Its value is **NULL**.
inmemory_compression	character varying(17)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inmemory_duplicate	character varying(13)	Not supported. Its value is **NULL**.
cellmemory	character varying(24)	Not supported. Its value is **NULL**.
inmemory_service	character varying(12)	Not supported. Its value is **NULL**.
inmemory_service_name	character varying(100)	Not supported. Its value is **NULL**.
memoptimize_read	character varying(8)	Not supported. Its value is **NULL**.
memoptimize_write	character varying(8)	Not supported. Its value is **NULL**.

12.3.1.24 GS_STATIO_ALL_PARTITIONS

GS_STATIO_ALL_PARTITIONS contains I/O statistics about each partition in a partitioned table of the current database. The information can be queried by using the gs_statio_get_all_partitions_stats() function.

Table 12-170 GS_STATIO_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Specifies a partition OID.
schemaname	name	Specifies the name of a partition schema.
relname	name	Specifies the name of a table where the partition is located.
partition_name	name	Specifies the name of a level-1 partition to which the partition belongs.
sub_partition_name	name	Specifies the name of a level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set this parameter to **NULL**.
heap_blks_read	bigint	Specifies the number of disk blocks read from the partition.
heap_blks_hit	bigint	Specifies the number of cache hits in the partition.
idx_blks_read	bigint	Specifies the number of disk blocks read from indexes in the partition.
idx_blks_hit	bigint	Specifies the number of cache hits in indexes in the partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
toast_blks_read	bigint	Specifies the number of disk blocks read from the TOAST table partition (if any) in the partition.
toast_blks_hit	bigint	Specifies the number of buffer hits in the TOAST table partition (if any) in the partition.
tidx_blks_read	bigint	Specifies the number of disk blocks read from the TOAST table partitioned index (if any) in the partition.
tidx_blks_hit	bigint	Specifies the number of buffer hits in the TOAST table partitioned index (if any) in the partition.

12.3.1.25 GS_STAT_XACT_ALL_PARTITIONS

GS_STAT_XACT_ALL_PARTITIONS displays the transaction status about all partitions of partitioned tables in a namespace. The information can be queried by using the gs_stat_get_xact_all_partitions_stats() function.

Table 12-171 GS_STAT_XACT_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Name of a partition schema.
relname	name	Name of a table where the partition is located.
partition_name	name	Name of a level-1 partition to which the partition belongs.
sub_partition_name	name	Name of a level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set it to **NULL**.
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

12.3.1.26 GS_STAT_ALL_PARTITIONS

GS_STAT_ALL_PARTITIONS displays information about each partition in all partitioned tables in the current database. Each partition occupies a row, showing statistics about access to the partition. The view information is queried by the gs_stat_get_all_partitions_stats() function.

Table 12-172 GS_STAT_ALL_PARTITIONS columns

Name	Type	Description
partition_oid	oid	Partition OID.
schemaname	name	Schema name of a table to which the partition belongs.
relname	name	Name of a table where the partition is located.
partition_name	name	Name of a level-1 partition to which the partition belongs.
sub_partition_name	name	Name of a level-2 partition to which the partition belongs. The distributed system does not support level-2 partitions. Set it to **null**.
seq_scan	bigint	Number of sequential scans initiated by a partition.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated by a partition.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)
n_live_tup	bigint	Estimated number of live rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of dead row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Time when the partition was last cleared.
last_autovacuum	timestamp with time zone	Time when the partition was last cleared by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Time when the partition was last analyzed.
last_autoanalyze	timestamp with time zone	Time when the partition was last analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that a partition is cleared.
autovacuum_count	bigint	Number of times that a partition is cleared by the autovacuum daemon thread.
analyze_count	bigint	Number of times that a partition is analyzed.
autoanalyze_count	bigint	Number of times that a partition is analyzed by the autovacuum daemon thread.

12.3.2 Workload Management

12.3.2.1 GS_WLM_CGROUP_INFO

GS_WLM_CGROUP_INFO displays information about a Cgroup for a job that is being executed.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

Table 12-173 GS_WLM_CGROUP_INFO columns

Name	Type	Description
cgroup_name	text	Cgroup name.
priority	integer	Priority of the job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usage_percent	integer	Percentage of resources used by the Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
cpuacct	bigint	Allocated CPU quota.
cpuset	text	Allocated CPU cores.
relpath	text	Relative path of the Cgroup.
valid	text	Specifies whether the Cgroup is valid.
node_group	text	Reserved column.

12.3.2.2 GS_WLM_REBUILD_USER_RESOURCE_POOL

GS_WLM_REBUILD_USER_RESOURCE_POOL is used to rebuild a user's resource pool information in memory on the current connection node. It is used as a remedy only when resource pool information is missing or disordered. Only users with the sysadmin permission can query this view.

Table 12-174 GS_WLM_REBUILD_USER_RESOURCE_POOL columns

Name	Type	Description
gs_wlm_rebuild_user_resource_pool	Boolean	Rebuilds information about the user resource pool in the memory. **t** indicates success, and **f** indicates failure.

12.3.2.3 GS_WLM_USER_INFO

GS_WLM_USER_INFO displays user statistics. Only users with the sysadmin permission can query this view.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

Table 12-175 GS_WLM_USER_INFO columns

Name	Type	Description
userid	oid	OID of a user.
username	name	Username.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sysadmin	Boolean	Specifies whether the user is the administrator. • **t** (true): yes. • **f** (false): no.
rpoid	oid	OID of the associated resource pool.
respool	name	Name of the associated resource pool.
parentid	oid	OID of the user group.
totalspace	bigint	Available space limit of the user.
spacelimit	bigint	User table space limit.
childcount	integer	Number of child users.
childlist	text	Child user list.

12.3.2.4 GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO

GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO is used to view the real-time concurrency usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN. You need to log in to the standby node and use the system function **gs_wlm_respool_concurrency_info()** to query the usage of concurrent tasks.

Table 12-176 GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	name	Name of a resource pool.
max_concurrency	integer	Maximum number of concurrent queries allowed by the resource pool.
running_conurrency	integer	Number of concurrent tasks that are being executed in the current resource pool.
waiting_concurrency	integer	Number of concurrent tasks that are waiting in the current resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | max_concurrency | running_concurrency | waiting_concurrency
-------------+--------------+-----------------+---------------------+---------------------
 coordinator1 | default_pool |              -1 |                   1 |                   0
 datanode3    | default_pool |              -1 |                   1 |                   0
 datanode1    | default_pool |              -1 |                   1 |                   0
 datanode2    | default_pool |              -1 |                   1 |                   0
(4 rows)
```

12.3.2.5 GLOBAL_WLM_RESPOOL_CONNECTION_INFO

This view is used to view the real-time connection usage of resource pool on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN. You need to log in to the standby node and use the system function **gs_wlm_respool_connection_info()** to query the usage of concurrent tasks.

Table 12-177 GLOBAL_WLM_RESPOOL_CONNECTION_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	name	Name of a resource pool.
max_connections	name	Maximum number of connections to a resource pool.
curr_connections	integer	Number of existing connections in the current resource pool.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | max_connections | curr_connections
-------------+--------------+-----------------+------------------
 coordinator1 | default_pool |              -1 |                1
 datanode2    | default_pool |              -1 |                2
 datanode3    | default_pool |              -1 |                2
 datanode1    | default_pool |              -1 |                2
(4 rows)
```

12.3.2.6 GLOBAL_WLM_RESPOOL_CPU_INFO

This view is used to view the real-time CPU usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN. You need to log in to the standby node and use the system function **gs_wlm_respool_cpu_info()** to query the usage of CPU.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-178 GLOBAL_WLM_RESPOOL_CPU_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	name	Name of a resource pool.
control_group	name	Cgroup name.
cpu_affinity	name	Value of cores bound to the CPU.
cpu_usage	integer	CPU usage of a resource pool. **NOTE** If the CN and DN are deployed together, the CN and DN share the same CPU resources. Therefore, the **cpu_usage** values of the CN and DN are the same. If the CN and DN are independently deployed, the **cpu_usage** values of the CN and DN are displayed separately.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name |     control_group     | cpu_affinity | cpu_usage
-------------+--------------+-----------------------+--------------+-----------
 coordinator1 | default_pool | DefaultClass:Medium | 0-71         |         0
 datanode1    | default_pool | DefaultClass:Medium | 0-71         |         0
 datanode2    | default_pool | DefaultClass:Medium | 0-71         |         0
 datanode3    | default_pool | DefaultClass:Medium | 0-71         |         0
(4 rows)
```

12.3.2.7 GLOBAL_WLM_RESPOOL_IO_INFO

This view is used to view the real-time I/O usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN. You need to log in to the standby node and use the system function **gs_wlm_respool_io_info()** to query the usage of I/Os.

Table 12-179 GLOBAL_WLM_RESPOOL_IO_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	name	Name of a resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
io_limits	integer	Upper limit of IOPS. The value **0** indicates there is no limit. • Row-store: The unit is determined by GUC parameter **io_control_unit**, which is used to count the number of I/Os during I/O control. The value of **io_control_unit** is **1**, which indicates one IOPS.
io_priority	text	I/O priority set for jobs that consume I/O resources. It takes effect when the I/O usage reaches 90%. **None** indicates there is no control.
current_iops	integer	Number of times that the current I/O has been triggered. The current I/O statistics occasionally exceed the upper limit, which is related to the I/O statistics algorithm and is normal.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | io_limits | io_priority | current_iops
--------------+--------------+-----------+-------------+--------------
 coordinator1 | default_pool |         0 | None        |            0
 datanode2    | default_pool |         0 | None        |            0
 datanode3    | default_pool |         0 | None        |            0
 datanode1    | default_pool |         0 | None        |            0

12.3.2.8 GLOBAL_WLM_RESPOOL_MEMORY_INFO

This view is used to view the real-time memory usage of resource pools on all nodes in a distributed system. Only the user with the SYSADMIN or MONADMIN permission can query this view.

This view can be used to query only the data on the primary DN. You need to log in to the standby node and use the system function **gs_wlm_respool_memory_info()** to query the memory usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-180 GLOBAL_WLM_RESPOOL_MEMORY_INFO columns

Name	Type	Description
node_name	name	Node name.
respool_name	name	Name of a resource pool.
max_dynamic_memory	integer	Maximum dynamic memory that can be used.
current_dynamic_memory	integer	Used dynamic memory.
max_shared_memory	integer	Maximum shared memory that can be used.
current_shared_memory	integer	Shared memory that has been used.
shared_memory_hits_percent	integer	This function is unavailable and is reserved for future evolution. This column is reserved and the value is **0**.

Example:

```
gaussdb=# SELECT * FROM GLOBAL_WLM_RESPOOL_CONCURRENCY_INFO;
 node_name   | respool_name | max_dynamic_memory | current_dynamic_memory | max_shared_memory |
current_shared_memory | shared_memory_hits_percent
-------------+--------------+--------------------+------------------------+-------------------+------------------------
+---------------------------
 coordinator1 | default_pool | -1                 | 9415kB                 | -1                | 3856kB
|                          0
 datanode1    | default_pool | -1                 | 10724kB                | -1                | 2808kB
|                          0
 datanode2    | default_pool | -1                 | 10724kB                | -1                | 2808kB
|                          0
 datanode3    | default_pool | -1                 | 10724kB                | -1                | 560kB
|                          0
(4 rows)
```

12.3.2.9 PGXC_WLM_REBUILD_USER_RESPOOL

Rebuilds a user's resource pool information in memory on all nodes. It is used as a remedy only when resource pool information is missing or disordered. Only users with the sysadmin permission can query this view.

NOTE

If no data is displayed in the queried view, contact Huawei technical support.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-181 PGXC_WLM_REBUILD_USER_RESPOOL columns

Name	Type	Description
gs_wlm_rebuild_user_resource_pool	Boolean	Rebuilds information about the user resource pool in the memory. **t** indicates success, and **f** indicates failure.

12.3.3 OLTP Table Compression

12.3.3.1 GS_ADM_ILMDATAMOVEMENTPOLICIES

GS_ADM_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions. Only the system administrator can access this system view.

Table 12-182 GS_ADM_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is **null** in the current version.
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is **null** in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is **null** in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is **null** in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
action_clause	clob	Text that can be automatically executed during policy execution. The value is **null** in the current version.
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is **null** in the current version.
node_name	name	Name of a data source node.

12.3.3.2 GS_ADM_ILMOBJECTS

GS_ADM_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status. Only the system administrator can access this system view.

Table 12-183 GS_ADM_ILMOBJECTS columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p+*Policy ID*.
object_owner	character varying(128)	Owner of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(18)	Data object type. Value range: • **TABLE**: table. • **TABLE PARTITION**: partition.
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. Value range: • **TABLE**: table. • **TABLE PARTITION**: partition. • **POLICY NOT INHERITED**: not inherited.
tbs_inherited_from	character varying(30)	Tablespace whose policy is inherited by the current policy. In the current version, this parameter is set to **NULL**.
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.
node_name	name	Name of a data source node.

12.3.3.3 GS_ADM_ILMPOLICIES

GS_ADM_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status. Only the system administrator can access this system view.

Table 12-184 GS_ADM_ILMPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.
policy_type	character varying(13)	Policy type.
tablespace	character varying(30)	Tablespace name. This parameter has a value when the policy is created on a tablespace. The value is **null** in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.
deleted	character varying(7)	Specifies whether the policy is deleted.
node_name	name	Name of a data source node.

12.3.3.4 GS_ADM_ILMEVALUATIONDETAILS

GS_ADM_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name. By default, only the system administrator can access the system view.

Table 12-185 GS_ADM_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.
object_owner	character varying(128)	Name of the schema where the data object is located.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(18)	Data object type. • **TABLE**: table. • **TABLE PARTITION**: partition.
selected_for_execution	character varying(42)	Evaluation result: • **SELECTED FOR EXECUTION**: The evaluation is passed. • **PRECONDITION NOT SATISFIED**: The evaluation fails. • **JOB ALREADY EXISTS**: The task already exists.
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.
comments	character varying(4000)	Reserved column.
node_name	name	Name of a data source node.

12.3.3.5 GS_ADM_ILMPARAMETERS

GS_ADM_ILMPARAMETERS displays the environment parameters related to ILM scheduling and execution. The parameters can be modified through the DBE_ILM_ADMIN.CUSTOMIZE_ILM interface. By default, only the system administrator can access the system view.

Table 12-186 GS_ADM_ILMPARAMETERS columns

Name	Type	Description
name	character varying(128)	ADO-related environment parameters, which can be modified through the DBE_ILM_ADMIN.CUSTOMIZE_ILM interface.
value	numeric	Parameter value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.3.6 GS_ADM_ILMRESULTS

GS_ADM_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time. By default, only the system administrator can access this system view. Common users can access the system view only after being authorized.

Table 12-187 GS_ADM_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
job_name	character varying(128)	ADO job name.
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.
node_name	name	Name of a data source node.

12.3.3.7 GS_ADM_ILMTASKS

GS_ADM_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time. By default, only the system administrator can access this system view. Common users can access the system view only after being authorized.

Table 12-188 GS_ADM_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
task_owner	character varying(128)	User who initiates an ADO task. This column exists only in the ADM view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	character varying(9)	Status. • **INACTIVE** • **ACTIVE** • **COMPLETED** • **UNKNOWN**: being evaluated.
creation_time	timestamp with time zone	Creation time.
start_time	timestamp with time zone	Time when the status changes to active.
completion_time	timestamp with time zone	Completion time.
node_name	name	Name of a data source node.

12.3.3.8 GS_MY_ILMEVALUATIONDETAILS

GS_MY_ILMEVALUATIONDETAILS displays the evaluation details of an ADO task, including the task ID, policy information, object information, evaluation result, and ADO job name.

Table 12-189 GS_MY_ILMEVALUATIONDETAILS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is P + Policy ID.
object_owner	character varying(128)	Schema name of a data object.
object_name	character varying(128)	Data object name.
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(18)	Data object type. • **TABLE**: table. • **TABLE PARTITION**: partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
selected_for_execution	character varying(42)	Evaluation result: • **SELECTED FOR EXECUTION**: The evaluation is passed. • **PRECONDITION NOT SATISFIED**: The evaluation fails. • **JOB ALREADY EXISTS**: The task already exists.
job_name	character varying(128)	Name of the task that executes a specific ADO job. If the evaluation result is "passed", this parameter has a value.
comments	character varying(4000)	Reserved column.
node_name	name	Name of a data source node.

12.3.3.9 GS_MY_ILMRESULTS

GS_MY_ILMRESULTS displays the execution details of an ADO job, including the task ID, job name, job status, and job time.

Table 12-190 GS_MY_ILMRESULTS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
job_name	character varying(128)	ADO job name.
job_state	character varying(35)	ADO job status.
start_time	timestamp with time zone	Time when a job starts to be scheduled.
completion_time	timestamp with time zone	Completion time.
comments	character varying(4000)	If a job fails, the failure cause is recorded here.
statistics	clob	Statistics.
node_name	name	Name of a data source node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.3.10 GS_MY_ILMTASKS

GS_MY_ILMTASKS displays the brief information about an ADO task, including the task ID, task owner, status, and time.

Table 12-191 GS_MY_ILMTASKS columns

Name	Type	Description
task_id	bigint	ID of an ADO task.
task_owner	character varying(128)	User who initiates an ADO task.
state	character varying(9)	Status. • **INACTIVE** • **ACTIVE** • **COMPLETED** • **UNKNOWN**: being evaluated.
creation_time	timestamp with time zone	Creation time.
start_time	timestamp with time zone	Time when the status changes to active.
completion_time	timestamp with time zone	Completion time.
node_name	name	Name of a data source node.

12.3.3.11 GS_MY_ILMDATAMOVEMENTPOLICIES

GS_MY_ILMDATAMOVEMENTPOLICIES displays the data movement summary of ILM policies, including the policy name, action type, and conditions.

Table 12-192 GS_MY_ILMDATAMOVEMENTPOLICIES columns

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
action_type	character varying(11)	Action type. The current version supports only compression.
scope	character varying(7)	Scope. In the current version, only rows are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
compression_level	character varying(30)	Compression level. This parameter is available when the action type is compression.
tier_tablespace	character varying(128)	Target space. This parameter is available only when the action type is migration. The value is **null** in the current version.
tier_status	character varying(9)	Specifies whether the target space is read-only. The value is **null** in the current version.
condition_type	character varying(22)	Condition type. The current version supports only the last modification time.
condition_days	numeric	Number of days as a condition.
custom_function	character varying(128)	Name of a user-defined function. The value is **null** in the current version.
policy_subtype	character varying(10)	Policy subtype. The value is **null** in the current version.
action_clause	clob	Text that can be automatically executed during policy execution. The value is **null** in the current version.
tier_to	character varying(10)	Type of the target database to which data is migrated. The value is **null** in the current version.
node_name	name	Name of a data source node.

12.3.3.12 GS_MY_ILMOBJECTS

GS_MY_ILMOBJECTS displays the brief information about all data objects to which ILM policies are applied and the corresponding policies, including the policy name, data object name, policy source, and policy enabling/disabling status.

Table 12-193 GS_MY_ILMOBJECTS

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
object_owner	character varying(128)	Schema name of a data object.
object_name	character varying(128)	Data object name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
subobject_name	character varying(128)	Partition name of a data object.
object_type	character varying(18)	Data object type. • **TABLE**: table. • **TABLE PARTITION**: partition.
inherited_from	character varying(20)	Object whose policy is inherited by the current policy. The options are as follows: • **TABLE**: table. • **TABLE PARTITION**: partition. • **POLICY NOT INHERITED**: not inherited
tbs_inherited_from	character varying(30)	Tablespace whose policy is inherited by the current policy. The value is **null** in the current version.
enabled	character varying(7)	Specifies whether the policy is enabled for the current object.
deleted	character varying(7)	Specifies that the ILM policy on the object is deleted. If the partition or the policy on the partition is deleted, the record (ILMOBJ) is deleted.
node_name	name	Name of a data source node.

12.3.3.13 GS_MY_ILMPOLICIES

GS_MY_ILMPOLICIES displays the brief information about an ILM policy, including the policy name, type, enabling status, disabling status, and deletion status.

Table 12-194 GS_MY_ILMPOLICIES

Name	Type	Description
policy_name	character varying(128)	Name of an ADO policy, which is automatically generated. The name format is p + Policy ID.
policy_type	character varying(13)	Policy type.
tablespace	character varying(30)	Tablespace name. This parameter has a value when the policy is created on a tablespace. The value is **null** in the current version.
enabled	character varying(6)	Specifies whether the policy is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
deleted	character varying(7)	Specifies whether the policy is deleted.
node_name	name	Name of a data source node.

12.3.4 Communications

12.3.4.1 COMM_CLIENT_INFO

COMM_CLIENT_INFO displays information about active client connections of a single node (You can query this view on a DN to view the information about the connection between the CN and DN). By default, only the users with system administrator permission can access this view.

Table 12-195 COMM_CLIENT_INFO columns

Name	Type	Description
node_name	text	Name of the current DN, for example, dn_6001_6002_6003.
app	text	Query a view on a DN. The app displays the client connected to the current DN, such as the coordinator (CN), GTM, or DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
socket	integer	**socket fd** is displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

12.3.4.2 GLOBAL_COMM_CLIENT_INFO

GLOBAL_COMM_CLIENT_INFO queries information about active client connections of global nodes in a cluster. By default, only the system administrator has the permission to access this system view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-196 GLOBAL_COMM_CLIENT_INFO columns

Name	Type	Description
node_name	text	Current node name.
app	text	Client that connects to the current DN, such as a CN, GTM, or DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
socket	integer	Displayed if the connection is a physical connection.
remote_ip	text	Peer node IP address.
remote_port	text	Peer node port.
logic_id	integer	Displayed if the connection is a logical connection.

12.3.4.3 GS_COMM_LISTEN_ADDRESS_EXT_INFO

GS_COMM_LISTEN_ADDRESS_EXT_INFO queries DFX information, such as threads, sessions, and socket, for connecting the extended IP addresses of the current DN. For details about the application scenarios, see **gs_comm_listen_address_ext_info()**

Table 12-197 GS_COMM_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	text	Name of the current instance.
app	text	Client connected to the DN.
tid	bigint	Thread ID of the current thread.
lwtid	integer	Lightweight thread ID of the current thread.
query_id	bigint	Query ID of the current thread.
socket	integer	Socket FD of the current physical connection.
remote_ip	text	Peer IP address of the current connection.
remote_port	text	Peer port of the current connection.
local_ip	text	Local IP address of the current connection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
local_port	text	Local port of the current connection.

12.3.4.4 GS_GET_LISTEN_ADDRESS_EXT_INFO

GS_GET_LISTEN_ADDRESS_EXT_INFO queries the extended IP address configured for the current DN instance. For details about the application scenarios, see **gs_get_listen_address_ext_info()**.

Table 12-198 GS_GET_LISTEN_ADDRESS_EXT_INFO columns

Name	Type	Description
node_name	text	DN name.
host	text	Listening IP address of a DN.
port	bigint	Listening port of a DN.
ext_listen_ip	text	Extended IP address configured for a DN.

12.3.4.5 GS_LIBCOMM_FD_INFO

Records information about socket persistent connections of the libcomm communications library. Only the user with the PUBLIC permission can query this view.

Table 12-199 GS_LIBCOMM_FD_INFO columns

Name	Type	Description
node_name	text	DN name.
ip	text	IP address of the DN.
ctrl_port	bigint	Control channel port.
data_port	bigint	Data channel port.
remote_name	text	Instance name of the DN at the peer site.
remote_ip	text	Peer IP address.
remote_port	bigint	Peer port number.
local_ip	text	Local IP address.
local_port	bigint	Local port number.
fd	bigint	Socket connection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type	text	Type of the TCP connection channel. The options are as follows: • **DATA_SEND_FD**: socket of the sender of the data channel • **DATA_RECV_FD**: socket of the receiver of the data channel. • **CTL_SEND_FD**: socket of the sender of the control channel. • **CTL_RECV_FD**: socket of the receiver of the control channel.

12.3.4.6 GS_LIBCOMM_MEMORY_INFO

Records the basic configuration information used by the internal memory of the current libcomm communication library. Only the user with the PUBLIC permission can query this view.

Table 12-200 GS_LIBCOMM_MEMORY_INFO columns

Name	Type	Description
node_name	text	DN name.
current_used_memory	bigint	Memory used by the libcomm communication library, in bytes.
current_data_item_num	bigint	Number of data blocks in the libcomm lockless queue.
init_mailbox_memory	bigint	Memory used by libcomm to initialize the mailbox, in bytes.
max_datanode	bigint	Maximum number of DNs supported by the libcomm communications library.
max_stream	bigint	Maximum number of data streams supported by a single TCP connection of the libcomm.
max_quota_size	bigint	Total buffer size of the libcomm logical connection, in bytes.
max_usable_memory	bigint	Maximum memory that can be used by the libcomm communications library cache, in bytes.
max_memory_pool	bigint	Total size of the memory resource pool that can be used by the libcomm communications library on each DN. The unit is byte.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.4.7 GS_STATIC_THREADPOOL_CTRL_STATUS

GS_STATIC_THREADPOOL_CTRL_STATUS returns statistics about static threads related to the thread pool of the current instance. When the thread pool is enabled, the CN thread pool can be queried using this view. A blank line is returned when a DN is connected for query or the thread pool is disabled. If **static_thread_pool_num** is set to **0** or less than the number of groups in the thread pool, the default value of the static thread pool is **0**. Only the user with the PUBLIC permission can query this view.

Table 12-201 GS_STATIC_THREADPOOL_CTRL_STATUS columns

Name	Type	Description
node_name	text	Instance name.
group_id	integer	Group ID of the thread pool.
worker_info	text	Dynamic statistics about the running thread pool of the current group. The information includes: **default** and **default_s**: number of threads, including default value of the dynamic thread pool and default value of the static thread pool. **expect** and **expect_s**: number of threads, including the expected value of the dynamic thread pool and expected value of the static thread pool. **actual**: actual number of running threads, including dynamic pool threads and static pool threads. **static threads limit**: indicates the number of static pool threads configured for the current group. **has static threads**: specifies whether a static pool is created for the current group. The default value is **0**, indicating that no user is created. **idle static threads**: number of idle static pool threads. **wait session num**: number of waiting sessions.

12.3.4.8 PG_COMM_DELAY

PG_COMM_DELAY displays the communications library delay status for a single DN.

Table 12-202 PG_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond. **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond.
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond.

12.3.4.9 PG_COMM_RECV_STREAM

PG_COMM_RECV_STREAM displays the receiving stream status of all the communications libraries for a single DN.

Table 12-203 PG_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Status of the stream. • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream, in byte.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average receiving rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in byte.
buff_usize	bigint	Current size of the data cache of the stream, in byte.

12.3.4.10 PG_COMM_SEND_STREAM

PG_COMM_SEND_STREAM displays the sending stream status of all the communication libraries for a single DN.

Table 12-204 PG_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream, in bytes.
time	bigint	Current life cycle of a stream. The unit is ms.
speed	bigint	Average sending rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in bytes.
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms.

12.3.4.11 PG_COMM_STATUS

PG_COMM_STATUS displays the communications library status for a single DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-205 PG_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in kbyte/s.
buffer	bigint	Cache size of the cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** thread, in bytes.
memkbyte_libpq	bigint	Communication memory size of the **libpq** thread, in bytes.
used_pm	integer	Real-time usage of the **postmaster** thread.
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread.
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread.
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads.
stream	integer	Total number of used logical connections.

12.3.4.12 PG_GET_INVALID_BACKENDS

The PG_GET_INVALID_BACKENDS view displays information about current standby DN backend threads connected to the CN. Only system administrator and monitor administrator can access this view.

Table 12-206 PG_GET_INVALID_BACKENDS columns

Name	Type	Description
pid	bigint	Thread ID
node_name	text	Node information connected to the backend thread
dbname	name	Name of the connected database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
backend_start	timestamp with time zone	Backend thread startup time
query	text	Query statement executed by the backend thread

12.3.4.13 PG_POOLER_STATUS

PG_POOLER_STATUS queries the cache connection status in the pooler. This view can only query on the CN, and displays the connection cache information about the pooler module.

Table 12-207 PG_POOLER_STATUS columns

Name	Type	Description
database	text	Database name.
user_name	text	Username.
tid	bigint	• ID of the thread connected to the CN for non-thread pool logic. • Session ID for connecting to the CN for thread pool logic.
node_oid	bigint	OID of the node connected
node_name	name	Name of the node connected
in_use	boolean	Specifies whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the node connected.
node_port	bigint	Port number of the connected instance node.
fdsock	bigint	Peer socket.
remote_pid	bigint	If the peer site is not in the thread pool logic, the value is the thread ID of the peer site. If the peer site is in the thread pool logic, the value is the session ID of the peer site.
session_params	text	GUC session parameter delivered by the connection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

12.3.4.14 PGXC_COMM_DELAY

PGXC_COMM_DELAY displays the communications library delay status for all DNs. Only the system administrator and monitoring administrator can view this view.

Table 12-208 PGXC_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node
stream_num	integer	Number of logical stream connections used by the current physical connection
min_delay	integer	Minimum delay of the current physical connection within 1 minute, in microsecond. **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute, in microsecond.
max_delay	integer	Maximum delay of the current physical connection within 1 minute, in microsecond.

12.3.4.15 PGXC_COMM_RECV_STREAM

PGXC_COMM_RECV_STREAM displays the receiving stream status of the communications libraries for all the DNs.

Table 12-209 PGXC_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. • **UNKNOWN**: The logical connection status is unknown. • **READY**: The logical connection is ready. • **RUN**: The logical connection sends packets normally. • **HOLD**: The logical connection is waiting to send packets. • **CLOSED**: The logical connection is closed. • **TO_CLOSED**: The logical connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream, in byte.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average receiving rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in byte.
buff_usize	bigint	Current size of the data cache of the stream, in byte.

12.3.4.16 PGXC_COMM_SEND_STREAM

PGXC_COMM_SEND_STREAM displays the sending stream status of the communications libraries for all the DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-210 PGXC_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Status of the stream. The options are as follows: • **UNKNOWN**: The connection status is unknown. • **READY**: The connection is ready. • **RUN**: The connection sends packets normally. • **HOLD**: The connection is waiting to send packets. • **CLOSED**: The connection is closed. • **TO_CLOSED**: The connection will be closed.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream, in bytes.
time	bigint	Current service life of the stream, in ms.
speed	bigint	Average sending rate of the stream, in byte/s.
quota	bigint	Current communication quota of the stream, in byte.
wait_quota	bigint	Extra time generated when the stream waits the quota value, in ms.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.4.17 PGXC_COMM_STATUS

PGXC_COMM_STATUS displays the communications library status for all the DNs.

Table 12-211 PGXC_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on a node, in bytes/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the bigint node, in KB/s.
txkbyte_rate	bigint	Sending rate of the communications library on the bigint node, in KB/s.
buffer	bigint	Cache size of the cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the libcomm process, in bytes.
memkbyte_libpq	bigint	Communication memory size of the libpq process in bytes.
used_pm	integer	Real-time usage of the postmaster thread
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads
stream	integer	Total number of used logical connections.

12.3.5 Segment-Page Storage

12.3.5.1 GLOBAL_GS_SEG_DATAFILES

GLOBAL_GS_SEG_DATAFILES displays information about data files in all tablespaces on all nodes, which can only be executed on the CN. Only an administrator can query the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-212 GLOBAL_GS_SEG_DATAFILES columns

Name	Type	Description
node_name	text	Node name.
file_name	text	Data file name. Example: **base/17467/2_fsm**.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
tablespace_name	name	Name of the tablespace to which a data file belongs.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
extent_size	integer	Extent size of a data file.
meta_blocks	bigint	Number of allocated metadata pages of a data file.
data_blocks	bigint	Number of allocated data pages of a data file.
total_blocks	bigint	Total number of physical pages in a data file.
high_water_mark	bigint	High watermark of the number of pages used by a data file.
utilization	real	Percentage of used blocks to the total number of blocks, that is, (**data_blocks** + **meta_blocks**)/**total_blocks**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.5.2 GLOBAL_GS_SEG_EXTENTS

GLOBAL_GS_SEG_EXTENTS displays the extent information about all tablespaces on all nodes, which can only be executed on the CN. This view displays all extents of user segments, including segment heads, fork heads, and level-1 pages in file 1 and data extents in files 2 to 5. Only an administrator can query the information.

Table 12-213 GLOBAL_GS_SEG_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
head_block_id	bigint	Page number of the segment header.
extent_id	integer	Logical extent number.
file_id	integer	ID of the data file where the extent is located. Value range: an int4 value in the range [1,5].
forknum	integer	Fork of a segment object. Value range: • **0**: main. • **1**: fsm. • **2**: vm.
block_id	bigint	Start page number in the data file where the extent is located.
blocks	integer	Extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usage_type	text	Usage type of the extension. Value range: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.

12.3.5.3 GLOBAL_GS_SEG_SEGMENTS

GLOBAL_GS_SEG_SEGMENTS displays the segment information of all tablespaces on all nodes, including the table, index, TOAST and TOAST INDEX segments, and fsm fork and vm fork segments. It can only be executed on the CN. Only an administrator can query the information.

Table 12-214 GLOBAL_GS_SEG_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
schema_name	name	Namespace to which a segment belongs.
segment_name	name	Segment object name, which is obtained from pg_class and **relname** in pg_partition.
partition_name	name	Partition name of the segment object; **NULL** if the segment object is not partitioned. Source: pg_partition.relname.
forknum	integer	Fork type of a segment object. The options are as follows: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
segment_type	text	Segment object type. Value range: • **table**: segment-page ordinary table. • **table partition**: segment-page partitioned table (main table and child table) and segment-page level-2 partitioned table (level-1 partitioned table). • **table subpartition**: segment-page level-2 partitioned table (top node table and level-2 partitioned table). • **index**: index of a segment-page ordinary table. • **index partition**: index of a segment-page partitioned table or level-2 partitioned table. • **global partition index**: global index for segment-page partitioned tables and level-2 partitioned tables. • **toast**: segment-page TOAST table. • **toast index**: index of a segment-page TOAST table.
tablespace_name	name	Tablespace to which a segment object belongs.
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
head_block_id	bigint	Page number of the segment header.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
table_name	name	Name of the base table to which a segment belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
blocks	bigint	Number of logical pages of a segment.
total_blocks	bigint	Number of physical pages of a segment.
extents	integer	Number of logical extents of a segment.
total_extents	integer	Number of physical extents of a segment.
head_lsn	text	Segment header LSN.
level0_slots	bigint[]	Level-0 slot array of segment extent mapping.
level1_slots	bigint[]	Level-1 slot array of segment extent mapping.
fork_head	bigint[]	Fork head array of a segment.

12.3.5.4 GLOBAL_GS_SEG_SPC_EXTENTS

GLOBAL_GS_SEG_SPC_EXTENTS displays the information about used extents of all tablespaces on all nodes, which can only be executed on the CN. The output contains segment heads, fork heads, level-1 pages, data extents. Only an administrator can query the information.

Table 12-215 GLOBAL_GS_SEG_SPC_EXTENTS

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.5.5 GLOBAL_GS_SEG_SPC_SEGMENTS

GLOBAL_GS_SEG_SPC_SEGMENTS displays the information about used segments of all tablespaces on all nodes, which can only be executed on the CN. Only an administrator can query the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-216 GLOBAL_GS_SEG_SPC_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
forknum	integer	Fork type of a segment object. The options are as follows: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usage_type	text	Extended usage type. The options are as follows: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.
remain_flag	text	Specifies whether it is a shrink residual extension. The value can be **Y** or **N**.
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.5.6 GS_SEG_DATAFILES

GS_SEG_DATAFILES displays information about data files in all tablespaces. Only an administrator can query the information.

Table 12-217 GS_SEG_DATAFILES columns

Name	Type	Description
node_name	text	Node name.
file_name	text	Data file name, for example, **base/17467/2_fsm**.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
tablespace_name	name	Name of the tablespace to which a data file belongs.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
extent_size	integer	Extent size of a data file.
meta_blocks	bigint	Number of allocated metadata pages of a data file.
data_blocks	bigint	Number of allocated data pages of a data file.
total_blocks	bigint	Total number of physical pages in a data file.
high_water_mark	bigint	High watermark of the number of pages used by a data file.
utilization	real	Percentage of used blocks to the total number of blocks, that is, (**data_blocks** + **meta_blocks**)/**total_blocks**.

12.3.5.7 GS_SEG_DATAFILE_LAYOUT

GS_SEG_DATAFILE_LAYOUT displays the static layout of data files 1 to 5 in segment-page mode. Only an administrator can query the information.

Table 12-218 GS_SEG_DATAFILE_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: **1.0**.
seg_storage_type	text	• **segment** indicates common segment-page data. • **hashbucket** indicates hash bucket data.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
section_id	integer	Data section ID of a data file.
section_type	text	Type of the data file section. Value range: • **file_header** indicates the file header. • **spc_header** indicates the space header. • **map_header** indicates the mapping header. • **map_pages** indicates the mapping page. • **ip_pages(inverse pointer pages)** indicates the reverse pointer page. • **data_pages** indicates the data page.
page_start	bigint	Start page number of the data section.
page_end	bigint	End page number of the data section.
page_count	bigint	Number of pages in the data section.
total_size	bigint	Size of the data section. The unit is byte.

12.3.5.8 GS_SEG_EXTENTS

GS_SEG_EXTENTS displays extent information about all tablespaces. This view displays all extents of user segments, including segment heads, fork heads, and level-1 pages in file 1 and data extents in files 2 to 5. Only an administrator can query the information.

Table 12-219 GS_SEG_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace to which a segment object belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
head_block_id	bigint	Page number of the segment header.
extent_id	integer	Logical extent number.
file_id	integer	ID of the data file where the extent is located. Value range: an int4 value in the range [1,5].
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	bigint	Start page number in the data file where the extent is located.
blocks	integer	Extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
usage_type	text	Usage type of the extension. Value range: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.

12.3.5.9 GS_SEG_SEGMENTS

GS_SEG_SEGMENTS displays information about segments in all tablespaces, including tables, indexes, TOAST, TOAST INDEX segments, and fsm fork and vm fork segments. Only an administrator can query the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-220 GS_SEG_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
schema_name	name	Namespace to which a segment belongs.
segment_name	name	Segment object name, which is obtained from pg_class and **relname** in pg_partition.
partition_name	name	Partition name of the segment object; **NULL** if the segment object is not partitioned. Source: pg_partition.relname.
forknum	integer	Fork type of a segment object. Value range: ● **0**: main fork. ● **1**: FSM fork. ● **2**: VM fork.
segment_type	text	Segment object type. Value range: ● **table**: segment-page ordinary table. ● **table partition**: segment-page partitioned table (main table and child table) and segment-page level-2 partitioned table (level-1 partitioned table). ● **table subpartition**: segment-page level-2 partitioned table (top node table and level-2 partitioned table). ● **index**: index of a segment-page ordinary table. ● **index partition**: index of a segment-page partitioned table or level-2 partitioned table. ● **global partition index**: global index for segment-page partitioned tables and level-2 partitioned tables. ● **toast**: segment-page TOAST table. ● **toast index**: index of a segment-page TOAST table.
tablespace_name	name	Tablespace to which a segment object belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
head_block_id	bigint	Page number of the segment header.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
table_name	name	Name of the base table to which a segment belongs.
blocks	bigint	Number of logical pages of a segment.
total_blocks	bigint	Number of physical pages of a segment.
extents	integer	Number of logical extents of a segment.
total_extents	integer	Number of physical extents of a segment.
head_lsn	text	Segment header LSN.
level0_slots	bigint[]	Level-0 slot array of segment extent mapping.
level1_slots	bigint[]	Level-1 slot array of segment extent mapping.
fork_head	bigint[]	Fork head array of a segment.

12.3.5.10 GS_SEG_SEGMENT_LAYOUT

GS_SEG_SEGMENT_LAYOUT displays the static layout of segment-page files. Only the administrator can query the information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-221 GS_SEG_SEGMENT_LAYOUT columns

Name	Type	Description
version	text	Segment-page version. Default value: **1.0**.
section_id	integer	ID of the data section divided by a segment.
section_type	text	Extent type of the segment data section. Value range: • **meta**: segment header. • **data**: data.
extent_size	integer	Extent size. The unit is byte.
extent_page_count	integer	Number of extent pages.
extent_count_start	bigint	Start extent number.
extent_count_end	bigint	End extent number.
total_size	bigint	Size of the segment data section. The unit is byte.

12.3.5.11 GS_SEG_SPC_EXTENTS

GS_SEG_SPC_EXTENTS displays information about the used extents of all tablespaces. The output contains segment heads, fork heads, level-1 pages, data extents. Only an administrator can query the information.

Table 12-222 GS_SEG_SPC_EXTENTS

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
forknum	integer	Data file fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. The options are as follows: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the reverse pointer corresponding to an extent.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.5.12 GS_SEG_SPC_SEGMENTS

GS_SEG_SPC_SEGMENTS displays information about used segments in all tablespaces. Only an administrator can query the information.

Table 12-223 GS_SEG_SPC_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Extended usage type. The options are as follows: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.5.13 GS_SEG_SPC_REMAIN_EXTENTS

GS_SEG_SPC_REMAIN_EXTENTS displays the residual isolated extent information of the index tablespace. The extent information is not included in the residual segment and can be used as an independent clearing unit. Only an administrator can query the information.

Table 12-224 GS_SEG_SPC_REMAIN_EXTENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
forknum	integer	Fork type of a segment object. Value range: • **0**: main fork. • **1**: FSM fork. • **2**: VM fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Usage type of the extension. Value range: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.5.14 GS_SEG_SPC_REMAIN_SEGMENTS

GS_SEG_SPC_REMAIN_SEGMENTS displays the residual segment information of the index tablespace, including the main fork, fsm fork, and vm fork segments. Only an administrator can query the information.

Table 12-225 GS_SEG_SPC_REMAIN_SEGMENTS columns

Name	Type	Description
node_name	text	Node name.
tablespace_name	name	Tablespace name.
file_id	integer	Data file ID. Value range: an int4 value in the range [1,5].
bucketnode	integer	• **0** to **1023** indicate the bucket nodes of a hash bucket table. • **1024** indicates the bucket node of a segment-page ordinary table. • **1025** indicates the bucket node of a segment-page global temporary table. • **1026** indicates the bucket node of a segment-page unlogged table. • **1027** indicates the bucket node of a segment-page local temporary table. • **2048** to **6143** indicate the bucket nodes of a range bucket table.
forknum	integer	Data file fork.
block_id	bigint	Start page number of a data extent.
blocks	integer	Data extent size. The value can be **1**, **8**, **128**, **1024**, or **4096**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
contents	text	Storage content of a data file. Value range: • **permanent**: permanent. • **unlogged**: no log. • **temporary**: global temporary. • **temporary2**: local temporary.
in_used	text	Specifies whether a resource has been allocated. The value can be **Y** or **N**.
mapblock_location	text	Position of the extension in the map block. The format is (*page_id*, *offset*).
head_file_id	integer	Segment header file ID.
head_block_id	bigint	Page number of the segment header.
usage_type	text	Usage type of the extension. Value range: • **segment head**: segment header. • **fork head**: fork header. • **level1 page**: level-1 page. • **data extent**: data extents.
remain_flag	text	Specifies whether it is a residual extent after the SHRINK operation. The value can be **Y** or **N**.
special_data	integer	Special data section of the reverse pointer corresponding to an extent.
ipblock_location	text	Position of the extended reverse pointer. The format is (*block_id*, *offset*).

12.3.6 SPM

12.3.6.1 GS_SPM_SQL_BASELINE

GS_SPM_SQL_BASELINE is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the baseline information of the current user. Users with permissions higher than common users can access this view.

Table 12-226 GS_SPM_SQL_BASELINE columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
status	text	Status of a plan. Value range: • **UNACC**: indicates that the plan is not accepted. • **ACC**: indicates that the plan has been accepted. • **FIXED**: indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plans.
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.
cost	double precision	Total plan cost.
sql_text	text	SQL text string.
param_num	integer	Number of SQL parameters.
source	text	Baseline source.
creation_time	timestamp with time zone	Time when the baseline is created.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

12.3.6.2 GS_SPM_SQL_PARAM

GS_SPM_SQL_PARAM is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the SQL parameter information of the current user. Users with permissions higher than common users can access this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-227 GS_SPM_SQL_PARAM columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
sql_text	text	SQL text string.
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	Boolean	Specifies whether a parameter value is **NULL**.
hash_value	bigint	Hash value of a parameter value.
creation_time	timestamp with time zone	Time when a record is created.

12.3.6.3 GS_SPM_SQL_EVOLUTION

GS_SPM_SQL_EVOLUTION is a system view of the SPM feature. Currently, this feature is not supported in the distributed system. This view is used to view the planned evolution result of the current user. Users with permissions higher than common users can access this view.

Table 12-228 GS_SPM_SQL_EVOLUTION columns

Name	Type	Description
sql_namespace	oid	OID of a schema.
sql_hash	bigint	Unique ID of an SQL statement in the current schema.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
better	Boolean	Determines whether it is a positive evolution.
status	text	Specifies whether exceptions occur during the evolution. Value range: • **SUCCESS**: The evolution is successful. • **FAILED**: The evolution fails.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
refer_plan	bigint	Plan hash used as a reference for report generation.
sql_text	text	SQL text string.
outline	text	Hint string list of the current plan.
reason	text	Content of the evolution report.
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the evolution result is created.

12.3.6.4 GS_SPM_SYS_BASELINE

GS_SPM_SYS_BASELINE is a system view of the SPM feature. This feature is not supported in the distributed system. This view is used to view baseline information in the database. The user with the SYSADMIN permission and the initial user can access this view.

Table 12-229 GS_SPM_SYS_BASELINE columns

Name	Type	Description
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
unique_sql_id	bigint	Unique ID of an SQL statement in the database.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
status	integer	Status of a plan. Value range: • **0** (UNACC): plan that is not accepted. • **1** (ACC): plan that has been accepted. • **2** (FIXED): a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.
gplan	Boolean	Specifies whether the plan corresponding to the current outline is a gplan.
cost	double precision	Total plan cost.
sql_text	text	SQL text string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
param_num	integer	Number of SQL parameters.
source	text	Baseline source.
creation_time	timestamp with time zone	Time when the baseline is created.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

12.3.7 Auditing

12.3.7.1 ADM_AUDIT_OBJECT

ADM_AUDIT_OBJECT displays the audit trail records of all objects in the database. This view exists in both PG_CATALOG and SYS schemas. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

Table 12-230 ADM_AUDIT_OBJECT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session)
owner	character varying(128)	Creator of the object affected by the operation

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
obj_name	character varying(128)	Name of the object affected by the operation
action_name	character varying(28)	Action name corresponding to the numeric code in the **ACTION** column in DBA_AUDIT_TRAIL **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
new_owner	character varying(128)	Not supported. Its value is **NULL**.
new_name	character varying(128)	Not supported. Its value is **NULL**.
ses_actions	character varying(19)	Not supported. Its value is **NULL**.
comment_text	character varying(4000)	Not supported. Its value is **NULL**.
sessionid	numeric	Not supported. Its value is **NULL**.
entryid	numeric	Not supported. Its value is **NULL**.
statementid	numeric	Not supported. Its value is **NULL**.
returncode	numeric	Not supported. Its value is **NULL**.
priv_used	character varying(40)	Not supported. Its value is **NULL**.
client_id	character varying(128)	Not supported. Its value is **NULL**.
econtext_id	character varying(64)	Not supported. Its value is **NULL**.
session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. Its value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. Its value is **NULL**.
sql_text	character varying	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is **NULL**.

12.3.7.2 ADM_AUDIT_SESSION

ADM_AUDIT_SESSION displays all audit trail records concerning CONNECT and DISCONNECT. The audit information of GaussDB is mainly queried through the gs_query_audit function. This view exists in both PG_CATALOG and SYS schema. Only users with the AUDITADMIN attribute can view audit information.

Table 12-231 ADM_AUDIT_SESSION columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created (user login date and time of the entry created by AUDIT SESSION).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
action_name	character varying(28)	Action name corresponding to the numeric code in the **ACTION** column in DBA_AUDIT_TRAIL. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
logoff_time	date	Not supported. Its value is **NULL**.
logoff_lread	numeric	Not supported. Its value is **NULL**.
logoff_pread	numeric	Not supported. Its value is **NULL**.
logoff_lwrite	numeric	Not supported. Its value is **NULL**.
logoff_dlock	numeric	Not supported. Its value is **NULL**.
sessionid	numeric	Not supported. Its value is **NULL**.
returncode	numeric	Not supported. Its value is **NULL**.
client_id	character varying(128)	Not supported. Its value is **NULL**.
session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Timestamp when an audit trail entry is created (user login timestamp of the entry created by AUDIT SESSION in UTC).
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.

12.3.7.3 ADM_AUDIT_STATEMENT

ADM_AUDIT_STATEMENT displays all grant and revoke audit trail entries. The audit information of GaussDB is mainly queried through the gs_query_audit function. This view exists in both PG_CATALOG and SYS schema. Only users with the AUDITADMIN attribute can view audit information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-232 ADM_AUDIT_STATEMENT columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action_name	character varying(28)	Action type corresponding to the code in the action column. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
new_name	character varying(128)	Not supported. Its value is **NULL**.
obj_privilege	character varying(32)	Not supported. Its value is **NULL**.
sys_privilege	character varying(40)	Not supported. Its value is **NULL**.
admin_option	character varying(1)	Not supported. Its value is **NULL**.
grantee	character varying(128)	Not supported. Its value is **NULL**.
audit_option	character varying(40)	Not supported. Its value is **NULL**.
ses_actions	character varying(19)	Not supported. Its value is **NULL**.
comment_text	character varying(4000)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sessionid	numeric	Not supported. Its value is **NULL**.
entryid	numeric	Not supported. Its value is **NULL**.
statementid	numeric	Not supported. Its value is **NULL**.
returncode	numeric	Not supported. Its value is **NULL**.
priv_used	character varying(40)	Not supported. Its value is **NULL**.
client_id	character varying(128)	Not supported. Its value is **NULL**.
econtext_id	character varying(64)	Not supported. Its value is **NULL**.
session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. Its value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. Its value is **NULL**.
sql_text	character varying(2000)	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.7.4 ADM_AUDIT_TRAIL

ADM_AUDIT_TRAIL displays all standard audit trail entries. The audit information of GaussDB is mainly queried through the gs_query_audit function. This view exists in both PG_CATALOG and SYS schema. Only users with the AUDITADMIN attribute and the SELECT permission of ADM_AUDIT_TRAIL can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information.

CAUTION

In a distributed system, the gs_query_audit function can only be used to query the audit information of the current node.

Table 12-233 ADM_AUDIT_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. Its value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. Its value is **NULL**.
terminal	character varying(255)	Not supported. Its value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session)
owner	character varying(128)	Creator of the object affected by the operation
obj_name	character varying(128)	Name of the object affected by the operation
action	numeric	Not supported. Its value is **NULL**.
action_name	character varying(28)	Action type corresponding to the code in the action column. **NOTE** The **action_name** column in GaussDB is inconsistent with the audit action of database ORA.
new_owner	character varying(128)	Not supported. Its value is **NULL**.
new_name	character varying(128)	Not supported. Its value is **NULL**.
obj_privilege	character varying(32)	Not supported. Its value is **NULL**.
sys_privilege	character varying(40)	Not supported. Its value is **NULL**.

session_cpu	numeric	Not supported. Its value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. Its value is **NULL**.
global_uid	character varying(32)	Not supported. Its value is **NULL**.
instance_number	numeric	Not supported. Its value is **NULL**.
os_process	character varying(16)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
transactionid	text	Identifier of the transaction that accesses or modifies an object. **NOTE** The type of the **transactionid** column in GaussDB must be the same as that in database ORA.
scn	numeric	Not supported. Its value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. Its value is **NULL**.
sql_text	nvarchar2	SQL text of the query. **NOTE** The **sql_text** column in GaussDB is the parsed SQL description statement, which is not completely the same as the executed SQL statement.
obj_edition_name	character varying(128)	Not supported. Its value is **NULL**.
dbid	numeric	Not supported. Its value is **NULL**.
rls_info	clob	Not supported. Its value is **NULL**.
current_user	character varying(128)	Not supported. Its value is **NULL**.

12.3.7.5 GS_AUDITING

GS_AUDITING displays all audit information about database-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-234 GS_AUDITING columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value can be **access** or **privilege**. ● **access**: DML operations are audited. ● **privilege**: DDL operations are audited.
polenabled	Boolean	Specifies whether the policy is enabled. ● **t** (true): enabled. ● **f** (false): disabled.
access_type	name	DML database operation types, such as SELECT, INSERT, and DELETE, or DDL database operation types, such as CREATE, ALTER, and DROP.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
label_name	name	Resource label name. This column corresponds to the **polname** column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion.

12.3.7.6 GS_AUDITING_ACCESS

GS_AUDITING_ACCESS displays all audit information about database DML-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-235 GS_AUDITING_ACCESS columns

Name	Type	Description
polname	name	Policy name, which must be unique.
pol_type	text	Audit policy type. The value is **'access'**, indicating that DML operations are audited.
polenabled	Boolean	Specifies whether the policy is enabled. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	DML database operation type. Example: SELECT, INSERT, and DELETE.
label_name	name	Resource label name. This column corresponds to the **polname** column in the GS_AUDITING_POLICY system catalog.
access_object	text	Path of the database asset.
filter_name	text	Logical character string of a filter criterion.

12.3.7.7 GS_AUDITING_PRIVILEGE

GS_AUDITING_PRIVILEGE displays all audit information about database DDL-related operations. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-236 GS_AUDITING_PRIVILEGE columns

Name	Type	Description
polname	name	Policy name, which must be unique.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pol_type	text	Audit policy type. The value is **'privilege'**, indicating that DDL operations are audited.
polenabled	Boolean	Specifies whether to enable a policy. • **t** (true): enabled. • **f** (false): disabled.
access_type	name	DDL database operation type. For example, CREATE, ALTER, and DROP.
label_name	name	Resource label name. This column corresponds to the **polname** column in the GS_AUDITING_POLICY system catalog.
priv_object	text	Full domain name of a database object.
filter_name	text	Logical character string of a filter criterion.

12.3.8 User and Permission Management

12.3.8.1 ADM_COL_PRIVS

ADM_COL_PRIVS displays permission granting information about all columns. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 12-237 ADM_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
grantable	character varying(3)	Specifies whether to grant privileges. • **YES**: The privileges are granted. • **NO**: The privileges are not granted.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.2 ADM_ROLE_PRIVS

ADM_ROLE_PRIVS displays information about roles granted to all users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 12-238 ADM_ROLE_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
delegate_option	character varying(3)	Not supported. Its value is **NULL**.
default_role	character varying(3)	Not supported. Its value is **NULL**.
os_granted	character varying(3)	Not supported. Its value is **NULL**.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.3 ADM_ROLES

ADM_ROLES displays information about database roles. This view exists in both the PG_CATALOG and SYS schemas. By default, only the system administrator can access this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-239 ADM_ROLES columns

Name	Type	Description
role	character varying(128)	Role name.
role_id	oid	Role ID
authentication_type	text	Role authentication mechanism. • **password**: Password authentication is required. • **null**: Authentication is not required.
common	character varying(3)	Not supported. Its value is **NULL**.
oracle_maintained	character varying(1)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.
implicit	character varying(3)	Not supported. Its value is **NULL**.
external_name	character varying(4000)	Not supported. Its value is **NULL**.

12.3.8.4 ADM_SYS_PRIVS

ADM_SYS_PRIVS displays information about system permissions granted to users and roles. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 12-240 ADM_SYS_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see Table 7-272.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.5 ADM_TAB_PRIVS

ADM_TAB_PRIVS displays authorization information about all objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 12-241 ADM_TAB_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name.
grantor	character varying(128)	Name of the user who grants the permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, PACKAGE, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. The value is **NULL**.
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

12.3.8.6 ADM_USERS

ADM_USERS displays information about all database users. This view is accessible only to system administrators. This view exists in both PG_CATALOG and SYS schemas.

Table 12-242 ADM_USERS columns

Name	Type	Description
username	character varying(128)	Username.
user_id	oid	User ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
account_status	character varying(32)	Account status. • **NULL**: The account is the initial system administrator with the highest permission. • **0**: normal. • **1**: The account is locked for a specific period of time because the number of failed login attempts exceeds the threshold. • **2**: The account is locked by the administrator.
lock_date	timestamp with time zone	By default, the creation date of the account is displayed. If the account is locked by the administrator or the account is locked because the number of login failures exceeds the threshold, the date when the account is locked is displayed. The value is **NULL** for the initial system administrator.
expiry_date	timestamp with time zone	Account expiration date.
default_tablespace	character varying(4000)	Default tablespace for storing data.
temporary_tablespace	character varying(4000)	Name of the default tablespace or tablespace group of a temporary table.
local_temp_tablespace	character varying(30)	Not supported. The default value is **NULL**.
created	timestamp with time zone	Date when a user is created.
profile	character varying(128)	Not supported. The default value is **NULL**.
initial_rsrc_consumer_group	character varying(128)	Not supported. The default value is **NULL**.
external_name	character varying(4000)	Not supported. The default value is **NULL**.
password_versions	character varying(12)	Encryption mode of the account password. The value can be **MD5**, **SHA256**, or **SM3**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
editions_enabled	character varying(1)	Not supported. The default value is **NULL**.
authentication_type	text	Authentication mechanism of the user.
proxy_only_connect	character varying(1)	Not supported. The default value is **NULL**.
common	character varying(3)	Not supported. The default value is **NULL**.
last_login	timestamp with time zone	Last login.
oracle_maintained	character varying(1)	Not supported. The default value is **NULL**.
inherited	character varying(3)	Not supported. The default value is **NULL**.
default_collation	character varying(100)	Default collation of the user schema.
implicit	character varying(3)	Not supported. The default value is **NULL**.
all_shard	character varying(3)	Not supported. The default value is **NULL**.
password_change_date	timestamp with time zone	Date when the user set a password last time.

12.3.8.7 DB_COL_PRIVS

DB_COL_PRIVS displays the following granting information:

- Column permission granting information when the current user is the object owner, grantor, or grantee.
- Column permission granting information when the enabled role or PUBLIC role is the grantee.

By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-243 DB_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.8 DB_DIRECTORIES

DB_DIRECTORIES is used to view all directories on which the current user has the operation permission. Administrators can query all directories, and common users can query only directories on which the current user has the operation permission. This view exists in both PG_CATALOG and SYS schemas.

Table 12-244 DB_DIRECTORIES columns

Name	Type	Description
owner	oid	OID of the owner of a directory object.
directory_name	name	Name of a directory object.
directory_path	text	Directory path represented by a directory object.
origin_con_id	character varying(256)	ID of the container where a directory object is created. Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.8.9 DB_TAB_PRIVS

DB_TAB_PRIVS displays authorization information about all objects accessible to the current user. All users can access this view. This view exists in both PG_CATALOG and SYS schemas.

Table 12-245 DB_TAB_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema to which an object belongs.
table_name	character varying(128)	Object name.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
type	character varying(24)	Object types, including NODE GROUP, COLUMN_ENCRYPTION_KEY, PACKAGE, COLUMN, TABLE, VIEW, SEQUENCE, TYPE, INDEX, DATABASE, DIRECTORY, FOREIGN DATA WRAPPER, FOREIGN SERVER, LANGUAGE, SCHEMA, TEMPLATE, FUNCTION, PROCEDURE, and TABLESPACE.
hierarchy	character varying(3)	Not supported. The value is **NULL**.
common	character varying(3)	Not supported. The value is **NULL**.
inherited	character varying(3)	Not supported. The value is **NULL**.

12.3.8.10 DB_USERS

DB_USERS displays all users of the database visible to the current user. However, it does not describe the users. By default, only the system administrator can access this view. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-246 DB_USERS columns

Name	Type	Description
user_id	oid	OID of a user
username	name	Name of a user

12.3.8.11 GS_DB_PRIVILEGES

GS_DB_PRIVILEGES displays the granting of ANY permissions. Each record corresponds to a piece of authorization information.

Table 12-247 GS_DB_PRIVILEGES columns

Name	Type	Description
rolename	name	Username.
privilege_type	text	ANY permission of a user. For details about the value, see **Table 7-272**.
admin_option	text	Specifies whether the ANY permission recorded in the **privilege_type** column can be re-granted. • **yes** • **no**

12.3.8.12 GS_LABELS

GS_LABELS displays all configured resource labels. Only the users with system administrator or security policy administrator permission can access this view.

Table 12-248 GS_LABELS columns

Name	Type	Description
labelname	name	Resource label name
labeltype	name	Resource label type This parameter corresponds to the **labeltype** column in the **GS_POLICY_LABEL** system catalog.
fqdntype	name	Database resource type. For example, table, schema, and index.
schemaname	name	Name of the schema to which the database resource belongs

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fqdnname	name	Database resource name
columnname	name	Name of the database resource column. If the marked database resource is not a column, this parameter is left blank.

12.3.8.13 MY_COL_PRIVS

MY_COL_PRIVS displays the column permission granting information of the current user as the object owner, grantor, or grantee. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-249 MY_COL_PRIVS columns

Name	Type	Description
grantor	character varying(128)	Name of the user who grants the permission.
owner	character varying(128)	Object owner.
grantee	character varying(128)	Name of the user or role to which the permission is granted.
table_schema	character varying(128)	Schema of an object.
table_name	character varying(128)	Object name.
column_name	character varying(128)	Column name.
privilege	character varying(40)	Permission on a column.
grantable	character varying(3)	Specifies whether to grant privileges. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.14 MY_ROLE_PRIVS

MY_ROLE_PRIVS displays permission information about roles (including the public role) granted to the current user. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-250 MY_ROLE_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
delegate_option	character varying(3)	Not supported. Its value is **NULL**.
default_role	character varying(3)	Not supported. Its value is **NULL**.
os_granted	character varying(3)	Not supported. Its value is **NULL**.
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.15 MY_SYS_PRIVS

MY_SYS_PRIVS displays information about system permissions granted to the current user. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-251 MY_SYS_PRIVS columns

Name	Type	Description
grantee	character varying(128)	Name of the user or role to which the permission is granted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see Table 7-272.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.16 PG_RLSPOLICIES

PG_RLSPOLICIES displays information about row-level security policies. The initial user and users with the **sysadmin** attribute can view all policy information. Other users can view only the policy information in their own tables.

Table 12-252 PG_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level security policy is applied.
tablename	name	Name of the table object to which a row-level security policy is applied.
policyname	name	Name of a row-level security policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
policypermissive	text	Expression concatenation mode of a row-level security policy. Value range: • **PERMISSIVE**: permissive policy, which is concatenated using the OR expression. • **RESTRICTIVE**: restrictive policy, which is concatenated using an AND expression.
policyroles	name[]	List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
policycmd	text	SQL operations affected by a row-level security policy.
policyqual	text	Expression of a row-level security policy.

12.3.8.17 GS_RLSPOLICIES

GS_RLSPOLICIES displays information about row-level security policies. The initial user and users with the sysadmin attribute can view all policy information. Other users can view only the policy information in their own tables.

Table 12-253 GS_RLSPOLICIES columns

Name	Type	Description
schemaname	name	Name of the schema of the table object to which a row-level security policy is applied.
tablename	name	Name of the table object to which the row-level security policy is applied.
policyname	name	Name of a row-level security policy.
policypermissive	text	Expression concatenation mode of a row-level security policy. Value range: • **PERMISSIVE**: permissive policy, which is concatenated using the OR expression. • **RESTRICTIVE**: restrictive policy, which is concatenated using the AND expression.
policyroles	name[]	List of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
policycmd	text	SQL operations affected by a row-level security policy.
policyqual	text	Expression of a row-level security policy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.8.18 PG_ROLES

PG_ROLES displays information about database roles. The initial user and users with the **SYSADMIN** or **createrole** attribute can view information about all roles. Other users can view only their own information.

Table 12-254 PG_ROLES columns

Name	Type	Reference	Description
rolname	name	N/A	Role name.
rolsuper	boolean	N/A	Specifies whether a role is the initial system administrator with the highest permissions. • **t** (true): yes. • **f** (false): no.
rolinherit	boolean	N/A	Specifies whether the role inherits the permissions for this type of roles. • **t** (true): yes. • **f** (false): no.
rolcreaterole	boolean	N/A	Specifies whether the role can create other roles. • **t** (true): yes. • **f** (false): no.
rolcreatedb	boolean	N/A	Specifies whether the role can create databases. • **t** (true): yes. • **f** (false): no.
rolcatupdate	boolean	N/A	Specifies whether the role can update system catalogs directly. Only the initial system administrator whose **usesysid** is **10** has this permission. It is unavailable for other users. • **t** (true): yes. • **f** (false): no.
rolcanlogin	boolean	N/A	Specifies whether the role can log in to the database. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolreplication	boolean	N/A	Specifies whether the role can be replicated. • **t** (true): yes. • **f** (false): no.
rolauditadmin	boolean	N/A	Specifies whether the role is an audit administrator. • **t** (true): yes. • **f** (false): no.
rolsystemadmin	boolean	N/A	Specifies whether the role is a system administrator. • **t** (true): yes. • **f** (false): no.
rolconnlimit	integer	N/A	Sets the maximum number of concurrent connections that this role can initiate if this role can log in. The value **–1** indicates no limit.
rolpassword	text	N/A	Encrypted user password. The value is displayed as ********.
rolvalidbegin	timestamp with time zone	N/A	Start time for account validity (**NULL** if no start time).
rolvaliduntil	timestamp with time zone	N/A	End time for account validity (**NULL** if end time is not specified).
rolrespool	name	N/A	Resource pool that a user can use.
rolparentid	oid	rolparentid in PG_AUTHID	OID of a group user to which the user belongs.
roltabspace	text	N/A	Storage space of the user permanent table, in KB.
rolconfig	text[]	**setconfig** in PG_DB_ROLE_SETTING	Default value of GUC items.
oid	oid	**oid** in PG_AUTHID	Role ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
roluseft	boolean	**roluseft** in PG_AUTHID	Specifies whether the role can perform operations on foreign tables. • **t** (true): yes. • **f** (false): no.
rolkind	"char"	N/A	Role type. • **n**: common user, that is, non-permanent user. • **p**: permanent user.
nodegroup	name	N/A	Name of the node group associated with a role. If no node group is associated, leave it blank.
roltempspace	text	N/A	Storage space of the user temporary table, in KB.
rolspillspace	text	N/A	Operator disk spill space of the user, in KB.
rolmonitoradmin	boolean	N/A	Specifies whether the role is a MONADMIN. • **t** (true): yes. • **f** (false): no.
roloperatoradmin	boolean	N/A	Specifies whether the role is an O&M administrator. • **t** (true): yes. • **f** (false): no.
rolpolicyadmin	boolean	N/A	Specifies whether the role is a security policy administrator. • **t** (true): yes. • **f** (false): no.

12.3.8.19 GS_ROLES

GS_ROLES displays information about database roles. The initial user and users with the SYSADMIN or CREATEROLE attribute can view information about all roles. Other users can view only their own information.

Table 12-255 GS_ROLES columns

Name	Type	Reference	Description
rolname	name	N/A	Role name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolsuper	boolean	N/A	Specifies whether a role is the initial system administrator with the highest permissions. • **t** (true): yes. • **f** (false): no.
rolinherit	boolean	N/A	Specifies whether the role inherits the permissions for this type of roles. • **t** (true): yes. • **f** (false): no.
rolcreaterole	boolean	N/A	Specifies whether the role can create other roles. • **t** (true): yes. • **f** (false): no.
rolcreatedb	boolean	N/A	Specifies whether the role can create databases. • **t** (true): yes. • **f** (false): no.
rolcatupdate	boolean	N/A	Specifies whether the role can update system catalogs directly. Only the initial system administrator whose **usesysid** is **10** has this permission. This permission is unavailable for other users. • **t** (true): yes. • **f** (false): no.
rolcanlogin	boolean	N/A	Specifies whether the role can log in to the database. • **t** (true): yes. • **f** (false): no.
rolreplication	boolean	N/A	Specifies whether the role can be replicated. • **t** (true): yes. • **f** (false): no.
rolauditadmin	boolean	N/A	Specifies whether the role is an audit administrator. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
rolsystemadmin	boolean	N/A	Specifies whether the role is a system administrator. • **t** (true): yes. • **f** (false): no.
rolconnlimit	integer	N/A	Sets the maximum number of concurrent connections that this role can initiate if this role can log in. The value **–1** indicates no limit.
rolpassword	text	N/A	Encrypted user password. The value is displayed as ********.
rolvalidbegin	timestamp with time zone	N/A	Account validity start time. If this column is not set, the value is **NULL**.
rolvaliduntil	timestamp with time zone	N/A	Account validity end time. If this column is not set, the value is **NULL**.
rolrespool	name	N/A	Resource pool that a user can use.
rolparentid	oid	**PG_AUTHID**.rolparentid	OID of a group user to which the user belongs.
roltabspace	text	N/A	Storage space of the user permanent table, in KB.
rolconfig	text[]	**setconfig** in **PG_DB_ROLE_SETTING**	Default value of runtime configuration items.
oid	oid	**oid** in **PG_AUTHID**	Role ID.
roluseft	boolean	**PG_AUTHID**.roluseft	Specifies whether the role can perform operations on foreign tables. • **t** (true): yes. • **f** (false): no.
rolkind	"char"	N/A	Role type. • **n**: common user, that is, non-permanent user. • **p**: permanent user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
roltempspace	text	N/A	Storage space of the user temporary table, in KB.
rolspillspace	text	N/A	Operator disk spill space of the user, in KB.
rolmonitoradmin	boolean	N/A	Specifies whether the role is a monitor administrator. • **t** (true): yes. • **f** (false): no.
roloperatoradmin	boolean	N/A	Specifies whether the role is an O&M administrator. • **t** (true): yes. • **f** (false): no.
rolpolicyadmin	boolean	N/A	Specifies whether the role is a security policy administrator. • **t** (true): yes. • **f** (false): no.

12.3.8.20 PG_SECLABELS

PG_SECLABELS provides information about storage security labels.

Table 12-256 PG_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to.
classoid	oid	**oid** in PG_CLASS	OID of the system catalog where the object to which the security label belongs is located.
objsubid	integer	-	• Column number for the security label on a table column (by referring to **objoid** and **classoid** in the table). • For all other object types, this column is set to **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
objtype	text	-	Type of the object to which the label belongs, in text format. Examples: • **table**: table type. • **column**: column type.
objnamespace	oid	**oid** in **PG_NAMESPACE**	OID of the namespace for the object, if applicable; otherwise, **NULL**.
objname	text	-	Name of the object to which the label belongs, in text format.
provider	text	**provider** in **PG_SECLABEL**	Provider of the label.
label	text	**label** in **PG_SECLABEL**	Security label name.

12.3.8.21 GS_SECLABELS

GS_SECLABELS provides information about storage security labels.

Table 12-257 GS_SECLABELS columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object that this security label pertains to.
classoid	oid	**oid** in **PG_CLASS**	OID of the system catalog where the object to which the security label belongs is located.
objsubid	integer	-	• Column number for the security label on a table column (by referring to **objoid** and **classoid** in the table). • For all other object types, this column is set to **0**.
objtype	text	-	Type of the object to which the label belongs, in text format. • **table**: table type • **column**: column type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
objnamespace	oid	**oid** in PG_NAMESPACE	OID of the namespace for the object, if applicable; otherwise, **NULL**.
objname	text	-	Name of the object to which the label belongs, in text format.
provider	text	**provider** in PG_SECLABEL	Provider of the label.
label	text	**label** in PG_SECLABEL	Security label name.

12.3.8.22 PG_SHADOW

PG_SHADOW displays the attributes of all roles marked with rolcanlogin in PG_AUTHID. Only the system administrator can access this system view.

The information in this view is basically the same as that in PG_USER. The difference is that in PG_USER, passwords are sensitive and displayed as ********.

Table 12-258 PG_SHADOW columns

Name	Type	Reference	Description
usename	name	**rolname** in PG_AUTHID	Username.
usesysid	oid	**oid** in PG_AUTHID	User ID.
usecreatedb	Boolean	-	Specifies whether this user has the permissions to create databases. • **t** (true): yes. • **f** (false): no.
usesuper	Boolean	-	Specifies whether this user is a system administrator. • **t** (true): yes. • **f** (false): no.
usecatupd	Boolean	-	Specifies whether this user can update a view. Even the system administrator cannot update the view unless this column is **t**. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
userepl	Boolean	-	Specifies whether this user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	**rolpassword** in PG_AUTHID	Password ciphertext. If there is no password, the value is **NULL**.
valbegin	timestamp with time zone	-	Start time for account validity (**NULL** if no start time).
valuntil	timestamp with time zone	-	End time for account validity (**NULL** if end time is not specified).
respool	name	-	Resource pool where this user is in.
parent	oid	-	Parent user OID.
spacelimit	text	-	Storage space of the permanent table, in KB.
useconfig	text[]	**setconfig** in PG_DB_ROLE_SETTING	Default value of GUC items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.
spillspacelimit	text	-	Operator disk flushing space, in KB.
usemonitoradmin	Boolean	-	Specifies whether this user is a monitor administrator. • **t** (true): yes. • **f** (false): no.
useoperatoradmin	Boolean	-	Specifies whether this user is an O&M administrator. • **t** (true): yes. • **f** (false): no.
usepolicyadmin	Boolean	-	Specifies whether this user is a security policy administrator. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.8.23 GS_SHADOW

GS_SHADOW displays the attributes of all roles marked with rolcanlogin in **PG_AUTHID**. Only the system administrator can access this system view.

The information in this view is basically the same as that of the view in **GS_USER**. The difference is that passwords are sensitive and displayed as ******** in the latter.

Table 12-259 GS_SHADOW columns

Name	Type	Reference	Description
usename	name	**rolname** in **PG_AUTHID**	Username.
usesysid	oid	**oid** in **PG_AUTHID**	User ID.
usecreatedb	Boolean	-	Specifies whether a user has the permissions to create databases. • **t** (true): yes • **f** (false): no
usesuper	Boolean	-	Specifies whether the user is a system administrator. • **t** (true): yes • **f** (false): no
usecatupd	Boolean	-	Specifies whether the user can update a view. Even the system administrator cannot update the view unless this column is **t**. • **t** (true): yes • **f** (false): no
userepl	Boolean	-	Specifies whether the user has the permissions to duplicate data streams. • **t** (true): yes • **f** (false): no
passwd	text	**rolpassword** in **PG_AUTHID**	Password ciphertext. If there is no password, the value is **NULL**.
valbegin	timestamp with time zone	-	Account validity start time. If this column is not set, the value is **NULL**.
valuntil	timestamp with time zone	-	Account validity end time. If this column is not set, the value is **NULL**.
respool	name	-	Resource pool where the user is in.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
parent	oid	-	Parent user OID.
spacelimit	text	-	Storage space of the permanent table, in KB.
useconfig	text[]	**setconfig** in PG_DB_ROLE_SETTING	Default value of runtime configuration items.
tempspacelimit	text	-	Storage space of the temporary table, in KB.
spillspacelimit	text	-	Operator disk flushing space, in KB.
usemonitoradmin	Boolean	-	Specifies whether the user is a monitor administrator. • **t** (true): yes • **f** (false): no
useoperatoradmin	Boolean	-	Specifies whether the user is an O&M administrator. • **t** (true): yes • **f** (false): no
usepolicyadmin	Boolean	-	Specifies whether the user is a security policy administrator. • **t** (true): yes • **f** (false): no

12.3.8.24 PG_USER

PG_USER displays information about database users. By default, only the initial user and users with the **SYSADMIN** attribute can view the information. Other users can view the information only after being granted with permissions.

Table 12-260 PG_USER columns

Name	Type	Description
usename	name	Username.
usesysid	oid	User ID.
usecreatedb	Boolean	Specifies whether this user has the permissions to create databases. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usesuper	Boolean	Specifies whether this user is the initial system administrator with the highest permissions. • **t** (true): yes. • **f** (false): no.
usecatupd	Boolean	Specifies whether the user can directly update system catalogs. Only the initial system administrator whose **usesysid** is **10** has this permission. It is unavailable for other users. • **t** (true): yes. • **f** (false): no.
userepl	Boolean	Specifies whether this user has the permissions to duplicate data streams. • **t** (true): yes. • **f** (false): no.
passwd	text	Encrypted user password. The value is displayed as ********.
valbegin	timestamp with time zone	Start time for account validity (**NULL** if no start time).
valuntil	timestamp with time zone	End time for account validity (**NULL** if end time is not specified).
respool	name	Resource pool where this user is in.
parent	oid	Parent user OID.
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of GUC items. For details, see **setconfig** in **PG_DB_ROLE_SETTING**.
nodegroup	name	Name of the node group associated with a user. If the user does not manage node groups, leave it blank.
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk flushing space, in KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usemonitoradmin	Boolean	Specifies whether this user is a MONADMIN. • **t** (true): yes. • **f** (false): no.
useoperatoradmin	Boolean	Specifies whether this user is an O&M administrator. • **t** (true): yes. • **f** (false): no.
usepolicyadmin	Boolean	Specifies whether this user is a security policy administrator. • **t** (true): yes. • **f** (false): no.

12.3.8.25 GS_USER

GS_USER displays information about database users. By default, only the initial user and users with the sysadmin attribute can view the information. Other users can view the information only after being granted with permissions.

Table 12-261 GS_USER columns

Name	Type	Description
usename	name	Username.
usesysid	oid	User ID.
usecreatedb	Boolean	Specifies whether a user has the permissions to create databases. • **t** (true): yes • **f** (false): no
usesuper	Boolean	Specifies whether the user is the initial system administrator with the highest permissions. • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usecatupd	Boolean	Specifies whether the user can directly update system catalogs. Only the initial system administrator whose **usesysid** is **10** has this permission. This permission is unavailable for other users. • **t** (true): yes • **f** (false): no
userepl	Boolean	Specifies whether the user has the permissions to duplicate data streams. • **t** (true): yes • **f** (false): no
passwd	text	Encrypted user password. The value is displayed as ********.
valbegin	timestamp with time zone	Account validity start time. If this column is not set, the value is **NULL**.
valuntil	timestamp with time zone	Account validity end time. If this column is not set, the value is **NULL**.
respool	name	Resource pool where the user is in.
parent	oid	Parent user OID.
spacelimit	text	Storage space of the permanent table, in KB.
useconfig	text[]	Default value of runtime configuration items. For details, see **setconfig** in **PG_DB_ROLE_SETTING**.
tempspacelimit	text	Storage space of the temporary table, in KB.
spillspacelimit	text	Operator disk flushing space, in KB.
usemonitoradmin	Boolean	Specifies whether the user is a monitor administrator. • **t** (true): yes • **f** (false): no
useoperatoradmin	Boolean	Specifies whether the user is an O&M administrator. • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usepolicyadmin	Boolean	Specifies whether the user is a security policy administrator. • **t** (true): yes • **f** (false): no

12.3.8.26 PG_USER_MAPPINGS

PG_USER_MAPPINGS displays user mapping information. All users can view the information.

Table 12-262 PG_USER_MAPPINGS columns

Name	Type	Reference	Description
umid	oid	**oid** in PG_USER_MAPPING	OID of the user mapping.
srvid	oid	**oid** in PG_FOREIGN_SERVER	OID of the foreign server that contains the mapping.
srvname	name	**srvname** in PG_FOREIGN_SERVER	Name of the foreign server.
umuser	oid	**oid** in PG_AUTHID	OID of the local role being mapped (**0** if the user mapping is public).
usename	name	-	Name of the local user to be mapped.
umoptions	text[]	-	User mapping specific options. If the current user is the owner of the foreign server, it is a string in the format of "keyword=value". Otherwise, it is **NULL**.

12.3.8.27 ROLE_ROLE_PRIVS

ROLE_ROLE_PRIVS displays roles granted to other roles and provides only information about the roles that the user has access to. By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-263 ROLE_ROLE_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
granted_role	character varying(128)	Role to be granted.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.28 ROLE_SYS_PRIVS

ROLE_SYS_PRIVS displays information about system privileges granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-264 ROLE_SYS_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
privilege	character varying(40)	System permissions or ANY permissions of the user. • System permissions include rolsuper, rolinherit, rolcreaterole, rolcreatedb, rolcatupdate, rolcanlogin, rolreplication, rolauditadmin, rolsystemadmin, roluseft, rolmonitoradmin, roloperatoradmin, and rolpolicyadmin. • For details about the value of the ANY permissions, see Table 7-272.
admin_option	character varying(3)	Specifies whether the grant contains the **ADMIN** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.8.29 ROLE_TAB_PRIVS

ROLE_TAB_PRIVS displays information about object permissions granted to roles (only roles accessible to the user are displayed). By default, it is accessible to all users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-265 ROLE_TAB_PRIVS columns

Name	Type	Description
role	character varying(128)	Role name.
owner	character varying(128)	Object owner.
table_name	character varying(128)	Object name. Object types include tables, packages, indexes, and sequences.
column_name	character varying(128)	Not supported. Its value is **NULL**.
privilege	character varying(40)	Permissions on an object, including USAGE, UPDATE, DELETE, INSERT, CONNECT, SELECT, and EXECUTE.
grantable	character varying(3)	Specifies whether the grant contains the **GRANT** option. • **YES** • **NO**
common	character varying(3)	Not supported. Its value is **NULL**.
inherited	character varying(3)	Not supported. Its value is **NULL**.

12.3.9 Dynamic Data Masking

12.3.9.1 GS_MASKING

GS_MASKING displays all configured dynamic masking policies. Only the users with system administrator or security policy administrator permission can access this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-266 GS_MASKING columns

Name	Type	Description
polname	name	Name of the masking policy
polenabled	boolean	Specifies whether to enable the masking policy.
maskaction	name	Masking function
labelname	name	Name of the label to which the masking function applies.
masking_object	text	Masking database resource object
filter_name	text	Logical expression of a filter criterion

12.3.10 DATABASE LINK

12.3.10.1 GS_DB_LINKS

GS_DB_LINKS displays information about DATABASE LINK objects. You can view information about your own DATABASE LINK objects and DATABASE LINK objects at the PUBLIC level.

Table 12-267 GS_DB_LINKS columns

Name	Type	Description
dblinkid	oid	OID of the current DATABASE LINK object.
dlname	name	Name of the current DATABASE LINK object.
dlowner	oid	Owner ID of the current DATABASE LINK object. If the object owner is **public**, the value is **0**.
dlownername	name	Name of the owner of the current DATABASE LINK object.
options	text[]	Connection information of the current DATABASE LINK object. The value is a character string in the "keyword=value" format.
useroptions	text	User information used by the remote end of the current DATABASE LINK object.
heterogeneous	text	Not supported. Its value is **NULL**.
protocol	text	Not supported. Its value is **NULL**.
opencursors	text	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
intransaction	Boolean	Specifies whether the current DATABASE LINK object exists in a transaction.
updatasent	Boolean	Specifies whether the current DATABASE LINK object uses statements for updating data.

12.3.10.2 V$DBLINK

V$DBLINK displays information about DATABASE LINK objects. You can view information about your own DATABASE LINK objects and DATABASE LINK objects at the PUBLIC level. By default, only administrators can view this view.

NOTE

The data in this view is obtained from **GS_DB_LINKS**. This view records only the information about the links that have been used or are being used in the current session. For details about database links, see **DATABASE LINK**.

Table 12-268 V$DBLINK columns

Name	Type	Description
db_link	character varying(128)	Name of the current DATABASE LINK object.
owner_id	numeric	Owner ID of the current DATABASE LINK object. If the owner of the DATABASE LINK object is **PUBLIC**, the value of **owner_id** is **0**.
logged_on	character varying(3)	Not supported. Its value is **NULL**.
heterogeneous	character varying(3)	Not supported. Its value is **NULL**.
protocol	character varying(6)	Not supported. Its value is **NULL**.
open_cursors	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
in_transaction	character varying(3)	Specifies whether the current DATABASE LINK object exists in a transaction. • **YES** • **NO**
update_sent	character varying(3)	Specifies whether the current DATABASE LINK object uses statements for updating data. • **YES** • **NO**
commit_point_strength	numeric	Not supported. Its value is **NULL**.
con_id	numeric	Not supported. Its value is **NULL**.

12.3.11 Materialized Views

12.3.11.1 GS_MATVIEWS

GS_MATVIEWS displays information about each materialized view in the database.

Table 12-269 GS_MATVIEWS columns

Name	Type	Reference	Description
schemaname	name	**nspname** in PG_NAMESPACE	Name of the schema of a materialized view.
matviewname	name	**relname** in PG_CLASS	Name of a materialized view.
matviewowner	name	**rolname** in PG_AUTHID	Owner of a materialized view.
tablespace	name	**spcname** in PG_TABLESPACE	Tablespace name of a materialized view. If the default tablespace of the database is used, the value is null.
hasindexes	Boolean	-	This column is true if a materialized view has (or has recently had) any indexes.
definition	text	-	Definition of a materialized view (a reconstructed SELECT query).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.12 Multi-Tenant Databases

The following are multi-tenant database feature views and are not supported in distributed mode.

12.3.12.1 GS_RESPLAN_PDB_INFO

GS_RESPLAN_PDB_INFO displays the real-time resource usage of all PDBs. You can compare the resource usage of each PDB. Each PDB occupies a row of data.

This is a multi-tenant database feature view. You are advised not to use or query this view in a distributed system.

12.3.12.2 GS_RESPLAN_PDB_METRIC

GS_RESPLAN_PDB_METRIC displays the resource usage statistics of all enabled PDBs in the last minute. Each PDB occupies a row of data.

This is a multi-tenant database feature view. You are advised not to use or query this view in a distributed system.

12.3.12.3 GS_RESPLAN_PDB_METRIC_HISTORY

GS_RESPLAN_PDB_METRIC_HISTORY displays the resource usage statistics per minute of all enabled PDBs. A maximum of 60 rows of data in the last hour can be returned. Each PDB occupies a row of data.

This is a multi-tenant database feature view. You are advised not to use or query this view in a distributed system.

12.3.12.4 MTD_USER

MTD_USER displays information about all current users. It is used only for table association in internal views and is not recommended for external use.

This is a multi-tenant database feature view. You are advised not to use or query this view in a distributed system.

12.3.12.5 GS_DATABASE_DETAILS

GS_DATABASE_DETAILS displays all information in the current PG_DATABASE system catalog, including its status (enabled or disabled).

This is a multi-tenant database feature view. You are advised not to use or query this view in a distributed system.

12.3.13 VACUUM

12.3.13.1 PG_STAT_USER_TABLES

PG_STAT_USER_TABLES displays status information about user-defined ordinary tables and TOAST tables in the namespaces. You can use this view to monitor the execution of VACUUM on a specific table. Pay attention to the **n_dead_tup** and **last_autovacuum** columns. The columns are described as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-270 PG_STAT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of dead rows.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time at which the table was vacuumed by the AUTOVACUUM daemon.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the AUTOVACUUM daemon.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times the table has been vacuumed by the AUTOVACUUM daemon.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the AUTOVACUUM daemon.
last_data_changed	timestamp with time zone	Last modification time of the table data.

Example:

```
gaussdb=# \x
Expanded display is on.
gaussdb=# select * from pg_stat_user_tables where relname='t2';
-[ RECORD 1 ]-----+------------------------------
relid             | 98316
schemaname        | public
relname           | t2
seq_scan          | 2
seq_tup_read      | 20002
idx_scan          |
idx_tup_fetch     |
n_tup_ins         | 10001
n_tup_upd         | 10001
n_tup_del         | 5001
n_tup_hot_upd     | 0
n_live_tup        | 5000
n_dead_tup        | 15002
last_vacuum       | 2025-02-09 10:16:47.317412-05
last_autovacuum   | 2025-02-09 10:16:47.317412-05
last_analyze      | 2025-02-09 10:16:37.491756-05
last_autoanalyze  | 2025-02-09 10:16:37.491756-05
vacuum_count      | 3
autovacuum_count  | 3
analyze_count     | 2
autoanalyze_count | 2
last_data_changed | 2025-02-09 10:16:34.660061-05
```

12.3.13.2 PG_AUTOVAC_STATUS

You can use this function to check whether a table reaches the AUTOVACUUM threshold. Pay attention to the values of **doanalyze** and **dovacuum** in the returned result. The columns in the view are defined as follows:

Table 12-271 PG_AUTOVAC_STATUS columns

Name	Type	Description
nspname	text	Name of a namespace.
relname	text	Name of an object, such as a table, an index, or a view.
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
doanalyze	Boolean	Specifies whether to execute ANALYZE.
anltuples	bigint	Number of ANALYZE tuples.
anlthresh	bigint	ANALYZE threshold.
dovacuum	Boolean	Specifies whether to execute VACUUM.
vactuples	bigint	Number of VACUUM tuples.
vacthresh	bigint	VACUUM threshold.

The command output is as follows:

```
gaussdb=# select * from pg_autovac_status('t2'::regclass);
 nspname | relname | nodename | doanalyze | anltuples | anlthresh | dovacuum | vactuples | vacthresh
---------+---------+----------+-----------+-----------+-----------+----------+-----------+-----------
 public  | t2      | sgnode   | f         |         0 |      2050 | t        |     15002 |      4050
(1 row)
```

12.3.13.3 PG_STAT_ACTIVITY

PG_STAT_ACTIVITY displays information about the current user's queries. The columns save information about the last query. This view displays the table that is being cleared by the current worker. The columns are described as follows:

Table 12-272 PG_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
username	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates that either the client is connected via a UDS on the server or this is an internal process, such as AUTOVACUUM.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will only be non-null for IP connections, and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Start time of the process when the client connects to the server.
xact_start	timestamp with time zone	Time when the current transaction is started. **NULL** if no transaction is active. If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Start time of the active query. If **state** is not **active**, the start time of the previous query is queried. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is **true**.
enqueue	text	Unsupported currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this backend. Values are as follows: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

The running result is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# select * from pg_stat_activity where query ilike '%vacuum%' and query not like 'select%';
 datid | datname  |       pid       |    sessionid    | usesysid |  username  | application_name | client_addr |
client_hostname | client_port |         backend_st
art         |          xact_start           |          query_start          |         state_change          | waiting | enqueue |
state  | resource_pool |     que
ry_id     |     query     |                                                                                  connection_info
                    | unique_sql_id | trace_id | top_xid | current_xid | xlog_quantity

12.3.13.4 GS_STAT_PROGRESS_VACUUM

Displays the current VACUUM progress. The columns are described as follows:

Table 12-273 GS_STAT_PROGRESS_VACUUM columns

Parameter Type	Parameter	Description
Input parameter	pid	PID of the VACUUM thread.
Output parameter	dataname	Name of the database that is being cleared.
Output parameter	relid	OID of the table that is being cleared.
Output parameter	relname	Name of the table that is being cleared.
Output parameter	phase	Current VACUUM phase.
Output parameter	detail	Clearance progress details, including the total number of pages, number of scanned pages, number of cleared pages, and number of cleared indexes.

The running result is as follows:

```
gaussdb=# select * from GS_STAT_PROGRESS_VACUUM(140123447490304);
      pid       | dataname | relid | relname |     phase     |
        detail

12.3.14 Other System Views

12.3.14.1 ADM_ARGUMENTS

ADM_ARGUMENTS displays parameter information of all stored procedures and functions. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 12-274 ADM_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Not supported. The value is **NULL**.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	The *n*th overloaded function of the same name.
subprogram_id	numeric	Not supported. The value is **NULL**.
argument_name	character varying(128)	Parameter name.
position	numeric	Position of a parameter in the parameter list. The value is **0** for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value of this column is always **0** because only one row is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
defaulted	character varying(1)	Specifies whether a parameter has a default value: ● **Y**: yes. ● **N**: no.
default_value	text	Not supported. The value is **NULL**.
default_length	numeric	Not supported. The value is **NULL**.
in_out	character varying(9)	Input and output attributes of a parameter: ● **IN**: input parameter. ● **OUT**: output parameter. ● **IN_OUT**: input and output parameters. ● **VARIADIC**: VARIADIC parameter.
data_length	numeric	Not supported. The value is **NULL**.
data_precision	numeric	Not supported. The value is **NULL**.
data_scale	numeric	Not supported. The value is **NULL**.
radix	numeric	Radix of a number, which is **10** when the data type is smallint, integer, bigint, numeric, or float. For other data types, set this column to **NULL**.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
type_owner	character varying(128)	Owner of a data type.
type_name	character varying(128)	Parameter type name. Only the user-defined type is displayed.
type_subname	character varying(128)	Not supported. The value is **NULL**.
type_link	character varying(128)	Not supported. The value is **NULL**.
type_object_type	character varying(7)	Types of types of the **type_owner**, **type_name**, and **type_subname** columns: ● **TABLE**: The parameter is of the table type. ● **VIEW**: The parameter is of the view type. ● For other data types, the value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. The value is **NULL**.
char_used	character varying(1)	Not supported. • **B**: varchar, nvarchar2, bpchar, and char. • **NULL**: other types.
origin_con_id	character varying(256)	Not supported. The value is **0**.

12.3.14.2 ADM_COL_COMMENTS

ADM_COL_COMMENTS displays information about table column comments in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-275 ADM_COL_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to **0**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.3 ADM_COLL_TYPES

ADM_COLL_TYPES displays information about all collection types. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-276 ADM_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. Set it to **NULL**.
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to **NULL**.
precision	numeric	Not supported. Set it to **NULL**.
scale	numeric	Not supported. Set it to **NULL**.
character_set_name	character varying(44)	Not supported. Set it to **NULL**.
elem_storage	character varying(7)	Not supported. Set it to **NULL**.
nulls_stored	character varying(3)	Not supported. Set it to **NULL**.
char_used	character varying(1)	Not supported. Set it to **NULL**.

12.3.14.4 ADM_CONS_COLUMNS

ADM_CONS_COLUMNS displays information about constraint columns in database tables. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-277 ADM_CONS_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
position	smallint	Position of a column in a table.

12.3.14.5 ADM_CONSTRAINTS

ADM_CONSTRAINTS displays information about table constraints in database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-278 ADM_CONSTRAINTS columns

Name	Type	Description
owner	character varying(64)	Constraint creator.
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: check constraint. • **f**: foreign key constraint. • **p**: primary key constraint. • **u**: unique constraint.
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
status	character varying(8)	Constraint status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
generated	character varying(14)	Not supported. Its value is **NULL**.
search_condition	text	Not supported. Its value is **NULL**.
search_condition_vc	character varying(4000)	Not supported. Its value is **NULL**.
r_owner	character varying(128)	Not supported. Its value is **NULL**.
r_constraint_name	character varying(128)	Not supported. Its value is **NULL**.
delete_rule	character varying(9)	Not supported. Its value is **NULL**.
con_deferrable	character varying(14)	Not supported. Its value is **NULL**.
deferred	character varying(9)	Not supported. Its value is **NULL**.
validated	character varying(13)	Not supported. Its value is **NULL**.
bad	character varying(3)	Not supported. Its value is **NULL**.
rely	character varying(4)	Not supported. Its value is **NULL**.
last_change	date	Not supported. Its value is **NULL**.
invalid	character varying(7)	Not supported. Its value is **NULL**.
view_related	character varying(14)	Not supported. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported. Its value is **NULL**.

12.3.14.6 ADM_DATA_FILES

ADM_DATA_FILES displays the description of database files. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-279 ADM_DATA_FILES columns

Name	Type	Description
tablespace_name	name	Name of the tablespace to which a file belongs.
bytes	double precision	Length of the file in bytes.

12.3.14.7 ADM_DEPENDENCIES

ADM_DEPENDENCIES displays the dependency relationships between types, tables, views, stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-280 ADM_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Set it to **NULL**.
dependency_type	character varying(4)	Not supported. Set it to **NULL**.

12.3.14.8 ADM_DIRECTORIES

ADM_DIRECTORIES stores information about all directory objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-281 ADM_DIRECTORIES columns

Name	Type	Description
owner	oid	Directory owner.
directory_name	name	Directory name.
directory_path	text	OS path name of a directory.
origin_con_id	character varying(256)	Not supported. Set it to **NULL**.

12.3.14.9 ADM_HIST_SNAPSHOT

ADM_HIST_SNAPSHOT records the WDR snapshot data stored in the current system. By default, only the system administrator can access this view. Common

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. This view can be accessed only when the GUC parameter **enable_wdr_snapshot** is set to **on**. To access the PG_CATALOG.ADM_HIST_SNAPSHOT and SYS.ADM_HIST_SNAPSHOT views, you must have the permission to access the **snapshot schema**, **snapshot**, and **tables_snap_timestamp** tables.

Table 12-282 ADM_HIST_SNAPSHOT columns

Name	Type	Description
snap_id	bigint	Unique snapshot ID.
dbid	oid	Database ID of the snapshot.
instance_number	oid	Not supported. The value is the same as that of **DBID**.
startup_time	timestamp(3) without time zone	Instance start time.
begin_interval_time	timestamp without time zone	Start time of the snapshot interval (the end time of the last snapshot).
end_interval_time	timestamp without time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot).
flush_elapsed	interval	Amount of time to perform the snapshot.
snap_level	numeric	Not supported. Its value is **NULL**.
error_count	numeric	Not supported. Its value is **NULL**.
snap_flag	numeric	Not supported. Its value is **NULL**.
snap_timezone	interval day to second(0)	Time offset between the snapshot time zone and the coordinated universal time (UTC).
begin_interval_time_tz	timestamp with time zone	Start time of the snapshot interval with the time zone (end time of the last snapshot).
end_interval_time_tz	timestamp with time zone	End time of the snapshot interval. Actual time when the snapshot is taken (that is, the end time of the snapshot), with the time zone.
con_id	numeric	Not supported. The value is **0**.

12.3.14.10 ADM_HIST_SQL_PLAN

ADM_HIST_SQL_PLAN displays plan information collected by the current user by running the EXPLAIN PLAN statement. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-283 ADM_HIST_SQL_PLAN columns

Name	Type	Description
dbid	text	Database ID
sql_id	character varying(30)	Session that inserts the data. Its value consists of a worker thread start timestamp and a worker thread ID. Values are constrained by **NOT NULL**.
plan_hash_value	bigint	Query ID.
id	integer	Number assigned to each step in the execution plan
operation	character varying(30)	Operation description
options	character varying(255)	Operation action
object_node	character varying(128)	Not supported. Set it to **NULL**.
object#	numeric	Not supported. Set it to **NULL**.
object_owner	name	Object number of a table or an index
object_name	name	Name of an operated object. It is defined by users.
object_alias	character varying(261)	Not supported. Set it to **NULL**.
object_type	character varying(30)	Object type
optimizer	character varying(20)	Not supported. Set it to **NULL**.
parent_id	numeric	Not supported. Set it to **NULL**.
depth	numeric	Not supported. Set it to **NULL**.
position	numeric	Not supported. Set it to **NULL**.
search_columns	numeric	Not supported. Set it to **NULL**.
cost	double precision	Execution cost estimated by the optimizer for an operator
cardinality	double precision	Cardinality estimated by the optimizer for an operator to access table records.
bytes	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
other_tag	character varying(35)	Not supported. Set it to **NULL**.
partition_start	character varying(64)	Not supported. Set it to **NULL**.
partition_stop	character varying(64)	Not supported. Set it to **NULL**.
partition_id	numeric	Not supported. Set it to **NULL**.
other	character varying(4000)	Not supported. Set it to **NULL**.
distribution	character varying(20)	Not supported. Set it to **NULL**.
cpu_cost	numeric	Not supported. Set it to **NULL**.
io_cost	numeric	Not supported. Set it to **NULL**.
temp_space	numeric	Not supported. Set it to **NULL**.
access_predicates	character varying(4000)	Not supported. Set it to **NULL**.
filter_predicates	character varying(4000)	Not supported. Set it to **NULL**.
projection	character varying(4000)	Returned column information
time	numeric	Not supported. Set it to **NULL**.
qblock_name	character varying(128)	Not supported. Set it to **NULL**.
remarks	character varying(4000)	Not supported. Set it to **NULL**.
timestamp	date	Not supported. Set it to **NULL**.
other_xml	clob	Not supported. Set it to **NULL**.
con_dbid	text	Database ID of a container, which is currently set to a value the same as that of **dbid**.
con_id	numeric	Container ID. Containers are not supported and this field is set to **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.11 ADM_HIST_SQLSTAT

ADM_HIST_SQLSTAT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), users can view the data in this view.

Table 12-284 ADM_HIST_SQLSTAT columns

Name	Type	Description
instance_number	integer	Instance ID of a snapshot.
plan_hash_value	integer	ID of the normalized SQL statement.
module	integer	Name of the module that is executing when the SQL statement is first parsed.
apwait_delta	integer	Delta value of the application wait time.
sql_id	bigint	Query ID.
snap_id	bigint	Unique snapshot ID.
elapsed_time_delta	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time_delta	bigint	CPU time (unit: μs).
executions_delta	bigint	Increment in the number of executions that have occurred on this object since it was brought into the cache.
iowait_delta	bigint	I/O time (unit: μs).
rows_processed_delta	bigint	Number of rows in the result set returned by the SELECT statement.
parsing_schema_name	character varying	Not supported. Its value is **NULL**.
disk_reads_delta	bigint	Not supported. Its value is **NULL**.
buffer_reads_delta	bigint	Not supported. Its value is **NULL**.
clwait_delta	bigint	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.12 ADM_HIST_SQLTEXT

ADM_HIST_SQLTEXT displays information about statements executed on the current node. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

After the WDR snapshot function is enabled (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), users can view the data in this view.

Table 12-285 ADM_HIST_SQLTEXT columns

Name	Type	Description
dbid	integer	Database ID.
sql_id	bigint	Query ID.
sql_text	clob	Text corresponding to the query.
command_type	integer	Not supported. Set it to **0**.
con_dbid	integer	Database ID of a container, which is currently set to a value the same as that of **dbid**.
con_id	integer	Container ID. Containers are not supported and this field is set to **0**.

12.3.14.13 ADM_IND_COLUMNS

ADM_IND_COLUMNS displays information about index fields in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-286 ADM_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_length	numeric	Column length. For the variable-length type, its value is **NULL**.
char_length	numeric	Maximum length of a column, in bytes.
descend	character varying(4)	Columns sorted in descending (**DESC**) or ascending (**ASC**) order.
collated_column_id	numeric	Not supported. Its value is **NULL**.

12.3.14.14 ADM_IND_EXPRESSIONS

ADM_IND_EXPRESSIONS displays information about expression indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-287 ADM_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

12.3.14.15 ADM_INDEXES

ADM_INDEXES displays all indexes in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-288 ADM_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is unique. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.
generated	character varying(1)	Specifies whether the name of the index is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.
index_type	character varying(27)	Index type • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of the index object
table_type	character(11)	Type of an index object • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of the tablespace that contains the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported. Its value is **NULL**.
prefix_length	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Not supported. Its value is **NULL**.
max_trans	numeric	Not supported. Its value is **NULL**.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extents	numeric	Not supported. Its value is **NULL**.
max_extents	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
pct_threshold	numeric	Not supported. Its value is **NULL**.
include_column	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
pct_free	numeric	Not supported. Its value is **NULL**.
logging	character varying(3)	Not supported. Its value is **NULL**.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_analyzed	date	Not supported. Its value is **NULL**.
degree	character varying(40)	Not supported. Its value is **NULL**.
instances	character varying(40)	Not supported. Its value is **NULL**.
temporary	character varying(1)	Not supported. Its value is **NULL**.
secondary	character varying(1)	Not supported. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported. Its value is **NULL**.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
duration	character varying(15)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
ityp_owner	character varying(128)	Not supported. Its value is **NULL**.
ityp_name	character varying(128)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_status	character varying(12)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
funcidx_status	character varying(8)	Not supported. Its value is **NULL**.
join_index	character varying(3)	Not supported. Its value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is **NULL**.
dropped	character varying(3)	Not supported. Its value is **NULL**.
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. • **VISIBLE**: The index is visible to the optimizer. • **INVISIBLE**: The index is visible to the optimizer.
domidx_management	character varying(14)	Not supported. Its value is **NULL**.
segment_created	character varying(3)	Not supported. Its value is **NULL**.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.

indexing	character varying(7)	Not supported. Its value is **NULL**.
auto	character varying(3)	Not supported. Its value is **NULL**.

12.3.14.16 ADM_OBJECTS

ADM_OBJECTS displays all database objects in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-289 ADM_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	OID of the object.
object_type	name	Object type. For example, table, schema, and index.
namespace	oid	Namespace containing the object.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status. • **valid**: The object is valid. • **invalid**: The object is invalid.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last time when an object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
timestamp	character varying(19)	Not supported. Its value is **NULL**.
secondary	character varying(1)	Not supported. Its value is **NULL**.
edition_name	character varying(128)	Not supported. Its value is **NULL**.
sharing	character varying(18)	Not supported. Its value is **NULL**.
editionable	character varying(1)	Not supported. Its value is **NULL**.
oracle_maintained	character varying(1)	Not supported. Its value is **NULL**.
application	character varying(1)	Not supported. Its value is **NULL**.
duplicated	character varying(1)	Not supported. Its value is **NULL**.
sharded	character varying(1)	Not supported. Its value is **NULL**.
created_appid	numeric	Not supported. Its value is **NULL**.
modified_appid	numeric	Not supported. Its value is **NULL**.
created_vsnid	numeric	Not supported. Its value is **NULL**.
modified_vsnid	numeric	Not supported. Its value is **NULL**.

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

12.3.14.17 ADM_PROCEDURES

ADM_PROCEDURES displays information about all stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-290 ADM_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, trigger, or package.
object_name	character varying(64)	Name of a stored procedure, function, or trigger. This column will be a package name if the object is a function in a package or a stored procedure.
procedure_name	character varying(128)	This column will be the name of a function or stored procedure in a package if **object_name** is a package name. Otherwise, the column is empty.
object_id	oid	OID of a stored procedure, function, trigger, or package.
subprogram_id	numeric	Location of a function or stored procedure in a package.
overload	character varying(40)	*n*th overloaded function of the name.
object_type	character varying(13)	Object type.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: • **YES**: yes. • **NO**: no.
pipelined	character varying(3)	Not supported. The value is **NO**.
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. The value is **NO**.
interface	character varying(3)	Not supported. The value is **NO**.
deterministic	character varying(3)	Not supported. The value is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
authid	character varying(12)	Permission type. • **DEFINER**: The creator permission is used. • **CURRENT_USER**: The caller permission is used. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Its value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.
polymorphic	character varying(5)	Not supported. Its value is **NULL**.
argument_number	smallint	Number of input parameters in the stored procedure.

12.3.14.18 ADM_SCHEDULER_JOB_ARGS

ADM_SCHEDULER_JOB_ARG displays parameters related to all jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-291 ADM_SCHEDULER_JOB_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.14.19 ADM_SCHEDULER_JOBS

ADM_SCHEDULER_JOBS displays information about all DBE_SCHEDULER scheduler jobs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-292 ADM_SCHEDULER_JOBS columns

Name	Type	Description
owner	name	Owner of a scheduler job.
job_name	text	Name of a scheduler job.
job_subname	character varying(128)	Not supported. Its value is **NULL**.
job_style	text	Action mode of a scheduler job. It is specified during creation. Its value can only be **"REGULAR"**. If this parameter is not specified, the value is **NULL**.
job_creator	name	Creator of a scheduler job.
client_id	character varying(65)	Not supported. Its value is **NULL**.
global_uid	character varying(33)	Not supported. Its value is **NULL**.
program_owner	character varying(4000)	Owner of a program referenced by a scheduler job.
program_name	text	Name of the program referenced by a scheduler job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_type	character varying(16)	Inline program type of a scheduled task. The options are as follows: • **PLSQL_BLOCK**: fast anonymous stored procedure. • **STORED_PROCEDURE**: stored procedure that is saved. • **EXTERNAL_SCRIPT**: external script.
job_action	text	Program content of a scheduler job.
number_of_arguments	text	Number of parameters of a scheduler job.
schedule_owner	character varying(4000)	Not supported. Its value is **NULL**.
schedule_name	text	Name of the schedule referenced by a scheduler job.
schedule_type	character varying(12)	Not supported. Its value is **NULL**.
start_date	timestamp without time zone	Start time of a scheduler job.
repeat_interval	text	Period of a scheduler job.
event_queue_owner	character varying(128)	Not supported. Its value is **NULL**.
event_queue_name	character varying(128)	Not supported. Its value is **NULL**.
event_queue_agent	character varying(523)	Not supported. Its value is **NULL**.
event_condition	character varying(4000)	Not supported. Its value is **NULL**.
event_rule	character varying(261)	Not supported. Its value is **NULL**.
file_watcher_owner	character varying(261)	Not supported. Its value is **NULL**.
file_watcher_name	character varying(261)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
end_date	timestamp without time zone	End time of a scheduler job.
job_class	text	Name of the scheduler job class to which a scheduler job belongs.
enabled	boolean	Status of a scheduler job.
auto_drop	text	Status of the automatic deletion function of a scheduler job.
restart_on_recovery	character varying(5)	Not supported. Its value is **NULL**.
restart_on_failure	character varying(5)	Not supported. Its value is **NULL**.
state	"char"	Status of a scheduler job.
job_priority	numeric	Not supported. Its value is **NULL**.
run_count	numeric	Not supported. Its value is **NULL**.
uptime_run_count	numeric	Not supported. Its value is **NULL**.
max_runs	numeric	Not supported. Its value is **NULL**.
failure_count	smallint	Number of scheduler job failures.
uptime_failure_count	numeric	Not supported. Its value is **NULL**.
max_failures	numeric	Maximum number of failures allowed before the status of a scheduler job is marked as broken.
retry_count	numeric	Not supported. Its value is **NULL**.
last_start_date	timestamp without time zone	Last time when a scheduler job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduler job.
next_run_date	timestamp without time zone	Next execution time of a scheduler job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schedule_limit	interval day to second(0)	Not supported. Its value is **NULL**.
max_run_duration	interval day to second(0)	Not supported. Its value is **NULL**.
logging_level	character varying(11)	Not supported. Its value is **NULL**.
store_output	character varying(5)	Specifies whether to store the output information of all scheduler jobs.
stop_on_window_close	character varying(5)	Not supported. Its value is **NULL**.
instance_stickiness	character varying(5)	Not supported. Its value is **NULL**.
raise_events	character varying(4000)	Not supported. Its value is **NULL**.
system	character varying(5)	Not supported. Its value is **NULL**.
job_weight	numeric	Not supported. Its value is **NULL**.
nls_env	character varying(4000)	Not supported. Its value is **NULL**.
source	character varying(128)	Not supported. Its value is **NULL**.
number_of_destinations	numeric	Not supported. Its value is **NULL**.
destination_owner	character varying(261)	Not supported. Its value is **NULL**.
destination	text	Target name of a scheduler job. If the value of **destination** is **CCN**, the task is a CCN job. For details, see **DBE_SCHEDULER**.
credential_owner	character varying(128)	Not supported. Its value is **NULL**.
credential_name	text	Certificate name of a scheduler job.
instance_id	oid	OID of the current database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
deferred_drop	character varying(5)	Not supported. Its value is **NULL**.
allow_runs_in_restricted_mode	character varying(5)	Not supported. Its value is **NULL**.
comments	text	Comments of a scheduler job.
flags	numeric	Not supported. Its value is **NULL**.
restartable	character varying(5)	Not supported. Its value is **NULL**.
has_constraints	character varying(5)	Not supported. Its value is **NULL**.
connect_credential_owner	character varying(128)	Not supported. Its value is **NULL**.
connect_credential_name	character varying(128)	Not supported. Its value is **NULL**.
fail_on_script_error	character varying(5)	Not supported. Its value is **NULL**.

12.3.14.20 ADM_SCHEDULER_PROGRAM_ARGS

ADM_SCHEDULER_PROGRAM_ARG displays parameters related to all programs in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-293 ADM_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter, which can be user-defined.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
metadata_attribute	character varying(19)	Not supported. Its value is **NULL**.
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Its value is **NULL**.
out_argument	character varying(5)	Reserved column. The value is **NULL**.

12.3.14.21 ADM_SCHEDULER_PROGRAMS

ADM_SCHEDULER_PROGRAMS displays information about all programs that can be scheduled in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-294 ADM_SCHEDULER_PROGRAMS columns

Name	Type	Description
owner	name	Owner of a scheduler program.
program_name	text	Name of a scheduler program.
program_type	character varying(16)	Type of a scheduler program. The options are as follows: • **PLSQL_BLOCK**: fast anonymous stored procedure. • **STORED_PROCEDURE**: stored procedure that is saved. • **EXTERNAL_SCRIPT**: external script.
program_action	text	Action performed by a scheduler program.
number_of_arguments	numeric	Number of scheduler program parameters.
enabled	character varying(5)	Specifies whether a scheduler program is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
comments	text	Comments of a scheduler program.
detached	character varying(5)	Not supported. Its value is **NULL**.
schedule_limit	interval day to second(0)	Not supported. Its value is **NULL**.
priority	numeric	Not supported. Its value is **NULL**.
weight	numeric	Not supported. Its value is **NULL**.
max_runs	numeric	Not supported. Its value is **NULL**.
max_failures	numeric	Not supported. Its value is **NULL**.
max_run_duration	interval day to second(0)	Not supported. Its value is **NULL**.
has_constraints	character varying(5)	Not supported. Its value is **NULL**.
nls_env	character varying(4000)	Not supported. Its value is **NULL**.

12.3.14.22 ADM_SCHEDULER_RUNNING_JOBS

ADM_SCHEDULER_RUNNING_JOBS displays information about all **DBE_SCHEDULER** jobs that are being executed in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-295 ADM_SCHEDULER_RUNNING_JOBS columns

Name	Type	Description
owner	character varying(128)	Owner of a scheduler job.
job_name	character varying(128)	Name of a scheduler job.
job_subname	character varying(128)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
job_style	character varying(17)	Action mode of a scheduler job. It is specified during creation. Its value can only be **"REGULAR"**. If this parameter is not specified, the value is **NULL**.
detached	character varying(5)	Not supported. Its value is **NULL**.
session_id	numeric	ID of the session that executes a scheduler job
slave_process_id	numeric	Not supported. Its value is **NULL**.
slave_os_process_id	character varying(12)	ID of the process that executes a scheduler job
running_instance	numeric	Not supported. Its value is **NULL**.
resource_consumer_group	character varying(32)	Not supported. Its value is **NULL**.
elapsed_time	interval day to second(2)	Execution duration of a scheduler job
cpu_used	interval day to second(2)	Not supported. Its value is **NULL**.
destination_owner	character varying(261)	Not supported. Its value is **NULL**.
destination	character varying(261)	Target name of a scheduler job. If the value of **destination** is **CCN**, the task is a CCN job. For details, see **DBE_SCHEDULER**.
credential_owner	character varying(128)	Not supported. Its value is **NULL**.
credential_name	character varying(128)	Certificate name of a scheduler job.
log_id	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.23 ADM_SEGMENTS

ADM_SEGMENTS displays the storage space allocated to all segments in the database. It exists in the PG_CATALOG and SYS schemas. Only the system administrator can access this view. The information cannot be obtained from the system catalog. The view is empty.

Table 12-296 ADM_SEGMENTS columns

Name	Type	Description
owner	character varying(128)	Not supported. Set it to **NULL**.
segment_name	character varying(128)	Not supported. Set it to **NULL**.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
segment_type	character varying(18)	Not supported. Set it to **NULL**.
segment_subtype	character varying(10)	Not supported. Set it to **NULL**.
tablespace_name	character varying(30)	Not supported. Set it to **NULL**.
header_file	numeric	Not supported. Set it to **NULL**.
header_block	numeric	Not supported. Set it to **NULL**.
bytes	numeric	Not supported. Set it to **NULL**.
blocks	numeric	Not supported. Set it to **NULL**.
extents	numeric	Not supported. Set it to **NULL**.
initial_extent	numeric	Not supported. Set it to **NULL**.
next_extent	numeric	Not supported. Set it to **NULL**.
min_extents	numeric	Not supported. Set it to **NULL**.
max_extents	numeric	Not supported. Set it to **NULL**.
max_size	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
retention	character varying(7)	Not supported. Set it to **NULL**.
minretention	numeric	Not supported. Set it to **NULL**.
pct_increase	numeric	Not supported. Set it to **NULL**.
freelists	numeric	Not supported. Set it to **NULL**.
freelist_groups	numeric	Not supported. Set it to **NULL**.
relative_fno	numeric	Not supported. Set it to **NULL**.
buffer_pool	character varying(7)	Not supported. Set it to **NULL**.
flash_cache	character varying(7)	Not supported. Set it to **NULL**.
cell_flash_cache	character varying(7)	Not supported. Set it to **NULL**.
inmemory	character varying(8)	Not supported. Set it to **NULL**.
inmemory_priority	character varying(8)	Not supported. Set it to **NULL**.
inmemory_distribute	character varying(15)	Not supported. Set it to **NULL**.
inmemory_duplicate	character varying(13)	Not supported. Set it to **NULL**.
inmemory_compression	character varying(17)	Not supported. Set it to **NULL**.
cellmemory	character varying(24)	Not supported. Set it to **NULL**.

12.3.14.24 ADM_SEQUENCES

ADM_SEQUENCES displays information about all sequences in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-297 ADM_SEQUENCES columns

Name	Type	Description
sequence_owner	character varying(64)	Owner of a sequence.
sequence_name	character varying(64)	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Increment of a sequence.
last_number	int16	Last value of the sequence allocated in a batch from the GTM at a time.
cache_size	int16	Size of the sequence disk cache.
cycle_flag	character(1)	Specifies whether a sequence is a cycle sequence. The value can be **Y** or **N**. • **Y**: It is a cycle sequence. • **N**: It is not a cycle sequence.

12.3.14.25 ADM_SOURCE

ADM_SOURCE displays the definition information about all stored procedures, functions, and triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-298 ADM_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. Its value can be **function**, **procedure**, or **trigger**.
line	numeric	Number of the line in the definition information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. The value is **0**.

12.3.14.26 ADM_SYNONYMS

ADM_SYNONYMS displays all synonyms in the database. This view is accessible only to system administrators. This view exists in the PG_CATALOG and SYS schemas.

Table 12-299 ADM_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym The owner of the PUBLIC synonym is PUBLIC.
schema_name	text	Name of the schema to which a synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.27 ADM_TAB_COL_STATISTICS

ADM_TAB_COL_STATISTICS displays column statistics and histogram information extracted from ADM_TAB_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-300 ADM_TAB_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span fewer than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
notes	character varying(99)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.28 ADM_TAB_COLS

ADM_TAB_COLS displays information about table and view columns. Each column of each table and view in the database has a row of data in ADM_TAB_COLS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. The number of rows displayed in this view is the same as that in the ADM_TAB_COLUMNS. Only columns are different.

Table 12-301 ADM_TAB_COLS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(128)	Name of a table or view.
column_name	character varying(128)	Column name.
data_type	character varying(128)	Data type of a column, which can be a user-defined data type.
data_type_mod	character varying(3)	Not supported. The value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	numeric	Length of a column, in bytes.
data_precision	numeric	Precision of the data type. It is valid for the numeric data type and **NULL** for other types.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
data_scale	numeric	Number of decimal places. It is valid for the numeric data type and **0** for other data types.
nullable	character varying(1)	Specifies whether the column can be null. For primary key constraints and NOT NULL constraints, the value is **n**.
column_id	numeric	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. The value is **NO**.
user_stats	character varying(3)	Not supported. The value is **NO**.
avg_col_len	numeric	Average length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
char_length	numeric	Column length (in bytes) which is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported currently. • **B**: varchar, bpchar, and char. • **C**: nvarchar2. • **NULL**: other types.
v80_fmt_image	character varying(3)	Not supported. The value is **NULL**.
data_upgraded	character varying(3)	Not supported. The value is **YES**.
hidden_column	character varying(3)	Not supported. The value is **NULL**.
virtual_column	character varying	Specifies whether a column is a virtual column (a generated column). • **YES**: yes. • **NO**: no.
segment_column_id	numeric	Not supported. The value is **NULL**.
internal_column_id	numeric	Internal sequence number of a column. The value is the same as that of **COLUMN_ID**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI_WIDTH**: equal-width histogram.
qualified_col_name	character varying(64)	Qualified column name, which is the same as **COLUMN_NAME**.
user_generated	character varying(3)	Not supported. The value is **YES**.
default_on_null	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
identity_column	character varying(3)	Not supported. The value is **NULL**.
sensitive_column	character varying(3)	Not supported. The value is **NULL**.
evaluation_edition	character varying(128)	Not supported. The value is **NULL**.
unusable_before	character varying(128)	Not supported. The value is **NULL**.
unusable_beginning	character varying(128)	Not supported. The value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
collated_column_id	numeric	Not supported. The value is **NULL**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.29 ADM_TAB_COLUMNS

ADM_TAB_COLUMNS displays information about the columns of tables and views. Each column of each table and view in the database has a row of data in ADM_TAB_COLUMNS. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-302 ADM_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It is valid for the numeric data type and **NULL** for other types.
data_scale	integer	Number of decimal places. It is valid for the numeric data type and **0** for other data types.
nullable	bpchar	Specifies whether the column can be null. Value range: • **y**: yes. • **n**: no. For primary key constraints and NOT NULL constraints, the value is **n**.
column_id	integer	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes. It is null if no default value left.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_stats	character varying(3)	Not supported. The value is **NO**.
user_stats	character varying(3)	Not supported. The value is **NO**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in the unit of bytes) which is valid only for varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported currently. • **B**: varchar, bpchar, and char. • **C**: nvarchar2. • **NULL**: other types.
v80_fmt_image	character varying(3)	Not supported. The value is **NULL**.
data_upgraded	character varying(3)	Not supported. The value is **YES**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI_WIDTH**: equal-width histogram.
default_on_null	character varying(3)	Not supported. The value is **NULL**.
identity_column	character varying(3)	Not supported. The value is **NULL**.
sensitive_column	character varying(3)	Not supported. The value is **NULL**.
evaluation_edition	character varying(128)	Not supported. The value is **NULL**.
unusable_before	character varying(128)	Not supported. The value is **NULL**.
unusable_beginning	character varying(128)	Not supported. The value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.30 ADM_TAB_COMMENTS

ADM_TAB_COMMENTS displays comments about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-303 ADM_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

12.3.14.31 ADM_TAB_HISTOGRAMS

ADM_TAB_HISTOGRAMS displays the histogram information about all tables and views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-304 ADM_TAB_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to **NULL**.
endpoint_repeat_count	numeric	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. Set it to **SHARED**.

12.3.14.32 ADM_TAB_STATISTICS

ADM_TAB_STATISTICS displays optimizer statistics for all tables in the database. This view exists in the PG_CATALOG and SYS schemas. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

Table 12-305 ADM_TAB_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
partition_position	numeric	Not supported. Set it to **NULL**.
subpartition_name	character varying(128)	Not supported. Set it to **NULL**.
subpartition_position	numeric	Not supported. Set it to **NULL**.
object_type	character varying(12)	Object type. The options are as follows: • **TABLE** • **PARTITION** • **SUBPARTITION**
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Set it to **NULL**.
empty_blocks	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_space	numeric	Not supported. Set it to **NULL**.
chain_cnt	numeric	Not supported. Set it to **NULL**.
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Set it to **NULL**.
num_freelist_blocks	numeric	Not supported. Set it to **NULL**.
avg_cached_blocks	numeric	Not supported. Set it to **NULL**.
avg_cache_hit_ratio	numeric	Not supported. Set it to **NULL**.
im_imcu_count	numeric	Not supported. Set it to **NULL**.
im_block_count	numeric	Not supported. Set it to **NULL**.
im_stat_update_time	timestamp(6) without time zone	Not supported. Set it to **NULL**.
scan_rate	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
stattype_locked	character varying(5)	Not supported. Set it to **NULL**.
stale_stats	character varying(7)	Not supported. Set it to **NULL**.
notes	character varying(25)	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. The default value is **SHARED**.

12.3.14.33 ADM_TAB_STATS_HISTORY

ADM_TAB_STATS_HISTORY provides historical statistics about all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-306 ADM_TAB_STATS_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner
table_name	character varying(128)	Table name
partition_name	character varying(128)	Not supported. Its value is **NULL**.
subpartition_name	character varying(128)	Not supported. Its value is **NULL**.
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

12.3.14.34 ADM_TABLES

ADM_TABLES displays all tables in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in both PG_CATALOG and SYS schemas.

Table 12-307 ADM_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. • **YES**: deleted. • **NO**: not deleted.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. • **VALID**: The current table is valid. • **UNUSABLE**: The current table is unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. ● **Y**: The table is a temporary table. ● **N**: The table is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table. ● **YES**: The table is a partitioned table. ● **NO**: The table is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. ● **ENABLED**: The partition row movement is allowed. ● **DISABLED**: The partition row movement is not allowed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
compression	character varying(8)	Specifies whether to enable a table compression. • **ENABLED**: A table compression is enabled. • **DISABLED**: A table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed. • **NULL**: The table is not a temporary table. • **sys$session**: The table is a temporary session table. • **sys$transaction**: The table is a temporary transaction table.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. • **ENABLED**: Logical replication is enabled. • **DISABLED**: Logical replication is disabled.
external	character varying(3)	Specifies whether the table is a foreign table. • **YES**: The table is a foreign table. • **NO**: The table is not a foreign table.
logging	character varying(3)	Specifies whether to record logs for table changes. • **YES**: Logs are recorded for table changes. • **NO**: Logs are not recorded for table changes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
default_collation	character varying(100)	Default collation of a table. ● default
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. ● **ENABLED**: The table lock is enabled. ● **DISABLED**: The table lock is disabled.
nested	character varying(3)	Specifies whether a table is a nested table. ● **YES**: The table is a nested table. ● **NO**: The table is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. ● **ENABLED**: The corrupted block is skipped. ● **DISABLED**: The corrupted block is not skipped.
has_identity	character varying(3)	Specifies whether a table has an identifier column. ● **YES**: There is an identifier column. ● **NO**: There is no identifier column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
inmemory	character varying(8)	Specifies whether to enable memory column store. • **ENABLED**: Memory column store is enabled. • **DISABLED**: Memory column store is disabled.
segment_created	character varying(3)	Specifies whether a table segment has been created. • **YES**: The table segment has been created. • **NO**: The table segment is not created.
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. • **YES**: The modification of the table is monitored. • **NO**: The modification of the table is not monitored.
cluster_name	character varying(128)	Not supported. The value is **NULL**.
iot_name	character varying(128)	Not supported. The value is **NULL**.
pct_used	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.

12.3.14.35 ADM_TABLESPACES

ADM_TABLESPACES displays information about available tablespaces. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas. The logical structure features of the GaussDB database are different from those of the ORA database.

Table 12-308 ADM_TABLESPACES columns

Name	Type	Description
tablespace_name	character varying(64)	Tablespace name.
block_size	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.

12.3.14.36 ADM_TRIGGERS

ADM_TRIGGERS displays information about triggers in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-309 ADM_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Time when a trigger is triggered. Value range: **before statement**, **before each row**, **after statement**, **after each row**, and **instead of**.
triggering_event	character varying	Event that triggers a trigger. Value range: **update**, **insert**, **delete**, and **truncate**.
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Defines the basic object of a trigger. Its values can be **table** and **view**.
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Its value is **NULL**.
referencing_name	character varying(422)	Not supported. Its value is **referencing new as new old as old**.
when_clause	character varying(4000)	Content of the WHEN clause. **trigger_body** can be executed only when the value is **true**.
status	character varying(64)	Trigger status. • **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports **call**.
trigger_body	text	Statement executed when a trigger is triggered.
crossedition	character varying(7)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
before_statement	character varying(3)	Not supported. Its value is **NULL**.
before_row	character varying(3)	Not supported. Its value is **NULL**.
after_row	character varying(3)	Not supported. Its value is **NULL**.
after_statement	character varying(3)	Not supported. Its value is **NULL**.
instead_of_row	character varying(3)	Not supported. Its value is **NULL**.
fire_once	character varying(3)	Not supported. Its value is **NULL**.
apply_server_only	character varying(3)	Not supported. Its value is **NULL**.

12.3.14.37 ADM_TYPE_ATTRS

ADM_TYPE_ATTRS displays the attributes of the current database object type. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-310 ADM_TYPE_ATTRS columns

Name	Type	Description
owner	oid	Owner of the type
type_name	name	Data type name
attr_name	name	Column name
attr_type_mod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **–1** for types that do not need ATTTYPMOD.
attr_type_owner	oid	Owner of an attribute of this type
attr_type_name	name	Data type attribute name Currently, this column records the type name after conversion.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
length	smallint	Number of bytes in the internal representation of the type for a fixed-size type. It is a negative number for a variable-length type. • The value **-1** indicates a "varlena" type (one that has a length word). • The value **-2** indicates a null-terminated C string.
precision	integer	Precision of the numeric type
scale	integer	Range of the numeric type
character_set_name	character(1)	Character set name of an attribute (**c** or **n**)
attr_no	smallint	Attribute number
inherited	character(1)	Whether the attribute is inherited from the super type (**Y** or **N**)
attr_length	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). The raw type is not recorded due to kernel implementation.

12.3.14.38 ADM_TYPES

ADM_TYPES describes all object types in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-311 ADM_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Its value is **NULL**.
instantiable	character varying(3)	Not supported. Its value is **NULL**.
persistable	character varying(3)	Not supported. Its value is **NULL**.
supertype_owner	character varying(128)	Not supported. Its value is **NULL**.
supertype_name	character varying(128)	Not supported. Its value is **NULL**.
local_attributes	numeric	Not supported. Its value is **NULL**.
local_methods	numeric	Not supported. Its value is **NULL**.
typeid	raw	Not supported. Its value is **NULL**.

12.3.14.39 ADM_VIEWS

ADM_VIEWS displays views in the database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-312 ADM_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of the view.
view_name	character varying(64)	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type_text_length	numeric	Not supported. The value is **NULL**.
type_text	character varying(4000)	Not supported. The value is **NULL**.
oid_text_length	numeric	Not supported. The value is **NULL**.
oid_text	character varying(4000)	Not supported. The value is **NULL**.
view_type_owner	character varying(128)	Not supported. The value is **NULL**.
view_type	character varying(128)	Not supported. The value is **NULL**.
superview_name	character varying(128)	Not supported. The value is **NULL**.
editioning_view	character varying(1)	Not supported. The value is **NULL**.
read_only	character varying(1)	Not supported. The value is **NULL**.
container_data	character varying(1)	Not supported. The value is **NULL**.
bequeath	character varying(12)	Not supported. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **NULL**.
default_collation	character varying(100)	Not supported. The value is **NULL**.
containers_default	character varying(3)	Not supported. The value is **NULL**.
container_map	character varying(3)	Not supported. The value is **NULL**.
extended_data_link	character varying(3)	Not supported. The value is **NULL**.
extended_data_link_map	character varying(3)	Not supported. The value is **NULL**.
has_sensitive_column	character varying(3)	Not supported. The value is **NULL**.
admit_null	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pdb_local_only	character varying(3)	Not supported. The value is **NULL**.

12.3.14.40 DB_ARGUMENTS

DB_ARGUMENTS displays parameter information about stored procedures and functions accessible to the current user. This view exists in both PG_CATALOG and SYS schemas. This view is accessible to all users and displays all information accessible to the current user.

Table 12-313 DB_ARGUMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a function or stored procedure.
object_name	character varying(128)	Name of a function or stored procedure.
package_name	character varying(128)	Not supported. The value is **NULL**.
object_id	oid	OID of a function or stored procedure.
overload	character varying(40)	The *n*th overloaded function of the same name.
subprogram_id	numeric	Not supported. The value is **NULL**.
argument_name	character varying(128)	Parameter name.
position	numeric	Position of the parameter in the parameter list. The value is **0** for the return value of the function by default.
sequence	numeric	Sequence of a parameter, which starts from 1, with the return type before all parameters.
data_level	numeric	Nesting depth of parameters of the composite type. The value of this column is always **0** because only one row is displayed for each parameter.
data_type	character varying(64)	Data type of a parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
defaulted	character varying(1)	Specifies whether a parameter has a default value: • **Y**: yes. • **N**: no
default_value	text	Not supported. The value is **NULL**.
default_length	numeric	Not supported. The value is **NULL**.
in_out	character varying(9)	Input and output attributes of a parameter: The options are as follows: • **IN**: input parameter. • **OUT**: output parameter. • **IN_OUT**: input and output parameters. • **VARIADIC**: VARIADIC parameter.
data_length	numeric	Not supported. The value is **NULL**.
data_precision	numeric	Not supported. The value is **NULL**.
data_scale	numeric	Not supported. The value is **NULL**.
radix	numeric	Radix of a number, which is **10** when the data type is smallint, integer, bigint, numeric, or float. For other data types, set this column to **NULL**.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
type_owner	character varying(128)	Owner of a data type.
type_name	character varying(128)	Parameter type name. Only the user-defined type is displayed.
type_subname	character varying(128)	Not supported. The value is **NULL**.
type_link	character varying(128)	Not supported. The value is **NULL**.
type_object_type	character varying(7)	Types of types of the **type_owner**, **type_name**, and **type_subname** columns: • **TABLE**: The parameter is of the table type. • **VIEW**: The parameter is of the view type. • **NULL**: The parameter is not of the table or view type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pls_type	character varying(128)	Name of the PL/SQL type for parameters of the number type. Otherwise, this column is empty.
char_length	numeric	Not supported. The value is **NULL**.
char_used	character varying(1)	Not supported. • **B**: varchar, nvarchar2, bpchar, and char. • **NULL**: other types.
origin_con_id	character varying(256)	Not supported. The value is **0**.

12.3.14.41 DB_ALL_TABLES

DB_ALL_TABLES displays tables or views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-314 DB_ALL_TABLES columns

Name	Type	Description
owner	name	Owner of a table or view.
table_name	name	Name of a table or view.
tablespace_name	name	Tablespace where a table or view is located.

12.3.14.42 DB_COL_COMMENTS

DB_COL_COMMENTS displays comment information about table columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-315 DB_COL_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.43 DB_COLL_TYPES

DB_COLL_TYPES displays information about collection types that can be accessed by the current user. By default, they are accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-316 DB_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. Set it to **NULL**.
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to **NULL**.
precision	numeric	Not supported. Set it to **NULL**.
scale	numeric	Not supported. Set it to **NULL**.
character_set_name	character varying(44)	Not supported. Set it to **NULL**.
elem_storage	character varying(7)	Not supported. Set it to **NULL**.
nulls_stored	character varying(3)	Not supported. Set it to **NULL**.
char_used	character varying(1)	Not supported. Set it to **NULL**.

12.3.14.44 DB_CONS_COLUMNS

DB_CONS_COLUMNS displays information about constraint columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-317 DB_CONS_COLUMNS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
table_name	character varying(64)	Name of a constraint-related table.
column_name	character varying(64)	Name of a constraint-related column.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

12.3.14.45 DB_CONSTRAINTS

DB_CONSTRAINTS displays information about constraints accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-318 DB_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
owner	character varying(64)	Constraint creator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.46 DB_DEPENDENCIES

DB_DEPENDENCIES displays the dependency relationship between types, tables, views, stored procedures, functions, and triggers accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-319 DB_DEPENDENCIES columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Not supported. Set it to **NULL**.
dependency_type	character varying(4)	Not supported. Set it to **NULL**.

12.3.14.47 DB_IND_COLUMNS

DB_IND_COLUMNS displays all index columns accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-320 DB_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Column length.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
char_length	numeric	Length of a column (character type).
descend	character varying(4)	Sorting mode of a column. The options are as follows: • **DESC**: descending order. • **ASC**: ascending order.
collated_column_id	numeric	Internal serial number of the language sorting columns.

12.3.14.48 DB_IND_EXPRESSIONS

DB_IND_EXPRESSIONS displays information about expression indexes accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-321 DB_IND_EXPRESSIONS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

12.3.14.49 DB_INDEXES

DB_INDEXES displays information about indexes accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-322 DB_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index
uniqueness	text	Specifies whether the index is unique. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.
generated	character varying(1)	Specifies whether the name of the index is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.
index_type	character varying(27)	Index type • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of the index object

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_type	character(11)	Type of an index object • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of the tablespace that contains the index
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported. Its value is **NULL**.
prefix_length	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Not supported. Its value is **NULL**.
max_trans	numeric	Not supported. Its value is **NULL**.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extents	numeric	Not supported. Its value is **NULL**.
max_extents	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
pct_threshold	numeric	Not supported. Its value is **NULL**.
include_column	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
pct_free	numeric	Not supported. Its value is **NULL**.
logging	character varying(3)	Not supported. Its value is **NULL**.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	date	Not supported. Its value is **NULL**.
degree	character varying(40)	Not supported. Its value is **NULL**.
instances	character varying(40)	Not supported. Its value is **NULL**.
temporary	character varying(1)	Not supported. Its value is **NULL**.
secondary	character varying(1)	Not supported. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported. Its value is **NULL**.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
duration	character varying(15)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
ityp_owner	character varying(128)	Not supported. Its value is **NULL**.
ityp_name	character varying(128)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_status	character varying(12)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
funcidx_status	character varying(8)	Not supported. Its value is **NULL**.
join_index	character varying(3)	Not supported. Its value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is **NULL**.
dropped	character varying(3)	Not supported. Its value is **NULL**.
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. • **VISIBLE**: The index is visible to the optimizer. • **INVISIBLE**: The index is visible to the optimizer.
domidx_management	character varying(14)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
segment_created	character varying(3)	Not supported. Its value is **NULL**.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.
indexing	character varying(7)	Not supported. Its value is **NULL**.
auto	character varying(3)	Not supported. Its value is **NULL**.

12.3.14.50 DB_OBJECTS

DB_OBJECTS displays all database objects accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-323 DB_OBJECTS columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.
object_id	oid	OID of the object.
object_type	name	Object type.
namespace	oid	ID of the namespace where an object resides.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status. • **valid**: The object is valid. • **invalid**: The object is invalid.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last time when an object was modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Its value is **NULL**.
timestamp	character varying(19)	Not supported. Its value is **NULL**.
secondary	character varying(1)	Not supported. Its value is **NULL**.
edition_name	character varying(128)	Not supported. Its value is **NULL**.
sharing	character varying(18)	Not supported. Its value is **NULL**.
editionable	character varying(1)	Not supported. Its value is **NULL**.
oracle_maintained	character varying(1)	Not supported. Its value is **NULL**.
application	character varying(1)	Not supported. Its value is **NULL**.
duplicated	character varying(1)	Not supported. Its value is **NULL**.
sharded	character varying(1)	Not supported. Its value is **NULL**.
created_appid	numeric	Not supported. Its value is **NULL**.
modified_appid	numeric	Not supported. Its value is **NULL**.
created_vsnid	numeric	Not supported. Its value is **NULL**.
modified_vsnid	numeric	Not supported. Its value is **NULL**.

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

12.3.14.51 DB_PROCEDURES

DB_PROCEDURES displays information about all stored procedures or functions accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-324 DB_PROCEDURES columns

Name	Type	Description
owner	name	Object owner.
object_name	name	Object name.

12.3.14.52 DB_SCHEDULER_JOB_ARGS

DB_SCHEDULER_JOB_ARG displays the parameters related to the tasks accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-325 DB_SCHEDULER_JOB_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the job to which the parameter belongs.
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.14.53 DB_SCHEDULER_PROGRAM_ARGS

DB_SCHEDULER_PROGRAM_ARG displays the parameters related to the programs accessible to the current user. This view is accessible to all users and displays all information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-326 DB_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
owner	character varying(128)	Owner of the program to which the parameter belongs.
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
metadata_attribute	character varying(19)	Not supported. Set it to **NULL**.
default_value	character varying(4000)	Default parameter value.
anydata_default_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.14.54 DB_SEQUENCES

DB_SEQUENCES displays all sequences accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 12-327 DB_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Value by which a sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cyclic sequence. Value range: • **Y**: It is a cycle sequence. • **N**: It is not a cycle sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. Not supported. The value is **NULL**.
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Last value of the sequence allocated in a batch from the GTM at a time.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. Not supported. The value is **NULL**.
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. The value is **NULL**.
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. The value is **NULL**.
session_flag	character varying(1)	Specifies whether a sequence is a private session. Not supported. The value is **NULL**.
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported. The value is **NULL**.

12.3.14.55 DB_SOURCE

DB_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-328 DB_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be **function**, **procedure**, or **trigger**.
line	numeric	Number of the source line.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Set it to **0**.

12.3.14.56 DB_SYNONYMS

DB_SYNONYMS displays all synonyms accessible to the current user.

Table 12-329 DB_SYNONYMS columns

Name	Type	Description
owner	text	Owner of a synonym. The owner of the PUBLIC synonym is PUBLIC.
schema_name	text	Name of the schema to which the synonym belongs. The name of the schema to which the PUBLIC synonym belongs is NULL.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.57 DB_TAB_COL_STATISTICS

DB_TAB_COL_STATISTICS displays column statistics and histogram information extracted from DB_TAB_COLUMNS. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-330 DB_TAB_COL_STATISTICS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span fewer than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/ NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
sample_size	numeric	Sample size used to analyze a column.
last_analyzed	timestamp(0) without time zone	Date when a column was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
notes	character varying(99)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI-WIDTH**: equal-width histogram.
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.58 DB_TAB_COLUMNS

DB_TAB_COLUMNS displays description information about columns of tables and views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas. This view is accessible to all users and displays all information accessible to the current user.

Table 12-331 DB_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. The value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It is valid for the numeric data type and **NULL** for other types.
data_scale	integer	Number of decimal places. It is valid for the numeric data type and **0** for other data types.
nullable	bpchar	Specifies whether the column can be null. The options are as follows: • **y**: yes. • **n**: no. For primary key constraints and NOT NULL constraints, the value is **n**.
column_id	integer	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. The value is **NO**.
user_stats	character varying(3)	Not supported. The value is **NO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Column length (in the unit of bytes) which is valid only for varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **B** for the varchar, bpchar, or char data type. Set it to **C** for the nvarchar2 data type. For other data types, set it to **NULL**.
v80_fmt_image	character varying(3)	Not supported. The value is **NULL**.
data_upgraded	character varying(3)	Not supported. The value is **YES**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram. • **NONE**: no histogram. • **FREQUENCY**: frequency histogram. • **EQUI_WIDTH**: equal-width histogram.
default_on_null	character varying(3)	Not supported. The value is **NULL**.
identity_column	character varying(3)	Not supported. The value is **NULL**.
evaluation_edition	character varying(128)	Not supported. The value is **NULL**.
unusable_before	character varying(128)	Not supported. The value is **NULL**.
unusable_beginning	character varying(128)	Not supported. The value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.59 DB_TAB_COMMENTS

DB_TAB_COMMENTS displays comments about all tables and views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-332 DB_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Owner of a table or view.
table_name	character varying(128)	Name of a table or view.
table_type	character varying(11)	Object type.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to **0**.
schema	character varying(64)	Name of the namespace to which the table belongs.

12.3.14.60 DB_TAB_HISTOGRAMS

DB_TAB_HISTOGRAMS displays histogram statistics about the tables and views accessible to the current user, that is, the distribution of data in each column of the table. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-333 DB_TAB_HISTOGRAMS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to **NULL**.
endpoint_repeat_count	numeric	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. Set it to **SHARED**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.61 DB_TAB_MODIFICATIONS

DB_TAB_MODIFICATIONS displays statistics about modifications to tables accessible to the current user since the last statistics collection on the tables. Currently, this view displays only the statistics data of tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-334 DB_TAB_MODIFICATIONS columns

Name	Type	Description
table_owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.
subpartition_name	character varying(128)	Subpartition name.
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.
timestamp	date	Last modification time. Currently, the modification time of a partitioned table is not supported. The value is **NULL**.
truncated	character varying(3)	Not supported. Its value is **NULL**.
drop_segments	numeric	Not supported. Its value is **NULL**.
schema_name	character varying(128)	Name of the schema to which the table belongs.

12.3.14.62 DB_TAB_STATS_HISTORY

DB_TAB_STATS_HISTORY records the tables, partitions, or subpartitions involved in table statistics and the time when table statistics are collected. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-335 DB_TAB_STATS_HISTORY columns

Name	Type	Description
owner	character varying(128)	Object owner.
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
subpartition_name	character varying(128)	Not supported. Set it to **NULL**.
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

12.3.14.63 DB_TABLES

DB_TABLES displays all tables accessible to the current user. This view exists in both PG_CATALOG and SYS schemas.

Table 12-336 DB_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. • **YES**: deleted. • **NO**: not deleted.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. • **VALID**: The current table is valid. • **UNUSABLE**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
temporary	character(1)	Specifies whether the table is a temporary table. • **Y**: The table is a temporary table. • **N**: The table is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table. • **YES**: The table is a partitioned table. • **NO**: The table is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.
row_movement	character varying(8)	Specifies whether to allow partition row movement. • **ENABLED**: The partition row movement is allowed. • **DISABLED**: The partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable a table compression. • **ENABLED**: A table compression is enabled. • **DISABLED**: A table compression is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
duration	character varying(15)	Time elapsed when a temporary table is processed. • **NULL**: The table is not a temporary table. • **sys$session**: The table is a temporary session table. • **sys$transaction**: The table is a temporary transaction table.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. • **ENABLED**: Logical replication is enabled. • **DISABLED**: Logical replication is disabled.
external	character varying(3)	Specifies whether the table is a foreign table. • **YES**: The table is a foreign table. • **NO**: The table is not a foreign table.
logging	character varying(3)	Specifies whether to record logs for table changes. • **YES**: Logs are recorded for table changes. • **NO**: Logs are not recorded for table changes.
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.
table_lock	character varying(8)	Specifies whether to enable a table lock. • **ENABLED**: The table lock is enabled. • **DISABLED**: The table lock is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
nested	character varying(3)	Specifies whether a table is a nested table. • **YES**: The table is a nested table. • **NO**: The table is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. • **ENABLED**: The corrupted block is skipped. • **DISABLED**: The corrupted block is not skipped.
has_identity	character varying(3)	Specifies whether a table has an identifier column. • **YES**: There is an identifier column. • **NO**: There is no identifier column.
inmemory	character varying(8)	Specifies whether to enable memory column store. • **ENABLED**: Memory column store is enabled. • **DISABLED**: Memory column store is disabled.
segment_created	character varying(3)	Specifies whether a table segment has been created. • **YES**: The table segment has been created. • **NO**: The table segment is not created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. • **YES**: The modification of the table is monitored. • **NO**: The modification of the table is not monitored.
cluster_name	character varying(128)	Not supported. The value is **NULL**.
iot_name	character varying(128)	Not supported. The value is **NULL**.
pct_used	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.

compress_for	character varying(30)	Not supported. The value is **NULL**.

12.3.14.64 DB_TRIGGERS

DB_TRIGGERS displays information about triggers accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-337 DB_TRIGGERS columns

Name	Type	Description
trigger_name	character varying(64)	Trigger name.
table_name	character varying(64)	Relational table name.
table_owner	character varying(64)	Role name.
status	character varying(64)	Trigger status. • **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.

12.3.14.65 DB_TYPES

DB_TYPES displays all object types accessible to the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-338 DB_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of the type.
type_name	character varying(128)	Type name.
type_oid	raw	Type OID.
typecode	character varying(128)	Type code.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. The value is **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is an incomplete type.
final	character varying(3)	Not supported. Its value is **NULL**.
instantiable	character varying(3)	Not supported. Its value is **NULL**.
persistable	character varying(3)	Not supported. Its value is **NULL**.
supertype_owner	character varying(128)	Not supported. Its value is **NULL**.
supertype_name	character varying(128)	Not supported. Its value is **NULL**.
local_attributes	numeric	Not supported. Its value is **NULL**.
local_methods	numeric	Not supported. Its value is **NULL**.
typeid	raw	Not supported. Its value is **NULL**.

12.3.14.66 DB_VIEWS

DB_VIEWS displays the description about all views accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-339 DB_VIEWS columns

Name	Type	Description
owner	name	Owner of the view.
view_name	name	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.
type_text_length	numeric	Not supported. The value is **NULL**.
type_text	character varying(4000)	Not supported. The value is **NULL**.
oid_text_length	numeric	Not supported. The value is **NULL**.
oid_text	character varying(4000)	Not supported. The value is **NULL**.
view_type_owner	character varying(128)	Not supported. The value is **NULL**.
view_type	character varying(128)	Not supported. The value is **NULL**.
superview_name	character varying(128)	Not supported. The value is **NULL**.
editioning_view	character varying(1)	Not supported. The value is **NULL**.
read_only	character varying(1)	Not supported. The value is **NULL**.
container_data	character varying(1)	Not supported. The value is **NULL**.
bequeath	character varying(12)	Not supported. The value is **NULL**.
origin_con_id	character varying(256)	Not supported. The value is **NULL**.
default_collation	character varying(100)	Not supported. The value is **NULL**.
containers_default	character varying(3)	Not supported. The value is **NULL**.
container_map	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
extended_data_link	character varying(3)	Not supported. The value is **NULL**.
extended_data_link_map	character varying(3)	Not supported. The value is **NULL**.
has_sensitive_column	character varying(3)	Not supported. The value is **NULL**.
admit_null	character varying(3)	Not supported. The value is **NULL**.
pdb_local_only	character varying(3)	Not supported. The value is **NULL**.

12.3.14.67 DICT

DICT displays the description of data dictionary tables and system views in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-340 DICT columns

Name	Type	Description
table_name	character varying(64)	Object name.
comments	character varying(4000)	Comment on an object.

12.3.14.68 DICTIONARY

DICTIONARY displays the description of data dictionary tables and system views in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-341 DICTIONARY columns

Name	Type	Description
table_name	character varying(64)	Object name.
comments	character varying(4000)	Comment on an object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.69 DUAL

DUAL is automatically created by the database based on the data dictionary and is used to save expression calculation results. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-342 DUAL columns

Name	Type	Description
DUMMY	text	Expression calculation result.

12.3.14.70 DV_SESSIONS

DV_SESSIONS displays information about all active backend threads. By default, only the system administrator can access this view. Common users can access the view only after being authorized.

Table 12-343 DV_SESSIONS columns

Name	Type	Description
sid	bigint	OID of the active backend thread of the current session.
serial#	integer	Sequence number of the active backend thread, which is **0** in GaussDB.
user#	oid	OID of the user who has logged in to the backend thread. The OID is **0** if the backend thread is a global auxiliary thread.
username	name	Name of the user logged in to the backend process. **username** is null if the backend thread is a global auxiliary thread. **application_name** can be identified by associating with **pg_stat_get_activity()**. Example: `SELECT s.*,a.application_name FROM DV_SESSIONS AS s LEFT JOIN pg_stat_get_activity(NULL) AS a ON s.sid=a.sessionid;`

12.3.14.71 DV_SESSION_LONGOPS

DV_SESSION_LONGOPS displays the progress of ongoing operations. Users can access this view only after being authorized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-344 DV_SESSION_LONGOPS columns

Name	Type	Description
sid	bigint	OID of the running backend thread.
serial#	integer	Sequence number of the running backend thread, which is **0** in GaussDB.
sofar	integer	Completed workload, which is empty in GaussDB
totalwork	integer	Total workload, which is empty in GaussDB

12.3.14.72 GET_GLOBAL_PREPARED_XACTS

GET_GLOBAL_PREPARED_XACTS displays prepared transactions on all nodes globally.

Table 12-345 GET_GLOBAL_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	XID of a prepared transaction
gid	text	GID of the prepared transaction
prepared	timestamp with time zone	Prepared time of the prepared transaction.
owner	name	Owner of the prepared transaction.
database	name	Database to which the prepared transaction belongs.
node_name	text	Name of the node where the prepared transaction resides

12.3.14.73 GLOBAL_BAD_BLOCK_INFO

GLOBAL_BAD_BLOCK_INFO is executed on the CN to collect statistics on damaged data pages of all instances. The queried result displays basic information about damaged pages. The execution result on the DN is empty. Based on the information, you can use the page detection and repair function in **Data Damage Detection and Repair Functions** to perform further repair operations. By default, only the initial user, users with the SYSADMIN permission, users with the OPRADMIN permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-346 GLOBAL_BAD_BLOCK_INFO columns

Name	Type	Description
node_name	text	Node information of the damaged page.
spc_node	oid	ID of the tablespace corresponding to the damaged page.
db_node	oid	ID of the database corresponding to the damaged page.
rel_node	oid	relfilenode of the relation corresponding to the damaged page.
bucket_node	integer	Bucket node of the damaged page. This column is used to specify whether a table is a segment-page table during repair. ● **-1**: non-segment page table. ● Non-zero value: segment-page table.
block_num	oid	Number of the damaged page.
fork_num	integer	File forknum of the damaged page.
file_path	text	Relative path of the damaged page. The logical path instead of the actual file is displayed for a segment-page table.
check_time	timestamp with time zone	Time when a fault is detected on the damaged page.
repair_time	timestamp with time zone	Time when the damaged page is repaired.

12.3.14.74 GLOBAL_CLEAR_BAD_BLOCK_INFO

GLOBAL_CLEAR_BAD_BLOCK_INFO is executed on the CN to clear information about repaired pages in all instances. The execution result on DNs is empty. By default, only the initial user, users with the ADMIN permission, users with the OPRADMIN permission in the O&M mode, and monitoring users can view the information. Other users can view the information only after being granted with permissions.

Table 12-347 GLOBAL_BAD_BLOCK_INFO columns

Name	Type	Description
node_name	text	Information about the node for clearing repaired pages.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
result	boolean	Execution result of clearing repaired pages of the current instance.

12.3.14.75 GLOBAL_SQL_PATCH

GLOBAL_SQL_PATCH stores information about all SQL patches. This view is available only in the PG_CATALOG schema.

Table 12-348 GLOBAL_SQL_PATCH columns

Name	Type	Description
node_name	text	Name of the node where the SQL PATCH is located.
patch_name	name	Name of the SQL PATCH.
unique_sql_id	bigint	Global unique query ID.
owner	oid	ID of the user created using the SQL PATCH.
enable	boolean	Specifies whether the SQL patch takes effect.
status	"char"	SQL patch status (reserved column).
abort	boolean	Specifies whether a hint is discarded.
hint_string	text	Hint text.
description	text	SQL patch description.
parent_unique_sql_id	bigint	Globally unique ID of the outer statement of the SQL statement for which SQL patch takes effect. • Its value is **0** for statements outside the stored procedure. • For a statement within a stored procedure, the value is the globally unique ID of the statement that calls the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.76 GLOBAL_STAT_HOTKEYS_INFO

GLOBAL_STAT_HOTKEYS_INFO queries the statistics of hotspot keys in the entire cluster. The query results are sorted by **count** in descending order.

Table 12-349 GLOBAL_STAT_HOTKEYS_INFO columns

Name	Type	Description
database_name	text	Name of the database where the hot key is located.
schema_name	text	Name of the mode where the hotspot key is located.
table_name	text	Name of the table where the hotspot key is located.
key_value	text	Value of the hotspot key
hash_value	bigint	Hash value of the hotspot key in the database. If the table is a list or range distributed table, the value of this column is **0**.
count	numeric	Frequency of accessing the hotspot key.

12.3.14.77 GLOBAL_WAL_SENDER_STATUS

GLOBAL_WAL_SENDER_STATUS displays the redo log transfer and replay status of the primary DN in the current cluster. Only the user with the SYSADMIN or MONADMIN permission can query this view.

Table 12-350 GLOBAL_WAL_SENDER_STATUS columns

Name	Type	Description
nodename	text	Name of the primary node
source_ip	text	IP address of the primary node
source_port	integer	Port of the primary node
dest_ip	text	IP address of the standby node
dest_port	integer	Port of the standby node
sender_pid	integer	PID of the sending thread

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
local_role	text	Type of the primary node • **UNKNOWN_MODE**: The status is unknown. • **NORMAL_MODE**: single-host node type. • **PRIMARY_MODE**: The node is a primary node. • **STANDBY_MODE**: The node is a standby node. • **CASCADE_STANDBY_MODE**: The node is a cascaded standby node. • **PENDING_MODE**: The node is in the arbitration phase. • **RECOVERY_MODE**: The node is in the restoration phase. • **STANDBY_CLUSTER_MODE**: The node is a standby cluster node. • **MAIN_STANDBY_MODE**: main standby cluster node. **NOTE** The expected values of the primary node type are **NORMAL_MODE**, **PRIMARY_MODE**, **PENDING_MODE**, and **RECOVERY_MODE**. Contact Huawei technical support if other node types are displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
peer_role	text	Type of the standby node • **UNKNOWN_MODE**: The status is unknown. • **NORMAL_MODE**: single-host node type. • **PRIMARY_MODE**: The node is a primary node. • **STANDBY_MODE**: The node is a standby node. • **CASCADE_STANDBY_MODE**: The node is a cascaded standby node. • **PENDING_MODE**: The node is in the arbitration phase. • **RECOVERY_MODE**: The node is in the restoration phase. • **STANDBY_CLUSTER_MODE**: The node is a standby cluster node. • **MAIN_STANDBY_MODE**: main standby cluster node. **NOTE** The expected values of the standby node type are **NORMAL_MODE**, **STANDBY_MODE**, **CASCADE_STANDBY_MODE**, **PENDING_MODE**, **RECOVERY_MODE**, **STANDBY_CLUSTER_MODE**, and **MAIN_STANDBY_MODE**. If other node types are displayed, contact Huawei technical support.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
peer_state	text	Status of the standby node • **UNKNOWN_STATE**: The node status is unknown. • **NORMAL_STATE**: The node is started properly. • **NEEDREPAIR_STATE**: The current node needs to be repaired. • **STARTING_STATE**: The node is being started. • **WAITING_STATE**: The node is waiting to be upgraded. • **DEMOTING_STATE**: The node is being downgraded. • **PROMOTING_STATE**: The standby node is being upgraded to the primary node. • **BUILDING_STATE**: The standby node fails to be started and needs to be rebuilt. • **CATCHUP_STATE**: The standby node is catching up with the primary node. • **COREDUMP_STATE**: The node breaks down.
state	text	WAL sender status • **WALSNDSTATE_STARTUP**: startup state. • **WALSNDSTATE_BACKUP**: backup state. • **WALSNDSTATE_CATCHUP**: catch-up state. • **WALSNDSTATE_STREAMING**: streaming replication state.
sender_sent_location	text	Sending position of the primary node
sender_write_location	text	Writing position of the primary node
sender_flush_location	text	Location where the master node writes the cache to the disk.
sender_replay_location	text	Redo position of the primary node
receiver_received_location	text	Receiving position of the standby node
receiver_write_location	text	Writing position of the standby node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
receiver_flush_location	text	Location where the standby node writes the cache to the disk.
receiver_replay_location	text	Redo location of the standby node

12.3.14.78 GS_ALL_CONTROL_GROUP_INFO

GS_ALL_CONTROL_GROUP_INFO displays all Cgroup information in a database.

Table 12-351 GS_ALL_CONTROL_GROUP_INFO columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type. • **GROUP_NONE**: no group. • **GROUP_TOP**: top group. • **GROUP_CLASS**: Class Cgroup, which does not control any thread. • **GROUP_BAKWD**: backend thread Cgroup. • **GROUP_DEFWD**: default control group, which controls only the query threads at this level. • **GROUP_TSWD**: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	**Class** Cgroup.
workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	**Workload** Cgroup level.
cpucores	text	Usage of CPU cores in the Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.79 GS_ALL_PREPARED_STATEMENTS

GS_ALL_PREPARED_STATEMENTS displays information about prepared statements that are available in all sessions. This view is accessible only to system administrators.

Table 12-352 GS_ALL_PREPARED_STATEMENTS columns

Name	Type	Description
pid	bigint	Backend thread ID. **NOTE** In thread pool mode, **pid** indicates the ID of the thread bound to the current session. When a session is executed on different threads, **pid** changes accordingly. In thread pool mode, statements are associated with **sessionid** but not **pid**. You are advised to use **sessionid** for associated query.
sessionid	bigint	Current session ID.
global_sessionid	text	Global session ID.
name	text	Identifier of the prepared statement.
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created.
parameter_types	regtype[]	Expected parameter type of the prepared statement in the form of a regtype array. The OID corresponding to this array can be obtained by converting the regtype value.
from_sql	boolean	• **True** if the prepared statement was created through the PREPARE statement. • **False** if the statement was prepared through the frontend/backend protocol.

12.3.14.80 GS_BUCKET_LOCKS

GS_BUCKET_LOCKS displays information about locks held by open transactions. Only CNs in distributed mode can be queried.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-353 GS_BUCKET_LOCKS columns

Name	Type	Reference	Description
node_name	text	-	Node name.
database	oid	OID in PG_DATABASE	OID of the database in which the locked target exists.
virtualtransaction	text	-	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	-	ID of the session that holds or waits for the lock.
modegs_seg_segments	text	-	Lock mode held or desired by this thread. The options are **AccessShareLock** and **AccessExclusiveLock**.
granted	boolean	-	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	-	The value is **TRUE** if the lock is obtained through fast-path. The value is **FALSE** if the lock is obtained through library-level lock information or two-phase commit.
global_sessionid	text	-	Global session ID.
bucketlist	text	-	List of locked buckets.
bucket_group	smallint	-	Bucket group to which the locked bucket belongs.

12.3.14.81 GS_GET_CONTROL_GROUP_INFO

GS_GET_CONTROL_GROUP_INFO displays information about all Cgroups. This view is accessible only to system administrators.

Table 12-354 GS_GET_CONTROL_GROUP_INFO columns

Name	Type	Description
group_name	text	Name of a Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
group_type	text	Type of the Cgroup. • **GROUP_NONE**: no group. • **GROUP_TOP**: top group. • **GROUP_CLASS**: class Cgroup, which does not control any thread. • **GROUP_BAKWD**: backend thread Cgroup. • **GROUP_DEFWD**: default Cgroup, which controls only the query threads at this level. • **GROUP_TSWD**: time-sharing Cgroup of each user, which controls the query threads at the bottom layer.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	**Class** Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to the Cgroup.
limits	bigint	Limit of CPUs allocated to the Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in the Cgroup.
nodegroup	text	Node group name.
group_kind	text	Node group type. The value must be one of the following: • **i**: installation node group • **n**: node group in a common cluster. • **e**: elastic cluster

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.82 GS_GLOBAL_ARCHIVE_STATUS

GS_GLOBAL_ARCHIVE_STATUS describes the archiving progress of CNs and all shards, including the shard name (**node_name**), archiving location (**restart_lsn**), name of the primary or standby node (**archive_node**), and current log location (**current_xlog_location**). To query this view, you need to enable the archiving function of the database and query the view from the CN. The monitor admin and sysadmin permissions are required. For details about the columns, see **Table 12-355**.

Table 12-355 GS_GLOBAL_ARCHIVE_STATUS columns

Name	Type	Description
node_name	text	Shard name.
restart_lsn	text	Archiving location.
archive_node	text	Name of the primary or standby node where archiving is performed.
current_xlog_location	text	Current log position.

12.3.14.83 GS_GSC_MEMORY_DETAIL

GS_GSC_MEMORY_DETAIL displays the global SysCache memory usage of the current process on the current node. The data is displayed only when Global SysCache is enabled.

Note that the query is separated by the database memory context. Therefore, some memory statistics are missing. The memory context corresponding to the missing memory statistics is **GlobalSysDBCache**.

Table 12-356 GS_GSC_MEMORY_DETAIL columns

Name	Type	Description
db_id	text	Database ID.
totalsize	numeric	Total size of the shared memory, in bytes.
freesize	numeric	Remaining size of the shared memory, in bytes.
usedsize	numeric	Used size of the shared memory, in bytes.

12.3.14.84 GS_IMCU_SLOT_STATUS

GS_IMCU_SLOT_STATUS displays the cache slot information of the IMCU in the IMCV table in the database. This view exists in both PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The HTAP feature does not support the distributed mode, and **enable_htap** cannot be set to **on** in the distributed mode. Therefore, no information is displayed when you query this system view.

Table 12-357 GS_IMCU_SLOT_STATUS columns

Name	Type	Description
reloid	oid	Table ID.
cu_id	integer	IMCU ID.
col_id	integer	Column ID of the IMCU.
slot_id	integer	Slot ID of the cache.
block_size	integer	IMCU size, in bytes.
flag	char	Idle or occupied.

12.3.14.85 GS_IMCV_STATUS

GS_IMCV_STATUS displays the status information in the IMCV catalog in the database. This view exists in both PG_CATALOG and SYS schemas.

The HTAP feature does not support the distributed mode, and **enable_htap** cannot be set to **on** in the distributed mode. Therefore, no information is displayed when you query this system view.

Table 12-358 GS_IMCV_STATUS columns

Name	Type	Description
reloid	oid	Table ID.
relname	name	Table name.
dbname	name	Database name.
username	name	Username.
parentoid	oid	Parent table ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
imcvstatus	char	IMCV table status: • **I**: POPULATE_STAT_INIT (initiate). • **L**: POPULATE_STAT_LOAD_START (start loading). • **M**: POPULATE_STAT_LOAD_META_DONE (load metadata). • **F**: POPULATE_STAT_LOAD_FINISH (loading completed). • **D**: POPULATE_STAT_DROP (deleted). • **E**: POPULATE_STAT_ERROR (abnormal).
imcvnattr	smallint	Number of loaded columns.
imcvkey	int2vector	Array of loaded columns.
priority	smallint	Loading priority.
rowgroup_num	integer	Number of loaded row groups.
cu_num_in_mem	integer	Number of IMCUs in the memory.
cu_mem_size	bigint	Memory occupied by IMCU, in bytes.
cu_num_in_disk	integer	Not supported. The value is **0**.
cu_disk_size	bigint	Not supported. The value is **0**.

12.3.14.86 GS_LOGICALSTANDBY_SKIP

GS_LOGICALSTANDBY_SKIP displays the defined skip rules. When **skiptype** is set to **1** or **3** (for details, see **GS_SQLAPPLY_SKIP**), the following columns are obtained from the system catalog GS_SQLAPPLY_SKIP to create or update the system view. The view is empty and reserved in distributed scenarios.

Table 12-359 GS_LOGICALSTANDBY_SKIP columns

Name	Type	Description
createtime	timestamp	SKIP definition time.
error	bool	Specifies whether it is triggered only if an error occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dump	char	Dump type.
stmt	text	SKIP statement or KEYWORD.
dbname	name	Database name.
schemaname	name	Schema name.
objectname	name	Object name.

12.3.14.87 GS_LOGICALSTANDBY_SKIP_TRANSACTION

GS_LOGICALSTANDBY_SKIP_TRANSACTION displays the defined SKIP rules. When **skiptype** is set to **2** (for details, see **GS_SQLAPPLY_SKIP**), the following columns are obtained from the system catalog GS_SQLAPPLY_SKIP to create or update the system view. The view is empty and reserved in distributed scenarios.

Table 12-360 GS_LOGICALSTANDBY_SKIP_TRANSACTION columns

Name	Type	Attributes
createtime	timestamp	SKIP definition time.
dumpcontext	char	Dump type.
commitcsn	text	Transaction CSN.
xid	xid	Transaction ID.

12.3.14.88 GS_LSC_MEMORY_DETAIL

GS_LSC_MEMORY_DETAIL displays the memory usage of the local system cache of all threads based on the MemoryContext node. The data is displayed only when Global SysCache is enabled.

Table 12-361 GS_LSC_MEMORY_DETAIL columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: *timestamp.sessionid*).
tid	bigint	Thread ID.
thrdtype	text	Thread type. It can be any thread type in the system, such as postgresql and wlmmonitor.
contextname	text	Name of the memory context.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Total size of used memory in the memory context, in bytes.

12.3.14.89 GS_MY_PLAN_TRACE

GS_MY_PLAN_TRACE is a view of the GS_PLAN_TRACE system catalog. This view displays the plan traces of the current user. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

Table 12-362 GS_MY_PLAN_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.
query	text	SQL statement of the current request. The value of this column cannot exceed the value of **track_activity_query_size**.
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.
plan	text	Query plan text corresponding to the SQL statement of the current request. The size of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

12.3.14.90 GS_SESSION_ALL_SETTINGS

GS_SESSION_ALL_SETTINGS displays the full GUC parameter settings of all sessions on the local node. Only the **sysadmin** and **monadmin** users have the permission to view this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-363 GS_SESSION_ALL_SETTINGS columns

Name	Type	Description
sessionid	bigint	Session ID.
pid	bigint	Backend thread ID.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of a parameter.

12.3.14.91 GS_SQL_COUNT

GS_SQL_COUNT displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) on the current node of the database. For details about the columns, see **Table 12-364**.

- When a common user queries the GS_SQL_COUNT view, statistics about the current node of the user are displayed. When an administrator queries the GS_SQL_COUNT view, statistics about the current node of all users are displayed.
- When the cluster or node is restarted, the statistics are cleared and will be measured again.
- The system counts when a node receives a query, including a query inside the cluster. For example, when a CN receives a query and distributes multiple queries to DNs, the queries are counted accordingly on the DNs.

Table 12-364 GS_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name.
user_name	name	Username.
select_count	bigint	Statistical result of the SELECT statement.
update_count	bigint	Statistical result of the UPDATE statement.
insert_count	bigint	Statistical result of the INSERT statement.
delete_count	bigint	Statistical result of the DELETE statement.
mergeinto_count	bigint	Statistical result of the MERGE INTO statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ddl_count	bigint	Number of DDL statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including TRUNCATE, VACUUM, ANALYZE, and CREATE (excluding CREATE ROLE and CREATE USER), DROP (excluding DROP ROLE and DROP USER), and ALTER (excluding ALTER ROLE, ALTER USER, and ALTER DEFAULT PRIVILEGES), REINDEX, and COMMENT statements.
dml_count	bigint	Number of DML statements. The statistics include the SQL statements executed by users and the SQL statements executed by database background threads, including UPDATE, INSERT, DELETE, MERGE, PREPARE, EXPLAIN, SHOW, LOCK, COPY, CLUSTER, ANONYMOUS, DELTA, EXECUTE, MOVE, FETCH, CLOSE, DEALLOCATE, DECLARE and LOAD statements.
dcl_count	bigint	Number of DCL statements. The statistics include the SQL statements executed by users and database background threads, including CREATE ROLE, CREATE USER, DROP ROLE, DROP USER, ALTER ROLE, ALTER USER, ALTER DEFAULT PRIVILEGES, GRANT, REVOKE, REASSIGN, and SET statements.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.
user_dml_count	bigint	Number of DML statements executed by users.
bg_dml_count	bigint	Number of DML statements executed by the database backend thread.

12.3.14.92 GS_TOTAL_NODEGROUP_MEMORY_DETAIL

GS_TOTAL_NODEGROUP_MEMORY_DETAIL returns the memory usage (in MB) of the current node group of the database. If the GUC parameter **enable_memory_limit** is set to **off**, this view is unavailable. For details about the columns, see **Table 12-365**.

Table 12-365 GS_TOTAL_NODEGROUP_MEMORY_DETAIL columns

Name	Type	Description
ngname	text	Node group name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory type. The value must be one of the following: • **ng_total_memory**: total memory size of the node group. • **ng_used_memory**: memory used by the node group. • **ng_estimate_memory**: estimated memory used by the node group. • **ng_foreignrp_memsize**: total memory of the external resource pool of the node group. • **ng_foreignrp_usedsize**: memory used by the external resource pool of the node group. • **ng_foreignrp_peaksize**: peak memory used by the external resource pool of the node group. • **ng_foreignrp_mempct**: percentage of the external resource pool of the node group to the total memory of the node group. • **ng_foreignrp_estmsize**: estimated memory used by the external resource pool of the node group.
memorymbytes	integer	Size of allocated memory-typed memory.

12.3.14.93 GS_WORKLOAD_RULE_STAT

GS_WORKLOAD_RULE_STAT displays information about SQL concurrency control rules. Only the user with the SYSADMIN permission can query this view. For details about the columns, see **Table 12-366**.

Table 12-366 GS_WORKLOAD_RULE_STAT columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID.
rule_name	name	Name of a concurrency control rule, which is used to search for the concurrency control rule.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is **NULL**, the concurrency control rules take effect for all databases.
rule_type	text	Concurrency control rule type. Currently, only **"sqlid"**, **"select"**, **"insert"**, **"update"**, **"delete"**, **"merge"**, and **"resource"** are supported. Other values are invalid.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value **NULL** indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value **NULL** indicates that the rules are always effective.
max_workload	bigint	Maximum number of concurrent rule settings.
option_val	text[]	Parameter values of a concurrency control rule, including SQL ID, keyword list, and resource restriction. For details, see the description of the **gs_add_workload_rule(rule_type, rule_name, databases, start_time, end_time, max_workload, option_val)** API.
is_valid	Boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to **false**.
validate_count	bigint	Number of SQL statements intercepted by the concurrency control rule.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.94 GV_INSTANCE

GV_INSTANCE displays information about the current database instance. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the PG_CATALOG and SYS schemas.

Table 12-367 GV_INSTANCE columns

Name	Type	Description
inst_id	oid	OID of the current database.
instance_number	oid	OID of the current database.
instance_name	character varying(16)	Name of the current database.
host_name	character varying(64)	Not supported. Set it to **NULL**.
version	character varying(17)	Not supported. Set it to **NULL**.
version_legacy	character varying(17)	Not supported. Set it to **NULL**.
version_full	character varying(17)	Not supported. Set it to **NULL**.
startup_time	date	Not supported. Set it to **NULL**.
status	character varying(12)	Not supported. Set it to **NULL**.
parallel	character varying(3)	Not supported. Set it to **NULL**.
thread#	numeric	Not supported. Set it to **NULL**.
archiver	character varying(7)	Not supported. Set it to **NULL**.
log_switch_wait	character varying(15)	Not supported. Set it to **NULL**.
logins	character varying(10)	Not supported. Set it to **NULL**.
shutdown_pending	character varying(3)	Not supported. Set it to **NULL**.
database_status	character varying(17)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
instance_role	character varying(18)	Not supported. Set it to **NULL**.
active_state	character varying(9)	Not supported. Set it to **NULL**.
blocked	character varying(3)	Not supported. Set it to **NULL**.
con_id	numeric	Not supported. Set it to **NULL**.
instance_mode	character varying(11)	Not supported. Set it to **NULL**.
edition	character varying(7)	Not supported. Set it to **NULL**.
family	character varying(80)	Not supported. Set it to **NULL**.
database_type	character varying(15)	Not supported. Set it to **NULL**.

12.3.14.95 GV_SESSION

GV_SESSION displays information about all current sessions. Only administrators can access this view. Common users can access the view only after being authorized. This view exists in both the PG_CATALOG and SYS schemas. When the thread pool is enabled (**enable_thread_pool** is set to **on**), all session information is displayed. When the thread pool is disabled (**enable_thread_pool** is set to **off**), the sessions connected by users are not displayed. For details about the columns, see **Table 12-368**.

Table 12-368 GV_SESSION columns

Name	Type	Description
inst_id	numeric	Not supported. Its value is **NULL**.
saddr	raw	Not supported. Its value is **NULL**.
sid	bigint	Session ID.
serial#	integer	Sequence number of the active backend thread, which is **0** in GaussDB.
audsid	numeric	Not supported. Its value is **NULL**.
paddr	raw	Not supported. Its value is **NULL**.
schema#	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the user logged in to the backend.
user#	oid	OID of the user who has logged in to the backend thread. (**0** if the background thread is a global auxiliary thread).
username	name	Name of the user logged in to the backend process. **username** is null if the backend thread is a global auxiliary thread.
command	numeric	Not supported. Its value is **NULL**.
ownerid	numeric	Not supported. Its value is **NULL**.
taddr	character varying(16)	Not supported. Its value is **NULL**.
lockwait	character varying(16)	Not supported. Its value is **NULL**.
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
sql_id	bigint	ID of a query.
client_info	text	Client information
event	text	Queuing status of a statement. The value must be one of the following: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if the value of **state** is not **active**.
program	text	Name of the application connected to the backend.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
status	text	Overall status of this backend. The value must be one of the following: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.
server	character varying(9)	Not supported. Its value is **NULL**.
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session.
process	character varying(24)	Process ID of the current session.
logon_time	date	Login time of the current session
last_call_et	integer	Duration when the status of the current session changes last time.
osuser	text	OS username of the server.
terminal	character varying(30)	Not supported. Its value is **NULL**.
type	character varying(10)	Not supported. Its value is **NULL**.
sql_address	raw	Not supported. Its value is **NULL**.
sql_hash_value	numeric	Not supported. Its value is **NULL**.
sql_child_number	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sql_exec_id	numeric	Not supported. Its value is **NULL**.
prev_sql_addr	raw	Not supported. Its value is **NULL**.
prev_hash_value	numeric	Not supported. Its value is **NULL**.
prev_sql_id	character varying(13)	Not supported. Its value is **NULL**.
prev_child_number	numeric	Not supported. Its value is **NULL**.
prev_exec_start	date	Not supported. Its value is **NULL**.
prev_exec_id	numeric	Not supported. Its value is **NULL**.
plsql_entry_object_id	numeric	Not supported. Its value is **NULL**.
plsql_entry_subprogram_id	numeric	Not supported. Its value is **NULL**.
plsql_object_id	numeric	Not supported. Its value is **NULL**.
plsql_subprogram_id	numeric	Not supported. Its value is **NULL**.
module	text	Name of the running module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE.
module_hash	numeric	Not supported. Its value is **NULL**.
action	text	Name of the current operation in the current module, which is set by calling DBE_APPLICATION_INFO.SET_MODULE or DBE_APPLICATION_INFO.SET_ACTION.
action_hash	numeric	Not supported. Its value is **NULL**.
fixed_table_sequence	numeric	Not supported. Its value is **NULL**.
row_wait_obj#	numeric	Not supported. Its value is **NULL**.
row_wait_file#	numeric	Not supported. Its value is **NULL**.
row_wait_block#	numeric	Not supported. Its value is **NULL**.
row_wait_row#	numeric	Not supported. Its value is **NULL**.
top_level_call#	numeric	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pdml_enabled	character varying(3)	Not supported. Its value is **NULL**.
failover_type	character varying(13)	Not supported. Its value is **NULL**.
failover_method	character varying(10)	Not supported. Its value is **NULL**.
failed_over	character varying(3)	Not supported. Its value is **NULL**.
resource_consumer_group	character varying(32)	Not supported. Its value is **NULL**.
pddl_status	character varying(8)	Not supported. Its value is **NULL**.
pq_status	character varying(8)	Not supported. Its value is **NULL**.
current_queue_duration	numeric	Not supported. Its value is **NULL**.
client_identifier	character varying(64)	Not supported. Its value is **NULL**.
blocking_session_status	character varying(11)	Not supported. Its value is **NULL**.
blocking_instance	numeric	Not supported. Its value is **NULL**.
blocking_session	numeric	Not supported. Its value is **NULL**.
final_blocking_session_status	character varying(11)	Not supported. Its value is **NULL**.
final_blocking_instance	numeric	Not supported. Its value is **NULL**.
final_blocking_session	numeric	Not supported. Its value is **NULL**.
seq#	numeric	Not supported. Its value is **NULL**.
event#	numeric	Not supported. Its value is **NULL**.
p1text	character varying(64)	Not supported. Its value is **NULL**.
p1	numeric	Not supported. Its value is **NULL**.
p1raw	raw	Not supported. Its value is **NULL**.
p2text	character varying(64)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sql_translation_profile_id	numeric	Not supported. Its value is **NULL**.
pga_tunable_mem	numeric	Not supported. Its value is **NULL**.
shard_ddl_status	character varying(8)	Not supported. Its value is **NULL**.
con_id	numeric	Not supported. Its value is **NULL**.
external_name	character varying(1024)	Not supported. Its value is **NULL**.
plsql_debugger_connected	character varying(5)	Not supported. Its value is **NULL**.

12.3.14.96 MPP_TABLES

MPP_TABLES displays information about tables in PGXC_CLASS.

Table 12-369 MPP_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains a table.
tablename	name	Table name.
tableowner	name	Table owner.
tablespace	name	Tablespace containing the table.
pgroup	name	Name of a node cluster.
nodeoids	oidvector_extend	List of distributed table node OIDs.

12.3.14.97 MY_AUDIT_TRAIL

MY_AUDIT_TRAIL displays the standard audit trail entries related to the current user. The GaussDB audit information is mainly obtained through the gs_query_audit() function. This view exists in both the PG_CATALOG and SYS schemas. Only users with the AUDITADMIN attribute and the SELECT permission on MY_AUDIT_TRAIL can view audit information. If separation of duties is disabled, users with the SYSADMIN attribute can also view audit information. The **action_name** field of GaussDB is different from that of the ORA database in terms of the audit actions. The type of the **transactionid** field is the same as that in the ORA database. In GaussDB, the **sql_text** field is the parsed SQL statement, which

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

is not completely the same as the executed SQL statement. For details about the columns, see **Table 12-370**.

CAUTION

In a distributed system, the gs_query_audit() function can only be used to query the audit information of the current node.

Table 12-370 MY_AUDIT_TRAIL columns

Name	Type	Description
os_username	character varying(255)	Not supported. The value is **NULL**.
username	character varying(128)	Name of the user whose operation is audited, not the user ID.
userhost	character varying(128)	Not supported. The value is **NULL**.
terminal	character varying(255)	Not supported. The value is **NULL**.
timestamp	date	Date and time when an audit trail entry is created in the local database session time zone (user login date and time of the entry created by the audit session).
owner	character varying(128)	Creator of the object affected by the operation.
obj_name	character varying(128)	Name of the object affected by the operation.
action	numeric	Not supported. The value is **NULL**.
action_name	character varying(28)	Action type corresponding to the code in the **action** column.
new_owner	character varying(128)	Not supported. The value is **NULL**.
new_name	character varying(128)	Not supported. The value is **NULL**.
obj_privilege	character varying(32)	Not supported. The value is **NULL**.
sys_privilege	character varying(40)	Not supported. The value is **NULL**.
admin_option	character varying(1)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
grantee	character varying(128)	Not supported. The value is **NULL**.
audit_option	character varying(40)	Not supported. The value is **NULL**.
ses_actions	character varying(19)	Not supported. The value is **NULL**.
logoff_time	date	Not supported. The value is **NULL**.
logoff_lread	numeric	Not supported. The value is **NULL**.
logoff_pread	numeric	Not supported. The value is **NULL**.
logoff_lwrite	numeric	Not supported. The value is **NULL**.
logoff_dlock	character varying(40)	Not supported. The value is **NULL**.
comment_text	character varying(4000)	Not supported. The value is **NULL**.
sessionid	numeric	Not supported. The value is **NULL**.
entryid	numeric	Not supported. The value is **NULL**.
statementid	numeric	Not supported. The value is **NULL**.
returncode	numeric	Not supported. The value is **NULL**.
priv_used	character varying(40)	Not supported. The value is **NULL**.
client_id	character varying(128)	Not supported. The value is **NULL**.
econtext_id	character varying(64)	Not supported. The value is **NULL**.
session_cpu	numeric	Not supported. The value is **NULL**.
extended_timestamp	timestamp(6) with time zone	Time zone of the timestamp when an audit trail entry is created (user login date and time of the entry created by the audit session in UTC).
proxy_sessionid	numeric	Not supported. The value is **NULL**.
global_uid	character varying(32)	Not supported. The value is **NULL**.
instance_number	numeric	Not supported. The value is **NULL**.
os_process	character varying(16)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
transactionid	text	Identifier of the transaction that accesses or modifies an object.
scn	numeric	Not supported. The value is **NULL**.
sql_bind	nvarchar2(2000)	Not supported. The value is **NULL**.
sql_text	nvarchar2	SQL text of the query.
obj_edition_name	character varying(128)	Not supported. The value is **NULL**.
dbid	numeric	Not supported. The value is **NULL**.
rls_info	clob	Not supported. The value is **NULL**.
current_user	character varying(128)	Not supported. The value is **NULL**.

12.3.14.98 MY_COL_COMMENTS

MY_COL_COMMENTS displays column comments of the table accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-371 MY_COL_COMMENTS columns

Name	Type	Description
owner	character varying(128)	Table owner.
table_name	character varying(128)	Table name.
column_name	character varying(128)	Column name.
comments	text	Comments.
origin_con_id	numeric	Not supported. Set it to **0**.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.99 MY_COLL_TYPES

MY_COLL_TYPES displays information about types of collections created by the current user. By default, it is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-372 MY_COLL_TYPES columns

Name	Type	Description
owner	character varying(128)	Owner of a collection.
type_name	character varying(128)	Name of a collection.
coll_type	character varying(128)	Description of a collection.
upper_bound	numeric	Not supported. Set it to **NULL**.
elem_type_mod	character varying(7)	Type modifier of an element.
elem_type_owner	character varying(128)	Owner of the element type on which the collection is based. This parameter is mainly used for user-defined types.
elem_type_name	character varying(128)	Name of the data type or user-defined type on which the collection is based.
length	numeric	Not supported. Set it to **NULL**.
precision	numeric	Not supported. Set it to **NULL**.
scale	numeric	Not supported. Set it to **NULL**.
character_set_name	character varying(44)	Not supported. Set it to **NULL**.
elem_storage	character varying(7)	Not supported. Set it to **NULL**.
nulls_stored	character varying(3)	Not supported. Set it to **NULL**.
char_used	character varying(1)	Not supported. Set it to **NULL**.

12.3.14.100 MY_CONS_COLUMNS

MY_CONS_COLUMNS displays information about primary key constraint columns in tables accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-373 MY_CONS_COLUMNS columns

Name	Type	Description
table_name	character varying(64)	Name of a constraint-related table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_name	character varying(64)	Name of a constraint-related column.
constraint_name	character varying(64)	Constraint name.
owner	character varying(64)	Constraint creator.
position	smallint	Position of a column in a table.

12.3.14.101 MY_CONSTRAINTS

MY_CONSTRAINTS displays table constraint information accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-374 MY_CONSTRAINTS columns

Name	Type	Description
constraint_name	character varying(64)	Constraint name.
constraint_type	text	Constraint type. • **c**: check constraint • **f**: foreign key constraint • **p**: primary key constraint • **u**: unique constraint
table_name	character varying(64)	Name of a constraint-related table.
index_owner	character varying(64)	Owner of a constraint-related index (only for the unique constraint and primary key constraint).
index_name	character varying(64)	Name of a constraint-related index (only for the unique constraint and primary key constraint).
owner	character varying(64)	Constraint creator.

12.3.14.102 MY_DEPENDENCIES

MY_DEPENDENCIES displays the dependencies between objects that are accessible to the current user. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-375 MY_DEPENDENCIES columns

Name	Type	Description
name	name	Object name.
type	character varying(18)	Object type.
referenced_owner	name	Owner of the referenced object.
referenced_name	name	Name of the referenced object.
referenced_type	character varying(18)	Type of the referenced object.
referenced_link_name	character varying(128)	Name of the link to the parent object (if remote).
dependency_type	character varying(4)	Specifies whether the dependency is an REF dependency.

12.3.14.103 MY_IND_COLUMNS

MY_IND_COLUMNS displays column information about all indexes accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-376 MY_IND_COLUMNS columns

Name	Type	Description
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	name	Column name.
column_position	smallint	Position of a column in an index.
column_length	numeric	Length of the column. For the variable-length type, the value of this field is **NULL**.
char_length	numeric	Maximum length of a column, in bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
descend	character varying(4)	Specifies whether columns are sorted in descending (**DESC**) or ascending (**ASC**) order.
collated_column_id	numeric	Not supported. Set it to **NULL**.

12.3.14.104 MY_IND_EXPRESSIONS

MY_IND_EXPRESSIONS displays information about function-based expression indexes accessible to the current user. It is accessible to all users. This view exists in the PG_CATALOG and SYS schemas.

Table 12-377 MY_IND_EXPRESSIONS columns

Name	Type	Description
table_owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
index_owner	character varying(64)	Index owner.
index_name	character varying(64)	Index name.
column_expression	text	Function-based index expression of a specified column.
column_position	smallint	Position of a column in an index.

12.3.14.105 MY_INDEXES

MY_INDEXES displays index information about the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 12-378**.

Table 12-378 MY_INDEXES columns

Name	Type	Description
owner	character varying(64)	Index owner
index_name	character varying(64)	Index name
table_name	character varying(64)	Name of the table corresponding to the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
uniqueness	text	Specifies whether the index is a unique index. • **UNIQUE**: unique index. • **NONUNIQUE**: non-unique index.
partitioned	character(3)	Specifies whether the index has the property of partitioned tables. • **Yes**: The index has the property of a partitioned table. • **No**: The index does not have the property of a partitioned table.
generated	character varying(1)	Specifies whether the index name is generated by the system. • **y**: The index name is generated by the system. • **n**: The index name is not generated by the system.
index_type	character varying(27)	Index type • **NORMAL**: Index attributes are simple references, and the expression tree is empty. • **FUNCTION-BASED NORMAL**: Expression trees are used for index attributes that are not simple column references.
table_owner	character varying(128)	Owner of the index object
table_type	character(11)	Type of an index object • **TABLE**: The index object is of the table type.
tablespace_name	character varying(30)	Name of the tablespace that contains the index
status	character varying(8)	Status of a non-partitioned index. • **VALID**: Non-partitioned indexes can be used for query. • **UNUSABLE**: The non-partitioned index is unavailable. • **N/A**: The index has the property of a partitioned table.
compression	character varying(13)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
prefix_length	numeric	Not supported. Its value is **NULL**.
ini_trans	numeric	Not supported. Its value is **NULL**.
max_trans	numeric	Not supported. Its value is **NULL**.
initial_extent	numeric	Not supported. Its value is **NULL**.
next_extent	numeric	Not supported. Its value is **NULL**.
min_extents	numeric	Not supported. Its value is **NULL**.
max_extents	numeric	Not supported. Its value is **NULL**.
pct_increase	numeric	Not supported. Its value is **NULL**.
pct_threshold	numeric	Not supported. Its value is **NULL**.
include_column	numeric	Not supported. Its value is **NULL**.
freelists	numeric	Not supported. Its value is **NULL**.
freelist_groups	numeric	Not supported. Its value is **NULL**.
pct_free	numeric	Not supported. Its value is **NULL**.
logging	character varying(3)	Not supported. Its value is **NULL**.
blevel	numeric	Not supported. Its value is **NULL**.
leaf_blocks	numeric	Not supported. Its value is **NULL**.
distinct_keys	numeric	Not supported. Its value is **NULL**.
avg_leaf_blocks_per_key	numeric	Not supported. Its value is **NULL**.
avg_data_blocks_per_key	numeric	Not supported. Its value is **NULL**.
clustering_factor	numeric	Not supported. Its value is **NULL**.
num_rows	numeric	Not supported. Its value is **NULL**.
sample_size	numeric	Not supported. Its value is **NULL**.
last_analyzed	date	Not supported. Its value is **NULL**.
degree	character varying(40)	Not supported. Its value is **NULL**.
instances	character varying(40)	Not supported. Its value is **NULL**.
temporary	character varying(1)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
secondary	character varying(1)	Not supported. Its value is **NULL**.
buffer_pool	character varying(7)	Not supported. Its value is **NULL**.
flash_cache	character varying(7)	Not supported. Its value is **NULL**.
cell_flash_cache	character varying(7)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
duration	character varying(15)	Not supported. Its value is **NULL**.
pct_direct_access	numeric	Not supported. Its value is **NULL**.
ityp_owner	character varying(128)	Not supported. Its value is **NULL**.
ityp_name	character varying(128)	Not supported. Its value is **NULL**.
parameters	character varying(1000)	Not supported. Its value is **NULL**.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
domidx_status	character varying(12)	Not supported. Its value is **NULL**.
domidx_opstatus	character varying(6)	Not supported. Its value is **NULL**.
funcidx_status	character varying(8)	Not supported. Its value is **NULL**.
join_index	character varying(3)	Not supported. Its value is **NULL**.
iot_redundant_pkey_elim	character varying(3)	Not supported. Its value is **NULL**.
dropped	character varying(3)	Not supported. Its value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
visibility	character varying(9)	Specifies whether the index is visible to the optimizer. • **VISIBLE**: The index is visible to the optimizer. • **INVISIBLE**: The index is visible to the optimizer.
domidx_management	character varying(14)	Not supported. Its value is **NULL**.
segment_created	character varying(3)	Not supported. Its value is **NULL**.
orphaned_entries	character varying(3)	Not supported. Its value is **NULL**.
indexing	character varying(7)	Not supported. Its value is **NULL**.
auto	character varying(3)	Not supported. Its value is **NULL**.

12.3.14.106 MY_JOBS

MY_JOBS displays details about the scheduled tasks owned by the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-379 MY_JOBS columns

Name	Type	Description
job	bigint	Job ID
log_user	name	Username of the job creator.
priv_user	name	Username of the job executor.
dbname	name	Name of the database where the job is created.
schema_user	name	Default schema name of a scheduler job.
start_date	timestamp without time zone	Job start time.
start_suc	text	Start time of the successful job execution.
last_date	timestamp without time zone	Start time of the last job execution.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_suc	text	Start time of the last successful job execution.
last_sec	text	Start time of the last successful job execution. Compatibility is supported.
this_date	timestamp without time zone	Start time of the ongoing job execution.
this_suc	text	Start time of the ongoing successful job execution.
this_sec	text	Start time of an ongoing successful job execution. Compatibility is supported.
next_date	timestamp without time zone	Schedule time of the next job execution.
next_suc	text	Schedule time of the next successful job execution.
next_sec	text	Schedule time of the next successful job execution. Compatibility is supported.
total_time	numeric	Latest execution duration of a task.
broken	text	**y** if the job status is broken and **n** if otherwise.
status	"char"	Status of the current job. The value can be **'r'**, **'s'**, **'f'**, or **'d'**. The default value is **'r'**. ● **r**: running ● **s**: successful execution ● **f**: failed execution ● **d**: canceling an execution
interval	text	Time expression used to calculate the next time the job will be executed. If this parameter is set to **null**, the job will be executed once only.
failures	smallint	Number of times the job has started and failed. If a job fails to be executed for 16 consecutive times, no more attempt will be made on it.
what	text	Executable job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
nls_env	character varying(4000)	Not supported. Set it to **NULL**.
misc_env	raw	Not supported. Set it to **NULL**.
instance	numeric	Not supported. Set it to **NULL**.

12.3.14.107 MY_OBJECTS

MY_OBJECTS displays database objects accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-380 MY_OBJECTS columns

Name	Type	Description
object_name	name	Object name.
object_id	oid	OID of the object.
object_type	name	Type of the object (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, or **GLOBAL SECONDARY INDEX**).
namespace	oid	Namespace that an object belongs to.
temporary	character(1)	Specifies whether an object is a temporary object.
status	character varying(7)	Object status.
subobject_name	name	Subobject name of an object.
generated	character(1)	Specifies whether an object name is generated by the system.
created	timestamp with time zone	Creation time of an object.
last_ddl_time	timestamp with time zone	Last time when an object was modified.
default_collation	character varying(100)	Default collation of objects.
data_object_id	numeric	Not supported. Set it to **NULL**.
timestamp	character varying(19)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
secondary	character varying(1)	Not supported. Set it to **NULL**.
edition_name	character varying(128)	Not supported. Set it to **NULL**.
sharing	character varying(18)	Not supported. Set it to **NULL**.
editionable	character varying(1)	Not supported. Set it to **NULL**.
oracle_maintained	character varying(1)	Not supported. Set it to **NULL**.
application	character varying(1)	Not supported. Set it to **NULL**.
duplicated	character varying(1)	Not supported. Set it to **NULL**.
sharded	character varying(1)	Not supported. Set it to **NULL**.
created_appid	numeric	Not supported. Set it to **NULL**.
modified_appid	numeric	Not supported. Set it to **NULL**.
created_vsnid	numeric	Not supported. Set it to **NULL**.
modified_vsnid	numeric	Not supported. Set it to **NULL**.

NOTICE

For details on the value ranges of **created** and **last_ddl_time**, see **PG_OBJECT**.

12.3.14.108 MY_PROCEDURES

MY_PROCEDURES displays information about stored procedures, functions, or triggers owned by the current user. This view exists in the PG_CATALOG and SYS schemas. This view can be accessed by all users. Only the information about the current user can be viewed.

Table 12-381 MY_PROCEDURES columns

Name	Type	Description
owner	character varying(64)	Owner of a stored procedure, function, or trigger.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
object_name	character varying(64)	Name of a stored procedure, function, or trigger.
procedure_name	character varying(128)	Not supported. Set it to **NULL**.
object_id	oid	OID of a stored procedure, function, or trigger.
subprogram_id	numeric	Not supported. Set it to **NULL**.
overload	character varying(40)	*M*th overloaded function.
object_type	character varying(13)	Object type.
aggregate	character varying(3)	Specifies whether the function is an aggregate function: • **YES** • **NO**
pipelined	character varying(3)	Not supported. Set it to **NO**.
impltypeowner	character varying(128)	Owner of an implementation type.
impltypename	character varying(128)	Name of an implementation type.
parallel	character varying(3)	Not supported. Set it to **NO**.
interface	character varying(3)	Not supported. Set it to **NO**.
deterministic	character varying(3)	Not supported. Set it to **NO**.
authid	character varying(12)	Specifies whether to use the creator permission or caller permission: • **DEFINER**: The creator permission is used. • **CURRENT_USER**: The caller permission is used. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
result_cache	character varying(3)	Not supported. Set it to **NULL**.
origin_con_id	character varying(256)	Not supported. Set it to **0**.
polymorphic	character varying(5)	Not supported. Set it to **NULL**.
argument_number	smallint	Number of input parameters in the stored procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.109 MY_SCHEDULER_JOB_ARGS

MY_SCHEDULER_JOB_ARG displays the parameters related to the jobs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

Table 12-382 MY_SCHEDULER_JOB_ARGS columns

Name	Type	Description
job_name	character varying(128)	Name of the job to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
value	character varying(4000)	Parameter value.
anydata_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.14.110 MY_SCHEDULER_JOBS

MY_SCHEDULER_JOBS displays information about all DBE_SCHEDULER scheduled tasks owned by the current user in the database. By default, this view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-383 MY_SCHEDULER_JOBS columns

Name	Type	Description
job_name	text	Name of a scheduler job.
job_subname	character varying(128)	Not supported. Set it to **NULL**.
job_style	text	Action mode of a scheduler job.
job_creator	name	Creator of a scheduler job.
client_id	character varying(65)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_uid	character varying(33)	Not supported. Set it to **NULL**.
program_owner	character varying(4000)	Owner of a program referenced by a scheduler job.
program_name	text	Name of the program referenced by a scheduler job.
job_type	character varying(16)	Type of the inline program of a scheduler job.
job_action	text	Program content of a scheduler job.
number_of_arguments	text	Number of parameters of a scheduler job.
schedule_owner	character varying(4000)	Not supported. Set it to **NULL**.
schedule_name	text	Name of the schedule referenced by a scheduler job.
schedule_type	character varying(12)	Not supported. Set it to **NULL**.
start_date	timestamp without time zone	Start time of a scheduler job.
repeat_interval	text	Period of a scheduler job.
event_queue_owner	character varying(128)	Not supported. Set it to **NULL**.
event_queue_name	character varying(128)	Not supported. Set it to **NULL**.
event_queue_agent	character varying(523)	Not supported. Set it to **NULL**.
event_condition	character varying(4000)	Not supported. Set it to **NULL**.
event_rule	character varying(261)	Not supported. Set it to **NULL**.
file_watcher_owner	character varying(261)	Not supported. Set it to **NULL**.
file_watcher_name	character varying(261)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
end_date	timestamp without time zone	End time of a scheduler job.
job_class	text	Name of the scheduler job class to which a scheduler job belongs.
enabled	boolean	Status of a scheduler job.
auto_drop	text	Status of the automatic deletion function of a scheduler job.
restart_on_recovery	character varying(5)	Not supported. Set it to **NULL**.
restart_on_failure	character varying(5)	Not supported. Set it to **NULL**.
state	"char"	Status of a scheduler job.
job_priority	numeric	Not supported. Set it to **NULL**.
run_count	numeric	Not supported. Set it to **NULL**.
uptime_run_count	numeric	Not supported. Set it to **NULL**.
max_runs	numeric	Not supported. Set it to **NULL**.
failure_count	smallint	Number of scheduler job failures.
uptime_failure_count	numeric	Not supported. Set it to **NULL**.
max_failures	numeric	Maximum number of failures allowed before the status of a scheduler job is marked as broken.
retry_count	numeric	Not supported. Set it to **NULL**.
last_start_date	timestamp without time zone	Last time when a scheduler job was started.
last_run_duration	interval day to second(6)	Last execution duration of a scheduler job.
next_run_date	timestamp without time zone	Next execution time of a scheduler job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schedule_limit	interval day to second(0)	Not supported. Set it to **NULL**.
max_run_duration	interval day to second(0)	Not supported. Set it to **NULL**.
logging_level	character varying(11)	Not supported. Set it to **NULL**.
store_output	character varying(5)	Specifies whether to store the output information of all scheduler jobs.
stop_on_window_close	character varying(5)	Not supported. Set it to **NULL**.
instance_stickiness	character varying(5)	Not supported. Set it to **NULL**.
raise_events	character varying(4000)	Not supported. Set it to **NULL**.
system	character varying(5)	Not supported. Set it to **NULL**.
job_weight	numeric	Not supported. Set it to **NULL**.
nls_env	character varying(4000)	Not supported. Set it to **NULL**.
source	character varying(128)	Not supported. Set it to **NULL**.
number_of_destinations	numeric	Not supported. Set it to **NULL**.
destination_owner	character varying(261)	Not supported. Set it to **NULL**.
destination	text	Target name of a scheduler job. If the value of **destination** is **CCN**, the task is a CCN job. For details, see **DBE_SCHEDULER**.
credential_owner	character varying(128)	Not supported. Set it to **NULL**.
credential_name	text	Certificate name of a scheduler job.
instance_id	oid	OID of the current database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
deferred_drop	character varying(5)	Not supported. Set it to **NULL**.
allow_runs_in_restricted_mode	character varying(5)	Not supported. Set it to **NULL**.
comments	text	Comments of a scheduler job.
flags	numeric	Not supported. Set it to **NULL**.
restartable	character varying(5)	Not supported. Set it to **NULL**.
has_constraints	character varying(5)	Not supported. Set it to **NULL**.
connect_credential_owner	character varying(128)	Not supported. Set it to **NULL**.
connect_credential_name	character varying(128)	Not supported. Set it to **NULL**.
fail_on_script_error	character varying(5)	Not supported. Set it to **NULL**.

12.3.14.111 MY_SCHEDULER_PROGRAM_ARGS

MY_SCHEDULER_PROGRAM_ARG displays the parameters related to the programs owned by the current user. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

Table 12-384 MY_SCHEDULER_PROGRAM_ARGS columns

Name	Type	Description
program_name	character varying(128)	Name of the program to which the parameter belongs.
argument_name	character varying(128)	Parameter name.
argument_position	numeric	Position of the parameter in the parameter list.
argument_type	character varying(257)	Data type of a parameter.
metadata_attribute	character varying(19)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
default_value	character varying(4000)	Default parameter value.
default_anydata_value	character varying(4000)	Not supported. Set it to **NULL**.
out_argument	character varying(5)	Reserved column. Set it to **NULL**.

12.3.14.112 MY_SEQUENCES

MY_SEQUENCES displays the sequence information about the current user. This view exists in both PG_CATALOG and SYS schemas. For details about the columns, see **Table 12-385**.

Table 12-385 MY_SEQUENCES columns

Name	Type	Description
sequence_owner	name	Owner of a sequence.
sequence_name	name	Name of a sequence.
min_value	int16	Minimum value of a sequence.
max_value	int16	Maximum value of a sequence.
increment_by	int16	Value by which the sequence is incremented.
cycle_flag	character(1)	Specifies whether a sequence is a cycle sequence. The options are as follows: • **Y**: It is a cycle sequence. • **N**: It is not a cycle sequence.
order_flag	character varying(1)	Specifies whether a sequence occurs in a request sequence. This parameter is not supported. Set it to **NULL**.
cache_size	int16	Size of the sequence disk cache.
last_number	int16	Last value of the sequence allocated in a batch from the GTM at a time.
scale_flag	character varying(1)	Specifies whether a sequence is a scalable sequence. This parameter is not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
extend_flag	character varying(1)	Specifies whether the value generated by a scalable sequence exceeds the maximum or minimum value of the sequence. Not supported. The value is **NULL**.
sharded_flag	character varying(1)	Specifies whether a sequence is a shard sequence. Not supported. The value is **NULL**.
session_flag	character varying(1)	Specifies whether a sequence has a private session. This is not supported. The value is **NULL**.
keep_value	character varying(1)	Specifies whether to retain the sequence value during replay after a failure. Not supported. The value is **NULL**.

12.3.14.113 MY_SOURCE

MY_SOURCE displays the definition information about stored procedures, functions, and triggers accessible to the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-386 MY_SOURCE columns

Name	Type	Description
owner	name	Object owner.
name	name	Object name.
type	name	Object type. The value can be **function**, **procedure**, or **trigger**.
line	numeric	Number of the source line.
text	text	Text source of the storage object.
origin_con_id	character varying(256)	Not supported. Set it to **0**.

12.3.14.114 MY_SYNONYMS

MY_SYNONYMS displays synonyms in the current schema. This view can be accessed by all users. Only the information about the current user can be viewed. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-387 MY_SYNONYMS columns

Name	Type	Description
schema_name	text	Name of the schema to which the synonym belongs.
synonym_name	text	Synonym name.
table_owner	text	Owner of the associated object. Although the column is called **table_owner**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_name	text	Name of the associated object. Although the column is called **table_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
table_schema_name	text	Schema name of the associated object. Although the column is called **table_schema_name**, the associated object is not necessarily a table. It can be any common database object, such as a view, stored procedure, or synonym.
db_link	character varying(128)	Reserved column. Set it to **NULL**.
origin_con_id	character varying(256)	Not supported. Set it to **0**.

12.3.14.115 MY_TAB_COL_STATISTICS

MY_TAB_COL_STATISTICS displays column statistics and histogram information extracted from MY_TAB_COLUMNS. All users can access this view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 12-388**.

Table 12-388 MY_TAB_COL_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_name	character varying(128)	Column name.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Low value in a column.
high_value	raw	High value in a column.
density	numeric	• If there is a histogram on **COLUMN_NAME**, this column displays the selectivity of values in the histogram that span fewer than two endpoints. It does not represent the selectivity of values that span two or more endpoints. • If no histogram is available on **COLUMN_NAME**, the value of this column is **1/NUM_DISTINCT**.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Date when a column was last analyzed. After the database is restarted, data loss will occur.
sample_size	numeric	Sample size used to analyze a column.
global_stats	character varying(3)	Not supported. Its value is **NULL**.
user_stats	character varying(3)	Not supported. Its value is **NULL**.
notes	character varying(99)	Not supported. Its value is **NULL**.
avg_col_len	numeric	Average length of a column, in bytes.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. • **NONE**: no histogram • **FREQUENCY**: frequency histogram • **EQUI-WIDTH**: equal-width histogram

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
scope	character varying(7)	For statistics collected on any table other than global temporary tables, the value is SHARED (indicating that the statistics are shared among all sessions).
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.116 MY_TAB_COLUMNS

MY_TAB_COLUMNS displays the columns of the tables and views owned by the current user. This view exists in the PG_CATALOG and SYS schemas. All users can access this view. Only the information about the user is displayed. For details about the columns, see **Table 12-389**.

Table 12-389 MY_TAB_COLUMNS columns

Name	Type	Description
owner	character varying(64)	Table owner.
table_name	character varying(64)	Table name.
column_name	character varying(64)	Column name.
data_type	character varying(128)	Data type of a column.
data_type_mod	character varying(3)	Not supported. The value is **NULL**.
data_type_owner	character varying(128)	Owner of the data type of a column.
data_length	integer	Length of a column, in bytes.
data_precision	integer	Precision of the data type. It is valid for the numeric data type and **NULL** for other types.
data_scale	integer	Number of decimal places. It is valid for the numeric data type and **0** for other data types.
nullable	bpchar	Specifies whether a column can be empty (**n** for the primary key constraint and NOT NULL constraint).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
column_id	integer	Sequence number of a column when the table is created.
default_length	numeric	Length of the default value of a column, in bytes.
data_default	text	Default value of a column.
num_distinct	numeric	Number of different values in a column.
low_value	raw	Minimum value in a column.
high_value	raw	Maximum value in a column.
density	numeric	Column density.
num_nulls	numeric	Number of empty values in a column.
num_buckets	numeric	Number of buckets in the histogram of a column.
last_analyzed	date	Last analysis date.
sample_size	numeric	Sample size used to analyze a column.
character_set_name	character varying(44)	Not supported. The value is **NULL**.
char_col_decl_length	numeric	Declaration length of a column of the character type.
global_stats	character varying(3)	Not supported. The value is **NO**.
user_stats	character varying(3)	Not supported. The value is **NO**.
avg_col_len	numeric	Average length of a column, in bytes.
char_length	numeric	Length of the column, in characters. This parameter is valid only for the varchar, nvarchar2, bpchar, and char types.
char_used	character varying(1)	Not supported. Set it to **B** for the varchar, bpchar, or char data type. Set it to **C** for the nvarchar2 data type. For other data types, set it to **NULL**.
v80_fmt_image	character varying(3)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
data_upgraded	character varying(3)	Not supported. The value is **YES**.
histogram	character varying(15)	Specifies whether the histogram exists and the type of the histogram if it exists. • **NONE**: no histogram • **FREQUENCY**: frequency histogram • **EQUI_WIDTH**: equal-width histogram
default_on_null	character varying(3)	Not supported. The value is **NULL**.
identity_column	character varying(3)	Not supported. The value is **NULL**.
sensitive_column	character varying(3)	Not supported. The value is **NULL**.
evaluation_edition	character varying(128)	Not supported. The value is **NULL**.
unusable_before	character varying(128)	Not supported. The value is **NULL**.
unusable_beginning	character varying(128)	Not supported. The value is **NULL**.
collation	character varying(100)	Collation rule of a column. This column conflicts with reserved keywords. Therefore, add the view name when calling this column.
comments	text	Comment of a column.
schema	character varying(64)	Name of the namespace to which the column belongs.

12.3.14.117 MY_TAB_COMMENTS

MY_TAB_COMMENTS displays comments on all tables and views owned by the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-390 MY_TAB_COMMENTS columns

Name	Type	Description
owner	character varying(64)	Owner of a table or view.
table_name	character varying(64)	Name of a table or view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
comments	text	Comments.
schema	character varying(64)	Name of the namespace to which the table belongs.

12.3.14.118 MY_TAB_HISTOGRAMS

MY_TAB_HISTOGRAMS displays histogram information about the tables and views owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-391 MY_TAB_HISTOGRAMS columns

Name	Type	Description
table_name	character varying(128)	Table name.
column_name	character varying(4000)	Column name or attribute of an object column.
endpoint_number	numeric	Bucket ID of the histogram.
endpoint_value	numeric	Not supported. Set it to **NULL**.
endpoint_actual_value	character varying(4000)	Actual value of the bucket endpoint.
endpoint_actual_value_raw	raw	Not supported. Set it to **NULL**.
endpoint_repeat_count	numeric	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. Set it to **SHARED**.

12.3.14.119 MY_TAB_MODIFICATIONS

MY_TAB_MODIFICATIONS displays statistics about modifications to tables owned by the current user since the last statistics collection on the tables. Currently, this view displays only tables on which INSERT, DELETE, and UPDATE operations have been performed. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-392 MY_TAB_MODIFICATIONS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Partition name.
subpartition_name	character varying(128)	Subpartition name.
inserts	numeric	Approximate number of insertions since the last statistics collection.
updates	numeric	Approximate number of updates since the last statistics collection.
deletes	numeric	Approximate number of deletions since the last statistics collection.
timestamp	date	Last modification time. Currently, the modification time of a partitioned table is not supported. Set this parameter to **NULL**.
truncated	character varying(3)	Not supported. Set it to **NULL**.
drop_segments	numeric	Not supported. Set it to **NULL**.
schema_name	character varying(128)	Name of the schema to which the table belongs.

12.3.14.120 MY_TAB_STATS_HISTORY

MY_TAB_STATS_HISTORY provides the table statistics history of the tables owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-393 MY_TAB_STATS_HISTORY columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
subpartition_name	character varying(128)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stats_update_time	timestamp(6) with time zone	Time when statistics are updated. Database restart is not supported. Otherwise, data loss will occur.

12.3.14.121 MY_TAB_STATISTICS

MY_TAB_STATISTICS displays statistics about tables owned by the current user in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-394 MY_TAB_STATISTICS columns

Name	Type	Description
table_name	character varying(128)	Table name.
partition_name	character varying(128)	Not supported. Set it to **NULL**.
partition_position	numeric	Not supported. Set it to **NULL**.
subpartition_name	character varying(128)	Not supported. Set it to **NULL**.
subpartition_position	numeric	Not supported. Set it to **NULL**.
object_type	character varying(12)	Object type • TABLE • PARTITION • SUBPARTITION
num_rows	numeric	Number of rows in an object.
blocks	numeric	Not supported. Set it to **NULL**.
empty_blocks	numeric	Not supported. Set it to **NULL**.
avg_space	numeric	Not supported. Set it to **NULL**.
chain_cnt	numeric	Not supported. Set it to **NULL**.
avg_row_len	integer	Average row length, including the row overhead.
avg_space_freelist_blocks	numeric	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
num_freelist_blocks	numeric	Not supported. Set it to **NULL**.
avg_cached_blocks	numeric	Not supported. Set it to **NULL**.
avg_cache_hit_ratio	numeric	Not supported. Set it to **NULL**.
im_imcu_count	numeric	Not supported. Set it to **NULL**.
im_block_count	numeric	Not supported. Set it to **NULL**.
im_stat_update_time	timestamp(6) without time zone	Not supported. Set it to **NULL**.
scan_rate	numeric	Not supported. Set it to **NULL**.
sample_size	numeric	Number of samples used for analyzing a table.
last_analyzed	timestamp with time zone	Date when a table was last analyzed. Database restart is not supported. Otherwise, data loss will occur.
global_stats	character varying(3)	Not supported. Set it to **NULL**.
user_stats	character varying(3)	Not supported. Set it to **NULL**.
stattype_locked	character varying(5)	Not supported. Set it to **NULL**.
stale_stats	character varying(7)	Not supported. Set it to **NULL**.
notes	character varying(25)	Not supported. Set it to **NULL**.
scope	character varying(7)	Not supported. The default value is **SHARED**.

12.3.14.122 MY_TABLES

MY_TABLES displays information about the tables owned by the current user. This view exists in both PG_CATALOG and SYS schemas. For details about the columns, see **Table 12-395**.

Table 12-395 MY_TABLES columns

Name	Type	Description
owner	character varying(64)	Table owner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_name	character varying(64)	Table name.
tablespace_name	character varying(64)	Tablespace name of the table.
dropped	character varying	Specifies whether the current table is deleted. ● **YES**: It is deleted. ● **NO**: It is not deleted.
num_rows	numeric	Estimated number of rows in the table.
status	character varying(8)	Specifies whether the current table is valid. ● **VALID**: The current table is valid. ● **UNUSABLE**: The current table is unavailable.
sample_size	numeric	Number of samples used for analyzing the table.
temporary	character(1)	Specifies whether the table is a temporary table. ● **Y**: The table is a temporary table. ● **N**: The table is not a temporary table.
pct_free	numeric	Minimum percentage of free space in a block.
ini_trans	numeric	Initial number of transactions.
max_trans	numeric	Maximum number of transactions.
avg_row_len	integer	Average number of bytes in each row.
partitioned	character varying(3)	Specifies whether a table is a partitioned table. ● **YES**: The table is a partitioned table. ● **NO**: The table is not a partitioned table.
last_analyzed	timestamp with time zone	Last time when the table was analyzed. Database restart is not supported. Otherwise, data loss will occur.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
row_movement	character varying(8)	Specifies whether to allow partition row movement. • **ENABLED**: The partition row movement is allowed. • **DISABLED**: The partition row movement is not allowed.
compression	character varying(8)	Specifies whether to enable a table compression. • **ENABLED**: A table compression is enabled. • **DISABLED**: A table compression is disabled.
duration	character varying(15)	Time elapsed when a temporary table is processed. • **NULL**: The table is not a temporary table. • **sys$session**: The table is a temporary session table. • **sys$transaction**: The table is a temporary transaction table.
logical_replication	character varying(8)	Specifies whether logical replication is enabled for a table. • **ENABLED**: Logical replication is enabled. • **DISABLED**: Logical replication is disabled.
external	character varying(3)	Specifies whether the table is a foreign table. • **YES**: The table is a foreign table. • **NO**: The table is not a foreign table.
logging	character varying(3)	Specifies whether to record logs for table changes. • **YES**: Logs are recorded for table changes. • **NO**: Logs are not recorded for table changes.
default_collation	character varying(100)	Default collation of a table.
degree	character varying(10)	Number of instances in a scanned table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
table_lock	character varying(8)	Specifies whether to enable a table lock. • **ENABLED**: The table lock is enabled. • **DISABLED**: The table lock is disabled.
nested	character varying(3)	Specifies whether a table is a nested table. • **YES**: The table is a nested table. • **NO**: The table is not a nested table.
buffer_pool	character varying(7)	Default buffer pool of a table.
flash_cache	character varying(7)	Smart flash cache hint in database for a table block.
cell_flash_cache	character varying(7)	Cell flash cache hint for a table block.
skip_corrupt	character varying(8)	Specifies whether to skip corrupted blocks during table scanning. • **ENABLED**: The corrupted block is skipped. • **DISABLED**: The corrupted block is not skipped.
has_identity	character varying(3)	Specifies whether a table has an identifier column. • **YES**: There is an identifier column. • **NO**: There is no identifier column.
inmemory	character varying(8)	Specifies whether to enable memory column store. • **ENABLED**: Memory column store is enabled. • **DISABLED**: Memory column store is disabled.
segment_created	character varying(3)	Specifies whether a table segment has been created. • **YES**: The table segment has been created. • **NO**: The table segment is not created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
monitoring	character varying(3)	Specifies whether to monitor the modification of a table. • **YES**: The modification of the table is monitored. • **NO**: The modification of the table is not monitored.
cluster_name	character varying(128)	Not supported. The value is **NULL**.
iot_name	character varying(128)	Not supported. The value is **NULL**.
pct_used	numeric	Not supported. The value is **NULL**.
initial_extent	numeric	Not supported. The value is **NULL**.
next_extent	numeric	Not supported. The value is **NULL**.
min_extents	numeric	Not supported. The value is **NULL**.

12.3.14.124 MY_TRIGGERS

MY_TRIGGERS displays information about the triggers owned by the current user. This view exists in the PG_CATALOG and SYS schemas.

Table 12-397 MY_TRIGGERS columns

Name	Type	Description
owner	character varying(128)	Trigger owner.
trigger_name	character varying(64)	Trigger name.
trigger_type	character varying	Trigger type, which can be **before statement**, **before each row**, **after statement**, **after each row**, or **instead of**.
triggering_event	character varying	Event that triggers a trigger. The value can be **update**, **insert**, **delete**, or **truncate**.
table_owner	character varying(64)	Owner of the table that defines a trigger.
base_object_type	character varying(18)	Basic object type of a trigger, which can be **table** or **view**.
table_name	character varying(64)	Name of the table or view that defines a trigger.
column_name	character varying(4000)	Not supported. Set it to **NULL**.
referencing_name	character varying(422)	Not supported. Set it to **referencing new as new old as old**.
when_clause	character varying(4000)	Content of **when**. **TRUE** must be evaluated as **TRIGGER_BODY** to execute.
status	character varying(64)	• **O**: The trigger is enabled in origin or local mode. • **D**: The trigger is disabled. • **R**: The trigger is enabled in replica mode. • **A**: The trigger is always enabled.
description	character varying(4000)	Trigger description, which is used to rebuild a trigger creation statement.
action_type	character varying(11)	Action type of a trigger, which only supports **call**.
trigger_body	text	Statement executed when a trigger is triggered.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
crossedition	character varying(7)	Not supported. Set it to **NULL**.
before_statement	character varying(3)	Not supported. Set it to **NULL**.
before_row	character varying(3)	Not supported. Set it to **NULL**.
after_row	character varying(3)	Not supported. Set it to **NULL**.
after_statement	character varying(3)	Not supported. Set it to **NULL**.
instead_of_row	character varying(3)	Not supported. Set it to **NULL**.
fire_once	character varying(3)	Not supported. Set it to **NULL**.
apply_server_only	character varying(3)	Not supported. Set it to **NULL**.

12.3.14.125 MY_TYPE_ATTRS

MY_TYPE_ATTRS displays all types of attributes owned by the current user in the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view.

Table 12-398 MY_TYPE_ATTRS columns

Name	Type	Description
type_name	character varying(128)	Data type name.
attr_name	character varying(128)	Attribute name
attr_type_mod	character varying(7)	Type modifier of an attribute: • REF • POINT
attr_type_owner	character varying(128)	Owner of an attribute type
attr_type_name	character varying(128)	Name of an attribute type
length	numeric	Length of the CHAR attribute, or the maximum length of the VARCHAR and character varying attribute
precision	numeric	Decimal precision of a number or DECIMAL attribute, or binary precision of a FLOAT attribute

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
scale	numeric	Decimal places for a numeric or DECIMAL attribute
character_set_name	character varying(44)	Character set name of an attribute (**Char_CS** or **NCHAR_CS**)
attr_no	numeric	Syntax order number or location (not used as an ID number) of an attribute specified in the type specification or CREATE TYPE statement
inherited	character varying(3)	Specifies whether an attribute is inherited from a supertype. • **YES**: It is inherited from a supertype. • **NO**: It is not inherited from a supertype.

12.3.14.126 MY_TYPES

MY_TYPES describes all object types owned by the current user. All users can access this view. This view exists in the PG_CATALOG and SYS schemas.

Table 12-399 MY_TYPES columns

Name	Type	Description
type_name	character varying(128)	Type name.
type_oid	raw	Type OID
typecode	character varying(128)	Type code.
attributes	numeric	Number of attributes in a type.
methods	numeric	Not supported. Set it to **0**.
predefined	character varying(3)	Specifies whether the type is a predefined type.
incomplete	character varying(3)	Specifies whether the type is incomplete.
final	character varying(3)	Not supported. Set it to **NULL**.
instantiable	character varying(3)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
persistable	character varying(3)	Not supported. Set it to **NULL**.
supertype_owner	character varying(128)	Not supported. Set it to **NULL**.
supertype_name	character varying(128)	Not supported. Set it to **NULL**.
local_attributes	numeric	Not supported. Set it to **NULL**.
local_methods	numeric	Not supported. Set it to **NULL**.
typeid	raw	Not supported. Set it to **NULL**.

12.3.14.127 MY_VIEWS

MY_VIEWS displays information about all views of the current user. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 12-400**.

Table 12-400 MY_VIEWS columns

Name	Type	Description
owner	character varying(64)	Owner of the view.
view_name	character varying(64)	Name of the view.
text	text	Text of the view.
text_length	integer	Text length of the view.
text_vc	character varying(4000)	View creation statement. This column may truncate the view text. The BEQUEATH clause will not appear as part of the **TEXT_VC** column in this view.
type_text_length	numeric	Not supported. The value is **NULL**.
type_text	character varying(4000)	Not supported. The value is **NULL**.
oid_text_length	numeric	Not supported. The value is **NULL**.
oid_text	character varying(4000)	Not supported. The value is **NULL**.

12.3.14.128 NLS_DATABASE_PARAMETERS

NLS_DATABASE_PARAMETERS lists the permanent NLS parameters of the database server. This view exists in both **pg_catalog** and **sys_schema**. It is accessible to all users. Due to different database kernels and parameter setting

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

formats, the query results of the same parameters in the database may be obviously different from those in the ORA database.

Table 12-401 NLS_DATABASE_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name
value	character varying(64)	Parameter value

12.3.14.129 NLS_INSTANCE_PARAMETERS

NLS_INSTANCE_PARAMETERS lists the permanent NLS parameters of the database client. This view exists in both **pg_catalog** and **sys_schema**. It is accessible to all users. Due to different database kernels and parameter setting formats, the query results of the same parameters in the database may be obviously different from those in the ORA database.

Table 12-402 NLS_INSTANCE_PARAMETERS columns

Name	Type	Description
parameter	character varying(128)	Parameter name
value	character varying(64)	Parameter value

12.3.14.130 PG_AVAILABLE_EXTENSION_VERSIONS

PG_AVAILABLE_EXTENSION_VERSIONS displays extension versions of certain database features. This view is for internal use only. You are advised not to use it. For details about the columns, see **Table 12-403**.

Table 12-403 PG_AVAILABLE_EXTENSION_VERSIONS columns

Name	Type	Description
name	name	Extension name
version	text	Version name
installed	boolean	Specifies whether this extension version is installed. Otherwise, the value is **false**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
superuser	boolean	Specifies whether only system administrators are allowed to install the extension. Otherwise, the value is **false**.
relocatable	boolean	Specifies whether the extension can be relocated to another schema. Otherwise, the value is **false**.
schema	name	Name of the schema that the extension must be installed into (**NULL** if the extension is partially or fully relocatable)
requires	name[]	Names of prerequisite extensions (**NULL** if none)
comment	text	Comment from the extension's control file.

12.3.14.131 PG_AVAILABLE_EXTENSIONS

PG_AVAILABLE_EXTENSIONS displays the extension information about certain database features. This view is for internal use only. You are advised not to use it. For details about the columns, see **Table 12-404**.

Table 12-404 PG_AVAILABLE_EXTENSIONS columns

Name	Type	Description
name	name	Extension name
default_version	text	Name of the default version (**NULL** if none is specified)
installed_version	text	Currently installed version of the extension (**NULL** if no version is installed)
comment	text	Comment from the extension's control file.

12.3.14.132 PG_CONTROL_GROUP_CONFIG

PG_CONTROL_GROUP_CONFIG stores Cgroup configuration information in the system. Only the user with sysadmin permission can query this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-405 PG_CONTROL_GROUP_CONFIG columns

Name	Type	Description
pg_control_group_config	text	Configuration information of the Cgroup

12.3.14.133 PG_CURSORS

PG_CURSORS displays cursors that are currently available.

Table 12-406 PG_CURSORS columns

Name	Type	Description
name	text	Cursor name
statement	text	Query statement when the cursor is declared to change
is_holdable	boolean	**True** if the cursor is holdable (it can be accessed after the transaction that declared the cursor has committed); **false** otherwise
is_binary	boolean	Whether the cursor was declared BINARY. If it was, the value is **true**.
is_scrollable	boolean	Whether the cursor is scrollable (it allows rows to be retrieved in a nonsequential manner). If it is, the value is **true**.
creation_time	timestamp with time zone	Timestamp at which the cursor is declared

12.3.14.134 PG_EXT_STATS

PG_EXT_STATS displays extended statistics stored in **PG_STATISTIC_EXT**. The extension statistics means multiple columns of statistics. For details about the columns, see **Table 12-407**.

Table 12-407 PG_EXT_STATS columns

Name	Type	Reference	Description
schemaname	name	**PG_NAMESPACE**.nspname	Name of the schema that contains a table.
tablename	name	**relname** in **PG_CLASS**	Table name
attname	int2vector	**PG_STATISTIC_EXT**.stakey	Columns to be combined for collecting statistics

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
inherited	boolean	-	Inherited tables are not supported currently. The value of this column is **false**.
null_frac	real	-	Percentage of column combinations that are null to all records
avg_width	integer	-	Average width of column combinations, in byte
n_distinct	real	-	• Estimated number of distinct values in a column combination if the value is greater than 0 • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, **–1** indicates that the number of distinct values is the same as the number of rows for a column combination. 1. The negated form is used when **ANALYZE** believes that the number of distinct values is likely to increase as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. • The number of distinct values is unknown if the value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
n_dndistinct	real	-	Number of not-null distinct values in the **dn1** column combination. • Exact number of distinct values if the value is greater than **0**. • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, if a value in a column combination appears twice in average, **n_dndistinct** equals **–0.5**. • The number of distinct values is unknown if the value is **0**.
most_common_vals	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be **NULL**. None of the most common values in the column is **NULL**.
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of **most_common_vals** is **NULL**, the value of this column is **NULL**.
most_common_vals_null	anyarray	-	List of the most common values in a column combination. If this combination does not have the most common values, this column will be **NULL**. At least one of the common values in the column is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
most_common_freqs_null	real[]	-	List of the frequencies of the most common values in a column combination. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. If the value of **most_common_vals_null** is **NULL**, the value of this column is **NULL**.
histogram_bounds	anyarray	-	Boundary value list of the histogram
partitionname	name	**PG_PARTITION**.relname	Name of the level-1 partition in the partitioned table. For a non-partitioned table, this field is left blank.
subpartitionname	name	**PG_PARTITION**.relname	Name of the level-2 partition in the partitioned table. For a distributed system, this field is left blank.

12.3.14.135 PG_GET_SENDERS_CATCHUP_TIME

PG_GET_SENDERS_CATCHUP_TIME displays catchup information of the currently active primary/standby instance sender thread on the DN. For details about the columns, see **Table 12-408**.

Table 12-408 PG_GET_SENDERS_CATCHUP_TIME columns

Name	Type	Description
pid	bigint	Current sender thread ID
lwpid	integer	Current sender lwpid
local_role	text	Local role
peer_role	text	Peer role

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Current sender's replication status • **Startup**: startup state. • **Backup**: backup state. • **Catchup**: catch-up state, which indicates that the standby node is catching up with the primary node. • **Streaming**: streaming replication state. When the standby node catches up with the primary node, the replication remains in this state.
type	text	Current sender type • **Wal**: type that logs are written in advance. • **Data**: data type.
catchup_start	timestamp with time zone	Startup time of a catchup task
catchup_end	timestamp with time zone	End time of the catchup task

12.3.14.136 PG_GROUP

PG_GROUP displays the database role authentication and the relationship between roles.

Table 12-409 PG_GROUP columns

Name	Type	Description
groname	name	Group name
grosysid	oid	Group ID
grolist	oid[]	An array, including all the role IDs in this group

12.3.14.137 PG_GTT_STATS

PG_GTT_STATS displays statistics about a single column in all global temporary tables of the current session by calling pg_get_gtt_statistics(). Data is inherited from a centralized global temporary table. Before using this table, you need to perform ANALYZE on the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-410 PG_GTT_STATS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
attname	name	Attribute name.
inherited	boolean	Specifies whether to collect statistics for objects that have inheritance relationship.
null_frac	real	Percentage of column entries that are null.
avg_width	integer	Average stored width, in bytes, of non-null entries.
n_distinct	real	Number of distinct, non-null data values in the column.
most_common_vals	text[]	List of the most common values, which is sorted by occurrence frequency.
most_common_freqs	real[]	Frequencies of the most common values.
histogram_bounds	text[]	Data distribution (excluding the most common values) in a frequency histogram description column.
correlation	real	Correlation coefficient.
most_common_elems	text[]	List of the most common element values, which is used for the array type or some other types.
most_common_elem_freqs	real[]	Frequencies of the most common element values.
elem_count_histogram	real[]	Array type histogram.

12.3.14.138 PG_GTT_RELSTATS

PG_GTT_RELSTATS displays basic information about all global temporary tables of the current session by calling pg_get_gtt_relstats(). Data is inherited from a centralized global temporary table. The query result of the distributed global temporary table on a CN is not meaningful, and the query result on a DN is empty. Therefore, it is not recommended in distributed mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-411 PG_GTT_RELSTATS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relfilenode	oid	File object ID.
relpages	integer	Number of disk pages of a global temporary table.
reltuples	real	Number of records in a global temporary table.
relallvisible	integer	Number of pages that are marked as all visible.
relfrozenxid	xid	All transaction IDs before this one have been replaced with a permanent (frozen) transaction ID in the table.
relminmxid	xid	Reserved.

12.3.14.139 PG_GTT_ATTACHED_PIDS

PG_GTT_ATTACHED_PIDS is used to check which sessions are using global temporary tables by calling the pg_gtt_attached_pid() function. Data is inherited from a centralized global temporary table. In distributed mode, GS_GTT_ATTACHED_PIDS or GS_GLOBAL_GTT_ATTACHED_PIDS is recommended.

Table 12-412 PG_GTT_ATTACHED_PIDS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relid	oid	OID of a global temporary table.
pids	bigint[]	Thread PID list.
sessionids	bigint[]	Session ID list.

12.3.14.140 PG_INDEXES

PG_INDEXES provides access to useful information about each index in the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-413 PG_INDEXES columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains tables and indexes
tablename	name	PG_CLASS.relname	Name of the table for which the index serves
indexname	name	PG_CLASS.relname	Index name
tablespace	name	PG_TABLESPACE.nspname	Name of the tablespace that contains the index
indexdef	text	-	Index definition (a reconstructed **CREATE INDEX** command)

12.3.14.141 PG_LOCKS

PG_LOCKS displays information about locks held by open transactions. For details about the columns, see **Table 12-414**.

Table 12-414 PG_LOCKS columns

Name	Type	Reference	Description
locktype	text	-	Type of the locked object. The value can be **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, **advisory**, or **tablespace**.
database	oid	OID in PG_DATABASE	OID of the database in which the locked target exists. • The OID is **0** if the target is a shared object. • The OID is **NULL** if the locked object is a transaction.
relation	oid	OID in PG_CLASS	OID of the relationship targeted by the lock (**NULL** if the object is not a relation or part of a relation).
page	integer	-	Page number targeted by the lock within the relation (**NULL** if the object is not a relation page or row page).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
tuple	smallint	-	Row number targeted by the lock within the page (**NULL** if the object is not a row).
bucket	integer	-	Hash bucket ID.
virtualxid	text	-	ID of the virtual transaction The value is **NULL** if the object is not a virtual transaction.
transactionid	xid	-	ID of the transaction. The value is **NULL** if the object is not a transaction.
classid	oid	OID in **PG_CLASS**	OID of the system catalog that contains the object (**NULL** if the object is not a general database object).
objid	oid	-	OID of the lock target within its system catalog (**NULL** if the target is not a general database object).
objsubid	smallint	-	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	-	Virtual ID of the virtual transaction holding or awaiting this lock.
pid	bigint	-	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	-	ID of the session that holds or waits for the lock.
mode	text	-	Lock mode held or desired by this thread. The value can be **AccessShareLock**, **RowShareLock**, **RowExclusiveLock**, **ShareLock**, **ShareRowExclusiveLock**, **ExclusiveLock**, or **AccessExclusive-Lock**.
granted	boolean	-	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
fastpath	boolean	-	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	-	Lock information that the session waits for. It can be parsed using the locktag_decode() function.
global_sessionid	text	-	Global session ID.

12.3.14.142 PG_NODE_ENV

PG_NODE_ENV displays environment variables of the current node. Only the user with system administrator or monitor admin permission can access this system view.

Table 12-415 PG_NODE_ENV columns

Name	Type	Description
node_name	text	Current node name
host	text	Host name of the node
process	integer	Number of the node process
port	integer	Port ID of the node
installpath	text	Installation directory of the node
datapath	text	Data directory of the node
log_directory	text	Log directory of the node

12.3.14.143 PG_OS_THREADS

PG_OS_THREADS provides status information about all the threads under the current node. For details about the columns, see **Table 12-416**.

Table 12-416 PG_OS_THREADS columns

Name	Type	Description
node_name	text	Current node name
pid	bigint	PID of the thread running under the current node process

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID
dbid	oid	ID of the database to which a thread belongs.

12.3.14.144 PG_PREPARED_STATEMENTS

PG_PREPARED_STATEMENTS displays all prepared statements that are available in the current session.

Table 12-417 PG_PREPARED_STATEMENTS columns

Name	Type	Description
name	text	Identifier of the prepared statement
statement	text	Query string for creating this prepared statement. For prepared statements created through SQL, this is the PREPARE statement submitted by the client. For prepared statements created through the frontend/backend protocol, this is the text of the prepared statement itself.
prepare_time	timestamp with time zone	Timestamp when the prepared statement is created
parameter_types	regtype[]	Expected parameter types for the prepared statement in the form of an array of **regtype**. The OID corresponding to an element of this array can be obtained by converting the **regtype** value to **oid**.
from_sql	boolean	• **True** if the prepared statement was created through the PREPARE statement • **False** if the statement was prepared through the frontend/backend protocol

12.3.14.145 PG_PREPARED_XACTS

PG_PREPARED_XACTS displays information about transactions that are currently prepared for two-phase commit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-418 PG_PREPARED_XACTS columns

Name	Type	Reference	Description
transaction	xid	-	Numeric transaction identifier of the prepared transaction
gid	text	-	Global transaction identifier that was assigned to the transaction
prepared	timestamp with time zone	-	Time at which the transaction is prepared for commit
owner	name	PG_AUTHID.rolname	Name of the user who executes the transaction
database	name	PG_DATABASE.datname	Name of the database in which the transaction is executed

12.3.14.146 PG_REPLICATION_SLOTS

PG_REPLICATION_SLOTS displays replication slot information. For details about the columns, see **Table 12-419**.

Table 12-419 PG_REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Specifies whether the replication slot is activated. • **t** (true): yes. • **f** (false): no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter.
confirmed_flush	text	Dedicated logical replication slot. The client confirms the location of the received log.
confirmed_csn	xid	Dedicated logical replication slot. The client confirms the CSN corresponding to the last transaction in the received log.

Example:

```
-- Perform query on the DN.
gaussdb=# SELECT * FROM pg_replication_slots;
 slot_name |      plugin      | slot_type | datoid | database | active | xmin | catalog_xmin | restart_lsn |
dummy_standby | confirmed_flush | confirmed_csn
-----------+------------------+-----------+--------+----------+--------+------+--------------+-------------+---------------
+-----------------+---------------
 dn_6002   |                  | physical  |      0 |          | t      |      |              | 0/3622B528  | f               |               |
 dn_6003   |                  | physical  |      0 |          | t      |      |              | 0/3622B528  | f               |               |
 slot_lsn  | mppdb_decoding | logical   | 131072 | db_test  | f      |      |        66658 | 0/36252350  | f               |
0/362523D0       |
 slot_test | mppdb_decoding | logical   | 131072 | db_test  | f      |      |        66658 | 0/36251718  | f
|                 |       10025527
(4 rows)

-- Perform query on the CN.
gaussdb=# SELECT * FROM pg_replication_slots;
 slot_name |      plugin      | slot_type | datoid | database | active | xmin | catalog_xmin | restart_lsn |
dummy_standby | confirmed_flush | confirmed_csn
-----------+------------------+-----------+--------+----------+--------+------+--------------+-------------+---------------
+-----------------+---------------
 slot_test | mppdb_decoding | logical   | 139264 | db_test  | f      |      |              |             | f
|                 |
(1 row)
```

NOTICE

When a query is performed on a DN, the **confirmed_csn** query result of the LSN-based logical replication slot is empty, and the **confirmed_flush** query result of the CSN-based logical replication slot is empty. When a query is performed on the CN, **catalog_xmin**, **restart_lsn**, **confirmed_flush**, and **confirmed_csn** of the CSN-based logical replication slot are not displayed and the query result is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.147 PG_RULES

PG_RULES provides access to query useful information about rewrite rules.

Table 12-420 PG_RULES columns

Name	Type	Description
schemaname	name	Name of the schema containing the table
tablename	name	Name of the table to which the rule applies
rulename	name	Rule name
definition	text	Rule definition (a reconstructed creation command)

12.3.14.148 PG_RUNNING_XACTS

PG_RUNNING_XACTS displays information about running transactions on the current node. For details about the columns, see **Table 12-421**.

Table 12-421 PG_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status. • **3**: prepared. • **0**: starting.
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	boolean	Specifies whether the current transaction is lazy vacuum. • **t** (true): yes • **f** (false): no.
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the prepared state; otherwise, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

12.3.14.149 PG_SESSION_IOSTAT

PG_SESSION_IOSTAT displays I/O workload management information about the task currently executed by the user. Only the user with the SYSADMIN or MONADMIN permission can query this view. For details about the columns, see **Table 12-422**.

IOPS is counted by 10 thousands per second.

NOTE

Contact Huawei technical support if the view displays no data.

Table 12-422 PG_SESSION_IOSTAT columns

Name	Type	Description
query_id	bigint	Job ID.
mincurriops	integer	Minimum I/O of the current job across each DN.
maxcurriops	integer	Maximum I/O of the current job across each DN.
minpeakiops	integer	Minimum I/O peak at each DN during job running.
maxpeakiops	integer	Maximum I/O peak at each DN during job running.
io_limits	integer	The GUC parameter **io_limits** set for the job.
io_priority	text	The GUC parameter **io_priority** set for the job.
query	text	Job.
node_group	text	Node group of the user to which a job belongs.
curr_io_limits	integer	Real-time value of **io_limits** when **io_priority** is used to control I/Os.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.150 PG_SETTINGS

PG_SETTINGS displays information about parameters of the running database. For details about the columns, see **Table 12-423**.

Table 12-423 PG_SETTINGS columns

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, **user**, and **pdb sighup**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.
source	text	Method of assigning the parameter value.
min_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum-type parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number of the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The query results of the PG_SETTINGS columns do not contain empty character strings in ORA-compatible mode, but may contain empty character strings instead of **NULL** in other compatible modes.

12.3.14.151 PG_SHARED_MEMORY_DETAIL

PG_SHARED_MEMORY_DETAIL queries usage information about all the shared memory contexts.

Table 12-424 PG_SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the shared memory, in bytes
freesize	bigint	Remaining size of the shared memory, in bytes
usedsize	bigint	Used size of the shared memory, in bytes

12.3.14.152 PG_STATS

PG_STATS displays single-column statistics stored in the **pg_statistic** table. The GUC parameter **autovacuum_naptime** specifies the interval for updating statistics recorded in the view. For details about the columns, see **Table 12-425**.

Table 12-425 PG_STATS columns

Name	Type	Reference	Description
schemaname	name	**PG_NAMESPACE**.nspname	Name of the schema that contains a table.
tablename	name	**relname** in **PG_CLASS**	Table name
attname	name	**PG_ATTRIBUTE**.attname	Field name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
inherited	boolean	-	Inherited tables are not supported currently. The value of this column is **false**.
null_frac	real	-	Percentage of column entries that are null
avg_width	integer	-	Average width in bytes of column's entries
n_distinct	real	-	• Estimated number of distinct values in the column if the value is greater than 0. • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, **–1** indicates that the number of distinct values is the same as the number of rows for a column combination. 1. The negated form is used when ANALYZE believes that the number of distinct values is likely to increase as the table grows. 2. The positive form is used when the column seems to have a fixed number of possible values. • The number of distinct values is unknown if the value is **0**.
n_dndistinct	real	-	Number of not-null distinct values in the **dn1** column. • Exact number of distinct values if the value is greater than **0**. • Negative number obtained by multiplying the result calculated by dividing the number of distinct values by the number of rows by –1 if the value is less than 0. For example, if the value of a column appears twice in average, set **n_dndistinct=-0.5**. • The number of distinct values is unknown if the value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
most_common_vals	anyarray	-	List of the most common values in a column. If this column does not have the most common value, the value is **NULL**.
most_common_freqs	real[]	-	List of the frequencies of the most common values in a column. The frequencies are obtained by dividing the number of occurrences of each value by the number of rows. (**NULL** if **most_common_vals** is **NULL**)
histogram_bounds	anyarray	-	Frequency histogram consisting of values excluding null values and MCVs. If a value appears in the value of **most_common_vals**, it does not appear in the histogram. If the column data type does not have the < operator or the list specified by **most_common_vals** contains all values of the column, the histogram information of the column is **NULL**.
correlation	real	-	Correlation between the physical row sequence and logical row sequence of a column value. The value ranges from –1 to +1. When the value is close to –1 or +1, the index scan overhead is less than that when the value is close to 0 because random access to the disk is reduced. This column is **NULL** if the column data type does not have a < operator.
most_common_elems	anyarray	-	A list of non-null element values most often appearing
most_common_elem_freqs	real[]	-	List that records the frequency of the most commonly used non-null elements.
elem_count_histogram	real[]	-	A histogram of the counts of distinct non-null element values
partitionname	name	**PG_PARTITION**.relname	Name of the level-1 partition in the partitioned table. For a non-partitioned table, this field is left blank.
subpartitionname	name	**PG_PARTITION**.relname	Name of the level-2 partition in the partitioned table. For a distributed system, this field is left blank.

12.3.14.153 PG_STAT_ACTIVITY_NG

PG_STAT_ACTIVITY_NG displays information about all queries in the node group of the current user. For details about the columns, see **Table 12-426**.

Table 12-426 PG_STAT_ACTIVITY_NG columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
global_sessionid	text	Global session ID.
usesysid	oid	OID of the user logged in to the backend.
usename	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as **AUTOVACUUM**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will only be non-null for IP connections, and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this session was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current active transaction was started (**NULL** if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query_start	timestamp with time zone	Time when the current active query was started, or time when the last query was started if the value of **state** is not **active**. For a stored procedure, function, or package, the first query time is displayed and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is **true**. Otherwise, the value is **false**.
enqueue	text	Queuing status of a statement. The value can be: • **waiting in queue**: The statement is in the queue. • Empty: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Backend status. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pg_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pg_stat_activity_ng; datname | usename | usesysid | state | pid ----------+---------+----------+--------+----------------- testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query at the backend. If **state** is **active**, this column shows the executing query. In all other states, it shows the last query that was executed.
node_group	text	Node group of the user to which the statement belongs.

12.3.14.154 PG_STAT_ALL_INDEXES

PG_STAT_ALL_INDEXES displays statistics about accesses to a specific index by querying each index row in the current database. For details about the columns, see **Table 12-427**.

Indexes can be used via either simple index scans or bitmap index scans. In a bitmap scan the output of indexes can be combined via AND or OR rules, so it is difficult to associate individual heap row fetches with specific indexes when a bitmap scan is used. Therefore, each bitmap scan increments the **pg_stat_all_indexes.idx_tup_read** count(s) for the index(es) it uses, and it increments the **pg_stat_all_tables.idx_tup_fetch** count for the table, but it does not affect **pg_stat_all_indexes.idx_tup_fetch**.

Table 12-427 PG_STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.155 PG_STAT_ALL_TABLES

PG_STAT_ALL_TABLES queries one row for each table in the current database (including TOAST tables), showing statistics about a specific table. For details about the columns, see **Table 12-428**.

Table 12-428 PG_STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (that is, with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time when the table was cleared.
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
vacuum_count	bigint	Number of times the table is cleared.
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Time when the data in the table changes last time. Operations that cause data changes include insert, update, delete, and truncate on the table and exchange, truncate, and drop on the table partitions (partitions/subpartitions). This field is not recorded in the system catalog. Data in this column is recorded only on the local CN.

12.3.14.156 PG_STAT_BAD_BLOCK

PG_STAT_BAD_BLOCK displays statistics about page verification failures after a node is started. For details about the columns, see **Table 12-429**.

Table 12-429 PG_STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	OID of a database.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	File object ID.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	File type. The options are as follows: • **0**: main data file. • **1**: FSM file. • **2**: VM file. • **3**: BCM file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
error_count	integer	Number of verification failures.
first_time	timestamp with time zone	Time of the first verification failure.
last_time	timestamp with time zone	Time of the latest verification failure.

12.3.14.157 PG_STAT_BGWRITER

PG_STAT_BGWRITER displays statistics about the activity of the background writer process. For details about the columns, see **Table 12-430**.

Table 12-430 PG_STAT_BGWRITER columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of checkpoints that have been performed actively.
checkpoint_write_time	double precision	Total time spent in the checkpoint processing portion when writing files to disk, in milliseconds.
checkpoint_sync_time	double precision	Total time spent in the checkpoint processing portion when synchronizing files to disk, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written by checkpoints.
buffers_clean	bigint	Number of buffers written by the background writer process.
maxwritten_clean	bigint	Number of times that cleanup scanning stops because the background writer process writes too many buffers.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend calls fsync (usually, even if the backend executes these write actions, the background writer process processes them again).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time at which these statistics were last reset.

12.3.14.158 PG_STAT_DATABASE

PG_STAT_DATABASE displays statistics about each database in the cluster. For details about the columns, see **Table 12-431**.

Table 12-431 PG_STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of a database.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database. This is the only column in the view that returns the status value. Other columns return the accumulated value since the last reset.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of times that disk blocks have been found in the buffer cache and therefore the disk blocks do not need to be read (only those found in the buffer cache are counted, excluding those found in the file system cache of the OS).
tup_returned	bigint	Number of rows returned by queries in this database.
tup_fetched	bigint	Number of rows fetched by queries in this database.
tup_inserted	bigint	Number of rows inserted by queries in this database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tup_updated	bigint	Number of rows updated by queries in this database.
tup_deleted	bigint	Number of rows deleted by queries in this database.
conflicts	bigint	Number of queries canceled due to database recovery conflicts (conflicts occurring only on the standby server). For details, see **PG_STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. Calculates all temporary files, regardless of why the temporary files are created (such as sorting or hashing) or the setting of the **log_temp_files** parameter.
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. Calculates all temporary files, regardless of why the temporary files are created or the setting of the **log_temp_files** parameter.
deadlocks	bigint	Number of all deadlocks detected in the database since the last reset of statistics.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds.
blk_write_time	double precision	Time spent reading data file blocks by backends in this database, in milliseconds.
stats_reset	timestamp with time zone	Time when the status statistics are reset.

12.3.14.159 PG_STAT_DATABASE_CONFLICTS

PG_STAT_DATABASE_CONFLICTS displays statistics about database conflicts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-432 PG_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	ID of a database
datname	name	Database name
confl_tablespace	bigint	Number of conflicting tablespaces
confl_lock	bigint	Number of conflicting locks
confl_snapshot	bigint	Number conflicting snapshots
confl_bufferpin	bigint	Number of conflicting buffers
confl_deadlock	bigint	Number of conflicting deadlocks

12.3.14.160 PG_STAT_REPLICATION

PG_STAT_REPLICATION displays information about the log synchronization thread, such as the locations where the sender sends logs and where the receiver receives logs. For details about the columns, see **Table 12-433**.

Table 12-433 PG_STAT_REPLICATION columns

Name	Type	Description
pid	bigint	PID of the thread
usesysid	oid	User system ID.
usename	name	Username
application_name	text	Program name
client_addr	inet	Client address
client_hostname	text	Client name
client_port	integer	Port of the client
backend_start	timestamp with time zone	Start time of the program

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Status of the log synchronization thread: • **startup**: The thread is being started. • **catchup**: The thread is establishing a connection between the standby node and the primary node. • **streaming**: The thread has established a connection between the standby node and the primary node and is replicating data streams. • **backup**: The thread is sending a backup. • **stopping**: The thread is being stopped.
sender_sent_location	text	Location where the transmit sends logs
receiver_write_location	text	Location where the receive end writes logs
receiver_flush_location	text	Location where the receive end flushes logs
receiver_replay_location	text	Location where the receive end replays logs
sync_priority	integer	Priority of synchronous duplication (**0** indicates asynchronization.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sync_state	text	Synchronization state: • **async**: asynchronous replication. • **sync**: synchronous replication. • **potential**: The standby node is asynchronous currently, but if a current synchronization node fails, the standby node becomes synchronous. • **quorum**: switches between the synchronous and asynchronous states to ensure that there are more than a certain number of synchronous standby nodes. Generally, the number of synchronous standby nodes is (n +1)/2-1, where *n* indicates the total number of copies. Whether the standby node is synchronous depends on whether logs are received first. For details, see the description of the **synchronous_standby_names** parameter.

12.3.14.161 PG_STAT_SYS_INDEXES

PG_STAT_SYS_INDEXES displays index status information about all the system catalogs in the pg_catalog and information_schema schemas. For details about the columns, see **Table 12-434**.

Table 12-434 PG_STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

12.3.14.162 PG_STAT_SYS_TABLES

PG_STAT_SYS_TABLES displays statistics about the system catalogs of all the namespaces in pg_catalog and information_schema schemas. For details about the columns, see **Table 12-435**.

Table 12-435 PG_STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table.
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time when this table was manually vacuumed (excluding **VACUUM FULL**)
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time when the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times the table has been vacuumed by the autovacuum daemon thread.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_data_changed	timestamp with time zone	Last modification time of the table data.

12.3.14.163 PG_STAT_USER_FUNCTIONS

PG_STAT_USER_FUNCTIONS shows user-defined function status information in the namespace. (The language of the function is non-internal language.)

Table 12-436 PG_STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times the function has been called

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

12.3.14.164 PG_STAT_USER_INDEXES

PG_STAT_USER_INDEXES displays information about the index status of user-defined ordinary tables and TOAST tables. For details about the columns, see **Table 12-437**.

Table 12-437 PG_STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_scan	bigint	Number of index scans initiated on the index
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

12.3.14.165 PG_STAT_XACT_ALL_TABLES

PG_STAT_XACT_ALL_TABLES displays transaction status information about all ordinary tables and TOAST tables in the namespaces.

Table 12-438 PG_STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

12.3.14.166 PG_STAT_XACT_SYS_TABLES

PG_STAT_XACT_SYS_TABLES displays transaction status information of the system catalog in the namespace.

Table 12-439 PG_STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.167 PG_STAT_XACT_USER_FUNCTIONS

PG_STAT_XACT_USER_FUNCTIONS contains statistics on the execution of each function.

Table 12-440 PG_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of a function
schemaname	name	Schema name
funcname	name	Function name
calls	bigint	Number of times that the function has been called
total_time	double precision	Total time spent in the function and all other functions called by it
self_time	double precision	Total time spent in the function itself, excluding other functions called by it

12.3.14.168 PG_STAT_XACT_USER_TABLES

PG_STAT_XACT_USER_TABLES displays transaction status information of the user table in the namespace.

Table 12-441 PG_STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of the table
schemaname	name	Name of the schema that the table is in
relname	name	Table name
seq_scan	bigint	Number of sequential scans initiated on the table
seq_tup_read	bigint	Number of live rows fetched by sequential scans
idx_scan	bigint	Number of index scans initiated on the table
idx_tup_fetch	bigint	Number of live rows fetched by index scans
n_tup_ins	bigint	Number of rows inserted
n_tup_upd	bigint	Number of rows updated
n_tup_del	bigint	Number of rows deleted

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	bigint	Number of rows HOT updated (with no separate index update required)

12.3.14.169 PG_STATIO_ALL_INDEXES

PG_STATIO_ALL_INDEXES contains one row for each index in the current database, showing I/O statistics about accesses to that specific index.

Table 12-442 PG_STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

12.3.14.170 PG_STATIO_ALL_SEQUENCES

PG_STATIO_ALL_SEQUENCES contains the I/O statistics of each sequence in the current database.

Table 12-443 PG_STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.171 PG_STATIO_ALL_TABLES

PG_STATIO_ALL_TABLES contains I/O statistics for each table (including the TOAST table) in the current database.

Table 12-444 PG_STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from all indexes in the table
idx_blks_hit	bigint	Number of cache hits of all indexes in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

12.3.14.172 PG_STATIO_SYS_INDEXES

PG_STATIO_SYS_INDEXES displays I/O status information for all system catalog indexes in a namespace.

Table 12-445 PG_STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

12.3.14.173 PG_STATIO_SYS_SEQUENCES

PG_STATIO_SYS_SEQUENCES displays I/O status information about all the sequences in the namespace.

Table 12-446 PG_STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

12.3.14.174 PG_STATIO_SYS_TABLES

PG_STATIO_SYS_TABLES shows I/O status information about all the system catalogs in the namespace.

Table 12-447 PG_STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from the index in the table
idx_blks_hit	bigint	Number of cache hits in the table

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

12.3.14.175 PG_STATIO_USER_INDEXES

PG_STATIO_USER_INDEXES displays I/O status information about all the user relationship table indexes in the namespace.

Table 12-448 PG_STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index
indexrelid	oid	OID of the index
schemaname	name	Name of the schema that the index is in
relname	name	Name of the table for the index
indexrelname	name	Index name
idx_blks_read	bigint	Number of disk blocks read from the index
idx_blks_hit	bigint	Number of cache hits in the index

12.3.14.176 PG_STATIO_USER_SEQUENCES

PG_STATIO_USER_SEQUENCES shows I/O status information about all the user relationship table sequences in the namespace.

Table 12-449 PG_STATIO_USER_SEQUENCES columns

Name	Type	Description
relid	oid	OID of this sequence
schemaname	name	Name of the schema where the sequence is in

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Name of the sequence
blks_read	bigint	Number of disk blocks read from the sequence
blks_hit	bigint	Cache hits in the sequence

12.3.14.177 PG_STATIO_USER_TABLES

PG_STATIO_USER_TABLES displays I/O status information about all the user relationship tables in the namespace.

Table 12-450 PG_STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID
schemaname	name	Name of the schema that the table is in
relname	name	Table name
heap_blks_read	bigint	Number of disk blocks read from the table
heap_blks_hit	bigint	Number of cache hits in the table
idx_blks_read	bigint	Number of disk blocks read from the index in the table
idx_blks_hit	bigint	Number of cache hits in the table
toast_blks_read	bigint	Number of disk blocks read from the TOAST table (if any) in the table
toast_blks_hit	bigint	Number of buffer hits in the TOAST table (if any) in the table
tidx_blks_read	bigint	Number of disk blocks read from the TOAST table index (if any) in the table
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table

12.3.14.178 PG_TABLES

PG_TABLES is used to query useful information about each table in a database. For details about the columns, see **Table 12-451**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-451 PG_TABLES columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains a table.
tablename	name	PG_CLASS.relname	Table name
tableowner	name	pg_get_userbyid(PG_CLASS.relowner)	Table owner
tablespace	name	PG_TABLESPACE.spcname	Tablespace that contains the table (default value: **null**)
hasindexes	boolean	PG_CLASS.relhasindex	Whether the table has (or recently had) an index. If it does, the value is **true**. Otherwise, the value is **false**.
hasrules	boolean	PG_CLASS.relhasruls	Whether the table has rules. If it does, the value is **true**. Otherwise, the value is **false**.
hastriggers	boolean	PG_CLASS.RELHASTRIGGERS	The value is **true** if the table has triggers; otherwise, the value is **false**.
tablecreator	name	pg_get_userbyid(PG_OBJECT.creator)	Table owner
created	timestamp with time zone	PG_OBJECT.ctime	Time when the table is created.
last_ddl_time	timestamp with time zone	PG_OBJECT.mtime	Time when the last DDL operation is performed on a table.

12.3.14.179 PG_THREAD_WAIT_STATUS

PG_THREAD_WAIT_STATUS allows you to test the blocking status about the backend thread and auxiliary thread of the current instance. For details about the columns, see **Table 12-452**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-452 PG_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Current session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent session ID.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table 12-453**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting to obtain.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include modes in the table-level lock, row-level lock, and page-level lock.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

Table 12-453 shows the waiting status in the **wait_status** column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-453 Waiting state list

Value	Description
none	Waiting for no event.
acquire lock	Waiting for locking until the locking succeeds or times out.
acquire lwlock	Waiting for a lightweight lock.
wait io	Waiting until the I/O is complete.
wait cmd	Waiting for reading network communication packets to complete.
wait pooler get conn	Waiting for pooler to obtain connections.
wait pooler abort conn	Waiting for pooler to terminate connections.
wait pooler clean conn	Waiting for pooler to clear connections.
pooler create conn: [nodename], total N	Waiting for the pooler to set up a connection. The connection is being established with the node specified by *nodename*, and there are *N* connections waiting to be set up.
get conn	Obtaining connections to other nodes.
set cmd: [nodename]	Waiting for running the **SET**, **RESET**, **TRANSACTION BLOCK LEVEL PARA SET**, or **SESSION LEVEL PARA SET** statement on the connection. The statement is being executed on the node specified by *nodename*.
cancel query	Canceling the SQL statement that is being executed through a connection.
stop query	Stopping the query that is being executed through a connection.
wait node: [nodename] (plevel), total N, [phase]	Waiting for receiving data from a connected node. The thread is waiting for data from the plevel thread of the node specified by *nodename*. The data of *N* connections is waiting to be returned. If *phase* is included, the possible phases are as follows: • **begin**: The transaction is being started. • **commit**: The transaction is being committed. • **rollback**: The transaction is being rolled back.
wait transaction sync: xid	Waiting for synchronizing the transaction specified by *xid*.
wait wal sync	Waiting for the completion of WAL of synchronization from the specified LSN to the standby instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
wait data sync	Waiting for the completion of data page synchronization to the standby instance.
wait data sync queue	Waiting for putting the row-store data pages into the synchronization queue.
flush data: [nodename] (plevel), [phase]	Waiting for sending data to the plevel thread of the node specified by *nodename*. If *phase* is included, the possible phase is **wait quota**, indicating that the current communication flow is waiting for the quota value.
stream get conn: [nodename], total N	Waiting for connecting to the consumer object of the node specified by *nodename* when the stream flow is initialized. There are *N* consumers waiting to be connected.
wait producer ready: [nodename](plevel), total N	Waiting for each producer to be ready when the stream flow is initialized. The thread is waiting for the procedure of the plevel thread on the *nodename* node to be ready. There are *N* producers waiting to be ready.
synchronize quit	Waiting for the threads in the stream thread group to quit when the stream plan ends.
nodegroup destroy	Waiting for destroying the stream node group when the stream plan ends.
wait active statement	Waiting for job execution under resource and load control.
gtm connect	Waiting for connecting to GTM.
gtm get gxid	Waiting for obtaining XIDs from GTM.
gtm get snapshot	Waiting for obtaining transaction snapshots from GTM.
gtm begin trans	Waiting for GTM to start a transaction.
gtm commit trans	Waiting for GTM to commit a transaction.
gtm rollback trans	Waiting for GTM to roll back a transaction.
gtm start prepare trans	Waiting for GTM to start the prepare phase of a two-phase transaction.
gtm prepare trans	Waiting for GTM to complete the prepare phase of a two-phase transaction.
gtm open sequence	Waiting for GTM to open a sequence.
gtm close sequence	Waiting for GTM to close a sequence.
gtm create sequence	Waiting for GTM to create a sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
gtm alter sequence	Waiting for GTM to modify a sequence.
gtm get sequence val	Waiting for obtaining the next value of a sequence from GTM.
gtm set sequence val	Waiting for GTM to set a sequence value.
gtm drop sequence	Waiting for GTM to delete a sequence.
gtm rename sequence	Waiting for GTM to rename a sequence.
analyze: [relname], [phase]	Executing ANALYZE for the *relname* table. If *phase* is included, the possible phase is **autovacuum**, indicating that the database automatically enables the AutoVacuum thread to execute **ANALYZE**.
vacuum: [relname], [phase]	Executing VACUUM for the *relname* table. If *phase* is included, the possible phase is **autovacuum**, indicating that the database automatically enables the AutoVacuum thread to execute **VACUUM**.
vacuum full: [relname]	Executing VACUUM FULL for the *relname* table.
create index	Creating an index.
HashJoin - [build hash | write file]	The **HashJoin** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashJoin** operator is creating a hash table. • **write file**: The **HashJoin** operator is writing data to disks.
HashAgg - [build hash | write file]	The **HashAgg** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashAgg** operator is creating a hash table. • **write file**: The **HashAgg** operator is writing data to disks.
HashSetop - [build hash | write file]	The **HashSetop** operator is being executed. In this phase, you need to pay attention to the execution time-consuming. • **build hash**: The **HashSetop** operator is creating a hash table. • **write file**: The **HashSetop** operator is writing data to disks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
Sort | Sort - [fetch tuple | write file]	The **Sort** operator is used for sorting. **fetch tuple** indicates that the **Sort** operator is obtaining tuples, and **write file** indicates that the **Sort** operator is writing data to disks.
Material | Material - write file	The **Material** operator is being executed. **write file** indicates that the **Material** operator is writing data to disks.
standby read recovery conflict	The read-only mode of the standby node conflicts with the log replay mode.
standby get snapshot	The standby node obtains the snapshot in read-only mode.
prune table	Waiting for a heap table to clear historical deleted data.
prune index	Waiting for an index to clear historical deleted data.
vacuum gpi	Waiting for a GPI to clear historical deleted data.
gtm reset xmin	Waiting for GTM to reset the minimum transaction ID.
gtm get xmin	Waiting for obtaining the minimum transaction ID from GTM.
gtm get csn	Waiting for obtaining the CSN from GTM.
gtm start preprare trans	Waiting for the GTM to start a two-phase transaction.
gtm rename sequence	Waiting for GTM to rename a sequence.
wait reserve td	Waiting for an Ustore transaction slot allocation.
wait td rollback	Waiting for an Ustore transaction slot to roll back transactions.
wait available td	Waiting for an available transaction slot for Ustore.
wait transaction rollback	Waiting for a transaction to roll back.
gtm set disaster cluster	Waiting for setting the DR cluster information on the GTM.
gtm get disaster cluster	Waiting for obtaining the DR cluster information from the GTM.
gtm del disaster cluster	Waiting for deleting the DR cluster information from the GTM.
gtm set consistency point	Waiting for setting the barrier in GTM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
wait sync bgworkers	Waiting for an index worker thread created in parallel to complete local scanning and sorting.
wait gs_sleep	Waiting for the server thread delay.
wait vacuum delay	Waiting for VACUUM delay.
wait seq scan	Execution time of seq scan.
wait index scan	Execution time of index scan.
wait checkpoint start	Start time of the checkpoint phase.
wait checkpoint done	End time of the checkpoint phase.
wait xact start command	Start time of xact.
wait xact commit command	Commit time of xact.
wait io control	Waiting for job execution under I/O control.
security audit write pipe	Waiting for an audit log to be written to the pipe.
wait fetch undo record	Waiting for reading the target undo record.
wait heap hot search buffer	Waiting for reading the Astore tuple that meets the snapshot requirements through the hot link.
wait exclusive lwlock	The starvation prevention mechanism is triggered. A new lightweight lock request waits for the previously blocked lightweight lock to be obtained.

If **wait_status** is **acquire lwlock**, **acquire lock**, or **wait io**, there is an event performing I/O operations or waiting for obtaining the corresponding lightweight lock or transaction lock.

Table 12-454 describes the corresponding wait events when **wait_status** is **acquire lwlock**. If **wait_event** is **extension**, the lightweight lock is dynamically allocated and is not monitored.

Table 12-454 List of wait events corresponding to lightweight locks

wait_event	Description
ShmemIndexLock	Used to protect the primary index table, a hash table, in shared memory.
OidGenLock	Used to prevent different threads from generating the same OID.
XidGenLock	Used to prevent two transactions from obtaining the same XID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
ProcArrayLock	Used to prevent concurrent access to or concurrent modification on ProcArray shared arrays.
SInvalReadLock	Used to prevent concurrent execution with invalid message deletion.
SInvalWriteLock	Used to prevent concurrent execution with invalid message write and deletion.
WALInsertLock	Used to prevent concurrent execution with WAL insertion.
WALWriteLock	Used to prevent concurrent write from a WAL buffer to a disk.
ControlFileLock	Used to prevent concurrent read/write or concurrent write/write on the **pg_control** file.
CheckpointLock	Used to prevent multi-checkpoint concurrent execution.
CLogControlLock	Used to prevent concurrent access to or concurrent modification on the Clog control data structure.
SubtransControlLock	Used to prevent concurrent access to or concurrent modification on the subtransaction control data structure.
MultiXactGenLock	Used to allocate a unique MultiXact ID in serial mode.
MultiXactOffsetControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/offset**.
MultiXactMemberControlLock	Used to prevent concurrent read/write or concurrent write/write on **pg_multixact/members**.
RelCacheInitLock	Used to add a lock before any operations are performed on the **init** file when messages are invalid.
CheckpointerCommLock	Used to send file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
TwoPhaseStateLock	Used to prevent concurrent access to or modification on two-phase information sharing arrays.
TablespaceCreateLock	Used to check whether a tablespace exists.
BtreeVacuumLock	Used to prevent VACUUM from clearing pages that are being used by B-tree indexes.
AlterPortLock	Used to protect the CN's operation of changing the registered port number.
AutovacuumLock	Used to access the autovacuum worker array in serial mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
AutovacuumScheduleLock	Used to distribute tables requiring VACUUM in serial mode.
AutoanalyzeLock	Used to obtain and release resources related to a task that allows for autoanalyze execution.
SyncScanLock	Used to determine the start position of a relfilenode during heap scanning.
NodeTableLock	Used to protect a shared structure that stores CN and DN node information.
PoolerLock	Used to prevent two threads from simultaneously obtaining the same connection from a connection pool.
RelationMappingLock	Used to wait for the mapping file between system catalogs and storage locations to be updated.
Async Ctl	Used to protect asynchronization buffers.
AsyncCtlLock	Used to prevent concurrent access to or concurrent modification on the sharing notification status.
AsyncQueueLock	Used to prevent concurrent access to or concurrent modification on the sharing notification queue.
SerializableXactHashLock	Used to prevent concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
SerializableFinishedListLock	Used to prevent concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
SerializablePredicateLockListLock	Used to protect a linked list of serializable transactions that have locks.
OldSerXidLock	Used to protect a structure that records serializable transactions that have conflicts.
FileStatLock	Used to protect a data structure that stores statistics file information.
SyncRepLock	Used to protect Xlog synchronization information during primary/standby replication.
DataSyncRepLock	Used to protect data page synchronization information during primary/standby replication.
MetaCacheSweepLock	Used to add a lock when metadata is cyclically washed out.
ExtensionConnectorLibLock	Used to add a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
SearchServerLibLock	Used to add a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
LsnXlogChkFileLock	Used to serially update the Xlog flush points for primary and standby nodes recorded in a specific structure.
GTMHostInfoLock	Used to prevent concurrent access to or concurrent modification on GTM host information.
ReplicationSlotAllocationLock	Used to add a lock when a primary node allocates streaming replication slots during primary/standby replication.
ReplicationSlot-ControlLock	Used to prevent concurrent update of streaming replication slot status during primary/standby replication.
ResourcePoolHashLock	Used to prevent concurrent access to or concurrent modification on a resource pool table, a hash table.
OBSGetPathLock	Used to prevent concurrent read/write or concurrent write/write on an OBS path.
JobShmemLock	Used to protect global variables in the shared memory that is periodically read during a scheduled job where MPP is compatible with Oracle Database.
OBSRuntimeLock	Used to obtain environment variables, for example, *GAUSSHOME*.
LLVMDumpIRLock	Used to export the assembly language for dynamically generating functions.
LLVMParseIRLock	Used to compile and parse a finished IR function from the IR file at the start position of a query.
CriticalCacheBuildLock	Used to load caches from a shared or local cache initialization file.
WaitCountHashLock	Used to protect a shared structure in user statement counting scenarios.
BufMappingLock	Used to protect operations on a shared-buffer mapping table.
LockMgrLock	Used to protect a common lock structure.
PredicateLockMgrLock	Used to protect a lock structure that has serializable transactions.
OperatorRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
OperatorHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
SessionRealTLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
SessionHistLock	Used to prevent concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
CacheSlotMappingLock	Used to protect global CU cache information.
BarrierLock	Used to ensure that only one thread is creating a barrier at a time.
GPCCommitLock	Used to protect the addition of the global plan cache hash table.
GPCClearLock	Used to protect the clearing of the global plan cache hash table.
GPCTimelineLock	Used to protect the timeline check of the global plan cache hash table.
GPCMappingLock	Used to manage the global plan cache.
GPCPrepareMappingLock	Used to manage the global plan cache.
GPRCMappingLock	Used to manage the access and modification operations of the global cache hash table of autonomous transactions.
BufFreelistLock	Used to ensure the atomicity of free list operations in the shared buffer.
AddinShmemInitLock	Used to protect the initialization of the shared memory object.
wait active statement	Waiting for job execution under resource and load control.
wait memory	Waiting for obtaining the memory.
DnUsedSpaceHashLock	Used to update space usage information corresponding to a session.
InstanceRealTLock	Used to protect the update of the hash table that stores shared instance statistics.
IOStatLock	Used to concurrently maintain the hash table of resource management I/O statistics.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
PldebugLock	Used to debug stored procedures and perform concurrent maintenance operations.
StartBlockMappingLock	Used by globalstat to obtain information such as startblockarray from pgstat.
GlobalSeqLock	Used to manage global sequence numbers.
MatviewSeqnoLock	Used to manage the cache of materialized views.
DataFileIdCache-Lock	Used to manage the concurrent access and storage of hash table that stores data file descriptor in the shared memory.
GTMHostInfoLock	Used to protect the concurrent access and storage of shared GTM host information.
TwoPhaseStatePartLock	Used to protect the status information of two-phase transactions (in each partition).
WALBufMappingLock	Used to protect the mapping between WAL buffer page and LSN offset.
UndoZoneLock	Used to protect the concurrent access and storage of undo zone.
RollbackReqHashLock	Used to protect the concurrent access and storage of hash table that stores the rollback request in the shared memory.
UHeapStatLock	Used to protect the concurrent access and storage of Ustore statistics.
WALWritePaxosLock	Used to protect the concurrent sequence of WALs written to the paxos replication component.
SyncPaxosLock	Used to protect the concurrent access and storage of paxos synchronization queue.
BackgroundWorkerLock	Used to protect the concurrent sequence of background workers.
HadrSwitchoverLock	Used to protect the concurrent sequence of DR switchover.
HashUidLock	Used to protect the concurrent sequence of UID allocation.
ParallelDecodeLock	Used to protect the concurrent sequence of parallel decoding.
XLogMaxCSNLock	Used to protect the maximum volume of CSNs that can be restored locally in DR mode.
DisasterCacheLock	Used to protect the concurrent access and storage of DR cache information in the shared memory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
MaxCSNArrayLock	Used to protect the restoration progress of standby node CSNs in each shard in the shared memory.
RepairBadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
DropArchiveSlot-Lock	Used to protect the concurrent sequence of deleting the archive slot.
ProcXactMappingLock	Used to protect the concurrent access and storage of the hash table that stores the mapping information between transaction IDs and threads.
UndoPerZoneLock	Used to protect the concurrent access and storage of each information in undo zone.
UndoSpaceLock	Used to protect the concurrent access and storage of undo space.
SnapshotBlockLock	Used to control the concurrent sequence of snapshot-based backup and disk flushing.
DWSingleFlushFirstLock	Used to control the concurrent sequence of non-segment-pages and single-page doublewrite files.
DWSingleFlushSecondLock	Used to control the concurrent sequence of segment-pages and single-page doublewrite files.
DWSingleFlushSecondBufTagLock	Used to control the concurrent access and storage of metadata of segment-pages and single-page doublewrite files.
RestartPointQueueLock	Used to control the concurrent access and storage of restart point arrays on the standby node.
UnlinkRelHashTblLock	Used to protect the concurrent access and storage of the hash table that restores files to be deleted.
UnlinkRelForkHashTblLock	Used to protect the concurrent access and storage of the hash table that restores the fork files to be deleted.
WALFlushWait	Used to protect the concurrent sequence of log flushing.
WALConsensusWait	Used to protect the transaction commit or log replay which is performed only when the logs are consistent.
WALBufferInitWait	Used to protect the initialization and disk flushing sequence of WAL pages in the shared memory.
WALInitSegment	Used to protect the initialization sequence of WAL segment files.
SegmentHeadPartitionLock	Used to protect the partition lock of metadata in the segment-page header.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
PgwrSyncQueueLock	Used to protect the concurrent access and storage of file queues to be flushed to disks.
BarrierHashTblLock	Used to protect the concurrent access and storage of barrier tables in the shared memory.
PageRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired pages.
FileRepairHashTblLock	Used to protect the concurrent access and storage of the hash table that stores repaired files.
BadBlockStatHashLock	Used to protect the concurrent access and storage of the hash table that stores damaged pages in the shared memory.
BufferIOLock	Used to protect the concurrent I/O for loading or evicting a single page in the shared buffer.
BufferContentLock	Used to protect the concurrent read and write operations on a single page in the shared buffer.
CUSlotListLock	Used to protect the concurrent access and storage of the slot linked list in the shared CU.
DataCacheLock	Used to protect the concurrent access and storage of the read-only cache in the shared CU.
MetaCacheLock	Used to protect the concurrent access and storage of the meta cache in the shared CU.
CBMParseXlogLock	Used to control the concurrent access and storage of CBM files.
CLogBufMappingLock	Used to control the concurrent access and storage of mapping in the shared clog page.
CLOG Ctl	Used to control the concurrent access and storage of each clog partition.
CSNBufMappingLock	Used to control the concurrent access and storage of mapping in the shared csnlog page.
CSNLOG Ctl	Used to control the concurrent access and storage of each csnlog partition.
DelayDDLLock	Used to control the concurrent sequence of DDL and delay backup function of the deletion.
DoubleWriteLock	Used to control the concurrent sequence of double write module.
DfsConnectorCacheLock	Used to control the concurrent access and storage of dfs connection cache.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
DfsUserLoginLock	Used to control the concurrent sequence of dfs user login.
DfsSpaceCacheLock	Used to control the concurrent sequence of dfs space management cache.
PGPROCLock	Used to protect the concurrent access and storage of global shared thread array.
RelfilenodeReuseLock	Used to control the concurrent sequence of file name reuse.
ReplicationSlot-Lock	Used to protect the concurrent access and storage of logical replication slot.
LogicalReplicationSlotPersistent-DataLock	Used to control the concurrent access and storage of logical replication slot persistence.
RowPageReplicationLock	Used to control the concurrent sequence of row-store page replication.
MultiXactOffset Ctl	Used to protect the concurrent access and storage of multixact offset document.
MultiXactMember Ctl	Used to protect the concurrent access and storage of multixact member document.
OldSerXid SLRU Ctl	Used to protect the concurrent access and storage of oldser transaction ID cache.
FullBuildXlogCopyStartPtrLock	Used to control the concurrent access and storage of the start point of full build request.
RcvWriteLock	Used to control the concurrent sequence of WAL receiver writer.
XlogRemoveSegLock	Used to control the concurrent access and storage of latest deleted WAL document.
CsnMinLock	Used to control the concurrent access and storage of CSN MIN
HypoIndexLock	Used to create, delete and reset the virtual index by the lightweight lock.
XGBoostLibLock	Used by DB4AI to call the XGBoost library.
InstrUserLockId	Used to protect the concurrent modification of the hash table that stores user login and logout records.
GsStackLock	Used to ensure that the gs_stack function is not concurrently called.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
InstrStmtTrackCtlLock	Used to protect the concurrent access and storage of the hash table when full SQL statements are dynamically enabled.
CaptureViewFile-HashLock	Used to protect the concurrent access and storage of the hash table when capturing the performance view.
UniqueSqlEvictLock	Used to protect the concurrent access and storage of the hash table when the unique SQL reclamation is enabled.
ASPMappingLock	Used to manage the concurrent access and storage of the ASP hash table.
AuditIndexFileLock	Used to protect concurrent read and write of index files in the audit log.
SQLAdvisorLock	Used to manage the concurrent access and storage of recommended hash tables in distribution key management.
BlockchainVersionLock	Used to control the concurrent read and write of global block numbers in the ledger database.
GlobalPrevHashLock	Used to control the concurrent read and write of global verification hash tables in the ledger database.
LWTRANCHE_ACCOUNT_TABLE	Used to control the concurrent read and write of the hash table that stores the account locking status.

Table 12-455 describes the corresponding wait events when **wait_status** is **wait io**.

Table 12-455 List of I/O wait events

wait_event	Description
BufFileRead	Reads data from a temporary file to a specified buffer.
BufFileWrite	Writes the content of a specified buffer to a temporary file.
ControlFileRead	Reads the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileSync	Flushes the **pg_control** file to a disk, mainly during database initialization.
ControlFileSyncUpdate	Flushes the **pg_control** file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
ControlFileWrite	Writes the **pg_control** file, mainly during database initialization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
ControlFileWriteUpdate	Updates the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
CopyFileRead	Reads a file during file copying.
CopyFileWrite	Writes a file during file copying.
DataFileExtend	Writes a file during file name extension.
DataFileFlush	Flushes a table data file to a disk.
DataFileImmediateSync	Flushes a table data file to a disk immediately.
DataFilePrefetch	Reads a table data file asynchronously.
DataFileRead	Reads a table data file synchronously.
DataFileSync	Flushes table data file modifications to a disk.
DataFileTruncate	Truncates a table data file.
DataFileWrite	Writes a table data file.
LockFileAddToDataDirRead	Reads the **postmaster.pid** file.
LockFileAddToDataDirSync	Flushes the **postmaster.pid** file to a disk.
LockFileAddToDataDirWrite	Writes PID information into the **postmaster.pid** file.
LockFileCreateRead	Reads the LockFile file **%s.lock**.
LockFileCreateSync	Flushes the LockFile file **%s.lock** to a disk.
LockFileCreateWRITE	Writes PID information into the LockFile file **%s.lock**.
NgroupDestoryLock	Adds a lock to the concurrent modification of the Node Group hash table.
NGroupMappingLock	Adds a lock to the concurrent modification of a single bucket that protects the NodeGroup hash table.
RelationMapRead	Reads the mapping file between system catalogs and storage locations.
RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
ReplicationSlotRead	Reads a streaming replication slot file during a restart.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk during a restart.
ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
SLRUFlushSync	Flushes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files to a disk, mainly during checkpoint execution and database shutdown.
SLRURead	Reads the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.
SLRUSync	Writes dirty pages into the **pg_clog**, **pg_subtrans**, and **pg_multixact** files, and flushes the files to a disk, mainly during checkpoint execution and database shutdown.
SLRUWrite	Writes the **pg_clog**, **pg_subtrans**, and **pg_multixact** files.
TimelineHistoryRead	Reads the timeline history file during database startup.
TimelineHistorySync	Flushes the **timelinehistory** file to a disk during database startup.
TimelineHistoryWrite	Writes to the timeline history file during database startup.
TwophaseFileRead	Reads the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
TwophaseFileSync	Flushes the **pg_twophase** file to a disk, mainly during two-phase transaction commit and restoration.
TwophaseFileWrite	Writes the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WALInitWrite	Initializes a newly created WAL file to **0** during log reclaiming or writing.
WALRead	Reads data from Xlogs during redo operations on two-phase files.
WALSyncMethodAssign	Flushes all open WAL files to a disk.
WALWrite	Writes a WAL file.
DoubleWriteFileRead	Waits for reading the doublewrite file.
DoubleWriteFileSync	Waits for flushing the doublewrite file to the disk.
DoubleWriteFileWrite	Waits for writing the doublewrite file.
PredoProcessPending	Waits for the replay of the remaining records processing in parallel.
PredoApply	Waits for the replay of the application in parallel.
DisableConnectFileRead	Waits for reading the lock segment file.
DisableConnectFileSync	Waits for flushing lock segment files to the disk.
DisableConnectFileWrite	Waits for writing the lock segment file
BufHashTableSearch	Used to search the hash table in the shared buffer (page eviction may be triggered).
buffer_strategy_get	Used to obtain pages from strategy buffer (page eviction may be triggered).
UndoFileExtend	Used to extend an undo file.
UndoFilePrefetch	Used to prefetch an undo file.
UndoFileRead	Used to read an undo file.
UndoFileWrite	Used to write an undo file.
UndoFileSync	Flushes an undo file to a disk.
UndoFileUnlink	Deletes an undo file.
UndoMetaSync	Flushes an undo metadata file to a disk.
WALBufferAccess	Accesses WAL buffer. (To ensure performance, only the number of access times is counted in the kernel code, and the access duration is not counted.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wait_event	Description
WALBufferFull	Writes WAL files when the WAL buffer is full.
DWSingleFlushGet-Pos	Searches for an available location for a single-page doublewrite file.
DWSingleFlushWrite	Flushes a single-page doublewrite file to a disk.
CkptWaitPageWriter-Flush	Waits for page refreshing during full checkpoint execution.
CkptWaitPageWriter-Sync	Waits for the modified file to be synchronized to the disk before checkpointing.
CkptWaitCommitTransactionFinish	Waits until all transactions are committed before checkpointing.
MPFL_INIT	Initiates max_page_flush_lsn.
MPFL_READ	Reads max_page_flush_lsn.
MPFL_WRITE	Writes max_page_flush_lsn.
OBSList	Traverses an OBS directory.
OBSRead	Reads an OBS object.
OBSWrite	Writes an OBS object.
LOGCTRL_SLEEP	Waits for the standby node to catch up with logs.
ShareStorageWal-Read	Reads log files from the shared disk.
ShareStorageWal-Write	Writes log files to the shared disk.
ShareStorageCtlInfo-Read	Reads control information from the shared disk.
ShareStorageCtlInfo-Write	Writes control information to the shared disk.
SegFileExtend	Extends segment-page files.
SegReadDisk	Reads segment-page files.
SegWriteDisk	Writes segment-page files.
SegSync	Flushes segment-page files.
SegFileShrink	Collapses segment-page files.

Table 12-456 describes the corresponding wait events when **wait_status** is **acquire lock**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-456 List of wait events corresponding to transaction locks

wait_event	Description
relation	Adds a lock to a table.
extend	Adds a lock to a table being scaled out.
partition	Adds a lock to a partitioned table.
partition_seq	Adds a lock to a partition of a partitioned table.
page	Adds a lock to a table page.
tuple	Adds a lock to a tuple on a page.
transactionid	Adds a lock to a transaction ID.
virtualxid	Adds a lock to a virtual transaction ID.
object	Adds a lock to an object.
userlock	Adds a lock to a user.
advisory	Adds an advisory lock.
filenode	Locks a file name.
subtransactionid	Adds a lock to a sub-transaction ID.
tuple_uid	Used to add a lock to the UID hidden column in the tuple header.

12.3.14.180 PG_TIMEZONE_ABBREVS

PG_TIMEZONE_ABBREVS displays information about all available time zones.

Table 12-457 PG_TIMEZONE_ABBREVS columns

Name	Type	Description
abbrev	text	Time zone name abbreviation
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is **true**. Otherwise, the value is **false**.

12.3.14.181 PG_TIMEZONE_NAMES

PG_TIMEZONE_NAMES displays all time zone names that can be recognized by **SET TIMEZONE**, along with their abbreviations, UTC offsets, and daylight saving time (DST) statuses.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-458 PG_TIMEZONE_NAMES columns

Name	Type	Description
name	text	Name of the time zone
abbrev	text	Abbreviation of the ime zone name
utc_offset	interval	Offset from UTC
is_dst	boolean	Whether DST is used. If DST is used, the value is **true**. Otherwise, the value is **false**.

12.3.14.182 PG_TOTAL_MEMORY_DETAIL

PG_TOTAL_MEMORY_DETAIL displays memory usage of a node in the database.

Table 12-459 PG_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name
memorytype	text	Memory name
memorymbytes	integer	Size of the used memory, in MB

12.3.14.183 PG_TOTAL_USER_RESOURCE_INFO

PG_TOTAL_USER_RESOURCE_INFO displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**. I/O monitoring items are valid only when **enable_logical_io_statistics** is set to **on**.

Table 12-460 PG_TOTAL_USER_RESOURCE_INFO columns

Name	Type	Description
username	name	Username
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use. CPU usage data is collected only in complex jobs, and the value is the CPU usage of the related Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used permanent table storage space, in KB
total_space	bigint	Available permanent table storage space, in KB (**-1** if the storage space is not limited)
used_temp_space	bigint	Used temporary space, in KB
total_temp_space	bigint	Total available temporary space, in KB (**-1** if the temporary space is not limited)
used_spill_space	bigint	Size of the used operator flushing space, in KB
total_spill_space	bigint	Total size of the available operator flushing space, in KB (**-1** if the space is not limited)
read_kbytes	bigint	CN: total bytes read by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes read by the user's complex jobs from the instance startup time to the current time, in KB
write_kbytes	bigint	CN: total bytes written by the user's complex jobs on all DNs in the last 5 seconds, in KB DN: total bytes written by the user's complex jobs from the instance startup time to the current time, in KB
read_counts	bigint	CN: total number of read times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of read times of the user's complex jobs from the instance startup time to the current time
write_counts	bigint	CN: total number of write times of the user's complex jobs on all DNs in the last 5 seconds DN: total number of write times of the user's complex jobs from the instance startup time to the current time
read_speed	double precision	CN: average read rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average read rate of the user's complex jobs on the DN in the last 5 seconds, in KB/s

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
write_speed	double precision	CN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s DN: average write rate of the user's complex jobs on a single DN in the last 5 seconds, in KB/s

12.3.14.184 PG_TOTAL_USER_RESOURCE_INFO_OID

PG_TOTAL_USER_RESOURCE_INFO_OID displays resource usage of all users. Only administrators can query this view. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**.

Table 12-461 PG_TOTAL_USER_RESOURCE_INFO_OID columns

Name	Type	Description
userid	oid	User ID
used_memory	integer	Used memory, in MB
total_memory	integer	Available memory, in MB. The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	double precision	Number of CPU cores in use
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node
used_space	bigint	Used storage space, in KB
total_space	bigint	Available storage space, in KB. The value **-1** indicates that the space is not limited.
used_temp_space	bigint	Used temporary storage space, in KB
total_temp_space	bigint	Total available temporary space, in KB. The value **-1** indicates that the space is not limited.
used_spill_space	bigint	Used disk space for spilling, in KB
total_spill_space	bigint	Total available disk space for spilling, in KB. The value **-1** indicates that the space is not limited.
read_kbytes	bigint	Volume of data read from the disk, in KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
write_kbytes	bigint	Volume of data written to the disk, in KB.
read_counts	bigint	Number of disk read times.
write_counts	bigint	Number of disk write times.
read_speed	double precision	Disk read rate, in B/ms.
write_speed	double precision	Disk write rate, in B/ms.

12.3.14.185 PG_VARIABLE_INFO

PGXC_VARIABLE_INFO records information about transaction IDs and OIDs of the current node in a cluster.

Table 12-462 PG_VARIABLE_INFO columns

Name	Type	Description
node_name	text	Node name
next_oid	oid	OID generated next time for the node
next_xid	xid	Transaction ID generated next time for the node
oldest_xid	xid	Oldest transaction ID on the node
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node
last_extend_csn_logpage	xid	Number of the last extended csnlog page
start_extend_csn_logpage	xid	Number of the page from which csnlog extending starts
next_commit_seqno	xid	CSN generated next time for the node
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback
startup_max_xid	xid	Last transaction ID before the node is powered off

12.3.14.186 PG_VIEWS

PG_VIEWS provides access to basic information about each view in the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-463 PG_VIEWS columns

Name	Type	Reference	Description
schemaname	name	PG_NAMESPACE.nspname	Name of the schema that contains the view
viewname	name	PG_CLASS.relname	View name
viewowner	name	PG_AUTHID.Erolname	Owner of the view
definition	text	-	Definition of the view

12.3.14.187 PGXC_GET_STAT_ALL_TABLES

PGXC_GET_STAT_ALL_TABLES displays information about insertion, update, and deletion operations on tables and the dirty page rate of tables. Before running **VACUUM FULL** to a system catalog with a high dirty page rate, ensure that no user is performing operations on it. This view is a new feature of GaussDB, and will not collect statistics on insertion, update, and deletion operations in earlier versions. You are advised to run **VACUUM FULL** to tables (excluding system catalogs) whose dirty page rate exceeds 30% or run it based on service scenarios. Only users with the system admin or monitor admin permission can view the information. For details about the columns, see **Table 12-464**.

Table 12-464 PGXC_GET_STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID
relname	name	Table name
schemaname	name	Schema name of a table.
n_tup_ins	numeric	Number of inserted tuples
n_tup_upd	numeric	Number of updated tuples
n_tup_del	numeric	Number of deleted tuples
n_live_tup	numeric	Number of live tuples
n_dead_tup	numeric	Number of dead tuples It indicates the number of inactive row pointers in Ustore tables.
dirty_page_rate	numeric(5,2)	Dirty page rate (%) of a table

12.3.14.188 PGXC_GET_TABLE_SKEWNESS

PGXC_GET_TABLE_SKEWNESS stores the data skew on tables in the current database. Only the system administrator has the permission to access.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-465 PGXC_GET_TABLE_SKEWNESS columns

Name	Type	Description
schemaname	name	Schema name of a table
tablename	name	Table name
totalsize	numeric	Total size of the table, in bytes
avgsize	numeric(1000,0)	Average table size (total table size divided by the number of DNs), which is the ideal size of tables distributed on each DN
maxratio	numeric(4,3)	Ratio of the maximum table size on a single DN to the total table size
minratio	numeric(4,3)	Ratio of the minimum table size on a single DN to the total table size
skewsize	bigint	Table skew rate (the maximum table size on a single DN minus the minimum table size on a single DN)
skewratio	numeric(4,3)	Table skew rate (skew size divided by total table size)
skewstddev	numeric(1000,0)	Standard deviation of table distribution (For two tables of the same size, a larger deviation indicates a more severe skew.)

12.3.14.189 PGXC_NODE_ENV

PGXC_NODE_ENV provides environmental variables of all nodes in a cluster. This view can be viewed only by the monitor admin and sysadmin users.

Table 12-466 PGXC_NODE_ENV columns

Name	Type	Description
node_name1	text	All node names in the cluster
host1	text	Host names of all the nodes in the cluster
process1	integer	Process IDs of all the nodes in the cluster
port1	integer	Port numbers of all the nodes in the cluster
installpath1	text	Installation directory of all the nodes in the cluster
datapath1	text	Data directory of all the nodes in the cluster

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
log_directory1	text	Log directory of all the nodes in the cluster

12.3.14.190 PGXC_OS_THREADS

PGXC_OS_THREADS displays thread status information under all normal nodes in the current cluster. This view can be viewed only by the monitor admin and sysadmin users. For details about the columns, see **Table 12-467**.

Table 12-467 PGXC_OS_THREADS columns

Name	Type	Description
node_name	text	Names of normal nodes in a cluster.
pid	bigint	IDs of running threads among normal node processes in the current cluster.
lwpid	integer	Lightweight thread ID corresponding to the PID
thread_name	text	Thread name corresponding to the PID
creation_time	timestamp with time zone	Thread creation time corresponding to the PID
dbid	oid	ID of the database to which a thread belongs.

12.3.14.191 PGXC_PREPARED_XACTS

PGXC_PREPARED_XACTS displays two-phase transactions in the **prepared** phase. Only users with the system admin or monitor admin permission can view the information.

Table 12-468 PGXC_PREPARED_XACTS columns

Name	Type	Description
pgxc_prepared_xact	text	Displays the two-phase transaction in the **prepared** phase.

12.3.14.192 PGXC_RUNNING_XACTS

PGXC_RUNNING_XACTS displays information about running transactions on each node in the cluster. The content is the same as that displayed by

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

PG_RUNNING_XACTS. Only users with the system admin or monitor admin permission can view the information. For details about the columns, see **Table 12-469**.

Table 12-469 PGXC_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status. (**3**: prepared; **0**: starting.)
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	boolean	Specifies whether the current transaction is lazy vacuum. • **t** (true): yes. • **f** (false): no.
timeline	bigint	Number of database restarts.
prepare_xid	xid	Transaction ID in the **prepared** state. If the status is not **prepared**, the value is **0**.
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

12.3.14.193 PGXC_STAT_ACTIVITY

PGXC_STAT_ACTIVITY displays information about the current user's queries on all CNs in the current cluster. Only users with the **monitor admin** or **sysadmin** permission can view the view. Three columns are added to version 505.0.0. During the gray upgrade observation period, an error is reported. You need to use PG_STAT_ACTIVITY to directly connect to the target node for query. For details about the columns, see **Table 12-470**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-470 PGXC_STAT_ACTIVITY columns

Name	Type	Description
coorname	text	Name of a CN in the current cluster.
datid	oid	OID of the database that the user session connects to in the backend.
datname	text	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
sessionid	bigint	Session ID.
usesysid	oid	OID of the user logged in to the backend.
usename	text	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **null**, either the client is connected via a Unix socket on the server machine or this is an internal process such as autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null for IP connections only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when the current transaction was started (**null** if no transaction is active). If the current query is the first of its transaction, this column is equal to the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or if **state** is not **active**, when the last query was started.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state_change	timestamp with time zone	Time when the last **status** was changed.
waiting	boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is **true**. Otherwise, the value is **false**. If a lock is being waited for on a DN, determine the DN based on the **wait_status** column in the pg_thread_wait_status view and query the **waiting** column in pg_stat_activity on the DN to check whether a lock wait occurs.
enqueue	text	Queuing status of a statement. Its value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Backend status. Its value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Only system administrators can view the session status of their accounts. The state information of other accounts is empty. For example, after user **judy** is connected to the database, the state information of user **joe** and the initial user **omm** in **pgxc_stat_activity** is empty. SELECT datname, usename, usesysid, state,pid FROM pgxc_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+--------+----------------- testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | | 139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | | 139968643069712 testdb | omm | 10 | | 139968680818448 testdb | joe | 16390 | | 139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user
query_id	bigint	ID of a query statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
connection_info	text	A string in JSON format recording the driver type, driver version, driver deployment path, and process owner of the connected database. For details, see the GUC parameter **connection_info**.
global_sessionid	text	Global session ID.
unique_sql_id	bigint	Unique SQL statement ID
trace_id	text	Driver-specific trace ID, which is associated with an application request.
top_xid	xid	Top-level transaction ID of a transaction.
current_xid	xid	Current transaction ID of a transaction.
xlog_quantity	bigint	Amount of Xlogs currently used by a transaction, in bytes.

12.3.14.194 PGXC_STAT_BAD_BLOCK

PGXC_STAT_BAD_BLOCK displays statistics about page verification failures after all nodes in a cluster are started. Only users with the SYSADMIN and MONADMIN permissions can query this view. For details about the columns, see **Table 12-471**.

Table 12-471 PGXC_STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	File object ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
forknum	integer	File type. The options are as follows: • **0**: main data file. • **1**: FSM file. • **2**: VM file. • **3**: BCM file.
error_count	integer	Number of verification failures.
first_time	timestamp with time zone	Time of the first verification failure.
last_time	timestamp with time zone	Time of the latest verification failure.

12.3.14.195 PGXC_SQL_COUNT

PGXC_SQL_COUNT displays node-level and user-level statistical results for the **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO** statements in real time, identifies query types with heavy load, and measures the capability of a cluster or node to perform a specific type of query. For example, you can calculate QPS based on the quantities of the five types of SQL statements at certain time points. **USER1 SELECT** is counted as **X1** at T1 and as **X2** at T2. The **SELECT** QPS of the user can be calculated as follows: (X2 – X1)/(T2 – T1). In this way, the system can draw cluster-user-level QPS curve graphs and determine cluster throughput, tracing changes in the service load of each user. If there are drastic changes, the system can locate the specific statement type (such as **SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**). You can also observe QPS curves to determine the time points when problems occur and then locate the problems using other tools. The curves provide a basis for optimizing cluster performance and locating problems. This view can be viewed only by the monitor admin and sysadmin users. The query can be performed only on the CN. The **execute direct on (dn)'select * from PGXC_SQL_COUNT';** statement is not supported.

Columns in the **PGXC_SQL_COUNT** view are the same as those in the **GS_SQL_COUNT** view. For details, see **Table 12-364**.

NOTE

If a **MERGE INTO** statement can be pushed down and a DN receives it, the statement will be counted on the DN and the value of the **mergeinto_count** column will be incremented by 1. If pushdown is not allowed, the DN will receive an **UPDATE** or **INSERT** statement. In this case, the **update_count** or **insert_count** column will be incremented by 1.

12.3.14.196 PGXC_THREAD_WAIT_STATUS

In **PGXC_THREAD_WAIT_STATUS**, you can see all the call layer hierarchy relationship between threads of the SQL statements on all the nodes in a cluster, and the waiting status of the block for each thread, so that you can easily locate the causes of process response failures and similar phenomena.

The definitions of **PGXC_THREAD_WAIT_STATUS** view and **PG_THREAD_WAIT_STATUS** view are the same, because the essence of the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

PGXC_THREAD_WAIT_STATUS view is the query summary of the **PG_THREAD_WAIT_STATUS** view on each node in the cluster.

Table 12-472 PGXC_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Current node name
db_name	text	Database name
thread_name	text	Thread name
query_id	bigint	Query ID. It is equivalent to **debug_query_id**.
tid	bigint	Thread ID of the current thread
sessionid	bigint	Session ID
lwtid	integer	Lightweight thread ID of the current thread
psessionid	bigint	Parent session ID
tlevel	integer	Level of the streaming thread
smpid	integer	Concurrent thread ID
wait_status	text	Detailed information about the waiting status of the current thread
wait_event	text	Event that the current thread is waiting for. For details, see **Table 12-453**.
locktag	text	Information about the lock that the current thread is waiting for
lockmode	text	Lock mode that the current thread is waiting to obtain
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock
global_sessionid	text	Global session ID

Example:

If you run a statement on coordinator1 and no response is returned after a long period of time, establish another connection to coordinator1 to check the thread status on it.

```
gaussdb=# select * from pg_thread_wait_status where query_id > 0;
-[ RECORD 1 ]----+-------------------------------------
node_name        | cn_5001

12.3.14.197 PGXC_TOTAL_MEMORY_DETAIL

PGXC_TOTAL_MEMORY_DETAIL displays memory usage in the cluster. The query can be performed only on the CN. The EXECUTE DIRECT ON (dn) 'SELECT * FROM PGXC_TOTAL_MEMORY_DETAIL'; statement is not supported. Only users with the SYSADMIN and monitor admin permissions can query this view. For details about the columns, see **Table 12-473**.

Table 12-473 PGXC_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name. • **max_process_memory**: memory occupied by a GaussDB cluster instance. • **process_used_memory**: memory occupied by a GaussDB process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic memory peak. • **dynamic_used_shrctx**: maximum dynamic shared memory context. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **max_sctpcomm_memory**: maximum memory allowed for the communications library. • **sctpcomm_used_memory**: memory used by the communications library. • **sctpcomm_peak_memory**: memory peak of the communications library. • **other_used_memory**: other used memory.
memorymbytes	integer	Size of the used memory (unit: MB).

12.3.14.198 PGXC_VARIABLE_INFO

PGXC_VARIABLE_INFO records information about transaction IDs and OIDs of all nodes in a cluster. This view can be viewed only by the monitor admin and sysadmin users. The query can be performed only on the CN. The **execute direct on (dn)'select * from PGXC_VARIABLE_INFO';** statement is not supported. For details about the columns, see **Table 12-474**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-474 PGXC_VARIABLE_INFO columns

Name	Type	Description
node_name	text	Node name.
next_oid	oid	OID generated next time on the node.
next_xid	xid	Transaction ID generated next time on the node.
oldest_xid	xid	Oldest transaction ID on the node.
xid_vac_limit	xid	Critical point (transaction ID) that triggers forcible autovacuum.
oldest_xid_db	oid	OID of the database that has the minimum datafrozenxid on the node.
last_extend_csn_logpage	xid	Number of the last extended CSNlog page.
start_extend_csn_logpage	xid	Number of the page from which CSNlog extending starts.
next_commit_seqno	xid	CSN generated next time for the node.
latest_completed_xid	xid	Latest transaction ID on the node after the transaction commission or rollback.
startup_max_xid	xid	Last transaction ID before the node is powered off.

12.3.14.199 PLAN_TABLE

PLAN_TABLE displays plan information collected by **EXPLAIN PLAN**. Plan information is in a session-level lifecycle. After a session exits, the data will be deleted. Data is isolated between sessions and between users. This view exists in both PG_CATALOG and SYS schemas.

Table 12-475 PLAN_TABLE columns

Name	Type	Description
statement_id	character varying(30)	Query tag specified by a user.
plan_id	bigint	Query ID.
id	integer	ID of each operator in a generated plan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
operation	character varying(30)	Operation description of an operator in a plan.
options	character varying(255)	Operation action.
object_name	name	Object name corresponding to the operation, which is not the object alias used in the query. The object name is defined by users.
object_type	character varying(30)	Object type.
object_owner	name	Schema to which the object belongs. It is defined by users.
projection	character varying(4000)	Returned column information.
cost	double precision	Execution cost estimated by the optimizer for an operator.
cardinality	double precision	Number of rows estimated by the optimizer for an operator.
remarks	character varying(4000)	Not supported. The value is **NULL**.
timestamp	date	Not supported. The value is **NULL**.
object_node	character varying(128)	Not supported. The value is **NULL**.
object_alias	character varying(261)	Not supported. The value is **NULL**.
object_instance	numeric	Not supported. The value is **NULL**.
optimizer	character varying(255)	Not supported. The value is **NULL**.
search_columns	numeric	Not supported. The value is **NULL**.
parent_id	numeric	Not supported. The value is **NULL**.
depth	numeric	Not supported. The value is **NULL**.
position	numeric	Not supported. The value is **NULL**.
bytes	numeric	Not supported. The value is **NULL**.
other_tag	character varying(255)	Not supported. The value is **NULL**.
partition_start	character varying(255)	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
partition_stop	character varying(255)	Not supported. The value is **NULL**.
partition_id	numeric	Not supported. The value is **NULL**.
other	character varying	Not supported. The value is **NULL**.
other_xml	clob	Not supported. The value is **NULL**.
distribution	character varying(20)	Not supported. The value is **NULL**.
cpu_cost	numeric	Not supported. The value is **NULL**.
io_cost	numeric	Not supported. The value is **NULL**.
temp_space	numeric	Not supported. The value is **NULL**.
access_predicates	character varying(4000)	Not supported. The value is **NULL**.
filter_predicates	character varying(4000)	Not supported. The value is **NULL**.
time	numeric	Not supported. The value is **NULL**.
qblock_name	character varying(128)	Not supported. The value is **NULL**.

NOTE

- A valid **object_type** value consists of a relkind type defined in **PG_CLASS** (**TABLE**, **INDEX**, **SEQUENCE**, **VIEW**, **FOREIGN TABLE**, **COMPOSITE TYPE**, or **TOASTVALUE TOAST**) and the rtekind type used in the plan (**SUBQUERY**, **JOIN**, **FUNCTION**, **VALUES**, **CTE**, or **REMOTE_QUERY**).
- For RangeTableEntry (RTE), **object_owner** is the object description used in the plan. Non-user-defined objects do not have **object_owner**.
- Information in the **statement_id**, **object_name**, **object_owner**, and **projection** columns is stored in letter cases specified by users and information in other columns is stored in uppercase.
- **PLAN_TABLE** supports only SELECT and DELETE and does not support other DML operations.

12.3.14.200 PV_FILE_STAT

PV_FILE_STAT records statistics about data file I/O to indicate I/O performance and detect performance problems such as abnormal I/O operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-476 PV_FILE_STAT columns

Name	Type	Description
filenum	oid	File ID
dbid	oid	Database ID
spcid	oid	Tablespace ID
phyrds	bigint	Number of times of reading physical files
phywrts	bigint	Number of times of writing into physical files
phyblkrd	bigint	Number of times of reading physical file blocks
phyblkwrt	bigint	Number of times of writing into physical file blocks
readtim	bigint	Total duration of reading, in microseconds
writetim	bigint	Total duration of writing, in microseconds
avgiotim	bigint	Average duration of reading and writing, in microseconds
lstiotim	bigint	Duration of the last file reading, in microseconds
miniotim	bigint	Minimum duration of reading and writing, in microseconds
maxiowtm	bigint	Maximum duration of reading and writing, in microseconds

12.3.14.201 PV_INSTANCE_TIME

PV_INSTANCE_TIME records time consumption information of the current node. The time consumption information is classified into the following types:

- DB_TIME: effective time spent by jobs in multi-core scenarios
- CPU_TIME: CPU time spent
- EXECUTION_TIME: time spent in executors
- PARSE_TIME: time spent in parsing SQL statements
- PLAN_TIME: time spent on generating plans
- REWRITE_TIME: time spent for SQL rewriting
- PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure
- PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure
- NET_SEND_TIME: time spent on the network
- DATA_IO_TIME: I/O time spent

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-477 PV_INSTANCE_TIME columns

Name	Category	Description
stat_id	integer	Statistics ID
stat_name	text	Type name
value	bigint	Time value, in μs

12.3.14.202 PV_OS_RUN_INFO

PV_OS_RUN_INFO displays the running status of the OS.

Table 12-478 PV_OS_RUN_INFO columns

Name	Type	Description
id	integer	ID
name	text	Name of the OS running status
value	numeric	Value of the OS running status
comments	text	Remarks of the OS running status
cumulative	boolean	Whether the value of the OS running status is cumulative

12.3.14.203 PV_REDO_STAT

PV_REDO_STAT displays statistics on the replay of session thread logs.

Table 12-479 PV_REDO_STAT columns

Name	Type	Description
phywrts	bigint	Number of times that data is written during log replay
phyblkwrt	bigint	Number of data blocks written during log replay
writetim	bigint	Total time required for writing data during log replay
avgiotim	bigint	Average time required for writing data during log replay
lstiotim	bigint	Time consumed by the last data write operation during log replay

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
miniotim	bigint	Minimum time consumed by a single data write operation during log replay
maxiowtm	bigint	Maximum time consumed by a single data write operation during log replay

12.3.14.204 PV_SESSION_MEMORY

PV_SESSION_MEMORY collects statistics about memory usage at the session level, including all the memory allocated to Postgres and Stream threads on DNs for jobs currently executed by users.

Table 12-480 PV_SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID
init_mem	integer	Memory allocated to the currently executed jobs before they enter the executor, in MB
used_mem	integer	Memory allocated to the currently executed jobs, in MB
peak_mem	integer	Peak memory allocated to the currently executed jobs, in MB

12.3.14.205 PV_SESSION_MEMORY_CONTEXT

PV_SESSION_MEMORY_CONTEXT displays statistics on memory usage of all sessions based on the MemoryContext node. This view is valid only when **enable_thread_pool** is set to **on**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-481 PV_SESSION_MEMORY_CONTEXT columns

Name	Type	Description
sessid	text	Session start time + session ID (character string: *timestamp.sessionid*)
threadid	bigint	ID of the thread bound to a session (**-1** if no thread is bound)
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

CAUTION

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

12.3.14.206 PV_SESSION_MEMORY_DETAIL

PV_SESSION_MEMORY_DETAIL displays the memory usage of sessions based on the MemoryContext node. When **enable_thread_pool** is set to **on**, this view contains memory usage of all threads and sessions.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

You can run the SELECT * FROM PV_SESSION_MEMCTX_DETAIL(*threadid*, ''); statement to record information about all memory contexts of a thread into the *threadid_timestamp*.**log** file in the *$GAUSSLOG*/**gs_log**/*${node_name}*/**dumpmem** directory. *threadid* can be obtained from **sessid** in **Table 12-482**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-482 PV_SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	• When the thread pool is disabled (**enable_thread_pool = off**), this column indicates the thread start time + session ID (string: **timestamp.sessionid**). • When the thread pool is enabled (**enable_thread_pool = on**): If the memory context is at the thread level, this column indicates the thread start time + thread ID (string: **timestamp.threadid**). If the memory context is at the session level, the column indicates the thread start time + session ID (string: **timestamp.sessionid**).
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Hierarchy of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the memory context, in bytes.
freesize	bigint	Total size of released memory in the memory context, in bytes.
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

CAUTION

This view is an O&M view and is used to locate memory problems. Do not query this view concurrently. If you query this view concurrently, the waiting time for new connections increases as the number of concurrent connections increases. As a result, new connections cannot be connected for a long time.

12.3.14.207 PV_SESSION_STAT

PV_SESSION_STAT collects statistics about session states based on session threads or the **AutoVacuum** thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-483 PV_SESSION_STAT columns

Name	Type	Description
sessid	text	Thread ID and start time
statid	integer	Statistics ID
statname	text	Name of the statistics session
statunit	text	Unit of the statistics session
value	bigint	Value of the statistics session

12.3.14.208 PV_SESSION_TIME

PV_SESSION_TIME collects statistics about the running time of session threads and time consumed in each execution phase.

Table 12-484 PV_SESSION_TIME columns

Name	Type	Description
sessid	text	Thread ID and start time
stat_id	integer	Statistics ID
stat_name	text	Name of the session type • **DB_TIME**: effective time spent by jobs in multi-core scenarios • **CPU_TIME**: CPU time spent • **EXECUTION_TIME**: time spent within executors • **PARSE_TIME**: time spent on parsing SQL statements • **PLAN_TIME**: time spent on generating plans • **REWRITE_TIME**: time spent on rewriting SQL statements • **PL_EXECUTION_TIME**: execution time of the PL/pgSQL stored procedure • **PL_COMPILATION_TIME**: compilation time of the PL/pgSQL stored procedure • **NET_SEND_TIME**: time spent on the network. • **DATA_IO_TIME**: I/O time spent
value	bigint	Session value

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.209 PV_THREAD_MEMORY_CONTEXT

PV_THREAD_MEMORY_CONTEXT displays statistics about memory usage of all threads based on MemoryContext nodes. This view is equivalent to the **PV_SESSION_MEMORY_DETAIL** view when **enable_thread_pool** is set to **off**.

The memory context **TempSmallContextGroup** collects information about all memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the number of the collected memory contexts is recorded in the **usedsize** column. Therefore, the **totalsize** and **freesize** columns for **TempSmallContextGroup** in the view display the corresponding information about all the memory contexts whose value in the **totalsize** column is less than 8192 bytes in the current thread, and the **usedsize** column displays the number of these memory contexts.

Table 12-485 PV_THREAD_MEMORY_CONTEXT columns

Name	Type	Description
threadid	text	Thread start time + thread ID (string: *timestamp.tsessionid*)
tid	bigint	Thread ID
thrdtype	text	Thread type It can be any thread type in the system, such as wlmmonitor.
contextname	text	Name of the memory context
level	smallint	Hierarchy of the memory context
parent	text	Name of the parent memory context
totalsize	bigint	Total size of the memory context, in bytes
freesize	bigint	Total size of released memory in the current memory context, in bytes
usedsize	bigint	Size of used memory in the memory context, in bytes. For **TempSmallContextGroup**, this parameter specifies the number of collected memory contexts.

12.3.14.210 PV_TOTAL_MEMORY_DETAIL

PV_TOTAL_MEMORY_DETAIL displays statistics about memory usage of the current database node in the unit of MB. For details about the columns, see **Table 12-486**.

Table 12-486 PV_TOTAL_MEMORY_DETAIL columns

Name	Type	Description
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory type. The value must be one of the following: • **max_process_memory**: memory occupied by a GaussDB cluster instance. • **process_used_memory**: memory occupied by a GaussDB process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic peak memory. • **dynamic_used_shrctx**: maximum dynamic shared memory context. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_backend_memory**: maximum memory that can be used when the HA port is used to execute services. • **backend_used_memory**: memory that has been used when the HA port is used to execute services. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **max_sctpcomm_memory**: maximum memory allowed for the communications library. • **sctpcomm_used_memory**: memory used by the communications library. • **sctpcomm_peak_memory**: memory peak of the communications library. • **other_used_memory**: other used memory. • **llvm_used_memory**: memory occupied by the expression IR that is generated by Codegen and is not released.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorymbytes	integer	Size of allocated memory-typed memory.

12.3.14.211 SYS_DUMMY

SYS_DUMMY is automatically created by the database based on the data dictionary. It has only one text column in only one row for storing expression calculation results. It is accessible to all users. This view exists in both PG_CATALOG and SYS schema.

Table 12-487 SYS_DUMMY columns

Name	Type	Description
DUMMY	text	Expression calculation result

12.3.14.212 V_INSTANCE

V_INSTANCE displays instance information in current database. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-488 V_INSTANCE columns

Name	Type	Description
instance_number	oid	OID of the current database
instance_name	character varying(16)	Name of the current database
host_name	character varying(64)	Host name
version	character varying(17)	Not supported. Set it to **NULL**.
version_legacy	character varying(17)	Not supported. Set it to **NULL**.
version_full	character varying(17)	Not supported. Set it to **NULL**.
startup_time	date	Not supported. Set it to **NULL**.
status	character varying(12)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parallel	character varying(3)	Not supported. Set it to **NULL**.
thread#	numeric	Not supported. Set it to **NULL**.
archiver	character varying(7)	Not supported. Set it to **NULL**.
log_switch_wait	character varying(15)	Not supported. Set it to **NULL**.
logins	character varying(10)	Not supported. Set it to **NULL**.
shutdown_pending	character varying(3)	Not supported. Set it to **NULL**.
database_status	character varying(17)	Not supported. Set it to **NULL**.
instance_role	character varying(18)	Not supported. Set it to **NULL**.
active_state	character varying(9)	Not supported. Set it to **NULL**.

family	character varying(80)	Not supported. Set it to **NULL**.
database_type	character varying(15)	Not supported. Set it to **NULL**.

12.3.14.213 V_MYSTAT

V_MYSTAT displays statistics information about all sessions in the database. Only system administrators can access this view. Common users can access this view only after being authorized. This view exists in both the **PG_CATALOG** and **SYS** schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-489 V_MYSTAT columns

Name	Type	Description
sid	numeric	Current session ID
statistic#	numeric	Not supported. Set it to **NULL**.
value	numeric	Not supported. Set it to **NULL**.
con_id	numeric	Not supported. Set it to **NULL**.

12.3.14.214 V_SESSION

V_SESSION describes information about all current sessions. Only administrators can access this view. Common users can access this view only after being authorized. This view exists in both **PG_CATALOG** and **SYS** schemas.

Table 12-490 V_SESSION columns

Name	Type	Description
saddr	raw	Not supported. Set it to **NULL**.
sid	bigint	Session ID
serial#	integer	Sequence number of the active background thread, which is **0** in GaussDB
audsid	numeric	Not supported. Set it to **NULL**.
paddr	raw	Not supported. Set it to **NULL**.
schema#	numeric	Not supported. Set it to **NULL**.
schemaname	name	Name of the user logged in to the backend
user#	oid	OID of the user who has logged in to the background thread (**0** if the background thread is a global auxiliary thread)
username	name	Username of the user who has logged in to the background thread. (null if the background thread is a global auxiliary thread)
command	numeric	Not supported. Set it to **NULL**.
ownerid	numeric	Not supported. Set it to **NULL**.
taddr	character varying(16)	Not supported. Set it to **NULL**.
lockwait	character varying(16)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
machine	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
sql_id	bigint	ID of a query
client_info	text	Client information
event	text	Queuing status of a statement. Its value can be: • **waiting in queue**: The statement is in the queue. • **Empty**: The statement is running.
sql_exec_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if the value of **state** is not **active**
program	text	Name of the application connected to the backend
status	text	Overall status of this backend. Its value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.
server	character varying(9)	Not supported. Set it to **NULL**.
pdml_status	character varying(8)	Specifies whether to enable a DML parallel execution in the current session.
port	numeric	Port number of the current session
process	character varying(24)	Process ID of the current session
logon_time	date	Login time of the current session
last_call_et	integer	Duration when the status of the current session changes last time

12.3.14.215 V$GLOBAL_OPEN_CURSOR

V$GLOBAL_OPEN_CURSOR displays information about all opened cursors on all current nodes. For details about the columns, see **Table 12-491**.

Table 12-491 V$GLOBAL_OPEN_CURSOR columns

Name	Type	Description
node_name	name	Node name.
saddr	raw	Not supported. The value is **NULL**.
sid	numeric	Session ID.
user_name	character varying(128)	Username.
address	raw	Not supported. The value is **NULL**.
hash_value	numeric	Not supported. The value is **NULL**.
sql_id	character varying(13)	ID of a query statement.
sql_text	character varying(60)	First 60 bytes of the SQL text of a cursor.
last_sql_active_time	date	Not supported. The value is **NULL**.
sql_exec_id	numeric	Not supported. The value is **NULL**.
cursor_type	character varying(64)	Cursor type. • **OPEN-PL/SQL**: opened PL/SQL cursor. • **OPEN**: other open cursors.
child_address	raw	Not supported. The value is **NULL**.
con_id	numeric	Not supported. The value is **NULL**.
dbid	oid	ID of the database to which the cursor belongs.

12.3.14.216 V$GLOBAL_TRANSACTION

V$GLOBAL_TRANSACTION displays information about currently active global transactions. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in the **PG_CATALOG** and **SYS** schemas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-492 V$GLOBAL_TRANSACTION columns

Name	Type	Description
formatid	numeric	Global transaction format identifier. If this parameter is not supported, set it to **NULL**.
globalid	raw	Global transaction identifier.
branchid	raw	Global transaction branch identifier. If this parameter is not supported, set it to **NULL**. Each individual transaction of a global transaction is called a branch.
branches	numeric	Total number of global transaction branches.
refcount	numeric	Number of siblings for the global transaction (must be the same as branches).
preparecount	numeric	Number of prepared global transaction branches. If the value of **system_view_version** is greater than **0** and no prepared global transaction branch exists, the value is **0**. Otherwise, the value is **NULL**.
state	character varying(38)	Status of the global transaction branch.
flags	numeric	Numeric representation of the status.
coupling	character varying(15)	Specifies whether the branch is free (`FREE`), loosely coupled (`LOOSELY COUPLED`), or tightly coupled (TIGHTLY COUPLED). If this parameter is not supported, set it to **NULL**.
con_id	numeric	ID of the container related to data. If this parameter is not supported, set it to **0**.

12.3.14.217 V$LOCK

V$LOCK displays information about locks held by open transactions. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-493 V$LOCK columns

Name	Type	Description
addr	raw	Not supported. Set it to **NULL**.
kaddr	raw	Not supported. Set it to **NULL**.
sid	number	ID of the session that owns the lock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type	varchar(2)	TM or TX. • TM: corresponding relation lock in pg_locks. • TX: other locks.
id1	number	• TM lock: **relationId** corresponding to the object ID. • TX lock: not supported. Set to **0**.
id2	number	• TM lock: The default value is **0**. • TX lock: not supported. Set to **0**.
lmode	number	For details, see **Table 12-494**.
request	number	For details, see **Table 12-494**.
ctime	number	Not supported. Set it to **NULL**.
block	number	Specifies whether it is blocked by other sessions. The value **1** indicates yes, and the value **0** indicates no.
con_id	number	Not supported. Set it to **NULL**.
blocksid	bigint	ID of another thread blocked by the current thread.

Table 12-494 Lock mode

Level	GaussDB
-	NULL
0	INVALID
1	AccessShare
2	RowShare
3	RowExclusive
4	ShareUpdateExclusive
5	Share
6	ShareRowExclusive
7	Exclusive
8	AccessExclusive

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.218 V$NLS_PARAMETERS

V$NLS_PARAMETERS displays the National Language Support (NLS) parameters and parameter values configured for the database. This view exists in the **PG_CATALOG** and **SYS** schemas and all users can access this view.

Table 12-495 V$NLS_PARAMETERS columns

Name	Type	Description
parameter	character varying(64)	NLS parameter name
value	character varying(64)	NLS parameter value
con_id	numeric	Not supported. Set it to **0**.

12.3.14.219 V$OPEN_CURSOR

V$OPEN_CURSOR displays information about cursors opened by all sessions on the current node. By default, only the system administrator can access the system view. Common users must be authorized to access the system view. This view exists in the PG_CATALOG and SYS schemas. For details about the columns, see **Table 12-496**.

Table 12-496 V$OPEN_CURSOR columns

Name	Type	Description
saddr	raw	Not supported. The value is **NULL**.
sid	numeric	Session ID.
user_name	character varying(128)	Username.
address	raw	Not supported. The value is **NULL**.
hash_value	numeric	Not supported. The value is **NULL**.
sql_id	character varying(13)	ID of a query statement.
sql_text	character varying(60)	First 60 bytes of the SQL text of a cursor.
last_sql_active_time	date	Not supported. The value is **NULL**.
sql_exec_id	numeric	Not supported. The value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cursor_type	character varying(64)	Cursor type. • **OPEN-PL/SQL**: opened PL/SQL cursor. • **OPEN**: other open cursors.
child_address	raw	Not supported. The value is **NULL**.
con_id	numeric	Not supported. The value is **NULL**.
dbid	oid	ID of the database to which the cursor belongs.

12.3.14.220 V$SESSION_WAIT

V$SESSION_WAIT stores the current wait event or the last wait event of each session of each user. By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-497 V$SESSION_WAIT columns

Name	Type	Description
sid	numeric	Session ID, which is mapped to the **V$SESSION.SID** column.
seq#	numeric	Not supported. Set it to **NULL**.
event	character varying(64)	If the session is waiting, the resource or event that is waiting for is displayed. If the session is not waiting, the resource or event that is waiting for the last time is displayed.
p1text	character varying(64)	Not supported. Set it to **NULL**.
p1	numeric	Not supported. Set it to **NULL**.
p1raw	raw	Not supported. Set it to **NULL**.
p2text	character varying(64)	Not supported. Set it to **NULL**.
p2	numeric	Not supported. Set it to **NULL**.
p2raw	raw	Not supported. Set it to **NULL**.
p3text	character varying(64)	Not supported. Set it to **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
p3	numeric	Not supported. Set it to **NULL**.
p3raw	raw	Not supported. Set it to **NULL**.
wait_class_id	numeric	Not supported. Set it to **NULL**.
wait_class#	numeric	Not supported. Set it to **NULL**.
wait_class	character varying(64)	Name of a wait event type
wait_time	numeric	If the session is waiting, the value is **0**. If the session is not waiting, the options are as follows: ● **>0**: duration of the last wait (unit: centisecond). ● **-1**: The duration of the last wait is less than a centisecond. ● **-2**: The **TIMED_STATISTICS** parameter is set to **false**. This column has been deprecated and replaced by **WAIT_TIME_MICRO** and **STATE**.
seconds_in_wait	numeric	If the session is waiting, the value is the amount of time to wait. If the session is not waiting, the value is the amount of time since the last wait started. This column has been deprecated and replaced by the **WAIT_TIME_MICRO** and **TIME_SINCE_LAST_WAIT_MICRO** columns.
state	character varying(19)	Waiting state. The options are as follows: ● **WAITING**: The session is waiting. ● **WAITED UNKNOWN TIME**: The duration of the last wait is unknown. This value is used when **TIMED_STATISTICS** is set to **false**. ● **WAITED SHORT TIME**: The duration of the last wait is less than a centisecond. ● **WAITED KNOWN TIME**: duration of the last wait specified in the **WAIT_TIME** column.
wait_time_micro	numeric	Wait time, in microseconds. If the session is waiting, the value is the time spent in the current wait. If the session is not waiting, the value is the time spent for the last wait.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
time_remaining_micro	numeric	Not supported. Set it to **NULL**.
time_since_last_wait_micro	numeric	Time elapsed since the last wait ended, in microseconds. If the session is waiting, the value is **0**.
con_id	numeric	Not supported. Set it to **0**.

12.3.14.221 V$SYSSTAT

V$SYSSTAT displays the resource usage of the entire database instance since the database instance starts to run. By default, only the initial user or monitoring administrator can access the database. Other users can access the database only after being granted the MONADMIN permission. This view exists in the **PG_CATALOG** and **SYS** schemas. Contact an administrator to enable the memory resource management function in the Arm environment.

Table 12-498 V$SYSSTAT columns

Name	Type	Description
statistic#	numeric	Statistics ID.
name	character varying(64)	Statistical item name.
class	numeric	Not supported. Set it to null.
value	numeric	Statistical item value.
stat_id	numeric	Not supported. Set it to null.
con_id	numeric	Not supported. Set it to **0**.

12.3.14.222 V$SYSTEM_EVENT

V$SYSTEM_EVENT displays information about all the wait events (summary of each wait event since the instance is started). By default, only the system administrator can access this view. Common users can access the view only after being authorized. This view exists in the **PG_CATALOG** and **SYS** schemas.

Table 12-499 V$SYSTEM_EVENT columns

Name	Type	Description
event	character varying(64)	Wait event name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_waits	numeric	Total number of wait events
total_timeouts	numeric	Total number of timeout events
time_waited	numeric	Total time (in centiseconds) of wait events
average_wait	numeric	Average time (in centiseconds) of wait events
time_waited_micro	numeric	Total time (in microseconds) of wait events
total_waits_fg	numeric	Not supported. Set it to **NULL**.
total_timeouts_fg	numeric	Not supported. Set it to **NULL**.
time_waited_fg	numeric	Not supported. Set it to **NULL**.
average_wait_fg	numeric	Not supported. Set it to **NULL**.
time_waited_micro_fg	numeric	Not supported. Set it to **NULL**.
event_id	numeric	Not supported. Set it to **NULL**.
wait_class_id	numeric	Not supported. Set it to **NULL**.
wait_class#	numeric	Not supported. Set it to **NULL**.
wait_class	character varying(64)	Class name of a wait event
con_id	numeric	Not supported. Set it to **0**.

12.3.14.223 V$VERSION

V$VERSION displays the version number of the database. This view exists in the PG_CATALOG and SYS schemas and all users can access this view. For details about the columns, see **Table 12-500**.

Table 12-500 V$VERSION columns

Name	Type	Description
banner	character varying(80)	Component name and version number.
banner_full	character varying(160)	Database version and specific version number.
banner_legacy	character varying(80)	Database version.
con_id	numeric	Not supported. It is always **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.3.14.224 GS_GTT_ATTACHED_PIDS

GS_GTT_ATTACHED_PIDS is used to check which sessions are using global temporary tables on DNs by calling the gs_gtt_attached_pid() function.

Table 12-501 GS_GTT_ATTACHED_PIDS columns

Name	Type	Description
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relid	oid	OID of a global temporary table.
pids	bigint	Session ID.
cn_session_ids	text[]	List of global session IDs on the CN in distributed mode.

12.3.14.225 GS_GLOBAL_GTT_ATTACHED_PIDS

GS_GLOBAL_GTT_ATTACHED_PIDS displays which sessions are using global temporary tables on DNs on a CN.

Table 12-502 GS_GLOBAL_GTT_ATTACHED_PIDS columns

Name	Type	Description
node_name	text	Node name.
schemaname	name	Schema name.
tablename	name	Name of a global temporary table.
relid	oid	OID of a global temporary table.
pids	bigint	Session ID.
cn_session_ids	text[]	List of global session IDs on the CN in distributed mode.

12.3.14.226 GS_GLOBAL_DIST_GTT_REMAIN_SESSIONS

GS_GLOBAL_DIST_GTT_REMAIN_SESSIONS displays all session information that remains on DNs on a CN.

Table 12-503 GS_GTT_ATTACHED_PIDS columns

Name	Type	Description
dn_name	text	DN name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cn_name	text	CN name.
cn_timeline	int	Timeline of the CN.
cn_sequence	int	Session sequence of the CN.
cn_session_id	bigint	Session ID of the CN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13 Schemas

Table 13-1 describes the schemas of GaussDB.

NOTE

Do not create service data of users in a schema that provides functional APIs, including but not limited to tables and functions (such as dbe_* and pkg_*).

Table 13-1 Schemas supported in GaussDB

Schema	Description
dbe_perf	Diagnoses performance issues and is also the data source of WDR snapshots. After a database is installed, only the initial user and MONADMIN have permission to view views and functions in the **DBE_PERF** schema by default.
snapshot	Manages data related to WDR snapshots. By default, the initial user or MONADMIN can access the data.
sqladvsior	Recommends distribution keys. For details, see **Distribution Key Recommendation Functions**.
sys	Provides the system information view APIs.
pg_catalog	Maintains system catalog information, including system catalogs and all built-in data types, functions, and operators.
pg_toast	Stores large objects (for internal use).
public	Public schema, which is used to store public objects. If **search_path** is not specified and a schema with the same name exists, new tables (and other objects) are created in the schema by default. If no schema with the same name exists, new tables (and other objects) are automatically placed in this public schema.
pkg_service	Manages information about the package service.
pkg_util	Manages information about the package tool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Schema	Description
dbe_raw	Advanced function package dbe_raw, which is used to convert raw data, obtain substrings, and calculate the length.
dbe_session	Advanced function package **dbe_session**, which is used to set the value of a specified attribute and support user query and verification.
dbe_lob	Advanced function package dbe_lob, which is used to read, write, and copy large files (CLOB/BLOB).
dbe_match	Advanced function package **dbe_match**, which is used to compare character string similarity.
dbe_task	Advanced function package **dbe_task**, which is used to schedule job tasks, including committing tasks, canceling tasks, synchronizing task status, and updating task information, so that the database can periodically execute specific tasks.
dbe_sql	Advanced function package **dbe_sql**, which is used to execute dynamic SQL statements and construct query and other commands during application running.
dbe_file	Advanced function package **dbe_file**, which is used to read, copy, write, delete, and rename external database files.
dbe_output	Advanced function package **dbe_output**, which is used to print output information.
dbe_random	Advanced function package **dbe_random**, which is used to generate random seeds and random numbers.
dbe_application_info	Advanced function package **dbe_application_info**, which is used for recording client information.
dbe_utility	Advanced function package **dbe_utility**, which is used to call the debugging tool in a stored procedure, for example, to print error stacks.
dbe_scheduler	Advanced function package **dbe_scheduler**, which is used to create scheduled jobs and enable the database to periodically execute specified tasks through programs and schedules. You can also perform external database tasks by authorizing and providing certificates.
information_schema	Stores information about objects defined in the current database.
dbe_sql_util	SQL O&M function, including the O&M API of SQL patches.
dbe_xmlgen	Advanced function package **dbe_xmlgen**, which is used to convert query results into XML character strings.
dbe_describe	Advanced function package **dbe_describe**, which is used to query parameter information about stored procedures or functions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-2 Schemas disabled in GaussDB

Schema	Description
dbe_pldebugger	Debugs PL/SQL functions and stored procedures. Currently, this view is not supported. An error message "unsupported" is displayed when the API is called in this view.
db4ai	Manages data of different versions in AI training.

13.1 Information Schema

An information schema named INFORMATION_SCHEMA automatically exists in all databases. An information schema consists of a group of views that contain information about objects defined in the current database. The owner of this schema is the initial database user. However, all users have only the permission to use this schema and do not have the permission to create objects such as tables and functions.

Information schemas are compatible with PG, including constraint_table_usage, domain_constraints, domain_udt_usage, domains, enabled_roles, key_column_usage, parameters, referential_constraints, applicable_roles, administrable_role_authorizations, attributes, character_sets, check_constraint_routine_usage, check_constraints, collations, collation_character_set_applicability, column_domain_usage, column_privileges, column_udt_usage, columns, constraint_column_usage, role_column_grants, routine_privileges, role_routine_grants, routines, schemata, sequences, table_constraints, table_privileges, role_table_grants, tables, triggered_update_columns, udt_privileges, role_udt_grants, usage_privileges, role_usage_grants, user_defined_types, view_column_usage, view_routine_usage, view_table_usage, views, data_type_privileges, element_types, column_options, foreign_data_wrapper_options, foreign_data_wrappers, foreign_server_options, foreign_servers, foreign_table_options, foreign_tables, user_mapping_options, user_mappings, sql_features, sql_implementation_info, sql_languages, sql_packages, sql_parts, sql_sizing, and sql_sizing_profiles.

The following sections display only the views that are not listed in the preceding description.

13.1.1 _PG_FOREIGN_DATA_WRAPPERS

Displays information about a foreign-data wrapper, as described in **Table 13-3**. Only the sysadmin user has the permission to view this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-3 _PG_FOREIGN_DATA_WRAPPERS columns

Name	Type	Description
oid	oid	OID of the foreign-data wrapper.
fdwowner	oid	OID of the owner of the foreign-data wrapper.
fdwoptions	text[]	Foreign-data wrapper specific option, expressed in a string in the format of *keyword*=*value*.
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database).
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper.
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign-data wrapper.
foreign_data_wrapper_language	information_schema.character_data	Programming language of the foreign-data wrapper.

13.1.2 _PG_FOREIGN_SERVERS

Displays information about a foreign server, as described in **Table 13-4**. Only the sysadmin user has the permission to view this view.

Table 13-4 _PG_FOREIGN_SERVERS columns

Name	Type	Description
oid	oid	OID of the foreign server.
srvoptions	text[]	Foreign server specific options, expressed in a string in the format of *keyword*=*value*.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
foreign_data_wrapper_catalog	information_schema.sql_identifier	Name of the database where the foreign-data wrapper is located (always the current database).
foreign_data_wrapper_name	information_schema.sql_identifier	Name of the foreign-data wrapper.
foreign_server_type	information_schema.character_data	Type of the foreign server.
foreign_server_version	information_schema.character_data	Version of the foreign server.
authorization_identifier	information_schema.sql_identifier	Role of the owner of the foreign server.

13.1.3 _PG_FOREIGN_TABLE_COLUMNS

Displays column information about a foreign table, as described in **Table 13-5**. Only the sysadmin user has the permission to view this view.

Table 13-5 _PG_FOREIGN_TABLE_COLUMNS columns

Name	Type	Description
nspname	name	Schema name.
relname	name	Table name.
attname	name	Column name.
attfdwoptions	text[]	Attribute-level foreign data wrapper options, expressed in a string in the format of *keyword*=*value*.

13.1.4 _PG_FOREIGN_TABLES

Stores information about all foreign tables defined in the current database, as described in **Table 13-6**, whereas displays information about foreign tables accessible to the current user. Only the sysadmin user has the permission to view this view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-6 _PG_FOREIGN_TABLES columns

Name	Type	Description
foreign_table_catalog	information_schema.sql_identifier	Name of the database where the foreign table is located (always the current database).
foreign_table_schema	name	Name of the schema that the foreign table is in.
foreign_table_name	name	Name of the foreign table.
ftoptions	text[]	Foreign table options.
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
authorization_identifier	information_schema.sql_identifier	Role of the owner.

13.1.5 _PG_USER_MAPPINGS

Stores mappings from local users to remote users, as described in **Table 13-7**. Only the sysadmin user has the permission to view this view.

Table 13-7 _PG_USER_MAPPINGS columns

Name	Type	Description
oid	oid	OID of the mapping from the local user to a remote user.
umoptions	text[]	User mapping specific options, expressed in a string in the format of *keyword*=*value*.
umuser	oid	OID of the local user being mapped (**0** if the user mapping is public).
authorization_identifier	information_schema.sql_identifier	Role of the local user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
foreign_server_catalog	information_schema.sql_identifier	Name of the database where the foreign server is located (always the current database).
foreign_server_name	information_schema.sql_identifier	Name of the foreign server.
srvowner	information_schema.sql_identifier	Owner of the foreign server.

13.1.6 INFORMATION_SCHEMA_CATALOG_NAME

Displays the name of the current database, as described in **Table 13-8**.

Table 13-8 INFORMATION_SCHEMA_CATALOG_NAME columns

Name	Type	Description
catalog_name	information_schema.sql_identifier	Current database name.

13.1.7 INFORMATION_SCHEMA.TRIGGERS

Displays all triggers defined on the tables and views in the current database. Only the triggers owned by the current user or those on which the current user has permissions other than SELECT are displayed, as shown in **Table 13-9**.

Table 13-9 INFORMATION_SCHEMA.TRIGGERS columns

Name	Type	Description
trigger_catalog	information_schema.sql_identifier	Name of the database that contains the trigger.
trigger_schema	information_schema.sql_identifier	Name of the schema that contains the trigger.
trigger_name	information_schema.sql_identifier	Trigger name.
event_manipulation	information_schema.character_data	Type of the event that triggers the trigger. The value can be **INSERT**, **UPDATE**, or **DELETE**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
event_object_catalog	information_schema.sql_identifier	Name of the database that contains the table where the trigger is located.
event_object_schema	information_schema.sql_identifier	Name of the schema that contains the table where the trigger is located.
event_object_table	information_schema.sql_identifier	Name of the table where the trigger is located.
action_order	information_schema.cardinal_number	Trigger sequence of triggers with the same **event_manipulation**, **action_timing** and **action_orientation** in the same table.
action_condition	information_schema.character_data	WHEN condition of a trigger. By default, this column is left blank.
action_statement	information_schema.character_data	Statement executed by the trigger.
action_orientation	information_schema.character_data	Specifies whether the trigger fires once for each row being processed or once for each statement.
action_timing	information_schema.character_data	Time when a trigger is triggered. The value can be **BEFORE**, **AFTER**, or **INSTEAD OF**.
action_reference_old_table	information_schema.sql_identifier	This parameter is meaningless and is left blank.
action_reference_new_table	information_schema.sql_identifier	This parameter is meaningless and is left blank.
action_reference_old_row	information_schema.sql_identifier	This parameter is meaningless and is left blank.
action_reference_new_row	information_schema.sql_identifier	This parameter is meaningless and is left blank.
created	information_schema.time_stamp	This parameter is meaningless and is left blank.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

INFORMATION_SCHEMA.TRIGGERS displays only triggers whose event types are INSERT, UPDATE, and DELETE.

13.2 DBE_PERF Schema

In the **DBE_PERF** schema, views are used to diagnose performance issues and are also the data source of WDR snapshots. After a database is installed, only the initial user and monitoring administrator have permission to view views and functions in the **DBE_PERF** scheme by default. To ensure forward compatibility, the permission on the dbe_perf schema has no change before and after an upgrade. In the current version, all users are not allowed to create operators in this schema. Existing operators are not affected. Organization views are divided based on multiple dimensions, such as OS, instance, and memory. These views comply with the following naming rules:

- A view starting with **GLOBAL_** requests data from a CN/DN and returns the data without processing the data.
- A view starting with **SUMMARY_** summarizes data in a cluster. In most cases, data from a CN/DN (sometimes only a CN) is processed, aggregated, and returned.
- A view that does not start with **GLOBAL_** or **SUMMARY_** is a local view and does not request data from any other CN/DN.

13.2.1 OS

13.2.1.1 OS_RUNTIME

Displays the running status of the current OS, as described in **Table 13-10**.

Table 13-10 OS_RUNTIME columns

Name	Type	Description
id	integer	ID.
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	Boolean	Specifies whether the value of the OS running status is cumulative.

13.2.1.2 GLOBAL_OS_RUNTIME

Provides OS running status information about all normal nodes in the entire cluster, as described in **Table 13-11**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-11 GLOBAL_OS_RUNTIME columns

Name	Type	Description
node_name	name	Node name.
id	integer	ID.
name	text	Name of the OS running status.
value	numeric	Value of the OS running status.
comments	text	Remarks of the OS running status.
cumulative	Boolean	Specifies whether the value of the OS running status is cumulative.

13.2.1.3 OS_THREADS

Provides status information about all threads on the current node, as described in **Table 13-12**.

Table 13-12 OS_THREADS columns

Name	Type	Description
node_name	text	Current node name.
pid	bigint	ID of the thread running within the current node process.
lwpid	integer	Lightweight thread ID corresponding to the PID.
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.
dbid	oid	ID of the database to which a thread belongs.

13.2.1.4 GLOBAL_OS_THREADS

Provides status information about threads on all normal nodes in the entire cluster, as described in **Table 13-13**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-13 GLOBAL_OS_THREADS columns

Name	Type	Description
node_name	text	Current node name.
pid	bigint	ID of the thread running within the current node process.
lwpid	integer	Lightweight thread ID corresponding to the PID.
thread_name	text	Thread name corresponding to the PID.
creation_time	timestamp with time zone	Thread creation time corresponding to the PID.
dbid	oid	ID of the database to which a thread belongs.

13.2.1.5 PERF_QUERY

Provides the name, tree structure, and percentage of the stack information collected on the current node, as described in **Table 13-14**. The monadmin permission is required.

Before using this view to query stack information, you need to execute the gs_perf_start function to collect flame graph data.

Table 13-14 PERF_QUERY columns

Name	Type	Description
backtrace	text	Text of the stack information tree structure.
overhead	double precision	Percentage of the time occupied by the current stack information in the entire stack collection process.

13.2.2 Instance

13.2.2.1 INSTANCE_TIME

Provides various time consumption information under the current cluster node, as described in **Table 13-15**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-15 INSTANCE_TIME columns

Name	Type	Description
stat_id	integer	Statistics ID.
stat_name	text	Type name. • DB_TIME: effective time spent by jobs in multi-core scenarios. • CPU_TIME: CPU time cost. • EXECUTION_TIME: time spent in the executor. • PARSE_TIME: time spent on parsing SQL statements. • PLAN_TIME: time spent on generating plans. • REWRITE_TIME: time spent on rewriting SQL statements. • PL_EXECUTION_TIME: execution time of the PL/SQL stored procedure. • PL_COMPILATION_TIME: compilation time of the PL/SQL stored procedure. • NET_SEND_TIME: time spent on the network. • DATA_IO_TIME: I/O time spent.
value	bigint	Time value (unit: μs).

13.2.2.2 GLOBAL_INSTANCE_TIME

Provides various time consumption information under all normal nodes in the entire cluster, as described in **Table 13-16**.

Table 13-16 GLOBAL_INSTANCE_TIME columns

Name	Type	Description
node_name	name	Node name.
stat_id	integer	Statistics ID.
stat_name	text	Type name. See the INSTANCE_TIME view.
value	bigint	Time value (unit: μs).

13.2.3 Memory

13.2.3.1 MEMORY_NODE_DETAIL

Displays memory usage of a node in the database, as described in **Table 13-17**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-17 MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name.
memorytype	text	Memory name. • **max_process_memory**: maximum available memory of the database node. • **process_used_memory**: memory occupied by a process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic peak memory. • **dynamic_used_shrctx**: context of the used dynamic shared memory. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **max_sctpcomm_memory**: maximum memory allowed for TCP proxy communication. • **sctpcomm_used_memory**: used memory for TCP proxy communication. • **sctpcomm_peak_memory**: peak memory of TCP proxy communication. • **other_used_memory**: other used memory. • **gpu_max_dynamic_memory**: maximum dynamic GPU memory. • **gpu_dynamic_used_memory**: used dynamic GPU memory. • **gpu_dynamic_peak_memory**: dynamic peak GPU memory. • **pooler_conn_memory**: memory allocated to the connection pool. • **pooler_freeconn_memory**: memory occupied by idle connections in the connection pool. • **storage_compress_memory**: memory used by the storage module for compression. • **udf_reserved_memory**: reserved memory for the UDF.
memorymbytes	integer	Size of the used memory, in MB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.3.2 GLOBAL_MEMORY_NODE_DETAIL

Displays the memory usage on all normal nodes in the cluster, as described in **Table 13-18**.

Table 13-18 GLOBAL_MEMORY_NODE_DETAIL columns

Name	Type	Description
nodename	text	Node name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
memorytype	text	Memory name. • **max_process_memory**: maximum available memory of the database node. • **process_used_memory**: memory occupied by a process. • **max_dynamic_memory**: maximum dynamic memory. • **dynamic_used_memory**: used dynamic memory. • **dynamic_peak_memory**: dynamic peak memory. • **dynamic_used_shrctx**: context of the used dynamic shared memory. • **dynamic_peak_shrctx**: dynamic peak value of the shared memory context. • **max_shared_memory**: maximum shared memory. • **shared_used_memory**: used shared memory. • **max_sctpcomm_memory**: maximum memory allowed for TCP proxy communication. • **sctpcomm_used_memory**: used memory for TCP proxy communication. • **sctpcomm_peak_memory**: peak memory of TCP proxy communication. • **other_used_memory**: other used memory. • **gpu_max_dynamic_memory**: maximum dynamic GPU memory. • **gpu_dynamic_used_memory**: used dynamic GPU memory. • **gpu_dynamic_peak_memory**: dynamic peak GPU memory. • **pooler_conn_memory**: memory allocated to the connection pool. • **pooler_freeconn_memory**: memory occupied by idle connections in the connection pool. • **storage_compress_memory**: memory used by the storage module for compression. • **udf_reserved_memory**: reserved memory for the UDF.
memorymbytes	integer	Size of the used memory, in MB.

13.2.3.3 MEMORY_NODE_NG_DETAIL

Table 13-19 describes the memory usage of a node group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-19 MEMORY_NODE_NG_DETAIL columns

Name	Type	Description
ngname	text	Node group name.
memorytype	text	Memory name. • **ng_total_memory**: total memory configured in the node group. • **ng_used_memory**: used memory. • **ng_estimate_memory**: memory used by the optimizer for evaluation. • **ng_foreignrp_memsize**: memory configured in the foreign resource pool. • **ng_foreignrp_usedsize**: memory used by the foreign resource pool. • **ng_foreignrp_peaksize**: peak memory used by the foreign resource pool. • **ng_foreignrp_mempct**: percentage of the system memory configured in attributes of the foreign resource pool. • **ng_foreignrp_estmsize**: memory used by the optimizer for job evaluation in the foreign resource pool.
memorymbytes	integer	Size of the used memory in the unit of MB.

13.2.3.4 SHARED_MEMORY_DETAIL

Displays the usage information about shared memory contexts on the current node, as shown in **Table 13-20**.

Table 13-20 SHARED_MEMORY_DETAIL columns

Name	Type	Description
contextname	text	Name of the memory context.
level	smallint	Level of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory (unit: byte).
freesize	bigint	Remaining size of the shared memory (unit: byte).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
usedsize	bigint	Used size of the shared memory (unit: byte).

13.2.3.5 GLOBAL_SHARED_MEMORY_DETAIL

Displays the usage information about shared memory contexts on all normal nodes in the entire cluster, as described in **Table 13-21**.

Table 13-21 GLOBAL_SHARED_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name.
contextname	text	Name of the memory context.
level	smallint	Level of the memory context.
parent	text	Name of the parent memory context.
totalsize	bigint	Total size of the shared memory (unit: byte).
freesize	bigint	Remaining size of the shared memory (unit: byte).
usedsize	bigint	Used size of the shared memory (unit: byte).

13.2.4 File

13.2.4.1 FILE_IOSTAT

Records statistics about data file I/Os to indicate I/O performance and detect performance problems such as abnormal I/O operations, as described in **Table 13-22**.

Table 13-22 FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
readtim	bigint	Total duration of reading (unit: μs).
writetim	bigint	Total duration of writing (unit: μs).
avgiotim	bigint	Average duration of reading and writing (unit: μs).
lstiotim	bigint	Duration of the last file reading (unit: μs).
miniotim	bigint	Minimum duration of reading and writing (unit: μs).
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs).

13.2.4.2 SUMMARY_FILE_IOSTAT

Records the summary of statistics about data file I/Os of each node in the cluster to reflect performance issues such as exceptions in I/O operations, as described in **Table 13-23**.

The values of **phyrds**, **phywrts**, **phyblkrd**, **phyblkwrt**, **readtim** and **writetim** are summed up based on the data of each node. **avgiotim** is the average value (total duration/total times) of each node. **lstiotim** and **maxiowtm** are the maximum values of each node. **miniotim** is the minimum value of each node.

Table 13-23 SUMMARY_FILE_IOSTAT columns

Name	Type	Description
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	numeric	Number of times of reading physical files.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.
readtim	numeric	Total duration of reading (unit: μs).
writetim	numeric	Total duration of writing (unit: μs).
avgiotim	bigint	Average duration of reading and writing (unit: μs).
lstiotim	bigint	Duration of the last file reading (unit: μs).
miniotim	bigint	Minimum duration of reading and writing (unit: μs).
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs).

13.2.4.3 GLOBAL_FILE_IOSTAT

Displays statistics about data file I/Os on all nodes in the cluster, as described in **Table 13-24**.

Table 13-24 GLOBAL_FILE_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
filenum	oid	File ID.
dbid	oid	Database ID.
spcid	oid	Tablespace ID.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
readtim	bigint	Total duration of reading (unit: μs).
writetim	bigint	Total duration of writing (unit: μs).
avgiotim	bigint	Average duration of reading and writing (unit: μs).
lstiotim	bigint	Duration of the last file reading (unit: μs).
miniotim	bigint	Minimum duration of reading and writing (unit: μs).
maxiowtm	bigint	Maximum duration of reading and writing (unit: μs).

13.2.4.4 FILE_REDO_IOSTAT

Records statistics about redo logs (WALs) on the current node, as described in **Table 13-25**.

Table 13-25 FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: μs).
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). **avgiotim** = **writetim**/ **phywrts**.
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs).

13.2.4.5 SUMMARY_FILE_REDO_IOSTAT

Records redo log (WAL) statistics of all nodes in the cluster, as described in **Table 13-26**. The values of the **phywrts**, **phyblkwrt**, and **writetim** columns are

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

accumulated based on the data of each node. The value of **avgiotim** is the average value of each node (summed up **writetim** or **phywrts**). The values of **lstiotim** and **maxiowtm** are the maximum values of each node, and the value of **miniotim** is the minimum value of each node.

Table 13-26 SUMMARY_FILE_REDO_IOSTAT columns

Name	Type	Description
phywrts	numeric	Number of times writing into the WAL buffer.
phyblkwrt	numeric	Number of blocks written into the WAL buffer.
writetim	numeric	Duration of writing into Xlog files (unit: μs).
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). The value is **writetim** divided by **phywrts**.
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs).

13.2.4.6 GLOBAL_FILE_REDO_IOSTAT

Displays statistics about redo logs (WALs) on nodes in the cluster, as described in **Table 13-27**.

Table 13-27 GLOBAL_FILE_REDO_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
phywrts	bigint	Number of times writing into the WAL buffer.
phyblkwrt	bigint	Number of blocks written into the WAL buffer.
writetim	bigint	Duration of writing into Xlog files (unit: μs).
avgiotim	bigint	Average duration of writing into Xlog files (unit: μs). The value is **writetim** divided by **phywrts**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lstiotim	bigint	Duration of the last writing into Xlog files (unit: μs).
miniotim	bigint	Minimum duration of writing into Xlog files (unit: μs).
maxiowtm	bigint	Maximum duration of writing into Xlog files (unit: μs).

13.2.4.7 LOCAL_REL_IOSTAT

Displays the accumulated I/O status of all data files on the current node, as described in **Table 13-28**.

Table 13-28 LOCAL_REL_IOSTAT columns

Name	Type	Description
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
dbid	oid	In the distributed database, the value is always **0**.

13.2.4.8 GLOBAL_REL_IOSTAT

Obtains statistics about data file I/Os on all nodes in the cluster, as described in **Table 13-29**.

Table 13-29 GLOBAL_REL_IOSTAT columns

Name	Type	Description
node_name	name	Node name.
phyrds	bigint	Number of times of reading physical files.
phywrts	bigint	Number of times of writing into physical files.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
phyblkrd	bigint	Number of times of reading physical file blocks.
phyblkwrt	bigint	Number of times of writing into physical file blocks.
dbid	oid	In the distributed database, the value is always **0**.

13.2.4.9 SUMMARY_REL_IOSTAT

Obtains statistics about data file I/Os on all nodes, as described in **Table 13-30**.

Table 13-30 SUMMARY_REL_IOSTAT columns

Name	Type	Description
phyrds	numeric	Number of times of reading physical files.
phywrts	numeric	Number of times of writing into physical files.
phyblkrd	numeric	Number of times of reading physical file blocks.
phyblkwrt	numeric	Number of times of writing into physical file blocks.
dbid	oid	In the distributed database, the value is always **0**.

13.2.5 Object

13.2.5.1 STAT_USER_TABLES

Displays the status information about user-defined ordinary tables in all schemas on the current node, as described in **Table 13-31**.

Table 13-31 STAT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.2 SUMMARY_STAT_USER_TABLES

Displays the sum of the status information about user-defined ordinary tables in all schemas of a cluster. It is used on the CN. The status information about user-defined ordinary tables on each DN is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in **Table 13-32**.

Table 13-32 SUMMARY_STAT_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.
n_dead_tup	numeric	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times the table has been manually analyzed.
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

13.2.5.3 GLOBAL_STAT_USER_TABLES

Displays the status of user-defined ordinary tables in all schemas on each node. It is used on CNs. The status information about user-defined ordinary tables on each DN is displayed but not summed up, as described in **Table 13-33**.

Table 13-33 GLOBAL_STAT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which the table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times that the table has been manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	bigint	Number of times that the table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times that the table has been manually analyzed.
autoanalyze_count	bigint	Number of times that the table has been analyzed by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.5.4 STAT_USER_INDEXES

Displays the index status information about the user-defined ordinary tables on the current node, as described in **Table 13-34**.

Table 13-34 STAT_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.5 SUMMARY_STAT_USER_INDEXES

Displays the index status statistics of user-defined ordinary tables in all schemas of a cluster. It applies to CNs only and the index status information about user-defined ordinary tables on each CN is summed up, as described in **Table 13-35**.

Table 13-35 SUMMARY_STAT_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

13.2.5.6 GLOBAL_STAT_USER_INDEXES

Displays the index status information about user-defined ordinary tables in all schemas on each node. The information is about CNs and DNs. It is used on CNs and information is not summed up, as described in **Table 13-36**.

Table 13-36 GLOBAL_STAT_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

13.2.5.7 STAT_SYS_TABLES

Displays status information about all the system catalogs in the pg_catalog, information_schema, and pg_toast schemas on the current node, as described in **Table 13-37**.

Table 13-37 STAT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times the table has been manually vacuumed (not counting **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.8 SUMMARY_STAT_SYS_TABLES

Displays the status statistics of all system catalogs in the pg_catalog, information_schema, and pg_toast schemas in the cluster. The statistics are used on CNs and include data on CNs and DNs. The status information in the system catalog on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in **Table 13-38**.

Table 13-38 SUMMARY_STAT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_dead_tup	numeric	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times the table has been manually analyzed.
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.

13.2.5.9 GLOBAL_STAT_SYS_TABLES

Displays the status information of all system catalogs in pg_catalog, information_schema, and pg_toast modes on each node in the cluster. The status information includes that of CNs and DNs. It is used on CNs and is not summed up, as described in **Table 13-39**.

Table 13-39 GLOBAL_STAT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

13.2.5.10 STAT_SYS_INDEXES

Displays index status information about all the system catalogs in the pg_catalog, information_schema, and pg_toast schemas, as described in **Table 13-40**.

Table 13-40 STAT_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.11 SUMMARY_STAT_SYS_INDEXES

Displays the index status statistics of all system catalogs in the pg_catalog, information_schema, and pg_toast schemas of all nodes in the cluster. It is used on CNs and the index status information of system catalogs on each node is summed up, as described in **Table 13-41**.

Table 13-41 SUMMARY_STAT_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.

13.2.5.12 GLOBAL_STAT_SYS_INDEXES

Displays the index status information of all system catalogs in pg_catalog, information_schema, and pg_toast schemas on each node. The index status information is about CNs and DNs. It is used on CNs and information is not summed up, as described in **Table 13-42**.

Table 13-42 GLOBAL_STAT_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.

13.2.5.13 STAT_ALL_TABLES

Displays the status of each table (including the TOAST table) of the current node in the database, as described in **Table 13-43**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-43 STAT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.14 SUMMARY_STAT_ALL_TABLES

Displays the sum of the status information of each table (including the TOAST table) in the cluster database. It is used on the CN. The status information in the table on each node is summed up. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in **Table 13-44**.

Table 13-44 SUMMARY_STAT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	numeric	Estimated number of live rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_dead_tup	numeric	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	numeric	Number of times this table is manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	numeric	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	numeric	Number of times the table has been manually analyzed.
autoanalyze_count	numeric	Number of times the table has been analyzed by the autovacuum daemon thread.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.5.15 GLOBAL_STAT_ALL_TABLES

Displays the status of each table (including the TOAST table) on each node. It is used on CNs and the status of each table on each node is not summed up, as described in **Table 13-45**.

Table 13-45 GLOBAL_STAT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).
n_live_tup	bigint	Estimated number of live rows.
n_dead_tup	bigint	Estimated number of inactive rows. It indicates the number of inactive row pointers in Ustore tables.
last_vacuum	timestamp with time zone	Last time at which this table was manually vacuumed (excluding **VACUUM FULL**).
last_autovacuum	timestamp with time zone	Last time when the table was vacuumed by the autovacuum daemon thread.
last_analyze	timestamp with time zone	Last time at which the table was manually analyzed.
last_autoanalyze	timestamp with time zone	Last time when the table was analyzed by the autovacuum daemon thread.
vacuum_count	bigint	Number of times this table is manually vacuumed (excluding **VACUUM FULL**).
autovacuum_count	bigint	Number of times this table has been vacuumed by the autovacuum daemon.
analyze_count	bigint	Number of times the table has been manually analyzed.
autoanalyze_count	bigint	Number of times the table has been analyzed by the autovacuum daemon thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.5.16 STAT_ALL_INDEXES

Displays the access information about each index of the current node in the database, as described in **Table 13-46**.

Table 13-46 STAT_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.5.17 SUMMARY_STAT_ALL_INDEXES

Displays the access statistics of each index on each database node in a cluster. It is used on CNs. The access statistics of each node index are summed up. The timestamp column is not summed up, and only the latest value of the column on all nodes is used, as described in **Table 13-47**.

Table 13-47 SUMMARY_STAT_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema where the index is located.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	numeric	Number of index scans performed on the index.
idx_tup_read	numeric	Number of index entries returned by scans on the index.
idx_tup_fetch	numeric	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

13.2.5.18 GLOBAL_STAT_ALL_INDEXES

Displays the access information about each index on each node of the database in the cluster. It is used on the CN. The status information of each index on each node is not summed up, as described in **Table 13-48**.

Table 13-48 GLOBAL_STAT_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table for this index.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema where the index is located.
relname	name	Name of the table for the index.
indexrelname	name	Index name.
idx_scan	bigint	Number of index scans performed on the index.
idx_tup_read	bigint	Number of index entries returned by scans on the index.
idx_tup_fetch	bigint	Number of live rows fetched in the original table by a simple index scan that uses the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.5.19 STAT_DATABASE

Displays the statistics of the current node in the database, as described in **Table 13-49**.

Table 13-49 STAT_DATABASE columns

Name	Type	Description
datid	oid	OID of the database.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	bigint	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see **STAT_DATABASE_CONFLICTS**.
temp_files	bigint	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

13.2.5.20 SUMMARY_STAT_DATABASE

Displays the summary of the status information about each database node in the cluster. It is used on CNs. The status information of each node in the database is summed up by database name. The timestamp column is not summed up and only the latest value of this column on all nodes is used, as described in **Table 13-50**.

Table 13-50 SUMMARY_STAT_DATABASE columns

Name	Type	Description
datname	name	Database name.
numbackends	bigint	Number of backends currently connected to this database.
xact_commit	numeric	Number of transactions in this database that have been committed.
xact_rollback	numeric	Number of transactions in this database that have been rolled back.
blks_read	numeric	Number of disk blocks read in this database.
blks_hit	numeric	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tup_returned	numeric	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.
tup_fetched	numeric	Number of rows returned by the current database through indexes.
tup_inserted	bigint	Number of rows inserted.
tup_updated	bigint	Number of rows updated.
tup_deleted	bigint	Number of rows deleted.
conflicts	bigint	Number of queries canceled due to conflicts with database replay (conflicts occur only on the standby node). For details, see STAT_DATABASE_CONFLICTS.
temp_files	numeric	Number of temporary files created by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
temp_bytes	numeric	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

13.2.5.21 GLOBAL_STAT_DATABASE

Displays the statistics of each database node in the cluster, as described in **Table 13-51**. (It is used on CNs and the status statistics of each database are not summed up.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-51 GLOBAL_STAT_DATABASE columns

Name	Type	Description
node_name	name	Node name.
datid	oid	OID of the database.
datname	name	Database name.
numbackends	integer	Number of backends currently connected to this database.
xact_commit	bigint	Number of transactions in this database that have been committed.
xact_rollback	bigint	Number of transactions in this database that have been rolled back.
blks_read	bigint	Number of disk blocks read in this database.
blks_hit	bigint	Number of disk blocks that have been hit in the cache. In this case, data does not need to be read from disks. (The cache includes only the buffer cache and does not include the file system cache of the OS.)
tup_returned	bigint	Number of live rows fetched by sequential scans and number of index rows returned by index scans in the database.

Name	Type	Description
temp_bytes	bigint	Total amount of data written to temporary files by queries in this database. All temporary files are counted, which is not affected by the value of the GUC parameter **log_temp_files**.
deadlocks	bigint	Number of deadlocks detected in this database.
blk_read_time	double precision	Time spent reading data file blocks by backends in this database (unit: ms).
blk_write_time	double precision	Time spent in writing data file blocks by backends in this database (unit: ms).
stats_reset	timestamp with time zone	Time at which the current statistics were reset.

13.2.5.22 STAT_DATABASE_CONFLICTS

Displays statistics about the conflict status of the current node in the database, as described in **Table 13-52**.

Table 13-52 STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

13.2.5.23 SUMMARY_STAT_DATABASE_CONFLICTS

Displays the conflict status statistics of all database nodes in the cluster. It is used on CNs and the conflict status statistics of each node are summed up by database name, as described in **Table 13-53**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-53 SUMMARY_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

13.2.5.24 GLOBAL_STAT_DATABASE_CONFLICTS

Displays statistics about the conflict status of each database node. It is used on CNs and the status information of each database node is not summed up, as described in **Table 13-54**.

Table 13-54 GLOBAL_STAT_DATABASE_CONFLICTS columns

Name	Type	Description
node_name	name	Node name.
datid	oid	Database ID.
datname	name	Database name.
confl_tablespace	bigint	Number of conflicting tablespaces.
confl_lock	bigint	Number of conflicting locks.
confl_snapshot	bigint	Number of conflicting snapshots.
confl_bufferpin	bigint	Number of conflicting buffers.
confl_deadlock	bigint	Number of conflicting deadlocks.

13.2.5.25 STAT_XACT_ALL_TABLES

Displays transaction status information about all ordinary tables and TOAST tables in schemas on the current node, as described in **Table 13-55**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-55 STAT_XACT_ALL_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.26 SUMMARY_STAT_XACT_ALL_TABLES

Displays the transaction status statistics of all ordinary tables and TOAST tables in schemas of all nodes in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name, as described in **Table 13-56**.

Table 13-56 SUMMARY_STAT_XACT_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_del	numeric	Number of rows deleted.
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.27 GLOBAL_STAT_XACT_ALL_TABLES

Displays the transaction status information of all ordinary tables and TOAST tables in the schemas of each node, as described in **Table 13-57**. (It is used on CNs. The transaction status information of the same table name on different nodes is not summed up.)

Table 13-57 GLOBAL_STAT_XACT_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.28 STAT_XACT_SYS_TABLES

Displays transaction status information about the system catalogs in the schemas of the current node, as described in **Table 13-58**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-58 STAT_XACT_SYS_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.29 SUMMARY_STAT_XACT_SYS_TABLES

Displays the transaction status statistics of system catalogs in schemas of all nodes in the cluster. It is used on a CN and the transaction status statistics of tables on each node are summed up by table name, as described in **Table 13-59**.

Table 13-59 SUMMARY_STAT_XACT_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.30 GLOBAL_STAT_XACT_SYS_TABLES

Displays the transaction status information of the system catalogs in the schemas of each node, as described in **Table 13-60**. (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

Table 13-60 GLOBAL_STAT_XACT_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.31 STAT_XACT_USER_TABLES

Displays transaction status information about the user tables in schemas on the current node, as described in **Table 13-61**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-61 STAT_XACT_USER_TABLES columns

Name	Type	Description
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.32 SUMMARY_STAT_XACT_USER_TABLES

Displays the transaction status statistics of user tables in schemas of all nodes in the cluster. It is used on CNs and the transaction status statistics of tables on each node are summed up by table name, as described in **Table 13-62**.

Table 13-62 SUMMARY_STAT_XACT_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	numeric	Number of sequential scans initiated on the table.
seq_tup_read	numeric	Number of live rows fetched by sequential scans.
idx_scan	numeric	Number of index scans initiated on the table.
idx_tup_fetch	numeric	Number of live rows fetched by index scans.
n_tup_ins	numeric	Number of rows inserted.
n_tup_upd	numeric	Number of rows updated.
n_tup_del	numeric	Number of rows deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_tup_hot_upd	numeric	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.33 GLOBAL_STAT_XACT_USER_TABLES

Displays the transaction status information of the user tables in the schemas of each node, as described in **Table 13-63**. (It is used on CNs. The transaction status information of the same table on different nodes is not summed up.)

Table 13-63 GLOBAL_STAT_XACT_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of a table.
schemaname	name	Name of the schema where the table is located.
relname	name	Table name.
seq_scan	bigint	Number of sequential scans initiated on the table.
seq_tup_read	bigint	Number of live rows fetched by sequential scans.
idx_scan	bigint	Number of index scans initiated on the table.
idx_tup_fetch	bigint	Number of live rows fetched by index scans.
n_tup_ins	bigint	Number of rows inserted.
n_tup_upd	bigint	Number of rows updated.
n_tup_del	bigint	Number of rows deleted.
n_tup_hot_upd	bigint	Number of HOT updated rows (that is, the number of rows whose index columns are not updated).

13.2.5.34 STAT_XACT_USER_FUNCTIONS

Displays statistics about function executions in the current transaction on the current database node, as described in **Table 13-64**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-64 STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

13.2.5.35 SUMMARY_STAT_XACT_USER_FUNCTIONS

Displays the summary of function execution statistics in the current transaction on each node in the cluster, as described in **Table 13-65**. (It is used on CNs.)

Table 13-65 SUMMARY_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

13.2.5.36 GLOBAL_STAT_XACT_USER_FUNCTIONS

Displays statistics about function execution in the current transaction on each node in the cluster, as described in **Table 13-66**. (It is used on CNs.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-66 GLOBAL_STAT_XACT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	Function name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function and all other functions called by it.
self_time	double precision	Time spent in this function, excluding other functions called by it.

13.2.5.37 STAT_BAD_BLOCK

Obtains the information about table and index read failures on the current node, as described in **Table 13-67**.

Table 13-67 STAT_BAD_BLOCK columns

Name	Type	Description
nodename	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
bucketid	smallint	ID of the bucket for consistent hashing.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

13.2.5.38 SUMMARY_STAT_BAD_BLOCK

Obtains the summary of the table and index read failure information on each node in the cluster, as described in **Table 13-68**. It is used on CNs. The statistics of

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

different DNs is summed up. The value of **first_time** is the statistics collection start time, and the value of **last_time** is the statistics collection end time.

Table 13-68 SUMMARY_STAT_BAD_BLOCK columns

Name	Type	Description
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
forknum	bigint	Fork number.
error_count	bigint	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

13.2.5.39 GLOBAL_STAT_BAD_BLOCK

Obtains information about table and index read failures on each node., as described in **Table 13-69**. It is used on CNs. The read failure information of DNs is displayed only, but not summed up.

Table 13-69 GLOBAL_STAT_BAD_BLOCK columns

Name	Type	Description
node_name	text	Node name.
databaseid	integer	Database OID.
tablespaceid	integer	Tablespace OID.
relfilenode	integer	Relationship file node.
forknum	integer	Fork number.
error_count	integer	Number of errors.
first_time	timestamp with time zone	Time when the page damage occurs for the first time.
last_time	timestamp with time zone	Time when the page damage occurs for the last time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.5.40 STAT_USER_FUNCTIONS

Displays statistics about user-defined functions (the function language is not an internal language) in all the schemas of the current node, as described in **Table 13-70**.

Table 13-70 STAT_USER_FUNCTIONS columns

Name	Type	Description
funcid	oid	OID of the function.
schemaname	name	Schema name.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

13.2.5.41 SUMMARY_STAT_USER_FUNCTIONS

Displays the summary of statistics about user-defined functions on each node in the entire cluster. It is used on CNs and the status information of user-defined functions on each node is summed up by function name, as described in **Table 13-71**.

Table 13-71 SUMMARY_STAT_USER_FUNCTIONS columns

Name	Type	Description
schemaname	name	Schema name.
funcname	name	UDF name.
calls	numeric	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.5.42 GLOBAL_STAT_USER_FUNCTIONS

Displays statistics about user-defined functions on each node in the entire cluster, as described in **Table 13-72**. (It is used on CNs. Status information about functions with the same name on different nodes is not summed up.)

Table 13-72 GLOBAL_STAT_USER_FUNCTIONS columns

Name	Type	Description
node_name	name	Node name.
funcid	oid	OID of the function.
schemaname	name	Name of the schema where the function is located.
funcname	name	UDF name.
calls	bigint	Number of times the function has been called.
total_time	double precision	Total time spent in this function, including other functions called by it (unit: ms).
self_time	double precision	Time spent in this function, excluding other functions called by it (unit: ms).

13.2.6 Workload

13.2.6.1 WORKLOAD_SQL_COUNT

Displays the distribution of SQL statements in workloads on the current node, as described in **Table 13-73**.

Table 13-73 WORKLOAD_SQL_COUNT columns

Name	Type	Description
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
ddl_count	bigint	Number of DDL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dml_count	bigint	Number of DML statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dcl_count	bigint	Number of DCL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dbid	oid	ID of the database to which the statistics belong.
user_dml_count	bigint	Number of DML statements executed by users.
bg_dml_count	bigint	Number of DML statements executed by the database backend thread.

13.2.6.2 SUMMARY_WORKLOAD_SQL_COUNT

Displays the distribution of SQL statements in workloads on each CN in the cluster, as described in **Table 13-74**.

Table 13-74 SUMMARY_WORKLOAD_SQL_COUNT columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
select_count	bigint	Number of SELECT statements.
update_count	bigint	Number of UPDATE statements.
insert_count	bigint	Number of INSERT statements.
delete_count	bigint	Number of DELETE statements.
ddl_count	bigint	Number of DDL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dml_count	bigint	Number of DML statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dcl_count	bigint	Number of DCL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dbid	oid	ID of the database to which the statistics belong.
user_dml_count	bigint	Number of DML statements executed by users.
bg_dml_count	bigint	Number of DML statements executed by the database backend thread.

13.2.6.3 WORKLOAD_TRANSACTION

Displays information about transactions loaded on the current node, as described in **Table 13-75**.

Table 13-75 WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

13.2.6.4 SUMMARY_WORKLOAD_TRANSACTION

Displays the information about transactions in the cluster, as described in **Table 13-76**.

Table 13-76 SUMMARY_WORKLOAD_TRANSACTION columns

Name	Type	Description
workload	name	Workload name.
commit_counter	numeric	Number of user transactions committed.
rollback_counter	numeric	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	numeric	Total response time of user transactions (unit: μs).
bg_commit_counter	numeric	Number of background transactions committed.
bg_rollback_counter	numeric	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_resp_total	numeric	Total response time of background transactions (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

13.2.6.5 GLOBAL_WORKLOAD_TRANSACTION

Displays load information about workloads on each node, as described in **Table 13-77**.

Table 13-77 GLOBAL_WORKLOAD_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dbid	oid	ID of the database to which the statistics belong.

13.2.6.6 WORKLOAD_SQL_ELAPSE_TIME

WORKLOAD_SQL_ELAPSE_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics on workloads (services), as described in **Table 13-78**.

Table 13-78 WORKLOAD_SQL_ELAPSE_TIME columns

Name	Type	Description
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

13.2.6.7 SUMMARY_WORKLOAD_SQL_ELAPSE_TIME

SUMMARY_WORKLOAD_SQL_ELAPSE_TIME collects SELECT, UPDATE, INSERT, and DELETE (SUID) statistics on workloads (services) of all CNs, as described in **Table 13-79**.

Table 13-79 SUMMARY_WORKLOAD_SQL_ELAPSE_TIME columns

Name	Type	Description
node_name	name	Node name.
workload	name	Workload name.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

13.2.6.8 USER_TRANSACTION

USER_TRANSACTION collects statistics about transactions executed by users, as described in **Table 13-80**. MONADMIN can view information about transactions executed by all users.

Table 13-80 USER_TRANSACTION columns

Name	Type	Description
username	name	Username.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_commit_counter	bigint	Number of background transactions committed.
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

13.2.6.9 GLOBAL_USER_TRANSACTION

GLOBAL_USER_TRANSACTION collects statistics about transactions executed by all users, as described in **Table 13-81**.

Table 13-81 GLOBAL_USER_TRANSACTION columns

Name	Type	Description
node_name	name	Node name.
username	name	Username.
commit_counter	bigint	Number of user transactions committed.
rollback_counter	bigint	Number of user transactions rolled back.
resp_min	bigint	Minimum response time of user transactions (unit: μs).
resp_max	bigint	Maximum response time of user transactions (unit: μs).
resp_avg	bigint	Average response time of user transactions (unit: μs).
resp_total	bigint	Total response time of user transactions (unit: μs).
bg_commit_counter	bigint	Number of background transactions committed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bg_rollback_counter	bigint	Number of background transactions rolled back.
bg_resp_min	bigint	Minimum response time of background transactions (unit: μs).
bg_resp_max	bigint	Maximum response time of background transactions (unit: μs).
bg_resp_avg	bigint	Average response time of background transactions (unit: μs).
bg_resp_total	bigint	Total response time of background transactions (unit: μs).
dbid	oid	ID of the database to which the statistics belong.

13.2.7 Session and Thread

13.2.7.1 SESSION_STAT

Collects statistics about session status on the current node based on session threads or the AutoVacuum thread, as described in **Table 13-82**.

Table 13-82 SESSION_STAT columns

Name	Type	Description
sessid	text	Thread start time and ID.
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Session value.

13.2.7.2 GLOBAL_SESSION_STAT

Collects statistics about session status on each node based on session threads or the AutoVacuum thread, as described in **Table 13-83**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-83 GLOBAL_SESSION_STAT columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
statid	integer	Statistics ID.
statname	text	Name of the statistics session.
statunit	text	Unit of the statistics session.
value	bigint	Session value.

13.2.7.3 SESSION_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on the current node, as described in **Table 13-84**.

Table 13-84 SESSION_TIME columns

Name	Type	Description
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.
stat_name	text	Session type.
value	bigint	Session value.

13.2.7.4 GLOBAL_SESSION_TIME

Collects statistics about the running time of session threads and time consumed in each execution phase on each node, as described in **Table 13-85**.

Table 13-85 GLOBAL_SESSION_TIME columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
stat_id	integer	Statistics ID.
stat_name	text	Session type.
value	bigint	Session value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.7.5 SESSION_MEMORY

Collects statistics about memory usage at the session level in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users, as described in **Table 13-86**.

Table 13-86 SESSION_MEMORY columns

Name	Type	Description
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

13.2.7.6 GLOBAL_SESSION_MEMORY

Collects statistics about memory usage at the session level on each node in the unit of MB, including all the memory allocated to GaussDB and stream threads on DNs for jobs currently executed by users, as described in **Table 13-87**.

Table 13-87 GLOBAL_SESSION_MEMORY columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
init_mem	integer	Memory allocated to the currently executed job before the job enters the executor.
used_mem	integer	Memory allocated to the currently executed job.
peak_mem	integer	Peak memory allocated to the currently executed job.

13.2.7.7 SESSION_MEMORY_DETAIL

Collects statistics on the memory usage of threads on the current node, in the unit specified by **MemoryContext**, as described in **Table 13-88**.

Table 13-88 SESSION_MEMORY_DETAIL columns

Name	Type	Description
sessid	text	Thread start time and ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the applied memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

13.2.7.8 GLOBAL_SESSION_MEMORY_DETAIL

Collects statistics about thread memory usage on each node by **MemoryContext**, as described in **Table 13-89**.

Table 13-89 GLOBAL_SESSION_MEMORY_DETAIL columns

Name	Type	Description
node_name	name	Node name.
sessid	text	Thread start time and ID.
sesstype	text	Thread name.
contextname	text	Name of the memory context.
level	smallint	Level of memory context importance.
parent	text	Name of the parent memory context.
totalsize	bigint	Size of the applied memory (unit: byte).
freesize	bigint	Size of the idle memory (unit: byte).
usedsize	bigint	Size of the used memory (unit: byte).

13.2.7.9 SESSION_STAT_ACTIVITY

Displays information about threads that are running on the current node, as described in **Table 13-90**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-90 SESSION_STAT_ACTIVITY columns

Name	Type	Description
datid	oid	OID of the database that the user session connects to in the backend.
datname	name	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
usesysid	oid	OID of the user logged in to the backend.
usename	name	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, for example, **autovacuum** is displayed for the thread autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active**. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
waiting	Boolean	Specifies whether the backend is currently waiting for a lock. If the backend is currently waiting for a lock, the value is **true**.
state	text	Overall status of this backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in **pg_stat_activity** is empty. gaussdb=# SELECT datname, username, usesysid,state,pid FROM pg_stat_activity; datname | username | usesysid | state | pid ----------+----------+----------+-------- +-----------------testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | |139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | |139968643069712 testdb | omm | 10 | |139968680818448 testdb | joe | 16390 | |139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.
trace_id	text	Trace ID specified by the driver, which is used to identify a request of an application.

13.2.7.10 GLOBAL_SESSION_STAT_ACTIVITY

Displays information about threads that are running on each node in the cluster, as described in **Table 13-91**.

Table 13-91 GLOBAL_SESSION_STAT_ACTIVITY columns

Name	Type	Description
coorname	text	CN name.
datid	oid	OID of the database that the user session connects to in the backend.
datname	text	Name of the database that the user session connects to in the backend.
pid	bigint	Backend thread ID.
usesysid	oid	OID of the user logged in to the backend.
usename	text	Name of the user logged in to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, for example, **autovacuum** is displayed for the thread autovacuum.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_port	integer	TCP port number that the client uses for communication with the backend (**–1** if a Unix socket is used).
backend_start	timestamp with time zone	Time when this process was started, that is, when the client connected to the server.
xact_start	timestamp with time zone	Time when current transaction was started (null if no transaction is active). If the current query is the first of its transaction, the value of this column is the same as that of the **query_start** column.
query_start	timestamp with time zone	Time when the currently active query was started, or time when the last query was started if **state** is not **active**. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
state_change	timestamp with time zone	Time when **state** was last modified.
waiting	Boolean	If the background is waiting for a lock, the value is **true**. Otherwise, the value is **false**. If a lock is being waited for on a DN, determine the DN based on the **wait_status** column in the pg_thread_wait_status view and query the **waiting** column in pg_stat_activity on the DN to check whether a lock wait occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
state	text	Overall status of this backend. The value can be: • **active**: The backend is executing a query. • **idle**: The backend is waiting for a new client command. • **idle in transaction**: The backend is in a transaction, but is not currently executing a query. • **idle in transaction** (aborted): The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend. **NOTE** Common users can view their own session status only. The state information of other accounts is empty. For example, after the **judy** user is connected to the database, the state information of the **joe** user and the initial user **omm** in **pg_stat_activity** is empty. gaussdb=# SELECT datname, usename, usesysid,state,pid FROM pg_stat_activity; datname | usename | usesysid | state | pid ----------+---------+----------+--------+-----------------testdb | omm | 10 | | 139968752121616 testdb | omm | 10 | |139968903116560 db_tpcds | judy | 16398 | active | 139968391403280 testdb | omm | 10 | |139968643069712 testdb | omm | 10 | |139968680818448 testdb | joe | 16390 | |139968563377936 (6 rows)
resource_pool	name	Resource pool used by the user.
query_id	bigint	ID of a query.
query	text	Latest query at the backend. If **state** is **active**, this column shows the ongoing query. In all other states, it shows the last query that was executed.
unique_sql_id	bigint	Unique SQL statement ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
trace_id	text	Trace ID specified by the driver, which is used to identify a request of an application.

13.2.7.11 THREAD_WAIT_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on the current node, as described in **Table 13-92**. For details about the events, see **Table 13-184**.

Table 13-92 THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table Wait event information list**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_sessionid	text	Global session ID.

13.2.7.12 GLOBAL_THREAD_WAIT_STATUS

In this view, you can check the blocking and waiting status of the backend threads and auxiliary threads on all nodes, as described in **Table GLOBAL_THREAD_WAIT_STATUS columns**. For details about the events, see **Table Wait event information list**.

In GLOBAL_THREAD_WAIT_STATUS, you can see all the call hierarchy relationships between threads of the SQL statements on all nodes in the cluster, and the block waiting status for each thread. With this view, you can easily locate the causes of process hang and similar issues.

The definitions of GLOBAL_THREAD_WAIT_STATUS and THREAD_WAIT_STATUS are the same, because the essence of the GLOBAL_THREAD_WAIT_STATUS view is the query summary of the THREAD_WAIT_STATUS view on each node in the cluster.

Table 13-93 GLOBAL_THREAD_WAIT_STATUS columns

Name	Type	Description
node_name	text	Node name.
db_name	text	Database name.
thread_name	text	Thread name.
query_id	bigint	Query ID. The value of this column is the same as that of **debug_query_id**.
tid	bigint	Thread ID of the current thread.
sessionid	bigint	Session ID.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread.
smpid	integer	Concurrent thread ID.
wait_status	text	Waiting status of the current thread. For details about the waiting status, see **Table Wait event information list**.
wait_event	text	If **wait_status** is **acquire lock**, **acquire lwlock**, or **wait io**, this column describes the lock, lightweight lock, or I/O information. Otherwise, this column is empty.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
locktag	text	Information about the lock that the current thread is waiting for.
lockmode	text	Lock mode that the current thread is waiting to obtain. The values include table-level lock, row-level lock, and page-level lock modes.
block_sessionid	bigint	ID of the session that blocks the current thread from obtaining the lock.
global_sessionid	text	Global session ID.

13.2.7.13 LOCAL_THREADPOOL_STATUS

LOCAL_THREADPOOL_STATUS displays the status of worker threads and sessions in a thread pool, as described in **Table 13-94**. This view is valid only when **enable_thread_pool** is set to **on**.

Table 13-94 LOCAL_THREADPOOL_STATUS columns

Name	Type	Description
node_name	text	Node name.
group_id	integer	ID of the thread pool group.
bind_numa_id	integer	NUMA ID to which the thread pool group is bound.
bind_cpu_number	integer	Information about the CPU to which the thread pool group is bound. If no CPUs are bound, the value is **NULL**.
listener	integer	Number of listener threads in the thread pool group.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
worker_info	text	Information about threads in the thread pool, including: • **default**: Number of initial threads in the thread pool group. • **new**: Number of new threads in the thread pool group. • **expect**: Expected number of threads in the thread pool group. • **actual**: Actual number of threads in the thread pool group. • **idle**: Number of idle threads in the thread pool group. • **pending**: Number of pending threads in the thread pool group.
session_info	text	Information about sessions in the thread pool, including: • **total**: Total number of sessions in the thread pool group. • **waiting**: Number of sessions pending scheduling in the thread pool group. • **running**: Number of running sessions in the thread pool group. • **idle**: Number of idle sessions in the thread pool group.
stream_info	text	Information about streams in the thread pool, including: • **total**: total number of stream threads in the thread pool group. • **running**: number of running stream threads in the thread pool group. • **idle**: number of idle stream threads in the thread pool group.

NOTE

The thread pool has a dynamic scaling mechanism. When a new thread is idle after scaling, the thread pool scales in about 3 minutes. After dynamic scale-in, the number of threads in the thread pool is not less than the initial number of threads.

13.2.7.14 GLOBAL_THREADPOOL_STATUS

GLOBAL_THREADPOOL_STATUS displays the status of worker threads and sessions in thread pools on all nodes.

Columns in this view are the same as those in **Table 13-94**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.7.15 SESSION_CPU_RUNTIME

SESSION_CPU_RUNTIME displays information about CPU usage of ongoing complex jobs executed by the current user, as described in **Table 13-95**.

Table 13-95 SESSION_CPU_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
usename	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms).
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms).
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms).
query	text	Statement being executed.
node_group	text	Node group of the user to which the statement belongs.
top_cpu_dn	text	Top *N* CPU usage.

13.2.7.16 SESSION_MEMORY_RUNTIME

SESSION_MEMORY_RUNTIME displays information about memory usage of ongoing complex jobs executed by the current user, as described in **Table 13-96**.

Table 13-96 SESSION_MEMORY_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
usename	name	Name of the user logged in to the backend.
pid	bigint	Backend thread ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Time when the statement execution starts. For a stored procedure, function, or package, the first query time is queried and does not change with the running of statements in the stored procedure.
min_peak_memory	integer	Minimum peak memory of the statement among all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory of the statement among all DNs (unit: MB).
spill_info	text	Statement spill information on all DNs. • **None**: No data has been flushed to disks on all DNs. • **All**: Data has been flushed to disks on all DNs. • **[*a*:*b*]**: Data has been flushed to disks on *a* of *b* DNs.
query	text	Statement being executed.
node_group	text	Node group of the user to which the statement belongs.
top_mem_dn	text	Top *N* memory usage.

13.2.7.17 STATEMENT_IOSTAT_COMPLEX_RUNTIME

STATEMENT_IOSTAT_COMPLEX_RUNTIME displays I/O workload management information about ongoing jobs executed by the current user, as described in Table 13-97. IOPS is counted by 10 thousands per second.

Table 13-97 STATEMENT_IOSTAT_COMPLEX_RUNTIME columns

Name	Type	Description
query_id	bigint	Job ID.
mincurriops	integer	Minimum I/O of the current job across DNs.
maxcurriops	integer	Maximum I/O of the current job across DNs.
minpeakiops	integer	Minimum peak I/O of the current job across DNs.
maxpeakiops	integer	Maximum peak I/O of the current job across DNs.
io_limits	integer	**io_limits** set for the job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
io_priority	text	**io_priority** set for the job.
query	text	Job.
node_group	text	Node group of the user to which a job belongs.
curr_io_limits	integer	Real-time value of **iolimits** when **io_priority** is used to control I/Os.

13.2.7.18 LOCAL_ACTIVE_SESSION

LOCAL_ACTIVE_SESSION displays samples in the ACTIVE SESSION PROFILE memory on the current node, as shown in **Table 13-98**.

Table 13-98 LOCAL_ACTIVE_SESSION columns

Name	Type	Description
sampleid	bigint	Sample ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Event name.
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized text string of the unique SQL statement.
locktag	text	Information of a lock that the session waits for, which can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.
event_start_time	timestamp with time zone	Start time of a wait event.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
current_xid	xid	Current transaction ID.
top_xid	xid	Top-level transaction ID.
parent_unique_sql_id	bigint	SQL_Id of the parent statement that calls the statement.
control_status	text	The value is **under_cpu_throttle** when CPU resource for abnormal SQL statements are controlled. Otherwise, the value is **normal**.
top_unique_query_id	bigint	This column displays the **unique_query_id** of the top-level SQL statement of the stored procedure.
top_unique_query	text	This column displays the **unique_query** of the top-level SQL statement of the stored procedure.

13.2.7.19 GLOBAL_ACTIVE_SESSION

GLOBAL_ACTIVE_SESSION displays a summary of samples in the ACTIVE SESSION PROFILE memory on CN and main DN nodes, as described in **Table 13-99**. The **event_start_time**, **current_xid**, and **top_xid** columns are added to GaussDB Kernel 505.0. After GaussDB Kernel is upgraded to GaussDB Kernel 505.0 or later, the columns cannot be queried during the upgrade observation period.

Table 13-99 GLOBAL_ACTIVE_SESSION columns

Name	Type	Description
node_name	text	Node name.
sampleid	bigint	Sample ID.
sample_time	timestamp without time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be refreshed.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp without time zone	Start time of a session.
event	text	Specified event name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	A CN ID on a DN indicates that the unique SQL statement comes from a CN ID in a key of the unique query on a CN.
unique_query	text	Standardized UniqueSQL text string.
locktag	text	Information of a lock that the session waits for, which can be parsed using locktag_decode.
lockmode	text	Mode of a lock that the session waits for.
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.
final_block_sessionid	bigint	ID of the blocked session at the source end.
wait_status	text	Provides more details about the event column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
global_sessionid	text	Global session ID.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The value can be **active**, **idle in transaction**, **fastpath function call**, **idle in transaction (aborted)**, **disabled**, or **retrying**.
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	Current transaction ID.
top_xid	xid	Top-level transaction ID.
parent_unique_sql_id	bigint	SQL_Id of the parent statement that calls the statement.

13.2.8 Transaction

13.2.8.1 TRANSACTIONS_RUNNING_XACTS

Displays information about running transactions on the current node, as described in **Table 13-100**.

Table 13-100 TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; **0**: starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes. • **false**: no.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

13.2.8.2 SUMMARY_TRANSACTIONS_RUNNING_XACTS

Displays information about running transactions on each CN in the cluster, as described in **Table 13-101**.

Table 13-101 SUMMARY_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; **0**: starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes. • **false**: no.
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

13.2.8.3 GLOBAL_TRANSACTIONS_RUNNING_XACTS

Displays information about the running transactions on each CN and DN in the cluster, as described in **Table 13-102**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-102 GLOBAL_TRANSACTIONS_RUNNING_XACTS columns

Name	Type	Description
handle	integer	Handle corresponding to the transaction in GTM.
gxid	xid	Transaction ID.
state	tinyint	Transaction status (**3**: prepared; **0**: starting).
node	text	Node name.
xmin	xid	Minimum transaction ID on the node.
vacuum	Boolean	Specifies whether the current transaction is a lazy vacuum (VACUUM only if necessary) transaction. • **true**: yes • **false**: no
timeline	bigint	Number of database restarts.
prepare_xid	xid	ID of the transaction in the **prepared** state (the value is **0** if the state is not **prepared**).
pid	bigint	Thread ID corresponding to the transaction.
next_xid	xid	Transaction ID sent from a CN to a DN.
dbid	oid	ID of the database corresponding to the transaction.

13.2.8.4 TRANSACTIONS_PREPARED_XACTS

Displays information about transactions that are prepared for two-phase commit, as described in **Table 13-103**.

Table 13-103 TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.8.5 SUMMARY_TRANSACTIONS_PREPARED_XACTS

Summarizes the information about the transactions that are ready for two-phase commit on each CN in the cluster, as described in **Table 13-104**.

Table 13-104 SUMMARY_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed.

13.2.8.6 GLOBAL_TRANSACTIONS_PREPARED_XACTS

Summarizes the information about the transactions that are ready for two-phase commit on each CN and DN in the cluster, as described in **Table 13-105**.

Table 13-105 GLOBAL_TRANSACTIONS_PREPARED_XACTS columns

Name	Type	Description
transaction	xid	Numeric transaction identifier of the prepared transaction.
gid	text	Global transaction identifier that was assigned to the transaction.
prepared	timestamp with time zone	Time at which the transaction is prepared for commit.
owner	name	Name of the user who executes the transaction
database	name	Name of the database in which the transaction is executed.

13.2.9 Query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.9.1 STATEMENT

Obtains information about executed statements (normalized SQL statements) on the current node, as described in **Table 13-106**. You can view all statistics about normalized SQL statements received by the CN, whereas you can view only the statistics about normalized SQL statements executed on the current DN.

NOTE

The **unique_sql_id** generated by different **savepoint_name** values is different. When a large number of **savepoint_name** is used, the number of **unique_sql_id** values generated in the system increases rapidly. If the number of **unique_sql_id** values is greater than the number of **instr_unique_sql_count** values, the newly generated **unique_sql_id** information is not counted.

Table 13-106 STATEMENT columns

Name	Type	Description
node_name	name	Node name.
node_id	integer	Node ID (**node_id** in **pgxc_node**).
user_name	name	Username. If the user who runs the query statement does not exist, ***REMOVED_USER*** is displayed.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.
query	text	Normalized SQL statement. Note: The length is controlled by **track_activity_query_size**.
n_calls	bigint	Number of calls.
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: μs).
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: μs).
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: μs).
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_blocks_fetched	bigint	Number of logical reads.
n_blocks_hit	bigint	Number of memory hits.
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
db_time	bigint	Valid internal database time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	CPU time (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs).
plan_time	bigint	SQL plan generation time (unit: μs).
rewrite_time	bigint	SQL rewriting time (unit: μs).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	I/O time (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
last_updated	timestamp with time zone	Last time when the statement was updated.
sort_count	bigint	Sorting count.
sort_time	bigint	Sorting duration (unit: μs).
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB).
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB).
hash_count	bigint	Hashing count.
hash_time	bigint	Hashing duration (unit: μs).
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB).
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing.
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB).
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is **0** for a non-stored procedure substatement.
lock_wait_time	bigint	SQL lock waiting time (unit: μs).
total_used_memory	bigint	Total memory used by normalized statements, in MB.
max_used_memory	integer	Maximum memory usage of a single statement, in MB.
min_used_memory	integer	Minimum memory usage of a single statement (unit: MB).
db_name	name	Name of the database connected to the backend. If the database where the query statement is executed does not exist, ***REMOVED_DB*** is displayed.
db_id	oid	OID of the database that the backend is connected to.

NOTE

n_calls indicates the actual number of calling times. For the FETCH statement in the stored procedure, the actual number of triggering times of the FETCH statement is the increase times of **n_calls** of the statement actually executed by the cursor.

13.2.9.2 SUMMARY_STATEMENT

Displays all information (including DNs) about executed statements (normalized SQL statements) on each CN, as described in **Table 13-107**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-107 SUMMARY_STATEMENT columns

Name	Type	Description
node_name	name	Node name.
node_id	integer	Node ID (**node_id** in **pgxc_node**).
user_name	name	Username. If the user who runs the query statement does not exist, ***REMOVED_USER*** is displayed.
user_id	oid	OID of the user.
unique_sql_id	bigint	ID of the normalized SQL statement.
query	text	Normalized SQL statement. Note: The length is controlled by **track_activity_query_size**.
n_calls	bigint	Number of calls.
min_elapse_time	bigint	Minimum execution time of the SQL statement in the kernel (unit: μs).
max_elapse_time	bigint	Maximum execution time of the SQL statement in the kernel (unit: μs).
total_elapse_time	bigint	Total execution time of the SQL statement in the kernel (unit: μs).
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of logical reads.
n_blocks_hit	bigint	Number of memory hits.
n_soft_parse	bigint	Number of soft parsing times.
n_hard_parse	bigint	Number of hard parsing times.
db_time	bigint	Valid internal database time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	CPU time (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parse_time	bigint	SQL parsing time (unit: μs).
plan_time	bigint	SQL plan generation time (unit: μs).
rewrite_time	bigint	SQL rewriting time (unit: μs).
pl_execution_time	bigint	Execution time of PL/pgSQL (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	I/O time (unit: μs).
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: {"time":xxx, "n_calls":xxx, "size":xxx}.
last_updated	timestamp with time zone	Last time when the statement was updated.
sort_count	bigint	Sorting count.
sort_time	bigint	Sorting duration (unit: μs).
sort_mem_used	bigint	Size of work memory used during sorting (unit: KB).
sort_spill_count	bigint	Count of file writing when data is flushed to disks during sorting.
sort_spill_size	bigint	File size used when data is flushed to disks during sorting (unit: KB).
hash_count	bigint	Hashing count.
hash_time	bigint	Hashing duration (unit: μs).
hash_mem_used	bigint	Size of work memory used during hashing (unit: KB).
hash_spill_count	bigint	Count of file writing when data is flushed to disks during hashing.
hash_spill_size	bigint	File size used when data is flushed to disks during hashing (unit: KB).
parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is **0** for a non-stored procedure substatement.
lock_wait_time	bigint	SQL lock waiting time (unit: μs).
total_used_memory	bigint	Total memory used by normalized statements, in MB.
max_used_memory	integer	Maximum memory usage of a single statement, in MB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_used_memory	integer	Minimum memory usage of a single statement (unit: MB).
db_name	name	Name of the database connected to the backend. If the database where the query statement is executed does not exist, ***REMOVED_DB*** is displayed.
db_id	oid	OID of the database that the backend is connected to.

13.2.9.3 STATEMENT_COUNT

Displays statistics about five types of running statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) as well as DDL, DML, and DCL statements on the current node of the database, as described in **Table 13-108**.

NOTE

An administrator can query the STATEMENT_COUNT view to view the statistics of all users on the current node. When the cluster or node is restarted, the statistics are cleared and the counting restarts. The system counts when a node receives a query, including a query inside the cluster. For example, if the CN receives a query that contains multiple subqueries, the subqueries are counted separately when they are delivered to a single DN or multiple DNs.

Table 13-108 STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
select_count	bigint	Statistical result of the SELECT statements.
update_count	bigint	Statistical result of the UPDATE statement.
insert_count	bigint	Statistical result of the INSERT statement.
delete_count	bigint	Statistical result of the DELETE statement.
mergeinto_count	bigint	Statistical result of the MERGE INTO statement.
ddl_count	bigint	Number of DDL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dml_count	bigint	Number of DML statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dcl_count	bigint	Number of DCL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
total_select_elapse	bigint	Total response time of **SELECT** statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.
user_dml_count	bigint	Number of DML statements executed by users.
bg_dml_count	bigint	Number of DML statements executed by the database backend thread.

13.2.9.4 GLOBAL_STATEMENT_COUNT

Displays statistics about five types of running statements (**SELECT**, **INSERT**, **UPDATE**, **DELETE**, and **MERGE INTO**) as well as DDL, DML, and DCL statements on each node of the database, as described in **Table 13-109**.

Table 13-109 GLOBAL_STATEMENT_COUNT columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
select_count	bigint	Statistical result of the SELECT statements.
update_count	bigint	Statistical result of the UPDATE statements.
insert_count	bigint	Statistical result of the INSERT statements.
delete_count	bigint	Statistical result of the DELETE statements.
mergeinto_count	bigint	Statistical result of the MERGE INTO statements.
ddl_count	bigint	Number of DDL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dml_count	bigint	Number of DML statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dcl_count	bigint	Number of DCL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
total_select_elapse	bigint	Total response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
total_update_elapse	bigint	Total response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
total_insert_elapse	bigint	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
total_delete_elapse	bigint	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.
user_dml_count	bigint	Number of DML statements executed by users.
bg_dml_count	bigint	Number of DML statements executed by the database backend thread.

13.2.9.5 SUMMARY_STATEMENT_COUNT

Displays the summary statistics of five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) and DDL, DML, and DCL statements executed on each database node, as shown in **Table 13-110**.

Table 13-110 SUMMARY_STATEMENT_COUNT columns

Name	Type	Description
user_name	text	Username.
select_count	numeric	Statistical result of the SELECT statements.
update_count	numeric	Statistical result of the UPDATE statements.
insert_count	numeric	Statistical result of the INSERT statements.
delete_count	numeric	Statistical result of the DELETE statements.
mergeinto_count	numeric	Statistical result of the MERGE INTO statements.
ddl_count	numeric	Number of DDL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
dml_count	numeric	Number of DML statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dcl_count	numeric	Number of DCL statements. The statistical result contains the SQL statements executed by users and the SQL statements executed by the database backend thread.
total_select_elapse	numeric	Total response time of SELECT statements (unit: μs).
avg_select_elapse	bigint	Average response time of SELECT statements (unit: μs).
max_select_elapse	bigint	Maximum response time of SELECT statements (unit: μs).
min_select_elapse	bigint	Minimum response time of SELECT statements (unit: μs).
total_update_elapse	numeric	Total response time of UPDATE statements (unit: μs).
avg_update_elapse	bigint	Average response time of UPDATE statements (unit: μs).
max_update_elapse	bigint	Maximum response time of UPDATE statements (unit: μs).
min_update_elapse	bigint	Minimum response time of UPDATE statements (unit: μs).
total_insert_elapse	numeric	Total response time of INSERT statements (unit: μs).
avg_insert_elapse	bigint	Average response time of INSERT statements (unit: μs).
max_insert_elapse	bigint	Maximum response time of INSERT statements (unit: μs).
min_insert_elapse	bigint	Minimum response time of INSERT statements (unit: μs).
total_delete_elapse	numeric	Total response time of DELETE statements (unit: μs).
avg_delete_elapse	bigint	Average response time of DELETE statements (unit: μs).
max_delete_elapse	bigint	Maximum response time of DELETE statements (unit: μs).
min_delete_elapse	bigint	Minimum response time of DELETE statements (unit: μs).
dbid	oid	ID of the database to which the five types of statements (SELECT, INSERT, UPDATE, DELETE, and MERGE INTO) belong.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
user_dml_count	bigint	Number of DML statements executed by users.
bg_dml_count	bigint	Number of DML statements executed by the database backend thread.

13.2.9.6 GLOBAL_STATEMENT_COMPLEX_HISTORY

Displays workload management information about completed jobs executed on each node, as described in **Table 13-111**.

Table 13-111 GLOBAL_STATEMENT_COMPLEX_HISTORY columns

Name	Type	Description
datid	oid	OID of the database that the backend is connected to.
dbname	text	Name of the database that the backend is connected to.
schemaname	text	Schema name.
nodename	text	Name of the CN where the statement is executed.
username	text	Username used for connecting to the backend.
application_name	text	Name of the application connected to the backend.
client_addr	inet	IP address of the client connected to the backend. If this column is **NULL**, it indicates either the client is connected via a Unix socket on the server or this is an internal thread, such as **AUTOVACUUM**.
client_hostname	text	Host name of the connected client, as reported by a reverse DNS lookup of **client_addr**. This column will be non-null only for IP connections and only when **log_hostname** is enabled.
client_port	integer	TCP port number that the client uses for communication with this backend (**–1** if a Unix socket is used).
query_band	text	Job type, which is specified by the GUC parameter **query_band**. The default value is a null string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
block_time	bigint	Duration that the statement is blocked before being executed, including the statement parsing and optimization duration (unit: ms).
start_time	timestamp with time zone	Time when the statement execution starts.
finish_time	timestamp with time zone	Time when the statement execution ends.
duration	bigint	Execution time of the statement (unit: ms).
estimate_total_time	bigint	Estimated execution time of the statement (unit: ms).
status	text	Final statement execution status. The value can be **finished** (normal) or **aborted** (abnormal).
abort_info	text	Exception information displayed if the final statement execution status is **aborted**.
resource_pool	text	Resource pool used by the user.
control_group	text	Cgroup used by the statement.
estimate_memory	integer	Estimated memory used by the statement.
min_peak_memory	integer	Minimum peak memory of the statement across all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory of the statement across all DNs (unit: MB).
average_peak_memory	integer	Average memory usage during statement execution (unit: MB).
memory_skew_percent	integer	Memory usage skew of the statement among each DN.
spill_info	text	Statement spill information on all DNs. • **None**: No data is spilled to disks on all DNs. • **All**: Data is spilled to disks on all DNs. • **[*a*:*b*]**: The statement has been spilled to disks on *a* of *b* DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_dn_time	bigint	Minimum execution time of the statement across all DNs (unit: ms).
max_dn_time	bigint	Maximum execution time of the statement across all DNs (unit: ms).
average_dn_time	bigint	Average execution time of the statement across all DNs (unit: ms).
dntime_skew_percent	integer	Execution time skew of the statement among each DN.
min_cpu_time	bigint	Minimum CPU time of the statement across all DNs (unit: ms).
max_cpu_time	bigint	Maximum CPU time of the statement across all DNs (unit: ms).
total_cpu_time	bigint	Total CPU time of the statement across all DNs (unit: ms).
cpu_skew_percent	integer	CPU time skew of the statement among DNs.
min_peak_iops	integer	Minimum peak IOPS of the statement across all DNs (unit: 10 thousands per second).
max_peak_iops	integer	Maximum peak IOPS of the statement across all DNs (unit: 10 thousands per second).
average_peak_iops	integer	Average peak IOPS of the statement across all DNs (unit: 10 thousands per second).
iops_skew_percent	integer	I/O skew across DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
warning	text	Warning. The following warnings and warnings related to **Optimizing SQL Self-Diagnosis** are displayed: • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict
queryid	bigint	Internal query ID used for statement execution.
query	text	Statement executed.
query_plan	text	Execution plan of the statement.
cpu_top1_node_name	text	Name of the node with the highest CPU usage.
cpu_top2_node_name	text	Name of the node with the second highest CPU usage.
cpu_top3_node_name	text	Name of the node with the third highest CPU usage.
cpu_top4_node_name	text	Name of the node with the fourth highest CPU usage.
cpu_top5_node_name	text	Name of the node with the fifth highest CPU usage.
mem_top1_node_name	text	Name of the node with the highest memory usage.
mem_top2_node_name	text	Name of the node with the second highest memory usage.
mem_top3_node_name	text	Name of the node with the third highest memory usage.
mem_top4_node_name	text	Name of the node with the fourth highest memory usage.
mem_top5_node_name	text	Name of the node with the fifth highest memory usage.
cpu_top1_value	bigint	1st CPU usage.
cpu_top2_value	bigint	2nd CPU usage.
cpu_top3_value	bigint	3rd CPU usage.
cpu_top4_value	bigint	4th CPU usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
cpu_top5_value	bigint	5th CPU usage.
mem_top1_value	bigint	1st memory usage.
mem_top2_value	bigint	2nd memory usage.
mem_top3_value	bigint	3rd memory usage.
mem_top4_value	bigint	4th memory usage.
mem_top5_value	bigint	5th memory usage.
top_mem_dn	text	Top N memory usage.
top_cpu_dn	text	Top N CPU usage.
node_group	text	Node group of the user to which the statement belongs.

13.2.9.7 GLOBAL_STATEMENT_COMPLEX_HISTORY_TABLE

Displays workload management information about completed jobs executed on each node. Data is dumped from the kernel to this system catalog. If the GUC parameter **enable_resource_record** is set to **on**, the system imports records from **GLOBAL_STATEMENT_COMPLEX_HISTORY** to this system catalog every 3 minutes. You are advised not to enable this function, because it occupies storage space and affects performance.

For details about the columns, see **GLOBAL_STATEMENT_COMPLEX_HISTORY**.

13.2.9.8 STATEMENT_RESPONSETIME_PERCENTILE

Obtains the response times of 80% and 95% SQL statements in the cluster, as described in **Table 13-112**.

Table 13-112 STATEMENT_RESPONSETIME_PERCENTILE columns

Name	Type	Description
p80	bigint	Response time of 80% SQL statements in the cluster (unit: μs).
p95	bigint	Response time of 95% SQL statements in the cluster (unit: μs).

13.2.9.9 STATEMENT_WLMSTAT_COMPLEX_RUNTIME

STATEMENT_WLMSTAT_COMPLEX_RUNTIME displays load management information about ongoing jobs executed by the current user, as described in **Table 13-113**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-113 STATEMENT_WLMSTAT_COMPLEX_RUNTIME columns

Name	Type	Description
datid	oid	OID of the database that this backend is connected to.
datname	name	Name of the database that the backend is connected to.
threadid	bigint	Backend thread ID.
processid	integer	PID of the backend thread.
usesysid	oid	OID of the user logged in to the backend.
appname	text	Name of the application connected to the backend.
usename	name	Username for logging in to the backend.
priority	bigint	Priority of Cgroup where the statement is located.
attribute	text	Statement attribute: • **Ordinary**: default attribute of a statement before it is parsed by the database. • **Simple**: simple statement. • **Complicated**: complicated statement. • **Internal**: internal statement of the database.
block_time	bigint	Pending duration of the statement by now, in seconds.
elapsed_time	bigint	Actual execution duration of the statement by now, in seconds.
total_cpu_time	bigint	Total CPU usage duration of the statement on the DN in the last period, in seconds.
cpu_skew_percent	integer	CPU usage inclination ratio of the statement on the DN in the last period.
statement_mem	integer	Memory used for executing the statement (reserved column).
active_points	integer	Number of concurrently active points occupied by the statement in the resource pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dop_value	integer	DOP value obtained by the statement from the resource pool.
control_group	text	Cgroup currently used by the statement.
status	text	Statement status, which can be: • **pending**: waiting to be executed. • **running**: being executed. • **finished**: finished normally. (If **enqueue** is set to **StoredProc** or **Transaction**, this state indicates that only a part of jobs in the statement has been executed. This state persists until this statement is complete.) • **aborted**: terminated unexpectedly. • **active**: a normal state except for those above. • **unknown**: unknown.
enqueue	text	Queuing status of the statement, including: • **Global**: queuing in the global queue. • **Respool**: queuing in the resource pool queue. • **CentralQueue**: queuing on the CCN. • **Transaction**: queuing in a transaction block. • **StoredProc**: queuing in a stored procedure. • **None**: not in a queue. • **Forced None**: (transaction block statement or stored procedure statement) being forcibly executed because the statement waiting time exceeds the specified value.
resource_pool	name	Resource pool where the statement is located.
query	text	Latest query at the backend. If **state** is **active**, this column shows the executing query. In any other state, it shows the last query that was executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.9.10 STATEMENT_HISTORY

Displays information about statements executed on the current node. The result can be queried only in the system database but cannot be queried in the user database, as described in **Table 13-114**.

Table 13-114 STATEMENT_HISTORY columns

Name	Type	Description
db_name	name	Database name.
schema_name	name	Schema name.
origin_node	integer	Node name.
user_name	name	Username.
application_name	text	Name of the application that sends a request.
client_addr	text	IP address of the client that sends a request.
client_port	integer	Port number of the client that sends a request.
unique_query_id	bigint	ID of the normalized SQL statement.
debug_query_id	bigint	ID of the unique SQL statement.
query	text	Normalized SQL (available only on CNs).
start_time	timestamp with time zone	Time when a statement starts.
finish_time	timestamp with time zone	Time when a statement ends.
slow_sql_threshold	bigint	Standard for slow SQL statement execution.
transaction_id	bigint	Transaction ID.
thread_id	bigint	ID of an execution thread.
session_id	bigint	Session ID of a user.
n_soft_parse	bigint	Number of soft parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
n_hard_parse	bigint	Number of hard parsing times. The value of **n_soft_parse** plus the value of **n_hard_parse** may be greater than the value of **n_calls** because the number of subqueries is not counted in the value of **n_calls**.
query_plan	text	Statement execution plan.
n_returned_rows	bigint	Number of rows in the result set returned by the SELECT statement.
n_tuples_fetched	bigint	Number of rows randomly scanned.
n_tuples_returned	bigint	Number of rows sequentially scanned.
n_tuples_inserted	bigint	Number of rows inserted.
n_tuples_updated	bigint	Number of rows updated.
n_tuples_deleted	bigint	Number of rows deleted.
n_blocks_fetched	bigint	Number of buffer block access times.
n_blocks_hit	bigint	Number of buffer block hits.
db_time	bigint	Valid DB time, which is accumulated if multiple threads are involved (unit: μs).
cpu_time	bigint	Time consumed on the CPU (unit: μs).
execution_time	bigint	Execution time in the executor (unit: μs).
parse_time	bigint	SQL parsing time (unit: μs).
plan_time	bigint	SQL plan generation time (unit: μs).
rewrite_time	bigint	SQL rewriting time (unit: μs).
pl_execution_time	bigint	Execution time of PL/pgSQL statements (unit: μs).
pl_compilation_time	bigint	Compilation time of PL/pgSQL (unit: μs).
data_io_time	bigint	I/O time (unit: μs).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
net_send_info	text	Network status of messages sent through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.
net_recv_info	text	Network status of messages received through a physical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, CNs communicate with each other, CNs communicate with customer service ends, and CNs communicate with DNs through physical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.
net_stream_send_info	text	Network status of messages sent through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.
net_stream_recv_info	text	Network status of messages received through a logical connection, including the time (unit: μs), number of calls, and throughput (unit: byte). In a distributed database, DNs of different shards communicate with each other through logical connections. This column can be used to analyze the network overhead of SQL statements in a distributed system. Example: **{"time":***xxx***, "n_calls":***xxx***, "size":***xxx***}**.
lock_count	bigint	Number of locks.
lock_time	bigint	Time required for locking.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lock_wait_count	bigint	Number of lock waits.
lock_wait_time	bigint	Time required for lock waiting.
lock_max_count	bigint	Maximum number of locks.
lwlock_count	bigint	Number of lightweight locks (reserved).
lwlock_wait_count	bigint	Number of lightweight lock waits.
lwlock_time	bigint	Time required for lightweight locking (reserved).
lwlock_wait_time	bigint	Time required for lightweight lock waiting.
details	bytea	List of wait events and statement lock events. When the value of the record level is greater than or equal to L0, the list of wait events starts to be recorded. It displays statistics about wait events on the current node. For key events in the kernel, see **Table 13-184**. Alternatively, view the list of all events in the system in the wait_event_info view. For details about the impact of each transaction lock on services, see **LOCK**. When the value of the record level is **L2**, the list of statement lock events is recorded. The list records events in chronological order. The number of records is affected by the value of the **track_stmt_details_size** parameter. This column is in binary format and needs to be read by using the parsing function pg_catalog.statement_detail_decode. For details, see **Other Functions**. Events include: • Start locking. • Complete locking. • Start lock waiting. • Complete lock waiting. • Start unlocking. • Complete unlocking. • Start lightweight lock waiting. • Complete lightweight lock waiting.

Name	Type	Description
is_slow_sql	boolean	Specifies whether the SQL statement is a slow SQL statement.
trace_id	text	Driver-specific trace ID, which is associated with an application request.
advise	text	Risk information that may cause the SQL statement to be a slow SQL statement. **NOTE** If the statement is executed in SQLBypass mode, there is no risk of slow SQL statements and this column may be missing. You can run the explain command to view the plan.
parent_unique_sql_id	bigint	Normalized SQL ID of the outer SQL statement. For statements executed in a stored procedure, the value is the normalized SQL ID of the statement that calls the stored procedure. For statements outside the stored procedure, the value is **0**.
finish_status	text	Statement completion status. The default value is **normal**. **cancelled** indicates cancellation or termination.
used_memory	integer	Memory usage of a single statement (unit: MB).
sql_hash	integer	Hash value of the current query statement.
plan_hash	integer	Hash value of the current query plan.
plan_hash_prev	integer	For a generic plan, the value is the hash value of the previous plan.

13.2.9.11 GLOBAL_SESSION_SQL_MEMORY

GLOBAL_SESSION_SQL_MEMORY displays the memory usage of the statements being executed by the current user on each node, as shown in **Table 13-115**.

Table 13-115 GLOBAL_SESSION_SQL_MEMORY columns

Name	Type	Description
node_name	text	Name of the node in the current cluster.
pid	bigint	Thread ID.
sessionid	bigint	Session ID.
unique_sql_id	bigint	Unique SQL statement ID.
query_id	bigint	Debug query ID of a statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	text	Current running statement of the session.
peak_used_memory	integer	Peak memory usage of the statement, in MB.
current_used_memory	integer	Current memory usage of the statement, in MB.

13.2.9.12 SESSION_SQL_MEMORY

SESSION_SQL_MEMORY displays the memory usage of the statements being executed by the current user on the current node, as shown in **Table 13-116**.

Table 13-116 SESSION_SQL_MEMORY columns

Name	Type	Description
pid	bigint	Thread ID.
sessionid	bigint	Session ID.
unique_sql_id	bigint	Unique SQL statement ID.
query_id	bigint	Debug query ID of a statement.
query	text	Current running statement of the session.
peak_used_memory	integer	Peak memory usage of the statement, in MB.
current_used_memory	integer	Current memory usage of the statement, in MB.

13.2.10 Cache and I/O

13.2.10.1 STATIO_USER_TABLES

STATIO_USER_TABLES displays I/O status information about all user relationship tables in the namespace, as described in **Table 13-117**.

Table 13-117 STATIO_USER_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.2 SUMMARY_STATIO_USER_TABLES

SUMMARY_STATIO_USER_TABLES displays a summary of I/O status information about user relationship tables of each node in the cluster, as described in **Table 13-118**.

Table 13-118 SUMMARY_STATIO_USER_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that the table is in.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer hits in the TOAST table index (if any) in the table.

13.2.10.3 GLOBAL_STATIO_USER_TABLES

GLOBAL_STATIO_USER_TABLES displays I/O status information about all user relationship tables in namespaces on each node, as described in **Table 13-119**.

Table 13-119 GLOBAL_STATIO_USER_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer hits in the TOAST table index (if any) in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.10.4 STATIO_USER_INDEXES

STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces on the current node, as described in **Table 13-120**.

Table 13-120 STATIO_USER_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.5 SUMMARY_STATIO_USER_INDEXES

SUMMARY_STATIO_USER_INDEXES displays a summary of I/O status information about all user relationship table indexes in namespaces in the cluster, as described in **Table 13-121**.

Table 13-121 SUMMARY_STATIO_USER_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.10.6 GLOBAL_STATIO_USER_INDEXES

GLOBAL_STATIO_USER_INDEXES displays I/O status information about all user relationship table indexes in namespaces on each node, as described in **Table 13-122**.

Table 13-122 GLOBAL_STATIO_USER_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

13.2.10.7 STATIO_USER_SEQUENCES

STATIO_USER_SEQUENCE displays I/O status information about all user relationship table sequences in namespaces on the current node, as described in **Table 13-123**.

Table 13-123 STATIO_USER_SEQUENCE columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.10.8 SUMMARY_STATIO_USER_SEQUENCES

SUMMARY_STATIO_USER_SEQUENCES displays I/O status information about all user relationship table sequences in namespaces in the cluster, as described in **Table 13-124**.

Table 13-124 SUMMARY_STATIO_USER_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

13.2.10.9 GLOBAL_STATIO_USER_SEQUENCES

GLOBAL_STATIO_USER_SEQUENCES displays I/O status information about all user relationship table sequences in namespaces on each node, as described in **Table 13-125**.

Table 13-125 GLOBAL_STATIO_USER_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

13.2.10.10 STATIO_SYS_TABLES

STATIO_SYS_TABLES displays the I/O status information about all system catalogs in namespaces on the current node, as described in **Table 13-126**.

Table 13-126 STATIO_SYS_TABLES columns

Name	Type	Description
relid	oid	Table OID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.11 SUMMARY_STATIO_SYS_TABLES

SUMMARY_STATIO_SYS_TABLES displays a summary of I/O status information about system catalogs of each node in the cluster, as described in **Table 13-127**.

Table 13-127 SUMMARY_STATIO_SYS_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table.

13.2.10.12 GLOBAL_STATIO_SYS_TABLES

GLOBAL_STATIO_SYS_TABLES displays I/O status information about all system catalogs in namespaces on each node, as described in **Table 13-128**.

Table 13-128 GLOBAL_STATIO_SYS_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.

13.2.10.13 STATIO_SYS_INDEXES

STATIO_SYS_INDEXES displays the I/O status information about all system catalog indexes in the current namespace, as described in **Table 13-129**.

Table 13-129 STATIO_SYS_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.14 SUMMARY_STATIO_SYS_INDEXES

SUMMARY_STATIO_SYS_INDEXES displays a summary of I/O status information about all system catalog indexes in namespaces in the cluster, as described in **Table 13-130**.

Table 13-130 SUMMARY_STATIO_SYS_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

13.2.10.15 GLOBAL_STATIO_SYS_INDEXES

GLOBAL_STATIO_SYS_INDEXES displays I/O status information about all system catalog indexes in namespaces on each node, as described in **Table 13-131**.

Table 13-131 GLOBAL_STATIO_SYS_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.

13.2.10.16 STATIO_SYS_SEQUENCES

STATIO_SYS_SEQUENCES shows the I/O status information about all the system sequences in the current namespace, as described in **Table 13-132**.

Table 13-132 STATIO_SYS_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.10.17 SUMMARY_STATIO_SYS_SEQUENCES

SUMMARY_STATIO_SYS_SEQUENCES displays I/O status information about all system sequences in namespaces in the cluster, as described in **Table 13-133**.

Table 13-133 SUMMARY_STATIO_SYS_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

13.2.10.18 GLOBAL_STATIO_SYS_SEQUENCES

GLOBAL_STATIO_SYS_SEQUENCES displays I/O status information about all system sequences in namespaces on each node, as described in **Table 13-134**.

Table 13-134 GLOBAL_STATIO_SYS_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

13.2.10.19 STATIO_ALL_TABLES

STATIO_ALL_TABLES displays the I/O status information about each table (including TOAST tables) of the current node in the database, as described in **Table 13-135**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-135 STATIO_ALL_TABLES columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.20 SUMMARY_STATIO_ALL_TABLES

SUMMARY_STATIO_ALL_TABLES displays a summary of the I/O status information about each table (including TOAST tables) of each node in the cluster, as described in **Table 13-136**.

Table 13-136 SUMMARY_STATIO_ALL_TABLES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	numeric	Number of disk blocks read from the table.
heap_blks_hit	numeric	Number of cache hits in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
idx_blks_read	numeric	Number of disk blocks read from indexes in the table.
idx_blks_hit	numeric	Number of cache hits in indexes in the table.
toast_blks_read	numeric	Number of disk blocks read from TOAST tables (if any) in the table.
toast_blks_hit	numeric	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	numeric	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	numeric	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.10.21 GLOBAL_STATIO_ALL_TABLES

GLOBAL_STATIO_ALL_TABLES displays the I/O status information about each table (including TOAST tables) of each node in the cluster, as described in **Table 13-137**.

Table 13-137 GLOBAL_STATIO_ALL_TABLES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	Table OID.
schemaname	name	Name of the schema that contains the table.
relname	name	Table name.
heap_blks_read	bigint	Number of disk blocks read from the table.
heap_blks_hit	bigint	Number of cache hits in the table.
idx_blks_read	bigint	Number of disk blocks read from indexes in the table.
idx_blks_hit	bigint	Number of cache hits in indexes in the table.
toast_blks_read	bigint	Number of disk blocks read from TOAST tables (if any) in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
toast_blks_hit	bigint	Number of buffer hits in TOAST tables (if any) in the table.
tidx_blks_read	bigint	Number of disk blocks read from the TOAST tables index (if any) in the table.
tidx_blks_hit	bigint	Number of buffer-hits in the TOAST table index (if any) in the table.
last_updated	timestamp with time zone	Time when the monitoring data of the table in the view is updated for the last time.

13.2.10.22 STATIO_ALL_INDEXES

STATIO_ALL_INDEXES contains one row for each index in the current database, showing I/O statistics about specific indexes, as described in **Table 13-138**.

Table 13-138 STATIO_ALL_INDEXES columns

Name	Type	Description
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	bigint	Number of disk blocks read from the index.
idx_blks_hit	bigint	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.10.23 SUMMARY_STATIO_ALL_INDEXES

SUMMARY_STATIO_ALL_INDEXES contains one row for each index in the cluster database, showing a summary of I/O statistics about specific indexes, as described in **Table 13-139**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-139 SUMMARY_STATIO_ALL_INDEXES columns

Name	Type	Description
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

13.2.10.24 GLOBAL_STATIO_ALL_INDEXES

GLOBAL_STATIO_ALL_INDEXES contains one row for each index in databases on each node, showing I/O statistics about specific indexes, as described in **Table 13-140**.

Table 13-140 GLOBAL_STATIO_ALL_INDEXES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the table that the index is created for.
indexrelid	oid	OID of the index.
schemaname	name	Name of the schema that contains the index.
relname	name	Name of the table that the index is created for.
indexrelname	name	Index name.
idx_blks_read	numeric	Number of disk blocks read from the index.
idx_blks_hit	numeric	Number of cache hits in the index.
last_updated	timestamp with time zone	Time when the monitoring data of the index in the view is updated for the last time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.10.25 STATIO_ALL_SEQUENCES

STATIO_ALL_SEQUENCES contains one row for each sequence in the current database, showing I/O statistics about specific sequences, as described in **Table 13-141**.

Table 13-141 STATIO_ALL_SEQUENCES columns

Name	Type	Description
relid	oid	OID of the sequence.
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

13.2.10.26 SUMMARY_STATIO_ALL_SEQUENCES

SUMMARY_STATIO_ALL_SEQUENCES contains I/O statistics about one row of each sequence in databases in the cluster, as described in **Table 13-142**.

Table 13-142 SUMMARY_STATIO_ALL_SEQUENCES columns

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	numeric	Number of disk blocks read from the sequence.
blks_hit	numeric	Number of cache hits in the sequence.

13.2.10.27 GLOBAL_STATIO_ALL_SEQUENCES

GLOBAL_STATIO_ALL_SEQUENCES contains every row of each sequence in databases on each node, showing I/O statistics about specific sequences, as described in **Table 13-143**.

Table 13-143 GLOBAL_STATIO_ALL_SEQUENCES columns

Name	Type	Description
node_name	name	Node name.
relid	oid	OID of the sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
schemaname	name	Name of the schema that the sequence is in.
relname	name	Sequence name.
blks_read	bigint	Number of disk blocks read from the sequence.
blks_hit	bigint	Number of cache hits in the sequence.

13.2.11 Communication Library

13.2.11.1 COMM_DELAY

COMM_DELAY displays the TCP proxy communications library status for a single DN, as described in **Table 13-144**.

Table 13-144 COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node.
stream_num	integer	Number of logical stream connections used by the current physical connection.
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: μs). **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: μs).
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: μs).

13.2.11.2 GLOBAL_COMM_DELAY

GLOBAL_COMM_DELAY displays the TCP proxy communications library status for all the DNs, as described in **Table 13-145**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-145 GLOBAL_COMM_DELAY columns

Name	Type	Description
node_name	text	Node name.
remote_name	text	Name of the peer node.
remote_host	text	IP address of the peer node.
stream_num	integer	Number of logical stream connections used by the current physical connection.
min_delay	integer	Minimum delay of the current physical connection within 1 minute (unit: μs). **NOTE** A negative result is invalid. Wait until the delay status is updated and query again.
average	integer	Average delay of the current physical connection within 1 minute (unit: μs).
max_delay	integer	Maximum delay of the current physical connection within 1 minute (unit: μs).

13.2.11.3 COMM_RECV_STREAM

COMM_RECV_STREAM displays the receiving stream status of all TCP proxy communications libraries on a single DN, as described in **Table 13-146**.

Table 13-146 COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average receiving rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
buff_usize	bigint	Current size of the data cache of the stream (unit: byte).

13.2.11.4 GLOBAL_COMM_RECV_STREAM

GLOBAL_COMM_RECV_STREAM displays the receiving stream status of all TCP proxy communications libraries on all the DNs, as described in **Table 13-147**.

Table 13-147 GLOBAL_COMM_RECV_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
recv_bytes	bigint	Total data volume received by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average receiving rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
buff_usize	bigint	Current size of the data cache of the stream (unit: byte).

13.2.11.5 COMM_SEND_STREAM

COMM_SEND_STREAM displays the sending stream status of all TCP proxy communications libraries on a single DN, as described in **Table 13-148**.

Table 13-148 COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
send_bytes	bigint	Total data volume sent by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).
speed	bigint	Average sending rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms).

13.2.11.6 GLOBAL_COMM_SEND_STREAM

GLOBAL_COMM_SEND_STREAM displays the sending stream status of all TCP proxy communications libraries on all the DNs, as described in **Table 13-149**.

Table 13-149 GLOBAL_COMM_SEND_STREAM columns

Name	Type	Description
node_name	text	Node name.
local_tid	bigint	ID of the thread using this stream.
remote_name	text	Name of the peer node.
remote_tid	bigint	Peer thread ID.
idx	integer	Peer DN ID in the local DN.
sid	integer	Stream ID in the physical connection.
tcp_sock	integer	TCP socket used in the stream.
state	text	Stream status.
query_id	bigint	**debug_query_id** corresponding to the stream.
pn_id	integer	**plan_node_id** of the query executed by the stream.
send_smp	integer	**smpid** of the sender of the query executed by the stream.
recv_smp	integer	**smpid** of the receiver of the query executed by the stream.
send_bytes	bigint	Total data volume sent by the stream (unit: byte).
time	bigint	Current lifecycle service duration of the stream (unit: ms).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
speed	bigint	Average sending rate of the stream (unit: byte/s).
quota	bigint	Current communication quota value of the stream (unit: byte).
wait_quota	bigint	Extra time generated when the stream waits for the quota value (unit: ms).

13.2.11.7 COMM_STATUS

COMM_STATUS displays the TCP proxy communications library status on a single DN, as described in **Table 13-150**.

Table 13-150 COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in Kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in Kbyte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** thread, in bytes.
memkbyte_libpq	bigint	Communication memory size of the **libpq** thread, in bytes.
used_pm	integer	Real-time usage of the **postmaster** thread.
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread.
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread.
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads.
stream	integer	Total number of used logical connections.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.11.8 GLOBAL_COMM_STATUS

GLOBAL_COMM_STATUS displays the TCP proxy communications library status on all the DNs, as described in **Table 13-151**.

Table 13-151 GLOBAL_COMM_STATUS columns

Name	Type	Description
node_name	text	Node name.
rxpck_rate	integer	Receiving rate of the communications library on the node, in byte/s.
txpck_rate	integer	Sending rate of the communications library on the node, in byte/s.
rxkbyte_rate	bigint	Receiving rate of the communications library on the node, in Kbyte/s.
txkbyte_rate	bigint	Sending rate of the communications library on the node, in Kbyte/s.
buffer	bigint	Size of the buffer of the Cmailbox.
memkbyte_libcomm	bigint	Communication memory size of the **libcomm** thread, in bytes.
memkbyte_libpq	bigint	Communication memory size of the **libpq** thread, in bytes.
used_pm	integer	Real-time usage of the **postmaster** thread.
used_sflow	integer	Real-time usage of the **gs_sender_flow_controller** thread.
used_rflow	integer	Real-time usage of the **gs_receiver_flow_controller** thread.
used_rloop	integer	Highest real-time usage among multiple **gs_receivers_loop** threads.
stream	integer	Total number of used logical connections.

13.2.12 Utility

13.2.12.1 REPLICATION_STAT

REPLICATION_STAT describes information about log synchronization status, such as the locations where the sender sends logs and where the receiver receives logs, as described in **Table 13-152**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-152 REPLICATION_STAT columns

Name	Type	Description
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
usename	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.
state	text	Log replication state: • Catch-up state. • Consistent streaming state.
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication. • Synchronous replication. • Potential synchronization.
dbid	oid	ID of the database to which the statistics belong.

13.2.12.2 GLOBAL_REPLICATION_STAT

GLOBAL_REPLICATION_STAT displays information about log synchronization status on each node, such as the locations where the sender sends logs and where the receiver receives logs, as described in **Table 13-153**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-153 GLOBAL_REPLICATION_STAT columns

Name	Type	Description
node_name	name	Node name.
pid	bigint	PID of the thread.
usesysid	oid	User system ID.
usename	name	Username.
application_name	text	Program name.
client_addr	inet	Client address.
client_hostname	text	Client name.
client_port	integer	Port of the client.
backend_start	timestamp with time zone	Start time of the program.
state	text	Log replication state: • Catch-up state. • Consistent streaming state.
sender_sent_location	text	Location where the sender sends logs.
receiver_write_location	text	Location where the receiver writes logs.
receiver_flush_location	text	Location where the receiver flushes logs.
receiver_replay_location	text	Location where the receiver replays logs.
sync_priority	integer	Priority of synchronous duplication. (**0** indicates asynchronization.)
sync_state	text	Synchronization state: • Asynchronous replication. • Synchronous replication. • Potential synchronization.
dbid	oid	ID of the database to which the statistics belong.

13.2.12.3 REPLICATION_SLOTS

REPLICATION_SLOTS displays replication slot information, as described in **Table 13-154**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-154 REPLICATION_SLOTS columns

Name	Type	Description
slot_name	text	Replication slot name.
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Determines whether the replication slot is activated. • **t** (true): yes. • **f** (false): no.
xmin	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter. Specifies whether the peer end connected to the replication slot is a secondary node. • **t** (true): yes. • **f** (false): no.

13.2.12.4 GLOBAL_REPLICATION_SLOTS

GLOBAL_REPLICATION_SLOTS displays information about replicated slots on each node in the cluster, as described in **Table 13-155**.

Table 13-155 GLOBAL_REPLICATION_SLOTS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Replication slot name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
plugin	text	Name of the output plug-in corresponding to the logical replication slot.
slot_type	text	Replication slot type. • **physical**: physical replication slot. • **logical**: logical replication slot.
datoid	oid	OID of the database where the replication slot resides.
database	name	Name of the database where the replication slot resides.
active	boolean	Specifies whether the replication slot is activated. • **t** (true): yes. • **f** (false): no.
x_min	xid	XID of the earliest transaction that the database must reserve for the replication slot.
catalog_xmin	xid	XID of the earliest system catalog-involved transaction that the database must reserve for the logical replication slot.
restart_lsn	text	Physical location of the earliest Xlog required by the replication slot.
dummy_standby	boolean	Reserved parameter. Specifies whether the peer end connected to the replication slot is a secondary node. • **t** (true): yes. • **f** (false): no.

13.2.12.5 BGWRITER_STAT

BGWRITER_STAT displays statistics about the background writer thread's activities, as described in **Table 13-156**.

Table 13-156 BGWRITER_STAT columns

Name	Type	Description
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
checkpoint_write_time	double precision	Total time spent on performing write operations during checkpointing, in milliseconds.
checkpoint_sync_time	double precision	Total time spent on performing sync operations during checkpointing, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written during checkpointing.
buffers_clean	bigint	Number of buffers written by the BGWRITER thread.
maxwritten_clean	bigint	Number of times that the BGWRITER thread stops cleanup scanning because the number of pages refreshed in a single scan is too large.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend thread automatically executes fsync. Generally, fsync is called by the BGWRITER thread.
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time when the statistics of the current row were reset last time.

13.2.12.6 GLOBAL_BGWRITER_STAT

GLOBAL_BGWRITER_STAT displays statistics about the bgwriter thread's activities on all instances, as described in **Table 13-157**.

Table 13-157 GLOBAL_BGWRITER_STAT columns

Name	Type	Description
node_name	name	Instance name.
checkpoints_timed	bigint	Number of scheduled checkpoints that have been performed.
checkpoints_req	bigint	Number of requested checkpoints that have been performed.
checkpoint_write_time	double precision	Total time spent on performing write operations during checkpointing, in milliseconds.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
checkpoint_sync_time	double precision	Total time spent on performing sync operations during checkpointing, in milliseconds.
buffers_checkpoint	bigint	Number of buffers written during checkpointing.
buffers_clean	bigint	Number of buffers written by the BGWRITER thread.
maxwritten_clean	bigint	Number of times that the BGWRITER thread stops cleanup scanning because the number of pages refreshed in a single scan is too large.
buffers_backend	bigint	Number of buffers written directly by the backend.
buffers_backend_fsync	bigint	Number of times that the backend thread automatically executes fsync. Generally, fsync is called by the BGWRITER thread.
buffers_alloc	bigint	Number of buffers allocated.
stats_reset	timestamp with time zone	Time when the statistics of the current row were reset last time.

13.2.12.7 POOLER_STATUS

POOLER_STATUS is used to query the cache connection status of the pooler module on the local CN, as described in **Table 13-158**.

Table 13-158 POOLER_STATUS columns

Name	Type	Description
database	text	Database name.
user_name	text	Username.
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected.
node_name	name	Name of the node connected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
in_use	boolean	Specifies whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the node connected.
node_port	bigint	Port number of the node connected.
fdsock	bigint	Port file descriptor.
remote_pid	bigint	If the peer site is not in the thread pool logic, the value is the thread ID of the peer site. If the peer site is in the thread pool logic, the value is the session ID of the peer site.
session_params	text	Session parameter.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

13.2.12.8 GLOBAL_COMM_CHECK_CONNECTION_STATUS

GLOBAL_COMM_CHECK_CONNECTION_STATUS displays the connection status of all CNs and all active nodes (CNs and primary DNs). The permission control is inherited from the **DBE_PERF** schema, as described in **Table 13-159**.

Table 13-159 GLOBAL_COMM_CHECK_CONNECTION_STATUS columns

Name	Type	Description
node_name	name	Instance name.
remote_name	name	Name of the peer instance.
remote_host	text	IP address of the peer instance.
remote_port	bigint	Port number of the peer instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
is_connected	boolean	Detects the network status between the current instance and the peer instance: • **t** (true): The network between instances is normal. • **f** (false): The network between instances is abnormal.
no_error_occur	boolean	Pooler connection result between the current instance and the peer instance. • **t** (true) indicates that the pooler connection is normal. • **f** (false) indicates that the pooler connection is abnormal.

13.2.12.9 GLOBAL_CKPT_STATUS

GLOBAL_CKPT_STATUS displays the information about checkpoints and flushing pages of all instances in the entire cluster, as described in **Table 13-160**.

Table 13-160 GLOBAL_CKPT_STATUS columns

Name	Type	Description
node_name	text	Instance name.
ckpt_redo_point	text	Checkpoint of the current instance.
ckpt_clog_flush_num	bigint	Number of Clog flushing pages from the startup time to the current time.
ckpt_csnlog_flush_num	bigint	Number of CSN log flushing pages from the startup time to the current time.
ckpt_multixact_flush_num	bigint	Number of MultiXact flushing pages from the startup time to the current time.
ckpt_predicate_flush_num	bigint	Number of predicate flushing pages from the startup time to the current time.
ckpt_twophase_flush_num	bigint	Number of two-phase flushing pages from the startup time to the current time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.12.10 GLOBAL_DOUBLE_WRITE_STATUS

GLOBAL_DOUBLE_WRITE_STATUS displays the information about doublewrite files of all instances in the entire cluster, as described in **Table 13-161**.

Table 13-161 GLOBAL_DOUBLE_WRITE_STATUS columns

Name	Type	Description
node_name	text	Instance name.
curr_dwn	bigint	Sequence number of the doublewrite file.
curr_start_page	bigint	Start page for restoring the doublewrite file.
file_trunc_num	bigint	Number of times that the doublewrite file is reused.
file_reset_num	bigint	Number of reset times after the doublewrite file is full.
total_writes	bigint	Total number of I/Os of the doublewrite file.
low_threshold_writes	bigint	Number of I/Os for inefficient doublewrite files.
high_threshold_writes	bigint	Number of I/Os for efficient doublewrite files.
total_pages	bigint	Total number of pages that are flushed to the doublewrite file area.
low_threshold_pages	bigint	Number of pages that are flushed with low efficiency.
high_threshold_pages	bigint	Number of pages that are flushed with high efficiency.
file_id	bigint	ID of the current doublewrite file.

13.2.12.11 GLOBAL_PAGEWRITER_STATUS

GLOBAL_PAGEWRITER_STATUS displays the information about checkpoints and flushing pages of all instances in the entire cluster, as described in **Table 13-162**.

Table 13-162 GLOBAL_PAGEWRITER_STATUS columns

Name	Type	Description
node_name	text	Instance name.
pgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed from the startup to the current time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pgwr_last_flush_num	integer	Number of dirty pages flushed in the previous batch.
remain_dirty_page_num	bigint	Estimated number of remaining dirty pages.
queue_head_page_rec_lsn	text	**recovery_lsn** of the first dirty page in the dirty page queue of the current instance.
queue_rec_lsn	text	**recovery_lsn** of the dirty page queue of the current instance.
current_xlog_insert_lsn	text	The write position of Xlogs in the current instance.
ckpt_redo_point	text	Checkpoint of the current instance.

13.2.12.12 GLOBAL_POOLER_STATUS

GLOBAL_POOLER_STATUS is used to query the cache connection status of the pooler modules on all CNs, as described in **Table 13-163**.

Table 13-163 GLOBAL_POOLER_STATUS columns

Name	Type	Description
source_node_name	name	Source node name.
database	text	Database name.
user_name	text	Username.
tid	bigint	In non-thread pool logic, this parameter indicates the ID of the thread connected to the CN. In thread pool logic, this parameter indicates the ID of the session connected to the CN.
node_oid	bigint	OID of the node connected.
node_name	name	Name of the node connected.
in_use	boolean	Specifies whether the connection is currently used. • **t** (true): The connection is in use. • **f** (false): The connection is not in use.
local_host	text	Local IP address.
local_port	bigint	Local port number.
remote_host	text	IP address of the connected node.
node_port	bigint	Port number of the node connected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
fdsock	bigint	Port file descriptor.
remote_pid	bigint	Thread ID of the remote node connected.
session_params	text	Session parameter.
used_count	bigint	Number of reuse times of a connection.
idx	bigint	Logical connection ID of the connected instance node.
streamid	bigint	Stream ID corresponding to each logical connection.

13.2.12.13 GLOBAL_RECORD_RESET_TIME

GLOBAL_RECORD_RESET_TIME is used to obtain statistics about the reset (restart, active/standby switchover, and database deletion) time of each node in the cluster, as shown in **Table 13-164**.

Table 13-164 GLOBAL_RECORD_RESET_TIME columns

Name	Type	Description
node_name	text	Node name.
reset_time	timestamp with time zone	Time to be reset.

13.2.12.14 GLOBAL_REDO_STATUS

GLOBAL_REDO_STATUS displays the replaying of logs about instances in the entire cluster, as described in **Table 13-165**.

Table 13-165 GLOBAL_REDO_STATUS columns

Name	Type	Description
node_name	text	Instance name.
redo_start_ptr	bigint	Start point for replaying the instance logs.
redo_start_time	bigint	Start time (UTC) when the instance logs are replayed.
redo_done_time	bigint	End time (UTC) when the instance logs are replayed.
curr_time	bigint	Current time (UTC) of the instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_recovery_point	bigint	Minimum barrier for the current instance log to provide services after the replay is complete.
read_ptr	bigint	Position for reading the instance logs.
last_replayed_read_ptr	bigint	Position for replaying the instance logs.
recovery_done_ptr	bigint	Replay position after the instance is started.
read_xlog_io_counter	bigint	Number of I/Os when the current instance reads and replays logs.
read_xlog_io_total_dur	bigint	Total I/O duration when the current instance reads and replays logs.
read_data_io_counter	bigint	Number of data page I/O reads during replay in the current instance log.
read_data_io_total_dur	bigint	Total I/O duration reads during replay in the current instance log.
write_data_io_counter	bigint	Number of data page I/O writes during replay in the current instance log.
write_data_io_total_dur	bigint	Total I/O duration writes during replay in the current instance log.
process_pending_counter	bigint	Number of synchronization times of log distribution threads during replay in the instance log.
process_pending_total_dur	bigint	Synchronization duration of log distribution threads during replay in the instance log.
apply_counter	bigint	Number of synchronization times of replay threads during replay in the instance log.
apply_total_dur	bigint	Synchronization duration of replay threads during replay in the instance log.
speed	bigint	Log replay rate of the current instance. The value is updated every time when a 256 MB log is replayed. The unit is byte/s. In a cluster environment, you are advised to run the **cm_ctl query -rv** command to obtain a more accurate replay speed of the standby node. For details about the **cm_ctl** command, see "Unified Cluster Management Tool" in the *Tool Reference*.
local_max_ptr	bigint	Maximum number of replay logs received by the localhost after the instance is started.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
primary_flush_ptr	bigint	Log point where the host flushes logs to a disk.
worker_info	text	Replay thread information of the instance. If concurrent replay is not enabled, the value is **NULL**.

13.2.12.15 GLOBAL_RECOVERY_STATUS

GLOBAL_RECOVERY_STATUS displays log flow control information about the primary and standby nodes, as described in **Table 13-166**.

Table 13-166 GLOBAL_RECOVERY_STATUS columns

Name	Type	Description
node_name	text	Node name (including the primary and standby nodes).
standby_node_name	text	Name of the standby node.
source_ip	text	IP address of the primary node.
source_port	integer	Port number of the primary node.
dest_ip	text	IP address of the standby node.
dest_port	integer	Port number of the standby node.
current_rto	bigint	Current log flow control time of the standby node (unit: s).
target_rto	bigint	Expected flow control time of the standby node specified by the corresponding GUC parameter (unit: s).
current_sleep_time	bigint	Sleep time (in microseconds) required by the host to achieve the expected RTO.

13.2.12.16 CLASS_VITAL_INFO

CLASS_VITAL_INFO is used to check whether the OIDs of the same table or index are consistent for WDR snapshots, as described in **Table 13-167**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-167 CLASS_VITAL_INFO columns

Name	Type	Description
relid	oid	Table OID.
schemaname	name	Schema name.
relname	name	Table name.
relkind	"char"	Object type. Its value can be: • **r**: ordinary table. • **t**: TOAST table. • **i**: index. • **G**: global secondary index.
last_updated	timestamp with time zone	Time when the monitoring data of the object in the view is updated for the last time.

13.2.12.17 USER_LOGIN

USER_LOGIN records the number of user logins and logouts, as described in **Table 13-168**.

Table 13-168 USER_LOGIN columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
user_id	integer	User OID (Its value is the same as that of **oid** in **pg_authid**.)
login_counter	bigint	Number of logins.
logout_counter	bigint	Number of logouts.
dbid	oid	ID of the database to which the user logs in.

13.2.12.18 SUMMARY_USER_LOGIN

SUMMARY_USER_LOGIN records information about user logins and logouts on all CNs, as described in **Table 13-169**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-169 SUMMARY_USER_LOGIN columns

Name	Type	Description
node_name	text	Node name.
user_name	text	Username.
user_id	integer	User OID. (Its value is the same as that of **oid** in **pg_authid**.)
login_counter	bigint	Number of logins.
logout_counter	bigint	Number of logouts.
dbid	oid	ID of the database to which the user logs in.

13.2.12.19 GLOBAL_GET_BGWRITER_STATUS

GLOBAL_GET_BGWRITER_STATUS displays the information about pages flushed by the bgwriter threads of all instances in the entire cluster, number of pages in the candidate buffer chain, and buffer eviction information, as described in **Table 13-170**.

Table 13-170 GLOBAL_GET_BGWRITER_STATUS columns

Name	Type	Description
node_name	text	Instance name.
bgwr_actual_flush_total_num	bigint	Total number of dirty pages flushed by the bgwriter thread from the startup time to the current time.
bgwr_last_flush_num	integer	Number of dirty pages flushed by the bgwriter thread in the previous batch.
candidate_slots	integer	Number of pages in the current candidate buffer chain.
get_buffer_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction.
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction.

13.2.12.20 GLOBAL_SINGLE_FLUSH_DW_STATUS

GLOBAL_SINGLE_FLUSH_DW_STATUS displays information about doublewrite files eliminated on a single page of all instances in the entire cluster, as described in **Table 13-171**. In the displayed information, the information before the slash (/)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

indicates the page flushing status of the first version, and the information after the slash (/) indicates the page flushing status of the second version. The doublewrite page flushing status of the first version refers to performing single-page eviction doublewrite on a non-segment-page page, and the doublewrite page flushing case of the second version refers to performing single-page eviction doublewrite on a segment-page page.

Table 13-171 GLOBAL_SINGLE_FLUSH_DW_STATUS columns

Name	Type	Description
node_name	text	Instance name.
curr_dwn	text	Sequence number of the doublewrite file.
curr_start_page	text	Start position of the current doublewrite file.
total_writes	text	Total number of data write pages in the current doublewrite file.
file_trunc_num	text	Number of times that the doublewrite file is reused.
file_reset_num	text	Number of reset times after the doublewrite file is full.

13.2.12.21 GLOBAL_CANDIDATE_STATUS

GLOBAL_CANDIDATE_STATUS displays the number of candidate buffers and buffer eviction information of all instances in the database, as described in **Table 13-172**.

Table 13-172 GLOBAL_GET_BGWRITER_STATUS columns

Name	Type	Description
node_name	text	Node name.
candidate_slots	integer	Number of pages in the candidate buffer chain of the current normal buffer pool.
get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current normal buffer pool.
get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current normal buffer pool.
seg_candidate_slots	integer	Number of pages in the candidate buffer chain of the current segment buffer pool.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
seg_get_buf_from_list	bigint	Number of times that pages are obtained from the candidate buffer chain during buffer eviction in the current segment buffer pool.
seg_get_buf_clock_sweep	bigint	Number of times that pages are obtained from the original eviction solution during buffer eviction in the current segment buffer pool.

13.2.12.22 PARALLEL_DECODE_STATUS

PARALLEL_DECODE_STATUS displays parallel decoding information about replication slots on the current node, as described in **Table 13-173**. This view needs to be queried on DNs. If it is queried on CNs, no information is returned.

Table 13-173 PARALLEL_DECODE_STATUS columns

Name	Type	Description
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Specifies the total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestamp with time zone	Time when the replication slot reads the logical log for the last time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.12.23 GLOBAL_PARALLEL_DECODE_STATUS

GLOBAL_PARALLEL_DECODE_STATUS displays parallel decoding information about replication slots on each primary DN in a cluster, as described in **Table 13-174**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 13-174 GLOBAL_PARALLEL_DECODE_STATUS columns

Name	Type	Description
node_name	name	Node name.
slot_name	text	Specifies the replication slot name.
parallel_decode_num	integer	Specifies the number of parallel decoder threads of the replication slot.
read_change_queue_length	text	Concatenates the current length of the log queue read by each decoder thread and then outputs the result.
decode_change_queue_length	text	Concatenates the current length of the decoding result queue of each decoder thread and then outputs the result.
reader_lsn	text	Specifies the location of the log read by the current reader thread.
working_txn_cnt	bigint	Specifies the number of transactions that are being concatenated in the current sender thread.
working_txn_memory	bigint	Total memory occupied by concatenation transactions in the sender thread, in bytes.
decoded_time	timestamp with time zone	Time when the replication slot reads the logical log for the last time.

13.2.12.24 PARALLEL_DECODE_THREAD_INFO

PARALLEL_DECODE_THREAD_INFO displays information about threads that perform parallel decoding on the current node, as described in **Table 13-175**. This view needs to be queried on DNs. If it is queried on CNs, no information is returned.

Table 13-175 PARALLEL_DECODE_THREAD_INFO columns

Name	Type	Description
thread_id	bigint	Thread ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

13.2.12.25 GLOBAL_PARALLEL_DECODE_THREAD_INFO

GLOBAL_PARALLEL_DECODE_THREAD_INFO displays information about threads that perform parallel decoding on each primary DN in a cluster, as described in **Table 13-176**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 13-176 GLOBAL_PARALLEL_DECODE_THREAD_INFO columns

Name	Type	Description
node_name	name	Node name.
thread_id	bigint	Thread ID.
slot_name	text	Replication slot name.
thread_type	text	Thread type (sender, reader, or decoder).
seq_number	integer	Sequence number (starting from 1) of threads of the same type in the current replication slot.

13.2.12.26 GLOBAL_ADIO_COMPLETER_STATUS

GLOBAL_ADIO_COMPLETER_STATUS displays statistics about the AIO Completer thread in all cluster instances, as described in **Table 13-177**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 13-177 GLOBAL_ADIO_COMPLETER_STATUS columns

Parameter	Type	Description
node_name	text	Instance name.
tid	bigint	ID of the AIO Completer thread.
thread_type	text	AIO Completer thread type (read or write).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
aio_submitted_num	bigint	Number of committed asynchronous I/O requests of the AIO Completer thread.
aio_completed_num	bigint	Number of completed asynchronous I/O requests of the AIO Completer thread.
aio_incompleted_num	bigint	Number of asynchronous I/O requests that are not completed of the AIO Completer thread.
slot_count_left	bigint	Indicates the number of idle slots.

13.2.12.27 GLOBAL_AIO_SLOT_USAGE_STATUS

GLOBAL_AIO_SLOT_USAGE_STATUS displays statistics about asynchronous I/O commit slots in all cluster instances, as described in **Table 13-178**. The view needs to be queried on a CN. An error is reported when the view is queried on a DN.

Table 13-178 GLOBAL_AIO_SLOT_USAGE_STATUS columns

Parameter	Type	Description
node_name	text	Instance name.
slot_id	integer	Slot ID.
slot_type	"char"	Slot type. The value can be **r** (read) or **w** (write).
status	boolean	Slot usage status.
buffer_id	bigint	Buffer ID corresponding to the slot.
relfilenode_blocknum	text	Position of the physical page where the buffer corresponding to the slot is located.
lsn	bigint	LSN corresponding to the page.
submitted_time	bigint	Time when a page is committed asynchronously.
elapsed_time	bigint	Waiting time of the page.

13.2.13 Lock

13.2.13.1 LOCKS

LOCKS displays information about locks held by each open transaction, as described in **Table 13-179**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-179 LOCKS columns

Name	Type	Description
locktype	text	Type of the locked object. The value can be **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, **advisory**, or **tablespace**.
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
bucket	integer	Hash bucket number.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sessionid	bigint	ID of the session holding or awaiting this lock The value is **NULL** if the lock is held by a prepared transaction.
mode	text	Lock mode held or desired by this thread.
granted	boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the **locktag_decode()** function.
global_sessionid	text	Global session ID.

13.2.13.2 GLOBAL_LOCKS

GLOBAL_LOCKS displays information about locks held by open transactions on each node, as described in **Table 13-180**.

Table 13-180 GLOBAL_LOCKS columns

Name	Type	Description
node_name	name	Node name.
locktype	text	Type of the locked object. The value can be **relation**, **extend**, **page**, **tuple**, **transactionid**, **virtualxid**, **object**, **userlock**, **advisory**, or **tablespace**.
database	oid	OID of the database in which the locked object exists. • The OID is **0** if the object is a shared object. • The OID is **NULL** if the object is a transaction ID.
relation	oid	OID of the relationship targeted by the lock. The value is **NULL** if the object is not a relationship or part of a relationship.
page	integer	Page number targeted by the lock within the relationship. The value is **NULL** if the object is not a relationship page or row page.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
tuple	smallint	Row number targeted by the lock within the page. The value is **NULL** if the object is not a row.
bucket	integer	Hash bucket ID.
virtualxid	text	Virtual ID of the transaction targeted by the lock. The value is **NULL** if the object is not a virtual transaction ID.
transactionid	xid	ID of the transaction targeted by the lock. The value is **NULL** if the object is not a transaction ID.
classid	oid	OID of the system catalog that contains the object. The value is **NULL** if the object is not a general database object.
objid	oid	OID of the locked object within its system catalog. The value is **NULL** if the object is not a general database object.
objsubid	smallint	Column number for a column in the table. The value is **0** if the object is some other object type. The value is **NULL** if the object is not a general database object.
virtualtransaction	text	Virtual ID of the transaction holding or awaiting this lock.
pid	bigint	Logical ID of the server thread holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
sessionid	bigint	ID of the session holding or awaiting this lock. The value is **NULL** if the lock is held by a prepared transaction.
global_sessionid	text	Global session ID.
mode	text	Lock mode held or desired by this thread.
granted	boolean	• The value is **TRUE** if the lock is a held lock. • The value is **FALSE** if the lock is an awaited lock.
fastpath	boolean	The value is **TRUE** if the lock is obtained through **fast-path**, and is **FALSE** if the lock is obtained through the main lock table.
locktag	text	Information about the lock that the session waits for. It can be parsed using the **locktag_decode()** function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.14 Wait Event

13.2.14.1 WAIT_EVENTS

WAIT_EVENTS displays statistics about wait events on the current node, as described in **Table 13-181**. For key events in the kernel, see **Table 13-184**. Alternatively, view the list of all events in the system in the **wait_event_info** view. For details about the impact of each transaction lock on services, see **LOCK**.

Table 13-181 WAIT_EVENTS columns

Name	Type	Description
nodename	text	Node name.
type	text	Event type.
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of waiting failures.
total_wait_time	bigint	Total waiting time (unit: μs).
avg_wait_time	bigint	Average waiting time (unit: μs).
max_wait_time	bigint	Maximum waiting time (unit: μs).
min_wait_time	bigint	Minimum waiting time (unit: μs).
last_updated	timestamp with time zone	Last time when the event was updated.

13.2.14.2 GLOBAL_WAIT_EVENTS

GLOBAL_WAIT_EVENTS displays statistics about wait events on each node, as described in **Table 13-182**.

Table 13-182 GLOBAL_WAIT_EVENTS columns

Name	Type	Description
nodename	text	Node name.
type	text	Event type.
event	text	Event name.
wait	bigint	Number of waiting times.
failed_wait	bigint	Number of waiting failures.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
total_wait_time	bigint	Total waiting time (unit: μs).
avg_wait_time	bigint	Average waiting time (unit: μs).
max_wait_time	bigint	Maximum waiting time (unit: μs).
min_wait_time	bigint	Minimum waiting time (unit: μs).
last_updated	timestamp with time zone	Last time when the event was updated.

13.2.14.3 WAIT_EVENT_INFO

WAIT_EVENT_INFO displays the details about wait events, as described in **Table 13-183** and **Table 13-184**.

Table 13-183 WAIT_EVENT_INFO columns

Name	Type	Description
module	text	Name of the module an event belongs to.
type	text	Event type.
event	text	Event name.

Table 13-184 List of wait events

Module Category	Event Category	Event	Description
Lock	Wait event	acquire lock	Waits for locking until the locking succeeds or times out.
SharedMemory	LWLock event	ShmemIndexLock	Protects the primary index table, a hash table, in shared memory.
Shared buffer	LWLock event	BufMappingLock	Protects operations on a shared-buffer mapping table.
Lmgr	LWLock event	LockMgrLock	Protects the information about a common lock structure.
LWLock	Wait event	acquire lwlock	Waits for a lightweight lock.
I/O	Wait event	wait io	Waits for I/O completion.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
COMM	Wait event	wait cmd	Waits for reading network communication packets to complete.
COMM	Wait event	wait pooler get conn	Waits for pooler to obtain connections.
COMM	Wait event	wait pooler abort conn	Waits for pooler to terminate connections.
COMM	Wait event	wait pooler clean conn	Waits for pooler to clear connections.
COMM	Wait event	get conn	Obtains connections to other nodes.
COMM	Wait event	set cmd	Waits for running the **SET**, **RESET**, or **TRANSACTION BLOCK LEVEL** statement on the connection.
COMM	Wait event	cancel query	Cancels the SQL statement that is being executed through a connection.
COMM	Wait event	stop query	Stops the query that is being executed through a connection.
COMM	Wait event	wait node	Waits for receiving data through the connection to an instance.
COMM	Wait event	flush data	Waits for sending data to other nodes in the network.
COMM	Wait event	stream get conn	Waits for establishing connections to consumer nodes when the stream flow is initialized.
COMM	Wait event	wait producer ready	Waits for every producer to get ready when the stream flow is initialized.
Stream	Wait event	synchronize quit	Waits for the threads in the stream thread group to quit when the stream plan ends.
Stream	Wait event	wait stream group destroy	Waits for destroying the stream node group when the stream plan ends.
Transaction	Wait event	wait transaction sync	Waits for transaction synchronization.
Transaction	Wait event	wait data sync	Waits for the completion of data page synchronization to the standby instance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Transaction	Wait event	wait data sync queue	Waits for putting the row-store data pages into the synchronization queue.
Transaction	LWLock event	OidGenLock	Prevents different threads from generating the same OID.
Transaction	LWLock event	XidGenLock	Prevents two transactions from obtaining the same XID.
Transaction	LWLock event	ProcArrayLock	Prevents concurrent access to or concurrent modification on ProcArray shared arrays.
Transaction	LWLock event	SubtransControlLock	Prevents concurrent access to or concurrent modification on the sub-transaction control data structure.
Transaction	LWLock event	MultiXactGenLock	Allocates a unique MultiXact ID in serial mode.
Transaction	LWLock event	TwoPhaseStateLock	Prevents concurrent access to or concurrent modification on two-phase information sharing arrays.
Transaction	LWLock event	SerializableXactHashLock	Prevents concurrent read/write or concurrent write/write on a sharing structure for serializable transactions.
Transaction	LWLock event	SerializableFinishedListLock	Prevents concurrent read/write or concurrent write/write on a shared linked list for completed serial transactions.
Transaction	LWLock event	SerializablePredicateLockListLock	Protects a linked list of serializable transactions that have locks.
Transaction	LWLock event	PredicateLockMgrLock	Protects the information about a lock structure that has serializable transactions.
Transaction	LWLock event	OldSerXid SLRU lwlock	Protects SLRU buffers of old transaction IDs.
Transaction	LWLock event	OldSerXidLock	Protects a structure that records serializable transactions that have conflicts.
Transaction	Lock event	transactionid	Adds a lock to a transaction ID.
Transaction	Lock event	virtualxid	Adds a lock to a virtual transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Checkpoint	LWLock event	CheckpointLock	Prevents multi-checkpoint concurrent execution.
Checkpoint	LWLock event	CheckpointerCommLock	Sends file flush requests to a checkpointer. The request structure needs to be inserted to a request queue in serial mode.
Analyze	LWLock event	AutoanalyzeLock	Obtains and releases resources related to a task that allows for autoanalyze execution.
Vacuum	LWLock event	BtreeVacuumLock	Prevents VACUUM from clearing pages that are being used by B-tree indexes.
Vacuum	LWLock event	AutovacuumLock	Accesses the autovacuum worker array in serial mode.
Vacuum	LWLock event	AutovacuumScheduleLock	Distributes tables requiring VACUUM in serial mode.
Auto vacuum	LWLock event	AutovacuumLock	Protects the autovacuum shared memory structure.
Auto vacuum	LWLock event	AutovacuumScheduleLock	Protects the information about autovacuum workers.
Auto analyze	LWLock event	AutoanalyzeLock	Protects the *autoAnalyzeFreeProcess* variable and ensures that no more than 10 autoanalyze threads are running at the same time.
WAL	Wait event	wait wal sync	Waits for the completion of WAL of synchronization from the specified LSN to the standby instance.
WAL	I/O event	WALBootstrapSync	Flushes an initialized WAL file to a disk during database initialization.
WAL	I/O event	WALBootstrapWrite	Writes an initialized WAL file during database initialization.
WAL	I/O event	WALCopyRead	Reads operation generated when an existing WAL file is read for replication after archiving and restoration.
WAL	I/O event	WALCopySync	Flushes a replicated WAL file to a disk after archiving and restoration.
WAL	I/O event	WALCopyWrite	Writes operation generated when an existing WAL file is read for replication after archiving and restoration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
WAL	I/O event	WALInitSync	Flushes a newly initialized WAL file to a disk during log reclaiming or writing.
WAL	I/O event	WALInitWrite	Initializes a newly created WAL file to **0** during log reclaiming or writing.
WAL	I/O event	WALRead	Reads data from Xlogs during redo operations on two-phase files.
WAL	I/O event	WALSyncMethodAssign	Flushes all open WAL files to a disk.
WAL	I/O event	WALWrite	Writes a WAL file.
WAL	I/O event	LOGCTRL_SLEEP	Collects statistics on the number of stream control times and the sleep time of log stream control.
WAL	LWLock event	RcvWriteLock	Prevents concurrent call of WalDataRcvWrite.
WAL	LWLock event	WALBufMappingLock	An exclusive (X) lock needs to be added when the next page of an Xlog buffer is initialized.
WAL	LWLock event	WALInsertLock	Prevents multiple programs from writing data to the same Xlog buffer at the same time.
WAL	LWLock event	WALWriteLock	Prevents concurrent WAL write.
Relation	LWLock event	SInvalReadLock	Prevents concurrent execution with invalid message deletion.
Relation	LWLock event	SinvalWriteLock	Prevents concurrent execution with invalid message write and deletion.
Relation	LWLock event	RelCacheInitLock	Adds a lock before any operations are performed on the **init** file when messages are invalid.
Relation	LWLock event	TablespaceCreateLock	Checks whether a tablespace already exists.
Relation	LWLock event	RelfilenodeReuseLock	Prevents the link to a reused column attribute file from being canceled by mistake.
Relation	Lock event	relation	Adds a lock to a table.
Relation	Lock event	extend	Adds a lock to a table being scaled out.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Relation	Lock event	partition	Adds a lock to a partitioned table.
Relation	Lock event	partition_seq	Adds a lock to a partition of a partitioned table.
WLM	Wait event	wait active statement	Waits for active statements.
WLM	Wait event	wait memory	Waits for free memory.
DDL/DCL	Wait event	create index	Waits for the completion of index creation.
DDL/DCL	Wait event	analyze	Waits for analysis completion.
DDL/DCL	Wait event	vacuum	Waits for the completion of the **VACUUM** operation.
DDL/DCL	LWLock event	DelayDDLLock	Prevents concurrent DDL operations.
DDL/DCL	Wait event	vacuum full	Waits for the completion of the **VACUUM FULL** operation.
Executor	Wait event	Sort	Waits for the completion of tuple sorting.
Executor	Wait event	Sort - write file	Writes sorted data to a file temporarily since the memory is limited during merge sort.
Executor	Wait event	Material	Waits for tuple materialization.
Executor	Wait event	Material - write file	Waits for writing a materialized tuple to a file.
Executor	Wait event	HashJoin - build hash	Waits until a hash table is created when a hash join is executed.
Executor	Wait event	HashJoin - write file	Waits for writing the hash result of a tuple to a disk when a hash join is executed.
Executor	Wait event	HashAgg - build hash	Waits until a hash table is created when a hash aggregate is executed.
Executor	Wait event	HashAgg - write file	Waits for writing the hash result of a tuple to a disk when a hash aggregate is executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Executor	Wait event	HashSetop - build hash	Waits until a hash table is created when an OP operation is performed using the hash algorithm.
Executor	Wait event	HashSetop - write file	Waits for writing the hash result of a tuple to a disk when an OP operation is performed using the hash algorithm.
Executor	Wait event	wait sync consumer next step	Waits for the stream consumer to perform the next step.
Executor	Wait event	wait sync producer next step	Waits for the stream producer to perform the next step.
GTM	Wait event	gtm connect	Waits for connecting to GTM.
GTM	Wait event	gtm reset xmin	Waits for GTM to reset the minimum transaction ID.
GTM	Wait event	gtm get xmin	Waits for obtaining the minimum transaction ID from GTM.
GTM	Wait event	gtm get gxid	Waits for obtaining the global transaction ID from GTM during transaction startup.
GTM	Wait event	gtm get csn	Waits for obtaining the CSN from GTM during transaction startup.
GTM	Wait event	gtm get snapshot	Waits for obtaining snapshots from GTM during transaction startup.
GTM	Wait event	gtm begin trans	Waits for GTM to start a transaction.
GTM	Wait event	gtm commit trans	Waits for GTM to commit a transaction.
GTM	Wait event	gtm rollback trans	Waits for GTM to roll back transactions.
GTM	Wait event	gtm start preprare trans	Waits for GTM to complete the first phase during two-phase commit.
GTM	Wait event	gtm prepare trans	Waits for GTM to complete the second phase during two-phase commit.
GTM	Wait event	gtm open sequence	Waits for GTM to create a sequence.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
GTM	Wait event	gtm close sequence	Waits for GTM to complete the **ALTER SEQUENCE** operation.
GTM	Wait event	gtm set sequence val	Waits for GTM to set a sequence value.
GTM	Wait event	gtm drop sequence	Waits for GTM to delete a sequence.
GTM	Wait event	gtm rename sequence	Waits for GTM to rename a sequence.
GTM	LWLock event	GTMHostInfoLock	Protects GTM information.
Temp File	I/O event	BufFileRead	Reads data from a temporary file to a specified buffer.
Temp File	I/O event	BufFileWrite	Writes the content of a specified buffer to a temporary file.
Pg_control	I/O event	ControlFileRead	Reads the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileSync	Flushes the **pg_control** file to a disk, mainly during database initialization.
Pg_control	I/O event	ControlFileSyncUpdate	Flushes the **pg_control** file to a disk, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	I/O event	ControlFileWrite	Writes the **pg_control** file, mainly during database initialization.
Pg_control	I/O event	ControlFileWriteUpdate	Updates the **pg_control** file, mainly during database startup, checkpoint execution, and primary/standby verification.
Pg_control	LWLock event	ControlFileLock	Prevents concurrent read/write or concurrent write/write on the **pg_control** file.
File operation	I/O event	CopyFileRead	Reads a file during file copying.
File operation	I/O event	CopyFileWrite	Writes a file during file copying.
File operation	I/O event	DataFileExtend	Writes a file during file name extension.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Table data file	I/O event	DataFileImmediateSync	Flushes a table data file to a disk immediately.
Table data file	I/O event	DataFilePrefetch	Reads a table data file asynchronously.
Table data file	I/O event	DataFileRead	Reads a table data file synchronously.
Table data file	I/O event	DataFileSync	Synchronizes a table data file to a disk.
Table data file	I/O event	DataFileTruncate	Truncates a table data file.
Table data file	I/O event	DataFileWrite	Writes a table data file.
Table data file	LWLock event	SyncScanLock	Determines the start position of a relfilenode during heap scanning.
Table data file	LWLock event	RelationMappingLock	Waits for the mapping file between system catalogs and storage locations to be updated.
metadata	LWLock event	MetaCacheSweepLock	Adds a lock when metadata is cyclically washed out.
postmaster.pid	I/O event	LockFileAddToDataDirRead	Reads the **postmaster.pid** file.
postmaster.pid	I/O event	LockFileAddToDataDirSync	Flushes the **postmaster.pid** file to a disk.
postmaster.pid	I/O event	LockFileAddToDataDirWrite	Writes PID information into the **postmaster.pid** file.
Pid File	I/O event	LockFileCreateRead	Reads the LockFile file **%s.lock**.
Pid File	I/O event	LockFileCreateSync	Flushes the LockFile file **%s.lock** to a disk.
Pid File	I/O event	LockFileCreateWRITE	Writes PID information into the LockFile file **%s.lock**.
System catalog mapping file	I/O event	RelationMapRead	Reads the mapping file between system catalogs and storage locations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
System catalog mapping file	I/O event	RelationMapSync	Flushes the mapping file between system catalogs and storage locations to a disk.
System catalog mapping file	I/O event	RelationMapWrite	Writes the mapping file between system catalogs and storage locations.
Streaming replication	I/O event	ReplicationSlotRead	Reads a streaming replication slot file This operation is performed during a restart.
Streaming replication	I/O event	ReplicationSlotRestoreSync	Flushes a streaming replication slot file to a disk.
Streaming replication	I/O event	ReplicationSlotSync	Flushes a temporary streaming replication slot file to a disk during checkpoint execution.
Streaming replication	I/O event	ReplicationSlotWrite	Writes a temporary streaming replication slot file during checkpoint execution.
Streaming replication	LWLock event	ReplicationSlotAllocationLock	Allocates a replication slot.
Streaming replication	LWLock event	ReplicationSlotControlLock	Detects replication slot name conflicts and identifies replication slots that can be allocated.
Clog	I/O event	SLRUFlushSync	Flushes the **pg_clog** file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRURead	Reads the **pg_clog** file.
Clog	I/O event	SLRUSync	Writes dirty pages into the **pg_clog** file, and flushes the file to a disk, mainly during checkpoint execution and database shutdown.
Clog	I/O event	SLRUWrite	Writes the **pg_clog** file.
Clog	LWLock event	CLogControlLock	Prevents concurrent access to or concurrent modification on the Clog control data structure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Clog	LWLock event	MultiXactOffsetControlLock	Prevents concurrent read/write or concurrent write/write on **pg_multixact/offset**.
Clog	LWLock event	MultiXactMemberControlLock	Prevents concurrent read/write or concurrent write/write on **pg_multixact/members**.
timelinehistory	I/O event	TimelineHistoryRead	Reads the **timelinehistory** file, during database startup.
timelinehistory	I/O event	TimelineHistorySync	Flushes the **timelinehistory** file to a disk, during database startup.
timelinehistory	I/O event	TimelineHistoryWrite	Writes the **timelinehistory** file.
pg_twophase	I/O event	TwophaseFileRead	Reads the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileSync	Flushes the **pg_twophase** file to a disk, mainly during two-phase transaction commit and restoration.
pg_twophase	I/O event	TwophaseFileWrite	Writes the **pg_twophase** file, mainly during two-phase transaction commit and restoration.
Cluster	LWLock event	NodeTableLock	Protects a shared structure that stores CNs and DNs information.
Concurrency	LWLock event	PoolerLock	Prevents two threads from simultaneously obtaining the same connection from a connection pool.
Concurrency	LWLock event	AsyncCtlLock	Prevents concurrent access to or concurrent modification on the sharing notification status.
Concurrency	LWLock event	AsyncQueueLock	Prevents concurrent access to or concurrent modification on the sharing notification queue.
Double write	I/O event	DoubleWriteFileWrite	Writes pages to a doublewrite file during the doublewrite process.
Double write	I/O event	DoubleWriteFileRead	Reads a doublewrite file during restoration for a halfwrite.
Statistics file	LWLock event	FileStatLock	Protects a data structure that stores statistics file information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
Master-slave replication	LWLock event	SyncRepLock	Protects Xlog synchronization information during primary/standby replication.
Master-slave replication	LWLock event	ReplicationSlotAllocationLock	Adds a lock when a primary node allocates streaming replication slots during primary-standby replication.
Master-slave replication	LWLock event	ReplicationSlotControlLock	Prevents concurrent update of streaming replication slot status during primary/standby replication.
Master-slave replication	LWLock event	LsnXlogChkFileLock	Serially updates the Xlog flush points for primary and standby nodes recorded in a specific structure.
Master-slave replication	LWLock event	DataSyncRepLock	Protects data page synchronization information during primary/standby replication.
Speed up the cluster	LWLock event	SearchServerLibLock	Adds a lock on the file read operation when a specific dynamic library is initially loaded in GPU-accelerated scenarios.
Resource manage	LWLock event	ResourcePoolHashLock	Prevents concurrent access to or concurrent modification on a resource pool table, a hash table.
OBS	LWLock event	OBSGetPathLock	Prevents concurrent read/write or concurrent write/write on an OBS path.
OBS	LWLock event	OBSRuntimeLock	Obtains environment variables, for example, *GAUSSHOME*.
LLVM	LWLock event	LLVMDumpIRLock	Exports the assembly language for dynamically generating functions.
LLVM	LWLock event	LLVMParseIRLock	Compiles and parses a finished IR function from the IR file at the start position of a query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
MPP is compatible with ORACLE scheduled task function	LWLock event	JobShmemLock	Protects global variables in the shared memory that is periodically read during a scheduled job where MPP is compatible with Oracle Database.
Operator history information statistics	LWLock event	OperatorRealTLock	Prevents concurrent access to or concurrent modification on a global structure that contains real-time data at the operator level.
Operator history information statistics	LWLock event	OperatorHistLock	Prevents concurrent access to or concurrent modification on a global structure that contains historical data at the operator level.
query history information statistics	LWLock event	SessionRealTLock	Prevents concurrent access to or concurrent modification on a global structure that contains real-time data at the query level.
query history information statistics	LWLock event	SessionHistLock	Prevents concurrent access to or concurrent modification on a global structure that contains historical data at the query level.
query history information statistics	LWLock event	WaitCountHashLock	Protects a shared structure in user statement counting scenarios.
barrier	LWLock event	BarrierLock	Ensures that only one thread is creating a barrier at a time.
CSN	LWLock event	CSNBufMappingLock	Protects CSN pages.
instrumentation	LWLock event	UniqueSQLMappingLock	Protects a unique SQL hash table.
instrumentation	LWLock event	InstrUserLock	Protects InstrUserHTAB.
instrumentation	LWLock event	PercentileLock	Protects global percentile buffers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
instrumentation	LWLock event	InstrWorkloadLock	Protects a workload transaction hash table.
Pgproc	LWLock event	Pgproc lwlock	Protects the PGPROC structure.
Async buffer	LWLock event	AsyncCtlLock	Protects asynchronization buffers.
MultiXact	LWLock event	MultiXactOffset lwlock	Protects SLRU buffers of a MultiXact offset.
MultiXact	LWLock event	MultiXactMemberlwlock	Protects SLRU buffer of a MultiXact member.
CBM	LWLock event	CBMParseXlogLock	Protects the lock used when CBM parses Xlogs.
BadBlock	LWLock event	BadBlockStatHashLock	Protects the hash table **global_bad_block_stat**.
Page	Lock event	page	Adds a lock to a table page.
Tuple	Lock event	tuple	Adds a lock to a tuple on a page.
object	Lock event	object	Adds a lock to an object.
user	Lock event	userlock	Adds a lock to a user.
advisor	Lock event	advisory	Adds an advisory lock.
ODBC	LWLock event	ExtensionConnectorLibLock	Adds a lock when a specific dynamic library is loaded or uninstalled in ODBC connection initialization scenarios.
COMM	Wait event	Accept client conn - Total Time	(After GaussDB receives a connection request from a client) Total duration from the time when a connection is established to the time when the connection is successful.
COMM	Wait event	Accept client conn - ThrdPool - add epoll	(After GaussDB receives a connection request from a client) Duration from the time when a connection is established to the time when the thread pool adds the session handle to the epoll in thread pool mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module Category	Event Category	Event	Description
COMM	Wait event	Accept client conn - ThrdPool - wait worker	(After GaussDB receives a connection request from a client) Duration from the time when the thread pool adds the session handle to the epoll to the time when the worker thread starts to work in thread pool mode.
COMM	Wait event	Accept client conn - ThrdPool - init session	(After GaussDB receives a connection request from a client) Duration from the time when the worker thread starts to work to the time when the session initialization ends in thread pool mode.
COMM	Wait event	Accept client conn - Worker - init proc	(After GaussDB receives a connection request from a client) Duration from the time when a connection is established to the time when the thread initialization ends in non-thread pool mode.
COMM	Wait event	Accept client conn - Worker - init session	(After GaussDB receives a connection request from a client) Duration from the time when the thread initialization ends to the time when the session initialization ends in non-thread pool mode.
Undo	Wait event	wait fetch undo record	Waiting for reading the target undo record.
Heap	Wait event	wait heap hot search buffer	Waiting for reading the Astore tuple that meets the snapshot requirements through the hot link.
LWLock	Wait event	wait exclusive lwlock	The starvation prevention mechanism is triggered. A new lightweight lock request waits for the previously blocked lightweight lock to be obtained.

13.2.15 Configuration

13.2.15.1 CONFIG_SETTINGS

CONFIG_SETTINGS displays information about parameters of the running database, as described in **Table 13-185**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-185 CONFIG_SETTINGS columns

Name	Type	Description
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.
source	text	Method of assigning the parameter value.
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

13.2.15.2 GLOBAL_CONFIG_SETTINGS

GLOBAL_CONFIG_SETTINGS displays information about parameters of running databases on each node, as described in **Table 13-186**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-186 GLOBAL_CONFIG_SETTINGS columns

Name	Type	Description
node_name	text	Node name.
name	text	Parameter name.
setting	text	Current parameter value.
unit	text	Implicit unit of the parameter.
category	text	Logical group of the parameter.
short_desc	text	Brief description of the parameter.
extra_desc	text	Detailed description of the parameter.
context	text	Context required to set the parameter value, including **internal**, **postmaster**, **sighup**, **backend**, **superuser**, and **user**.
vartype	text	Parameter type, including **bool**, **enum**, **integer**, **real**, or **string**.
source	text	Method of assigning the parameter value.
min_val	text	Maximum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
max_val	text	Minimum value of the parameter. If the parameter type is not numeric, the value of this column is **null**.
enumvals	text[]	Valid values of an enum parameter. If the parameter type is not enum, the value of this column is **null**.
boot_val	text	Default parameter value used upon the database startup.
reset_val	text	Default parameter value used upon the database reset.
sourcefile	text	Configuration file used to set parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.
sourceline	integer	Row number in the configuration file for setting parameter values. If parameter values are not configured using the configuration file, the value of this column is **null**.

13.2.16 Operator

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.16.1 OPERATOR_HISTORY_TABLE

OPERATOR_HISTORY_TABLE displays records about operators of completed jobs. Data is dumped from the kernel to this system catalog, as described in **Table 13-187**.

Table 13-187 OPERATOR_HISTORY_TABLE columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

13.2.16.2 OPERATOR_HISTORY

OPERATOR_HISTORY displays information about operators of the jobs that are executed by the current user on the current CN. Data in the kernel is cleared every 3 minutes.

13.2.16.3 OPERATOR_RUNTIME

OPERATOR_RUNTIME displays information about operators of the jobs that are being executed by the current user, as described in **Table 13-188**.

Table 13-188 OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
status	text	Execution status of the current operator. Its value can be **finished** or **running**.
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

13.2.16.4 GLOBAL_OPERATOR_HISTORY

GLOBAL_OPERATOR_HISTORY displays the records about operators after jobs are executed by the current user on all CNs, as described in **Table 13-189**.

Table 13-189 GLOBAL_OPERATOR_HISTORY columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among each DN.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: 1. Sort/SetOp/HashAgg/HashJoin spill 2. Spill file size large than 256MB 3. Broadcast size large than 100MB 4. Early spill 5. Spill times is greater than 3 6. Spill on memory adaptive 7. Hash table conflict

13.2.16.5 GLOBAL_OPERATOR_HISTORY_TABLE

GLOBAL_OPERATOR_HISTORY_TABLE displays the records about operators of completed jobs on all CNs. Data is dumped from the kernel to the system catalog GS_WLM_OPERATOR_INFO. This view is an aggregated view for querying the system catalog GS_WLM_OPERATOR_INFO from all CNs.

Columns in this view are the same as those in **Table 13-189**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.16.6 GLOBAL_OPERATOR_RUNTIME

GLOBAL_OPERATOR_RUNTIME displays information about operators of the jobs that are being executed by the current user on all CNs, as described in **Table 13-190**.

Table 13-190 GLOBAL_OPERATOR_RUNTIME columns

Name	Type	Description
queryid	bigint	Internal query ID used for statement execution.
pid	bigint	Backend thread ID.
plan_node_id	integer	Plan node ID of the execution plan of a query.
plan_node_name	text	Name of the operator corresponding to the plan node ID.
start_time	timestamp with time zone	Time when the operator starts to process the first data record.
duration	bigint	Total execution time of the operator (unit: ms).
status	text	Execution status of the current operator. Its value can be **finished** or **running**.
query_dop	integer	DOP of the operator.
estimated_rows	bigint	Number of rows estimated by the optimizer.
tuple_processed	bigint	Number of elements returned by the operator.
min_peak_memory	integer	Minimum peak memory used by the operator on all DNs (unit: MB).
max_peak_memory	integer	Maximum peak memory used by the operator on all DNs (unit: MB).
average_peak_memory	integer	Average peak memory used by the operator on all DNs (unit: MB).
memory_skew_percent	integer	Memory usage skew of the operator among DNs.
min_spill_size	integer	Minimum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
max_spill_size	integer	Maximum spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).
average_spill_size	integer	Average spilled data among all DNs when a spill occurs (unit: MB; default value: **0**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
spill_skew_percent	integer	DN spill skew when a spill occurs.
min_cpu_time	bigint	Minimum execution time of the operator on all DNs (unit: ms).
max_cpu_time	bigint	Maximum execution time of the operator on all DNs (unit: ms).
total_cpu_time	bigint	Total execution time of the operator on all DNs (unit: ms).
cpu_skew_percent	integer	Skew of the execution time among DNs.
warning	text	Warning. The following warnings are displayed: • Sort/SetOp/HashAgg/HashJoin spill • Spill file size large than 256MB • Broadcast size large than 100MB • Early spill • Spill times is greater than 3 • Spill on memory adaptive • Hash table conflict

13.2.17 Workload Manager

13.2.17.1 WLM_CGROUP_CONFIG

WLM_CGROUP_CONFIG displays information about a Cgroup for a job that is being executed, as described in **Table 13-191**.

Table 13-191 WLM_CGROUP_CONFIG columns

Name	Type	Description
cgoup_name	text	Cgroup name.
priority	integer	Job priority.
usage_pecent	integer	Percentage of resources used by the Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.
cpuacct	bigint	Allocated CPU quota.
cpuset	text	Allocated CPU cores.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relpath	text	Relative path of the Cgroup.
valid	text	Specifies whether the Cgroup is valid.
node_group	text	Node group name.

13.2.17.2 WLM_CLUSTER_RESOURCE_RUNTIME

WLM_CLUSTER_RESOURCE_RUNTIME displays a DN resource summary, as described in **Table 13-192**.

Table 13-192 WLM_CLUSTER_RESOURCE_RUNTIME columns

Name	Type	Description
min_mem_util	integer	Minimum memory usage of a DN.
max_mem_util	integer	Maximum memory usage of a DN.
min_cpu_util	integer	Minimum CPU usage of a DN.
max_cpu_util	integer	Maximum CPU usage of a DN.
min_io_util	integer	Minimum I/O usage of a DN.
max_io_util	integer	Maximum I/O usage of a DN.
used_mem_rate	integer	Maximum memory usage of a physical node.

13.2.17.3 WLM_CONTROLGROUP_CONFIG

WLM_CONTROLGROUP_CONFIG displays information about all Cgroups in the current database, as described in **Table 13-193**.

Table 13-193 WLM_CONTROLGROUP_CONFIG columns

Name	Type	Description
name	text	Cgroup name.
type	text	Cgroup type.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	Class Cgroup.
workload	text	Workload Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
shares	bigint	CPU quota allocated to a Cgroup.
limits	bigint	Limit of CPUs allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in a Cgroup.

13.2.17.4 WLM_CONTROLGROUP_NG_CONFIG

WLM_CONTROLGROUP_NG_CONFIG displays information about all node groups in the database, as described in **Table 13-194**.

Table 13-194 WLM_CONTROLGROUP_NG_CONFIG columns

Name	Type	Description
group_name	text	Cgroup name.
group_type	text	Cgroup type.
gid	bigint	Cgroup ID.
classgid	bigint	ID of the **Class** Cgroup to which a **Workload** Cgroup belongs.
class	text	Class Cgroup.
group_workload	text	Workload Cgroup.
shares	bigint	CPU quota allocated to a Cgroup.
limits	bigint	Limit of CPUs allocated to a Cgroup.
wdlevel	bigint	Workload Cgroup level.
cpucores	text	Usage of CPU cores in a Cgroup.
group_kind	text	Node group type. Its value can be **i**, **n**, **v**, or **e**. • **i**: installation node group. • **n**: node group in a common cluster. • **e**: elastic cluster.

13.2.17.5 WLM_RESOURCEPOOL_RUNTIME

WLM_RESOURCEPOOL_RUNTIME displays statistics about a resource pool, as described in **Table 13-195**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-195 WLM_RESOURCEPOOL_RUNTIME columns

Name	Type	Description
rpoid	oid	OID of the resource pool.
respool	name	Name of the resource pool.
control_group	name	Cgroup associated with the resource pool.
parentid	oid	OID of the parent resource pool.
ref_count	integer	Number of jobs associated with the resource pool.
active_points	integer	Number of used points in the resource pool.
running_count	integer	Number of jobs running in the resource pool.
waiting_count	integer	Number of jobs queuing in the resource pool.
io_limits	integer	IOPS upper limit of the resource pool.
io_priority	integer	I/O priority of the resource pool.

13.2.17.6 WLM_USER_RESOURCE_CONFIG

WLM_USER_RESOURCE_CONFIG displays the resource configuration information of a user, as described in **Table 13-196**.

Table 13-196 WLM_USER_RESOURCE_CONFIG columns

Name	Type	Description
userid	oid	OID of the user.
username	name	Username.
sysadmin	boolean	Specifies whether the user has the sysadmin permission.
rpoid	oid	OID of the resource pool.
respool	name	Name of the resource pool.
parentid	oid	OID of the parent user.
totalspace	bigint	Size of the occupied space.
spacelimit	bigint	Upper limit of the space size.
childcount	integer	Number of child users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
childlist	texto	Child user list.

13.2.17.7 WLM_USER_RESOURCE_RUNTIME

WLM_USER_RESOURCE_RUNTIME displays resource usage of all users. Only administrators can query this view, as described in **Table 13-197**. This view is valid only when the GUC parameter **use_workload_manager** is set to **on**.

Table 13-197 WLM_USER_RESOURCE_RUNTIME columns

Name	Type	Description
username	name	Username.
used_memory	integer	Size of the memory being used (unit: MB).
total_memory	integer	Available memory (unit: MB). The value **0** indicates that the available memory is not limited and depends on the maximum memory available in the database.
used_cpu	integer	Number of CPU cores in use.
total_cpu	integer	Total number of CPU cores of the Cgroup associated with the user on the node.
used_space	bigint	Used storage space (unit: KB).
total_space	bigint	Available storage space (unit: KB). The value **-1** indicates that the space is not limited.
used_temp_space	bigint	Used temporary space (reserved column; unit: KB).
total_temp_space	bigint	Available temporary space (reserved column; unit: KB). The value **-1** indicates that the maximum temporary storage space is not limited.
used_spill_space	bigint	Used space for storing spilled data (reserved column; unit: KB).
total_spill_space	bigint	Available space for storing spilled data (reserved column; unit: KB). The value **-1** indicates that the maximum space for storing spilled data is not limited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.17.8 WLM_WORKLOAD_HISTORY_INFO

WLM_WORKLOAD_HISTORY_INFO displays information about workload management after a job is complete or the exception has been handled, as described in **Table 13-198**.

Table 13-198 WLM_WORKLOAD_HISTORY_INFO columns

Name	Type	Description
statement	text	Statement executed for exception handling.
block_time	bigint	Block time before the statement is executed.
elapsed_time	bigint	Elapsed time when the statement is executed.
total_cpu_time	bigint	Total time used by the CPU on the DN when the statement is executed for exception handling.
qualification_time	bigint	Period when the statement checks the skew.
cpu_skew_percent	integer	CPU usage skew on the DN when the statement is executed for exception handling.
control_group	text	Cgroup used when the statement is executed for exception handling.
status	text	Statement status after statement are executed for exception handling, including: • **pending**: waiting to be executed. • **running**: being executed. • **finished**: finished normally. • **abort**: terminated unexpectedly.
action	text	Actions when statements are executed for exception handling, including: • **abort**: terminating the operation. • **adjust**: executing the Cgroup adjustment operations. Currently, you can only perform the demotion operation. • **finish**: finished normally.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.17.9 WLM_WORKLOAD_RUNTIME

WLM_WORKLOAD_RUNTIME displays the status of jobs being executed by the current user on the current CN, as described in **Table 13-199**.

Table 13-199 WLM_WORKLOAD_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed.
thread_id	bigint	Backend thread ID.
processid	integer	PID of the backend thread.
time_stamp	bigint	Time when the statement starts to be executed.
username	name	Username for logging in to the backend.
memory	integer	Memory required by the statement.
active_points	integer	Number of resources consumed by the statement in the resource pool.
max_points	integer	Number of resources consumed by the statement in the resource pool.
priority	integer	Job priority.
resource_pool	text	Resource pool to which the job belongs.
status	text	Job execution status. Its value can be: • **pending**: blocked. • **running**: running. • **finished**: ended. • **aborted**: aborted. • **unknown**: unknown.
control_group	text	Cgroups used by the job.
enqueue	text	Queue that the job is in. Its value can be: • **GLOBAL**: global queue. • **RESPOOL**: resource pool queue. • **ACTIVE**: not in a queue.
query	text	Statement being executed.
node_group	text	Node group name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.17.10 GLOBAL_WLM_WORKLOAD_RUNTIME

Displays the status of jobs executed by the current user on CNs, as described in Table 13-200. This view is accessible only to users with the MONADMIN permission.

Table 13-200 GLOBAL_WAL_WORKLOAD_RUNTIME columns

Name	Type	Description
node_name	text	Name of the CN where the job is executed.
thread_id	bigint	Backend thread ID.
processid	integer	Lightweight process ID of a thread.
time_stamp	bigint	Time when the statement starts to be executed.
username	name	Username for logging in to the backend.
memory	integer	Memory required by the statement.
active_points	integer	Number of resources consumed by the statement in the resource pool.
max_points	integer	Maximum number of resources in the resource pool.
priority	integer	Job priority.
resource_pool	text	Resource pool to which the job belongs.
status	text	Job execution status. Its value can be: • **pending**: blocked status. • **running**: running status. • **finished**: final status. • **aborted**: termination status. • **unknown**: unknown status.
control_group	name	Cgroups used by the job.
enqueue	text	Queue that the job is in. Its value can be: • **GLOBAL**: global queue. • **RESPOOL**: resource pool queue. • **ACTIVE**: not in a queue.
query	text	Statement being executed.
node_group	text	Node group name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.17.11 LOCAL_IO_WAIT_INFO

Returns the real-time statistics of I/O control on the current node, as described in **Table 13-201**.

Table 13-201 LOCAL_IO_WAIT_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	double precision	Number of read completions per second.
write_per_second	double precision	Number of write completions per second.
write_ratio	double precision	Ratio of the disk write I/Os to the total I/Os.
io_util	double precision	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is **0**, no I/O is under control.

13.2.17.12 GLOBAL_IO_WAIT_INFO

Returns the real-time statistics of I/O control on all nodes, as described in **Table 13-202**.

Table 13-202 GLOBAL_IO_WAIT_INFO columns

Name	Type	Description
node_name	text	Node name.
device_name	text	Name of the data disk mounted to the node.
read_per_second	double precision	Number of read completions per second.
write_per_second	double precision	Number of write completions per second.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
write_ratio	double precision	Ratio of the disk write I/Os to the total I/Os.
io_util	double precision	Percentage of the I/O time to the total CPU time per second.
total_io_util	integer	Level of the CPU time occupied by the last three I/Os. The value ranges from 0 to 6.
tick_count	integer	Interval for updating disk I/O information. The value is fixed to 1 second. The value is cleared each time before data is read.
io_wait_list_len	integer	Size of the I/O request thread wait queue. If the value is **0**, no I/O is under control.

13.2.18 Global Plan Cache

Global plan cache (GPC) views are valid only when **enable_global_plancache** is set to **on**.

13.2.18.1 LOCAL_PLANCACHE_STATUS

LOCAL_PLANCACHE_STATUS displays the status of the GPC plan cache on the current node, as described in **Table 13-203**.

Table 13-203 LOCAL_PLANCACHE_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the plan cache belongs to.
query	text	Text of query statements.
refcount	integer	Number of times that the plan cache is referenced.
valid	bool	Specifies whether the plan cache is valid.
databaseid	oid	ID of the database that the plan cache belongs to.
schema_name	text	Schema that the plan cache belongs to.
params_num	integer	Number of parameters.
func_id	oid	OID of the stored procedure where the plan cache is located. If the plancache does not belong to the stored procedure, the value is **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pkg_id	oid	Package to which the stored procedure where the plancache is located belongs. If the stored procedure does not belong to a package, the value is **0**.
stmt_id	integer	Sequence number of the statement plan in the stored procedure.

13.2.18.2 GLOBAL_PLANCACHE_STATUS

GLOBAL_PLANCACHE_STATUS displays the status of GPC plan caches on all nodes.

For details about the columns, see **LOCAL_PLANCACHE_STATUS**.

13.2.18.3 LOCAL_PREPARE_STATEMENT_STATUS

LOCAL_PREPARE_STATEMENT_STATUS displays the information about prepare statements corresponding to the GPC plan cache on the current node, as described in **Table 13-204**.

Table 13-204 LOCAL_PREPARE_STATEMENT_STATUS columns

Name	Type	Description
nodename	text	Name of the node that the statement belongs to.
cn_sess_id	bigint	Session ID of the CN that the statement is sent from.
cn_node_id	integer	Node ID of the CN that the statement is sent from.
cn_time_line	integer	Number of restart times of the CN that the statement is sent from.
statement_name	text	Statement name.
refcount	integer	Number of times that the corresponding plan cache is referenced.
is_shared	bool	Specifies whether the corresponding plan cache is shared.
query	text	Corresponding query statement.

13.2.18.4 GLOBAL_PREPARE_STATEMENT_STATUS

GLOBAL_PREPARE_STATEMENT_STATUS displays the information about prepare statements corresponding to GPC plan caches on all nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For details about the columns, see **LOCAL_PREPARE_STATEMENT_STATUS**.

13.2.19 RTO & RPO

13.2.19.1 global_rto_status

global_rto_status displays log flow control information about the primary and standby nodes (except the current node and DNs), as described in **Table 13-205**.

Table 13-205 global_rto_status columns

Parameter	Type	Description
node_name	text	Node name (including the primary and standby nodes).
rto_info	text	Flow control information, including the current log flow control time (unit: second) of the standby server, the expected flow control time (unit: second) specified by the GUC parameter, and the primary server sleep time (unit: μs) required to reach the expectation.

13.2.19.2 global_streaming_hadr_rto_and_rpo_stat

global_streaming_hadr_rto_and_rpo_stat displays the log flow control information about the primary and standby clusters for streaming DR, as described in **Table 13-206**. (This view can be used only on the CN in the primary cluster and cannot obtain statistics from the DN or standby cluster.)

Table 13-206 global_streaming_hadr_rto_and_rpo_stat parameters

Parameter	Type	Description
hadr_sender_node_name	text	Name of the main standby node in the primary and standby clusters.
hadr_receiver_node_name	text	Name of the main standby node in the standby cluster.
current_rto	int	Flow control information, that is, log RTO time of the current primary and standby clusters (unit: second). **-1** indicates that the majority of the DR cluster is abnormal.
target_rto	int	Flow control information, that is, RTO time between the target primary and standby clusters (unit: second).
current_rpo	int	Flow control information, that is, log RPO time of the current primary and standby clusters (unit: second). **-1** indicates that the majority of the DR cluster is abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
target_rpo	int	Flow control information, that is, RPO time between the target primary and standby clusters (unit: second).
rto_sleep_time	int	RTO flow control information, that is, expected sleep time (unit: μs) required by WAL sender on the host to reach the specified RTO.
rpo_sleep_time	int	RPO flow control information, that is, the expected sleep time (unit: μs) required by xlogInsert on the host to reach the specified RPO.

13.2.20 AI Watchdog

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.20.1 ai_watchdog_monitor_status

Table 13-207 ai_watchdog_monitor_status parameters

Parameter	Type	Description
metric_name	text	Metric names: • **tps**: TPS. • **tps_hourly**: average TPS per hour. • **shared_used_mem**: the used shared memory (MB). • **dynamic_used_shrctx**: the used shared memory context (MB). • **other_used_mem**: other used memory (MB). • **process_used_mem**: the used resident memory (MB). • **dynamic_used_mem**: the used dynamic memory (MB). • **malloc_failures**: the number of memory allocation failures in each collection interval. • **D_state_rate**: percentage of threads in the D state. • **R_state_rate**: percentage of threads in the R state. • **S_state_rate**: ratio of threads in the S state. • **db_state**: database state (**68** indicates D, **82** indicates R, and **83** indicates S). • **cpu_usage**: CPU usage. The upper limit is 100. • **disk_io**: disk I/O delay between two collection intervals. • **network_io**: network I/O delay between two collection intervals. • **threadpool_usage**: thread pool usage. • **threadpool_hang_rate**: percentage of the thread pool group in the hang state.
max_length	int	Collection queue length.
current_length	int	The number of currently collected samples.
collection_interval	int	Collection interval, in seconds.
latest_value	int	Value collected last time. If no value is collected, the value is **null**.
last_report	timestamp	The last collection time.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.20.2 ai_watchdog_detection_warnings

Table 13-208 ai_watchdog_detection_warnings parameters

Parameter	Type	Description
event	text	Event name.
cause	text	Event cause.
details	text	Event details.
time	timestamp	Reporting time.
need_to_handle	bool	Determines whether automatic processing is required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.20.3 ai_watchdog_parameters

Table 13-209 ai_watchdog_parameters parameters

Parameter	Type	Description
name	text	Parameter name. The options are as follows: • **enable_ai_watchdog**: determines whether to enable this function. • **ai_watchdog_max_consuming_time_ms**: specifies the maximum duration. • **ai_watchdog_used_memory_kb**: specifies the memory used by this function. • **ai_watchdog_detection_times**: specifies the number of detection times. • **enable_self_healing**: determines whether self-healing can be performed after a problem is detected. • **oom_detected_times**: specifies the number of detected OOMs. • **hang_detected_times**: specifies the number of detected hang times. • **enable_oom_detection**: determines whether the OOM detection function is automatically enabled. • **in_wait_time**: determines whether the system is waiting. • **other_used_memory_has_risk**: determines whether other memory usage is risky. • **shared_used_mem_has_risk**: determines whether risks exist when the shared memory context is used. • **dynamic_used_shrctx_has_risk**: determines whether the dynamic memory usage is risky.
value	text	Parameter value.

13.2.20.4 ai_watchdog_ftask_status

Table 13-210 ai_watchdog_ftask_status parameters

Parameter	Type	Description
name	text	Name of the watchdog feeding task.
timeout_threshold	int	Timeout threshold of the watchdog feeding task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
register_time	timestamp	Registration time of the watchdog feeding task.
thread_id	bigint	ID of the thread on which the watchdog feeding task is used.
thread_name	text	Name of the thread on which the watchdog feeding task is used.
last_feed	timestamp	Latest time when the watchdog is fed. The default initial value is **register_time**.
restart_count	int	Number of times that the same name of watchdog feeding task is repeatedly registered due to the same backend thread exception. This parameter is cleared after the task calls the API for canceling watchdog resetting task registration.
timeout_action	text	Timeout processing action specified during task registration. Currently, the following actions are provided: • **WATCHDOG_REPORT_WARNING**: Prompt the timeout locating and demarcation. • **WATCHDOG_SEND_SIGTERM**: Send SIGTERM signals to threads. • **WATCHDOG_SEND_SIGUSR2**: Send SIGUSR2 signals to threads. • **WATCHDOG_SEND_SIGQUIT**: Send SIGQUIT signals to threads. • **WATCHDOG_EXIT_PROCESS**: Exit the process.

13.2.21 Trace Function

13.2.21.1 pl_trace_func_start

Function for enabling the trace function of a node. For details about the column, see **Table 13-211**.

Table 13-211 pl_trace_func_start

Parameter	Type	Description
session_id	bigint	ID of the session for which the trace function needs to be enabled.
node	text	Name of the node on which the trace function is to be enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
max_num	integer	Maximum number of messages that can be traced. The value ranges from 100 to 10000.
level	text	Trace level. • **session**: session level. The trace function is always enabled before the pl_trace_func_end function is called or the session is closed. • **portal**: portal level. The trace function is automatically disabled after a stored procedure is executed. • **time**: session level. The statement execution time is displayed at the session level. • **threshold**: session level. At the time level, only statements whose values are greater than or equal to the threshold are recorded.
threshold	float8	Threshold of the current trace, in milliseconds. This parameter is valid only when **level** is **threshold**.

13.2.21.2 pl_trace_func_end

Function for disabling the trace function of a node. For details about the column, see **Table 13-212**.

Table 13-212 pl_trace_func_end

Parameter	Type	Description
session_id	bigint	ID of the session for which the trace function needs to be disabled.
node	text	Name of the node on which the trace function is to be disabled.

13.2.21.3 pl_trace_info_clean

Function for clearing trace records of a node. For details about the column, see **Table 13-213**.

Table 13-213 pl_trace_info_clean

Parameter	Type	Description
node	text	Name of the node whose trace records need to be cleared.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
session_id	bigint	ID of the session whose trace information needs to be deleted. If this parameter is left empty, all information is deleted.

13.2.21.4 pl_get_global_trace_info

Function for checking trace records of all nodes. For details about the column, see **Table 13-214**.

Table 13-214 pl_get_global_trace_info

Parameter	Type	Description
session_id	bigint	ID of the session to which the SQL statement belongs.
node	text	Name of the node to which the SQL statement belongs.
level	text	Level of the SQL statement.
database	text	Name of the database to which the SQL statement belongs.
func	oid	OID of the stored procedure to which the SQL statement belongs.
source	text	This SQL statement.
plan	text	Execution plan of this SQL statement.
time	text	Execution time of this SQL statement.
threshold	float8	Threshold of the SQL statement, in milliseconds.

13.2.22 Deprecated Views

13.2.22.1 Query

The following views in GaussDB have been deprecated in the latest version:

- GS_SLOW_QUERY_HISTORY
- GLOBAL_SLOW_QUERY_HISTORY
- GLOBAL_SLOW_QUERY_INFO
- GLOBAL_STATEMENT_COMPLEX_RUNTIME

13.2.22.2 Memory

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.2.22.2.1 TRACK_MEMORY_CONTEXT_DETAIL

Queries the detailed memory application information about the memory context set by **DBE_PERF.track_memory_context**, as described in **Table 13-215**. Only the initial user or a user with the monadmin permission can execute this view.

Table 13-215 TRACK_MEMORY_CONTEXT_DETAIL columns

Name	Type	Description
context_name	text	Name of the memory context.
file	text	File to which the memory application location belongs.
line	integer	Line number of the memory application location.
size	bigint	Total size of memory that is applied for (unit: byte).

13.3 WDR Snapshot Schema

After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), objects are created in the snapshot schema in the postgres database of the **pg_default** tablespace to persist WDR snapshot data. By default, the initial user or monitor administrator can access and operate objects in the snapshot schema.

You can set the GUC parameter **wdr_snapshot_retention_days** to automatically manage the snapshot lifecycle.

13.3.1 Original Information of WDR Snapshots

13.3.1.1 SNAPSHOT.SNAPSHOT

SNAPSHOT records the index information, start time, and end time of WDR snapshots stored in the current system. Only the initial user or monitor administrator has the permission to view the information. The result can be queried only in the system database but cannot be queried in the user database, as described in **Table 13-216**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the table is created.

Table 13-216 SNAPSHOT attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Example
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.423742+08
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:43.67726+08
version	int	Version of a WDR snapshot.	1
snap_flag	bigint	Attribute of the WDR snapshot. • **NULL**: The snapshot is of an earlier version. • **0**: The snapshot is a full snapshot. • **1**: The snapshot is an incremental snapshot.	0
base_snapshot_id	bigint	ID of the full snapshot corresponding to the WDR snapshot.	1

13.3.1.2 SNAPSHOT.TABLES_SNAP_TIMESTAMP

TABLES_SNAP_TIMESTAMP records the start time and end time of data collection, as well as corresponding databases, and table objects for all stored WDR snapshots. Only the initialization user or monitor administrator has the permission to view the table, as described in **Table 13-217**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the table is created.

Table 13-217 TABLES_SNAP_TIMESTAMP attributes

Name	Type	Description	Example
snapshot_id	bigint	WDR snapshot ID.	1
db_name	text	Database corresponding to a WDR snapshot.	tpcc1000
tablename	text	Table corresponding to a WDR snapshot.	snap_xc_statio_all_indexes
start_ts	timestamp	Start time of a WDR snapshot.	2019-12-28 17:11:27.425849+08

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description	Example
end_ts	timestamp	End time of a WDR snapshot.	2019-12-28 17:11:27.707398+08

13.3.1.3 SNAP_SEQ

SNAP_SEQ is an ascending sequence, which provides IDs for WDR snapshots.

After the WDR snapshot is started (the GUC parameter **enable_wdr_snapshot** is enabled), the sequence is created.

13.3.1.4 SNAPSHOT.SNAP_QUERY

The SNAP_QUERY table records information about SQL statements in all stored WDR snapshots. After a WDR snapshot is started (that is, the GUC parameter **enable_wdr_snapshot** is set to **on**), the SNAP_QUERY table is created, as shown in **Table 13-218**.

Table 13-218 SNAP_QUERY columns

Name	Type	Description
snap_node_name	name	Node name.
snap_node_id	integer	Node ID.
snap_user_name	name	Username. If the user who runs the query statement does not exist, ***REMOVED_USER*** is displayed.
snap_user_id	oid	User OID.
snap_unique_sql_id	bigint	ID of the normalized SQL statement.
snap_query	text	Normalized SQL statement. Note: The length is controlled by the GUC parameter **track_activity_query_size**.
snap_last_updated	timestamp with time zone	Last time when the statement was updated.
snap_parent_unique_sql_id	bigint	Unique ID of the parent SQL statement. The value is **0** for a non-stored procedure substatement.
snap_db_name	name	Name of the database connected to the backend. If the database where the query statement is executed does not exist, ***REMOVED_DB*** is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
snap_db_id	db_id	OID of the database that the backend is connected to.

13.3.2 WDR Snapshot Data Table

The naming rule of a WDR snapshot data table is **snap**_*{source data table}*.

The source of WDR snapshot data tables is the view under **DBE_PERF Schema**. After the WDR snapshot function is enabled (the GUC parameter **enable_wdr_snapshot** is set to **on**), the WDR snapshot data table is created.

NOTE

The initial user or monitor administrator has the permission to view the WDR snapshot data table.

13.4 DBE_SQL_UTIL Schema

The **DBE_SQL_UTIL** schema stores tools for managing SQL patches, including creating, deleting, enabling, and disabling SQL patches. Common users have only the USAGE permission and do not have the CREATE, ALTER, DROP, and COMMENT permissions.

13.4.1 DBE_SQL_UTIL.create_hint_sql_patch

create_hint_sql_patch creates hint SQL patches on the connected CN and returns whether the execution is successful, as described in **Table 13-219**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

NOTE

- SQL patches are not shared among CNs and need to be created on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the **DBE_SQL_UTIL.create_remote_hint_sql_patch** API to create a CN.

Table 13-219 DBE_SQL_UTIL.create_hint_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.4.2 DBE_SQL_UTIL.create_abort_sql_patch

create_abort_sql_patch creates abort SQL patches on the connected CN and returns whether the execution is successful, as described in **Table 13-220**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

NOTE

- SQL patches are not shared among CNs and need to be created on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the **DBE_SQL_UTIL.create_remote_abort_sql_patch** API to create a CN.

Table 13-220 DBE_SQL_UTIL.create_abort_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
description	IN text	Patch description. The default value is **NULL**.
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.4.3 DBE_SQL_UTIL.drop_sql_patch

drop_sql_patch deletes SQL patches from the connected CN and returns whether the execution is successful, as described in **Table 13-221**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the **DBE_SQL_UTIL.drop_remote_sql_patch** API to delete a CN.

Table 13-221 DBE_SQL_UTIL.drop_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.4.4 DBE_SQL_UTIL.enable_sql_patch

enable_sql_patch enables SQL patches on the connected CN and returns whether the execution is successful, as described in **Table 13-222**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

NOTE

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the **DBE_SQL_UTIL.enable_remote_sql_patch** API to enable SQL patches.

Table 13-222 DBE_SQL_UTIL.enable_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.4.5 DBE_SQL_UTIL.disable_sql_patch

disable_sql_patch disables SQL patches on the connected CN and returns whether the execution is successful, as described in **Table 13-223**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

NOTE

- SQL patches are not shared among CNs and need to be executed on each CN.
- If load balancing is enabled or a CN needs to be specified, you are advised to use the **DBE_SQL_UTIL.disable_remote_sql_patch** API to disable SQL patches.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-223 DBE_SQL_UTIL.disable_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.4.6 DBE_SQL_UTIL.show_sql_patch

show_sql_patch is a function used to display the SQL patch corresponding to a specified patch name and return the running result, as described in **Table 13-224**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-224 DBE_SQL_UTIL.show_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	OUT bigint	Global unique ID.
enabled	OUT bool	Determines whether the patch takes effect.
abort	OUT bool	Determines whether the value is **AbortHint**.
hint_str	OUT text	Hint text.

13.4.7 DBE_SQL_UTIL.create_hint_sql_patch

create_hint_sql_patch creates hint SQL patches and returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent_unique_sql_id** can be used to limit the effective range of the hint patch, as described in **Table 13-225**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-225 DBE_SQL_UTIL.create_hint_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value **0** indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is **NULL**.
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.4.8 DBE_SQL_UTIL.create_abort_sql_patch

create_abort_sql_patch creates abort SQL patches and returns whether the execution is successful. This function is an overloaded function of the original function. The value of **parent_unique_sql_id** can be used to limit the effective range of the abort patch, as described in **Table 13-226**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-226 DBE_SQL_UTIL.create_abort_sql_patch input parameters and return values

Parameter	Type	Description
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
parent_unique_sql_id	IN bigint	Global unique ID of the outer SQL statement. The value **0** indicates that the SQL patch statement outside the stored procedure is restricted to take effect. A non-zero value indicates that the specific stored procedure is restricted to take effect.
description	IN text	Patch description. The default value is **NULL**.
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.4.9 DBE_SQL_UTIL.create_remote_hint_sql_patch

create_remote_hint_sql_patch creates hint SQL patches on a specified CN and returns whether the execution is successful, as described in **Table 13-227**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-227 DBE_SQL_UTIL.create_remote_hint_sql_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
hint_string	IN text	Hint text.
description	IN text	Patch description. The default value is **NULL**.
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.4.10 DBE_SQL_UTIL.create_remote_abort_sql_patch

create_remote_abort_sql_patch creates abort SQL patches and returns whether the execution is successful, as described in **Table 13-228**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-228 DBE_SQL_UTIL.create_remote_abort_sql_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
unique_sql_id	IN bigint	Global unique ID.
description	IN text	Patch description. The default value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Description
enabled	IN bool	Specifies whether the patch takes effect. The default value is **true**.
result	OUT bool	Specifies whether this operation is successful.

13.4.11 DBE_SQL_UTIL.drop_remote_sql_patch

drop_remote_sql_patch deletes SQL patches from a specified CN and returns whether the execution is successful, as described in **Table 13-229**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-229 DBE_SQL_UTIL.drop_remote_sql_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.4.12 DBE_SQL_UTIL.enable_remote_sql_patch

enable_remote_sql_patch enables SQL patches on a specified CN and returns whether the execution is successful, as described in **Table 13-230**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-230 DBE_SQL_UTIL.enable_remote_sql_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

13.4.13 DBE_SQL_UTIL.disable_remote_sql_patch

disable_remote_sql_patch disables SQL patches on a specified CN and returns whether the execution is successful, as described in **Table 13-231**.

Only the initial user, sysadmin, opradmin, and monadmin have the permission to call it.

Table 13-231 DBE_SQL_UTIL.disable_remote_sql_patch input parameters and return values

Parameter	Type	Description
node_name	IN text	Destination node name.
patch_name	IN name	Patch name.
result	OUT bool	Specifies whether this operation is successful.

13.5 DBE_PLDEBUGGER Schema

System functions in DBE_PLDEBUGGER Schema are used to debug stored procedures. Only administrators have the permission to execute these debugging APIs, but do not have the permission to modify or create functions. The following table describes the supported APIs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- When a user is created in the function body, the plaintext password is returned when attach, next, continue, info_code, step, info_breakpoint, backtrace, or finish is called. You are advised not to create a user in the function body.
- Stored procedures can be debugged only on CNs, and the debugging end and the debugged end must be connected to the same CN.
- The debugging end and the debugged end must be connected to the same database. Otherwise, the API that uses the function OID to obtain function information is unavailable.
- After you use the dbe_pldebugger.turn_on function to enable stored procedure debugging in the current session, all PL/SQL stored procedures of the current session cannot be pushed down to DNs. Therefore, after the debugging is complete, use the dbe_pldebugger.turn_off function to disable stored procedure debugging in the current session in a timely manner.
- Triggers cannot be directly debugged. EXECUTE DIRECT ON cannot be used to deliver statements to DNs to trigger debugging.
- Prepared statements generated before the dbe_pldebugger.turn_on function is used to enable stored procedure debugging may fail to be debugged.
- The dbe_pldebugger.error_* functions can be used only when an error is reported.
- During the debugging of a stored procedure, if the stored procedure to be debugged involves lock operations, do not perform operations that may cause deadlocks on the debugging end.

The administrator can run the following command to grant the **gs_role_pldebugger** role and debugger permissions to a user:

```
GRANT gs_role_pldebugger to user;
```

Two clients are required to connect to the database. One client is responsible for executing the debugging API as the debug end, and the other client is responsible for executing the debugging function to control the execution of stored procedures on the server. Example:

- Prepare for debugging.

  Use PG_PROC to find the OID of the stored procedure to be debugged and execute **DBE_PLDEBUGGER.turn_on(oid)**. In this case, the client functions as the server.

  ```
  gaussdb=# CREATE OR REPLACE PROCEDURE test_debug ( IN  x INT)
  AS
  BEGIN
      INSERT INTO t1 (a) VALUES (x);
      DELETE FROM t1 WHERE a = x;
  END;
  /
  CREATE PROCEDURE
  gaussdb=# SELECT OID FROM PG_PROC WHERE PRONAME='test_debug';
    oid
  -------
   16389
  (1 row)
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.turn_on(16389);
   nodename | port
  ----------+------
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 datanode |    0
(1 row)
```

- Start debugging.

  When the server executes the stored procedure, the server hangs before the first SQL statement in the stored procedure and waits for the debugging message sent by the debug end. Debugging is supported only by directly executing a stored procedure and cannot be achieved by calling an executed stored procedure through a trigger.

  ```
  gaussdb=# call test_debug(1);
  ```

  Start another client as the debug end and call DBE_PLDEBUGGER.attach to attach with the stored procedure for debugging based on the data returned by **turn_on**.

  ```
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.attach('datanode',0);
   funcoid |  funcname  | lineno |              query
  ---------+------------+--------+----------------------------------
     16389 | test_debug |      3 |   INSERT INTO t1 (a) VALUES (x);
  (1 row)
  ```

  Execute the next statement on the client where the attach operation is performed.

  ```
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.next();
   funcoid |  funcname  | lineno |        query
  ---------+------------+--------+----------------------
     16389 | test_debug |      0 | [EXECUTION FINISHED]
  (1 row)
  ```

  Execute the following variable operations on the client where the attach command is performed.

  ```
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_locals(); -- Print all variables.
   varname | vartype | value | package_name | isconst
  ---------+---------+-------+--------------+---------
   x       | int4    | 1     |              | f
  (1 row)
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.set_var('x', 2); -- Assign a value to a variable.
   set_var
  ---------
   t
  (1 row)
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.print_var('x'); -- Print a single variable.
   varname | vartype | value | package_name | isconst
  ---------+---------+-------+--------------+---------
   x       | int4    | 2     |              | f
  (1 row)
  ```

  Directly execute the stored procedure that is being debugged.

  ```
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
   funcoid |  funcname  | lineno |        query
  ---------+------------+--------+----------------------
     16389 | test_debug |      0 | [EXECUTION FINISHED]
  (1 row)
  ```

  When the stored procedure reports an error, the following information is displayed. In this case, the suspended process logic is triggered.

  ```
  gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
   funcoid |  funcname  | lineno |            query
  ---------+------------+--------+-------------------------------
     16389 | test_debug |      0 | [EXECUTION HAS ERROR OCCURRED!]
  (1 row)
  ```

  If the suspended process logic is triggered, you can call the error_info_locals,error_backtrace, error_end, and print_var APIs to view information. Other APIs cannot be used anymore. You need to use error_end to end the suspended process logic.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.error_end();
 funcoid |  funcname  | lineno |      query
---------+------------+--------+-----------------
   16389 | test_debug |      0 | [END HANG ERROR!]
(1 row)
```

Exit the stored procedure that is being debugged (the suspended process logic is unavailable), and do not execute statements that have not been executed before.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.abort();
 abort
-------
 t
(1 row)
```

View the code information on the client and identify the line number of the breakpoint that can be set.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_code(16389);
 lineno |                          query                          | canbreak
--------+---------------------------------------------------------+----------
        | CREATE OR REPLACE PROCEDURE public.test_debug( IN  x INT) | f
      1 | AS  DECLARE                                               | f
      2 | BEGIN                                                     | f
      3 |     INSERT INTO t1 (a) VALUES (x);                        | t
      4 |     DELETE FROM t1 WHERE a = x;                           | t
      5 | END;                                                      | f
      6 | /                                                         | f
(7 rows)
```

Sets a breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.add_breakpoint(16389,4);
 breakpointno
--------------
            0
(1 row)
```

View the breakpoint information.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.info_breakpoints();
 breakpointno | funcoid | lineno |             query              | enable
--------------+---------+--------+--------------------------------+--------
            0 |   16389 |      4 |     DELETE FROM t1 WHERE a = x; | t
(1 row)
```

Execute to the breakpoint.

```
gaussdb=# SELECT * FROM DBE_PLDEBUGGER.continue();
 funcoid |  funcname  | lineno |             query
---------+------------+--------+--------------------------------
   16389 | test_debug |      4 |     DELETE FROM t1 WHERE a = x;
(1 row)
```

After the stored procedure is executed, the debugging automatically exits. To debug the stored procedure again, you need to attach again. If the server does not need to be debugged, run the **turn_off** command to disable the debugging or exit the session. **Table 13-232** describes the debugging APIs.

Table 13-232 DBE_PLDEBUGGER

API	Description
DBE_PLDEBUGGER.turn_on	Called by the server, indicating that the stored procedure can be debugged. After the API is called, the stored procedure is hung to wait for debugging information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_PLDEBUGGER.turn_off	Called by the server, indicating that debugging the stored procedure is disabled.
DBE_PLDEBUGGER.local_debug_server_info	Called by the server to print all stored procedures that have been turned on in the current session.
DBE_PLDEBUGGER.attach	Called by the debug end to attach with the stored procedure that is being debugged.
DBE_PLDEBUGGER.info_locals	Called by the debug end to print the current values of variables in the stored procedure that is being debugged.
DBE_PLDEBUGGER.next	Called by the debug end to execute the next step.
DBE_PLDEBUGGER.continue	Called by the debug end to continue the execution until the breakpoint or stored procedure ends.
DBE_PLDEBUGGER.abort	Called by the debug end to stop debugging. The server reports a long jump error.
DBE_PLDEBUGGER.print_var	Called by the debug end to print the current values of specified variables in the stored procedure that is being debugged.
DBE_PLDEBUGGER.info_code	Called by the debug end or server to print the source statement of a specified stored procedure and the line number corresponding to each line.
DBE_PLDEBUGGER.step	Called by the debug end to execute step by step.
DBE_PLDEBUGGER.add_breakpoint	Called by the debug end to add a breakpoint.
DBE_PLDEBUGGER.delete_breakpoint	Called by the debug end to delete a breakpoint.
DBE_PLDEBUGGER.info_breakpoints	Called by the debug end to view all breakpoints.
DBE_PLDEBUGGER.backtrace	Called by the debug end to check the current call stack.
DBE_PLDEBUGGER.enable_breakpoint	Called by the debug end to enable breakpoints.
DBE_PLDEBUGGER.disable_breakpoint	Called by the debug end to disable breakpoints.
DBE_PLDEBUGGER.finish	Called by the debug end to continue the debugging until the breakpoint is reached or the upper-layer call stack is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_PLDEBUGGER.set_var	Called by the debug end to assign a value to a variable.

13.5.1 DBE_PLDEBUGGER.turn_on

This function is used to mark a stored procedure as debuggable, as described in Table 13-233. After **turn_on** is executed, the server can execute the stored procedure for debugging. You need to manually obtain the OID of the stored procedure based on the PG_PROC system catalog and transfer it to the function. After **turn_on** is executed, the execution of the stored procedure in the current session is hung before the first SQL statement to wait for the debugging instruction from the debug end. This setting is cleared by default after the session is disconnected. Currently, stored procedures and functions with autonomous transactions enabled cannot be debugged. The number of **turn_on** stored procedures cannot exceed 100.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_on(Oid)
RETURN Record;
```

Table 13-233 turn_on input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.
nodename	OUT text	Node name.
port	OUT integer	Number of the connected port.

13.5.2 DBE_PLDEBUGGER.turn_off

This function is used only to remove the debugging flag added by **turn_on** to the current session. The return value indicates success or failure, as described in Table 13-234. You can run the **DBE_PLDEBUGGER.local_debug_server_info** command to query the OID of the stored procedure that has been turned on.

The function prototype is as follows:

```
DBE_PLDEBUGGER.turn_off(Oid)
RETURN boolean;
```

Table 13-234 turn_off input parameters and return values

Name	Type	Description
func_oid	IN oid	Function OID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
turn_off	OUT boolean	Whether turn-off is successful.

13.5.3 DBE_PLDEBUGGER.local_debug_server_info

This function is used to query the OID of the stored procedure that has been turned on in the current connection. You can use **funcoid** and **pg_proc** together to determine which stored procedures are to be debugged, as described in **Table 13-235**.

Table 13-235 local_debug_server_info returned return values

Name	Type	Description
nodename	OUT text	Node name.
port	OUT bigint	Port number.
funcoid	OUT oid	Stored procedure OID.

13.5.4 DBE_PLDEBUGGER.attach

When the server executes a stored procedure, the server hangs the execution before the first statement and waits for attaching with the debug end. The debug end invokes the attach function and transfers node name and port number to attach with the specified stored procedure, as described in **Table 13-236**.

If an error is reported during debugging, the attach operation automatically becomes invalid. If the debug end is attached to another stored procedure during debugging, the debugging of the attached stored procedure becomes invalid. If the attach operation is performed repeatedly, the current stored procedure is disconnected.

Table 13-236 attach input parameters and return values

Name	Type	Description
nodename	IN text	Node name.
port	IN integer	Connection port number.
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	OUT text	Source code of the next line of the function that is being debugged.

13.5.5 DBE_PLDEBUGGER.info_locals

During debugging on the debug end, **info_locals** is called to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried, as described in **Table 13-237**.

Table 13-237 info_locals input parameters and return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Name of the package corresponding to the variable. If the variable is not a package, the value is null.
isconst	OUT boolean	Determines whether the value is a constant.

13.5.6 DBE_PLDEBUGGER.next

This function is used to execute the current SQL statement in a stored procedure and return the number of the next SQL statement and the corresponding query, as described in **Table 13-238**.

Table 13-238 next return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.5.7 DBE_PLDEBUGGER.continue

Executes the current stored procedure until reaching the next breakpoint or end, and returns the line number of the next execution and the corresponding query, as described in **Table 13-239**.

The function prototype is as follows:

```
DBE_PLDEBUGGER.continue()
RETURN Record;
```

Table 13-239 continue return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.5.8 DBE_PLDEBUGGER.abort

This function is used to abort the stored procedure executed on the server and report an error. The return value indicates whether the abort message is successfully sent, as described in **Table 13-240**.

The function prototype is as follows:

```
DBE_PLDEBUGGER.abort()
RETURN boolean;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-240 abort input parameters and return values

Name	Type	Description
abort	OUT boolean	Success or failure.

13.5.9 DBE_PLDEBUGGER.print_var

During debugging on the debug end, print_var is called to print the name and value of the specified variable in the current stored procedure. You can also use this function to print variables when an error is reported. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without **frameno**. By default, the top-layer stack variable is queried, as shown in **Table 13-241**.

Table 13-241 print_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable.
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varname	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.
package_name	OUT text	Package name corresponding to the variable. This parameter is reserved and is left empty currently.
isconst	OUT boolean	Determines whether the value is a constant.

13.5.10 DBE_PLDEBUGGER.info_code

During debugging on the debug end, **info_code** is called to view the source statement of the specified stored procedure and the line number corresponding to each line. The line number starts from the function body, and the line number in the function header is empty, as described in **Table 13-242**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-242 info_code input parameters and return values

Name	Type	Description
funcoid	IN oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Source statement.
canbreak	OUT bool	Whether the current line supports breakpoints.

13.5.11 DBE_PLDEBUGGER.step

During debugging on the debug end, if a stored procedure is being executed, the stored procedure continues to be executed and information such as the line number in the first line of the stored procedure is returned. If the executed object is not a stored procedure, the return is the same as that for **next**. After the SQL statement is executed, information such as the line number in the next line is returned, as described in **Table 13-243**.

Table 13-243 step input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.5.12 DBE_PLDEBUGGER.add_breakpoint

During debugging on the debug end, call **add_breakpoint** to add a breakpoint. If **–1** is returned, the specified breakpoint is invalid. Determine a proper breakpoint position by referring to the **canbreak** column. If the outer function does not have a breakpoint before entering the inner function, a breakpoint cannot be added to the outer function when the inner function is executed, as described in **Table 13-244**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-244 add_breakpoint input parameters and return values

Name	Type	Description
funcoid	IN text	Function ID.
lineno	IN integer	Line number.
breakpointno	OUT integer	Breakpoint number.

13.5.13 DBE_PLDEBUGGER.delete_breakpoint

During debugging on the debug end, call **delete_breakpoint** to delete the existing breakpoint, as described in **Table 13-245**.

Table 13-245 delete_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Whether the request is successful.

13.5.14 DBE_PLDEBUGGER.info_breakpoints

During debugging on the debug end, call **info_breakpoints** to view the current function breakpoint, as described in **Table 13-246**.

Table 13-246 info_breakpoints return values

Name	Type	Description
breakpointno	OUT integer	Breakpoint number.
funcoid	OUT oid	Function ID.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
enable	OUT boolean	Whether the value is valid.

13.5.15 DBE_PLDEBUGGER.backtrace

During debugging on the debug end, call **backtrace** to view the current call stack, as described in **Table 13-247**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-247 backtrace return values

Name	Type	Description
frameno	OUT integer	Call stack ID.
funcname	OUT text	Function name.
lineno	OUT integer	Line number.
query	OUT text	Breakpoint content.
funcoid	OUT oid	Function OID.

13.5.16 DBE_PLDEBUGGER.enable_breakpoint

During debugging on the debug end, calls enable_breakpoint to enable breakpoints, as described in **Table 13-248**.

Table 13-248 enable_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Whether the request is successful.

13.5.17 DBE_PLDEBUGGER.disable_breakpoint

During debugging on the debug end, call disable_breakpoint to disable breakpoints, as described in **Table 13-249**.

Table 13-249 disable_breakpoint input parameters and return values

Name	Type	Description
breakpointno	IN integer	Breakpoint number.
result	OUT bool	Whether the request is successful.

13.5.18 DBE_PLDEBUGGER.finish

Executes the current SQL statement in the stored procedure until the next breakpoint is triggered or the next line of the upper-layer stack is executed, as described in **Table 13-250**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 13-250 finish input parameters and return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	Number of the next line in the current debugging process.
query	OUT text	Source code of the next line of the function that is being debugged.

13.5.19 DBE_PLDEBUGGER.set_var

Changes the variable on the top-layer stack in the specified debugging stored procedure to the value of the input parameter. If a stored procedure contains variables with the same name, set_var supports only the setting of the first variable value, as described in **Table 13-251**.

Table 13-251 set_var input parameters and return values

Name	Type	Description
var_name	IN text	Variable name.
value	IN text	New value.
result	OUT boolean	Whether the request is successful.

13.5.20 DBE_PLDEBUGGER.backtrace

If the server is suspended due to an error reported by the stored procedure, you can call error_backtrace on the debug end to view the current function call stack, as described in **Table 13-252**. (This function is used only for suspension after an error is reported.)

Table 13-252 error_backtrace return values

Name	Type	Description
frameno	OUT integer	Call stack ID.
funcname	OUT text	Function name.
lineno	OUT integer	Line number.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
query	OUT text	Breakpoint content.
funcoid	OUT oid	Function OID.

13.5.21 DBE_PLDEBUGGER.error_end

If the server is suspended due to an error reported by the stored procedure, you can call error_end on the debug end to end the suspended process, end the debugging process, return the ended suspended process, and stop debugging, as described in **Table 13-253**. (This function is used only for suspension after an error is reported.)

Table 13-253 error_end return values

Name	Type	Description
funcoid	OUT oid	Function ID.
funcname	OUT text	Function name.
lineno	OUT integer	The next debugging line number (fixed value: 0).
query	OUT text	Ends the suspended process and stops debugging.

13.5.22 DBE_PLDEBUGGER.error_info_locals

If the server is suspended due to an error reported by the stored procedure, you can call error_info_locals on the debug end to print the variables in the current stored procedure. The input parameter **frameno** of this function indicates the stack layer to be traversed. This function can be called without input parameters. By default, the top-layer stack variable is queried, as described in **Table 13-254**. (This function is used only for suspension after an error is reported.)

Table 13-254 error_info_locals return values

Name	Type	Description
frameno	IN integer (optional)	Specified stack layer. The default value is the top layer.
varna+me	OUT text	Variable name.
vartype	OUT text	Variable type.
value	OUT text	Variable value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
package_name	OUT text	Name of the package corresponding to the variable. If the variable is not a package, the value is null.
isconst	OUT boolean	Determines whether the value is a constant.

13.6 DBE_PLDEVELOPER

The DBE_PLDEVELOPER system catalog records information required for compiling PL/SQL packages, functions, and stored procedures.

13.6.1 DBE_PLDEVELOPER.gs_source

Records information about PL/SQL objects (stored procedures, functions, packages, and package bodies), as described in **Table 13-255**.

NOTE

- The gs_source table records only user-defined original object statements. Even if a user uses ALTER to change the created schema or name, the information in the gs_source table does not change. If the user changes the schema or name of an object, after the user deletes the object, the object is deleted from the gs_source table.
- The owner in the gs_source table is the user who creates the table, not the user specified when the user creates the stored procedure or package.
- After the GUC parameter **behavior_compat_options="skip_insert_gs_source**" is set, information about PL/SQL objects (stored procedures, functions, packages, and package bodies) is not recorded in the gs_source table.
- The permissions of gs_source are the same as those of system catalogs in pg_catalog. System administrators and common users cannot perform DROP, ALTER, DELETE, UPDATE, and INSERT operations, but can perform the SELECT operation. The GUC parameter **allow_system_table_mods** is used to control the permissions of gs_source, and the default value is **off**. After modifying this parameter, you need to restart the database for the modification to take effect.
- By default, row-level security is not configured for the gs_source table in the database. If you need to use the database isolation feature, use the following statement to add row-level security:

```
ALTER TABLE dbe_pldeveloper.gs_source ENABLE ROW LEVEL SECURITY;
CREATE ROW LEVEL SECURITY POLICY all_data_rls ON dbe_pldeveloper.gs_source USING(owner = (SELECT oid FROM gs_roles WHERE rolname=current_user));
```

Table 13-255 DBE_PLDEVELOPER.gs_source columns

Name	Type	Description
id	oid	Object ID.
owner	bigint	ID of the user who creates the object.
nspid	oid	Schema ID of an object.
name	name	Object name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

type	text	Object type (**procedure**/**function**/**package**/**package body**).
status	Boolean	Determines whether the creation is successful.
src	text	Original statement for creating an object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14 Configuring GUC Parameters

14.1 Viewing Parameters

GaussDB uses a set of default GUC parameters after it is installed. You can modify the GUC parameters to enable GaussDB to better fit your service scenarios and data volume.

Procedure

Step 1 Connect to the database. For details, see "Database Quick Start > Connecting to a Database > Using gsql to Connect to a Database" in *Developer Guide*.

Step 2 View the GUC parameter values in the database.

- Method 1: Run the **SHOW** command.
  - View the value of a certain parameter.
    ```
    gaussdb=# SHOW server_version;
    ```
    server_version indicates the database version.
  - View values of all parameters.
    ```
    gaussdb=# SHOW ALL;
    ```
- Method 2: Query the pg_settings view.
  - View the value of a certain parameter.
    ```
    gaussdb=# SELECT * FROM pg_settings WHERE NAME='server_version';
    ```
  - View values of all parameters.
    ```
    gaussdb=# SELECT * FROM pg_settings;
    ```

----End

Example

Check the character encoding type of the client.

```
gaussdb=# SHOW client_encoding;
 client_encoding
-----------------
 UTF8
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14.2 Setting Parameters

Context

GaussDB provides multiple methods to set GUC parameters for databases, users, or sessions.

- Parameter names are case-insensitive.
- The parameter values can be integers, floating points, strings, Boolean values, or enumerated values.
  - The Boolean values can be **on**/**off**, **true**/**false**, **yes**/**no**, or **1**/**0**, and are case-insensitive.
  - The enumerated value range is specified in the **enumvals** column of the system catalog pg_settings.
- For parameters using units, specify their units during the setting. Otherwise, default units are used.
  - The default units are specified in the **unit** column of pg_settings.
  - The unit of memory can be KB, MB, or GB.
  - The unit of time can be ms, s, min, h, or d.
- You can set parameters related to CNs and DNs at a time, but cannot do the same to other parameters.

For details about parameters, see **GUC Parameters**.

Setting GUC Parameters

GaussDB provides six types of GUC parameters. For details about parameter types and their setting methods, see **Table 14-1**.

Table 14-1 GUC parameter types

Parameter Type	Description	Setting Method
INTERNAL	Fixed parameters. They are set during database creation and cannot be modified. Users can only view the parameters by running the **SHOW** command or in the pg_settings view.	None
POSTMASTER	Database server parameters. They can be set when the database is started or in the configuration file.	Method 1 in **Table 14-2**.
SIGHUP	Global database parameters. They can be set during database startup or be modified later.	Method 1 or 2 in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Type	Description	Setting Method
BACKEND	Session connection parameters. They are specified during session connection creation and cannot be modified after that. The parameter setting becomes invalid when the session is disconnected. The parameters of this type are internal parameters and not recommended for users to set it.	Method 1 or 2 in **Table 14-2**. **NOTE** The parameter setting takes effect when the next session is created.
SUSET	Database administrator parameters. They can be set by common users during database startup or after the database is started. They can also be set by database administrators using SQL statements.	Method 1 or 2 by a common user, or method 3 by a database administrator in **Table 14-2**.
USERSET	Common user parameters. They can be set by any user at any time.	Method 1, 2, or 3 in **Table 14-2**. **NOTE** When you set parameters of the USERSET type, the parameter value set using **ALTER DATABASE** takes precedence over that set using gs_guc. To make the parameter settings of gs_guc take effect, run the **alter database** *xxx* **reset** *xxx* command to reset the parameters.

You can set GUC parameters in GaussDB using the methods listed in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-2 Methods for setting GUC parameters

No.	Setting Method
Method 1	1. Log in to the management console. 2. On the **Instances** page, click the name of the target instance to go to the **Basic Information** page. 3. In the navigation pane on the left, choose **Parameters**. On the displayed page, modify parameters. If the parameters cannot be modified on the console, evaluate the modification risks and contact customer service for modification. 4. Reboot the DB instance to make the modifications take effect. **NOTE** Rebooting instances will interrupt user operations. Plan a proper execution window before the reboot.
Method 2	1. Log in to the management console. 2. On the **Instances** page, click the name of the target instance to go to the **Basic Information** page. 3. In the navigation pane on the left, choose **Parameters**. On the displayed page, modify parameters. If the parameters cannot be modified on the console, evaluate the modification risks and contact customer service for modification.
Method 3	Modify a session-level parameter. • Set a session-level parameter. **gaussdb=# SET** *paraname* **TO** *value;* The parameter value in the current session is changed. After you exit the session, the setting becomes invalid.

CAUTION

- If you use method 1 or 2 to set a parameter that does not belong to the current node, the database displays a message indicating that the parameter is not supported.
- You cannot set a parameter in the unit of pages by using method 1 or method 2.
- When you use method 3 to set a parameter, if the parameter value is an integer, leading zeros will be filtered out. For example, **SET** *paraname* **TO** *008192* and **SET** *paraname* **TO** *8192* have the same effect.

14.3 GUC Parameters

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14.3.1 GUC Parameter Usage

A database provides many GUC parameters. Changing these parameters will affect the behavior of the database system. Before modifying these parameters, learn the specifications of these parameters and the impact of the modification on the database. Otherwise, unexpected results may occur.

- Some internal database parameters are related to the environment and have been specified during database installation. You are advised not to modify them. If the modification is required, ensure that the content and format are correct. Otherwise, the instance will be abnormal. For example, set the **listen_addresses**, **port**, and **local_bind_address** (IP address) parameters, and various parameters for setting the file output path.
- Due to the size of used hardware resources, the following parameters need to be modified with caution: memory, number of connections, and parameters that affect disk space usage. Before modifying the parameters, check the hardware specifications to ensure that the modified parameters do not exceed the hardware size limit. Otherwise, the database instance may fail to apply for sufficient resources and the instance status may be abnormal.
- Due to the association between parameters, you need to read the specifications of the parameters before modifying the parameters. For example, the value of **max_wal_senders** must be smaller than that of **max_connections** so that the database can be started properly.
- If this parameter is set to a large value or a small value, services may be affected. Therefore, you need to learn the meaning of this parameter and modify it with caution. For example, if the **session_timeout** parameter is set to **1** (in seconds) and no operation is performed within 1 second after the service is connected to the server, the service is disconnected. As a result, the service execution is affected. **log_min_messages** specifies the log level. If the log level is too low, a large number of logs will be recorded, affecting the performance.

Precautions

- If the value range of a parameter is a string, the string should comply with the path and file naming conventions of the OS running the target database.
- If the maximum value of a parameter is *INT_MAX*, the maximum parameter value varies by OS. *INT_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
- If the maximum value of a parameter is *DBL_MAX* (maximum value of the FLOAT data type), the maximum parameter value varies by OS.
- Some GUC parameters affect the selection of functions and operators, compilation of stored procedures, and generation of execution plans. As a result, views, default values of function parameters, compilation products of stored procedures, and plan cache are affected. Due to these mechanisms, subsequent GUC parameter changes may not affect these behaviors.
  - View: When defining a view, the database generates rewriting rules based on the GUC parameter status. Subsequent operations on the view directly follow the corresponding rules without being affected by GUC parameters (which affect the generation of rewriting rules).
  - Default value of a function parameter: For a function parameter, a function is selected as the default parameter value based on the GUC

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

parameter status when the function parameter is created and the OID of the function that is used as the default value is recorded in the corresponding system catalog (pg_proc). When this function parameter is executed later, the function OID recorded in the system catalog will be used as the default value, and the value is not affected by GUC parameters.

- Compilation product of a stored procedure: When compiling a stored procedure, the database generates a compilation product based on the GUC parameter status. When executing the stored procedure, the database directly uses the compilation product without being affected by GUC parameters (which affect the generation of compilation products).
- Plan cache: When executing an SQL statement, the database generates an execution plan based on the GUC parameter status. If the plan is cached, the SQL statement will be executed according to the plan without being affected by GUC parameters (which affect the generation of execution plans).

The following table lists the GUC parameters that exert influence. You can view the function of each GUC parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GUC Parameter	Enabled	Disabled	Impact	Example

convert_string_to_digit	Character strings are preferentially converted to numbers.	Character strings cannot be preferentially converted to numbers.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	CREATE or REPLACE FUNCTION test(c numeric) RETURN text package AS
				BEGIN
				RETURN 'test(c numeric)';
				END;
				/
				CREATE or REPLACE FUNCTION test(c varchar2) RETURN text package AS
				BEGIN
				RETURN 'test(c varchar2)';
				END;
				/
				
				SET convert_string_to_digit=on;
				CREATE or REPLACE VIEW test_view AS SELECT test('123'::text);
				
				SELECT test('123'::text);
				test
				----------------- 	
				test(c numeric)
				(1 row)
				
				SELECT * FROM test_view;
				test
				----------------- 	
				test(c numeric)
				(1 row)
				
				-- Disable the parameter.
				SET convert_string_to_digit=off;
				
				SELECT test('123'::text);
				test
				------------------ 	
				test(c varchar2)
				(1 row)
				
				-- The view behavior is inconsistent with the direct function calling behavior.
				SELECT * FROM test_view;
				test
				----------------- 	
				test(c numeric)
				(1 row))

GUC Parameter	Enabled	Disabled	Impact	Example

query_Dop	Users can specify the degree of query parallelism. If the SMP function is enabled, the system uses the specified degree of parallelism.	The default value is **1**, which indicates that parallel query is disabled.	Plan cache.	SET enable_auto_explain=true;
				SET auto_explain_level=notice;
				CREATE TABLE t1(a int, b int, c int,d varchar)WITH(storage_type=ustore);
				CREATE TABLE t2(a int, b int, c int,d varchar)WITH(storage_type=ustore);
				INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'||i from generate_series(1,1000) i;
				CREATE INDEX index1 ON t1(a);
				SET enable_bitmapscan=f;
				CREATE OR REPLACE PROCEDURE proc_while_loop()
				AS
				DECLARE
				i int :=1;
				BEGIN
				WHILE i < 5 LOOP
				INSERT INTO t2 SELECT /*+ indexscan(t1 index1) */* FROM t1 WHERE a = i ;
				i:=i+1;
				END LOOP;
				END;
				/
				SET enable_auto_explain=true;
				SET auto_explain_level=notice;
				SET client_min_messages=log;
				SET enable_stream_operator=on;
				SET query_dop=4;
				CALL proc_while_loop();
				SET query_Dop=6;
				CALL proc_while_loop();

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GUC Parameter	Enabled	Disabled	Impact	Example

set plan_cache_mode = force_generic_plan	In PBE mode, the gplan is forcibly executed.	In PBE mode, the gplan is not forcibly executed.	Plan cache.	SET enable_auto_explain=true;
				SET auto_explain_level=notice;
				CREATE TABLE t1(a int, b int, c int,d varchar)WITH(storage_type=ustore);
				CREATE TABLE t2(a int, b int, c int,d varchar)WITH(storage_type=ustore);
				INSERT INTO t1 SELECT i,10*random()*i,i%20,'atr'||i from generate_series(1,1000) i;
				CREATE INDEX index1 ON t1(a);
				SET enable_bitmapscan=on;
				SET enable_seqscan=off;
				SET enable_indexscan=off;
				CREATE OR REPLACE PROCEDURE proc_while_loop()
				AS
				DECLARE
				i int :=1;
				BEGIN
				WHILE i < 5 LOOP
				insert into t2 select * from t1 where a = i ;
				i:=i+1;
				END LOOP;
				END;
				/
				CALL proc_while_loop();
				SET plan_cache_mode = force_generic_plan;
				PREPARE aa AS SELECT proc_while_loop();
				EXECUTE aa;
				SET enable_bitmapscan=off;
				EXECUTE aa;

a_format_date_timestamp	CURRENT_DATE returns the timestamp when the current SQL statement is started.	CURRENT_DATE returns the date or date and time when the transaction is started.	Views, default values of function parameters, stored procedure compilation products, and plan cache.	SET a_format_date_timestamp=on;
				CREATE OR REPLACE PROCEDURE proc_while_loop()
				AS
				DECLARE
				i date;
				BEGIN
				i:=current_date;
				raise info 'step2:%',TO_CHAR(current_date, 'MM-DD-YYYY HH24:MI:SS');
				END;
				/
				CALL proc_while_loop();
				PREPARE p1 AS SELECT current_timestamp;
				EXECUTE p1;
				SET a_format_date_timestamp=off;
				CALL proc_while_loop();
				EXECUTE p1;

GUC Parameter	Enabled	Disabled	Impact	Example

disable_keyword_options	The behaviors of keywords in each compatibility mode are affected. For details, see **Table 14-25**.	The behaviors of keywords in each compatibility mode are affected. For details, see **Table 14-25**.	Plan cache.	gaussdb=# SET disable_keyword_options = 'dbtimezone';
				SET
				gaussdb=# PREPARE p1 AS SELECT 1 dbtimezone;
				PREPARE
				gaussdb=# EXECUTE p1;
				dbtimezone
				------------ 	
				1
				(1 row)
				
				gaussdb=# SET disable_keyword_options = '';
				SET
				gaussdb=# EXECUTE p1;
				dbtimezone
				------------ 	
				1
				(1 row)
				
				gaussdb=# DEALLOCATE p1;
				DEALLOCATE

backslash_quote	Enabling the parameter allows single quotation marks in the string text to be represented by \'.	Disabling the parameter does not allow single quotation marks in the string text to be represented by \'.	Plan cache.	gaussdb=# SET backslash_quote = 'safe_encoding';
				SET
				gaussdb=# PREPARE p1 AS SELECT text E'Don \'t do that.';
				PREPARE
				gaussdb=# EXECUTE p1;
				text
				------------------ 	
				Don 't do that.
				(1 row)
				
				gaussdb=# SET backslash_quote = off;
				SET
				gaussdb=# EXECUTE p1;
				text
				------------------ 	
				Don 't do that.
				(1 row)
				
				gaussdb=# DEALLOCATE p1;
				DEALLOCATE

14.3.2 File Location

After a database has been installed, three configuration files (**gaussdb.conf**, **gs_hba.conf**, and **gs_ident.conf**) are automatically generated and saved in the data directory. You can use the methods described in this section to change the names and save paths of these configuration files.

When changing the storage directory of a configuration file, set **data_directory** in **gaussdb.conf** to the actual data directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> If a configuration file is incorrectly modified, the database will be seriously affected. Do not modify the configuration files mentioned in this section after installation.

data_directory

Parameter description: Specifies the GaussDB **data** directory. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: Specify this parameter during installation. If this parameter is not specified during installation, the database is not initialized by default.

Setting method: This parameter can be set as follows:

- Set it when GaussDB is installed.
- This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

config_file

Parameter description: Specifies the configuration file (**gaussdb.conf**) of the primary node.

Parameter type: string.

Unit: none

Value range: a string of more than 0 characters.

Default value: **gaussdb.conf** (The absolute directory of this file may be displayed in the actual situation.)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

hba_file

Parameter description: Specifies the configuration file (**gs_hba.conf**) for host-based authentication (HBA). This parameter can be specified only in the **gaussdb.conf** file and can be accessed only by the SYSADMIN user.

Parameter type: string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: a string of more than 0 characters.

Default value: **gs_hba.conf** (The absolute directory of this file may be displayed in the actual situation.)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to modify the parameters in the configuration file.

Risks and impacts of improper settings: The cluster upgrade and backup functions may be affected.

ident_file

Parameter description: Specifies the name of the configuration file (**gs_ident.conf)** for client authentication. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: a string of more than 0 characters.

Default value: **gs_ident.conf** (The absolute directory of this file may be displayed in the actual situation.)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to modify the parameters in the configuration file.

Risks and impacts of improper settings: The cluster upgrade and backup functions may be affected.

external_pid_file

Parameter description: Specifies the extra PID file that can be used by the server management program. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: valid file name.

Default value: **""**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

NOTE

This parameter takes effect only after the database restarts.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.3 Connection and Authentication

14.3.3.1 Connection Settings

This section describes parameters related to client-server connection modes.

light_comm

Parameter description: Specifies whether the server uses the lightweight communications mode.

This parameter specifies whether the server uses the communication mode based on lightweight locks and non-blocking sockets.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The lightweight communications mode is used.
- **off**: The lightweight communications mode is not used.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

listen_addresses

Parameter description: Specifies the TCP/IP address of the client for a server to listen on.

This parameter specifies the IP address used by the GaussDB server for listening, for example, an IPv4 address or IPv6 address. Multiple NICs may exist on the host and each NIC can be bound to multiple IP addresses. This parameter specifies the IP addresses to which GaussDB is bound. The client can use the IP addresses specified by this parameter to connect to GaussDB or send requests to GaussDB.

Parameter type: string.

Unit: none

Value range:

- Host name or IP address. Multiple values are separated with commas (,).
- Asterisk (*), **::**, or **0.0.0.0**, indicating that all IP addresses will be listened on, which is not recommended due to potential security risks.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the parameter is not specified, the server does not listen on any IP address. In this case, only UDSs can be used for database connections.

Default value:

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public_cloud.conf** file. The default value of CN is **"localhost,***IP address of the mgr.net NIC,IP address of the data.net NIC,IP address of the virtual.net NIC***"**. The default value of DN is **"***IP address of the data.net NIC***"**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

NOTE

localhost indicates that only local loopback is allowed.

The **public_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

If an IPv6 address is used and the IP address is a fe80 address block, add '%zone index' during the configuration.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

listen_address_ext

Parameter description: Specifies the extended TCP/IP address of the client for a server to listen on. This parameter specifies the IP addresses used by the GaussDB server as the extended listening IP address.

Parameter type: string.

Unit: none

Value range: an IPv4 or IPv6 address. Multiple IP addresses are not supported.

Default value: **"localhost"**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: In BMS deployment mode, this parameter is automatically configured when the cluster is installed and started. You are advised not to manually configure this parameter.

NOTE

- The setting of the **listen_address_ext** parameter involves the network topology and configuration of the extended IP addresses of the entire cluster. Therefore, it must be set and reloaded by using the OM tool.
- **listen_address_ext** is a network channel used to extend specific IP addresses. If this parameter is set to **"*"**, **"0.0.0.0"**, **"localhost"**, **"::-1"**, or **"127.0.0.1"**, the setting does not take effect. If required, you are advised to set these addresses in **listen_addresses**.
- **listen_address_ext** is used to configure distributed DNs. It does not take effect if it is configured for CNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

local_bind_address

Parameter description: Specifies the host IP address bound to the current node for connecting to other nodes in the cluster.

Parameter type: string.

Unit: none

Value range: an IPv4 or IPv6 address. Multiple IP addresses are not supported.

Default value:

After the cluster is installed, configure different default values based on the IP addresses of different instances in the **public_cloud.conf** file. The default value of CN/DN is "*IP address of the data.net NIC*".

NOTE

The **public_cloud.conf** file contains the following NIC information: **mgr.net** (management NIC), **data.net** (data NIC), and **virtual.net** (virtual NIC).

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: This parameter is specified in the configuration file during installation. Do not modify this parameter unless necessary. Otherwise, database communications will be affected after the modification.

port

Parameter description: Specifies the TCP port listened on by the GaussDB.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

NOTE

- When setting the port number, ensure that the port number is not in use. When setting the port numbers of multiple instances, ensure that the port numbers do not conflict.
- Ports 1 to 1023 are reserved for the OS. Do not use them.
- When the cluster is installed using the configuration file, pay attention to the ports reserved in the communication matrix in the configuration file. For example, the DN needs to reserve **dataPortBase** + 1 as the port used by internal tools. Therefore, during cluster installation, the maximum value of **port** is **65532** for CNs, **65529** for DNs, and **65534** for GTMs. Ensure that the port number does not conflict with each other.

Default value: **5432** (The actual value is specified in the configuration file during installation.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: This parameter is specified in the configuration file during installation. Do not modify this parameter unless necessary. Otherwise, database communications will be affected after the modification.

max_connections

Parameter description: Specifies the maximum number of concurrent connections to the database. This parameter influences the concurrent processing capability of the cluster.

Parameter type: integer.

Unit: none

Value range: The minimum value is **10** (greater than the value of **max_wal_senders**). The theoretical maximum value is **262143**. The actual maximum value is a dynamic value, which is calculated using the formula: 262143 – **job_queue_processes** – **autovacuum_max_workers** – **max_inner_tool_connections** – **max_concurrent_autonomous_transactions** – **AUXILIARY_BACKENDS** – **AV_LAUNCHER_PROCS** – *min(max(newValue/4,64),1024)*. The values of **job_queue_processes**, **autovacuum_max_workers**, **max_inner_tool_connections**, and **max_concurrent_autonomous_transactions** depend on the settings of the corresponding GUC parameters. **AUXILIARY_BACKENDS** indicates the number of reserved auxiliary threads, which is fixed to **20**. **AV_LAUNCHER_PROCS** indicates the number of reserved autovacuum launcher threads, which is fixed to **2**. In *min(max(newValue/4,64),1024)*, **newValue** indicates the new value.

For different memory specifications, the value range of this parameter in different instances is as follows:

Table 14-3 Value ranges of memory specifications for different instances in independent deployment mode

Memory Specifications	Value Range for CNs	Value Range for DNs
< 32 GB	[10,100]	[10,100]
[32GB,64GB)	[10,200]	[10,200]
[64GB,128GB)	[10,1000]	[10,2500]
[128GB,256GB)	[10,2000]	[10,6000]
[256GB,480GB)	[10,4000]	[10,12000]
≥ 480 GB	[10,8000]	[10,24000]

Default value:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Independent deployment:

  CN: **8000** (60-core CPU/480 GB memory); **4000** (32-core CPU/256 GB memory); 2000 (16-core CPU/128 GB memory); **1000** (8-core CPU/64 GB memory)

  DN: **24000** (60-core CPU/480 GB memory); 12000 (32-core CPU/256 GB memory); 6000 (16-core CPU/128 GB memory); **2500** (8-core CPU/64 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value of this parameter in the primary database node file. If this parameter is set to a smaller value, the number of available connections decreases. Before changing the value of this parameter, understand the parameter description and exercise caution to avoid risks caused by misoperations.

Risks and impacts of improper settings:

- If the value of **max_connections** exceeds the maximum dynamic value, the CN and DN fail to be started and the error message "invalid value for parameter "max_connections"" is displayed. Alternatively, the memory fails to be allocated during the node startup and the error message "Cannot allocate memory" is displayed.
- If the value of **max_connections** is not increased based on the external export specifications, the memory parameter is not adjusted in the same proportion. When the service load is heavy, the memory may be insufficient and the error message "memory is temporarily unavailable" is displayed.
- In the hybrid deployment scenario, if the value of **max_connections** on the CN is greater than the value of **max_connections** divided by the number of CNs on the DN and the total pressure on the client exceeds the value of **max_connections** on the DN, the CN may fail to connect to the DN, and the error message "pooler... Too many clients already" is displayed.

NOTE

- If the number of connections of the administrator exceeds the value of **max_connections**, the administrator can still connect to the database after the connections are used up by common users. If the number of connections exceeds the value of **sysadmin_reserved_connections**, an error is reported. That is, the maximum number of connections of the administrator is equal to the value of **max_connections** + **sysadmin_reserved_connections**.
- For common users, internal jobs use some connections. Therefore, the value of this parameter is slightly less than that of **max_connections**. The value depends on the number of internal connections.
- After the thread pool is enabled, the maximum number of stream threads is determined by the value of **max_connections**. If the number of stream threads reaches the upper limit, the error message "Exceed stream thread pool limitation..." is reported. In this case, you can increase the value of **max_connections** to increase the upper limit. This is a POSTMASTER parameter. Therefore, you can estimate the number of stream threads based on service requirements. The formula is as follows: Total number of stream threads = Number of concurrent services x Number of stream threads consumed by each concurrently executed statement (which can be viewed in the execution plan).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_inner_tool_connections

Parameter description: Specifies the maximum number of concurrent connections of a tool which is allowed to connect to the database. This parameter influences the concurrent connection capability of the GaussDB tool.

Parameter type: integer.

Unit: none

Value range: The minimum value is **1**, the theoretical maximum value is **262143**, and the actual maximum value is a dynamic value. The calculation formula is 262143 – **job_queue_processes** – **autovacuum_max_workers** – **max_connections** – **max_concurrent_autonomous_transactions** – **AUXILIARY_BACKENDS** – **AV_LAUNCHER_PROCS** – **min(max(max_connections/4,64),1024)**. The values of **job_queue_processes**, **autovacuum_max_workers**, **max_connections**, and **max_concurrent_autonomous_transactions** depend on the setting of the corresponding GUC parameter. **AUXILIARY_BACKENDS** indicates that the number of reserved auxiliary threads is fixed to **20**. **AV_LAUNCHER_PROCS** reserves two launcher threads for autovacuum.

Default value: **50**. If the default value is greater than the maximum value supported by the kernel (determined when the **gs_initdb** command is executed), an error message is displayed.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value of this parameter in the primary database node file.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

sysadmin_reserved_connections

Parameter description: Specifies the minimum number of connections reserved for administrators. You are advised not to set this parameter to a large value. This parameter is used together with the **max_connections** parameter. The maximum number of connections of the administrator is equal to the value of **max_connections** + **sysadmin_reserved_connections**.

NOTE

- When the thread pool function is enabled, if the thread pool is fully occupied, a processing bottleneck occurs. As a result, connections reserved by the administrator cannot be established. In this case, you can use gsql to establish connections through the port specified by the primary port number plus 1 and clear useless sessions.
- When the reserved connections are used up, new connections will fail. In this case, you can only restart the cluster to restore the connections. Therefore, exercise caution when using the reserved connections.

Parameter type: integer.

Unit: none

Value range: 0 to *MIN(262143, max_connections)* (the smaller value between **262143** and **max_connections**). For details about how to calculate the value of **max_connections**, see **max_connections**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **3**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

service_reserved_connections

Parameter description: Specifies the minimum number of connections reserved for background O&M users (with the persistence attribute). A large value is not recommended. This parameter is used together with **max_connections**. The maximum number of connections of an O&M user can be calculated as follows: **max_connections** + **service_reserved_connections**.

Parameter type: integer.

Unit: none

Value range: 0 to 262143

Default value: 10

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the O&M user (with the persistence attribute) cannot connect to the database and jobs cannot be executed when the number of connections reaches the maximum (**max_connections**). If the value is too large, there are too many idle resources.

extip_reserved_connections

Parameter description: Specifies the minimum number of common gsql service connections reserved for a user on the extended IP address specified by **listen_address_ext**. This parameter is used together with **max_connections**. The maximum number of connections of a corresponding service can be calculated as follows: **max_connections** + **service_reserved_connections**.

NOTE

This parameter is valid only when a specific IP address of **listen_address_ext** is configured for a distributed DN.

Parameter type: integer.

Unit: none

Value range: 0 to *MIN(262143, max_connections)* (the smaller value between **262143** and **max_connections**). For details about how to calculate the value of **max_connections**, see **max_connections**.

Default value: **5**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

unix_socket_directory

Parameter description: Specifies the UDS directory for the GaussDB server to listen to connections from the client. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

NOTE

The parameter length limit varies by the maximum length of a path of a directory in the OS. In the Linux OS, the length of a socket path name (combination of a socket directory and a socket file name) cannot exceed 107 bytes, and the length of a directory cannot exceed 92 bytes. If this limit is exceeded, the error "Unix-domain socket path "xxx" is too long" will be reported.

Default value: **""**. The actual value is specified by **tmpMppdbPath** in the configuration file during installation.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper configuration: If the configuration is incorrect (for example, the length exceeds the limit or the directory is invalid), the process cannot be started properly. You can retrieve the system_call log in the CM Agent directory to locate configuration issues.

unix_socket_group

Parameter description: Specifies the group of the UDS (the user of a socket is the user who starts the server). This parameter can work with **unix_socket_permissions** to control socket access.

Parameter type: string.

Unit: none

Value range: existing user groups in the system.

Default value: **""**, indicating the default group of the current user.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

unix_socket_permissions

Parameter description: Specifies access permissions on the UDS.

The UDS uses the usual permission set of the Unix file system. The value of this parameter should be a number (acceptable for the **chmod** and **umask** commands). If a user-defined octal format is used, the number must start with 0.

Parameter type: integer.

Unit: none

Value range: 0000 to 0777

NOTE

In the Linux OS, a document has one document attribute and nine permission attributes, which are the read (r), write (w), and execute (x) permissions of the **owner**, **group**, and **others** groups.

The r, w, and x permissions are represented by the following numbers:

r: 4

w: 2

x: 1

-: 0

The three attributes in a group are accumulative.

For example, **-rwxrwx---** indicates the following permissions:

owner = rwx = 4+2+1 = 7

group = rwx = 4+2+1 = 7

others = --- = 0+0+0 = 0

The permission of the file is 0770.

Default value: **0700**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set it to **0770** (only allowing access from users connecting to the database and users in the same group as them) or **0700** (only allowing access from users connecting to the database).

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

application_name

Parameter description: Specifies the client name used in the current connection request.

Parameter type: string.

Unit: none

Value range: valid client name. The actual query result depends on the client used for queries or user configurations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> When a standby node requests to replicate logs on the primary node, if this parameter is not an empty string, it is used as the name of the streaming replication slot of the standby node on the primary node. In this case, if the length of this parameter exceeds 61 bytes, only the first 61 bytes are used as the streaming replication slot name.

Default value: **""** (The actual value is the name of the application connected to the backend.)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. Note that after the client is connected, this parameter is set to the client name and the client level. Therefore, only the session-level parameters take effect. Other methods do not take effect because they are lower than the client level.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The database depends on **application_name** to identify some internal processes. If you set **application_name** to the same name as an internal process, unexpected behavior may occur.

connection_info

Parameter description: Specifies the database connection information, including the driver type, driver version, driver deployment path, and process owner.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **""**, indicating that the driver connected to the database does not support automatic setting of the **connection_info** parameter or the parameter is not set by users in applications.

> **NOTE**
>
> The following is an example of the concatenated value of **connection_info**:
> ```
> {"driver_name":"ODBC","driver_version": "(GaussDB XXX.XXX.XXX build 290d125f) compiled at 2020-05-08 02:59:43 commit 2143 last mr 131 release","driver_path":"/usr/local/lib/gsqlodbcw.so","os_user":"omm"}
> ```
>
> By default, **driver_name** and **driver_version** are displayed. The displays of **driver_path** and **os_user** are controlled by users. For details, see "Application Development Guide > Development Based on JDBC > Connecting to the Database" in *Developer Guide* and "Application Development Guide > Development Based on ODBC > Configuring a Data Source in the Linux OS" in *Developer Guide*.

Setting method: This is a USERSET parameter used for O&M. You are advised not to set the parameter.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

backend_version

Parameter description: Specifies the version number of the synchronous connection between CNs or between a CN and a DN. This parameter involves the version number and cannot be set randomly.

Parameter type: integer.

Unit: none

Value range: 0 to 100000

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the settings are incorrect, the versions of different nodes are inconsistent.

check_disconnect_query

Parameter description: Specifies whether to terminate the execution of statements on the GaussDB server after the client is disconnected abnormally (for example, socketTimeout is triggered by JDBC, rwtimeout is triggered by libpq and the connection is closed, or the client process is terminated during service running).

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the GaussDB server stops running the corresponding statements after the client is disconnected unexpectedly.
- **off**: indicates that the GaussDB server does not stop running the corresponding statements after the client is disconnected unexpectedly.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

The GaussDB signal mechanism is designed as follows: After a signal is received, only the corresponding interrupt position is marked as **true**, and the actual processing is performed only when the interrupt function is executed. When system resources encounter a bottleneck (for example, the CPU usage is too high, the memory is insufficient, the disk I/O is fully loaded, or the NIC receiving and sending buffer is fully loaded due to network problems), a delay may occur from the time when a signal is received to the time when the signal is processed. As a result, the time required for processing the signal increases.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

connection_reject_nodes

Parameter description: Specifies the blacklist of CNs/DNs that reject connections from other CNs. The blacklists are separated by commas (,), for example, **'cn_5001,cn_5002'**. When a CN (for example, **cn_5001**) in the blacklist attempts to connect to the local node, the connection will be rejected and the error message "Reject cn_5001 connection" will be displayed.

Parameter type: string.

Unit: none

Value range: a character string consisting of several node names and commas (,).

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a node name, other nodes will reject the connection request. As a result, a connection error is reported.

14.3.3.2 Security and Authentication

This section describes parameters about client-to-server authentication.

authentication_timeout

Parameter description: Specifies the longest duration to wait before the client authentication times out. If a client is not authenticated by the server within the period, the server automatically disconnects from the client so that the client does not occupy connection resources.

Parameter type: integer.

Unit: second

Value range: 1–600

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **600** without a unit, **authentication_timeout** indicates 600s. If the value is **10min**, **authentication_timeout** indicates 10 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, connection failures may occur frequently, affecting user experience. If the value is too large, security risks increase and resources are wasted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

auth_iteration_count

Parameter description: Specifies the number of iterations during the generation of encryption information for authentication.

Parameter type: integer.

Unit: none

Value range: 2048–134217728

Default value: **10000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set the number of iterations based on actual hardware conditions. You are advised to retain the default value.

Risks and impacts of improper settings: If the number of iterations is too small, the password storage security is reduced. If the number of iterations is too large, the performance deteriorates in scenarios involving password encryption, such as authentication and user creation.

session_authorization

Parameter description: Specifies the user ID of the current session. The value of this parameter can be queried only by running the **SHOW** statement.

Parameter type: string.

Unit: none

Value range: a valid user ID.

Default value: **""**

Setting method: This parameter is a USERSET parameter. Set it based on the syntax described in "SQL Reference" > "SQL Syntax" > "S" > "SET SESSION AUTHORIZATION" in *Developer Guide*. If you directly set the value, it can only be set to **DEFAULT**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

session_timeout

Parameter description: Specifies the longest duration allowed when no operations are performed on a client after it is connected to the server. If this parameter is not set to **0** and a user does not perform any operation for a period longer than the value of this parameter, the server is disconnected.

Parameter type: integer

Unit: second

Value range: 0–86400 (1 day)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The value **0** indicates that the timeout setting is disabled.
- A positive number indicates the maximum duration in which no operation is performed after the connection to the server is set up. When the value of this parameter is exceeded, the client is disconnected from the server.

Default value: **1800**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **600** without a unit, **session_timeout** indicates 600s. If the value is **10min**, **session_timeout** indicates 10 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Set this parameter based on service security requirements. A smaller value indicates higher security but more inconvenient use.

Risks and impacts of improper settings: If the value is too small, persistent connections in the service connection pool may become invalid, causing service failures.

NOTE

The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.

idle_in_transaction_timeout

Parameter description: Specifies the maximum idle duration of a transaction after the connection to the server is established and the transaction is started. If this parameter is not set to **0**, the transaction is idle, and no operation is performed for a period longer than the value of this parameter, the server is disconnected.

Parameter type: integer

Unit: second

Value range: 0–86400 (1 day)

- The value **0** indicates that the timeout setting is disabled.
- The positive number indicates the maximum idle duration of a transaction after the connection to the server is established and the transaction is started. When the value of this parameter is exceeded, the client is disconnected from the server.

Default value: **300** (5 minutes)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **600** without a unit, **idle_in_transaction_timeout** indicates 600s. If the value is **10min**, **idle_in_transaction_timeout** indicates 10 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Set this parameter based on service security requirements. A smaller value indicates higher security but more inconvenient use.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the value is too small, the client application may not send new requests in a timely manner after a transaction is started. As a result, the session times out and exits, affecting user experience.

NOTE

- The gsql client of GaussDB has an automatic reconnection mechanism. For local connection of initialized users, the client reconnects to the server if the connection breaks after the timeout.
- If both **idle_in_transaction_timeout** and **session_timeout** are enabled, the timeout interval takes effect regardless of whether the transaction is idle. The smaller timeout interval prevails.
- For a newly delivered instance, the value of this parameter is **300**. For an upgraded instance, the value of this parameter is **0** by default.
- After an idle transaction times out, the transaction start time, thread ID, application name, and query information is recorded in logs. This log file is used to locate the problem that an idle transaction exits due to timeout. The log file does not contain the prefix format **log_line_prefix**.

ssl

Parameter description: Specifies whether to enable the SSL connection on the server. Before using this option, read "Database Quick Start" > "Connecting to a Database" > "Using gsql to Connect to a Database" in *Developer Guide*.

Parameter type: Boolean

Unit: none

Value range:

- **on**: The SSL connection is enabled on the server. Whether SSL encrypted transmission is used during actual communication depends on the client configuration.
- **off**: The SSL connection is disabled on the server.

Default value: **on** (for CNs) or **off** (for DNs)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If high security is required, you are advised to enable this function. If high performance is required, you are advised to disable this function. GaussDB supports SSL when a client connects to a CN. You are advised to enable SSL connections only on CNs. The default value is **off** on DNs.

Risks and impacts of improper settings: Before enabling this parameter, ensure that the parameters **ssl_cert_file**, **ssl_key_file**, and **ssl_ca_file** are correctly set. If SM cryptographic algorithms are used, ensure that the parameters **ssl_enc_cert_file** and **ssl_enc_key_file** are correctly set. Incorrect settings may cause cluster startup failures.

comm_ssl

Parameter description: Specifies whether to enable the SSL connection between primary DNs. Before using this option, read "Database Quick Start" > "Connecting to a Database" > "Using gsql to Connect to a Database" in *Developer Guide*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean

Unit: none

Value range:

- **on**: The SSL connection is enabled between primary DNs.
- **off**: The SSL connection is disabled between primary DNs.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to enable this parameter only on DNs. The default value is **off** on CNs.

Risks and impacts of improper settings: To enable SSL connections, you also need to ensure that parameters such as **ssl_cert_file**, **ssl_key_file**, and **ssl_ca_file** are configured correctly. Incorrect configurations may cause startup failure of the cluster.

require_ssl

Parameter description: Specifies whether the server requires SSL connections. This parameter is valid only when **ssl** is set to **on**. Before using this option, read "Database Quick Start" > "Connecting to a Database" > "Using gsql to Connect to a Database" in *Developer Guide*.

Parameter type: Boolean

Unit: none

Value range:

- **on**: The server requires SSL connections.
- **off**: The server does not require SSL connections.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: GaussDB supports SSL when a client connects to a CN. It is recommended that the SSL connection be enabled only on CNs.

Risks and impacts of improper setting: If SSL-related parameters are incorrectly configured, enabling this parameter may cause communication connection setup failures or even cluster startup failures.

ssl_ciphers

Parameter description: Specifies the list of encryption algorithms supported by SSL. Only the SYSADMIN user can access the list.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string. Separate multiple encryption algorithms by semicolons (;).

Default value: **"ALL"**, indicating that all supported encryption algorithms (excluding ADH, LOW, EXP, and MD5) can be used for the peer end.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the specifications. You are advised not to specify the insecure algorithms DHE-RSA-AES128-GCM-SHA256 and DHE-RSA-AES256-GCM-SHA384.

Risks and impacts of improper setting: If **ssl_ciphers** is incorrectly set, the database cannot be started.

ssl_renegotiation_limit

Parameter description: Specifies the allowed traffic volume over an SSL-encrypted channel before the session key is renegotiated. The renegotiation mechanism reduces the probability that attackers use the password analysis method to crack the key based on a huge amount of data but causes big performance losses. The traffic indicates the sum of transmitted and received traffic.

Parameter type: integer.

Unit: KB

Value range: 0 to 2147483647. **0** indicates that the renegotiation mechanism is disabled.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **ssl_renegotiation_limit** indicates 1024 KB. If the value is **1MB**, **ssl_renegotiation_limit** indicates 1 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value. The SSL renegotiation mechanism has been disabled because of potential risks. This parameter is reserved for version compatibility and does not take effect.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

ssl_cert_file

Parameter description: Specifies the name of the file that contains the SSL server certificate. The path is relative to the data directory.

Parameter type: string.

Unit: none

Value range: valid file name, which must end with .crt.

Default value: **"server.crt"**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When configuring the file path, ensure that the file path matches other SSL-related certificate and private key configuration files.

Risks and impacts of improper settings: If the file path is incorrect, the SSL connection cannot be established between the client and the database node, and the database cluster nodes cannot communicate with each other in SSL mode. As a result, data leakage may occur.

ssl_key_file

Parameter description: Specifies the name of the file that contains the SSL private key. The path is relative to the data directory.

Parameter type: string.

Unit: none

Value range: valid file name, which must end with .key.

Default value: **"server.key"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When configuring the file path, ensure that the file path matches other SSL-related certificate and private key configuration files.

Risks and impacts of improper settings: If the file path is incorrect, the SSL connection cannot be established between the client and the database node, and the database cluster nodes cannot communicate with each other in SSL mode. As a result, data leakage may occur.

ssl_enc_cert_file

Parameter description: Specifies the name of the SSL server certificate file that is encrypted using SM cryptographic algorithms. The path is relative to the data directory.

Parameter type: string.

Unit: none

Value range: valid file name, which must end with .crt.

Default value: **""**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When configuring the file path, ensure that the file path matches other certificates and private key configuration files related to SSL that uses SM cryptographic algorithms.

Risks and impacts of improper settings: If the file path is incorrect, the SSL connection that uses SM cryptographic algorithms cannot be established between the client and the database node, and the cluster nodes of the database instance

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cannot communicate with each other in SSL that uses SM cryptographic algorithms. As a result, data leakage may occur.

ssl_enc_key_file

Parameter description: Specifies the name of the SSL server certificate file (with the private key) that is encrypted using SM cryptographic algorithms. The path is relative to the data directory.

Parameter type: string.

Unit: none

Value range: valid file name, which must end with .key.

Default value: **""**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When configuring the file path, ensure that the file path matches other certificates and private key configuration files related to SSL that uses SM cryptographic algorithms.

Risks and impacts of improper settings: If the file path is incorrect, the SSL connection that uses SM cryptographic algorithms cannot be established between the client and the database node, and the cluster nodes of the database instance cannot communicate with each other in SSL that uses SM cryptographic algorithms. As a result, data leakage may occur.

ssl_ca_file

Parameter description: Specifies the name of the root certificate that contains CA information. Its path is relative to the data directory.

Parameter type: string.

Unit: none

Value range: valid file name, which must end with .pem. An empty character string indicates that no CA file is loaded and client certificate verification is not performed.

Default value: **"cacert.pem"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If client certificate verification is required, configure the file path correctly.

Risks and impacts of improper settings: If the file path is incorrect, the database cannot verify the client certificate, reducing communication security.

ssl_crl_file

Parameter description: Specifies the name of the file that contains the certificate revocation list (CRL). If a client certificate is in the list, the certificate is invalid. The path is relative to the data directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: string.

Unit: none

Value range: valid file name. An empty string indicates that there is no CRL.

Default value: ""

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the file name in the CRL is incorrectly configured, invalid client certificates may be used to establish SSL connections, causing data leakage risks. Valid client certificates are considered revoked and SSL connections cannot be established.

enable_shared_sslctx

Parameter description: Specifies whether to enable global SSL certificate loading and SSL context sharing. This parameter is valid only when **SSL** is set to **on**.

Parameter type: Boolean

Unit: none

Value range:

- **on**: Global SSL certificate loading is enabled and the SSL context is initialized only once when the database is started.
- **off**: Global SSL certificate loading is disabled and the SSL context is initialized each time a session is established.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to disable this function. You are advised to enable this function only when high performance is required in SSL non-two-way authentication scenarios.

Risks and impacts of improper settings: After the global SSL certificate loading function takes effect, the new certificate cannot take effect in real time. You need to restart the database.

NOTE

If the SSL global context fails to be initialized during database startup, this parameter is automatically set to **off**, and the session-level SSL certificate is loaded.

ssl_cert_notify_time

Parameter description: Specifies the number of days prior to SSL server certificate expiration that a user will receive a reminder. When the SSL certificate is initialized during connection establishment, if the duration from the current time to the certificate expiration time is shorter than the specified value, an expiration notification is recorded in the log.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: day

Value range: 7–180

Default value: **90**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The unit must be **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the server certificate expiration may not be detected in advance. As a result, the certificate cannot be replaced in a timely manner. If the value is too large, alarms may be frequently generated.

krb_server_keyfile

Parameter description: Specifies the location of the main configuration file of the Kerberos service. Only the SYSADMIN user can access the file.

Parameter type: string

Unit: none

Value range: valid file path.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: For details, see "Database Configuration > Security Authentication > Configuring Internal Kerberos Authentication on the Server" in *Security Hardening Guide*.

Risks and impacts of improper settings: If this parameter is incorrectly set, nodes in the cluster cannot use the Kerberos authentication function.

krb_srvname

Parameter description: Specifies the Kerberos service name.

Parameter type: string

Unit: none

Value range: a string.

Default value: **"postgres"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

krb_caseins_users

Parameter description: Specifies whether the Kerberos username is case-sensitive.

Parameter type: Boolean

Unit: none

Value range:

- **on**: It is case-insensitive.
- **off**: It is case-sensitive.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

modify_initial_password

Parameter description: After GaussDB is installed, there is only one initial user account (whose UID is 10) in the database. When a user logs in to the database using this initial account for the first time, this parameter specifies whether the password of the initial account needs to be modified.

NOTE

If the initial user password is not specified during the installation, the initial user password is empty by default after the installation. Before performing other operations, you need to set the initial user password using the gsql client. This parameter no longer takes effect and is reserved only for compatibility with upgrade scenarios.

Parameter type: Boolean

Unit: none

Value range:

- **on**: The password of the initial account needs to be modified upon the first login after the cluster is installed.
- **off**: The password of the initial account does not need to be modified after the cluster is installed.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

password_policy

Parameter description: Specifies whether to check the password complexity when you run the **CREATE ROLE/USER** or **ALTER ROLE/USER** command to create or modify the GaussDB account.

Parameter type: integer

Unit: none

Value range: **0** or **1**

- **0**: No password complexity policy is enabled.
- **1**: The default password complexity policy is enabled.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: For security purposes, do not disable the password complexity policy.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

password_reuse_time

Parameter description: Specifies whether to check the reuse interval of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password.

NOTE

When you change the password, the system checks the values of **password_reuse_time** and **password_reuse_max**.

- If the values of **password_reuse_time** and **password_reuse_max** are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of **password_reuse_time** is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of **password_reuse_max** is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both **password_reuse_time** and **password_reuse_max** are **0**, password reuse is not restricted.

Parameter type: floating-point.

Unit: day

Value range: 0 to 3650

- **0** indicates that the password reuse interval is not checked.
- A positive number indicates that a new password cannot be chosen from passwords in history that are newer than the specified number of days.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Set this parameter based on service security requirements. A larger value indicates higher security but more inconvenient use.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

password_reuse_max

Parameter description: Specifies whether to check the reuse times of the new password when you run the **ALTER USER** or **ALTER ROLE** command to change a user password. Only the SYSADMIN user can access this parameter.

NOTE

When you change the password, the system checks the values of **password_reuse_time** and **password_reuse_max**.

- If the values of **password_reuse_time** and **password_reuse_max** are both positive numbers, an old password can be reused when it meets either of the reuse restrictions.
- If the value of **password_reuse_time** is **0**, password reuse is restricted based on the number of reuse times, and not on the reuse interval.
- If the value of **password_reuse_max** is **0**, password reuse is restricted based on the reuse interval, and not on the number of reuse times.
- If the values of both **password_reuse_time** and **password_reuse_max** are **0**, password reuse is not restricted.

Parameter type: integer.

Unit: none

Value range: 0 to 1000

- **0** indicates that the password reuse times are not checked.
- A positive number indicates that the new password cannot be the one whose reuse times exceed the specified number.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service security requirements. A larger value indicates higher security but more inconvenient use.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

password_lock_time

Parameter description: Specifies the duration before a locked account is automatically unlocked.

NOTE

The account locking and unlocking functions take effect only when the values of **password_lock_time** and **failed_login_attempts** are positive numbers.

Parameter type: floating-point.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: day

Value range: 0 to 365. The integer part of the value indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password_lock_time=1.5** indicates one day and 12 hours.

- **0** indicates that an account is not automatically locked if the password verification fails.
- A positive number indicates the duration after which a locked account is automatically unlocked.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The unit must be **d** if required.

Setting suggestion: Retain the default value. The automatic unlock time should not be too long. This parameter and **failed_login_attempts** should be set within a proper range.

Risks and impacts of improper settings: If the value of **failed_login_attempts** is too small and the automatic unlock time is too long, the account cannot be used for a long time due to incorrect input, affecting user experience.

failed_login_attempts

Parameter description: If the number of incorrect password attempts reaches the value of **failed_login_attempts**, the current account is locked. The account is automatically unlocked after the time specified by **password_lock_time**. During this period, only the SYSADMIN user can access the account. If you fail to enter the password during login or fail to change the password when running the **ALTER USER** command, the system considers that the entered password is incorrect.

NOTE

The account locking and unlocking functions take effect only when the values of **failed_login_attempts** and **password_lock_time** are positive numbers.

Parameter type: integer.

Unit: none

Value range: 0 to 1000.

- **0** indicates that the automatic locking function does not take effect.
- A positive number indicates that an account is locked when the number of incorrect password attempts reaches the specified number.

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set it to a value ranging from 5 to 10.

Risks and impacts of improper settings: If this parameter is set to a large value that allows too many incorrect password attempts (less than the maximum value of 1000), but no security measure is taken, security risk occurs. If this parameter is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

set to a small value (greater than 0 and less than 10), the account may be locked due to failed password attempts, affecting normal use.

enable_lock_account

Parameter description: If **failed_login_attempts** is set to **0**, the automatic lock function is disabled. In this setting, the system cannot record the number of login failures of an account. If **enable_lock_account** is set to disable the automatic lock function, the account will not be automatically locked after the number of consecutive login failures using incorrect passwords reaches the value of **failed_login_attempts**. In this case, the system reports an alarm to ensure account security. For details, see "ALM_AI_SecurityAccountFailedAttempt" in *Alarm Reference*. Manual locking by administrators is not controlled by parameters.

Parameter type: Boolean

Unit: none

Value range:

- **on**: An account is automatically locked when the number of consecutive login failures using incorrect passwords reaches the value of **failed_login_attempts**.
- **off**: An account is not automatically locked when the number of consecutive login failures using incorrect passwords reaches the value of **failed_login_attempts**.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: For security purposes, do not disable the automatic account locking function if the alarm function is not enabled.

Risks and impacts of improper settings: If it is set to **off**, account security deteriorates.

password_encryption_type

Parameter description: Specifies the encryption type of a user password. Changing the value of this parameter does not automatically trigger the change of the password encryption type of an existing user. Only the password of a new user or the password changed by an existing user is encrypted using the new encryption type.

Parameter type: integer.

Unit: none

Value range: **0**, **1**, **2**, or **3**

- **0** indicates that passwords are encrypted with MD5.
- **1** indicates that passwords are encrypted with SHA-256 and MD5.
- **2** indicates that passwords are encrypted with SHA-256.
- **3** indicates that the passwords are encrypted with SM3.

Default value: 2

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: The MD5 encryption algorithm is not recommended and has low security. If this parameter is set to **0** or **1**, security risks exist.

password_min_length

Parameter description: Specifies the minimum length of an account password. Only the SYSADMIN user can access this parameter.

Parameter type: integer.

Unit: none

Value range: 6 to 999

Default value: **8**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual situations. You are advised to use the default value.

Risks and impact of improper settings: If this parameter is set to a value greater than **password_max_length**, accounts cannot be created.

password_max_length

Parameter description: Specifies the maximum length of an account password. Only the SYSADMIN user can access this parameter.

Parameter type: integer.

Unit: none

Value range: 6 to 999

Default value: **32**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual situations. You are advised to use the default value.

Risks and impact of improper settings: If this parameter is set to a value smaller than **password_min_length**, accounts cannot be created.

password_min_uppercase

Parameter description: Specifies the minimum number of uppercase letters that an account password must contain. Only the SYSADMIN user can access this parameter.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: 0 to 999.

- **0**: no limit.
- 1 to 999: minimum number of uppercase letters required in a password when you create an account.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual situations. You are advised to use the default value.

Risks and impact of improper settings: If this parameter is set to a value greater than **password_max_length**, accounts cannot be created.

password_min_lowercase

Parameter description: Specifies the minimum number of lowercase letters that an account password must contain. Only the SYSADMIN user can access this parameter.

Parameter type: integer.

Unit: none

Value range: 0 to 999.

- **0**: no limit.
- 1 to 999: minimum number of lowercase letters required in a password when you create an account.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual situations. You are advised to use the default value.

Risks and impact of improper settings: If this parameter is set to a value greater than **password_max_length**, accounts cannot be created.

password_min_digital

Parameter description: Specifies the minimum number of digits that an account password must contain. Only the SYSADMIN user can access this parameter.

Parameter type: integer.

Unit: none

Value range: 0 to 999.

- **0**: no limit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- 1 to 999: minimum number of digits required in a password when you create an account.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual situations. You are advised to use the default value.

Risks and impact of improper settings: If this parameter is set to a value greater than **password_max_length**, accounts cannot be created.

password_min_special

Parameter description: Specifies the minimum number of special characters that an account password must contain. Only the SYSADMIN user can access the page.

Parameter type: integer

Unit: none

Value range: 0 to 999.

- **0**: no limit.
- 1 to 999: minimum number of special characters required in a password when you create an account.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual situations. You are advised to use the default value.

Risks and impact of improper settings: If this parameter is set to a value greater than **password_max_length**, accounts cannot be created.

password_effect_time

Parameter description: Specifies the validity period of an account password.

Parameter type: floating-point.

Unit: day

Value range: 0 to 999. The integer part indicates the number of days, and the decimal part can be converted into hours, minutes, and seconds. For example, **password_effect_time=0.5** indicates 0 days and 12 hours.

- **0**: The validity period restriction of an account password is disabled.
- 1 to 999: The number of days for which an account password is valid. When the password is about to expire or has expired, the system prompts the user to change the password.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set the password validity period based on service security requirements. A smaller value indicates higher security.

Risks and impact of improper settings: If this parameter is set to **0**, security risks exist if the password is not changed for a long time.

password_notify_time

Parameter description: Specifies how many days in advance a user is notified before a password expires.

Parameter type: integer.

Unit: day

Value range: 0 to 999.

- **0**: The reminder is disabled.
- 1 to 999: number of days prior to password expiration that a user will receive a reminder.

Default value: **7**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: If this parameter is set to **0**, password expiration is not reminded in advance.

enable_innertool_cert

Parameter description: Specifies whether internal tools use certificate authentication.

Parameter type: Boolean

Unit: none

Value range:

- **on**: Internal tools use certificate-based authentication.
- **off**: Internal tools do not use certificate-based authentication.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This parameter takes effect only when both this parameter and **ssl** are enabled.
- By default, the certificate in the *$GAUSSHOME*/**share/sslcert/gsql** directory is used. **Common Name** of the certificate must be the same as the initial user. Otherwise, the authentication fails.
- After this parameter is enabled, the initial user uses certificate-based authentication, and other users use password-based authentication.
- After this parameter is enabled, the initial user can remotely connect to the database using certificate-based authentication.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value is recommended. If you have high security requirements, you are advised to enable this parameter and correctly configure related certificates.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.3.3 Communications Library Parameters

This section describes parameter settings and value ranges for communications libraries.

tcp_keepalives_idle

Parameter description: Specifies the interval for transmitting keepalive signals on an OS that supports the **TCP_KEEPIDLE** socket option. If no keepalive signal is transmitted, the connection is in idle mode.

NOTE

- If the OS does not support **TCP_KEEPIDLE**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the UDS.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

Default value: **60**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **tcp_keepalives_idle** indicates 60s. If the value is **1min**, **tcp_keepalives_idle** indicates 1 minute. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Before setting this parameter, ensure that the OS supports the **TCP_KEEPIDLE** socket option.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

tcp_keepalives_interval

Parameter description: Specifies the response time before retransmission on an OS that supports the **TCP_KEEPINTVL** socket option.

NOTE

- If the OS does not support **TCP_KEEPINTVL**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the UDS.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

Parameter type: integer.

Unit: second

Value range: 0 to 180

Default value: **30**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **tcp_keepalives_interval** indicates 60s. If the value is **1min**, **tcp_keepalives_interval** indicates 1 minute. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Before setting this parameter, ensure that the OS supports the **TCP_KEEPINTVL** socket option.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

tcp_keepalives_count

Parameter description: Specifies the number of keepalive signals that can be waited before the GaussDB server is disconnected from the client on an OS that supports the **TCP_KEEPCNT** socket option.

NOTE

- If the OS does not support **TCP_KEEPCNT**, set this parameter to **0**.
- The parameter is ignored on an OS where connections are established using the UDS.
- If this parameter is set to **0**, the system value is used.
- This parameter is not shared among different sessions. That is, different session connections may have different values.
- The parameter value in the current session connection, not the value of the GUC copy, is displayed.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 100. **0** indicates that the connection is immediately broken if GaussDB does not receive a keepalive signal from the client.

Default value: 20

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Before setting this parameter, ensure that the OS supports the **TCP_KEEPCNT** socket option.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

tcp_user_timeout

Parameter description: Specifies the maximum duration for which the transmitted data can remain in the unacknowledged state before the TCP connection is forcibly closed when the GaussDB sends data on the OS that supports the **TCP_USER_TIMEOUT** socket option.

NOTE

- If the OS does not support the **TCP_USER_TIMEOUT** option, the value of this parameter does not take effect. The default value is **0**.
- The parameter is ignored on an OS where connections are established using the UDS.

Parameter type: integer.

Unit: ms

Value range: 0 to 3600000

Default value: **0**, indicating that the value is set based on the OS.

Note that the effective result of this parameter varies according to the OS kernel.

- For AArch64 EulerOS (Linux kernel version: 4.19), the timeout interval is the value of this parameter.
- For x86 Euler 2.5 (Linux kernel version: 3.10), the timeout interval is not the value of this parameter but the maximum value in different ranges. That is, the timeout interval is the maximum upper limit of the total Linux TCP retransmission duration to which the value of **tcp_user_timeout** belongs. For example, when **tcp_user_timeout** is set to **40000**, the total retransmission duration is 51 seconds.

  Table 14-4 Value of tcp_user_timeout for x86 Euler 2.5 (Linux kernel version: 3.10)

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
1	(0.2,0.6]	400	0.6

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Number of Linux TCP Retransmission Times	Total Linux TCP Retransmission Duration Range (s)	Example of tcp_user_timeout (ms)	Actual Linux TCP Retransmission Duration (s)
2	(0.6,1.4]	1000	1.4
3	(1.4,3]	2000	3
4	(3,6.2]	4000	6.2
5	(6.2,12.6]	10000	12.6
6	(12.6,25.4]	20000	25.4
7	(25.4,51]	40000	51
8	(51,102.2]	80000	102.2
9	(102.2,204.6]	150000	204.6
10	(204.6,324.6]	260000	324.6
11	(324.6,444.6]	400000	444.6

Note: The duration of each TCP retransmission increases exponentially with the number of retransmission times. When the duration of a TCP retransmission reaches 120 seconds, the duration of each subsequent retransmission does not change.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Before setting this parameter, ensure that the OS supports the **TCP_USER_TIMEOUT** socket option.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

tcp_syn_retries

Parameter description: Specifies the number of SYN packet retransmissions due to SYN packet transmission failures in the three-way handshake for connecting to other internal nodes on the GaussDB that supports the **TCP_SYNCNT** socket option.

Parameter type: integer.

Unit: none

Value range: 0–127. The value **0** indicates OS-based.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value (greater than **0**) and the network fluctuates, the number of SYN retransmissions is small. If the retransmission duration is shorter than the network recovery duration, the connection setup fails. If this parameter is set to a large value and the network is disconnected, the number of SYN retransmissions is large and the retransmission takes a long time. As a result, the overall error reporting time is prolonged.

NOTICE

- If the OS does not support the **TCP_SYNCNT** option, setting this parameter to any value does not take effect but the value is **0** by default.
- The parameter is ignored on an OS where connections are established using the UDS.

comm_tcp_mode

Parameter description: Specifies whether the communications library uses the TCP protocol to set up a data channel. The parameter setting takes effect after you restart the cluster.

NOTE

SCTP is no longer supported. This parameter is provided for compatibility, but its value is fixed at **on**.

Parameter type: Boolean.

Unit: none

Value range: If this parameter is set to **on** for a CN, it connects to a DN using TCP. If this parameter is set to **on** for a DN, the DN communicates with each other using TCP.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

comm_sctp_port

Parameter description: Specifies the TCP port used to listen on data packet channels by the TCP proxy communications library.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: 0–65535

Default value: **25110** (The actual value is the specified value of the **port** GUC parameter plus 2.)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to set this parameter. Related configurations are automatically delivered during cluster installation.

Risks and impacts of improper settings: This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

comm_control_port

Parameter description: Specifies the TCP listening port used by the TCP proxy communications library.

Parameter type: integer.

Unit: none

Value range: 0–65535

Default value: **25111** (The actual value is the specified value of the **port** GUC parameter plus 3.)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to set this parameter. Related configurations are automatically delivered during cluster installation.

Risks and impacts of improper settings: This port number is automatically allocated during cluster deployment. Do not change the parameter. If the port number is incorrectly configured, the database communication fails.

comm_max_datanode

Parameter description: Specifies the maximum number of DNs supported by the TCP proxy communications library.

Parameter type: integer.

Unit: none

Value range: 1 to 8192

Default value: maximum number of primary DNs supported by each node.

Setting method: This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. During scale-in, this parameter takes effect only after the cluster is restarted.

Setting suggestion: The recommended value is **256**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the parameter value is less than the number of DNs in the current cluster, the connection fails to be established. If the value is too large, too much memory is occupied.

comm_max_stream

Parameter description: Specifies the maximum number of concurrent data streams supported by the TCP proxy communications library. The value of this parameter must be greater than: Number of concurrent data streams x Number of operators in each stream x Square of **query_dop**.

Parameter type: integer.

Unit: none

Value range: 1–60000

Default value: **1024**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- You are advised not to set this parameter to a large value because this will cause high memory usage (256 bytes x **comm_max_stream** x **comm_max_datanode**). If the number of concurrent data streams is large, the query is complex and the SMP is large, resulting in insufficient memory.
- If the process memory is sufficient, you can properly increase the value of **comm_max_stream**.

Risks and impacts of improper settings: If the value is too small, a large number of concurrent distributed stream queries are restricted. If the value is too large, too much memory may be occupied.

comm_max_receiver

Parameter description: Specifies the maximum number of receiver threads for the TCP proxy communications library.

Parameter type: integer.

Unit: none

Value range: 1 to 50

Default value: **4**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value to avoid thread switchover scheduling caused by excessive thread resources.

Risks and impacts of improper settings: If the value is too large, too many data receiving threads are started, wasting thread resources.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

comm_quota_size

Parameter description: Specifies the maximum size of packets that can be consecutively sent by the TCP proxy communications library.

Parameter type: integer.

Unit: KB

Value range: 0 to 2048000

Default value: **1024**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **comm_quota_size** indicates 1024 KB. If the value is **1MB**, **comm_quota_size** indicates 1 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value. When you use a 1GE NIC, a small value ranging from 20 KB to 40 KB is recommended.

Risks and impacts of improper settings: If this parameter is set to a small value, the TCP communications library may wait for the quota during the sending and receiving phases.

comm_usable_memory

Parameter description: Specifies the maximum memory available for buffering on the TCP proxy communications library on a DN.

Parameter type: integer.

Unit: KB

Value range: 102400 to 1073741823

Default value: **4096000** (that is, 4000 MB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **102400** without a unit, **comm_usable_memory** indicates 102400 KB. If the value is **100MB**, **comm_usable_memory** indicates 100 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value. Set this parameter based on the environment memory and deployment mode.

Risks and impacts of improper settings: If the value is too large, OOM occurs. If the value is too small, the performance of the TCP proxy communications library deteriorates.

comm_memory_pool

Parameter description: Specifies the size of the memory pool resources that can be used by the TCP proxy communications library on a DN.

Parameter type: integer.

Unit: KB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 102400 to 1073741823

Default value: **2048000** (that is, 2000 MB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **102400** without a unit, **comm_memory_pool** indicates 102400 KB. If the value is **100MB**, **comm_memory_pool** indicates 100 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value. If the memory used by the communications library is small, set this parameter to a small value. Otherwise, set it to a large value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

comm_memory_pool_percent

Parameter description: Specifies the percentage of the memory pool resources that can be used by the TCP proxy communications library on a DN. This parameter is used to adaptively reserve memory used by the communications libraries.

Parameter type: integer.

Unit: none

Value range: 0 to 100

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If the memory used by the communications library is small, set this parameter to a small value. Otherwise, set it to a large value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

comm_client_bind

Parameter description: Specifies whether to bind the client of the communications library to a specified IP address when the client initiates a connection.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The client is bound to a specified IP address.
- **off**: The client is not bound to a specified IP address.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If multiple IP addresses of a node in the cluster are on the same network segment, set this parameter to **on**. In this case, the client is bound to the IP address specified by **listen_addresses**. The concurrency performance of the cluster depends on the number of random ports because a port can be used by only one client at a time.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

comm_no_delay

Parameter description: Specifies whether to use the **NO_DELAY** attribute of a communications library connection.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The NO_DELAY attribute is used.
- **off**: The NO_DELAY attribute is not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Enable this parameter for delay-sensitive services and disable it for high throughput requirements. In addition, if packet loss occurs in the cluster because a large number of packets are received per second, set this parameter to **off** so that small packets are combined into large packets for transmission to reduce the total number of packets.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

comm_debug_mode

Parameter description: Specifies whether to enable the debug mode of the TCP proxy communications library, that is, whether to print logs about the communication layer.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The debug logs of the communications library are printed.
- **off**: The debug logs of the communications library are not printed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: If this parameter is set to **on**, a large number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

comm_ackchk_time

Parameter description: Specifies the duration after which the communications library server automatically triggers ACK when no data packet is received.

Parameter type: integer.

Unit: ms

Value range: 0 to 20000. **0**: disabled.

Default value: **2000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **comm_ackchk_time** indicates 60 ms. If the value is **1min**, **comm_ackchk_time** indicates 1 minute. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

comm_timer_mode

Parameter description: Specifies whether to enable the timer mode of the TCP proxy communications library, that is, whether to print timer logs in each phase of the communication layer.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The timer logs of the communications library are printed.
- **off**: The timer logs of the communications library are not printed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If this parameter is set to **on**, a large number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

comm_stat_mode

Parameter description: Specifies whether to enable the statistics mode of the TCP proxy communications library, that is, whether to print statistics about the communication layer.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The statistics logs of the communications library are printed.
- **off**: The statistics logs of the communications library are not printed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If this parameter is set to **on**, a large number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_stateless_pooler_reuse

Parameter description: Specifies whether to enable the reuse of the pooler connection pool. After the parameter is enabled, existing idle TCP connections can be reused. The setting takes effect after the cluster is restarted.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The pooler reuse mode is enabled.
- **off**: The pooler reuse mode is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Synchronize the settings for CNs and DNs. If this parameter is set to **off** for CNs and **on** for DNs, the cluster communication fails. Set this parameter to the same value for CNs and DNs. Restart the cluster for the setting to take effect.

Risks and impacts of improper settings: If this parameter is disabled, the reuse granularity of the pooler connection pool decreases and the memory usage of DNs may increase.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

comm_cn_dn_logic_conn

Parameter description: Specifies whether logical connections are used between CNs and DNs. The setting takes effect after the cluster is restarted.

NOTE

Logical connections between CNs and DNs are no longer supported. This parameter is provided for compatibility, but its value is fixed at **off**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The connections between CNs and DNs are logical, with the libcomm component in use.
- **off**: The connections between CNs and DNs are physical, with the libpq component in use.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is enabled, logical connections are used between CNs and DNs to eliminate the upper limit of sockets. Logical connections cause performance overhead of the communications library.

COMM_IPC

Parameter description: Specifies whether to print the packet sending and receiving status of each communication node.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The function of logging packet sending and receiving status data is enabled.
- **off**: The function of logging packet sending and receiving status data is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTE

```
set logging_module='on(COMM_IPC)';   -- Enable.
set logging_module='off(COMM_IPC)';   -- Disable.
show logging_module;   -- View the setting result.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: If this parameter is set to **on**, a large number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and disable it in a timely manner.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

COMM_PARAM

Parameter description: Specifies whether to print the **session** parameter settings during node communication.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The function of logging the **session** parameter settings is enabled.
- **off**: The function of logging the **session** parameter settings is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

NOTE

```
set logging_module='on(COMM_PARAM)';   -- Enabled
set logging_module='off(COMM_PARAM)';   -- Disabled
show logging_module;   -- View the setting result.
```

Setting suggestion: If this parameter is set to **on**, a large number of logs will be printed, adding extra overhead and reducing database performance. Therefore, set it to **on** only in debugging scenarios and disable it in a timely manner.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.4 Resource Consumption

14.3.4.1 Memory

This section describes memory parameters.

NOTE

These parameters, except **local_syscache_threshold**, take effect only after the database restarts.

memorypool_enable

Parameter description: Specifies whether to enable a memory pool.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: The memory pool is enabled.
- **off**: The memory pool is disabled.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

memorypool_size

Parameter description: Specifies the memory pool size.

Parameter type: integer.

Unit: KB

Value range: 131072–1073741823

Default value: **524288** (512 MB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **131072** without a unit, **memorypool_size** indicates 131072 KB. If the value is **128MB**, **memorypool_size** indicates 128 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_memory_limit

Parameter description: Specifies whether to enable the logical memory management module.

NOTE

Fixed cost exists, that is, **shared_buffers** and metadata (about 200 MB). If **max_process_memory** minus the fixed cost is less than 2 GB, GaussDB forcibly sets **enable_memory_limit** to **off**. Metadata is the memory used in GaussDB and is related to some concurrent parameters, such as **max_connections**, **thread_pool_attr**, and **max_prepared_transactions**.

Parameter type: Boolean

Unit: none

Value range:

- **on**: The logical memory management module is enabled.
- **off**: The logical memory management module is disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **off**, the memory used by the database is not limited. When a large number of concurrent or complex queries are performed, too much memory is used, which may cause OS OOM problems.

max_process_memory

Parameter description: Specifies the maximum physical memory of a database node.

Parameter type: integer.

Unit: KB

Value range: 2097152 to 2147483647

Default value: For details, see "Typical scenario settings."

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **2097152** without a unit, **max_process_memory** indicates 2097152 KB. If the value is **2GB**, **max_process_memory** indicates 2 GB. The unit must be KB, MB, or GB if required.

Setting suggestion: This parameter is used to prevent node OOM caused by memory bloat, ensuring OS reliability. On DNs, the value of this parameter depends on the physical memory of the OS and the number of primary DNs deployed on a single server. The recommended formula is as follows: (Physical memory – **vm.min_free_kbytes**) x 0.7/(*n* + Number of primary DNs). **vm.min_free_kbytes** in this formula indicates that the OS memory reserved for the kernel to receive and send data. Its value is at least 5% of the total memory. That is, **max_process_memory** = Physical memory size x 0.665/(*n* + Number of primary DNs). When the number of nodes in the cluster is less than or equal to 256, *n* is 1. When the number of nodes in the cluster is greater than 256 and less than 512, *n* is 2. When the number of nodes in the cluster is greater than 512, n = 3. When the cluster is deployed independently, *n* is 0. Set this parameter on CNs to the same value as that on DNs.

Risks and impacts of improper settings: If this parameter is set to an improper value, for example, greater than the physical memory of the server, OS OOM problems may occur.

Typical scenario settings:

The following typical scenario settings are the optimal output values provided after the recommended specifications are tested and optimized. For details, see **Table 14-5**.

- Distributed independent deployment (single node, 1 CN or 1 DN)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-5 Distributed independent deployment settings

Resource Setting	Recommended Value on CN	Recommended Value on DN
60 vCPUs/480 GB	360 GB	360 GB
32 vCPUs/256 GB	192 GB	192 GB
16 vCPUs/128 GB	96 GB	96 GB
8 vCPUs/64 GB	40 GB	40 GB

local_syscache_threshold

Parameter description: Specifies the maximum memory occupied by the system cache of a single session. When the actual system cache size exceeds the threshold, memory eviction is triggered. If the **enable_global_plancache** parameter is enabled, the value of **local_syscache_threshold** does not take effect when it is less than **16MB**. In this case, the minimum value of this parameter is **16MB** to ensure that GPC takes effect. If **enable_global_syscache** and **enable_thread_pool** are enabled, this parameter indicates the total cache size of the current thread and sessions bound to the current thread.

Parameter type: integer

Unit: KB

Value range: 1024 to 524288

Default value:

- Independent deployment: **16MB**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **local_syscache_threshold** indicates 1024 KB. If the value is **1MB**, **local_syscache_threshold** indicates 1 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: You are advised to set this parameter to an integer multiple of 1024. The background noise memory is 2 MB. Each time a table or index is added, the memory increases by 11 KB.

Risks and impacts of improper settings: If the value is too small, memory is frequently evicted, affecting performance.

enable_memory_context_control

Parameter description: Enables the function of checking whether the number of memory contexts exceeds the specified limit. This parameter applies only to the DEBUG version.

Parameter type: Boolean.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **on**: The function of checking the number of memory contexts is enabled.
- **off**: The function of checking the number of memory contexts is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

uncontrolled_memory_context

Parameter description: Specifies which memory context will not be checked when the function of checking whether the number of memory contexts exceeds the specified limit is enabled. This parameter applies only to the DEBUG version.

NOTE

When the parameter is queried, the title meaning string "MmgrMemoryController white list:" is added to the beginning of the parameter value.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

huge_pages

Parameter description: Specifies whether to enable huge pages of static memory for the shared memory of the database.

NOTE

To enable the static huge page memory function, you need to set sufficient static huge page memory resources in the OS kernel in advance. The related parameters are **vm.nr_hugepages** and **vm.nr_overcommit_hugepages**, which are set in the **/etc/sysctl.conf** file.

Parameter type: string.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: enables the function of applying for huge pages of static memory. If the application fails, the database fails to be started.
- **off**: disables the function of applying for huge pages of static memory and common shared memory is applied for.
- **try**: attempts to apply for huge page resources of static memory. If the application fails, the system applies for common shared memory.

Default value: **try**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

shared_buffers

Parameter description: Specifies the size of shared memory used by GaussDB. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

Parameter type: integer.

Unit: page (8 KB)

Value range: 16–1073741823

Default value: For details, see "Typical scenario settings."

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **shared_buffers** indicates 8192 KB (1024 x 8 KB). If the value is **8MB**, **shared_buffers** indicates 8 MB. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

Setting suggestion:

- Set this parameter on DNs to a value greater than that on CNs because most queries in GaussDB are pushed down.
- Set **shared_buffers** to a value less than 40% of **max_process_memory**.
- If **shared_buffers** is set to a larger value, increase the value of **checkpoint_segments** because a longer interval is required to write a large amount of new or changed data.
- If the process fails to be restarted after the value of **shared_buffers** is changed, perform either of the following operations based on the error information:
  - Adjust the **kernel.shmall**, **kernel.shmmax**, and **kernel.shmmin** OS parameters. For details, see "Preparing for Installation > Modifying OS Configuration > Configuring Other OS Parameters" in *Installation Guide*.
  - Run the **free -g** command to check whether the available memory and swap space of the OS are sufficient. If the memory is insufficient, manually stop other user programs that occupy much memory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Set this parameter to the recommended default value for different specifications. Otherwise, the value of **shared_buffers** may be too large or too small. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + **wal_receiver_buffer_size** (of the standby node) < **max_process_memory** < Memory size of the physical machine.

Risks and impacts of improper settings: If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot apply for sufficient memory.

Typical scenario settings:

The following typical scenario settings are the optimal output values provided after the recommended specifications are tested and optimized. For details, see **Table 14-6**.

- Distributed independent deployment (single node, 1 CN or 1 DN)

Table 14-6 Distributed independent deployment settings

Resource Setting	Recommended Value on CN	Recommended Value on DN
60 vCPUs/480 GB	4 GB	140 GB
32 vCPUs/256 GB	2 GB	76 GB
16 vCPUs/128 GB	2 GB	40 GB
8 vCPUs/64 GB	1 GB	16 GB

page_version_check

Parameter description: Specifies whether to perform verification for underlying storage faults and pages not marked as dirty based on page version information. **page_version_check** is a level-3 switch. The verification for underlying storage faults is to check whether a page read from the underlying storage is of a correct version, which prevents loss of page version information caused by a fault such as a disk power failure. The verification for pages not marked as dirty is to check whether modified pages are not marked as dirty, and is controlled by an independent switch **page_missing_dirty_check**.

Parameter type: enumerated type.

Unit: none

Value range:

- **off**: The verification for underlying storage faults and pages not marked as dirty is disabled.
- **memory**: The page version verification function (that is, verification for underlying storage faults and pages not marked as dirty) in pure memory mode is enabled. The page version information is cached only in the memory and will be lost after a restart.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **persistence**: The persistent page version verification function (that is, verification for underlying storage faults and pages not marked as dirty) is enabled. The page version information is persisted to files and will not be lost after a restart.

Default value: **persistence**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: Set this parameter based on different specifications, that is, **off** (four-core CPU/16 GB memory, four-core CPU/32 GB memory, and eight-core CPU/64 GB memory) or **persistence** (16-core CPU/128 GB memory, 32-core CPU/256 GB memory, 60-core CPU/480 GB memory, 64-core CPU/512 GB memory, 72-core CPU/576 GB memory, 80-core CPU/640 GB memory, and 96-core CPU/768 GB memory, 96-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 128-core CPU/1024 GB memory, and 196-core CPU/1536 GB memory).

Risks and impacts of improper settings: Setting this parameter to **memory** and **persistence** affects the performance of a device, and the one with smaller specifications suffers more. (For example, the performance of a 16-core CPU/128 GB storage device using TPC-C model is about 7%.) If the system needs to restart frequently, you are advised to set this parameter to **persistence** to ensure that the version information on the page is not lost. However, the performance will be affected.

page_missing_dirty_check

Parameter description: Checks whether the modified pages are not marked as dirty. **page_missing_dirty_check** is controlled by **page_version_check**. If **page_version_check** is set to **off**, setting **page_missing_dirty_check** to **on** does not take effect.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The verification for pages not marked as dirty is performed.
- **off**: The verification for pages not marked as dirty is not performed.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to enable this function in test scenarios to detect as many pages not marked as dirty that lead to code bugs in non-production environments as possible. On the live network, this function is disabled by default to avoid extra cost and performance deterioration.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

page_version_max_num

Parameter description: Specifies the maximum number of page versions that can be cached in the memory. This parameter is valid only when **page_version_check**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

is not set to **off**. Each **page_version** occupies 36 bytes of memory. Pay attention to the memory usage.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647.

- **0**: The value is automatically calculated based on the value of **shared_buffers** using the following formula: **page_version_max_num** = **shared_buffers** x 2. For example, 32 MB of **shared_buffers** corresponds to 4096 buffers. Therefore, the value of this parameter is set to **8192**.
- Non-zero values: The manually configured value is forcibly used. The parameter cannot be set a value less than 16 times of **page_version_partitions**. Otherwise, it is forcibly set to a value equal to the value of **page_version_partitions** multiplied by 16.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If the memory is limited, the valid value must be twice to four times the value of **shared_buffers**. **Setting suggestion**: If high performance is required and the memory is sufficient, you are advised to manually set this parameter to a value larger than four times the value of **shared_buffers** and the ratio range of this parameter to **page_version_partitions** is 256 to 1024.

Risks and impacts of improper settings: If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot apply for sufficient memory.

page_version_partitions

Parameter description: Specifies the number of hash table partitions in cached page version information in the memory. This parameter directly affects the hash query efficiency and hash conflict probability. This parameter is valid only when **page_version_check** is not set to **OFF**.

Parameter type: integer

Unit: none

Value range: 0–2097152

- **0**: The value is automatically calculated based on the value of **page_version_max_num** using the following formula: **page_version_partitions** = **page_version_max_num**/512. If the automatically calculated value is smaller than 4, the parameter is forcibly set to **4**.
- Non-zero values: The manually configured value is forcibly used. The minimum value is **4**. If the value is less than 4, the parameter is forcibly set to **4**.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: If you have high performance requirements, you are advised to manually set this parameter to a value 1/256 to 1/1024 of the value of **page_version_max_num**.

Risks and impacts of improper settings: If the number of partitions is too large, the hash query efficiency decreases. If the number of partitions is too small, the probability of hash conflicts increases.

page_version_recycler_thread_num

Parameter description: Specifies the number of threads for recycling and verifying page version information. This parameter is valid only when **page_version_check** is not set to **off**.

Parameter type: integer.

Unit: none

Value range: 0–16

- If **page_version_check** is set to **memory**:
  - **0**: The value is automatically calculated based on the value of **page_version_partitions** using the following formula: **page_version_recycler_thread_num** = **page_version_partitions**/16384. If the automatically calculated value is greater than 4, the parameter is forcibly set to **4**.
  - Non-zero values: The manually configured value is forcibly used.
  - The parameter cannot be set to a value greater than that of **page_version_partitions**. Otherwise, **page_version_partitions** is forcibly set to a value equal to that of **page_version_partitions**.
- If **page_version_check** is set to **persistence**:

  If the value is less than 2, set this parameter to **2**. If the value is greater than or equal to 2, the manually configured parameter value is forcibly used.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_cached_context

Parameter description: Specifies the number of cached memory contexts. If this parameter is set to **0**, the memory context optimization framework does not take effect.

Parameter type: integer.

Unit: none

Value range: 0 to 1024

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If this parameter is set to **0**, the memory context optimization framework does not take effect.
- If this parameter is set to a non-zero value, the memory context optimization framework takes effect, and the value of this parameter is the number of cached memory contexts.

Default value: **128**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

verify_log_buffers

Parameter description: Specifies the size of the verifyLog buffer. This parameter is valid only when **page_version_check** is set to **persistence**. The verifyLog buffer memory is managed by page, and each page is 8 KB.

Parameter type: integer.

Unit: page (8 KB)

Value range: 4-262144

Default value: **4** (32 KB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, the value **131072** of **verify_log_buffers** indicates that the size is 131072 x 8 KB = 1GB, and the value **131072kB** indicates that **verify_log_buffers** is 131072 KB. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

Setting suggestion: Set this parameter based on the system hardware specifications.

1GB (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory); **128MB** (4-core CPU/32 GB memory); **16MB** (4-core CPU/16 GB memory)

Risks and impacts of improper settings: If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot apply for sufficient memory.

segment_buffers

Parameter description: Specifies the memory size of a GaussDB segment-page metadata page.

Parameter type: integer.

Unit: page (8 KB)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 16–1073741823

Default value: **1024** (that is, 8 MB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **segment_buffers** indicates 8192 KB (1024 x 8 KB). If the value is **8MB**, **segment_buffers** indicates 8 MB. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

Setting suggestions: **segment_buffers** is used to cache the content of segment-page headers, which is key metadata information. To improve performance, it is recommended that the segment headers of ordinary tables be cached in the buffer and not be replaced. You are advised to set this parameter based on the following formula: Number of tables (including indexes and TOAST tables) x Number of partitions x 3 + 128. Multiplying by 3 is because each table (partition) has some extra metadata segments. Generally, a table has three segments. Adding 128 at last is because segment-page tablespace management requires a certain number of buffers. If this parameter is set to a small value, it takes a long time to create a segment-page table for the first time. Therefore, you are advised to retain the default value to avoid setting **segment_buffers** to an excessively large or small value. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + **wal_receiver_buffer_size** (of the standby node) < **max_process_memory** < Memory size of the physical machine.

Risks and impacts of improper settings: If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot apply for sufficient memory.

bulk_read_ring_size

Parameter description: Specifies the size of a ring buffer used for parallel data export.

Parameter type: integer.

Unit: KB

Value range: 256 to 2147483647

Default value: **16384** (that is, 16 MB)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **bulk_read_ring_size** indicates 1024 KB. If the value is **1MB**, **bulk_read_ring_size** indicates 1 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

bulk_write_ring_size

Parameter description: Specifies the size of a ring buffer used for parallel data import.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: KB

Value range: 16384 to 2147483647

Default value: **2097152** (that is, 2 GB)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **16384** without a unit, **bulk_write_ring_size** indicates 16384 KB. If the value is **16MB**, **bulk_write_ring_size** indicates 16 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Increase the value of this parameter on DNs if a huge amount of data will be imported.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

standby_shared_buffers_fraction

Parameter description: Specifies the **shared_buffers** proportion used on the server where a standby instance is deployed.

Parameter type: floating point

Unit: none

Value range: 0.1 to 1.0

Default value: 1

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

temp_buffers

Parameter description: Specifies the maximum size of local temporary buffers used by a database session.

NOTE

- **temp_buffers** can be modified only before the first use of temporary tables within each session. Subsequent attempts to change the value of this parameter will not take effect on that session.
- A session allocates temporary buffers based on the value of **temp_buffers**. If a large value is set in a session that does not require many temporary buffers, only the cost of one buffer descriptor is added. If a buffer is used, additional 8192 bytes will be consumed for it.

Parameter type: integer.

Unit: page (8 KB)

Value range: 100 to 1073741823

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **128** (that is, 1 MB)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **100** without a unit, **temp_buffers** indicates 800 KB (100 x 8 KB). If the value is **16MB**, **temp_buffers** indicates 16 MB. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_prepared_transactions

Parameter description: Sets the maximum number of transactions that can be in the "prepared" state simultaneously. Increasing the value of this parameter causes GaussDB to request more System V shared memory than the default configuration allows.

Parameter type: integer.

Unit: none

Value range: 0 to 262143

Default value:

- Independent deployment:

  1200 (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); 800 (16-core CPU/128 GB memory); 400 (8-core CPU/64 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: The default value is recommended. You need to adjust the value only when a two-phase transaction reports an error indicating insufficient slots. To avoid failures in the preparation step, the value of this parameter must be greater than the number of worker threads in **thread_pool_attr** in thread pool mode. In non-thread pool mode, the value of this parameter must be greater than or equal to the value of **max_connections**.

Risks and impacts of improper settings: When GaussDB is deployed as an HA system, set this parameter on standby nodes to a value greater than or equal to that on primary nodes. Otherwise, queries will fail on the standby nodes.

work_mem

Parameter description: Specifies the amount of memory to be used by internal sort operations and hash tables before they write data into temporary disk files. Sort operations are required for **ORDER BY**, **DISTINCT**, and merge joins. Hash tables are used in hash joins, hash-based aggregation, and hash-based processing of IN subqueries.

In a complex query, several sort or hash operations may run in parallel; each operation will be allowed to use as much memory as this parameter specifies. If the memory is insufficient, data will be written into temporary files. In addition,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

several running sessions could be performing such operations concurrently. Therefore, the total memory used may be many times the value of **work_mem**.

Parameter type: integer.

Unit: KB

Value range: 64 to 2147483647

Default value:

- Independent deployment:

  128MB (60-core CPU/480 GB memory, 32-core CPU/256 GB memory, and 16-core CPU/128 GB memory); **64MB** (8-core CPU/64 GB memory)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **work_mem** indicates 1024 KB. If the value is **1MB**, **work_mem** indicates 1 MB. The unit must be KB, MB, or GB if required.

Setting suggestion:

If the physical memory specified by **work_mem** is insufficient, additional operator calculation data will be written into temporary tables based on query characteristics and the degree of parallelism. This reduces performance by five to ten times, and prolongs the query response time from seconds to minutes.

- For complex serial queries, each query requires five to ten associated operations. Set **work_mem** using the following formula: **work_mem** = 50% of the memory/10.
- For simple serial queries, each query requires two to five associated operations. Set **work_mem** using the following formula: **work_mem** = 50% of the memory/5.
- For concurrent queries, set **work_mem** using the following formula: **work_mem** = **work_mem** for serial queries/Number of concurrent SQL statements.
- BitmapScan hash tables are also restricted by **work_mem**, but will not be forcibly flushed to disks. In the case of complete lossify, every 1-MB memory occupied by the hash table corresponds to a 16 GB page of BitmapHeapScan. After the upper limit of **work_mem** is reached, the memory increases linearly with the data access traffic based on this ratio.

Risks and impacts of improper settings: The default value is the recommended value. You are advised not to change it. Before changing the values, check the specifications of the parameters and ensure that the hardware resources are sufficient. Otherwise, the cluster may be abnormal.

query_mem

Parameter description: Specifies the memory used by a query.

Parameter type: integer.

Unit: KB

Value range: 0 to 2147483647

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the value of **query_mem** is greater than 32768 (that is, 32 MB), the optimizer adjusts the memory cost estimate to this value when generating an execution plan.
- If the value is set to a negative value or a positive integer less than 32768 (that is, 32 MB), the default value **0** is forcibly used. In this case, the optimizer does not adjust the estimated query memory.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **32768** without a unit, **query_mem** indicates 32768 KB. If the value is **32MB**, **query_mem** indicates 32 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

query_max_mem

Parameter description: Specifies the maximum memory that can be used by a query.

Parameter type: integer.

Unit: KB

Value range: 0 to 2147483647

- If the value of **query_max_mem** is greater than 32768 (that is, 32 MB), an error is reported when the query memory usage exceeds the value.
- If the value is set to a negative value or a positive integer less than 32768 (that is, 32 MB), the default value **0** is used. In this case, the optimizer does not limit the query memory.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **32768** without a unit, **query_max_mem** indicates 32768 KB. If the value is **32MB**, **query_max_mem** indicates 32 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

maintenance_work_mem

Parameter description: Specifies the maximum amount of memory to be used by maintenance operations, such as **VACUUM** and **CREATE INDEX**. This parameter may affect the execution efficiency of **VACUUM**, **VACUUM FULL**, **CLUSTER**, and **CREATE INDEX**.

Parameter type: integer.

Unit: KB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 1024 to 2147483647

Default value:

- Independent deployment:

  CN: **1GB** (60-core CPU/480 GB memory); **512MB** (32-core CPU/256 GB memory); **256MB** (16-core CPU/128 GB memory); **128MB** (8-core CPU/64 GB memory)

  DN: **2GB** (60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **maintenance_work_mem** indicates 1024 KB. If the value is **1MB**, **maintenance_work_mem** indicates 1 MB. The unit must be KB, MB, or GB if required.

Setting suggestion:

- The value of this parameter must be greater than that of **work_mem** so that database dumps can be more quickly cleared or restored. In a database session, only one maintenance operation can be performed at a time. Maintenance is usually performed when there are not many running sessions.
- When the **Autovacuum** process is running, up to ***autovacuum_max_workers*** times this memory may be allocated. In this case, set **maintenance_work_mem** to a value greater than or equal to that of **work_mem**.
- If a large amount of data is to be clustered, increase the value of this parameter in the session.
- Use the default value. You are advised not to change the value. Otherwise, set **maintenance_work_mem** to an excessively large or small value. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + **wal_receiver_buffer_size** (of the standby node) < **max_process_memory** < Memory size of the physical machine.

Risks and impacts of improper settings: The default value is the recommended value. You are advised not to change it. Before changing the values, check the specifications of the parameters and ensure that the hardware resources are sufficient. Otherwise, the cluster may be abnormal.

max_stack_depth

Parameter description: Specifies the maximum safe depth of the GaussDB execution stack. The safety margin is required because the stack depth is not checked in every routine in the server, but only in key potentially-recursive routines, such as expression evaluation.

Parameter type: integer.

Unit: KB

Value range: 100–2147483647

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value:

- If the value of **ulimit -s** minus 640 KB is greater than or equal to 2 MB, the default value of this parameter is **2 MB**.
- If the value of **ulimit -s** minus 640 KB is less than 2 MB, the default value of this parameter is the value of **ulimit -s** minus 640 KB.

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **max_stack_depth** indicates 1024 KB. If the value is **1MB**, **max_stack_depth** indicates 1 MB. The unit must be KB, MB, or GB if required.

Setting suggestion:

- The database needs to reserve 640 KB stack depth. Therefore, the ideal value of this parameter is the actual stack size limit enforced by the OS kernel (as set by **ulimit -s**) minus 640 KB.
- If the value of this parameter is greater than the value of **ulimit -s** minus 640 KB before the database is started, the database fails to be started. During database running, if the value of this parameter is greater than the value of **ulimit -s** minus 640 KB, this parameter does not take effect.
- Since not all operations can be detected, you are advised to set a specific value for this parameter.
- The default value is **2 MB**, which is relatively small and does not easily cause system breakdown.

Risks and impacts of improper settings:

- If the value of **ulimit -s** minus 640 KB is less than the minimum value of this parameter, the database fails to be started.
- Setting this parameter to a value greater than the actual kernel limit means that a running recursive function may crash an individual backend process.

enable_early_free

Parameter description: Specifies whether the operator memory can be released in advance.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The operator memory can be released in advance.
- **off**: The operator memory cannot be released in advance.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

memory_trace_level

Parameter description: Specifies the control level for recording memory allocation information after the dynamic memory usage exceeds 90% of the maximum dynamic memory. This parameter takes effect only when the parameters **use_workload_manager** and **enable_memory_limit** are enabled.

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: indicates that memory allocation information is not recorded.
- **level1**: After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following memory information is recorded and saved in the *$GAUSSLOG*/**mem_log** directory:
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
- **level2**: After the dynamic memory usage exceeds 90% of the maximum dynamic memory, the following memory information is recorded and saved in the *$GAUSSLOG*/**mem_log** directory:
  - Global memory overview.
  - Memory usage of the top 20 memory contexts of the instance, session, and thread types.
  - The **totalsize** and **freesize** columns for each memory context.
  - Detailed information about all memory applications in each memory context, including the file where the allocated memory is located, line number, and size.

Default value: **level1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If this parameter is set to **level2**, the memory allocation details (file, line, and size) of each memory context are recorded, which greatly affects the performance. Therefore, exercise caution when setting this parameter.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- You can use the system function **gs_get_history_memory_detail(cstring)** to query the recorded memory snapshot information. For details about the function, see "SQL Reference" > "Functions and Operators" > "Statistics Functions" in *Developer Guide*.
- If the **use_workload_manager** parameter is disabled and the **bypass_workload_manager** parameter is enabled, this parameter also takes effect. The **bypass_workload_manager** parameter is of the SIGHUP type. Therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The recorded memory context is obtained after all memory contexts of the same type with the same name are summarized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

resilience_memory_reject_percent

Parameter description: Specifies the dynamic memory usage percentage for escape from memory overload. This parameter takes effect only when the parameters **use_workload_manager** and **enable_memory_limit** are enabled.

Parameter type: string

Unit: none

Value range: a string of more than 0 characters.

This parameter consists of **recover_memory_percent** and **overload_memory_percent**. The meanings of the two parts are as follows:

- **recover_memory_percent**: Percentage of the dynamic memory usage when the memory recovers from overload to the maximum dynamic memory. When the dynamic memory usage is less than the maximum dynamic memory multiplied by the value of this parameter, the overload escape function is disabled and new connections are allowed. The value ranges from 0 to 100, which indicates a percentage.
- **overload_memory_percent**: Percentage of the dynamic memory usage to the maximum dynamic memory when the memory is overloaded. When the dynamic memory usage is greater than the maximum dynamic memory multiplied by the value of this parameter, the current memory is overloaded. In this case, the overload escape function is triggered to kill sessions and new connections are prohibited. The value ranges from 0 to 100, which indicates a percentage.

Default value: **"0,0"**, indicating that the escape from memory overload function is disabled.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

The following command is an example. When the memory usage exceeds 90% of the upper limit, new connections are forbidden and stacked sessions are killed. When the memory usage is less than 70% of the upper limit, session killing is stopped and new connections are allowed.

```
gs_guc reload -Z coordinator -Z datanode -N all -I all -c "resilience_memory_reject_percent='70,90'"
```

Setting suggestion: If the value is too small, the escape from memory overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual memory usage.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- You can query the maximum dynamic memory and used dynamic memory in the pv_total_memory_detail view. **max_dynamic_memory** indicates the maximum dynamic memory, and **dynamic_used_memory** indicates the used dynamic memory.
- If the **use_workload_manager** parameter is disabled and the **bypass_workload_manager** parameter is enabled, this parameter also takes effect. The **bypass_workload_manager** parameter is of the SIGHUP type. Therefore, after the reload mode is set, you need to restart the database for the setting to take effect.
- The values of **recover_memory_percent** and **overload_memory_percent** can be **0** at the same time. In addition, the value of **recover_memory_percent** must be smaller than that of **overload_memory_percent**. Otherwise, the setting does not take effect.

resilience_escape_user_permissions

Parameter description: Specifies the escape permission of users. You can set it for multiple users and separate users by commas (,). The value **sysadmin** indicates that jobs of the SYSADMIN user can be canceled by the escape function. The value **monadmin** indicates that jobs of the MONADMIN user can be canceled by the escape function. By default, this parameter is left blank, indicating that the escape function of the SYSADMIN and MONADMIN users is disabled. The value can only be **sysadmin**, **monadmin**, or an empty string.

Parameter type: string.

Unit: none

Value range: a string of more than 0 characters.

Currently, this parameter supports only three values: **sysadmin**, **monadmin**, and **""**. The meanings of these values are as follows:

- **sysadmin**: Jobs of the SYSADMIN user can be canceled by the escape function.
- **monadmin**: Jobs of the **monadmin** user can be canceled by the escape function.
- **""**: The escape function of the **sysadmin** and **monadmin** users is disabled.

Default value: **""**, indicating that the escape function of the sysadmin and monadmin users is disabled.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. You can set this parameter to multiple values separated by commas (,), for example, **resilience_escape_user_permissions = 'sysadmin,monadmin'**. You can also set this parameter to only one value, for example, **resilience_escape_user_permissions = 'monadmin'**.

For example, the following command is used to enable the escape function for both the **sysadmin** and **monadmin** users:

```
gs_guc reload -Z coordinator -Z datanode -N all -I all -c
"resilience_escape_user_permissions='sysadmin,monadmin'"
```

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If this parameter is set for multiple times, the latest setting takes effect.
- If this parameter is set to any value in the value range, common users support the escape function.
- If a user has both the sysadmin and monadmin role permissions, the escape function of the user can be triggered only when **resilience_escape_user_permissions** is set to **"sysadmin,monadmin"**.

14.3.4.2 Disk Space

This section describes the disk space parameters, which are used to set limits on the disk space for storing temporary files.

sql_use_spacelimit

Parameter description: Specifies the space size for files to be written to disks when a single SQL statement is executed on a single DN. The managed space includes the space occupied by ordinary tables, temporary tables, and intermediate result sets to be written to disks. This parameter does not take effect for the initial user.

Parameter type: integer.

Unit: KB

Value range: –1 to 2147483647. The value **–1** indicates that there is no limit.

Default value: –1

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 1 GUC parameters**. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

temp_file_limit

Parameter description: Specifies the maximum disk space that can be used for temporary files in a session. For example, temporary files that need to be sorted or use outer hash tables in a connection session, and temporary files occupied due to the use of cursors.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

This parameter does not apply to disk space used for temporary tables during the SQL query process.

In the SMP scenario (**query_dop** is greater than or equal to 2), the SQL statement in the frontend session is split into several backend threads (the number of split SQL statements is equal to the value of **query_dop**) for execution. When the size of temporary files generated by any thread reaches the threshold, an SQL error is reported in the frontend session. In this case, the size of temporary files may be greater than the value of this parameter set in the frontend session. (In this scenario, the peak size of temporary files occupied by a single frontend session does not exceed the value of **temp_file_limit** multiplied by the value of **query_dop**.)

When the disk usage exceeds the read-only threshold **datastorage_threshold_value_check**, this parameter is taken over by the CM and is set to **0**. In this case, the modification of **temp_file_limit** does not take effect. After the disk usage is restored, the CM restores this parameter to the default value.

Parameter type: integer.

Unit: KB

Value range: –1 to 2147483647. The value **–1** indicates that there is no limit.

Default value: **–1**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, frequent I/O operations will occur, causing performance deterioration. If the value is too large, too much disk space may be occupied.

14.3.4.3 Kernel Resource Usage

This section describes kernel resource parameters. Whether these parameters take effect depends on OS settings.

max_files_per_process

Parameter description: Specifies the maximum number of simultaneously open files allowed by each database thread.

Parameter type: integer.

Unit: none

Value range: 25 to 2147483647

Default value: **1024**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If the kernel is enforcing a proper limit, setting this parameter is not required. However, on some platforms, such as most Berkeley Software Distribution (BSD) systems, the kernel allows individual processes to open many

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

more files than the system can support. If the message "Too many open files" is displayed, set this parameter to a smaller value. Generally, the system must meet this requirement: Number of file descriptors ≥ Maximum number of concurrent requests x Number of primary DNs on the current server x Value of **max_files_per_process** x 3.

Risks and impacts of improper settings: Set this parameter according to the actual situation. If the value is too small, the number of valid security file handles may be small. As a result, the cluster status is abnormal.

shared_preload_libraries

Parameter description: Specifies one or more shared libraries that need to be preloaded before the database is started. If multiple libraries are to be loaded, separate their names using commas (,). For example, **'*$libdir*/mylib'** will cause **mylib.so** (or **mylib.sl** on some platforms) to be preloaded before the standard library directory is loaded. Currently, only the SYSADMIN user can access and set this parameter.

NOTE

- If a specified library is not found, the GaussDB service will fail to start.
- Each GaussDB-supported library has a special mark that is checked to guarantee compatibility. Therefore, libraries that do not support GaussDB cannot be loaded in this way.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **''platform_compatibility_b,security_plugin''**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You can preinstall the GaussDB's stored procedure library using the '*$libdir*/pl*XXX*' syntax as described in the preceding text. *XXX* can only be **pgsql**, **perl**, **tcl**, or **python**.

By preloading a shared library and initializing it as required, the library startup time is avoided when the library is first used. However, the time to start each new server process may increase, even if that process never uses the library. Therefore, set this parameter only for libraries that will be used in most sessions.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.4.4 Cost-based Vacuum Delay

This feature allows administrators to reduce the I/O impact of the VACUUM and ANALYZE statements on concurrent database activities. It is often more important to prevent maintenance statements, such as VACUUM and ANALYZE, from affecting other database operations than to run them quickly. Cost-based vacuum delay provides a way for administrators to achieve this purpose.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Certain VACUUM operations hold critical locks and should be complete as quickly as possible. In GaussDB, cost-based vacuum delays do not take effect during such operations. To avoid uselessly long delays in such cases, the actual delay is the larger of the two calculated values:

- **vacuum_cost_delay** x **accumulated_balance**/**vacuum_cost_limit**
- **vacuum_cost_delay** x 4

Context

During the execution of the ANALYZE | ANALYSE (see "SQL Reference > SQL Syntax > A > ANALYZE | ANALYSE" in *Developer Guide*) and VACUUM (see "SQL Reference > SQL Syntax > V > VACUUM" in *Developer Guide*) statements, the system maintains an internal counter that keeps tracking the estimated cost of various I/O operations that are performed. When the accumulated cost reaches a limit (specified by **vacuum_cost_limit**), the thread performing the operation will sleep for a short period of time (specified by **vacuum_cost_delay**). Then, the counter resets and the operation continues.

By default, this feature is disabled. To enable this feature, set **vacuum_cost_delay** to a non-zero value.

vacuum_cost_delay

Parameter description: VACUUM starts the backend service thread to sort dead tuples in the data table, which conflicts with the service thread. If **vacuum_cost_delay** is set to the value of **vacuum_cost_limit** to control the impact of VACUUM on services, the VACUUM thread hibernates the time specified by **vacuum_cost_delay** and allocates resources to service threads for execution to ensure that services are not blocked by backend VACUUM.

Parameter type: integer.

Unit: ms

Value range: 0 to 100. The value **0** indicates that the cost-based vacuum delay feature is disabled, and a positive value indicates that the cost-based vacuum delay feature is enabled. In many systems, the effective resolution of the hibernation time is 10 milliseconds. Therefore, setting **vacuum_cost_delay** to a value that is not an integer multiple of 10 has the same effect as setting it to the next higher multiple of 10.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is usually set to a small value, such as **10ms** or **20ms**. Adjusting vacuum's resource consumption is best done by changing other vacuum cost parameters.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

vacuum_cost_page_hit

Parameter description: Specifies the estimated cost for VACUUM to clean up data pages hit in a buffer.

Parameter type: integer.

Unit: none

Value range: 0 to 10000

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

vacuum_cost_page_miss

Parameter description: Specifies the estimated cost for VACUUM to clean up data pages that do not hit in a buffer.

Parameter type: integer.

Unit: none

Value range: 0 to 10000

Default value: **10**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

vacuum_cost_page_dirty

Parameter description: Specifies the cost of VACUUM cleanup dirty pages. If the data page to be cleaned up is a clean page, VACUUM cleanup generates an extra cost of flushing dirty pages to disks. You can set this parameter to specify the cost of VACUUM cleanup dirty pages.

Parameter type: integer.

Unit: none

Value range: 0 to 10000

Default value: 20

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

vacuum_cost_limit

Parameter description: Specifies the cost limit. The vacuum thread will hibernate if this limit is exceeded. When the execution cost of the VACUUM thread reaches **vacuum_cost_limit**, the thread sleeps for the time specified by **vacuum_cost_delay**.

Parameter type: integer.

Unit: none

Value range: 1 to 10000

Default value: **1000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. A larger value indicates a smaller I/O frequency limit of the VACUUM, a lower probability of entering the hibernation, more efficient VACUUM, and a greater impact on service I/Os.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

vacuum_defer_cleanup_age

Parameter description: Specifies the delay for the VACUUM operation to clear invalid row-store table records. The delay is calculated based on the number of executed transactions. You can set the value of **vacuum_defer_cleanup_age** to control the number of delayed transactions. That is, the VACUUM and VACUUM FULL operations do not clear a deleted tuple immediately. Instead, they clear and delete the tuple only after a certain number of transactions have been processed.

Parameter type: integer.

Unit: none

Value range: 0 to 1000000. **0** indicates no delay.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, VACUUM and VACUUM FULL cannot be performed in a timely manner.

14.3.4.5 Background Writer

This section describes background writer parameters. The background writer thread is used to write dirty data (new or modified data) in shared buffers to disks. This mechanism ensures that database processes seldom or never need to wait for a write action to occur when handling user queries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

It also mitigates performance deterioration caused by checkpoints because the background writer continues to write dirty pages to disks and only several pages need to be written to disks at each checkpoint. This mechanism, however, increases the overall net I/O load because while a repeatedly-dirtied page may otherwise be written only once per checkpoint interval, the background writer may write it several times as it is dirtied in the same interval. In most cases, continuous light loads are preferred, instead of periodic load peaks. The parameters discussed in this section can be set based on actual requirements.

bgwriter_delay

Parameter description: Specifies the interval for periodically scanning dirty data in the buffer block by block. In full checkpoint mode, the **bgwriter_lru_maxpages** parameter is used to control the amount of data written each time. After the **bgwriter_lru_maxpages** parameter is hibernated for **bgwriter_delay** milliseconds, the checkpoint is started again. In incremental checkpoint mode, the number of target idle buffer pages is calculated based on the configured **candidate_buf_percent_target**. When candidate buffer pages are insufficient, 10 GB buffer pages are scanned every **bgwriter_delay** ms. When dirty pages are detected, the dirty pages are flushed to disks and then added to the candidate linked list, when a clean page is encountered, it is directly put into the candidate linked list. In many systems, the effective resolution of the sleep time is 10 milliseconds. Therefore, setting this parameter to a value that is not a multiple of 10 has the same effect as setting it to a value multiple of 10.

Parameter type: integer.

Unit: ms

Value range: 10 to 10000

Default value: **2000** (2s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

Incremental checkpoint mode: If the data volume is multiple times the value of **shared_buffers**, the value of **bgwriter_delay** cannot be greater than 2s. If the data volume is smaller than the value of **shared_buffers**, the value of **bgwriter_delay** can be increased to save I/O resources.

Full checkpoint mode: Retain the default value. If the disk capability is poor, increase the value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

candidate_buf_percent_target

Parameter description: Specifies the expected percentage of the candidate linked list of clean pages to the total number of pages in the buffer when incremental checkpointing is enabled. If the proportion of pages in the linked list of clean pages is less than the value of this parameter, the bgwriter thread starts, scans the buffer pages, adds clean pages to the linked list, flushes dirty pages to disks, and then adds dirty pages to the linked list.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: floating point.

Unit: none

Value range: 0.1 to 0.85

Default value: **0.3**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter directly affects the number of pages flushed by the background writer thread. If the data volume is greater than the value of **shared_buffers** and **candidate_buf_percent_target** is set to an excessively small value, the performance is affected. If the data volume is twice or more of the value of **shared_buffers**, the value of this parameter cannot be smaller than the default value. In other scenarios, to reduce I/Os, set this parameter to a smaller value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

bgwriter_lru_maxpages

Parameter description: Specifies the maximum number of dirty pages that can be flushed by the background writer thread each time.

Parameter type: integer.

Unit: none

Value range: 0 to 1000. **0** indicates that the background writer is disabled. This setting does not affect checkpoints.

Default value: **100**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

bgwriter_lru_multiplier

Parameter description: The database kernel sets **shared_buffers** based on the current buffer size. If the value of **shared_buffers** is too small or too large when the kernel runs services, you can adjust the value of **bgwriter_lru_multiplier** to provide the optimal recommended value, the recommended value is the product of the value of this parameter and the value of **shared_buffers**. After you set this parameter to the recommended value, the setting takes effect when the database is restarted.

Parameter type: floating point.

Unit: none

Value range: 0 to 10

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- The number of dirty buffers written in each round depends on the number of buffers used by server processes during recent rounds. The estimated number of buffers used in the next round is calculated using the following formula: Average number of recently used buffers x **bgwriter_lru_multiplier**. The background writer writes dirty buffers until sufficient, clean, and reusable buffers are available. The number of buffers the background writer writes in each round is always equal to or less than the value of **bgwriter_lru_maxpages**.
- Therefore, the value **1.0** of **bgwriter_lru_multiplier** indicates a just-in-time policy of writing exactly the number of dirty buffers predicted to be required. Larger values provide some cushion against spikes in demand, whereas smaller values intentionally leave more writes to be done by server processes.
- Smaller values of **bgwriter_lru_maxpages** and **bgwriter_lru_multiplier** reduce the extra I/O load caused by the background writer, but make it more likely that server processes will have to issue writes for themselves, delaying response to queries.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

pagewriter_thread_num

Parameter description: Specifies the number of threads for backend page flushing after incremental checkpointing is enabled. Data is flushed to disks based on the sequence in which dirty pages are set to dirty, clean buffer pages are generated, and recovery points for checkpointing are pushed.

Parameter type: integer.

Unit: none

Value range: 1 to 16

Default value: **4**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dirty_page_percent_max

Parameter description: Specifies the maximum expected percentage of dirty pages to **shared_buffers** after the incremental checkpoint is enabled. When the value of this parameter is reached, the background page flush thread flushes dirty pages based on the value of **max_io_capacity**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: floating point.

Unit: none

Value range: 0.1 to 1

Default value: **0.9**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

pagewriter_sleep

Parameter description: Specifies the dirty data flush period of the pagewriter page flush thread in incremental checkpoint mode.

Parameter type: integer.

Unit: ms

Value range: 0 to 3600000

Default value: **2000** (2s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value for CNs. Do not set this parameter to a value greater than 2s for DNs. If dirty pages are generated quickly, you are advised to set this parameter to a value ranging from 100 ms to 500 ms. If this parameter is set to a large value, redo points are updated slowly, affecting Xlog recycling.

Risks and impacts of improper settings: If the value is too large, the page flushing speed decreases and redo points are pushed too slowly, affecting Xlog reclamation. In addition, the instance needs to wait for the time specified by this parameter when being stopped. As a result, the process exit times out.

max_io_capacity

Parameter description: Specifies the maximum I/Os per second for the background writer to flush dirty pages in batches.

Parameter type: integer.

Unit: KB

Value range: 30720 to 10485760

Default value: **512000** (that is, 500 MB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. If the value of the parameter does not contain a unit, the default unit is KB. The unit can also be MB or GB. For example, **max_io_capacity=512000**,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_io_capacity=512000kB and **max_io_capacity=500MB** indicate that **max_io_capacity** is set to 500 MB.

Setting suggestion: Set this parameter based on the service scenario and disk I/O capability of the host. For example, if the disk I/O bandwidth is 500 MB, you are advised to set the bandwidth to a value less than 500 MB. If a shorter RTO is required or a large capacity is required, you can increase the value of **max_io_capacity**, for example, 2 GB.

Risks and impacts of improper settings: If the value is too small, the dirty page flushing speed is slower than the dirty page generation speed. As a result, the dirty pages in the buffer are full and the performance deteriorates. If the value is too large, write amplification occurs, affecting the service life of the storage device.

enable_consider_usecount

Parameter description: Specifies whether the page eviction algorithm of the buffer considers the page popularity.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The page popularity is considered.
- **off**: The page popularity is not considered.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Enable this parameter in scenarios where single-page elimination is frequently performed, such as large-capacity scenarios.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dw_file_num

Parameter description: Specifies the number of batch doublewrite files.

Parameter type: integer.

Unit: none

Value range: 1 to 16

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The value of this parameter is related to **pagewriter_thread_num** and cannot be greater than that of **pagewriter_thread_num**. If the value of **dw_file_num** is too large, the value is internally corrected to the value of **pagewriter_thread_num**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dw_file_size

Parameter description: Specifies the size of each doublewrite file.

Parameter type: integer.

Unit: MB

Value range: 32 to 256

Default value: **256**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

postmaster_parallel_init_thread_num

Parameter description: Specifies the number of parallel threads that can be used when the database is started.

Parameter type: integer.

Unit: none

Value range: 1 to 256

Default value: **16**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter indicates the number of threads for parallel initialization. Therefore, you are advised to set this parameter to a value less than or equal to the number of CPU cores minus 1.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.4.6 Asynchronous I/O

checkpoint_flush_after

Parameter description: Specifies the threshold for the number of dirty pages flushed by the checkpointer thread. If the number of pages exceeds the threshold, the thread instructs the OS to asynchronously flush the data pages cached in the file to disks. In GaussDB, the disk page size is 8 KB.

Parameter type: integer.

Unit: page (8 KB)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 256. **0** indicates that the asynchronous flush function is disabled.

Default value: **256kB** (32 pages)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. You can set the number of pages or the size in bytes, for example, **32** or **256kB**. After the checkpointer thread continuously writes 32 disk pages, that is, 32 x 8 = 256 KB disk space, the asynchronous flush is performed. **gs_guc** does not allow you to set the number of pages as a parameter unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

bgwriter_flush_after

Parameter description: Specifies the threshold for the number of dirty pages flushed by the background writer thread. If the number of pages exceeds the threshold, the thread instructs the OS to asynchronously flush the data pages cached in the file to disks. In GaussDB, the disk page size is 8 KB.

Parameter type: integer.

Unit: page (8 KB)

Value range: 0 to 256. **0** indicates that the asynchronous flush function is disabled.

Default value: **512kB** (64 pages)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. You can set the number of pages or the size in bytes, for example, **64** or **512kB**. After the background writer thread continuously writes 64 disk pages, that is, 64 x 8 = 512 KB disk space, the asynchronous flush is performed. **gs_guc** does not allow you to set the number of pages as a parameter unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

backend_flush_after

Parameter description: Specifies the threshold for the number of dirty pages flushed by the backend thread. If the number of pages exceeds the threshold, the thread instructs the OS to asynchronously flush the data pages cached in the file to disks. In GaussDB, the disk page size is 8 KB.

Parameter type: integer.

Unit: page (8 KB)

Value range: 0 to 256. **0** indicates that the asynchronous flush function is disabled.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. You can set the number of pages or the size in bytes, for example, **64** or **512kB**. After the backend thread continuously writes 64 disk pages, that is, 64 x 8 = 512 KB disk space, the asynchronous flush is performed. **gs_guc** does not allow you to set the number of pages as a parameter unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_adio_function

Parameter description: Specifies whether to enable the ADIO mode. For details about the ADIO mode, see "High Performance > ADIO and Doublewrite Removal" in *Feature Description*.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The ADIO mode is enabled.
- **off**: The ADIO mode is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. You can change the value of this parameter from **off** to **on** by referring to "Method 2" in **Table 14-2**. After the setting is complete, you can use the system function gs_get_io_type() to check whether the ADIO mode is enabled. For details, see "SQL Reference > Functions and Operators > System Management Functions > Other Functions" in *Developer Guide*. If you want to change the value of this parameter from **on** to **off**, restart the instance. For details, see "Method 1" in **Table 14-2**.

Setting suggestion: If the **candidate_slots** column in the DBE_PERF.global_candidate_status system view is less than 15% of the buffer page for multiple times in a short period of time, you are advised to set this parameter to **on**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.5 Parallel Data Import and Export

GaussDB provides a parallel data import and export function that enables a large amount of data to be imported and exported in a fast and efficient manner. This section describes parameters for importing and exporting data to GaussDB in parallel.

raise_errors_if_no_files

Parameter description: Specifies whether to distinguish between "the number of imported file records is empty" and "the imported file does not exist." If this parameter is enabled and the imported file does not exist, GaussDB displays an error message indicating that the file does not exist.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The messages of "the number of imported file records is empty" and "the imported file does not exist" are distinguished when files are imported.
- **off**: The messages of "the number of imported file records is empty" and "the imported file does not exist" are the same when files are imported.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

The **raise_errors_if_no_files** parameter is valid only when the distributed GDS tool is used.

gds_debug_mod

Parameter description: Specifies whether to enable the debug function of Gauss Data Service (GDS). This parameter is used to better locate and analyze GDS faults. After the debug function is enabled, types of packets received or sent by GDS, peer end of GDS during command interaction, and other interaction information about GDS are written into the logs of corresponding nodes in the cluster. In this way, the state switching on the GaussDB state machine and the current state are recorded.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The GDS debug function is enabled.
- **off**: The GDS debug function is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Enable this function only when locating GDS problems.

Risks and impacts of improper settings: If this parameter is enabled, extra logs will be generated, increasing the log I/O overhead and affecting the performance and log validity.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

safe_data_path

Parameter description: Specifies the path prefix restriction except for the initial user. Currently, the path prefix restriction applies to the COPY operation and advanced packages.

Parameter type: string.

Unit: none

Value range: valid directory path containing a maximum of 4096 characters.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Ensure that the path **safe_data_path** covers a limited range. Do not set a large path range.

Risks and impacts of improper settings: If **enable_copy_server_files** is enabled and **safe_data_path** is set to a large value, malicious users may access sensitive files on the server.

NOTE

- If a soft link file exists in the **safe_data_path** directory, the system processes the file based on the actual file path to which the soft link points. If the actual path is not in the **safe_data_path** directory, an error is reported.
- If a hard link file exists in the **safe_data_path** directory, it can be used properly. For security purposes, exercise caution when using hard link files. Do not create hard link files that point to other directories in the **safe_data_path** directory. Ensure that the permission on the **safe_data_path** directory is minimized.

enable_copy_server_files

Parameter description: Specifies whether to enable the permission to copy server files.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The permission to copy server files is enabled. Users with the SYSADMIN permission or users inherited from the built-in role gs_role_copy_files can run the **COPY FROM FILENAME** or **COPY TO FILENAME** command.
- **off**: The permission to copy server files is disabled. Only the initial user is allowed to run the **COPY FROM FILENAME** or **COPY TO FILENAME** command.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestions: Enable this function only when you need to copy server files. After this function is enabled, you are advised to set **safe_data_path** synchronously.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: After this parameter is enabled, malicious users may access sensitive files on the server if the value range of **safe_data_path** is too large.

support_binary_copy_version

Parameter description: Specifies whether the encoding information of the current database server is included when data is exported in BINARY mode using COPY TO.

Parameter type: string.

Unit: none

Value range: **""** and **"header_encoding"**.

Table 14-7 Configuration items

Configuration Item	Behavior
header_encoding	When the BINARY mode of COPY TO is used to export data, the binary file header contains the encoding information of the current database server.
Empty string	Forward compatibility configuration is performed and data is exported in the original binary format.

Default value: **"header_encoding"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If forward compatibility is required, leave this parameter empty.

Risks and impacts of improper settings: If this parameter is set to an empty string, the exported result does not contain the server-side encoding information. In scenarios where the encoding information is required, you need to query and record the information.

copy_special_character_version

Parameter description: Determines the processing of invalid characters during data import and export using COPY.

Parameter type: string.

Unit: none

Value range: **""**, **"no_error"**, and **"per_byte"**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-8 Configuration items

Configuration Item	Behavior
"no_error"	When COPY is used to import a data file with the same encoding as that on the server, fault tolerance is performed on the data that does not meet the encoding requirements in the data file. No error is reported and the data with the original codes is directly inserted into the table.
"per_byte"	Determines how to process files encoded in GBK or ZHS16GBK when COPY is used to export text files. After the parameter is set to **per_byte**, one byte of data is exported at a time. Otherwise, two bytes of data are exported at a time. (One character occupies two bytes if data is encoded in GBK.)
""	The default value, which does not affect any function. Forward compatibility is supported. That is, an error is reported when invalid characters are found during COPY.

Default value: ""

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. Use gsql to connect to the database. If you use the set method, the value is case-insensitive. If you use gs_guc, the value can only be lowercase.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- To ensure that the data to be imported is valid, its encoding must be validated when it is being copied. If this parameter is enabled, verification against invalid encoding will be masked, which causes invalid characters in the field. Therefore, exercise caution before enabling this parameter.
- Currently, data encoding verification is masked only when the server-side encoding is the same as the data encoding. That is, if **copy_special_character_version** is set to **"no_error"**, the database server-side encoding must be the same as the data file encoding. Otherwise, an error is reported. If no data encoding is specified, the client-side encoding is used by default.
- In binary mode, **copy_special_character_version** is set to **"no_error"**, and it takes effect only for fields of the TEXT, CHAR, VARCHAR, NVARCHAR2, or CLOB type.
- This parameter is valid only in the database with character sets encoded in UTF-8, GB18030, GB18030_2022, ZHS16GBK, or LATIN1.
- When the encoding of both the client and server is GBK or ZHS16GBK and the database contains data encoded in an invalid format, if **copy_special_character_version** is not set to **"per_byte"**, the exported data file may contain unexpected data.
- The priority of setting **copy_special_character_version** to **"no_error"** is higher than that of **COMPATIBLE_ILLEGAL_CHARS** in COPY.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_log_copy_illegal_chars

Parameter description: Specifies whether to write records to the database run log if invalid characters are encountered when gs_loader is used to import data or COPY is used to import or export data.

Parameter type: Boolean

Unit: none

Value range: **on** and **off**

Table 14-9 Configuration items

Configuration Item	Behavior
on	Each time a line of data contains invalid encoding characters, a record is written to the database run log.
off	Records related to invalid encoding characters are not written into database run logs.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value unless otherwise specified. Set this parameter to **off** only when there are requirements on database performance and disk bandwidth.

Risks and impacts of improper settings: If this parameter is set to **off**, records related to invalid encoding characters will not be written into run logs, affecting the fault locating capability.

a_format_enable_copy_empty_lobs

Parameter description: Specifies whether null strings can be inserted into the BLOB and CLOB types through null string input when COPY FROM is executed in ORA-compatible mode.

Parameter type: Boolean

Unit: none

Value range: **on** and **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-10 Configuration items

Configuration Item	Behavior
on	In ORA-compatible mode, null strings can be inserted into CLOB and BLOB types using null string input. For example, after **1,"",3** is inserted into the table, the result of the second column is empty. However, **WHERE col2 IS null** cannot be used for filtering, and the column length is 0.
off	In ORA-compatible mode, null strings can be inserted into CLOB and BLOB types using null string input. A null string is converted to **NULL** for storage. For example, after **1,"",3** is inserted into the table, the result of the second column is **NULL**. In this case, **WHERE col2 IS null** can be used to filter the result.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If forward compatibility is required, set this parameter to **off**.

NOTE

- Null string input and null value input:

  In the CSV format of COPY, **1,,3** indicates a null value input, and **1,"",3** indicates a null string input. When the parameter is enabled, the second column of the former is inserted as **NULL**, and the second column of the latter is inserted as a null string. When the parameter is disabled, the second columns of the former and latter are inserted as **NULL**.
- For a newly installed database, the default value is **on**. For an upgraded database, the default value is **off** to ensure forward compatibility.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.6 Write Ahead Log

14.3.6.1 Settings

wal_level

Parameter description: Specifies the level of information to be written to the WAL. The value cannot be empty or commented out.

Parameter type: enumerated type.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **minimal**

  Advantages: Certain bulk operations (including creating tables and indexes, executing cluster operations, and copying tables) are safely skipped in logging, which can make those operations much faster.

  Disadvantages: WALs contain only basic information required for recovery from a database server crash or an emergency shutdown. Data cannot be restored from archived WALs.

- **archive**

  Adds logging required for WAL archiving, supporting the database restoration from archives.

- **hot_standby**
  - Further adds information required to run SQL queries on a standby node and takes effect after the database restarts.
  - To enable read-only queries on a standby node, the **wal_level** parameter must be set to **hot_standby** or a higher level on the primary node and **hot_standby** must be enabled on the standby node. The performance difference between the **hot_standby** and **archive** levels is small.

- **logical**

  Only when this parameter is set to **logical**, logical logs can be parsed and the primary key information is recorded in Xlogs.

Default value: **hot_standby**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter to **logical** when the logical replication function is enabled. In other scenarios, set this parameter to **hot_standby**. The parameter levels meet the following priority: **logical** > **hot_standby** > **archive** > **minimal**.

NOTICE

- To enable WAL archiving and data streaming replication between the primary and standby nodes, set this parameter to **archive**, **hot_standby**, or **logical**.
- If this parameter is set to **archive** or **minimal**, **hot_standby** must be set to **off**. In a distributed system, **hot_standby** cannot be set to **off**, because this setting can affect other features of the HA system. Therefore, you are advised not to set this parameter to **archive** or **minimal**. Otherwise, the database cannot be started.

Risks and impacts of improper settings: When the read function of the standby node is enabled and the level is lower than **hot_standby**, the node cannot be started.

fsync

Parameter description: Specifies whether the GaussDB server uses the fsync function to ensure that updated data is written to physical disks in a timely

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

manner. For details about the implementation of the fsync function, see **wal_sync_method**.

NOTICE

- Using the fsync() function ensures that the data can be recovered to a known state when the OS or hardware crashes.
- Setting this parameter to **off** may result in unrecoverable data corruption in a system crash.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The fsync() function is used.
- **off**: The fsync() function is not used.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

wal_sync_method

Parameter description: Specifies the method for forcibly updating WAL data to disks when **fsync** is enabled.

NOTICE

If **fsync** is set to **off**, the setting of this parameter does not take effect because WAL updates will not be forcibly written to disks.

Parameter type: enumerated type.

Unit: none

Value range:

- **open_datasync**: WAL files are opened with the **O_DSYNC** option.
- **fdatasync**: fdatasync() is called at each commit (SUSE 10 and SUSE 11 are supported).
- **fsync_writethrough**: fsync() is called at each commit to force data in the buffer to be written to disks.
- **fsync**: fsync() is called at each commit. (SUSE 10 and SUSE 11 are supported.)
- **open_sync**: open() with the **O_SYNC** option is used to write WAL files (SUSE 10 and SUSE 11 are supported).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> Not all platforms support the preceding parameters.
>
> **wal_sync_method** can be set to **fsync_writethrough** on a Windows platform, but this setting has the same effect as setting the parameter to **fsync** on the Windows platform.

Default value: fdatasync

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

synchronous_commit

Parameter description: Specifies the synchronization mode of the current transaction.

Generally, logs generated by a transaction are synchronized in the following sequence:

1. The primary node writes the logs to the local memory.
2. The primary node writes the logs in the local memory to the local file system.
3. The primary node flushes the logs in the local file system to disks.
4. The primary node sends the logs to the standby node.
5. The standby node receives the logs and saves them to the local memory.
6. The standby node writes the logs in the local memory to the local file system.
7. The standby node flushes the logs in the local file system to disks.
8. The standby node replays the logs to complete the incremental update of data files.

Parameter type: enumerated type.

Unit: none

Value range:

- **on**: The primary node waits for the standby node to flush logs to disks before committing a transaction.
- **off**: The primary node commits transactions without waiting for the primary node to flush logs to disks. This mode is also called asynchronous commit.
- **local**: The primary node waits for the primary node to flush logs to disks before committing a transaction. This mode is also called local commit.
- **remote_write**: The primary node waits for the standby node to write logs to the file system before committing a transaction. (The logs do not need to be flushed to disks.)
- **remote_receive**: The primary node waits for the standby node to receive logs before committing a transaction. (The logs do not need to be written to the file system.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **remote_apply**: The primary node waits for the standby node to complete log replay before committing a transaction.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. The **synchronous_commit** parameter has been taken over by the CM. In normal cases, the automatic copy upgrade function is enabled by default (that is, the CM parameter **enable_az_auto_switchover** is set to **on**). In this case, the modification of the **synchronous_commit** parameter does not take effect. Only multi-AZ scenarios are supported. To modify this parameter, you need to disable the automatic copy upgrade function (that is, set the CM parameter **enable_az_auto_switchover** to **off**). In this case, the modification of **synchronous_commit** takes effect.

Setting suggestion: Retain the default value. If you manually change the value of this parameter to a non-default value, data may be lost and this parameter cannot be put into commercial use.

Risks and impacts of improper settings: This parameter is maintained by the CM. If it is manually modified, data may be lost. For details, see "Unified Cluster Management Tool > Features > Automatic Copy Addition and Reduction by Shard > Remarks" in *Tool Reference*.

full_page_writes

Parameter description: Specifies whether the GaussDB server writes the entire content of each disk page to WALs during the first modification of that page after a checkpoint. When both **enable_incremental_checkpoint** and **enable_double_write** are enabled, **full_page_writes** is disabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: This feature is enabled.
- **off**: This feature is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. After this feature is enabled, a complete page is written to a disk. During a crash and restart, the page can be correctly restored to ensure data integrity at the cost of increasing the amount of data written to WALs.

Risks and impacts of improper settings: After this feature is disabled, only part of data may be written to the disk page when the OS breaks down. As a result, the original data cannot be restored. This parameter can be disabled only when you have hardware (such as a battery-backed disk controller) or file-system software (such as ReiserFS 4) that reduces the risk of partial page writes to an acceptable low level.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wal_log_hints

Parameter description: Specifies whether to write an entire page to WALs during the first modification of that page after a checkpoint, even for non-critical modifications of so-called hint bits.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The entire page is written to WALs.
- **off**: The entire page is not written to WALs.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

wal_buffers

Parameter description: Specifies the size of shared memory for storing WALs, in multiples of **XLOG_BLCKSZ** or the actual size. **XLOG_BLCKSZ** indicates the size of an Xlog block, typically 8 KB.

Parameter type: integer.

Unit: 8 KB (**XLOG_BLCKSZ** size)

Value range: –1 and 4 to 2^{18}. The minimum value is **-1** and the maximum value is **262144** (multiples of **XLOG_BLCKSZ**).

- If this parameter is set to **–1**, the **wal_buffers** size is dependent on the value of **shared_buffers**. The default value of **wal_buffers** is 1/32 of **shared_buffers**. The minimum value is **XLOG_BLCKSZ** multiplied by 8 and the maximum value is **XLOG_BLCKSZ** multiplied by 2048. If the automatically adjusted value is less than the minimum value, the value is forcibly set to the minimum value. If the value is greater than the maximum value, the value is forcibly set to the maximum value.
- If this parameter is set to a value smaller than 4 (that is, **0**, **1**, **2**, or **3**), the value **4** is forcibly used.
- Independent deployment: **1GB** (60-core CPU/480 GB memory and 32-core CPU/256 GB memory); **512MB** (16-core CPU/128 GB memory); **256MB** (8-core CPU/64 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, the value **2048** indicates that **wal_buffers** is 2048 x 8 KB, and the value **20480KB** indicates that **wal_buffers** is **20480KB**. If the value contains a unit, the value must be KB, MB, or GB and must be an integer multiple of 8 KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: The content of the WAL buffer is written to disks at every transaction commit. Therefore, setting an extremely large value is unlikely to bring a significant increase in system performance. However, setting this parameter to a few megabytes can improve the disk write performance on a server where a large number of transactions are committed at the same time. According to experience, the default value can meet the requirements of most cases. For different specifications, use the default values in the corresponding suggestions. You are advised to retain the default value. Do not set **wal_buffers** to an excessively large or small value, and the following condition must be true: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + (Standby node) **wal_receiver_buffer_size** < **max_process_memory** < Memory size of the physical machine. If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database fails to be started because no sufficient memory can be allocated.

Risks and impacts of improper settings: The default value is the recommended value. You are advised not to change it. Before changing the values, check the specifications of the parameters and ensure that the hardware resources are sufficient. Otherwise, the cluster may be abnormal.

wal_writer_delay

Parameter description: Specifies the delay between activity rounds for the WAL writer.

Parameter type: integer.

Unit: ms

Value range: 1 to 10000

Default value: **200ms**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If time is too long, the memory of the WAL buffer may be insufficient. If time is too short, WALs are continuously written, increasing the disk I/O load.

commit_delay

Parameter description: Specifies the duration for committed data to be stored in the WAL buffer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- When this parameter is set to a non-zero value, the committed transaction is stored in the WAL buffer instead of being written to the WAL immediately. Then the WAL writer flushes the buffer to disks periodically.
- If system load is high, other transactions are probably ready to be committed within the delay. However, if no transaction is ready to be committed, this delay may cause unnecessary waiting.

Parameter type: integer.

Unit: μs

Value range: 0 to 100000. **0** indicates no delay.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: For details, see the notice.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

commit_siblings

Parameter description: Specifies a threshold on the number of concurrent open transactions. If the number of concurrent open transactions is greater than the value of this parameter, a transaction that initiates a commit request will wait for a period of time specified by **commit_delay**. Otherwise, this transaction is written into WALs immediately.

Parameter type: integer.

Unit: none

Value range: 0 to 1000

Default value: **5**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

wal_block_size

Parameter description: Specifies the size of a log page in a WAL segment file.

Parameter type: integer.

Unit: byte

Value range: **8192**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **8192**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

wal_segment_size

Parameter description: Specifies the size of a WAL segment file. It can be specified by the multiples of **XLOG_BLCKSZ** or the actual size. **XLOG_BLCKSZ** indicates the size of an Xlog block, typically 8 KB.

Parameter type: integer.

Unit: 8 KB

Value range: **2048** (16 MB)

Default value: **16MB** (2048 x 8 KB)

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

force_promote

Parameter description: Specifies whether to enable the forcible switchover function on the standby node.

NOTICE

When a cluster is faulty, the forcible switchover enables the cluster to recover services as soon as possible at the cost of losing some data. This is an escape method used when the cluster is unavailable. You are advised not to trigger this method frequently. You are advised not to use this function if you are not clear about the impact of data loss on services.

Parameter type: integer.

Unit: none

Value range:

- **0**: disabled.
- **1**: enabled.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. To use the forcible standby node switchover function,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable this parameter for both DNs and CM Servers. The setting takes effect after the database is restarted.

Setting suggestion: Do not enable this parameter.

Risks and impacts of improper settings: After this function is enabled, some data will be lost if a forcible switchover is triggered.

wal_file_init_num

Parameter description: Specifies the number of Xlog segment files created at a time when the WAL writer auxiliary thread is started.

Parameter type: integer.

Unit: none

Value range: 1 to 1000000

Default value: **10**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, too much disk space (**wal_file_init_num** x **wal_segment_size**) will be occupied.

wal_file_preinit_bounds

Parameter description: Specifies the maximum number of WAL segment files that can be pre-expanded by the WAL writer auxiliary thread per second during service running. The WAL segment file size is 16 MB. If this parameter is set to **0**, there is no restriction.

Parameter type: integer.

Unit: none

Value range: 0 to 1024

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Set this parameter to a valid value based on the disk I/O capability. For details, see the value of **max_io_capacity**.

- If **max_io_capacity** is set to **500MB**, set this parameter to **25**.
- If **max_io_capacity** is set to **1GB**, set this parameter to **50**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wal_debug

Parameter description: Specifies whether to output WAL-related debugging information. This parameter is available only when **WAL_DEBUG** is enabled during compilation.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: WAL-related debugging information can be output.
- **off**: WAL-related debugging information cannot be output.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used for debugging. You are advised not to enable this parameter in the production environment.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

walwriter_sleep_threshold

Parameter description: Specifies the number of times that idle Xlogs are refreshed before the Xlog flusher enters the sleep state. If the number of times reaches the threshold, the Xlog flusher enters the sleep state.

Parameter type: integer.

Unit: none

Value range: 1 to 50000

Default value: **500**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

wal_flush_timeout

Parameter description: Specifies the timeout interval for traversing **walInsertStatusTable**. It is the maximum wait time for the adaptive Xlog disk flushing I/O to traverse **walInsertStatusTable**.

Parameter type: integer.

Unit: μs

Value range: 0 to 90000000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the Xlog flushing frequency may decrease and the Xlog processing performance may deteriorate.

xlog_file_path

Parameter description: Specifies the path of the Xlog shared disk in dual-cluster shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **NULL**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The database cannot be started.

xlog_file_size

Parameter description: Specifies the size of the Xlog shared disk in dual-cluster shared storage scenarios. This parameter is configured by the OM during database system initialization. You are advised not to modify the configuration.

Parameter type: integer.

Unit: byte

Value range: 134217728 to 576460752303423487

Default value: **549755813888**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: This parameter is set during installation. You are advised not to change the value.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

xlog_lock_file_path

Parameter description: Specifies the path of the lock file preempted by the Xlog shared disk in dual-cluster shared storage scenarios. This parameter is configured

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

by the OM during database system initialization. You are advised not to modify the configuration.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **NULL**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The database cannot be started.

max_size_for_shared_storage_xlog_write

Parameter description: Specifies the maximum amount of data that can be written to a shared disk at a time.

Parameter type: integer.

Unit: KB

Value range: 8 to 131072

Default value: 1024

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is set during installation. You are advised not to change the value.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

shared_storage_write_mode

Parameter description: Specifies the maximum Xlog writeable position of the primary cluster in shared storage mode.

Parameter type: enumerated type

Unit: none

Value range:

- **none**: No limit.
- **standby**: maximum local Xlog LSN of the connected standby node in the cluster plus the value of **xlog_file_size** (size of the Xlog shared disk in dual-database instance shared storage scenarios).
- **disaster_standby**: maximum local LSN of the standby node connected to the standby node in the standby cluster plus the value of **xlog_file_size**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **disaster_standby_strict**: maximum local LSN of the standby node in the standby cluster plus the value of **xlog_file_size**. (Different from **disaster_standby**, data is not overwritten even if the data plane network between the primary and standby clusters is isolated.)
- **standby_and_disaster_standby**: smaller value between the maximum local LSNs of the connected standby nodes in the cluster and the connected standby nodes in the standby cluster for DR plus the value of **xlog_file_size**.

Default value: **disaster_standby**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Modifying this parameter may cause the standby cluster to be rebuilt. You are advised not to manually modify this parameter.

enable_shared_storage_optimization

Parameter description: Specifies whether to enable performance optimization in shared storage mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enables performance optimization in shared storage mode.
- **off**: disables performance optimization in shared storage mode.

Default value: **on**. If an earlier version is upgraded to the current version, the default value is **off**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the performance of shared storage in low-concurrency scenarios will be affected.

14.3.6.2 Checkpoints

checkpoint_segments

Parameter description: Specifies the maximum number of WAL files that can be retained in the period specified by **checkpoint_timeout**. The size of each log file is 16 MB.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483646

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: 1024

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Increasing the value of this parameter speeds up the import of a large amount of data. Set this parameter based on **checkpoint_timeout** and **shared_buffers**. This parameter affects the number of WAL files that can be reused. Generally, the maximum number of reused files in the **pg_xlog** folder is twice the value of **checkpoint_segments**. The reused files are not deleted and are renamed to the WAL segment files which will be later used.

Risks and impacts of improper settings: If the value is too small, checkpoints are frequently triggered. If the value is too large, the RTO may be increased, the number of WAL files to be retained increases, and more disk space is occupied.

checkpoint_timeout

Parameter description: Specifies the maximum time between automatic checkpoints.

Parameter type: integer.

Unit: second

Value range: 30 to 3600

Default value: **900** (that is, 15 minutes)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If the value of **checkpoint_segments** is increased, you need to increase the value of this parameter. The increase of these two parameters further requires the increase of **shared_buffers**. Consider all these parameters during setting.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

checkpoint_completion_target

Parameter description: Specifies the ratio of the estimated completion time of each checkpoint to the value of **checkpoint_timeout**.

Parameter type: floating point

Unit: none

Value range: 0.0 to 1.0

Default value: **0.5**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

checkpoint_warning

Parameter description: If the checkpoint interval is less than the value of this parameter because the checkpoint file is written, a warning message is written, indicating that the value of **checkpoint_segments** needs to be increased.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647. **0** indicates that the warning is disabled.

Default value: **300**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

checkpoint_wait_timeout

Parameter description: Sets the longest time that the checkpoint waits for the checkpointer thread to start.

Parameter type: integer.

Unit: second

Value range: 2 to 3600

Default value: **1min**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_incremental_checkpoint

Parameter description: Specifies whether to enable incremental checkpoint.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The incremental checkpoint function is enabled.
- **off**: The incremental checkpoint function is disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to disable this function when the memory is small or the disk performance is poor. In other scenarios, you are advised to enable this function by default.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

When **enable_incremental_checkpoint** is disabled and the checkpoint is manually executed, **full_page_writes** is used to generate the first Xlog. When backup and restoration are triggered, the log containing "xlog contains no data" may be generated.

enable_double_write

Parameter description: Specifies whether to enable dual-write feature. When the incremental checkpoint function **enable_incremental_checkpoint** is enabled and **enable_double_write** is enabled, the **enable_double_write** dual-write feature is used for protection and **full_page_writes** is not used to prevent partial page writes.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The dual-write function is enabled.
- **off**: The dual-write function is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter to **on** in incremental checkpoint mode.

Risks and impacts of improper settings: Partial page writes may occur when this parameter is disabled and the incremental checkpoint function is enabled. As a result, persistent data is unavailable.

incremental_checkpoint_timeout

Parameter description: Specifies the maximum interval between automatic WAL checkpoints when the incremental checkpoint (**enable_incremental_checkpoint**) is enabled.

Parameter type: integer.

Unit: second

Value range: 1 to 3600

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_xlog_prune

Parameter description: Specifies whether the primary node recycles logs if the size of Xlogs exceeds the value of **max_size_for_xlog_prune** when any standby node is disconnected.

Parameter type: Boolean.

Unit: none

Value range:

- If this parameter is set to **on**, the primary node recycles logs when any standby node is disconnected.
- If this parameter is set to **off**, the primary node does not recycle logs when any standby node is disconnected.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_size_for_xlog_prune

Parameter description: Specifies the maximum number of Xlogs retained on the primary node when the standby node is faulty. This parameter takes effect when **enable_xlog_prune** is enabled. The mechanism is as follows:

1. If all standby nodes specified by the replconninfo series GUC parameters are connected to the primary node, this parameter does not take effect.
2. This parameter takes effect when one or more standby nodes specified by the replconninfo series GUC parameters are disconnected to the primary node. If the number of Xlogs on the host is greater than the value of this parameter, the Xlogs will be forcibly recycled. Exception: In synchronous commit mode (that is, the **synchronous_commit** parameter is not set to **local** or **off**), if there are standby nodes connecting to the primary node, the primary node retains the logs after the minimum log receiving location in the majority of standby nodes. In this case, the number of retained logs may be greater than the value of **max_size_for_xlog_prune**.
3. If a standby node is being built, this parameter does not take effect. All logs on the primary node are retained to prevent failures caused by log recycling during the build operation.

Parameter type: integer.

Unit: KB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 2199023255551

Default value: **256GB**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. If the value of the parameter does not contain a unit, the default unit is KB. The unit can also be MB or GB.

Setting suggestion: If the disk space is small, you are advised to set this parameter to a small value. The maximum value is **256GB**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_redo_log_size

Parameter description: Standby DN indicates the expected log volume between the latest log replay point and the latest checkpoint position. Primary DN indicates the expected log volume between the latest log insertion point and the latest checkpoint position. This parameter is used to specify the page refreshing speed of checkpoints.

Parameter type: integer.

Unit: KB

Value range: 163840 to 2147483647

Default value: **1048576**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. It is recommended that this parameter be set to a small value if the RTO is concerned.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.6.3 Log Replay

recovery_time_target

Parameter description: Specifies the flow control threshold for the standby node to complete log writing and replay. If the expected replay completion time of the standby node is greater than the value of this parameter, the primary node triggers log flow control and reduces the rate at which the primary node sends logs to the standby node.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

- **0**: Log flow control is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- 1 to 3600: The standby node can write and replay logs within the period specified by the value, so that the standby node can quickly assume the primary role.

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the performance of the primary node will be affected. For example, if this parameter is set to **10**, there is a delay in replaying logs on the standby node compared with receiving logs on the standby node and the maximum delay is 10s. If the delay exceeds 10s, the primary node cannot send logs to the standby node, which affects the performance of the primary node. In primary and standby scenarios, transactions on the primary node can be committed only after logs on the standby node are flushed to disks. In this case, transaction execution on the primary node is restricted, affecting performance. If the value is too large, the flow control does not take effect. After flow control is disabled, the RTO/RPO may increase.

recovery_max_workers

Parameter description: Specifies the maximum number of parallel replayer threads. This parameter takes effect only when both **recovery_parse_workers** and **recovery_redo_workers** are set to **1**.

Parameter type: integer.

Unit: none

Value range: 0 to 20

Default value: **4**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, the CPU and memory resources will be insufficient, reducing the replay speed.

recovery_parallelism

Parameter description: Queries the actual number of parallel replayer threads.

Parameter type: integer.

Unit: none

Value range: 1 to 165

Default value: **4**

Setting method: This is a POSTMASTER parameter and cannot be modified. If any of the **recovery_max_workers**, **recovery_parse_workers**, and **recovery_redo_workers** parameters is modified, **recover_parallelism** is recalculated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: This parameter is read-only and cannot be modified.

Risks and impacts of improper settings: none

queue_item_size

Parameter description: Specifies the maximum length of the task queue of each redo replayer thread.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: **560**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, a large number of system resources will be occupied.

recovery_parse_workers

Parameter description: Specifies the number of **ParseRedoRecord** threads for the ultimate RTO feature.

1. In addition, it must be used together with **recovery_redo_workers**. If **recovery_parse_workers** or **recovery_redo_workers** is greater than 1, ultimate RTO is enabled. If you do not want to enable ultimate RTO, retain the default value **1** of **recovery_parse_workers**.
2. Ensure that the value of this parameter **replication_type** is set to **1** when ultimate RTO is enabled.
3. If both the ultimate RTO and parallel replay are enabled at the same time, the ultimate RTO feature takes effect but the parallel replay feature does not take effect.
4. Ultimate RTO does not support flow control. Flow control is determined by the parameter **recovery_time_target**.

Parameter type: integer.

Unit: none

Value range: 1 to 16

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: For details about the values of **recovery_parse_workers** and **recovery_redo_workers** for different CPUs, memories, and deployment modes, see **Table 1 Parameter settings for different CPUs, memory sizes, and deployment modes**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

After ultimate RTO is enabled, the total number of extra replayer threads started by the standby node = **recovery_parse_workers** x (**recovery_redo_workers** + 2) + 5. More replayer threads occupy more CPU, memory, and I/O resources. Set parameters based on the actual hardware configuration. Otherwise, the system may fail to start due to insufficient resources. In hybrid deployment scenarios, host performance may be affected.

Risks and impacts of improper settings: If this parameter is set to a large value, the CPU and memory resources will be insufficient, reducing the replay speed.

recovery_redo_workers

Parameter description: Specifies the number of **PageRedoWorker** threads corresponding to each **ParseRedoRecord** thread when the ultimate RTO feature is enabled. **recovery_redo_workers** must be used together with **recovery_parse_workers**. If **recovery_parse_workers** or **recovery_redo_workers** is greater than 1, ultimate RTO is enabled. If you do not want to enable ultimate RTO, retain the default value **1** of **recovery_redo_workers**.

Parameter type: integer.

Unit: none

Value range: 1 to 8

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: For details about the values of **recovery_parse_workers** and **recovery_redo_workers** for different CPUs, memories, and deployment modes, see **Table 1 Parameter settings for different CPUs, memory sizes, and deployment modes**.

Risks and impacts of improper settings: If this parameter is set to a large value, the CPU and memory resources will be insufficient, reducing the replay speed.

Table 14-11 Parameter settings for different CPUs, memory sizes, and deployment modes

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	recovery_parse_workers	recovery_redo_workers	Number of Replayer Threads	Remarks
1	4	-	-	1	1	-	Ultimate RTO is not recommended.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	recovery_parse_workers	recovery_redo_workers	Number of Replayer Threads	Remarks
2	8	-	Yes	1	1	-	Ultimate RTO is not recommended.
3	8	64	No	1	3	10	-
4	16	128	Yes	1	2	9	-
5	16	128	No	2	3	15	-
6	32	256	Yes	2	2	13	-
7	32	256	No	2	8	25	-
8	64	512	Yes	2	4	17	-
9	64	512	No	2	8	25	Set the parameter to the recommended value for larger hardware specifications.
10	96	768	-	2	8	25	Set the parameter to the recommended value for larger hardware specifications.

enable_page_lsn_check

Parameter description: Specifies whether to enable the data page LSN check. During replay, the current LSN of the data page is checked to see if it is the expected one.

Parameter type: Boolean.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **on**: The data page LSN check function is enabled.
- **off**: The data page LSN check function is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, data page errors may not be quickly detected, resulting in unexpected errors.

recovery_min_apply_delay

Parameter description: Specifies the replay delay of the standby node.

Parameter type: integer.

Unit: millisecond

Value range: 0 to 2147483647

Default value: **0** (no delay added)

Setting method: This is a SIGHUP parameter. Set it based on instructions in **Table 14-1**.

Setting suggestion: See the notice below.

Risks and impacts of improper settings: See the notice below.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- This parameter does not take effect on the primary node. It must be set on the standby node that requires a delay. You are advised to set this parameter on the asynchronous standby node. If the delay is set on the asynchronous standby node, the RTO will take a long time after the node is promoted to primary.
- The delay time is calculated based on the transaction commit timestamp on the primary node and the current time on the standby node. Therefore, ensure that the clocks of the primary and standby nodes are synchronized.
- If the delay time is too long, the disk where the Xlog file is located on the standby node may be full. Therefore, you need to set the delay time based on the disk size.
- Operations without transactions are not delayed.
- After the primary/standby switchover, if the original primary node needs to be delayed, you need to manually set this parameter.
- When **synchronous_commit** is set to **remote_apply**, synchronous replication is affected by the delay. Each commit message is returned only after the replay on the standby node is complete.
- **hot_standby_feedback** will be delayed due to using this feature, which may cause the primary node to expand. Therefore, you need to balance the risk when using both parameters.
- After a DDL operation (such as DROP or TRUNCATE) that holds an AccessExclusive lock is performed on an object on the primary node, if the object is queried on the standby node during the delayed replay of the record on the standby node, it will be returned only after the lock is released.

dcf_truncate_dump_info_level

Parameter description: Specifies whether to print the LSN truncated by the DCF and the subsequent LSNs.

Parameter type: integer.

Unit: none

Value range: 0 to 2

- **0**: disabled.
- **1**: prints all LSNs truncated by the DCF (Xlogs whose LSN is greater than or equal to the truncated LSN).
- **2**: prints all LSNs truncated by the DCF and prints warning-level logs when the LSNs flushed to disks are greater than the truncated LSNs.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

redo_bind_cpu_attr

Parameter description: Specifies the core binding operation of the replayer thread. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: a string of more than 0 characters. The value is case-insensitive.

- **'nobind'**: The thread is not bound to a core.
- **'nodebind: 1, 2'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads.
- **'cpubind: 0-30'**: Use the CPU cores 0 to 30 to bind threads.
- **'cpuorderbind: 16-32'**: One thread is bound to one CPU core starting from core 16. If the number of cores in the range is insufficient, the remaining threads are not bound. You are advised to set the interval to a value greater than or equal to the value of **recovery_parallelism** plus 1.

Default value: **'nobind'**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: See the note below.

Risks and impacts of improper settings: The database node cannot be started.

NOTE

- This parameter is used for core binding in the Arm environment. You are advised to bind all replayer threads to the same NUMA group for better performance. In hybrid deployment scenarios, you are advised to bind the replayer threads of different nodes on the same host to different NUMA groups.
- The core binding range specified by this parameter must be different from the core binding range specified by the **thread_pool_attr** parameter.

14.3.6.4 Archiving

archive_timeout

Parameter description: Specifies the archiving period.

NOTICE

- The server is forced to switch to a new WAL segment file when the period specified by this parameter has elapsed since the last file switch.
- Archived files that are closed early due to a forced switch are still of the same length as full files. Therefore, a very short **archive_timeout** will bloat the archive storage. You are advised to set **archive_timeout** to **60s**.

Parameter type: integer.

Unit: second

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 1073741823. **0** indicates that archiving timeout is disabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, Xlogs will be switched frequently, occupying storage space.

archive_interval

Parameter description: Specifies the archiving interval. Log files are forcibly archived when the period specified by this parameter has elapsed.

Parameter type: integer.

Unit: second

Value range: 1 to 1000

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, data will be archived frequently, occupying storage space. If the value is too large, the RPO of PITR will be affected.

time_to_target_rpo

Parameter description: In dual-cluster remote DR mode, logs of the primary cluster are archived to OBS. Specifies the time allowed from the time when the primary cluster is abnormal to the time when the primary cluster is archived to the recovery point of OBS.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

- **0** indicates that log flow control is disabled.
- A value ranges from 1 to 3600 indicates the duration from the time when the primary cluster is abnormal to the time when the primary cluster is archived to the recovery point of OBS. This ensures that the maximum data loss duration is within the allowed range when the primary cluster breaks down due to a disaster.

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the value is too small, the host performance is affected. If the value is too large, the flow control does not take effect.

14.3.7 HA Replication

14.3.7.1 Sending Server

enable_slot_log

Parameter description: Specifies whether to enable primary/standby synchronization for replication slots. Only logical replication slots, archive slots, and backup slots are involved.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Primary/standby synchronization is enabled for replication slots.
- **off**: Primary/standby synchronization is disabled for replication slots.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Enable the function of creating archive/backup slots on the primary node and disable the function of creating archive/backup slots on the standby node.

Risks and impacts of improper settings: Functions (except replication and synchronization between the primary and standby nodes) such as backup, archiving, and building, will be affected.

max_wal_senders

Parameter description: Specifies the maximum number of concurrent connections of the Xlog sender. The value must be smaller than that of **max_connections**.

NOTICE

The prerequisite for setting **max_wal_senders** is as follows: **wal_level** must be set to **archive**, **hot_standby**, or **logical** to allow the connection to the standby node.

Parameter type: integer.

Unit: none

Value range: 0 to 1024. The recommended value range is 8 to 100.

Default value:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- This parameter can be set to **0** only when a single DN is used and there is no primary/standby instance.
- When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to: Number of current standby nodes + Number of backup connections + Number of required logical replication connections.

Risks and impacts of improper settings: If this parameter is set to a value less than the recommended value range, these functions may be unavailable or abnormal.

wal_keep_segments

Parameter description: Specifies the minimum number of Xlog files that can be retained in the **pg_xlog** directory. The standby node obtains the Xlogs from the primary node to perform streaming replication.

Parameter type: integer.

Unit: none

Value range: 2 to 2147483647

Default value: **128**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- During WAL archiving or recovery from a checkpoint on the server, the system may retain more log files than the number specified by **wal_keep_segments**.
- If the HA system uses asynchronous transmission, increase the value of **wal_keep_segments** when data greater than 4 GB is continuously imported in COPY mode. Take T6000 board as an example. If the data to be imported reaches 50 GB, you are advised to set this parameter to **1000**. You can dynamically restore the setting of this parameter after data import is complete and the log synchronization is normal.
- If the **synchronous_commit** level is lower than LOCAL_FLUSH, you are advised to set this parameter to **1000** when rebuilding the standby node to prevent rebuilding failures caused by primary node log recycling during the rebuilding.

Risks and impacts of improper settings: If the value is too large, the **pg_xlog** folder may occupy too much disk space. If the value is too small, the transaction log may have been overwritten by a new one before requested by the standby node. As a result, the request fails and the connection between the primary and standby nodes is terminated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wal_sender_timeout

Parameter description: Specifies the maximum duration that the node waits for the receiver to receive transaction logs.

NOTICE

- If the data volume on the primary node is huge, the value of this parameter must be increased for rebuilding. For example, if the data volume on the primary node reaches 500 GB, you are advised to set this parameter to **600s**.
- This parameter cannot be set to a value larger than the value of **wal_receiver_timeout** or the timeout parameter for database rebuilding.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

Default value: **6000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the system is more sensitive to network fluctuation and intermittent disconnection. As a result, the connection between the primary and standby nodes may be abnormal. If the value is too large, the response to exceptions is slower.

max_replication_slots

Parameter description: Specifies the maximum number of log replication slots on the primary node.

Parameter type: integer.

Unit: none

Value range: 0 to 1024. The recommended value range is 8 to 100.

Default value: **20**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

When HA replication, backup and restoration, and logical decoding are used, you are advised to set this parameter to a value by referring to the following formula: Number of current physical streaming replication slots + Number of backup slots + Number of required logical replication slots. If the actual value is smaller than the recommended value, these functions may be unavailable or abnormal.

- Physical streaming replication slots provide an automatic method to ensure that Xlogs are not removed from a primary DN before they are received by all

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the standby DNs. Therefore, physical streaming replication slots are used to support the cluster HA. The number of physical streaming replication slots required by the cluster is as follows: ratio of the number of standby DNs to the number of primary DNs in a ring of DNs. If the HA DN has 1 primary cluster and 3 standby clusters, the number of physical streaming replication slots required is 3.

- Backup slot records replication information during backup execution. Full backup and incremental backup correspond to two independent backup slots.
- Plan the number of logical replication slots as follows:
  - A logical replication slot can carry changes of only one database for decoding. If multiple databases are involved, create multiple logical replication slots.
  - If logical replication is needed by multiple target databases, create multiple logical replication slots in the source database. Each logical replication slot corresponds to one logical replication link.
  - A maximum of 20 logical replication slots can be enabled for decoding on the same instance.

Risks and impacts of improper settings: If the value is too small, the standby node cannot be connected, or logical decoding and backup archiving cannot be enabled. If the value is too large, the performance will be affected.

enable_wal_shipping_compression

Parameter description: Specifies whether to enable cross-cluster log compression in streaming DR mode.

NOTICE

This parameter applies only to a pair of WAL senders and WAL receivers for cross-cluster transmission in streaming DR and is configured in the primary cluster.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Cross-cluster log compression is enabled in streaming DR mode.
- **off**: Cross-cluster log compression is disabled in streaming DR mode.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You do not need to set this parameter separately. This function is enabled by default during DR setup.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_wal_replication_compression

Parameter description: Specifies whether to enable the Xlog compression function during physical replication between the primary and standby DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The log compression function is enabled.
- **off**: The log compression function is disabled.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter applies only to a pair of WAL Sender and WAL Receiver threads for data transmission between the primary and standby DNs. Configure this parameter on the primary DN. You are advised not to enable this parameter in scenarios with small Xlogs and delay sensitivity.

Risks and impacts of improper settings: After this parameter is enabled, performance and resources are consumed. Therefore, you need to set **wal_replication_compression_thread_settings** and **wal_replication_compression_settings** properly.

- Impact on performance: For details, see the description of the **wal_replication_compression_settings** parameter.
- Configurations in different resource scenarios: For details, see the description of the **wal_replication_compression_thread_settings** parameter.

NOTICE

This parameter has the following restrictions:

- Do not modify the compression algorithm during the upgrade.
- DCF is not supported.
- Currently, DR clusters are not supported.
- You are advised not to enable this function in small specifications (for example, 4 or 8 vCPUs).

wal_replication_compression_thread_settings

Parameter description: Specifies the number of parallel compression threads and single-thread queue depth of the primary and standby clusters. This parameter takes effect only when **enable_wal_replication_compression** is enabled.

Parameter type: string.

Unit: none

Value range: a string of two integers separated by a comma (,). The value ranges of both integer parameters are 1 to 16.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **'1,6'**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter and **walsender_max_send_size** are used together to specify the memory usage of the compression thread. You need to use this parameter with caution. You are advised to set this parameter to a small value for low-performance machines.

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	walsender_max_send_size (MB)	Maximum Number of Threads for Xlog Compression	Maximum Queue Depth of the Compression Buffer	wal_replication_compression_thread_settings	Remarks
1	4	-	-	8	0	0	-	Generally, Xlog compression is not recommended. If the network traffic is limited, you can set this parameter based on the hardware specifications to enable Xlog compression to relieve the traffic pressure.
2	8	-	Yes	8	0	0	-	
3	8	64	No	8	1	1	1,1	
4	16	128	Yes	8	2	2	2,2	
5	16	128	No	8	2	2	2,2	
6	32	256	Yes	8	4	2 to 4 (Determine the recommended value based on the optimal performance after the performance test.)	4,2 to 4,4	

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	walsender_max_send_size (MB)	Maximum Number of Threads for Xlog Compression	Maximum Queue Depth of the Compression Buffer	wal_replication_compression_thread_settings	Remarks
7	32	256	No	8	4	2 to 4 (Determine the recommended value based on the optimal performance after the performance test.)	4,2 to 4,4	
8	64	512	Yes	8	8	2 to 4 (Determine the recommended value based on the optimal performance after the performance test.)	8,2 to 8,4	

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

No.	Number of CPUs	Memory (GB)	Hybrid Deployment or Not	walsender_max_send_size (MB)	Maximum Number of Threads for Xlog Compression	Maximum Queue Depth of the Compression Buffer	wal_replication_compression_thread_settings	Remarks
9	64	512	No	8	8	2 to 4 (Determine the recommended value based on the optimal performance after the performance test.)	8,2 to 8,4	
10	96	768	-	8	12	2 to 4 (Determine the recommended value based on the optimal performance after the performance test.)	12,2~12,4	

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is set to a large value, a large amount of dynamic memory is occupied. As a result, the process cannot be started or the service fails to apply for memory.

wal_replication_compression_settings

Parameter description: Specifies the algorithm rule used for Xlog compression of the primary and standby clusters.

Parameter type: string. The parameter value consists of the compression algorithm and compression parameter. The format is '*string*,*int*', for example, **'zstd,5'**. Other formats are incorrect, which will cause the setting failure.

Unit: none

Value range: The first parameter (compression algorithm) can be set to **lz4** or **zstd**. Other values are invalid.

- If the first parameter is set to **lz4**, the second parameter is the acceleration factor and the value ranges from 1 to 300.
- If the first parameter is set to **zstd**, the second parameter is the compression level and the value ranges from 1 to 15.

Default value: **'lz4,3'**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- A larger acceleration factor of the LZ4 algorithm indicates a lower compression ratio and better performance.
- A higher compression level of the zstd algorithm indicates a higher compression ratio and poorer performance.
- Increasing the compression ratio will reduce the network bandwidth, but the TPS performance will also deteriorate. You are advised to set the compression ratio to the minimum compression ratio that meets the bandwidth requirements.
- The zstd algorithm has a higher compression ratio and more performance degradation, while the lz4 algorithm has a lower compression ratio and less performance degradation.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

repl_auth_mode

Parameter description: Specifies the validation mode for primary/standby replication and standby node rebuilding.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If UUID validation is enabled on the primary node and a non-null repl_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

Parameter type: enumerated type.

Unit: none

Value range:

- **off**: UUID validation is disabled.
- **default**: indicates that UUID validation is disabled.
- **uuid**: indicates that UUID validation is enabled.

Default value: **default**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determine whether to enable this function based on the restrictions in the notice and requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

repl_uuid

Parameter description: Specifies the UUID used for primary/standby UUID validation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If UUID validation is enabled on the primary node and a non-null repl_uuid validation code is configured, UUID validation must also be enabled on the standby node and the same repl_uuid validation code must be configured on the standby node. Otherwise, requests for log replication between the primary and standby nodes and standby node rebuilding will be rejected by the primary node.
- The SIGHUP parameter can dynamically load new values. The modification does not affect the established primary/standby connection and takes effect for subsequent primary/standby replication requests and primary/standby rebuilding requests.
- It supports the standby node rebuild validation under the Quorum and DCF protocols and the primary/standby replication validation under the Quorum protocol. It does not support primary/standby replication validation under the DCF protocol.
- It does not support the authentication between the primary and standby nodes across clusters, including the primary/standby Dorado and DR clusters.
- The UUID validation function is used to prevent data crosstalk and pollution caused by incorrect connection between the primary and standby nodes. It is not used for security purposes.
- This parameter cannot be automatically synchronized between the primary and standby nodes.

Parameter type: string.

Unit: none

Value range: a string. The value contains 0 to 63 characters, including letters and digits. The value is case-insensitive and is converted to lowercase letters for storage. An empty string indicates that UUID validation is disabled.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determine whether to enable this function based on the restrictions in the notice and requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

replconninfo1

Parameter description: Specifies the information about the first node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo1 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: a string. An empty string indicates that no information about the first node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo2

Parameter description: Specifies the information about the second node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo2 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the second node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo3

Parameter description: Specifies the information about the third node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo3 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the third node is configured.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo4

Parameter description: Specifies the information about the fourth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo4 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the fourth node is configured.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo5

Parameter description: Specifies the information about the fifth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo5 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the fifth node is configured.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo6

Parameter description: Specifies the information about the sixth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo6 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the sixth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo7

Parameter description: Specifies the information about the seventh node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo7 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the seventh node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo8

Parameter description: Specifies the information about the eighth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo8 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the eighth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo9

Parameter description: Specifies the information about the ninth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo9 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the ninth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

replconninfo10

Parameter description: Specifies the information about the tenth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo10 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the tenth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo11

Parameter description: Specifies the information about the eleventh node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo11 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the eleventh node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

replconninfo12

Parameter description: Specifies the information about the twelfth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo12 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the twelfth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo13

Parameter description: Specifies the information about the thirteenth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo13 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the thirteenth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

replconninfo14

Parameter description: Specifies the information about the fourteenth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo14 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the fourteenth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo15

Parameter description: Specifies the information about the fifteenth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo15 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the fifteenth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

replconninfo16

Parameter description: Specifies the information about the sixteenth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo16 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the sixteenth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

replconninfo17

Parameter description: Specifies the information about the seventeenth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo17 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the seventeenth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

replconninfo18

Parameter description: Specifies the information about the eighteenth node to be listened on and authenticated by the current server. This parameter is automatically configured after the cluster is successfully installed.

Example:

```
replconninfo18 = "localhost=XXXX localport=XXXX localheartbeatport=XXXX localservice=XXXX
remotehost=XXXX remoteport=XXXX remoteheartbeatport=XXXX remoteservice=XXXX"
```

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the eighteenth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal cluster status.

cross_cluster_replconninfo1

Parameter description: Specifies the information about the first node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the first node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

cross_cluster_replconninfo2

Parameter description: Specifies the information about the second node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string. An empty string indicates that no information about the second node is configured.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

cross_cluster_replconninfo3

Parameter description: Specifies the information about the third node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the third node is configured.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

cross_cluster_replconninfo4

Parameter description: Specifies the information about the fourth node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the fourth node is configured.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cross_cluster_replconninfo5

Parameter description: Specifies the information about the fifth node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the fifth node is configured.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

cross_cluster_replconninfo6

Parameter description: Specifies the information about the sixth node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the sixth node is configured.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

cross_cluster_replconninfo7

Parameter description: Specifies the information about the seventh node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the seventh node is configured.

Default value: ""

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

cross_cluster_replconninfo8

Parameter description: Specifies the information about the eighth node to be listened on and authenticated by the current server across clusters.

Parameter type: string.

Unit: none

Value range: a string. An empty string indicates that no information about the eighth node is configured.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set during installation. You are advised not to change the value.

Risks and impacts of improper settings: The incorrect connection information may cause the abnormal status of a standby cluster for DR.

enable_time_report

Parameter description: Specifies whether to record the time consumed by each redo log.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The time consumed by each redo log is recorded.
- **off**: The time consumed by each redo log is not recorded.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to enable the non-debugging mode because the performance deteriorates after the non-debugging mode is enabled.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

thread_top_level

Parameter description: Increases the priority of the WALWRITERAUXILIARY, WALWRITER, STARTUP,WALRECEIVER, WAL_NORMAL_SENDER, and PGSTAT threads to the highest.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The priority of the preceding threads is increased to the highest.
- **off**: The priority of the preceding threads is not increased.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

page_work_queue_size

Parameter description: Specifies the length of the blocking queue of each redo worker.

Parameter type: integer.

Unit: none

Value range: 1 to 100000

Default value: **4096**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the pipeline capability becomes invalid. If the value is too large, too much memory is occupied.

14.3.7.2 Primary Node

synchronous_standby_names

Parameter description: Specifies a comma-separated list of names of potential standby nodes that support synchronous replication.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The current synchronous standby node is on the top of the list. If the current synchronous standby node is disconnected, it will be replaced immediately with the next-highest-priority standby node. Name of the next-highest-priority standby node is added to the list.
- The standby node name can be specified by setting the environment variable **PGAPPNAME**.

Value range: If this parameter is set to *****, the name of any standby node that provides synchronous replication is matched. The value can be configured in the following format:

- ANY *num_sync* (*standby_name* [, ...])
- [FIRST] *num_sync* (*standby_name* [, ...])
- *standby_name* [, ...]

  NOTE

  - In the preceding command, *num_sync* indicates the number of standby nodes that need to wait for responses from the transaction, *standby_name* indicates the name of the standby node, and FIRST and ANY specify the policies for selecting standby nodes for synchronous replication from the listed servers.
  - **ANY N (dn_instanceId1, dn_instanceId2,...)** indicates that any *N* host names in the brackets are selected as the name list of standby nodes for synchronous replication. For example, **ANY 1(dn_instanceId1, dn_instanceId2)** indicates that either of **dn_instanceId1** or **dn_instanceId2** is used as the standby node for synchronous replication.
  - **FIRST N (dn_instanceId1, dn_instanceId2, ...)** indicates that the first N primary node names in the brackets are selected as the standby node name list for synchronous replication based on the priority. For example, **FIRST 1 (dn_instanceId1, dn_instanceId2)** indicates that **dn_instanceId1** is selected as the standby node for synchronous replication.
  - The meanings of **dn_instanceId1, dn_instanceId2, ...** are the same as those of **FIRST 1 (dn_instanceId1, dn_instanceId2, ...)**.

NOTICE

This parameter is maintained by the CM. If it is manually modified, data may be lost. For details, see "Unified Cluster Management Tool > Features > Automatic Copy Addition and Reduction by Shard > Remarks" in *Tool Reference*.

If you use the gs_guc tool to set this parameter, perform the following operations:

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY 1(dn_instanceId1, dn_instanceId2)'"
```

or

```
gs_guc reload -Z datanode -N @NODE_NAME@ -D @DN_PATH@ -c "synchronous_standby_names='ANY 1(AZ1, AZ2)'"
```

Default value: *****

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the synchronization standby list is incorrect, the primary and standby synchronization majority protocol becomes invalid.

most_available_sync

Parameter description: Specifies whether to block the primary node when the primary-standby synchronization fails.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The primary node is not blocked when the synchronization fails.
- **off**: The primary node is blocked when the synchronization fails.

Default value: **off** (In the two-copy scenario, that is, one primary node and one standby node, the default value of the DN is **on**.)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: After this function is enabled, the primary node does not wait for the standby node to commit for verification. If the host is in the single-primary state, the committing is successful, not the majority write is successful.

Risks and impacts of improper settings: Customers need to exercise caution when enabling this function based on their application scenarios.

enable_stream_replication

Parameter description: Specifies whether data and logs are synchronized between the primary and standby nodes.

NOTICE

- This parameter is used for testing performance with standby DNs and without standby DNs. If this parameter is set to **off**, tests on abnormal scenarios, such as switchover and faults, cannot be performed to prevent inconsistency between the primary and standby nodes.
- This is a restricted parameter, and you are advised not to set it to **off** in normal service scenarios.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Synchronization between the primary and standby nodes is enabled.
- **off**: Synchronization between the primary and standby nodes is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the multi-copy capability of the cluster will be unavailable, reducing availability and causing backup failures. Therefore, you are advised not to disable this parameter.

enable_mix_replication

Parameter description: Specifies how WAL files and data are replicated between the primary and standby nodes.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The WAL file and data page mixed replication mode is enabled.
- **off**: The WAL file and data page mixed replication mode is disabled.

Default value: **off**

Setting method: This parameter is a POSTMASTER parameter. Its default value is **off** and cannot be modified.

Setting suggestion: Retain the default value. This parameter cannot be modified in normal service scenarios. That is, the WAL file and data page mixed replication mode is disabled by default.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

data_replicate_buffer_size

Parameter description: Specifies the amount of memory used by queues when the sender sends data pages to the receiver. The value of this parameter affects the buffer size used during the replication from the primary node to the standby node.

Parameter type: integer.

Unit: KB

Value range: 4096 to 1072693248

Default value: **128MB** (that is, 131072 KB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Do not set this parameter to an excessively large or small value. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** +

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wal_receiver_buffer_size (standby node) < **max_process_memory** < Memory size of the physical machine.

Risks and impacts of improper settings: If the value of the memory parameter is too large and exceeds the upper limit of the physical memory, the database cannot be started because it cannot apply for sufficient memory.

walsender_max_send_size

Parameter description: Specifies the size of the log or data sending buffer on the primary node.

Parameter type: integer.

Unit: KB

Value range: 8 to 2147483647

Default value: **8192** (8 MB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, too much memory is occupied. If the value is too small, the synchronization performance between the primary and standby nodes deteriorates.

enable_data_replicate

Parameter description: Specifies the data synchronization mode between the primary and standby nodes when a row-store table is imported.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The primary and standby nodes synchronize data using data pages when the data is imported to a row-store table. When **replication_type** is set to **1**, this parameter cannot be set to **on**. If this parameter is set to **on** using the GUC tool, its value will be forcibly changed to **off**.
- **off**: The primary and standby nodes synchronize data using Xlogs when the data is imported to a row-store table.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ha_module_debug

Parameter description: Specifies the replication status log of a specific data block during data replication.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The status of each data block is recorded in logs during data replication.
- **off**: The status of each data block is not recorded in logs during data replication.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Printing logs occupies unnecessary disk, CPU, and I/O bandwidth. Therefore, you are advised not to enable this function.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

catchup2normal_wait_time

Parameter description: Specifies the maximum duration that the primary node is blocked during the data catchup on the standby node in the case of a single synchronous standby node.

Parameter type: integer.

Unit: millisecond

Value range: –1 to 10000

- The value **–1** indicates that the primary node is blocked until the data catchup on the standby node is complete.
- The value **0** indicates that the primary node is not blocked during the data catchup on the standby node.
- A positive integer indicates the maximum duration that the primary node is blocked during the data catchup on the standby node. For example, if this parameter is set to **5000**, the primary node is blocked until the data catchup on the standby node is complete in 5s.

Default value: **–1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

sync_config_strategy

Parameter description: Specifies the policy for synchronizing configuration files between the primary node and standby node, and between the standby node and cascaded standby node.

NOTICE

If this parameter is configured after an upgrade from a version earlier than 503.0.0 to 503.0.0, this parameter cannot be identified after a rollback. Do not set this parameter during the upgrade to 503.0.0.

Parameter type: enumerated type.

Unit: none

Value range:

- **all_node**: If this parameter is set to **all_node** for the primary node, the primary node is allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **all_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **all_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **only_sync_node**: If this parameter is set to **only_sync_node** for the primary node, the primary node is only allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **only_sync_node** for a standby node, the standby node is allowed to send synchronization requests to its primary node, and the standby node is not allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **only_sync_node** for a cascaded standby node, the current cascaded standby node is allowed to send synchronization requests to its standby node.
- **none_node**: If this parameter is set to **none_node** for the primary node, the primary node is not allowed to proactively synchronize configuration files to all standby nodes. If this parameter is set to **none_node** for a standby node, the standby node is not allowed to send synchronization requests to its primary node, and the standby node is allowed to proactively synchronize configuration files to all cascaded standby nodes. If this parameter is set to **none_node** for a cascaded standby node, the current cascaded standby node is not allowed to send synchronization requests to its standby node.

Default value: all_node

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: After this function is disabled, the primary node stops synchronizing GUC parameters to the standby node. In this case, exercise caution when setting this parameter to a value other than **all_node**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is set to **none_node**, GUC parameters will not be synchronized between the primary and standby nodes. In this case, exercise caution when setting this parameter.

hadr_recovery_time_target

Parameter description: Specifies whether the standby database instance completes log writing and replay in streaming DR mode.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

- **0** indicates that log flow control is disabled.
- 1 to 3600 indicates that the standby node can write and replay logs within the time specified by **hadr_recovery_time_target**. This ensures that logs can be written and replayed within the time specified by **hadr_recovery_time_target** during the switchover between the primary and standby database instances. In this case, the standby database instance can be quickly switched to the primary database instance.

Default value: 60 (financial edition (data computing))

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, frequent flow control will affect host performance. If the value is too large or the parameter is disabled, the RTO of the standby node will exceed the expectation if the standby node does not replay data in a timely manner. As a result, the RTO and RPO of HA will be decreased.

hadr_recovery_point_target

Parameter description: Specifies the RPO time allowed for the standby database instance to flush logs to disks in streaming DR mode.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

- **0** indicates that log flow control is disabled.
- 1 to 3600 indicates that the standby node can flush logs to disks within the time specified by **hadr_recovery_point_target**. This ensures that logs can be replayed within the time specified by **hadr_recovery_point_target** during the switchover between the primary and standby database instances. In this case, the standby database instance is switched to primary.

Default value: 10 (financial edition (data computing))

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, frequent flow control will affect host performance. If the value is too large or the parameter is disabled, the RTO of the standby node will exceed the expectation if the standby node does not replay data in a timely manner. As a result, the RTO and RPO of HA will be decreased.

hadr_super_user_record_path

Parameter description: Specifies the path for storing encrypted files of the **hadr_disaster** user in the standby cluster in streaming DR mode.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The value is automatically set by the streaming DR password transfer tool and does not need to be manually added. You are advised not to change the value.

Risks and impacts of improper settings: If the settings are incorrect, the standby cluster status will be abnormal, and the primary cluster cannot be connected. As a result, data cannot be synchronized.

check_sync_standby

Parameter description: Specifies whether to check the standby node. After the **synchronous_standby_names** parameter is correctly configured in the primary and standby scenarios, if the synchronous standby node is faulty, the write service on the primary node reports a write failure.

NOTE

- This parameter cannot be synchronized in job work and autonomous transactions. Otherwise, the check may not take effect.
- If the standby node check is not configured for a specified user or session and the standby node is faulty when the forcible synchronization commit mode is enabled, the write operation on a table causes the query on the same table by another user or in another session to hang. In this case, you need to recover the standby node or manually terminate the hung client.
- The standby node check function cannot be enabled in scenarios (such as VACUUM ANALYZE and gs_clean) where non-write operations trigger log writing. If the standby node does not meet the requirements for synchronizing configurations to the standby node, services will be hung in this scenario. In this case, you need to manually terminate the services.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: The standby node check is enabled.
- **off**: The standby node check is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

enable_wal_sender_crc_check

Parameter description: Specifies whether to enable CRC for the WAL sender thread. CRC is performed before the primary node sends logs. If this parameter is enabled, the performance may deteriorate by less than 5%.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The check function is enabled.
- **off**: The check function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter ensures log validity. Determine whether to enable this function based on scenario requirements.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

14.3.7.3 Standby Node

hot_standby

Parameter description: Specifies whether the standby node is allowed to accept connections and queries after it is restored to the minrecovery point.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The standby node is allowed to accept connections and queries after it is restored to the minrecovery point.
- **off**: The standby node is not allowed to accept connections and queries after it is restored to the minrecovery point.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: After the read function of the standby node is enabled, certain resources, including the CPU, memory, disk space, and I/O usage, are consumed even if the standby node does not respond to services. If there is no read service on the standby node, you are advised to disable this parameter.

- If this parameter is set to **on**, **wal_level** must be set to **hot_standby** or higher. Otherwise, the database startup fails.
- In a distributed system, **hot_standby** cannot be set to **off**, because this setting can affect other features of the HA system.
- If the **hot_standby** parameter was disabled and the **wal_level** parameter was set to a value smaller than that of **hot_standby**, perform the following operations to ensure that the logs to be replayed on the standby node can be queried on the standby node before enabling the **hot_standby** parameter again:
  a. Change the value of **wal_level** of the primary and standby nodes to the value of **hot_standby** or a higher value, and restart the instances for the change to take effect.
  b. Perform the checkpoint operation on the primary node and query the **pg_stat_get_wal_senders()** function to ensure that the value of **receiver_replay_location** of each standby node is the same as that of **sender_flush_location** of the primary node. Ensure that the value adjustment of **wal_level** is synchronized to the standby nodes and takes effect, and the standby nodes do not need to replay low-level logs.
  c. Set the **hot_standby** parameter of the primary and standby nodes to **on**, and restart the instances for the setting to take effect.
- If the read on standby function is enabled, conflicts between replay and query on the standby node may cause the query to cancel. The error information is as follows:
  - ERROR: canceling statement due to conflict with recovery
  - ERROR: terminating connection due to conflict with recovery
- During the standby node read in serial and parallel replay modes, when the primary node rebuilds indexes online, an error may be reported when the standby node is read. Try again later. Error information:
  - could not open relation with OID xxx during recovery delete object, please try again later
  - Catalog is missing xxx attribute(s) for relid xxx
  - cache lookup failed for index xxx, refilenode:xxx, name:"xxx"
  - could not find pg_class entry for xxx
  - could not open block during recovery delete object, please try again later
- During the standby node read in the case of ultimate RTO, the VM with small memory configuration may report an error indicating insufficient memory. You can enable the GUC parameter **exrto_standby_read_opt** (enabled by default) to effectively reduce the memory and I/O overhead.
- The standby node does not support autonomous transactions.
- Use sysbench to test the read performance of the standby node in typical scenarios: The primary node executes 100 concurrent update services. The

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

primary and standby nodes both execute 200 concurrent read services at the same time. When the I/O and CPU are not limited, the read performance of the standby node in serial replay mode is not lower than 80% of that of the primary node, and the read performance of the standby node in ultimate RTO deteriorates by no more than 10% compared with that of the standby node in serial replay mode.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_standby_archive_delay

Parameter description: Specifies the wait period before queries on the standby node are canceled. A query conflict occurs when you use the standby node to read data in hot standby mode. In the current version, the setting does not take effect and is controlled by the **max_standby_streaming_delay** parameter.

Parameter type: integer.

Unit: millisecond

Value range: –1 to 2147483647. **–1** indicates that the standby node waits until the conflicting queries are complete.

Default value: **3000** (that is, 3s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_standby_streaming_delay

Parameter description: Specifies the wait period before queries on the standby node are canceled when the queries conflict with WAL data receiving through streaming replication in hot standby mode. If this parameter is set to a large value or the service load is heavy, an error may be reported, indicating that queries conflict with conflict.

Parameter type: integer.

Unit: millisecond

Value range: –1 to 2147483647

NOTICE

–1 indicates that the standby node waits until the conflicting queries are complete. In the scenario where serial or parallel replay is enabled, if the system detects that the query thread and replayer thread are in the deadlock state, the system still cancels the query to prevent replay blocking.

Default value: **3000** (that is, 3s)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements. The default value is recommended. A larger value indicates a higher query service priority on the standby node, but affects replay on the standby node. A smaller value indicates that long queries are more likely to be canceled, but the replay priority is higher.

Risks and impacts of improper settings: If the value is too large and long queries conflict with replay, replay may be blocked for a long time, affecting the RTO and RPO of the standby node.

wal_receiver_status_interval

Parameter description: Specifies the maximum interval for notifying the primary node of the WAL receiver status.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483

Default value: **5**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **0**, the standby node does not send information, such as the log receiving location, to the primary node. As a result, the transaction commit on the primary node may be blocked, and the switchover may fail. In normal service scenarios, you are advised not to set this parameter to **0**.

hot_standby_feedback

Parameter description: Specifies that the minimum transaction ID of a query performed on the standby node is sent to the primary node to avoid query conflicts.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The ID of the oldest transaction active on standby nodes will be sent to the primary node.
- **off**: The ID of the oldest transaction active on standby nodes will not be sent to the primary node.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **on**, the deletion of source version data on the primary node is restricted by the transactions that are being read by the standby node. That is, the primary node can delete only the changes whose transaction IDs are smaller than those reported by the standby node. Therefore, the performance of the primary node will be affected when this parameter is enabled. If replay conflicts with query on the standby node and a query error is reported, you are advised to increase the value of **max_standby_streaming_delay**.

wal_receiver_timeout

Parameter description: Specifies the maximum wait period for a standby node to receive data from the primary node.

Parameter type: integer.

Unit: millisecond

Value range: 0 to 2147483647

Default value: **6000** (that is, 6s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the walreceiver thread is frequently disconnected when the network fluctuates.

wal_receiver_connect_timeout

Parameter description: Specifies the timeout interval for a standby node to connect to the primary node.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483

Default value: **2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

wal_receiver_connect_retries

Parameter description: Specifies the maximum attempts that a standby node connects to the primary node.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: 1 to 2147483647

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

wal_receiver_buffer_size

Parameter description: Specifies the memory buffer size for the standby nodes to store the received Xlog files.

Parameter type: integer.

Unit: KB

Value range: 4096 to 1047552

Default value: **65536** (that is, 64 MB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Do not set this parameter to an excessively large or small value. The following condition must be met: **data_replicate_buffer_size** + **segment_buffers** + **shared_buffers** + **wal_buffers** + **temp_buffers** + **maintenance_work_mem** + **work_mem** + **query_mem** + **wal_receiver_buffer_size** (standby node) < **max_process_memory** < Memory size of the physical machine.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

primary_slotname

Parameter description: Specifies the slot name of the primary node corresponding to a standby node. This parameter is used for verifying the primary-standby relationship.

Parameter type: string.

Unit: none

Value range: a string

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is incorrectly set, the standby node may fail to connect to the primary node, and the cluster status may be abnormal.

max_standby_base_page_size

Parameter description: Specifies the maximum storage space of base page files on the standby node after the ultimate RTO function is enabled.

Parameter type: integer.

Unit: KB

Value range: 1048576 to 562949953421311

Default value: **268435456** (that is, 256 GB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual size of the physical disk.

Risks and impacts of improper settings: If the value is too small, the probability of read errors on the standby node increases.

max_standby_lsn_info_size

Parameter description: Specifies the maximum size of LSN info files on the standby node after the ultimate RTO function is enabled.

Parameter type: integer.

Unit: KB

Value range: 1048576 to 562949953421311

Default value: **268435456** (that is, 256 GB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the actual size of the physical disk.

Risks and impacts of improper settings: If the value is too small, the probability of read errors on the standby node increases.

max_keep_csn_info_size

Parameter description: Specifies the maximum size of CSN info linked lists allowed by each DN on the standby node after the ultimate RTO function is enabled.

Parameter type: integer.

Unit: KB

Value range: 16384 to 131072

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **16384** (that is, 16 MB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

base_page_saved_interval

Parameter description: Specifies the interval for generating base pages on the standby node after the ultimate RTO function is enabled. For the same page, a base page is generated each *n* (specified by this parameter) times.

Parameter type: integer.

Unit: none

Value range: 5 to 2000

Default value: **400**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the interval is too long, a large number of Xlogs need to be replayed each time the standby node reads data, and the performance deteriorates. If the interval is too short, more disk space is occupied and the forcible reclamation point is reached more quickly.

standby_force_recycle_ratio

Parameter description: Specifies the percentage of files read by the standby node to trigger forcible recycling after the ultimate RTO function is enabled. When the total size of base page files exceeds the value of **max_standby_base_page_size** x **standby_force_recycle_ratio** or the total size of LSN info files exceeds the value of **max_standby_lsn_info_size** x **standby_force_recycle_ratio**, forcible recycling is triggered and some queries are canceled. When the value of **standby_force_recycle_ratio** is **0**, forcible recycling is not started, and the setting of **max_standby_base_page_size** and **max_standby_lsn_info_size** does not take effect.

Parameter type: floating point

Unit: none

Value range: 0.0 to 1.0

Default value: **0.8**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

standby_recycle_interval

Parameter description: Specifies the interval for the standby node to recycle read files after the ultimate RTO function is enabled. The thread for recycling read resources on the standby node attempts to clear read files on the standby node at the interval specified by this parameter.

Parameter type: integer.

Unit: second

Value range: 0 to 86400

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the interval is too long, historical pages cannot be reclaimed in a timely manner, which may cause excessive disk usage.

standby_max_query_time

Parameter description: Specifies the maximum query time supported on the standby node after the ultimate RTO function is enabled. If the query time exceeds the value of this parameter, the query will be canceled.

NOTE

The time when the query is canceled is affected by the interval parameter **standby_recycle_interval** of the recycling thread and the time when the snapshot is obtained. Therefore, the actual execution time of the query on the standby node must be greater than the value of this parameter.

Parameter type: integer.

Unit: second

Value range: 0 to 86400

Default value: **600**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set the value based on service requirements.

Risks and impacts of improper settings: If the value is too large, the disk space usage will be too high.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

exrto_standby_read_opt

Parameter description: Specifies whether to support read optimization of the standby node with ultimate RTO. This parameter is not synchronized between the primary and standby nodes.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The optimization is enabled.
- **off**: The optimization is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

walrcv_writer_crc_check_level

Parameter description: Specifies whether to enable Xlog verification on the standby node in the primary/standby clusters in the streaming DR scenario. By default, the parameter is enabled only in the standby cluster.

Parameter type: integer.

Unit: none

Value range: 0 to 3

- **0**: The verification is disabled.
- **1**: The verification takes effect in the standby cluster.
- **2**: The verification on the standby node in the primary cluster takes effect.
- **3**: The verification on all standby nodes in the primary cluster and nodes in the standby cluster take effect.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set in the DR establishment process.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

standby_read_use_az_info

Parameter description: Specifies whether the GTM-Lite standby node uses AZ information to read data. The standby node in the same AZ as the CN is preferentially selected. This parameter is disabled by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements. After this function is enabled, all available standby DNs need to be traversed before being selected, which may cause query performance deterioration.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

standby_read_use_load_balance

Parameter description: Specifies whether the GTM-lite standby node uses the load balancing function to randomly select DNs that meet the consistency point (and AZ information). This function is disabled by default.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements. After this function is enabled, all available standby DNs need to be traversed before being selected, which may cause query performance deterioration.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_standby_bufferpool

Parameter description: Specifies whether to enable the function of reading data from an independent buffer on the standby node with ultimate RTO.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

When this function is enabled, it takes effect only when **enable_incremental_checkpoint** is enabled and the difference between the value of **standby_shared_buffers_fraction** and that of **standby_bufferpool_scale** is greater than or equal to 0.1.

standby_bufferpool_scale

Parameter description: Specifies the percentage of the **shared_buffers** memory buffer used by the independent buffer after the function of independent buffer for read on the standby node with ultimate RTO is enabled.

Parameter type: floating point.

Unit: none

Value range: 0.1 to 0.9

Default value: **0.5**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to an improper value, page refreshing will be accelerated.

14.3.7.4 Logical Replication

max_changes_in_memory

Parameter description: Specifies the maximum number of DML statements cached in memory for a single transaction during logical decoding.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **4096**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the value is too large, a large amount of dynamic memory is occupied when large transactions are decoded. If the value is too small, the decoding efficiency decreases.

max_cached_tuplebufs

Parameter description: Specifies the upper limit of the total tuple information cached in the memory during logical decoding.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **8192**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You are advised to set this parameter to a value greater than or equal to twice of **max_changes_in_memory**.

Risks and impacts of improper settings: If the value is too large, a large amount of dynamic memory is occupied when large transactions are decoded. If the value is too small, the decoding efficiency decreases.

logical_decode_options_default

Parameter description: Specifies the global default parameters when a logical decoding task is started.

Parameter type: string.

Unit: none

Value range: a string of key=value characters separated by commas (,), for example, **"parallel-decode-num=4,parallel-queue-size=128,exclude-users=userA,skip-generated-columns=on"**. An empty string indicates that the default value hardcoded by the program is used.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Currently, the following logical decoding options are supported: **parallel-decode-num**, **parallel-queue-size**, **max-txn-in-memory**, **max-reorderbuffer-in-memory**, **exclude-users**, **skip-generated-columns**, **decode-sequence**, and **data-limit**. For details about the options, see "Logical Replication > Logical Decoding > Logical Decoding Options" in *Feature Guide*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The SIGHUP parameter does not affect the started logical decoding process. The options specified by **logical_decode_options_default** are used as the default settings for subsequent logical decoding startup, and the settings specified in the startup command are used.
- The **exclude-users** option specified by **logical_decode_options_default** is different from the logical decoding startup option **exclude-users**. You are not allowed to specify multiple blacklisted users.
- **decode-sequence** configured in **logical_decode_options_default** can only be set to **false**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

logical_sender_timeout

Parameter description: Specifies the maximum waiting time for the sender to wait for the receiver to receive logical logs.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

Default value: **30000** (30s)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_logicalrepl_xlog_prune

Parameter description: Specifies whether to enable the function of forcibly invalidating a logical replication slot. When **enable_logicalrepl_xlog_prune** is set to **on**, **max_size_for_xlog_retention** is greater than 0, and the number of retained log segments (16 MB for each log segment) exceeds the value of **max_size_for_xlog_retention** due to the current logical replication slot, or **max_size_for_xlog_retention** is less than 0 and the disk usage reaches (–**max_size_for_xlog_retention**)/100, the logical replication slot will be forcibly invalidated, **restart_lsn** is set to **7FFFFFFF/FFFFFFFF**, and the replication slot does not block the recycling of Xlogs.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: The function of forcibly invalidating a logical replication slot is enabled.
- **off**: The function of forcibly invalidating a logical replication slot is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determine whether to enable this function based on service requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_logical_replication_ddl

Parameter description: Specifies whether the logical decoding supports DDL statements, reverse parsing, and log generation.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Logical replication supports DDL statements, reversely parses DDL execution results, and generates DDL WALs.
- **off**: DDL statements are not supported, reverse parsing is not performed, and WALs are not generated.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_logical_replication_dictionary

Parameter description: Specifies whether to enable the function of creating logical replication slots for multi-version dictionary tables.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value **on**. If you need to create a logical replication slot of the online catalog type, set this parameter to **off**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

If this parameter is enabled, a logical replication slot can be created only after the system catalog of the dictionary type is baselined. Otherwise, the creation fails.

max_keep_log_seg

Parameter description: Flow control parameter. In logical replication, physical logs are parsed and converted into logical logs locally on the DN. When the number of physical log files that are not parsed is greater than the value of this parameter, flow control is triggered.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647. **0** indicates that the flow control function is disabled.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determine whether to perform flow control based on service requirements.

Risks and impacts of improper settings: If the value is too large, flow control will not be triggered.

logical_replication_dictionary_retention_time

Parameter description: Specifies the retention period of data in the system catalogs related to GS_TXN_LSN_TIME and the data dictionary.

Parameter type: integer

Unit: day

Value range: 1 to 3650

Default value: **365**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements.

Risks and impacts of improper settings: If the value is too small, the available interval for decoding the positioning point is too small. If the value is too large, the decoding performance is affected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

logical_replica_identity_force

Parameter description: Specifies the record level of old tuples for global logical replication.

Parameter type: enumerated type

Unit: none

Value range:

- **'full'**: All columns are recorded as replica identifiers.
- **'unique'**: The replica identifier is the primary key and unique key.
- **'default'**: The replica identifier is selected by default (primary key or none).
- **'nothing'**: There is no replica identifier for recording this relationship.
- **'none'**: The global control parameter does not take effect.

Default value: **'none'**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

NOTE

To reset **logical_replica_identity_force** that has been set to a non-default value to **'none'**, you need to restore the GUC parameter to the default value.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.8 Query Planning

This section describes the method configuration, cost constants, planning algorithm, and some configuration parameters for the optimizer.

NOTE

- Two parameters are involved in the optimizer:
  - *INT_MAX* indicates the maximum value of the INT data type. The value is **2147483647**.
  - *DBL_MAX* indicates the maximum value of the FLOAT data type.
- In addition to customer services, global query planning parameters also affect database O&M and monitoring services, such as scale-out, redistribution, and data import and export.

14.3.8.1 Optimizer Method Configuration

These configuration parameters provide a crude method of influencing the query plans chosen by the query optimizer. If the default plan chosen by the optimizer for a particular query is not optimal, a temporary solution is to use one of these configuration parameters to force the optimizer to choose a different plan. Better ways include adjusting the optimizer cost constants, manually running **ANALYZE**, increasing the value of the **default_statistics_target** parameter, and increasing the amount of the statistics collected in specific columns using **ALTER TABLE SET STATISTICS**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_bitmapscan

Parameter description: Specifies the query optimizer's use of bitmap-scan plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this function is disabled, the bitmap scan operator is disabled globally, which may cause performance deterioration in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

force_bitmapand

Parameter description: Specifies whether the query optimizer forcibly uses BitmapAnd plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this parameter is enabled, the optimizer forcibly performs bitmap and index scan when the conditions for using the bitmap and index scan operator are met. In some scenarios, the query performance may be affected. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

enable_hashagg

Parameter description: Specifies the query optimizer's use of Hash aggregation plan types.

Parameter type: Boolean.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the Hash aggregation operator cannot be used in some scenarios, affecting the query rewriting logic and deteriorating the query performance. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

enable_hashjoin

Parameter description: Specifies whether the optimizer uses hash join plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this function is disabled, the Hash Join operator cannot be used globally and other Join plans are preferentially generated. As a result, the performance may deteriorate in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

enable_indexscan

Parameter description: Specifies whether the optimizer uses index-scan plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this function is disabled, the index scan operator is disabled globally, which may cause performance deterioration in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

enable_indexonlyscan

Parameter description: Specifies whether the optimizer uses index-only-scan plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this function is disabled, the index-only-scan operator cannot be used globally. Some plans that require only index scan but do not require table return cannot be generated. As a result, the performance may deteriorate in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

enable_gsiscan

Parameter description: Specifies whether the query optimizer uses global secondary-index-only scan plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: In scenarios where global secondary indexes are available, if this parameter is disabled, only global secondary index scan plans cannot be generated, which may affect the query performance.

enable_gsitablescan

Parameter description: Specifies whether the query optimizer uses the global secondary index table scan plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: In scenarios where global secondary indexes are available, if this parameter is disabled, only global secondary index scan plans cannot be generated, which may affect the query performance.

gsi_fastpath_level

Parameter description: Specifies whether the optimizer executes the determination system of simple query rules of GSI. The simple query rules of GSI are as follows:

- A single table, no subquery, no sublink, or the target table is not a view.
- The query statement cannot generate an execution plan for an ordinary index.
- The query statement cannot generate the IndexOnlyScan execution plan of GSI.
- Query statements do not contain scan hints, such as TableScan and IndexScan.
- The WHERE condition contains an equivalent condition that contains the index key of the candidate GSI (unique and not a partial GSI index).

Parameter type: enumerated type.

Unit: none

Value range:

- **strict**: The equivalent condition contains all GSI index keys.
- **partial**: The equivalent condition contains partial index keys (leftmost match) of GSI. The performance may not be optimal.
- **none**: disabled.

Default value: **strict**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Improper settings may affect plan generation in some GSI scenarios, affecting query performance.

NOTE

If you want to use **partial**:

```
gaussdb=# CREATE TABLE t1(a INT, b INT, c INT);
gaussdb=# CREATE GLOBAL UNIQUE INDEX t1_gsi ON t1(b,c);
-- Q1
gaussdb=# SELECT * FROM t1 WHERE b=1;
-- Q2
gaussdb=# SELECT * FROM t1 WHERE b=1 LIMIT 1;
```

In the preceding scenario, the GSI is created on the **b** and **c** columns. When **gsi_fastpath_level** is set to **partial**, the GSI non-stream return plan can be generated for query statements Q1 and Q2. The uniqueness of an index is ensured by the **b** and **c** columns. For query statement Q1, multiple results may be returned. The performance of the GSI non-stream return plan may not be optimal. For query statement Q2, the limit 1 condition is included, the performance of the GSI non-stream return plan is still optimal.

enable_material

Parameter description: Specifies whether the query optimizer uses materialization. It is impossible to suppress materialization entirely, but setting this parameter to **off** prevents the optimizer from inserting materialized nodes.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this function is disabled, the optimizer is prohibited from inserting entity nodes. As a result, the Material operator cannot be generated in some scenarios, and the performance may deteriorate in some scenarios.

enable_mergejoin

Parameter description: Specifies whether the optimizer uses merge-join plan types.

Parameter type: Boolean.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is enabled, the optimizer generates a merge join path for joins that meet the conditions. As a result, the selected join operator in this scenario may not be the optimal one.

enable_nestloop

Parameter description: Specifies whether the query optimizer uses nested-loop join plan types to fully scan internal tables. It is impossible to completely eliminate nested-loop joins. However, if this parameter is disabled, the optimizer prefers other methods when other methods exist.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is enabled, the optimizer generates a nested-loop join path for joins that meet the conditions. As a result, the selected join operator in this scenario may not be the optimal one.

enable_index_nestloop

Parameter description: Specifies whether the optimizer uses the nested-loop join plan type to scan the parameterized indexes of inner tables.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, parameterized paths cannot be generated in some scenarios. Generally, parameterized paths can improve query performance. Therefore, you are advised to enable this parameter.

enable_remote_param

Parameter description: Specifies whether to use the XC parameterized path feature. If this parameter is enabled, an XC parameterized path plan can be generated.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: In related sublink and nested loop scenarios, if the outer table is small and the inner table is large, and the inner table has the leftmost matching index in the join condition, set this parameter to **on** to improve performance.

Risks and impacts of improper settings: In related sublink and nested loop scenarios, if the outer table size is large and the inner table size is small, setting this parameter to **on** may cause performance deterioration.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Only XC plans are supported. Stream and FQS plans are not supported.
- A plan with the parameter **rescan** is generated for the base table only when the index parameterized path is generated for the base table.
- Only the parameterized path of the base table is supported. The parameterized path of the join table is not supported.
- Stream and XC plans cannot be adaptively selected.
- The nested loop parameterized path supports only the scenario where the inner table is **RemoteQuery**.
- The predpush hint is not supported.
- **RemoteQuery** with the PBE parameter cannot be pushed down.
- In some scenarios, there is no obvious advantage in the execution performance of parameterized paths. Manual optimization is required.
- In M-compatible database, the DN plan cannot be displayed when the value of **max_datanode_for_plan** is greater than 0.

enable_remote_pbe_reuse

Parameter description: Specifies whether to reuse the PBE packets of DNs delivered by the CN as planned by the XC. After this function is enabled, the packets sent by the CN to the DN in the XC plan are changed from unnamed packets to packets with the **_disqry_sys_cached** prefix. The packets are reused during execution, improving query performance.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the XC plan query performance will be affected in some scenarios.

enable_seqscan

Parameter description: Specifies whether the query optimizer uses sequential scan plan types. It is impossible to completely eliminate sequential scan. However, if this parameter is disabled, the optimizer prefers other methods when other methods exist.

Parameter type: Boolean.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the optimizer tends to select other scan methods and lowers the priority of sequential scan methods. In some scenarios, the query performance may be affected.

enable_sort

Parameter description: Specifies whether the optimizer uses sort methods. It is impossible to completely eliminate explicit sorting. However, if this parameter is disabled, the optimizer prefers other methods when other methods exist.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the optimizer prefers other methods and lowers the priority of the sorting method. Therefore, you are advised to enable this parameter.

enable_tidscan

Parameter description: Specifies whether the optimizer uses Tuple ID (TID) scan plan types.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the optimizer prefers other methods and lowers the priority of the TID scan method. Therefore, you are advised to enable this parameter.

enable_kill_query

Parameter description: In CASCADE mode, when a user is deleted, all the objects belonging to the user are deleted. This parameter specifies whether the queries of the objects belonging to the user can be unlocked when the user is deleted.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the unlocking is allowed.
- **off** indicates that the unlocking is not allowed.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this parameter is enabled, when a user is deleted, the query of the user may be exposed, affecting system consistency and security.

enable_stream_concurrent_update

Parameter description: Specifies the optimizer's use of streams in concurrent update scenarios. This parameter is restricted by the **enable_stream_operator** parameter. If concurrent update conflicts occur, an error may be reported. This parameter can be used to control the conflict.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the optimizer can generate stream plans for the UPDATE statement.
- **off** indicates that the optimizer can generate only non-stream plans for the UPDATE statement.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is disabled, the optimizer prefers other methods and generates only non-stream plans for update statements. Therefore, you are advised to enable this parameter.

enable_stream_operator

Parameter description: Specifies whether the optimizer uses stream. When the **enable_stream_operator** parameter is disabled, a large number of logs indicating that the stream plans cannot be pushed down are recorded. If you do not need these logs, you are advised to disable **enable_unshipping_log** when disabling **enable_stream_operator**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value:

- Independent deployment: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to an improper value, the optimizer cannot generate stream plans, which may deteriorate the query performance.

enable_stream_recursive

Parameter description: Specifies whether to push **WITH RECURSIVE** join queries to DNs for processing.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that WITH RECURSIVE join queries will be pushed down to DNs.
- **off** indicates that WITH RECURSIVE join queries will not be pushed down.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query performance may deteriorate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_recursive_times

Parameter description: Specifies the maximum number of WITH RECURSIVE iterations.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **200**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements.

Risks and impacts of improper settings: This parameter is used to prevent an infinite loop of the WITH RECURSIVE statement by using nocycle in hierarchical queries to exit the loop. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

enforce_a_behavior

Parameter description: Specifies the rule matching modes of regular expressions.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The A matching rule is used.
- **off**: The POSIX matching rule is used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual service scenario.

Risks and impacts of improper settings: The regular expression in the query statement cannot be matched as expected.

enable_vector_engine

Parameter description: Specifies whether the optimizer uses vectorized executor.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the optimizer may fail to generate vectorized query plans for specific scenarios, affecting query performance.

enable_broadcast

Parameter description: Specifies whether the query optimizer uses broadcast distribution method when it evaluates the cost of stream.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The accuracy of stream plan generation and the query performance are affected.

enable_change_hjcost

Parameter description: Specifies whether the optimizer excludes inner table running costs when selecting the hash join cost path. If it is set to **on**, tables with a few records and high running costs are more possible to be selected.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The hash join cost may be incorrectly estimated, affecting the accuracy of generating hash join plans.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

best_agg_plan

Parameter description: Specifies the type of hash aggregation plan generated by the optimizer. The optimizer can generate three plans for the aggregation operation in a stream:

1. hashagg+gather(redistribute)+hashagg
2. redistribute+hashagg(+gather)
3. hashagg+redistribute+hashagg(+gather)

Parameter type: integer.

Unit: none

Value range: 0 to 3.

- **0**: The optimizer generates the optimal plan based on the estimated costs of the three plans.
- **1**: The first plan is forcibly generated.
- **2**: The second plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.
- **3**: The third plan is forcibly generated if the **group by** column can be redistributed. Otherwise, the first plan is generated.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter affects the hashagg generation mode. You are advised to use the default value. If this parameter is set to another value, the corresponding hashagg generation mode is preferred. If this parameter is set to an improper value, the query performance in some scenarios may be affected.

agg_redistribute_enhancement

Parameter description: When the aggregate operation is performed, which contains multiple **group by** columns and all of the columns are not in the distribution key, you need to select one **group by** column for redistribution. This parameter specifies the policy of selecting a redistribution key.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The column that can be redistributed with the most distinct value evaluated is selected for redistribution.
- **off**: The first column that can be redistributed is selected for redistribution.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is enabled, the plan generation time increases, but a more reasonable redistribution key may be selected.

enable_absolute_tablespace

Parameter description: Specifies whether the tablespace can use the absolute path.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: An absolute path can be used.
- **off**: No absolute path can be used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, absolute paths cannot be used when tablespaces are created. You are advised to set this parameter based on service requirements. No other risk exists.

enable_valuepartition_pruning

Parameter description: Specifies whether the DFS partitioned table is dynamically or statically optimized.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The DFS partitioned table is dynamically or statically optimized.
- **off**: The DFS partitioned table is not dynamically or statically optimized.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this parameter is disabled, the query performance of DFS partitioned tables may deteriorate.

expected_computing_nodegroup

Parameter description: Specifies a compute node group or the way to choose such a group. The node group mechanism is internal. You do not need to set it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

During join or aggregation operations, a node group can be selected in four modes. In each mode, the specified candidate compute node groups are listed for the optimizer to select the most appropriate one for the current operator.

Parameter type: string.

Unit: none

Value range:

- **optimal**: The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups on which the current user has the COMPUTE permission.
- **query**: The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the node group that combines all DNs in the node groups where base tables involved in the query are located.
- *Node group name* (when **enable_nodegroup_debug** is set to **off**): The list of candidate compute node groups consists of the node groups where the operator's operation objects are located and the specified node group.
- *Node group name* (when **enable_nodegroup_debug** is set to **on**): A specific node group is used as the compute node group.

Default value: **query**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The optimizer may fail to select a better compute node group, affecting query performance.

enable_nodegroup_debug

Parameter description: Specifies whether the optimizer assigns computing workloads to a specific node group when multiple node groups exist in an environment. The node group mechanism is internal. You do not need to set it. This parameter takes effect only when **expected_computing_nodegroup** is set to a specific node group.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Computing workloads are assigned to the node group specified by **expected_computing_nodegroup**.
- **off**: No node group is specified for computing.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: The query performance may be affected.

enable_default_index_deduplication

Parameter description: Specifies whether to deduplicate and compress tuples with duplicate key values for a B-tree index by default. The deduplication and compression functions do not take effect for primary key indexes and unique indexes. When there are a large number of indexes with duplicate key values, the deduplication and compression function can effectively reduce the space occupied by indexes. If the WITH (**deduplication** set to **on**/**off**) syntax is used during index creation, the deduplication parameter is preferentially used to determine whether to use deduplication and compression for the index.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The deduplication and compression function is enabled for B-tree indexes.
- **off**: The deduplication and compression function is disabled for B-tree indexes.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can enable this parameter for non-unique indexes, high index key value repetition, and large index space usage.

Risks and impacts of improper settings: In scenarios where non-unique indexes are used and index key values are seldom repeated or unique, the deduplication and compression function slightly deteriorates the index insertion performance.

enable_expr_fusion

Parameter description: Specifies whether to enable the SRF, expression flattening, transition status of shared aggregate functions, and step number optimization features.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The SRF, expression flattening, transition status of shared aggregate functions, and step number optimization features are enabled.
- **off**: This function is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is enabled, the optimizer running cost increases.

NOTE

The SRF supports only the scenario where **query_dop** is set to **1**.

stream_multiple

Parameter description: Specifies the weight used by the optimizer to calculate the final cost of stream operators. The base stream cost is multiplied by this weight to obtain the final cost.

NOTE

This parameter is applicable only to Redistribute and Broadcast streams.

Parameter type: floating point.

Unit: none

Value range: 0 to *DBL_MAX*

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value and adjust the value based on the deployment environment.

Risks and impacts of improper settings: The optimizer may incorrectly estimate the overhead of the stream operator, affecting the query performance.

qrw_inlist2join_optmode

Parameter description: Specifies whether to enable inlist-to-join query rewriting.

Parameter type: string.

Unit: none

Value range:

- **disable**: The inlist-to-join query rewriting is disabled.
- **cost_base**: cost-based inlist-to-join query rewriting. That is, whether to use inlist-to-join query rewriting is automatically evaluated based on the cost.
- **rule_base**: The rule-based inlist-to-join query rewriting is forcibly enabled.
- A positive integer (1 to 2147483647) indicates the threshold of inlist-to-join query rewriting. If the number of elements in the list is greater than the threshold, the rewriting is performed.

Default value: **cost_base**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value. Use other values only when manual optimization is required in abnormal scenarios or when the query performance of the plan selected by the optimizer is low.

Risks and impacts of improper settings: Whether the optimizer performs inlist-to-join query rewriting is affected. No better plan is generated due to improper settings.

skew_option

Parameter description: Specifies whether an optimization policy is used.

Parameter type: enumerated type.

Unit: none

Value range: **off**, **normal**, and **lazy**

- **off** indicates that the policy is disabled.
- **normal** indicates that a radical policy is used. All possible skews are optimized.
- **lazy** indicates that a conservative policy is used. Uncertain skews are ignored.

Default value: **normal**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Whether the optimizer optimizes skew is affected. The plan generation performance or query execution performance is affected due to improper settings.

default_limit_rows

Parameter description: Specifies the default estimated number of limit rows for generating genericplan.

Parameter type: floating point.

Unit: none

Value range: –100 to *DBL_MAX*

- If this parameter is set to a non-negative number, the value is used as the estimated number of limit rows.
- If this parameter is set to a negative value, the value is used as the default estimated number in percentage. A negative value is converted to the default percentage, that is, **–5** indicates 5%.

Default value: **–10**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: The genericplan query performance of the limit operator may be affected.

check_implicit_conversions

Parameter description: Specifies whether to check candidate index paths generated for index columns that have implicit type conversion in a query. This parameter can be set at the PDB level. For details about the application scenarios of this parameter, see "SQL Optimization > Checking the Performance of Implicit Conversion" in *Developer Guide*.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A check will be performed for candidate index paths generated for index columns that have implicit type conversion in a query.
- **off**: No check will be performed.

Default value: **off**. In the PDB scenario, if this parameter is not set, the global setting is inherited.

NOTE

When this parameter is set to **on**, you need to set **enable_fast_query_shipping** to **off** so that the mechanism for identifying implicit data type casting of index columns can take effect.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: If the check is not performed, the regular expression in the query statement may not be matched as expected.

cost_weight_index

Parameter description: Specifies the cost weight of index_scan.

Parameter type: floating point.

Unit: none

Value range: 1e-6 to 1e+10

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter specifies whether the optimizer uses index_scan. The optimizer may use a non-optimal plan due to improper settings, affecting query performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

try_vector_engine_strategy

Parameter description: Specifies the policy for processing row-store tables by using the vectorized executor. By setting this parameter, queries containing row-store tables can be converted to vectorized execution plans for calculation, improving the execution performance of complex queries in AP-like scenarios.

Parameter type: enumerated type.

Unit: none

Value range:

- **off**: This function is disabled. That is, row-store tables will not be converted into vectorized execution plans for execution.
- **force**: The base table to be queried is a row-store table as long as queries do not contain types or expressions that are not supported by the vectorized engine. Queries are forcibly converted to vectorized execution plans for execution. In this case, the performance may deteriorate in different query scenarios.
- **optimal**: On the basis of **force**, the optimizer determines whether to convert a query statement into a vectorized execution plan based on the query complexity to avoid performance deterioration after the conversion.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Whether the optimizer uses a vectorized execution plan is affected. The query performance may be affected in some scenarios due to improper settings.

enable_opfusion_reuse

Parameter description: Specifies whether to reuse the opfusion obj memory.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the opfusion obj memory is reused when conditions are met.
- **off**: This function is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, plans may be regenerated and the query performance may deteriorate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_iud_fusion

Parameter description: Specifies whether to optimize the IUD statements.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the input is optimized during type conversion.
- **off**: This function is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can enable this function if the IUD statement performance needs to be optimized.

Risks and impacts of improper settings: If this parameter is enabled, the optimizer cost increases without significant risk.

enable_cached_operator

Parameter description: Specifies whether to enable the cache feature for operators in execution state.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Operators can be executed in cache mode.
- **off**: This function is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the operator execution status cannot be cached, affecting the query performance.

enable_smp_partitionwise

Parameter description: Specifies whether to enable the Partition-wise Join capability in the SMP scenario.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: The Partition-wise Join capability is enabled in the SMP scenario.
- **off**: The Partition-wise Join capability is disabled in the SMP scenario.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The data query performance in the SMP scenario may be affected.

force_smp_partitionwise_scan

Parameter description: Specifies whether to enable the Partition-wise Scan parallel scan mode globally after the Partition-wise Join switch **enable_smp_partitionwise** is turned on in the SMP scenario.

Parameter type: Boolean.

Unit: none

Value range:

- **on**:The Partition-wise Scan parallel scan mode is enabled in the SMP scenario.
- **off**:The Partition-wise Scan parallel scan mode is disabled in the SMP scenario.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The performance of reading partitioned table data in the SMP scenario may be affected.

enable_nestagg

Parameter description: Specifies whether to enable nested aggregate function. Nested aggregation is a double aggregation syntax similar to sum(min(col)).

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The nested aggregate function is enabled.
- **off**: The nested aggregate function is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: The nested aggregate function is affected.

14.3.8.2 Optimizer Cost Constants

This section describes the optimizer cost constants. The cost variables described here are measured on an arbitrary scale. Only their relative values matter, therefore scaling them all up or down by the same factor will result in no change in the optimizer's choices. By default, they use the cost of fetching sequential pages as the basic unit. That is, **seq_page_cost** is set to **1.0** and the other cost variables are set with reference to the parameter. However, you can use a different scale, such as actual execution time in milliseconds.

seq_page_cost

Parameter description: Specifies the optimizer's estimated cost of a disk page fetch that is part of a series of sequential fetches.

Parameter type: floating point.

Unit: none

Value range: 0 to *DBL_MAX*

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter affects the performance overhead evaluation of sequentially fetching disk pages in a query. If this parameter is incorrectly set, the optimizer's selection of the generation plan is affected, and the query performance is affected in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

random_page_cost

Parameter description: Specifies the optimizer's estimated cost of an out-of-sequence disk page fetch.

Parameter type: floating point.

Unit: none

Value range: 0 to *DBL_MAX*

Default value: **4**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: See the parameter description.

Risks and impacts of improper settings: This parameter affects the performance overhead evaluation of randomly fetching disk pages in a query. If this parameter is incorrectly set, the optimizer's selection of the generation plan is affected, and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the query performance is affected in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

NOTE

- Although the server allows you to set **random_page_cost** to a value less than that of **seq_page_cost**, it is not physically sensitive to do so. However, setting them equal makes sense if the database is entirely cached in RAM, because in that case there is no penalty for fetching pages out of sequence. Also, in a heavily-cached database you should lower both values relative to the CPU parameters, since the cost of fetching a page already in RAM is much smaller than it would normally be.
- For tables and indexes in a specified tablespace, you can set a tablespace parameter with the same name to overwrite the database-level parameter value. That is, the priority of the tablespace-level parameter is higher than that of the database-level parameter.
- Reducing this value relative to **seq_page_cost** will cause the system to prefer index scans and raising it will make index scans relatively more expensive. You can increase or decrease both values together to change the disk I/O costs relative to CPU costs.

cpu_tuple_cost

Parameter description: Specifies the optimizer's estimated cost of processing each row during a query.

Parameter type: floating point.

Unit: none

Value range: 0 to *DBL_MAX*

Default value: **0.01**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter affects the evaluation of the performance overhead for processing a row of data in a query. If this parameter is incorrectly set, the optimizer's selection of the generation plan is affected, and the query performance is affected in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

cpu_index_tuple_cost

Parameter description: Specifies the optimizer's estimated cost of processing each index entry during an index scan.

Parameter type: floating point.

Unit: none

Value range: 0 to *DBL_MAX*

Default value: 0.005

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: This parameter affects the performance cost evaluation of index scan in a query. If this parameter is incorrectly set, the optimizer's selection of the generation plan is affected, and the query performance is affected in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

cpu_operator_cost

Parameter description: Specifies the optimizer's estimated cost of processing each operator or function executed during a query.

Parameter type: floating point.

Unit: none

Value range: 0 to *DBL_MAX*

Default value: **0.0025**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter affects the performance overhead evaluation of operators or functions in a query. If this parameter is incorrectly set, the optimizer's selection of the generation plan is affected, and the query performance is affected in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

effective_cache_size

Parameter description: Specifies the optimizer's assumption about the effective size of the disk cache that is available to a single query.

Set this parameter based on the following factors: the GaussDB's shared buffer space, the kernel's disk buffer space, and the estimated number of concurrent queries on different tables that share the available space.

This parameter does not affect the size of the shared memory allocated during actual GaussDB running. It is used only for estimation in the plan generation phase. The value is in the unit of disk page. Usually the size of each page is 8192 bytes.

Parameter type: integer.

Unit: page (8 KB)

Value range:

Method 1: Set this parameter to an integer without a unit. The integer ranges from 1 to 2147483647. For example, **200** indicates that there are 200 pages, that is, the size of 200 x 8 KB.

Method 2: Set this parameter to a value with a unit. The value ranges from 1 x 8 KB to 2147483647 x 8 KB. For example, the value **200MB** indicates 200 MB. The unit can only be KB, MB, or GB.

Default value:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Independent deployment:

CN: **2GB** (60-core CPU/480 GB memory); **1GB** (32-core CPU/256 GB memory and 16-core CPU/128 GB memory); **512MB** (8-core CPU/64 GB memory)

DN: **70GB** (60-core CPU/480 GB memory); **38GB** (32-core CPU/256 GB memory); **20GB** (16-core CPU/128 GB memory); **8GB** (8-core CPU/64 GB memory)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: A larger value indicates that the optimizer prefers index scan, and a smaller value indicates that the optimizer prefers full table scanning. Generally, the value is half of the value of **shared_buffers**. More radically, you can set the value to three-fourth of the value of **shared_buffers**. If the memory is sufficient, a larger value indicates better performance.

Risks and impacts of improper settings: The optimizer's selection of the generation plan will be affected, and the query performance will be affected in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

allocate_mem_cost

Parameter description: Specifies the query optimizer's estimated cost of creating a hash table for memory space using hash join. This parameter is used for optimization when the hash join estimation is inaccurate.

Parameter type: floating point.

Unit: none

Value range: 0 to *DBL_MAX*

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Adjust this parameter only when the Hash Join estimation is inaccurate.

Risks and impacts of improper settings: Hash Join estimation may be inaccurate, affecting query performance in some scenarios. Exercise caution when modifying the parameter to avoid risks caused by misoperations.

14.3.8.3 Genetic Query Optimizer

This section describes parameters related to genetic query optimizer. The genetic query optimizer (GEQO) is an algorithm that plans queries by using heuristic searching. This algorithm reduces planning time for complex queries and the costs of producing plans are sometimes inferior to those found by the normal exhaustive-search algorithm.

geqo

Parameter description: Specifies whether to enable the genetic query optimization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Generally, do not disable the parameter during the execution. **geqo_threshold** provides more subtle control of GEQO.

Risks and impacts of improper settings: If the GEQO parameter is disabled, dynamic planning is still used to enumerate all combinations when a query statement involves a large number of tables. As a result, the optimizer generates a plan with high cost.

geqo_threshold

Parameter description: Specifies the number of **FROM** items. Genetic query optimization is used to plan queries when the number of statements executed is greater than this value.

> NOTE
>
> - For simpler queries, it is best to use the regular, exhaustive-search planner; but for queries with many tables, it is better to use GEQO to manage the queries.
> - A **FULL OUTER JOIN** construct counts as only one **FROM** item.

Parameter type: integer.

Unit: none

Value range: 2 to 2147483647

Default value: **12**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If the performance overhead of dynamic planning is acceptable, increase the value of this parameter. If the performance overhead of dynamic planning is unacceptable, decrease the value of this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the value is too large, the cost of enumerating all plans in dynamic planning may be unacceptable. If the value is too small, the plan accuracy may be affected.

geqo_effort

Parameter description: Specifies the trade-off between planning time and query plan quality in GEQO.

Parameter type: integer.

Unit: none

Value range: 1 to 10

Default value: **5**

NOTE

- **geqo_effort** does not do anything directly. This parameter is only used to compute the default values for the other variables that influence GEQO behavior. You can also manually set other parameters.
- Larger values increase the time spent in query planning, but also increase the probability that an efficient query plan is chosen.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the query planning cost may be high. If the value is too small, the quality of the generated query plan may be poor.

geqo_pool_size

Parameter description: Specifies the pool size used by GEQO, that is, the number of individuals in the genetic population.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **0**

NOTE

If this parameter is set to **0**, GaussDB selects a proper value based on **geqo_effort** and the number of tables. In other cases, the value of the parameter is at least **2**, and the useful value typically ranges from 100 to 1000.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the value is too large, the query planning cost may be high. If the value is too small, the quality of the generated query plan may be poor.

geqo_generations

Parameter description: Specifies the number of iterations of the GEQO.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **0**

NOTE

If it is set to **0**, a suitable value is chosen based on **geqo_pool_size**. In other cases, the value of this parameter is at least **1**, and useful values are typically from **100** to **1000**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the query planning cost may be high. If the value is too small, the quality of the generated query plan may be poor.

geqo_selection_bias

Parameter description: Specifies the selection bias used by GEQO. The selection bias is the selective pressure within the population.

Parameter type: floating point.

Unit: none

Value range: 1.5 to 2

Default value: **2**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the parameter is set to a large value, the GEQO algorithm may focus on some excellent plans more quickly than exploring diversity in feasible plans. This may reduce the possibility that the algorithm finds the global optimal solution, but can improve the speed of finding a feasible better solution.

geqo_seed

Parameter description: Specifies the initial value of the random number generator used by GEQO to select random paths through the join order search space.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: floating point.

Unit: none

Value range: 0 to 1

Default value: **0**

NOTE

Varying the value changes the set of join paths explored, and may result in a better or worse best path being found.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Different values bring different randomness, which may affect the quality of connection path generation.

14.3.8.4 Other Optimizer Options

cost_model_version

Parameter description: Specifies the version of the optimizer cost model. It can be regarded as a protection parameter to disable the latest optimizer cost model and keep consistent with the plan of the earlier version.

Parameter type: integer.

Unit: none

Value range: **0**, **1**, **2**, **3**, **4**, and **5**

- **0** indicates that the latest cost estimation model is used. The current version is equivalent to **5**.
- **1**: The original cost estimation model is used.
- **2**: indicates that the enhanced COALESCE expression, hash join cost, and semi/anti join cost are used for estimation on the basis of **1**.
- **3**: indicates that the boundary correction estimator is used to estimate the NDV on the basis of **2**. The hint of indexscan can be applied to indexonlyscan.
- **4**: Partition-level statistics are used for cost estimation on the basis of **3**.
- **5**: The cost estimation of outer join calculation filter is enhanced on the basis of **4**, making the cost-based query rewriting more accurate. The calculation of filter conditions of outer join foreign tables during selectivity calculation is optimized, which can be controlled by the **enable_poisson_outer_optimization** parameter.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When upgrading the database, you are advised to set this parameter the same as that of the source version. When installing a new environment, you are advised to set this parameter to the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is modified, many SQL plans may be changed. Therefore, exercise caution when changing this parameter.

enable_fast_query_shipping

Parameter description: Specifies whether to use the distributed framework for a query planner.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the distributed framework is not used. Execution plans are generated on CNs and DNs separately.
- **off** indicates that the distributed framework is used. Execution plans are generated on CNs and then sent to DNs for execution.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the generated plan may not use the distributed cluster performance more efficiently. You are advised to enable this parameter.

enable_trigger_shipping

Parameter description: Specifies whether the trigger can be pushed to DNs for execution.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the trigger can be pushed to DNs for execution.
- **off** indicates that the trigger cannot be pushed to DNs. It must be executed on CNs.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the performance load is concentrated on the CN, and the cluster performance cannot be maximized. You are advised to enable this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_remotejoin

Parameter description: Specifies whether JOIN operation plans can be pushed to DNs for execution.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: JOIN operation plans can be pushed to DNs for execution.
- **off**: JOIN operation plans cannot be pushed to DNs for execution.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If there is a large amount of data in the JOIN table, the data has been distributed on different DNs based on the JOIN condition, and the DNs have sufficient computing resources to efficiently complete the JOIN operation locally, disabling this parameter may deteriorate the query performance.

enable_remotegroup

Parameter description: Specifies whether the execution plans of GROUP BY and AGGREGATE can be pushed to DNs for execution.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The execution plans of GROUP BY and AGGREGATE can be pushed to DNs for execution.
- **off**: The execution plans of GROUP BY and AGGREGATE cannot be pushed to DNs for execution.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the query involves grouping of a large amount of data and the data is distributed on multiple data nodes, disabling this parameter may deteriorate the query performance.

enable_remotelimit

Parameter description: Specifies whether the execution plan specified in the LIMIT clause can be pushed to DNs for execution.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The execution plan specified in the LIMIT clause can be pushed down to DNs for execution.
- **off**: The execution plan specified in the LIMIT clause cannot be pushed to DNs for execution.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the query involves quick tailoring of a large amount of data and data is distributed on multiple nodes, disabling this parameter may cause query performance deterioration.

enable_remotesort

Parameter description: Specifies whether the execution plan of the ORDER BY clause can be pushed to DNs for execution.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The execution plan of the ORDER BY clause can be pushed to DNs for execution.
- **off**: The execution plan of the ORDER BY clause cannot be pushed to DNs for execution.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the query involves sorting of a large amount of data and the data is distributed on multiple data nodes, disabling this parameter may cause performance deterioration.

enable_rep_table_strict_shipping

Parameter description: Specifies the behavior when the pushdown necessary and sufficient conditions of a replication table fail to be determined during DML operations on the replication table.

Parameter type: Boolean.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **on**: When DML operations are performed on replication tables, the tables cannot be pushed down if the pushdown conditions fail to be determined.
- **off**: When DML operations are performed on replication tables, the pushdown is not disabled and only prompt information is printed in logs if the pushdown conditions of replication tables fail to be determined.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_csqual_pushdown

Parameter description: Specifies whether to push down filter criteria for a rough check during query.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A rough check is performed with filter criteria pushed down during query.
- **off**: A rough check is performed without filter criteria pushed down during query.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If a query involves filtering of a large amount of data and the data is distributed on different nodes, disabling pushdown of filter criteria may cause performance deterioration.

explain_dna_file

Parameter description: Specifies the object file to be exported when **explain_perf_mode** is set to **run**.

Parameter type: string.

Unit: none

Value range: absolute path plus the file name in .csv format.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Set this parameter based on the service scenario if necessary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Improper settings may cause file write overhead.

explain_perf_mode

Parameter description: Specifies the display format of the **explain** command.

Parameter type: enumerated type.

Unit: none

Value range: **normal**, **pretty**, **summary**, and **run**

- **normal** indicates that the default printing format is used.
- **pretty** indicates a new format improved by using GaussDB. The new format contains a plan node ID, directly and effectively analyzing performance.
- **summary** indicates that the analysis result on this information is printed in addition to the printed information specified by **pretty**.
- **run** indicates that the system exports the printed information specified by **summary** as a CSV file for further analysis.

Default value: **pretty**

NOTE

The pretty mode supports only plans that contain stream operators and does not support plans that deliver statements to DNs. Therefore, the display format is affected by the **enable_stream_operator** parameter. When **enable_stream_operator** is set to **off**, the plan containing the stream operator cannot be generated.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can set another value if necessary.

Risks and impacts of improper settings: Different formats affect the amount of information provided by EXPLAIN.

analysis_options

Parameter description: Specifies whether to enable function options in the corresponding options to use the corresponding location functions, including data verification and performance statistics. For details, see the description of the value range.

Parameter type: string.

Unit: none

Value range:

Each time this parameter is set, the current value is changed through the set operation.

```
gaussdb=# show analysis_options;
                      analysis_options
------------------------------------------------------------
 ALL,on(),off(LLVM_COMPILE,HASH_CONFLICT,STREAM_DATA_CHECK)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# SET analysis_options = 'on(LLVM_COMPILE)';
SET
gaussdb=# show analysis_options;
                    analysis_options
------------------------------------------------------------
 ALL,on(LLVM_COMPILE),off(HASH_CONFLICT,STREAM_DATA_CHECK)
(1 row)

gaussdb=# SET analysis_options = 'on(HASH_CONFLICT)';
SET
gaussdb=# show analysis_options;
                    analysis_options
------------------------------------------------------------
 ALL,on(LLVM_COMPILE,HASH_CONFLICT),off(STREAM_DATA_CHECK)
(1 row)
gaussdb=# SET analysis_options = 'off(ALL)';
SET
gaussdb=# show analysis_options;
                     analysis_options
------------------------------------------------------------
 ALL,on(),off(LLVM_COMPILE,HASH_CONFLICT,STREAM_DATA_CHECK)
(1 row)
```

- **LLVM_COMPILE**: The codegen compilation time of each thread is displayed on the explain performance page.
- **HASH_CONFLICT**: The log file in the **gs_log** directory of the DN process displays the hash table statistics, including the hash table size, hash chain length, and hash conflict information.
- **STREAM_DATA_CHECK**: A CRC check is performed on data before and after network data transmission.

Default value: **off(ALL)**, which indicates that no location function is enabled.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If manual setting is required, check whether the expected result meets the requirements.

cost_param

Parameter description: Specifies use of different estimation methods in specific customer scenarios, allowing the cost model estimation more accurate. You can change the parameter values to enable different methods. This parameter can control multiple methods at the same time. Each method is controlled by a number. If the result of the AND operation between the parameter value and the number corresponding to the method is not 0, the method is enabled.

- When **cost_param & 1** is set to a value other than 0, an improved mechanism is used for connecting the selectivity of non-equi-joins. This method is more accurate for estimating the selectivity of joins between two identical tables. At present, if **cost_param & 1** is set to a value other than 0, the path is not used. That is, a better formula is selected for calculation.
- When **cost_param & 2** is set to a value other than 0, the selectivity is estimated based on multiple filter criteria. The lowest selectivity among all filter criteria, but not the product of the selectivities for two tables under a

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

specific filter criterion, is used as the total selectivity. This method is more accurate when a close correlation exists between the columns to be filtered.

- When **cost_param & 4** is not 0, the selected debugging model is not recommended when the stream node is evaluated.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter after determining the scenario where the selectivity needs to be adjusted.

Risks and impacts of improper settings: The estimated cost may not meet the expectation. You are advised to confirm the parameter settings after thorough tests.

enable_partitionwise

Parameter description: Specifies whether to select an intelligent algorithm for joining partitioned tables.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that an intelligent algorithm is selected.
- **off** indicates that an intelligent algorithm is not selected.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Before enabling this function, ensure that SMP is enabled. Otherwise, the performance of the join operation on partitioned tables in non-SMP scenarios may be affected.

enable_partition_pseudo_predicate

Parameter description: Specifies whether to rewrite pseudo-predicates to calculate the selectivity of query in a specified partition.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on** indicates that pseudo-predicate rewriting is used.
- **off** indicates that pseudo-predicate rewriting is not used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

rewrite_rule

Parameter description: Specifies the optional query rewriting rules that are enabled. Some query rewriting rules are optional. Enabling them cannot always improve the query efficiency. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter specifies the combination of query rewriting rules. For example, if there are multiple rewriting rules **rule1**, **rule2**, **rule3**, and **rule4**, you can perform settings as follows:

```
set rewrite_rule=rule1;          -- Enable query rewriting rule rule1
set rewrite_rule=rule2, rule3;     -- Enable query rewriting rules rule2 and rule3
set rewrite_rule=none;         -- Disable all optional query rewriting rules
```

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: No optional query rewriting rules are used.
- **lazyagg**: The Lazy Agg query rewriting rules are used to eliminate aggregation operations in subqueries.
- **magicset**: The Magic Set query rewriting rules are used to associate subqueries which have aggregation operators with the main query in advance to reduce repeated scanning of sublinks.
- **partialpush**: The Partial Push query rewriting rules are used. For statements that cannot be pushed down, push down some subqueries to DNs for execution and the rest to CNs for execution.
- **uniquecheck**: The Unique Check query rewriting rules are used to optimize the subquery statements in target columns without agg and check whether the number of returned rows is 1.
- **disablerep**: The Disable Replicate query rewriting rules are used. The performance may deteriorate after a replication table is optimized. Therefore, after this rule is enabled, subqueries cannot be optimized.
- **intargetlist**: The In Target List query rewriting rules are used to improve subqueries in the target column.
- **predpushnormal**: The Predicate Push query rewriting rules are used. When predicate conditions are pushed down to subqueries, the BROADCAST operator may be added to support distributed execution.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **predpushforce**: The Predicate Push query rewriting rules are used to push down predicate conditions to subqueries and use indexes as much as possible for acceleration.
- **predpush**: The optimal plan is selected based on the cost in **predpushnormal** and **predpushforce**.
- **disable_pullup_expr_sublink**: The optimizer is not allowed to pull up sublinks of the expr_sublink type. For details about sublink classification and pull-up principles, see "SQL Optimization > Typical SQL Optimization Methods > Optimizing Subqueries" in *Developer Guide*.
- **enable_sublink_pullup_enhanced**: Enhanced sublink query rewriting rules are used, including unrelated sublink pull-up of the WHERE and HAVING clauses and WinMagic rewriting optimization.
- **disable_pullup_not_in_sublink**: The optimizer is not allowed to pull up sublinks related to NOT IN. For details about sublink classification and pull-up principles, see "SQL Optimization > Typical SQL Optimization Methods > Optimizing Subqueries" in *Developer Guide*.
- **disable_rownum_pushdown**: The filter criterion ROWNUM in the parent query cannot be pushed down to the subquery.
- **disable_windowagg_pushdown**: The filter criterion of the window function in the parent query cannot be pushed down to the subquery.
- **cse_rewrite_opt**: The common expression CSE is used to replace the common expression in the Having subquery with windowAgg.
- **groupby_pushdown_subquery**: The Group By clause and aggregate function are pushed down to the subquery.
- **enable_sublink_pullup_rownum**: The optimizer can be used to promote subjoins when the SQL statement contains the ROWNUM pseudocolumn.

Default value: **magicset, groupby_pushdown_subquery**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If other rewriting is necessary, you are advised to specify the query rewriting scenario and enable only the corresponding rewriting rule.

Risks and impacts of improper settings: The cost of rewriting statements in some scenarios may not be optimal. You are advised to use the corresponding rules after thorough tests.

costbased_rewrite_rule

Parameter description: Specifies whether to enable the cost-based evaluation policy for a specified query rewriting rule. Some query rewriting rules support cost-based evaluation of whether to rewrite SQL statements. In this way, the kernel can generate better query plans and improve SQL execution efficiency.

This parameter is mutually exclusive with the GUC parameter **rewrite_rule**. If both **costbased_rewrite_rule** and **rewrite_rule** are set, the rule configuration related to **rewrite_rule** does not take effect.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter can be used to set multiple cost-based query rewriting rules. The parameters are not mutually exclusive. For example, if there are multiple rewriting rules **rule1**, **rule2**, **rule3**, and **rule4**, you can perform settings as follows:

```
set costbased_rewrite_rule= rule1;          -- Enable the cost-based evaluation policy of query rewriting rule rule1.
set costbased_rewrite_rule= rule2,rule3;    -- Enable the cost-based evaluation policy for query rewriting rules rule2 and rule3.
set costbased_rewrite_rule=none;            -- Disable the cost-based evaluation policy for all optional query rewriting rules.
```

Parameter type: string.

Unit: none

Value range:

- **none**: No cost-based query rewriting policy is used.
- **pullup_subquery**: The cost-based query rewriting policy is enabled for the rewriting rules of simple subquery expansion.
- **pullup_sublink_any_exists**: The cost-based query rewriting policy is enabled for the rewriting rules of non-correlated sublinks of the ANY type and related sublinks of the [NOT] EXISTS type in a single or AND condition.
- **pullup_not_in_sublink**: The cost-based query rewriting policy is enabled for the rewriting rules of non-correlated sublinks of the NOT IN type in a single or AND condition. This option is mutually exclusive with the **disable_pullup_not_in_sublink** option of the GUC parameter **rewrite_rule**. When this option is enabled, the **disable_pullup_not_in_sublink** option of **rewrite_rule** does not take effect.
- **pullup_expr_sublink**: The rewriting scenarios of expression sublinks, non-correlated sublinks of the ANY type, and related sublinks of [NOT] the EXISTS type in the OR condition take effect. This option is mutually exclusive with the **disable_pullup_expr_sublink**, **enable_sublink_pullup_enhanced**, and **magicset** options of the GUC parameter **rewrite_rule**. When this option is enabled, the corresponding options of **rewrite_rule** do not take effect.
- **intargetlist**: The cost-based query rewriting policy is enabled for the rewriting rules of the sublinks of related expression in the TargetList. This option is mutually exclusive with the **intargetlist** and **magicset** options of the GUC parameter **rewrite_rule**. When this option is enabled, the **intargetlist** and **magicset** options of **rewrite_rule** does not take effect.
- **enable_sublink_pullup_enhanced**: The cost-based query rewriting policy is enabled for the rewriting rules of expression sublinks in the enhanced scenario. This option is affected by the **pullup_expr_sublink** option. This option takes effect only when the **pullup_expr_sublink** option is enabled for the expression sublink rewriting scenario in the AND condition. It is mutually exclusive with the **enable_sublink_pullup_enhanced** option of the GUC parameter **rewrite_rule**. When this option is enabled, the **enable_sublink_pullup_enhanced** option of **rewrite_rule** does not take effect.

Default value: **intargetlist**, **pullup_expr_sublink**, **pullup_not_in_sublink**, and **enable_sublink_pullup_enhanced**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

For details about parameter application scenarios, see "SQL Optimization > Optimization Cases > Case: Adjusting the GUC Parameter costbased_rewrite_rule for Cost-based Query Rewriting" in *Developer Guide*.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Simple subquery expansion (specified by the **pullup_subquery** parameter), ANY non-correlated sublinks, and [NOT] EXISTS related sublinks (specified by the **pullup_sublink_any_exists** parameter) are rewritten based on the default rules to generate an execution plan, because enabling the cost rewriting policy brings some performance overhead, therefore, you are advised not to enable the cost-based rewriting policy for such rules.

Risks and impacts of improper settings: If the rewriting rules related to this parameter are disabled, rewriting is performed based on rules. If the cost evaluation is missing, the generated plans in some scenarios may be poor, affecting the query performance.

costbased_rewrite_rule_max_iterations

Parameter description: In the plan generation phase of an SQL statement, if the number of conditions that meet the cost evaluation in the same rule exceeds the value of this parameter, the cost-based evaluation policy is disabled for the conditions that exceed the threshold in the current request and converted to the rule-based rewriting policy. This parameter takes effect when the cost-based evaluation policy is enabled in the query rewriting phase.

Parameter type: integer.

Unit: none

Value range: 0 to 1000

Default value: **10**

NOTE

- This parameter is affected by the GUC parameter **costbased_rewrite_rule**. This parameter takes effect when the value of **costbased_rewrite_rule** is a value other than **none**.
- If this parameter is set to **0**, the cost-based rewriting policy is disabled for the current SQL statement.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Adjust the value based on service requirements. If the value is too large or too small, extra performance overhead may occur, affecting the final query performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

costbased_rewrite_rule_timeout

Parameter description: In the plan generation phase of an executed SQL statement, if the overall cost evaluation time using each rule exceeds the timeout interval specified by this parameter, the cost-based evaluation policy is disabled for subsequent processes of the current request and the rule-based rewriting policy is used. This parameter takes effect when the cost-based evaluation policy is enabled in the query rewriting phase.

Parameter type: integer.

Unit: ms

Value range: –1 to 300000

Default value: **–1**

NOTE

- This parameter is affected by the GUC parameter **costbased_rewrite_rule**. This parameter takes effect when the value of **costbased_rewrite_rule** is a value other than **none**.
- If this parameter is set to **0**, the cost-based rewriting policy is disabled for the current SQL statement.
- If this parameter is set to **–1**, the timeout interval control is disabled for the current SQL statement.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Adjust the value based on service requirements. If the value is too large or too small, extra performance overhead may occur, affecting the final query performance.

enable_pbe_optimization

Parameter description: Specifies whether the optimizer optimizes the query plan for statements executed in parse bind execute (PBE) mode. The optimization principle is to use gplan for FQS.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The optimizer optimizes the query plan for statements executed in PBE mode and the gplan is used for FQS.
- **off** indicates that the optimization is not performed.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you do not use gplan for FQS, set this parameter to **off**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is disabled, the cplan may be used in some scenarios.

enable_light_proxy

Parameter description: Specifies whether the optimizer optimizes the execution of simple queries on CNs. This parameter does not take effect if the character set of the application side does not match that of the kernel side. You are advised to set the character set to UTF8 when creating a database.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the optimizer optimizes the execution of simple queries on CNs.
- **off** indicates that the optimization is not performed.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the execution pressure of simple queries may be concentrated on the CN.

enable_global_plancache

Parameter description: Specifies whether to share the cache for the execution plans of statements in PBE queries and stored procedures. If this parameter is set to **on**, the memory usage of the CNs and DNs in high concurrency scenarios can be reduced.

When **enable_global_plancache** is enabled, the default value of **local_syscache_threshold** is greater than or equal to 16 MB to ensure that GPC takes effect. If the value of **local_syscache_threshold** is less than 16 MB, set it to 16 MB. If the value is greater than 16 MB, the actual value is used.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that cache sharing is enabled for the execution plans of statements in PBE queries and stored procedures.
- **off** indicates no sharing.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. The value of this parameter must be the same on CNs and DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is set to different values on CNs and DNs, the packets delivered by CNs to DNs do not match. As a result, errors are reported.

enable_stream_pbe

Parameter description: Specifies whether the optimizer uses cache to optimize the STREAM distributed plan on DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the optimizer uses the cache to optimize the STREAM distributed plan on DNs.
- **off** indicates that the optimization is not performed.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the cost of generating a plan may increase.

gpc_clean_timeout

Parameter description: Specifies the retention period of a shared plan that is not used. When **enable_global_plancache** is enabled, if a plan in the shared plan list is not used within the period specified by **gpc_clean_timeout**, the plan will be deleted.

Parameter type: integer.

Unit: second

Value range: 300 to 86400

Default value: **1800**, that is, 30 minutes

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **300** without a unit, it indicates 300s. If this parameter is set to **30min**, it indicates 30 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the GPC may occupy too much memory. You are advised to set this parameter to a proper value after thorough tests.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_gpc_grayrelease_mode

Parameter description: Specifies whether to enable GPC in a distributed cluster. The cluster needs to be restarted to enable GPC. If you want to enable GPC without restarting the cluster, use **enable_gpc_grayrelease_mode**.

NOTICE

Perform operations in a distributed cluster.

To enable GPC:

1. Enable **enable_gpc_grayrelease_mode** on all DNs.
2. Enable **enable_gpc_grayrelease_mode** on all CNs.
3. Enable the GPC parameter which is a POSTMASTER parameter. You need to reload the parameter and then kill the node in polling mode for GPC on the restarted node to take effect.

To disable GPC:

1. Ensure that **enable_gpc_grayrelease_mode** is set to **on**, reload and then disable the GPC parameter, and kill the node in polling mode for GPC on the restarted node to take effect.
2. Disable **enable_gpc_grayrelease_mode** on all CNs.
3. Disable **enable_gpc_grayrelease_mode** on all DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: GPC is enabled in scrolling mode.
- **off**: GPC is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is enabled, the logic for sending and receiving PBE packets is affected. Therefore, you must set this parameter in strict accordance with the parameter description to avoid improper errors.

enable_opfusion

Parameter description: Specifies whether to optimize simple queries.

NOTE

This parameter is used to optimize the query performance of DNs. You can set **max_datanode_for_plan** to view the execution plan of a query DN. If the execution plan of the DN contains **[Bypass]**, the query can be optimized on the DN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The restrictions on simple queries are as follows:

- Only index scan and index-only scan are supported, and the filter criteria of all WHERE statements are on indexes.
- Only single tables can be added, deleted, modified, and queried. JOIN and USING operations are not supported.
- Only row-store tables are supported. Partitioned tables and tables with triggers are not supported.
- Information statistics features of active SQL statements and queries per second (QPS) are not supported.
- Tables that are being scaled out or in are not supported.
- System columns cannot be queried or modified.
- Only simple SELECT statements are supported. For example:
  ```
  SELECT c3 FROM t1 WHERE c1 = ? and c2 =10;
  ```
  Only columns in the target table can be queried. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters. You can use **for update**.
- Only simple INSERT statements are supported. For example:
  ```
  INSERT INTO t1 VALUES (?,10,?);
  ```
  Only one VALUES is supported. The type in VALUES can be a constant or a parameter. RETURNING is not supported.
- Only simple DELETE statements are supported. For example:
  ```
  DELETE FROM t1 WHERE c1 = ? and c2 = 10;
  ```
  Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.
- Only simple UPDATE statements are supported. For example:
  ```
  UPDATE t1 SET c3 = c3+? WHERE c1 = ? and c2 = 10;
  ```
  The values modified in column **c3** can be constants, parameters, or a simple expression. Columns **c1** and **c2** are index columns, which can be followed by constants or parameters.
- Simple insertion with a sequence table is supported, for example:
  ```
  CREATE SEQUENCE SEQ;
  INSERT INTO t1 VALUES (10, nextval('SEQ'::regclass));
  ```
  The second column in **t1** is sequence auto-increment. This parameter takes effect only when **enable_bypass_insert_sequence** is enabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query performance may deteriorate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

sql_beta_feature

Parameter description: Specifies the SQL engine's optional beta features to be enabled, including optimization of row count estimation and query equivalence estimation. These optional features provide optimization for specific scenarios, but performance deterioration may occur in some scenarios for which testing is not performed. In a specific customer scenario, you can set the query rewriting rules through this GUC parameter to achieve optimal query efficiency.

This parameter determines the combination of the SQL engine's beta features, for example, feature1, feature2, feature3, and feature4, as follows:

```
set sql_beta_feature=feature1;          -- Enable the beta feature 1 of the SQL engine.
set sql_beta_feature=feature2,feature3;    -- Enable the beta features 2 and 3 of the SQL engine.
set sql_beta_feature=none;          -- Disable all optional SQL engine beta features.
```

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: uses none of the beta optimizer features.
- **sel_semi_poisson**: uses Poisson distribution to calibrate the equivalent semi-join and anti-join selectivity.
- **sel_expr_instr**: uses the matching row count estimation method to provide more accurate estimation for **instr(col, 'const') > 0, = 0, = 1**.
- **param_path_gen**: generates more possible parameterized paths.
- **rand_cost_opt**: optimizes the random read cost of tables that have a small amount of data.
- **param_path_opt**: uses the bloating ratio of the table to optimize the analysis information of indexes.
- **page_est_opt**: optimizes the **relpages** estimation for the analysis information of table indexes.
- **no_unique_index_first**: disables optimization of the primary key index scan path first.
- **join_sel_with_cast_func**: supports type conversion functions when the number of join rows is estimated.
- **canonical_pathkey**: The regular path key is generated in advance (**pathkey**: a set of ordered key values of data).

  NOTE

  After this option is enabled, the semantics of the output data of statements such as ORDER BY may be different from that of the standard ones in the case of outer join. Contact Huawei technical support and determine whether to enable this parameter.

- **index_cost_with_leaf_pages_only**: specifies whether index leaf nodes are included when the index cost is estimated.
- **a_style_coerce**: enables the Decode type conversion rule to be compatible with ORA. For details, see the part related to case processing in ORA-compatible mode in "SQL Reference > Type Conversion > UNION, CASE, and Related Constructs" in *Developer Guide*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **plpgsql_stream_fetchall**: enables the function of obtaining all tuple results when the SQL statements which use streams are executed on the for loop or cursor in a stored procedure.
- **partition_fdw_on**: supports the creation of SQL statements related to GaussDB foreign tables based on partitioned tables.
- **predpush_same_level**: enables the **predpush** hint to control parameterized paths at the same layer.
- **disable_bitmap_cost_with_lossy_pages**: disables the computation of the cost of lossy pages in the bitmap path cost.
- **enable_upsert_execute_gplan**: allows execution through **gplan** in the PBE scenario, if the UPDATE clause in the ON DUPLICATE KEY UPDATE statement contains parameters.
- **disable_text_expr_flatten**: disables the function of automatically inlining expressions during comparison between text and numeric types (numeric, bigint).

Default value:
"sel_semi_poisson,sel_expr_instr,rand_cost_opt,param_path_opt,page_est_opt"

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. This parameter specifies multiple query optimization and compatibility behaviors. The settings of some options are risky. Therefore, you are advised to use this parameter with caution. If you want to adjust the value, understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

Risks and impacts of improper settings: Sufficient tests are required. Otherwise, unexpected risks may occur.

enable_global_stats

Parameter description: Specifies the current statistics mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The global statistics collection mode is used.
- **off**: The statistics of the first node in the cluster are collected. In this case, the quality of the generated query plan may be affected. However, the information collection performance is optimal. Therefore, exercise caution when disabling this parameter.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query plan generation quality in the cluster environment may be affected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

default_statistics_target

Parameter description: Specifies the default statistics target for table columns without a column-specific target set by running **ALTER TABLE SET STATISTICS**. This parameter affects only the target number of sampled rows in the statistics. The actual number of sampled rows is also affected by the memory parameter **maintenance_work_mem**.

Parameter type: integer.

Unit: none

Value range: –100 to 10000

- If this parameter is set to a positive value, it indicates the expected number of buckets in the statistics histogram. The number of sampled rows is **default_statistics_target** multiplied by 300.
- If this parameter is set to a negative value, it indicates the statistical target in percentage. The negative value is converted to the corresponding percentage. For example, **-5** indicates 5%. The number of sampled rows is the total number of rows multiplied by 5%.

Default value: **100**

NOTE

- A larger positive number than the default value increases the time required to do **ANALYZE**, but might improve the quality of the optimizer's estimates.
- Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
  1. Restore to the default statistics.
  2. Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Optimization > Hint-based Optimization" in *Developer Guide*.
- If this GUC parameter is set to a negative value, the number of samples is greater than or equal to 2% of the total data volume, and the number of records in user tables is less than 1.6 million, the time taken by running **ANALYZE** will be longer than that when this parameter uses its default value.
- If this GUC parameter is set to a negative value, AUTOANALYZE does not take effect.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Before changing settings of this parameter, perform a comprehensive evaluation based on the specific workload and query mode. For tables whose data features are not evenly distributed or whose data volume is large, you may need to manually adjust the value of this parameter.

Risks and impacts of improper settings:

- If the value of **default_statistics_target** is too large, the time and resource consumption of the ANALYZE operation may increase because more sample data needs to be collected to generate statistics. This can result in increased overhead for database maintenance, especially on large tables.
- If the value of **default_statistics_target** is too small, the accuracy of statistics may be reduced. As a result, the query optimizer's capability of generating efficient query plans is affected, and the query performance deteriorates.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

default_gsi_statistics_target

Parameter description: Specifies the default statistics target for global secondary indexes.

Parameter type: integer.

Unit: none

Value range: –100 to 3000000

- If this parameter is set to a positive number, it indicates the number of samples of statistics.
- If this parameter is set to a negative value, it indicates the statistical target in percentage. The negative value is converted to the corresponding percentage. For example, **-5** indicates 5%.

Default value: **0**

NOTE

- The default value **0** indicates that the default sampling rate is used for sampling.
- Changing settings of this parameter may result in performance deterioration. If query performance deteriorates, you can:
  1. Restore to the default statistics.
  2. Use hints to force the optimizer to use the optimal query plan. For details, see "SQL Optimization > Hint-based Optimization" in *Developer Guide*.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Before changing settings of this parameter, perform a comprehensive evaluation based on the specific workload and query mode. For tables whose data features are not evenly distributed or whose data volume is large, you may need to manually adjust the value of this parameter.

Risks and impacts of improper settings:

- If the value of **default_gsi_statistics_target** is too large, the time and resource consumption of the ANALYZE operation may increase because more sample data needs to be collected to generate statistics. This may increase the overhead of database maintenance.
- If the value of **default_gsi_statistics_target** is too small, the accuracy of statistics may be reduced. As a result, the query optimizer's capability of generating efficient query plans is affected, and the query performance deteriorates.

auto_statistic_ext_columns

Parameter description: Collects statistics about multiple columns based on the first **auto_statistic_ext_columns** columns of the composite index in the data table. For example, if a composite index is (a,b,c,d,e) and the GUC parameter is set to **3**, statistics about multiple columns are generated on columns (a,b) and (a,b,c). Multi-column statistics can enable the optimizer to estimate the cardinality more accurately when combined conditions are used for query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The system catalog does not take effect.
- The statistics take effect only when the types of all columns support the comparison functions '=' and '<'.
- System pseudocolumns in indexes, such as **tableoid** and **ctid**, are not collected.
- By default, distinct values, MCVs without NULL, and MCVs with NULL are collected. If the AI-based cardinality estimation parameter **enable_ai_stats** is enabled, MCVs are not collected. Instead, models for AI-based cardinality estimation are collected.
- If the index for creating multi-column statistics is deleted and no other index contains the multi-column combination, the multi-column statistics will be deleted in the next ANALYZE operation.
- If the value of this parameter decreases, the new index generates multi-column statistics based on the value of this parameter. The generated multi-column statistics that exceed the value of this parameter will not be deleted.
- If you want to disable the multi-column statistics on a specific combination only, you can retain the value of this parameter and run the DDL command **ALTER TABLE** *tablename* **disable statistics** *((column list))* to disable the statistics on multiple columns in a specific combination.

Parameter type: integer.

Unit: none

Value range: 1 to 4. **1** indicates that statistics about multiple columns are not automatically collected.

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. When adjusting the value of this parameter, consider the following factors:

- Table size and data characteristics, such as multi-column correlation.
- Query mode, especially the columns and indexes involved in the query.
- Available system resources, such as CPU, memory, and storage space.

Risks and impacts of improper settings:

- If the value is too large, ANALYZE operations may be performed frequently, which increases the database maintenance overhead, especially for large tables.
- If the value is too small, the correlation between columns in the table may not be fully captured. As a result, the query optimizer cannot generate the optimal query plan.

constraint_exclusion

Parameter description: Specifies the query optimizer's use of table constraints to optimize queries.

Parameter type: enumerated type.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **on** indicates that constraints for all tables are examined.
- **off** indicates that constraints for any table are not examined.
- **partition** indicates that only constraints for inheritance child tables and **UNION ALL** subqueries are examined.

Default value: **partition**

NOTE

- When **constraint_exclusion** is set to **on**, the optimizer compares query conditions with the table's **CHECK** constraints, and omits scanning tables for which the conditions contradict the constraints.
- Currently, **constraint_exclusion** is enabled by default only for cases that are often used to implement table partitioning. If this parameter is enabled for all tables, extra planning is imposed on simple queries, which has no benefits. If you have no partitioned tables, disable the parameter.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If table constraints are frequently used in service queries and these constraints help optimize the query, it may be beneficial to keep enabling this parameter. Otherwise, if these constraints are not helpful for query optimization, disabling this parameter may improve performance.

Risks and impacts of improper settings: The query performance may be affected.

cursor_tuple_fraction

Parameter description: Specifies the optimizer's estimated fraction of a cursor's rows that are retrieved.

Parameter type: floating point.

Unit: none

Value range: 0 to 1

Default value: **0.1**

NOTE

Smaller values of this setting bias the optimizer towards using **fast start** plans for cursors, which will retrieve the first few rows quickly while perhaps taking a long time to fetch all rows. Larger values put more emphasis on the total estimated time. At the maximum setting of **1.0**, cursors are planned exactly like regular queries, considering only the total estimated time and how soon the first rows might be delivered.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If most rows in the table are frequently accessed, you can increase the value of this parameter.

Risks and impacts of improper settings: The performance may deteriorate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

from_collapse_limit

Parameter description: Specifies whether the optimizer merges subqueries into upper queries based on the resulting FROM list. The optimizer merges subqueries into upper queries if the resulting FROM list would have no more than this many items.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **8**

NOTE

Smaller values reduce planning time but may lead to inferior execution plans.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If multiple subqueries need to be processed frequently in a query and these subqueries can be effectively combined to improve query performance, you can increase the value of this parameter. Otherwise, if merging subqueries deteriorates performance or increases the time for the optimizer to generate an execution plan, you can reduce the value.

Risks and impacts of improper settings: The performance may deteriorate.

join_collapse_limit

Parameter description: Specifies whether the optimizer rewrites JOIN constructs (except FULL JOINS) into lists of FROM items based on the number of the items in the result list.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **8**

NOTE

- Setting this parameter to **1** prevents join reordering. As a result, the join order specified in the query will be the actual order in which the relations are joined. The query optimizer does not always choose the optimal join order. Therefore, advanced users can temporarily set this parameter to **1**, and then specify the join order they desire explicitly.
- Smaller values reduce planning time but lead to inferior execution plans.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Decreasing the value reduces the planning time but may reduce the plan generation quality. Increasing the value increases the planning time but may generate a better plan.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: The trade-off between the planning time and the plan generation quality. Improper settings may cause the effect of one party to be unacceptable.

plan_mode_seed

Parameter description: This is a debugging parameter. Currently, it supports only **OPTIMIZE_PLAN** and **RANDOM_PLAN**.

Parameter type: integer.

Unit: none

Value range: –1 to 2147483647

- **0**: **OPTIMIZE_PLAN** mode. In this mode, the dynamic planning algorithm is used to estimate the cost and generate the optimal plan.
- **-1**: **RANDOM_PLAN** mode. In this mode, a plan is randomly generated, and the seed value for generating a random number is not specified. The optimizer randomly generates an integer value within the range of 1 to 2147483647 and generates a random execution plan based on the random number.
- Integer within the range of 1 to 2147483647: **RANDOM_PLAN** mode. In this mode, a plan is randomly generated, and the seed value of the seed identifier for generating a random number is specified by the user. The optimizer generates a random execution plan based on the seed value.

Default value: **0**

NOTE

- If this parameter is not set to **0**, the specified plan hint will not be used.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When this parameter is set to the **RANDOM_PLAN** mode, the optimizer randomly generates an execution plan. The execution plan may not be the optimal one, which affects the query performance. Therefore, you are advised to set this parameter to **0** during normal service operations or O&M, such as upgrade, scale-out, and scale-in.

Risks and impacts of improper settings: The performance may deteriorate.

enable_random_datanode

Parameter description: Specifies whether the query of the replication table is conducted on a random DN. A complete replication table is stored on each each DN for random retrieval to release the pressure on nodes.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the function of querying the replication table on a random DN is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off** indicates that the function of querying the replication table on a random DN is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the node pressure may increase sharply.

hashagg_table_size

Parameter description: Specifies the hash table size during the execution of the HASH JOIN operation.

Parameter type: integer.

Unit: none

Value range: 0 to 1073741823. **0** indicates that the database automatically adjusts the size of the hash table as required.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. In actual applications, if you encounter specific query scenarios, for example, aggregation operations that process a large amount of data, you may need to manually adjust this parameter to optimize performance.

Risks and impacts of improper settings: Increasing the size of the hash table can reduce the disk I/O in the HASH AGG operation because more data can be retained in the memory. However, if the size of the hash table is too large, too much memory may be occupied, resulting in insufficient memory. If this parameter is set to a small value, the memory may not be effectively used, resulting in more disk I/O operations and decreasing the query speed.

enable_codegen

Parameter description: Specifies whether code optimization can be enabled. Currently, the code optimization uses the LLVM optimization.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that code optimization is enabled.
- **off** indicates that code optimization is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is enabled, resource usage may increase in expression query scenarios.

codegen_compile_thread_num

Parameter description: Specifies the number of Codegen compilation threads.

Parameter type: integer.

Unit: none

Value range: 1 to 8

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Change the value when the number of concurrent services is large and the service performance bottleneck occurs during expression execution.

Risks and impacts of improper settings: If the number of threads is too large, the system performance may deteriorate. However, when there are a large number of concurrent services, you can increase the number of threads to improve the throughput performance.

llvm_max_memory

Parameter description: Specifies the maximum memory occupied by IRs (including cached and in-use IRs) generated during Codegen compilation. The memory used by Codegen is not applied for by preoccupation. It is a part of **max_dynamic_memory** and is restricted by the **llvm_max_memory** parameter.

Parameter type: integer.

Unit: KB

Value range: 0 to 2147483647. If the value exceeds the specified value, the original recursive execution logic, instead of the Codegen execution logic, is used. When the upper limit is reached and a downgrade is triggered, decreasing the value of **llvm_max_memory** cannot immediately release the memory occupied by extra IRs. The memory occupied by IRs is released after the corresponding SQL statements are executed.

Default value: **131072**, that is, 128 MB.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **100** without a unit, it indicates 100 KB. If this parameter is set to **16MB**, it indicates 16 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value. Change the value when the value of **llvm_used_memory** in the pv_total_memory_detail view reaches the upper limit of the default value and the service performance bottleneck lies in the expression execution process.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings:

- If the parameter is set to an excessively small value, the system does not use the Codegen execution logic, affecting the use of functions.
- If the parameter is set to an excessively small value, LLVM compilation may occupy too many resources of other threads. As a result, the overall system performance deteriorates.

enable_codegen_print

Parameter description: Specifies whether the LLVM IR function can be printed in logs.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the IR function can be printed in logs.
- **off** indicates that the IR function cannot be printed in logs.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Enable this function when locating faults.

Risks and impacts of improper settings: If this parameter is enabled, a large number of logs are generated, occupying disk I/O resources. As a result, the read and write performance of the database system frontend query deteriorates.

codegen_cost_threshold

Parameter description: The LLVM compilation takes some time to generate executable machine code. Therefore, LLVM compilation is beneficial only when the actual execution cost is more than the sum of the cost required for generating machine code and the optimized execution cost. Parameter **codegen_cost_threshold** specifies a threshold. If the estimated execution cost exceeds the threshold, LLVM optimization is performed. codegen uses **plan_rows** of the execution operator as the cost to compare with the value of **codegen_cost_threshold**. You can run the **explain** command to view the value of **plan_rows**.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **100000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can change the value only when you need to change the threshold for triggering the codegen mechanism.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_bloom_filter

Parameter description: Specifies whether the Bloom filter optimization can be used.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that Bloom filter optimization is not allowed. The current version does not support the use of Bloom filter. The value **on** is reserved for forward compatibility.
- **off** indicates that the Bloom filter optimization cannot be used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. The current version does not support the Bloom filter. Even if this parameter is set to **on**, the Bloom filter cannot be used.

enable_extrapolation_stats

Parameter description: Specifies whether the extrapolation logic is used for data of date type based on historical statistics. If this logic is used, the estimation accuracy can be improved for tables whose statistics are not collected in a timely manner. However, the estimation may be too large due to inference errors. This parameter must be enabled when date-type data is periodically inserted.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the extrapolation logic is used.
- **off** indicates that the extrapolation logic is not used.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Before enabling **enable_extrapolation_stats**, you should evaluate the frequency of data changes and the query mode. Enabling this parameter may be helpful if the data changes quickly and process incomplete statistics are required frequently for the query optimizer. Before official launch, adequate testing should be conducted in the test environment to determine the specific impact of enabling extrapolation statistics on performance. After extrapolation statistics are enabled, closely monitor the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

query performance and the accuracy of database statistics to ensure that no performance problem is introduced or the accuracy of statistics is greatly reduced.

Risks and impacts of improper settings: If this parameter is enabled, the query performance may deteriorate due to inference errors.

query_dop

Parameter description: Specifies the user-defined degree of parallelism (DOP).

Parameter type: integer.

Unit: none

Value range: –64 to 64

- A value ranging from 1 to 64 indicates that the fixed SMP is enabled and the system will use the specified DOP.
- **0** indicates that the SMP adaptation is enabled, and the system will dynamically select the optimal DOP based on resource usage and plan characteristics.
- A value ranging from –64 to –1 indicates that the SMP adaptation is enabled, and the system limits the DOP that can be adaptively selected.

NOTE

- After enabling concurrent queries, ensure you have sufficient CPU, memory, network, and I/O resources to achieve the optimal performance.
- To prevent performance deterioration caused by an overly large value of **query_dop**, the system calculates the maximum number of available CPU cores for a DN and uses the number as the upper limit for this parameter. If the value of **query_dop** is greater than 4 and also the upper limit, the system resets **query_dop** to the upper limit.

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. When resources such as the CPU, memory, I/O, and network bandwidth are sufficient, a higher degree of parallelism indicates the better performance improvement.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_analyze_check

Parameter description: Specifies whether it is allowed to check whether statistics were collected about tables whose **reltuples** and **relpages** are displayed as **0** in pg_class during plan generation.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the tables will be checked.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off** indicates that the tables will not be checked.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Enabling the check may cause plan generation overhead, but ensures that statistics have been collected. If most tables whose **reltuples** and **relpages** are **0** in pg_class do not need to collect additional statistics, you can disable the check.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_sonic_hashagg

Parameter description: Specifies whether to use the hash aggregation operator designed for column-oriented hash tables when certain constraints are met.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the hash aggregation operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash aggregation operator designed for column-oriented hash tables is not used.

NOTE

- If **enable_sonic_hashagg** is enabled and the hash aggregation operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the memory usage of the hash aggregation operator can be reduced. However, in scenarios where **enable_codegen** is enabled and the performance is significantly improved, the performance of the operator may deteriorate.
- If **enable_sonic_hashagg** is enabled and the hash agg operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Aggregation in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Aggregation. For details, see "SQL Optimization > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query performance may deteriorate in this scenario.

enable_sonic_hashjoin

Parameter description: Specifies whether to use the hash join operator designed for column-oriented hash tables when certain constraints are met.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the hash join operator designed for column-oriented hash tables is used when certain constraints are met.
- **off** indicates that the hash join operator designed for column-oriented hash tables is not used.

NOTE

- Currently, the parameter can be used only for Inner Join.
- When **enable_sonic_hashjoin** is enabled, the memory usage of query using the Hash Inner operator can be reduced. However, in scenarios where the code generation technology can significantly improve performance, the performance of the operator may deteriorate.
- When **enable_sonic_hashjoin** is enabled and the hash join operator designed based on the column-oriented hash table is used when the query meets the constraint condition, the operator is displayed as Sonic Hash Join in the execution plan and execution information of Explain Analyze/Performance; when the query does not meet the constraint condition, the operator is displayed as Hash Join. For details, see "SQL Optimization > Introduction to the SQL Execution Plan > Description" in *Developer Guide*.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query performance may deteriorate in this scenario.

enable_sonic_optspill

Parameter description: Specifies whether to optimize the number of files to be written to disks for the hash join operator designed for column-oriented hash tables. If this parameter is enabled, the number of files written to disks does not increase significantly when the hash join operator writes a large number of files to disks.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the number of files to be written to disks for the hash join operator designed for column-oriented hash tables is optimized.
- **off** indicates that the number of files to be written to disks for the hash join operator designed for column-oriented hash tables is not optimized.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query performance may deteriorate in this scenario.

plan_cache_mode

Parameter description: Specifies the policy for generating an execution plan in the prepared statement.

Parameter type: enumerated type.

Unit: none

Value range: **auto**, **force_generic_plan**, and **force_custom_plan**

- **auto**: The optimizer automatically selects a custom plan or generic plan.
- **force_generic_plan** indicates that the generic plan is forcibly used (soft parse). The generic plan is a plan generated after you run a prepared statement. The plan policy binds parameters to the plan when you run the **EXECUTE** statement to execute the plan. The advantage of this scheme is that repeated optimizer overheads can be avoided in each execution. The disadvantage is that the plan may not be optimal when data skew occurs for the bound parameters and may result in poor plan execution performance. The bound parameters bind the types of parameters set for the first time. If the type of a parameter set to the same placeholder is different from the previous time, an error is reported.
- **force_custom_plan** indicates that the custom plan is forcibly used (hard parse). The custom plan is a plan generated after you run a prepared statement where parameters in the EXECUTE statement are embedded. The custom plan generates a plan based on specific parameters in the EXECUTE statement. This scheme generates a preferred plan based on specific parameters each time and has good execution performance. The disadvantage is that the plan needs to be regenerated before each execution, resulting in a large amount of repeated optimizer overhead.

NOTE

This parameter is valid only for prepared statements. It is used when the parameterized field in a prepared statement has severe data skew.

Default value: **auto**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual service scenario.

Risks and impacts of improper settings: The plan generation overhead may increase or the plan generation quality may deteriorate.

enable_router

Parameter description: Specifies whether to enable the manual pushdown function so that supported query statements can be pushed down to specific DNs for execution.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You need to manually set the pushdown node to be enabled for a specific distribution key.

Risks and impacts of improper settings: After this function is enabled, if the distribution key is incorrectly set, data may be stored on an incorrect DN. Therefore, exercise caution when enabling this function.

router

Parameter description: Specifies the detailed attributes of the router function. This parameter is valid only when **enable_router** and **enable_light_proxy** are enabled. This parameter is used to calculate the DN where the given distribution key is located based on the hash distribution key of the table. After the router is set, the supported SQL statements are pushed down to the DN for execution.

Parameter type: string.

Unit: none

Value range:

This parameter consists of two parts: **'schema_name.table_name,"distribute_keys"'** (pay attention to the double quotation marks). The meanings are as follows:

- **schema_name.table_name**: indicates the schema name and table name. If schema_name is not set, the default value current_schema is used.
- **distribute_keys**: Values of all distribution keys in the distributed table are separated by commas (,). The sequence of the values must be the same as that of the distribution keys in the table.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You need to manually set the pushdown node to be enabled for a specific distribution key.

Risks and impacts of improper settings: If **router** is incorrectly set, data may be stored to an incorrect DN, causing unpredictable problems. Therefore, exercise caution when setting this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_hypo_index

Parameter description: Specifies whether the optimizer creates virtual indexes when executing the **EXPLAIN** command.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A virtual index is created when the **EXPLAIN** command is executed.
- **off**: No virtual index is created when the **EXPLAIN** command is executed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions in **Table 14-2**.

Setting suggestion: Retain the default value. You can enable this parameter when evaluating whether index creation can improve performance.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_force_vector_engine

Parameter description: Specifies whether to forcibly generate vectorized execution plans for a vectorized execution operator if the operator's child node is a non-vectorized operator. When this parameter is set to **on**, vectorized execution plans are forcibly generated.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that vectorized operators are forcibly generated.
- **off** indicates that the vectorized operator optimizer determines whether to perform vectorization.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You are advised to enable this function in vectorized service scenarios.

Risks and impacts of improper settings: If this parameter is enabled, the query performance may deteriorate.

enable_auto_explain

Parameter description: Specifies whether to enable the function of automatically printing execution plans. This parameter is used to locate slow stored procedures or slow queries and is valid only for the currently connected CN. It does not affect the execution of other CNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you want to view the execution plan, enable this parameter. However, this causes the current system performance to deteriorate.

Risks and impacts of improper settings: After this function is enabled, the current system performance may deteriorate.

auto_explain_level

Parameter description: Specifies the log level for automatically printing execution plans.

Parameter type: enumerated type.

Unit: none

Value range:

- **log**: Logs of the **log** level or higher will be printed.
- **notice**: Logs of the **notice** level or higher will be printed.

Default value: **log**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

auto_explain_log_min_duration

Parameter description: Specifies the minimum duration of execution plans that are automatically printed. Only execution plans whose duration is greater than the value of **auto_explain_log_min_duration** will be printed. For example, if this parameter is set to **0**, all executed plans are printed. If this parameter is set to **3000**, all executed plans are printed if the execution of a statement takes more than 3000 ms.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **100** without a unit, it indicates 100 ms. If this parameter is set to **2min**, it indicates 2 minutes. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value. You can adjust the value based on service requirements to output slow query statements.

Risks and impacts of improper settings: If the value is too small, too much output content may be generated.

max_datanode_for_plan

Parameter description: Specifies the number of execution plans displayed on DNs when FQS plans are generated. The number of plans that are displayed on DNs is determined by the smaller value between the number of DNs on the cluster and the value of this parameter.

Parameter type: integer.

Unit: none

Value range: 0 to 8192

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Change the value when you need a more detailed multi-node execution plan.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_inner_unique_opt

Parameter description: Specifies whether to optimize Inner Unique for nested-loop join, hash join, and sort merge join, that is, whether to reduce the number of matching times when the attribute corresponding to the inner table in the join condition meets the uniqueness constraint.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is disabled, the query performance of the corresponding scenarios may deteriorate.

enable_indexscan_optimization

Parameter description: Specifies whether to optimize B-tree index scan (IndexScan and IndexOnlyScan) in the Astore.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: used.
- **off**: not used.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query performance of the corresponding scenarios may deteriorate.

enable_uniq_idx_a_compat

Parameter description: Specifies whether composite unique indexes are compatible with the ORA database for **NULL** values.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: compatible.
- **off**: incompatible.

Default value: **off**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is applicable only to ORA-compatible databases. Retain the default value.

Risks and impacts of improper settings: Improper settings may affect compatibility or increase query planning overheads.

create_gsi_opt

Parameter description: Specifies the GSI creation mode. Other modes except **none** take effect only after the **enable_stream_operator** parameter is enabled.

Parameter type: enumerated type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **none**: PGXC is used.
- **build**: The STREAMING and GSI BUILD operators are used.
- **parallel**: The STREAMING and GSI BUILD operators and the parallel sorting mode are used. (The **parallel_workers** parameter of the base table needs to be set.)

Default value: **build**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The performance of creating global secondary indexes may deteriorate.

session_sequence_cache

Parameter description: Specifies the **sequence** value applied for one-time interaction in the current session. The unused values are automatically discarded after the session ends.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **10**

NOTE

The default value is **10**. In high-concurrency scenarios, the performance of single and batch insertion is good.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When using **sequence** to import data in batches, you can increase the value of this parameter to improve the insertion speed and high concurrency performance. When a single data record is inserted concurrently, set this parameter to **1** to reduce the sequence change. If you have high requirements on continuity, you need to specify the required cache when creating a sequence. If the value of this parameter is greater than that of cache, the value automatically becomes invalid.

Risks and impacts of improper settings: If the value is too large, the performance of inserting a single record may deteriorate. If the value is too small, the performance of inserting records in batches may deteriorate.

enable_invisible_indexes

Parameter description: Specifies whether the optimizer can use invisible indexes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> After an index is set to invisible, the performance of query statements may be affected. If you do not want to change the index visibility status and want to use invisible indexes, set **enable_invisible_indexes** to **on**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The optimizer can use invisible indexes.
- **off**: The optimizer cannot use invisible indexes.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If invisible indexes are used but this parameter is not enabled, invisible indexes may be ignored. Therefore, a better plan may not be considered.

enable_dynamic_samplesize

Parameter description: Specifies whether to dynamically adjust the number of sampled rows. For a large table with more than one million rows, the number of sampled rows is dynamically adjusted during statistics collection to improve statistics accuracy.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the function is enabled.
- **off**: indicates that the function is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the accuracy of statistics may decrease.

> NOTE
>
> The function of dynamically adjusting the number of sampled rows supports only absolute sampling.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

default_statistic_granularity

Parameter description: Specifies which partition-level statistics of a partitioned table are collected by default when **PARTITION MODE** is not specified. This parameter does not take effect for non-partitioned tables.

Parameter type: enumerated type

Unit: none

Value range:

- **all**: Statistics of the entire table and level-1 partition are collected.
- **global**: Statistics of the entire table are collected.
- **partition**: Statistics of the level-1 partition are collected.
- **global_and_partition**: Statistics about the entire table and level-1 partitions are collected.
- **all_complete**: Statistics about the entire table and level-1 partition are collected.

Default value: **all**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If partition-level statistics need to be collected, you can set this parameter as required. However, the **ANALYZE** performance may be affected.

Risks and impacts of improper settings: You need to balance the maintenance overhead and the accuracy of statistics. Improper settings may cause high costs for one party.

enable_fast_numeric_agg

Parameter description: Specifies whether to enable aggregation optimization for the numeric data type.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The aggregation optimization is enabled for the numeric data type.
- **off**: The aggregation optimization is disabled for the numeric data type.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the query performance of the corresponding scenarios may deteriorate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_poisson_outer_optimization

Parameter description: Specifies whether to use Poisson to correct the selectivity of the filter condition in the foreign table in outer join when the selectivity is calculated in the plan generation phase.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Poisson is not used to modify the selectivity of the filter condition of the foreign table in outer join. That is, the filter condition of the foreign table is not calculated as pushdown.
- **off**: The selectivity is calculated based on the filter condition of the outer join foreign table.

Default value: **off** for an upgraded cluster and **on** for a newly installed cluster.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: A good execution plan may not be selected, and slow SQL statements may occur.

NOTE

The related functions take effect only when **cost_model_version** is greater than or equal to 5 or is set to **0** and **enable_poisson_outer_optimization** is set to **on**.

14.3.9 Error Reporting and Logging

14.3.9.1 Logging Destination

log_destination

Parameter description: GaussDB supports several methods of logging server messages. Set this parameter to a list of desired log destinations separated by commas. (For example, **log_destination** can be set to **"stderr,csvlog"**.)

Parameter type: string.

Unit: none

Value range: **"stderr"**, **"csvlog"**, **"syslog"**, and **"eventlog"**.

- **"stderr"** indicates that logs are printed to the screen.
- **"csvlog"** indicates that logs are output in comma separated value (CSV) format. The prerequisite for generating logs in CSV format is that **logging_collector** must be set to **on**. For details, see **Using CSV Log Output**.
- **"syslog"** indicates that logs are recorded using the syslog of the OS. GaussDB can record logs using syslog from **LOCAL0** to **LOCAL7**. For details, see **syslog_facility**. To record logs using syslog, add the following information to syslog daemon's configuration file:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
local0.*  /var/log/gaussdb
```

- **"eventlog"** indicates that logs are recorded using the event log component. This function is supported only in the Windows OS.

Default value: **"stderr"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

logging_collector

Parameter description: Specifies whether to enable the logger thread to collect logs. This thread captures log messages sent to **stderr** or **csvlog** and redirects them into log files.

This method is more effective than recording logs to syslog because some types of messages cannot be displayed in syslog output, such as messages indicating the loading failures of dynamic link libraries and error messages generated by scripts.

NOTICE

It is possible to log to **stderr** without using the parameter **logging_collector** and the log messages will go to where the server's **stderr** is directed. However, this method is only suitable for low log volumes due to difficulties in rotating log files.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The log collection is enabled.
- **off**: The log collection is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: When this parameter is disabled, CSV logs cannot be used to record logs.

log_directory

Parameter description: Specifies the directory for storing log files when **logging_collector** is set to **on**. The value can be an absolute path, or relative to the data directory. The **log_directory** parameter can be dynamically modified using the **gs_guc reload** command. Only the SYSADMIN user can access this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If **log_directory** is set to an invalid path, the cluster cannot be started.
- If you modify the **log_directory** parameter using the **gs_guc reload** command, and the specified path is valid, the log files are output to this new path. If the specified path is invalid, the log files are output to the valid path set last time and the database operation is not affected. The invalid value of **log_directory** is still written into the configuration file.
- In the sandbox environment, the path cannot contain **/var/chroot**. For example, if the absolute path of log is **/var/chroot/var/lib/log/Ruby/gs_log/cn_log**, you only need to set the path to **/var/lib/log/Ruby/gs_log/cn_log**.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

Parameter type: string.

Unit: none

Value range: a string.

Default value: specified during installation

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_filename

Parameter description: Specifies the names of generated log files when **logging_collector** is set to **on**. The value is treated as a strftime pattern, so %-escapes can be used to specify time-varying file names. Only the SYSADMIN user can access this parameter.

NOTICE

- You are advised to use %-escapes to specify the log file names for efficient management of log files.
- If **log_destination** is set to **csvlog**, log files are output in CSV format with timestamped names, for example, **server_log.1093827753.csv**.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **gaussdb-***%Y-%m-%d_%H%M%S*.**log**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_file_mode

Parameter description: Specifies the permissions of log files when **logging_collector** is set to **on**. The value of **log_file_mode** is usually a number in the format acceptable to the **chmod** and **umask** system calls.

NOTICE

- Before setting this parameter, set **log_directory** to store the logs to a directory other than the data directory.
- Do not make the log files world-readable because they might contain sensitive data.

Parameter type: integer.

Unit: none

Value range: an octal integer ranging from 0000 to 0777 (that is, 0 to 511 in the decimal format).

NOTE

- **0600** indicates that log files are readable and writable only to the server administrator.
- **0640** indicates that log files are readable and writable to members of the administrator's group.

Default value: 0600

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_truncate_on_rotation

Parameter description: Specifies the writing mode of the log files when **logging_collector** is set to **on**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: GaussDB overwrites the existing log files of the same name on the server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off**: GaussDB appends the logging messages to the existing log files of the same name on the server.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_rotation_age

Parameter description: Specifies the interval for creating a log file when **logging_collector** is set to **on**. If the duration from the time when the last log file was created to the current time is greater than the value of **log_rotation_age**, a new log file will be generated.

NOTE

Assume that you want logs to be kept for 7 days, a log file generated each day to be named **server_log.Mon** on Monday, **server_log.Tue** on Tuesday, and so forth, and this week's log files to be overwritten by next week's log files.

Setting method: Set **log_filename** to **server_log.%a**, **log_truncate_on_rotation** to **on**, and **log_rotation_age** to **1440**.

Parameter type: integer.

Unit: minute

Value Range: 0 to 35791394. **0** indicates that the time-based creation of new log files is disabled.

Default value: **1440** (that is, 1 day)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_rotation_size

Parameter description: Specifies the maximum size of a server log file when **logging_collector** is set to **on**. If the total size of messages in a log file exceeds the maximum size, a log file will be generated.

Parameter type: integer.

Unit: KB

Value Range: 0 to 2097151. **0** indicates that the capacity-based creation of new log files is disabled.

Default value: 20480 (20 MB)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

syslog_facility

Parameter description: Specifies the syslog facility to be used when **log_destination** is set to **syslog**.

Parameter type: enumerated type.

Unit: none

Value range: **local0**, **local1**, **local2**, **local3**, **local4**, **local5**, **local6**, and **local7**.

Default value: local0

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

syslog_ident

Parameter description: Specifies the identifier of GaussDB messages in syslog logs when **log_destination** is set to **syslog**.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **"postgres"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

event_source

Parameter description: This parameter takes effect only in a Windows environment. It specifies the identifier of GaussDB messages in logs when **log_destination** is set to **eventlog**.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string.

Default value: **"PostgreSQL"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.9.2 Logging Time

client_min_messages

Parameter description: Specifies the level of messages sent to the client. When messages of the same or higher level are generated, these messages are sent to the client. A lower level indicates that more messages are sent to the client.

Parameter type: enumerated type.

Unit: none

Value range: The message levels are **debug5**, **debug4**, **debug3**, **debug2** (**debug**), **debug1**, **log**, **info**, **notice**, **warning**, **error**, **fatal**, and **panic** in ascending order. For details about the parameters, see **Table 14-12**.

NOTICE

- The message level **debug** is equivalent to **debug2**.
- If the configured level is higher than **error**, for example, **fatal** or **panic**, the system changes the level to **error** by default.

Default value: **notice**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_min_messages

Parameter description: Specifies the level of messages written to CN and DN log files in the server log folder. When a message of the same or higher level is generated, the message is recorded in the log file. Therefore, a lower level indicates that more messages are recorded in the run log of the server.

Parameter type: enumerated type.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: The message levels are **debug5**, **debug4**, **debug3**, **debug2** (**debug**), **debug1**, **info**, **notice**, **warning**, **error**, **log**, **fatal**, and **panic** in ascending order. For details about the parameters, see **Table 14-12**.

NOTE

- The message level **debug** is equivalent to **debug2**.
- For **log_min_messages**, the log message level is higher than **error** and lower than **fatal**.

Default value: **warning**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_min_error_statement

Parameter description: Specifies the message level for recording error SQL statements in server logs. When messages of the same or higher level are generated, the SQL statements that generate these logs are recorded in the log file. Therefore, a lower level indicates more SQL statements are recorded in the log.

Parameter type: enumerated type.

Unit: none

Value range: The message levels are **debug5**, **debug4**, **debug3**, **debug2** (**debug**), **debug1**, **info**, **notice**, **warning**, **error**, **log**, **fatal**, and **panic** in ascending order. For details about the parameters, see **Table 14-12**.

NOTE

- The message level **debug** is equivalent to **debug2**.
- For **log_min_error_statement**, the log message level is higher than **error** and lower than **fatal**. Therefore, when this parameter is set to **error**, the SQL statements that generate logs at the **error**, **log**, **fatal**, and **panic** levels are recorded.

Default value: **error**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_min_duration_statement

Parameter description: When the execution time of an SQL statement is greater than or equal to the value of this parameter, the SQL statement and its execution time are recorded.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting **log_min_duration_statement** makes it easy to trace query statements that need to be optimized. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

Parameter type: integer.

Unit: ms

NOTICE

When you use this parameter together with **log_statement**, the SQL statements that have been logged by **log_statement** will not be repeatedly logged. If syslog is not used, you are advised to use **log_line_prefix** to record PIDs or session IDs so that statement messages and execution time messages can be associated based on PIDs or session IDs.

Value range: –1 to 2147483647

- **–1** indicates that the duration logging is disabled.
- **0** indicates that all SQL statements and their execution time are recorded.
- Positive integer indicates that an SQL statement and its execution time are recorded when the execution time of the SQL statement is greater than or equal to the value of this parameter.

Default value: 3000 (that is, 3s)

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**. If the value is an integer, the default unit is ms. If the value contains a unit, the unit must be ms, s, min, h, or d. For example, if the value is **600** without a unit, **log_min_duration_statement** indicates 600 ms. If the value is **10min**, **log_min_duration_statement** indicates 10 minutes.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is out of the range or the value contains a unit other than ms, s, min, h, and d, an error message is displayed.

backtrace_min_messages

Parameter description: Specifies the message level for printing function stack information. The function's stack information is printed to the server's log file if the information generated is at least the level specified by this parameter.

Parameter type: enumerated type.

Unit: none

NOTICE

This parameter is used to locate problems on-site. Frequent stack printing will affect the system's overhead and stability. Therefore, you are advised not to set **backtrace_min_messages** to a level other than fatal and panic when locating problems.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: The message levels are **debug5**, **debug4**, **debug3**, **debug2** (**debug**), **debug1**, **log**, **info**, **notice**, **warning**, **error**, **fatal**, and **panic** in ascending order. For details about the parameters, see **Table 14-12**.

NOTE

The message level **debug** is equivalent to **debug2**.

Default value: **panic**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

Table 14-12 explains message severities used by GaussDB. If logging output is sent to **syslog** or **eventlog**, the severities are translated as shown in the table. (Note that the translation takes effect only in a Windows environment where GaussDB does not involve this parameter.)

Table 14-12 Message severity levels

Severity	Description	System Log	Event Log
debug[1-5]	Provides detailed debug information.	DEBUG	INFORMATION
log	Reports information of interest to administrators, for example, checkpoint activity.	INFO	INFORMATION
info	Provides information implicitly requested by users, for example, output from **VACUUM VERBOSE**.	INFO	INFORMATION
notice	Provides information that might be helpful to users, for example, truncation of long identifiers and index created as part of the primary key.	NOTICE	INFORMATION
warning	Provides warnings of likely problems, for example, **COMMIT** outside a transaction block.	NOTICE	WARNING
error	Reports an error that causes a command to terminate.	WARNING	ERROR
fatal	Reports the reason that causes a session to terminate.	ERR	ERROR

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Severity	Description	System Log	Event Log
panic	Reports an error that caused all database sessions to terminate.	CRIT	ERROR

14.3.9.3 Logging Content

debug_print_parse

Parameter description: Specifies whether to print parsing tree results.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The printing is enabled.
- **off**: The printing is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

debug_print_rewritten

Parameter description: Specifies whether to print query rewriting results.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The printing is enabled.
- **off**: The printing is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

debug_print_plan

Parameter description: Specifies whether to print the query execution plan to logs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The query execution plan is printed to logs.
- **off**: The query execution plan is not printed to logs.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTICE

- Debugging information about **debug_print_parse**, **debug_print_rewritten**, and **debug_print_plan** is printed only when the log level is set to **log** or higher. When these parameters are set to **on**, their debugging information will be recorded in server logs and will not be sent to client logs. You can change the log level by setting **client_min_messages** and **log_min_messages**.
- Do not call the **gs_encrypt_aes128** and **gs_decrypt_aes128** functions when **debug_print_plan** is set to **on**, preventing the risk of sensitive information disclosure. You are advised to filter parameter information of the **gs_encrypt_aes128** and **gs_decrypt_aes128** functions in the log files generated when **debug_print_plan** is set to **on** before providing the log files to external maintenance engineers for fault locating. After you finish using the logs, delete them as soon as possible.

debug_pretty_print

Parameter description: If this parameter is enabled, logs generated by **debug_print_parse**, **debug_print_rewritten**, and **debug_print_plan** are indented and output in a longer format that is easy to read.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The indentation is enabled.
- **off**: The indentation is disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_checkpoints

Parameter description: Specifies whether the statistics on checkpoints and restart points are recorded in the server logs. When this parameter is set to **on**, statistics on checkpoints and restart points are recorded in the log messages, including the number of buffers written and the time spent in writing them.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Statistics on checkpoints and restart points are recorded in the server logs.
- **off**: Statistics on checkpoints and restart points are not recorded in the server logs

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_connections

Parameter description: Specifies whether to record logs of connection requests from the client. Logs include the IP address, port number, username, database name, and duration of key steps in the GaussDB connection setup process.

NOTE

Some client programs (such as gsql) attempt to connect to the database twice when determining whether a password is required. Therefore, the log message may contain duplicate "connection receive" (indicating that a connection request is received).

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the logs are recorded.
- **off** indicates that the logs are not recorded.

Default value: **off**

Setting method: This is a BACKEND parameter. Set it based on instructions in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_disconnections

Parameter description: Specifies whether to record disconnection request information of the client.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The information is recorded.
- **off**: The information is not recorded.

Default value: **off**

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_duration

Parameter description: Specifies whether to record the duration of every completed SQL statement. For clients using extended query protocols, the time required for parsing, binding, and executing steps are logged independently.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The execution time of all completed SQL statements is recorded.
- **off**: The execution time of SQL statements is not recorded.

  NOTE

  If this parameter is set to **on** or **log_min_duration_statement** is set to **0**, the execution time of each completed SQL statement is recorded. The difference is that **log_min_duration_statement** forcibly records SQL statements.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

log_error_verbosity

Parameter description: Specifies the content output to the server log for each message that is logged.

Parameter type: enumerated type.

Unit: none

Value range:

- **terse**: The record excludes the DETAIL, HINT, QUERY, and CONTEXT error information.
- **verbose**: The record includes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.
- **default**: The record includes the DETAIL, HINT, QUERY, and CONTEXT error information, and excludes the SQLSTATE error code, the source code file name, function name, and number of the line in which the error occurs.

Default value: **default**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter according to the requirement for the detail level of the log message.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_hostname

Parameter description: By default, connection log messages only show the IP address of the connecting host. If this parameter is enabled, the host name is also recorded. It may take some time to parse the host name. Therefore, the database performance may be affected.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The host name is recorded.
- **off**: The host name is not recorded.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The database performance may be affected when this parameter is enabled.

log_line_prefix

Parameter description: Specifies the prefix format of each log. A prefix is a printf-style string that is output at the beginning of each line of the log. The escape

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

character starting with **%** indicates the status information. For details, see **Table 14-13**.

Table 14-13 Escape characters

Escape Character	Status Information
%a	Application name.
%u	Username.
%d	Database name.
%r	Remote host name or IP address and remote port. If **log_hostname** is set to **off**, only the IP address and remote port are displayed.
%h	Remote host name or IP address. If **log_hostname** is set to **off**, only the IP address is displayed.
%p	Thread ID.
%t	Timestamp without milliseconds (no time zone in the Windows OS).
%m	Timestamp with milliseconds.
%n	Node to which an error is reported.
%i	Command tag: type of command executed in the current session.
%e	SQLSTATE error code.
%c	Session ID. For details, see the note below the table.
%l	Number of the log line for each session or thread, starting at 1.
%s	Thread startup time.
%v	Virtual transaction ID (backendID/ localXID).
%x	Transaction ID (**0** indicates that no transaction ID is assigned).
%q	Produces no output. If the current thread is a backend thread, this escape sequence is ignored and subsequent escape sequences are processed. Otherwise, this escape sequence and subsequent escape sequences are all ignored.
%S	Session ID.
%T	Trace ID.
%%	The character %.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The %c escape character prints a session ID consisting of two 4-byte hexadecimal numbers separated by a period (.). The two hexadecimal numbers indicate the thread startup time and thread ID, respectively. Therefore, %c can also be used to record the thread startup time and thread ID, which saves space. For example, you can use the following query to generate such a hexadecimal session ID from pg_stat_activity:

```
SELECT to_hex(EXTRACT(EPOCH FROM backend_start)::integer) || '.' ||
       to_hex(pid)
FROM pg_stat_activity;
```

- If you set a nonempty value for **log_line_prefix**, you should usually make its last character be a space, to provide visual separation from the rest of the log line. A punctuation character can be used, too.
- Syslog generates its own timestamp and thread ID information. Therefore, you do not need to include those escape characters when you are logging in to syslog.

Parameter type: string.

Unit: none

Value range: a string

Default value: **'%m %n %u %d %h %p %S %x %a '**

NOTE

%m %n %u %d %h %p %S %x %a indicates the session start timestamp, error reporting node, username, database name, remote host name or IP address, thread ID, session ID, transaction ID, and application name.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the requirements for log status information.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_lock_waits

Parameter description: When the time for a session to wait for a lock exceeds the value of **deadlock_timeout**, this parameter specifies whether to record the message in the database log. This helps determine whether the lock wait event causes problems such as deadlock.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The information is recorded.
- **off**: The information is not recorded.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_statement

Parameter description: Specifies which SQL statements are recorded. For clients using extended query protocols, logging occurs when an execute message and values (enclosed by a pair of single quotation marks) of bound parameters are received.

NOTICE

- Statements that contain simple syntax errors are not logged even if **log_statement** is set to **all**, because logging occurs only after basic parsing has been completed and the statement type is determined. If an extended query protocol is used, statements that fail before the execution phase (during parsing or planning) are not logged, either. Set **log_min_error_statement** to **ERROR** or lower to log such statements.
- If this parameter is set to a value other than **none**, the statement audit function is enabled. The database administrator can access server logs to view SQL execution records.

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: No SQL statement is recorded.
- **ddl**: All data definition statements, such as CREATE, ALTER, and DROP, are recorded.
- **mod**: All DDL statements and data modification statements, such as INSERT, UPDATE, DELETE, TRUNCATE, and COPY FROM, are recorded.
- **all**: All statements, including the PREPARE, EXECUTE, and EXPLAIN ANALYZE statements, are recorded.

Default value: **none**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on whether SQL statements need to be recorded.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_temp_files

Parameter description: Specifies whether to record the deletion information about temporary files whose size is greater than the value of this parameter. Temporary files can be created for sorting, hashing, and storing temporary querying results. If the recording is enabled, a log entry is generated for each temporary file when it is deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: KB

Value range: –1 to 2147483647

- A positive value indicates that the deletion information of temporary files whose size is larger than the value specified by **log_temp_files** is recorded.
- **0** indicates that the delete information of all temporary files is recorded.
- **–1** indicates that the delete information of any temporary files is not recorded.

Default value: **–1**

Setting method: This is a SUSET parameter. Set it based on instructions in **Table 14-1**. If the value is an integer, the default unit is KB. If the value contains a unit, the unit must be KB, MB, or GB. For example, if the value is **16384** without a unit, **log_temp_files** indicates 16384 KB. If the value is **16MB**, **log_temp_files** indicates 16 MB.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a value other than –1, more temporary files that meet the recording requirements indicate more logs are recorded, affecting the system performance. If the value is out of the range or the value contains a unit other than KB, MB, and GB, an error message is displayed.

log_timezone

Parameter description: Specifies the time zone used for timestamps written in the server log. Different from **TimeZone**, this parameter takes effect for all sessions in the database.

Parameter type: string.

Unit: none

Value range: a string. You can query the PG_TIMEZONE_NAMES view to obtain the value. For details, see "System Catalogs and System Views > System Views > PG_TIMEZONE_NAMES" in *Developer Guide*.

Default value: Set this parameter based on the OS time zone.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

The default value will be changed when **gs_initdb** is used to set system environments.

logging_module

Parameter description: Specifies whether module logs are output on the server. This parameter depends on the setting of the **log_min_messages** parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Module logs whose levels are lower than the value of **log_min_messages** will not be printed.

Parameter type: string.

Unit: none

Default value: **'off(ALL)'**. That is, all module logs are disabled by default.

Value range: All module logs are not output on the server. You can run the **SHOW logging_module** command to view the logs.

```
ALL,on(),off(COMMAND,DFS,GUC,GSCLEAN,HDFS,ORC,SLRU,MEM_CTL,AUTOVAC,CACHE,ADIO,SSL,GDS,TBL

```

NOTICE

CN_RETRY does not take effect in the current version.

Setting method: This is a session-level parameter, and you are advised not to use the gs_guc tool to set it.

Setting method: Run **SHOW logging_module** to view which modules are controllable. For example, the query output result is as follows:

```
gaussdb=# show logging_module;
logging_module
-------------------
```

```
gaussdb=# set logging_module='on(SSL)';
SET
gaussdb=# show
logging_module;
       logging_module
-------------------
```

```

REPAIR,AUTHID,CCINDEX,ONLINE_DDL,MTD,EXRTO_BUFFER,HTAP,UALT,GTM_LITE_READ_S,UGIN),off()
(1 row)
```

Setting suggestion: Enable the log printing function of the corresponding module as required. You are advised not to enable the log printing function for all modules (that is, set this parameter to **'on(ALL)'**).

Risks and impacts of improper settings: If this parameter is enabled, a large number of logs related to the corresponding module may be printed, affecting system performance.

enable_unshipping_log

Parameter description: Specifies whether to log statements that are not pushed down. The logs help locate performance issues that may be caused by statements not pushed down. If **enable_stream_operator** is disabled and this parameter is set to **on**, a large number of logs indicating that plans cannot be pushed down are recorded. If you do not need these logs, you are advised to disable **enable_unshipping_log** when disabling **enable_stream_operator**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Logs are printed.
- **off**: Logs are not printed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

opfusion_debug_mode

Parameter description: Checks whether simple queries are optimized for debugging. If this parameter is set to **log**, you can view the specific reasons why queries are not optimized in the DN execution plans.

Parameter type: enumerated type.

Unit: none

Value range:

- **off**: This function is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **log**: This function is enabled. You can view reasons why queries are not optimized are included in the DN execution plan.

NOTICE

- You need to set **max_datanode_for_plan** to view the DN execution plans.
- To view the reasons why queries are not optimized in the log, set the parameter to **log**, **log_min_messages** to **debug4**, and **logging_module** to **'on(OPFUSION)'**. Note that a large number of log messages may be generated. Therefore, execute only a small number of jobs during debugging.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_debug_vacuum

Parameter description: Specifies whether to allow output of some VACUUM-related logs for problem locating. This parameter is used only by developers. Common users are advised not to use it.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_err_stack

Parameter description: Specifies whether to print stack information for errors whose **ACTION** is "Contact Huawei technical support."

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_show_err_code

Parameter description: Specifies whether to display error codes for front-end connections such as gsql.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.9.4 Using CSV Log Output

Prerequisites

- The **log_destination** parameter is set to **csvlog**.
- The **logging_collector** parameter is set to **on**.

Definition of csvlog

Log lines are emitted in comma separated values (CSV) format.

An example table definition for storing CSV-format log output is shown as follows:

```
CREATE TABLE gaussdb_log
(
log_time timestamp(3) with time zone,
node_name text,
user_name text,
database_name text,
process_id bigint,
connection_from text,
"session_id" text,
session_line_num bigint,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
command_tag text,
session_start_time timestamp with time zone,
virtual_transaction_id text,
transaction_id bigint,
query_id bigint,
module text,
error_severity text,
sql_state_code text,
message text,
detail text,
hint text,
internal_query text,
internal_query_pos integer,
context text,
query text,
query_pos integer,
location text,
application_name text
);
```

For details, see **Table 14-14**.

Table 14-14 Meaning of each csvlog field

Field	Description	Field	Description
log_time	Timestamp in milliseconds	module	Log module
node_name	Node name	error_severity	ERRORSTATE code
user_name	Username	sql_state_code	SQLSTATE code
database_name	Database name	message	Error message
process_id	Thread ID	detail	Detailed error message
connection_from	Port number of the client host	hint	Prompt message
session_id	Session ID	internal_query	Internal query (This field is used to query the information leading to errors if any.)
session_line_num	Number of lines in each session	internal_query_pos	Pointer for an internal query
command_tag	Command tag	context	Environment

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Field	Description	Field	Description
session_start_time	Start time of a session	query	Character count at the position where errors occur
virtual_transaction_id	Regular transaction	query_pos	Pointer at the position where errors occur
transaction_id	Transaction ID	location	Position where errors occur in the GaussDB source code if **log_error_verbosity** is set to **verbose**.
query_id	Query ID	application_name	Application name

Run the **COPY FROM** command to import a log file to this table.

```
COPY gaussdb_log FROM '/opt/data/gs_log/logfile.csv' WITH csv;
```

NOTE

The log name (**logfile.csv**) here needs to be replaced with the name of a log generated.

Simplifying Input

Simplify importing CSV log files by performing the following operations:

- Set **log_filename** and **log_rotation_age** to provide a consistent, predictable naming solution for log files. By doing this, you can predict when an individual log file is complete and ready to be imported.
- Set **log_rotation_size** to **0** to disable size-based log rollback, as it makes the log file name difficult to predict.
- Set **log_truncate_on_rotation** to **on** so that old log data cannot be mixed with the new one in the same file.

14.3.10 Alarm Reporting

During the running of cluster, error can be reported and informed to users in a timely manner. You can view system_alarm logs in *$GAUSSLOG*/**cm**, *$GAUSSLOG*/**gs_log/gtm**, *$GAUSSLOG*/**gs_log**, or *$GAUSSLOG*/**roach/agent**.

enable_alarm

Parameter description: Specifies whether to enable the alarm reporting thread to report possible fault scenarios in the database.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The alarm reporting thread is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off**: The alarm reporting thread is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, users cannot perceive some fault scenarios in the database.

NOTE

This parameter takes effect only on CNs and DNs.

connection_alarm_rate

Parameter description: Specifies the ratio restriction on the maximum number of allowed parallel connections to the database. The maximum number of concurrent connections to the database is **max_connections** x **connection_alarm_rate**. When the number of concurrent connections exceeds **max_connections** x **connection_alarm_rate**, the backend prints the connection information log (**connection_log**), you can view the pg_stat_activity view and thread pool view LOCAL_THREADPOOL_STATUS in logs. (To view the pg_stat_activity view, you need to enable the tracing function. To view the thread pool view LOCAL_THREADPOOL_STATUS, you need to enable the thread pool function.)

Parameter type: floating point.

Unit: none

Value range: 0 to 1

Default value: **0.9**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings:

- If the value is too large and the same alarm is detected for multiple times within the specified alarm reporting interval, key alarms will be lost.
- If the value is too small and the same alarm is detected continuously within the specified alarm reporting interval, the alarm is reported frequently.

alarm_component

Parameter description: Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm_report_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: valid file name.

- If **--alarm-type** in the gs_preinstall script is set to **5**, no third-party component is connected and alarms are written into system_alarm logs. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the gs_preinstall script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **"/opt/huawei/snas/bin/snas_cm_cmd"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

table_skewness_warning_threshold

Parameter description: Specifies the threshold for triggering a table skew alarm.

Parameter type: floating point.

Unit: none

Value range: 0 to 1

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can adjust the value based on the sensitivity to table skew in service scenarios.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is set to a small value, the system may be more sensitive to table skew. There is no significant risk.

table_skewness_warning_rows

Parameter description: Specifies the number of rows for triggering a table skew alarm.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **100000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You can adjust the value based on the sensitivity to table skew in service scenarios.

Risks and impacts of improper settings: If this parameter is set to a small value, the system may be more sensitive to table skew. There is no significant risk.

14.3.11 Statistics During the Database Running

14.3.11.1 Query and Index Statistics Collector

The query and index statistics collector is used to collect statistics during database running. The statistics include the times of inserting and updating a table and index, the number of disk blocks and tuples, and the time required for the last cleanup and analysis on each table. The statistics can be viewed by querying system views pg_stats and pg_statistic. The parameters below are used to set the statistics collection feature in the server scope.

track_activities

Parameter description: Specifies whether to collect statistics about the commands that are being executed in each session. For a stored procedure, if this parameter is enabled, you can view the PERFORM statement, stored procedure calling statement, SQL statement, and OPEN CURSOR statement that are being executed in the stored procedure in the pg_stat_activity view.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The statistics collection function is enabled.
- **off**: The statistics collection function is disabled.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **off**, the space reclamation capability of the storage engine is affected, causing space expansion.

track_counts

Parameter description: Specifies whether to collect statistics about database activities. Database statistics are required when the autovacuum process checks for databases that need to be vacuumed. Therefore, the default value is set to **on**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The statistics collection function is enabled.
- **off**: The statistics collection function is disabled.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **off**, the space reclamation capability of the storage engine is affected, causing space expansion.

track_procedure_sql

Parameter description: Specifies whether the SQL statements that are being executed in the stored procedure are printed in the query column in the pg_stat_activity system catalog.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: When a stored procedure is called, the statements that are being executed by the stored procedure are printed in the query column of pg_stat_activity.
- **off**: When a stored procedure is called, only statements for calling the stored procedure are printed in the query column of pg_stat_activity.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

track_io_timing

Parameter description: Specifies whether to collect statistics about I/O timing in the database. The I/O timing statistics can be queried by using the **pg_stat_database** parameter. When this parameter is enabled, the collector repeatedly queries the OS information at the current time, which may cause significant cost on some platforms. Therefore, the default value is **off**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The statistics collection function is enabled.
- **off**: The statistics collection function is disabled.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

track_functions

Parameter description: Specifies whether to collect statistics of the number and duration of function calls.

NOTE

When the SQL functions are set to inline functions queried by the calling, these SQL functions cannot be traced no matter the parameter is enabled or not.

Parameter type: enumerated type.

Unit: none

Value range:

- **pl**: Only procedural language functions are traced.
- **all**: SQL language functions are traced.
- **none**: The function tracing function is disabled.

Default value: **none**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

track_activity_query_size

Parameter description: Specifies byte counts of the current running commands used to trace each active session. If the actual number of bytes in a command is greater than the value of this parameter, the command is truncated.

Parameter type: integer.

Unit: byte

Value range: 100 to 102400

Default value: 1024

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual service scenario.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

update_process_title

Parameter description: Specifies whether to control statistics updated with a thread name each time the server receives a new SQL statement.

The thread name can be viewed on Windows task manager by running the **ps** command.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The statistics collection function is enabled.
- **off**: The statistics collection function is disabled.

Default value: **off**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

stats_temp_directory

Parameter description: Specifies the directory for storing temporary statistics. Only the SYSADMIN user can access this parameter.

NOTE

If a RAM-based file system directory is used, the actual I/O cost can be lowered and the performance can be improved.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: valid directory.

Default value: **"pg_stat_tmp"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_gsstat_cache

Parameter description: Specifies whether to enable cache acceleration for PgStat functions.

PgStat functions include pg_stat_get_numscans, pg_stat_get_tuples_returned, pg_stat_get_tuples_fetched, pg_stat_get_tuples_inserted, pg_stat_get_tuples_updated, pg_stat_get_tuples_deleted, pg_stat_get_tuples_hot_updated, pg_stat_get_live_tuples, pg_stat_get_dead_tuples, pg_stat_get_autovacuum_count, pg_stat_get_autoanalyze_count, pg_stat_get_blocks_fetched, pg_stat_get_blocks_hit, pg_timestamp stat_get_last_autoanalyze_time, pg_timestamp stat_get_last_autovacuum_time, and pg_timestamp stat_get_last_updated.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The cache acceleration function is enabled for PgStat functions.
- **off**: The cache acceleration function is disabled for PgStat functions.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If this parameter is disabled and the query of PgStat-related views using the preceding functions is slow, you are advised to enable this parameter.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

track_thread_wait_status_interval

Parameter description: Specifies the interval of collecting the thread status information.

Parameter type: integer.

Unit: minute

Value range: 0 to 1440

Default value: **30**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **100** without a unit, it indicates 100 minutes. If this parameter is set to **1d**, it indicates 1 day. The unit must be **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_save_datachanged_timestamp

Parameter description: Specifies whether to record the time when **INSERT**, **UPDATE**, **DELETE**, or **EXCHANGE**/**TRUNCATE**/**DROP PARTITION** is performed on table data.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The time when an operation is performed on table data will be recorded.
- **off**: The time when an operation is performed on table data will not be recorded.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

plan_collect_thresh

Parameter description: Collects statistics about the plans that are being executed in each session.

Parameter type: integer.

Unit: none

Value range: –1 to 2147483647

- **–1**: Plans that are being executed are not collected.
- **0**: If the current SQL execution time is greater than or equal to the value of **log_min_duration_statement** and the total number of tuples processed by all operators in the plan is greater than or equal to 10000, the system starts to collect plans in running state. Each time the total number of tuples processed by all operators exceeds 10000, a collection is performed.
- Value greater than **0**: When the total number of tuples incrementally returned by all operators in a plan is greater than or equal to the value of this parameter, plans that are being executed are collected once.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

track_sql_count

Parameter description: Specifies whether to collect statistics about the statements (SELECT, INSERT, UPDATE, MERGE INTO, and DELETE) that are being executed in a session.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The statistics collection function is enabled.
- **off**: The statistics collection function is disabled.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

If this parameter is disabled, the query result is 0.

14.3.11.2 Hotspot Key Statistics

In the distributed architecture, if applications access a node in a short period of time, the resource usage of the node is too high, affecting the normal running of the database. GaussDB provides the function of quickly detecting hotspot keys to quickly determine whether there are hotspot keys and the distribution of hotspot keys.

enable_hotkeys_collection

Parameter description: Specifies whether to automatically collect statistics on the accessed key values in the database.

NOTE

If you set parameters using **gs_guc** set, you need to restart the database for the GUC parameters to take effect. During the restart, hotspot key information is cleared.

When the GUC parameter is disabled, the query result of the hotspot key is empty and a message is displayed indicating that the GUC parameter is disabled. However, when the function is disabled, the hotspot key clearance API can still be used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The statistics collection function is enabled.
- **off**: The statistics collection function is disabled.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Enable this parameter when the hotspot detection function is required.

Risks and impacts of improper settings: If this function is enabled, the TPC-C performance slightly deteriorates by less than 5%, and each instance occupies 500 MB memory resources.

14.3.12 Workload Management

If database resource usage is not controlled, concurrent tasks may preempt resources. As a result, the OS will be overloaded and cannot respond to user tasks; or even crash and cannot provide any services to users. The GaussDB workload management balances the database workload based on available resources to prevent database overloads.

use_workload_manager

Parameter description: Specifies whether to enable the resource management function. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The resource management function is enabled.
- **off**: The resource management function is disabled.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If method 2 in **Table 14-1** is used to change the parameter value, the new value takes effect only for the threads that are started after the change. In addition, the new value does not take effect for new jobs that are executed by backend threads and reused threads. You can make the new value take effect for these threads by using **kill session** or restarting the node.
- After the value of **use_workload_manager** changes from **off** to **on**, statistics about storage resources when **use_workload_manager** was **off** are not collected. To collect statistics about such resources, run the following SQL statement:
  ```
  SELECT gs_wlm_readjust_user_space(0);
  ```

enable_control_group

Parameter description: Specifies whether to enable the Cgroup function. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The Cgroups function is enabled.
- **off**: The Cgroups function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on the corresponding setting method in **Table 14-1**. When you change the parameter value using method 2 listed in the table, the new value takes effect only for the thread that is started after the change.

Setting suggestion: The modification does not take effect for backend threads and new jobs that are reused by threads. If you want such threads to identify parameter changes in real time, kill sessions or restart nodes.

Risks and impacts of improper settings: If this parameter and the resource management function (**use_workload_manager**) are enabled at the same time, the user resource management function takes effect, deteriorating the performance of jobs executed by users.

enable_cgroup_switch

Parameter description: Specifies whether a statement is automatically switched to the TopWD group when the statement is executed by control group type.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A statement is automatically switched to the TopWD group when the statement is executed by control group type.
- **off**: A statement is not automatically switched to the TopWD group when the statement is executed by control group type.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

This parameter is valid only when **enable_control_group** is set to **on**.

cgroup_name

Parameter description: Specifies the name of the Cgroup in use and changes the priority of items in the queue of the Cgroup.

If you set **cgroup_name** and then **session_respool**, the Cgroup associated with **session_respool** takes effect. If you reverse the order, the Cgroup associated with **cgroup_name** takes effect.

If the workload Cgroup level is specified during the **cgroup_name** change, the database does not check the Cgroup level. The level ranges from 1 to 10.

Parameter type: string.

Unit: none

Value range: name of an existing Cgroup.

Default value: **"DefaultClass:Medium"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Do not use both **cgroup_name** and **session_respool**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

DefaultClass:Medium indicates the **Medium** Cgroup that belongs to the **Timeshare** Cgroup under the **DefaultClass** Cgroup.

enable_backend_control

Parameter description: Specifies whether the database permanent thread is bound to the **DefaultBackend** Cgroup. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Permanent threads are bound to the **DefaultBackend** Cgroup.
- **off**: Permanent threads are not bound to the **DefaultBackend** Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

This parameter is valid only when **enable_control_group** is set to **on**.

enable_vacuum_control

Parameter description: Specifies whether autovacuum worker in the database permanent thread is bound to the **Vacuum** Cgroup. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The autovacuum worker thread is bound to the **Vacuum** Cgroup.
- **off**: The autovacuum worker thread is not bound to the **Vacuum** Cgroup.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

This parameter is valid only when **enable_control_group** is set to **on**.

enable_perm_space

Parameter description: Specifies whether to enable the perm space function. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The perm space management is enabled.
- **off**: The perm space management is disabled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_verify_active_statements

Parameter description: Specifies whether to enable the background calibration during static self-adaptive workload balancing. This parameter must be used on CNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The backend calibration is enabled.
- **off**: The backend calibration is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

parctl_min_cost

Parameter description: Specifies the execution cost threshold of a statement. If the execution cost of a statement exceeds the specified value, the statement is subject to the concurrent limit of a resource pool.

Parameter type: integer.

Unit: none

Value range: –1 to 2147483647

- If the value is **–1** or the cost of executing a statement is less than 10, the statement is not subject to the concurrency limit of the resource pool.
- If the value is greater than or equal to **0**, **enable_dynamic_workload** is set to **off**, and the cost of executing a statement exceeds the value and is greater than or equal to 10, the statement is subject to the concurrency limit of the resource pool.

Default value: **100000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cpu_collect_timer

Parameter description: Specifies how frequently CPU data is collected during statement execution on database nodes.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **30**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: A database administrator should set a proper collection frequency based on system resources (for example, CPU, I/O, and memory resources). A too small value will affect the execution efficiency and a too large value will reduce the accuracy of exception handling.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

memory_tracking_mode

Parameter description: Specifies the memory information recording mode.

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: Memory statistics are not collected.
- **peak**: Memory statistics on the peak value of the query level are collected. The value is recorded in the database log and can also be output by using **explain analyze**.
- **normal**: Memory statistics are collected in real time but no file is generated.
- **executor**: A statistics file is generated, containing the context information of all allocated memory used on the execution layer.
- **fullexec**: A statistics file is generated, containing the information about all memory contexts requested by the execution layer.

Default value: **none**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

memory_detail_tracking

Parameter description: Specifies the memory context allocation priority of a thread and the plannodeid of the query for which the current thread is running. This parameter is used only in the debug version.

Parameter type: string.

Unit: none

Value range: a string.

Default value: ""

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You are not allowed to set this parameter.

Risks and impacts of improper settings: none

enable_resource_track

Parameter description: Specifies whether to enable the real-time resource monitoring function. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The resource monitoring is enabled.
- **off**: The resource monitoring is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_resource_record

Parameter description: Specifies whether resource monitoring records are archived. If this parameter is set to **on**, records in the history views (GS_WLM_SESSION_HISTORY and GS_WLM_OPERATOR_HISTORY) are archived to the corresponding info views (GS_WLM_SESSION_INFO and GS_WLM_OPERATOR_INFO) at an interval of 3 minutes. After being archived, the records are deleted from the history views. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **on**: The resource monitoring records are archived.
- **off**: The resource monitoring records are not archived.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_logical_io_statistics

Parameter description: Specifies whether to enable the logical I/O statistics function during resource monitoring. If this function is enabled, the **read_kbytes**, **write_kbytes**, **read_counts**, **write_counts**, **read_speed**, and **write_speed** fields in the PG_TOTAL_USER_RESOURCE_INFO view will collect statistics on the byte count, number of times, and speed of logical read and write. Fields related to logical read and write in the system catalogs GS_WLM_USER_RESOURCE_HISTORY and GS_WLM_INSTANCE_HISTORY will collect statistics on the logical read and write of related users and instances.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The logical I/O statistics function is enabled.
- **off**: The logical I/O statistics function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_user_metric_persistent

Parameter description: Specifies whether to dump the historical monitoring data of user resources. If this function is enabled, data in the PG_TOTAL_USER_RESOURCE_INFO view is periodically sampled and saved to the GS_WLM_USER_RESOURCE_HISTORY system catalog. For details, see "System Catalogs and System Views > System Views > GS_WLM_USER_RESOURCE_HISTORY" in *Developer Guide*.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: The historical monitoring data of user resources is dumped.
- **off**: The historical monitoring data of user resources is not dumped.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

user_metric_retention_time

Parameter description: Specifies the retention days of the historical monitoring data of user resources. This parameter is valid only when **enable_user_metric_persistent** is set to **on**.

Parameter type: integer.

Unit: day

Value range: 0–3650

- If this parameter is set to **0**, the historical monitoring data of user resources is permanently stored.
- If the value is greater than 0, user historical resource monitoring data is stored for the specified number of days.

Default value: **7**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The unit must be **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_instance_metric_persistent

Parameter description: Specifies whether the instance resource monitoring data is dumped. If this function is enabled, instance monitoring data is saved to the GS_WLM_INSTANCE_HISTORY system catalog. For details, see "System Catalogs and System Views > System Catalogs > GS_WLM_INSTANCE_HISTORY" in *Developer Guide*.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The instance resource monitoring data is dumped.
- **off**: The instance resource monitoring data is not dumped.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

instance_metric_retention_time

Parameter description: Specifies the retention days of the historical monitoring data of instance resources. This parameter is valid only when **enable_instance_metric_persistent** is set to **on**.

Parameter type: integer.

Unit: day

Value range: 0–3650

- If this parameter is set to **0**, the historical monitoring data of instance resources is permanently stored.
- If the value is greater than **0**, the historical monitoring data of instance resources is stored for the specified number of days.

Default value: **7**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The unit must be **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

resource_track_level

Parameter description: Specifies the resource monitoring level of the current session. This parameter is valid only when **enable_resource_track** is set to **on**.

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: Resources are not monitored.
- **query**: Resources used at the query level are monitored.
- **operator**: Resources used at the query and operator levels are monitored.

Default value: **query**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

resource_track_cost

Parameter description: Specifies the minimum execution cost for resource monitoring on statements in the current session. This parameter is valid only when **enable_resource_track** is set to **on**.

Parameter type: integer.

Unit: none

Value range: –1 to 2147483647

- **–1** indicates that resource monitoring is disabled.
- A value ranging from 0 to 9 indicates that statements whose execution cost is greater than or equal to 10 will be monitored.
- A value greater than or equal to **10** indicates that statements whose execution cost exceeds this value will be monitored.

Default value: **100000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

resource_track_duration

Parameter description: Specifies the minimum statement execution time that determines whether information about jobs of a statement recorded in the real-time view will be dumped to a historical view after the statement is executed. Job information will be dumped from the real-time view (with the suffix **statistics**) to a historical view (with the suffix **history**) if the statement execution time is no less than this value. This parameter is valid only when **enable_resource_track** is set to **on**.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

- **0** indicates that historical information about all statements recorded in the real-time resource monitoring view are archived.
- If the value is greater than **0**, historical information about a statement whose execution time exceeds this value will be archived.

Default value: **60**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **3600** without a unit, **resource_track_duration** indicates 3600s. If the value is **1h**, **resource_track_duration** indicates 1 hour. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dynamic_memory_quota

Parameter description: Specifies the memory quota in adaptive load scenarios, that is, the proportion of maximum available memory to total system memory.

Parameter type: integer.

Unit: none

Value range: 1 to 100

Default value: **80**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

disable_memory_protect

Parameter description: Specifies whether to stop memory protection. To query system views when system memory is insufficient, set this parameter to **on** to stop memory protection. This parameter is used only to diagnose and debug the system when system memory is insufficient. Set it to **off** in other scenarios.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Memory protection is disabled.
- **off**: Memory protection is enabled.

Default value: **off**

Setting method: This parameter is a USERSET parameter and is valid only for the current session. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

query_band

Parameter description: Specifies the user-defined job type of the current session.

Parameter type: string.

Unit: none

Value range: a string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: ""

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

memory_fault_percent

Parameter description: Specifies the ratio of memory allocation failures during the memory fault test. This parameter is used only in the DEBUG version.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_bbox_dump

Parameter description: Specifies whether to enable the black box function and whether to generate core files when the core mechanism is not configured in the system. This function is valid only for CNs or DNs. For CM Agent, CM Server, GTM, and fenced UDF, the system core mechanism must be configured to capture core files.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The black box function is enabled.
- **off**: The black box function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> The generation of core files by the black box function depends on the open ptrace API of the OS. If the permission is insufficient (errno = 1), ensure that the **/proc/sys/kernel/yama/ptrace_scope** configuration is correct.

bbox_dump_count

Parameter description: Specifies the maximum number of core files that are generated by GaussDB and can be stored in the path specified by **bbox_dump_path**. If the number of core files exceeds this value, old core files will be deleted. This parameter is valid only when **enable_bbox_dump** is set to **on**.

> NOTE
>
> When core files are generated concurrently, the number of files may be larger than the value of **bbox_dump_count**.

Parameter type: integer.

Unit: none

Value range: 1 to 20

Default value: **8**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

bbox_dump_path

Parameter description: Specifies the path where the black box core files are generated. This parameter is valid only when **enable_bbox_dump** is set to **on**.

Parameter type: string.

Unit: none

Value range: valid file path.

Default value: **""**. The default path where the black box core files are generated is **"/proc/sys/kernel/core_pattern"**. If the path is not a directory or you do not have the write permission on the directory, black box core files will be generated under the data directory of the database.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

bbox_blanklist_items

Parameter description: Specifies the anonymized data items of black box core files. This parameter is valid only when **enable_bbox_dump** is set to **on**.

Parameter type: string.

Unit: none

Value range: a string of sensitive data items separated by commas (,).

Default value: **""**, which indicates that all supported sensitive data items of the core files generated by the black box are anonymized.

Currently, the following data items can be anonymized:

- **SHARED_BUFFER**: data buffer.
- **XLOG_BUFFER**: redo log buffer.
- **DW_BUFFER**: dual-write data buffer.
- **XLOG_MESSAGE_SEND**: buffer for sending primary/standby replication logs.
- **WALRECEIVER_CTL_BLOCK**: buffer for receiving primary/standby replication logs.
- **DATA_MESSAGE_SEND**: buffer for sending primary/standby replication data.
- **DATA_WRITER_QUEUE**: buffer for receiving primary/standby replication data.
- **BUCKET_XLOG_MESSAGE_SEND**: buffer for sending replay logs during bucket scale-out.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_ffic_log

Parameter description: Specifies whether to enable the first failure information capture (FFIC) function. This function is valid only for CNs or DNs. For CM Agent, CM Server, GTM, and fenced UDF, the system core mechanism must be configured to capture core files.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The FFIC function is enabled.
- **off**: The FFIC function is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_dynamic_workload

Parameter description: Specifies whether to enable the dynamic workload management function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The dynamic workload management function is enabled.
- **off**: The dynamic workload management function is disabled.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- If memory adaptation is enabled, you do not need to use **work_mem** to optimize the operator memory usage. The system will generate a plan for each statement based on the current workload, estimating the memory used by each operator and by the entire statement. In a concurrency scenario, statements are queued based on the system workload and their memory usage.
- In some cases, the optimizer cannot accurately estimate the number of rows and thereby underestimates or overestimates memory usage. If the memory usage is underestimated, the allocated memory will be automatically increased during statement running. If the memory usage is overestimated, system memory resources will not be fully used, and the number of statements waiting in a queue will increase, which probably results in low performance. In this case, you need to identify the statements whose estimated memory usage is much greater than the actual DN peak memory and optimize the performance by setting **query_mem**. For details, see "SQL Optimization Guide > Adjusting Key Parameters During SQL Optimization" in *Developer Guide*.

enable_dywlm_adjust

Parameter description: Specifies whether inaccurate resource values will be dynamically adjusted. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Inaccurate resource values will be dynamically adjusted.
- **off**: Inaccurate resource values will not be dynamically adjusted.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_force_memory_control

Parameter description: Specifies whether to control simple queries based on memory usage when the concurrency control is enabled in a resource pool. This parameter must be set to a same value on CNs and DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Simple queries are controlled.
- **off**: Simple queries are not controlled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_reaper_backend

Parameter description: Specifies whether the signal sent by a worker thread when it exits is collected by a separate thread.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: This function is enabled.
- **off**: This function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

bypass_workload_manager

Parameter description: Specifies whether to enable independent I/O management and control. This parameter must be used together with CNs and DNs.

If **use_workload_manager** is not set to **on**, this parameter can be used to enable the I/O control independently. After the I/O control is enabled, you can set **io_limits** or **io_priority** to configure control details.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The I/O control is enabled.
- **off**: The I/O control is disabled.

Default value:

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

io_limits

Parameter description: Specifies the upper limit of input/output operations per second (IOPS).

Parameter type: integer.

Unit: none

Value range: 0 to 1073741823

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

io_priority

Parameter description: Specifies the I/O priority for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 50%.

Parameter type: enumerated type.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **None**: no limitation.
- **Low**: The IOPS is reduced to 10% of the original value.
- **Medium**: The IOPS is reduced to 20% of the original value.
- **High**: The IOPS is reduced to 50% of the original value.

Default value: **None**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

io_control_unit

Parameter description: Specifies the unit used to count the number of I/Os during I/O control in row-store scenarios. This parameter must be set to a same value on CNs and DNs.

Set a certain number of I/Os as one unit. This unit is used during the I/O control.

Parameter type: integer.

Unit: none

Value range:1000 to 1000000

Default value: **6000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

session_respool

Parameter description: Specifies the resource pool associated with the current session.

If you set **cgroup_name** and then **session_respool**, the Cgroup associated with **session_respool** takes effect. If you reverse the order, the Cgroup associated with **cgroup_name** takes effect.

If the workload Cgroup level is specified during the **cgroup_name** change, the database does not check the Cgroup level. The level ranges from 1 to 10.

Parameter type: string.

Unit: none

Value range: name of the resource pool set by running **create resource pool**.

Default value: **"invalid_pool"**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Do not use both **cgroup_name** and **session_respool**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

session_statistics_memory

Parameter description: Specifies the memory size of a real-time query view.

Parameter type: integer.

Unit: KB

Value range: 5120 to 2147483647

Default value: 5120 (that is, 5 MB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **16384** without a unit, **session_statistics_memory** indicates 16384 KB. If the value is **16MB**, **session_statistics_memory** indicates 16 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: You are advised to set this parameter to a value less than or equal to 50% of the value of **max_process_memory**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

session_history_memory

Parameter description: Specifies the memory size of a historical query view.

Parameter type: integer.

Unit: KB

Value range: 10240 to 2147483647

Default value: **10240** (that is, 10 MB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **16384** without a unit, **session_history_memory** indicates 16384 KB. If the value is **16MB**, **session_history_memory** indicates 16 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: You are advised to set this parameter to a value less than or equal to 50% of the value of **max_process_memory**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_transaction_parctl

Parameter description: Specifies whether to control transaction block statements and stored procedure statements.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Transaction block statements and stored procedure statements are controlled.
- **off**: Transaction block statements and stored procedure statements are not controlled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

topsql_retention_time

Parameter description: Specifies the retention period of historical TopSQL data in the **gs_wlm_session_query_info_all** and **gs_wlm_operator_info** tables.

Parameter type: integer.

Unit: day

Value range: 0–3650

- If it is set to **0**, the data is stored permanently.
- If the value is greater than **0**, the data is stored for the specified number of days.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

transaction_pending_time

Parameter description: Specifies the maximum queuing time of transaction block statements and stored procedure statements. This parameter is valid only when **enable_transaction_parctl** is set to **on**.

Parameter type: integer.

Unit: second

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: –1 to 1073741823.

- **–1** or **0** indicates that no queuing timeout is specified for transaction block statements and stored procedure statements. The statements can be executed when resources are available.
- A value greater than **0** indicates that if transaction block statements and stored procedure statements have been queued for a time longer than the specified value, they are forcibly executed regardless of the current resource situation.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

node_group_mode

Parameter description: Displays the current node group mode.

Parameter type: string.

Unit: none

Value range: name of the node group mode.

Default value: **"node group"**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

resilience_ctrlslot_available_maxpercent

Parameter description: Specifies the maximum percentage of threads in the thread pool that can be occupied by slow SQL statements. This parameter is valid only for SELECT statements executed by non-SYSADMIN/MONADMIN users.

Parameter type: integer.

Unit: none

Value range: 0 to 100

Default value: **100**, indicating that slow SQL statements can occupy all threads in the thread pool.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

resilience_ctrlstmt_detect_timelimit

Parameter description: Specifies the execution time of a normal SQL statement after which it is marked as a slow SQL statement. The value **0** indicates that slow SQL statements are not identified. A value greater than 0 indicates that the SQL statement is marked as a slow SQL statement when its execution time exceeds the value of this parameter. This parameter is valid only for SELECT statements executed by non-SYSADMIN/MONADMIN users.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647. **0** indicates that the slow SQL detection function is disabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **6000** without a unit, **resilience_ctrlstmt_detect_timelimit** indicates 6000 ms. If the value is **6s**, **resilience_ctrlstmt_detect_timelimit** indicates 6s. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Set this parameter based on the average SQL execution duration of the real-time database.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

resilience_ctrlstmt_control_iopslimit

Parameter description: Specifies the maximum IOPS that can be used by slow SQL statements after normal SQL statements are marked as slow SQL statements. This parameter is valid only for SELECT statements executed by non-SYSADMIN/MONADMIN users.

Parameter type: string.

Unit: none

Value range: **"Low"**, **"Medium"**, **"High"**, **"None"**, or a value ranging from 0 to 2147483647. The lower the level, the stricter the control.

- **"Low"**: low level.
- **"Medium"**: medium level.
- **"High"**: high level.
- **"None"**: Logical I/O control for slow SQL statements is disabled.
- 0 to 2147483647: A smaller value indicates stricter and a larger value indicates looser.

Default value: **"None"**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. If this parameter is set to a number, the value must be a character string, for example, **resilience_ctrlstmt_control_iopslimit = '1024'**.

Setting suggestion: Set this parameter to a small value when I/O access is full and to a large value when I/O access is idle.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

session_max_dynamic_memory

Parameter description: Specifies the upper limit of the session-level memory. If the session memory usage exceeds the value of this parameter, an error is reported and the session is interrupted. This parameter is valid only when **enable_memory_limit** is set to **on**.

Parameter type: integer.

Unit: KB

Value range: –1 to 2147483647

Default value: **–1**, indicating no control.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The parameter cannot be set to a small value. If the value is too small, the session fails to execute statements due to insufficient memory. If the parameter is set to a value by using method 3 in **Table 14-2** but the value cannot be set larger due to insufficient memory, you can only exit the session to eliminate the restriction. If the value is less than 16 MB, a message is displayed.

max_concurrency

Parameter description: Specifies the upper limit of global concurrency.

Parameter type: integer.

Unit: none

Value range: –1 to 2147483647

Default value: **–1**, indicating no control.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: A database administrator needs to adjust the value of this parameter based on the usage of system resources (such as CPU, I/O, and memory resources) to maximize the number of concurrent jobs and prevent system breakdown caused by excessive concurrent jobs.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_workload_rule

Parameter description: Specifies whether to enable the SQL statement concurrency control.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The SQL statement concurrency control is enabled.
- **off**: The SQL statement concurrency control is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If the SQL statement concurrency control function is not required, set this parameter to **off**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

workload_uncontrolled_users

Parameter description: Specifies the user whitelist for load management. Workload management is not performed on users in the whitelist. Currently, this parameter takes effect only for SQL statement concurrency control.

Parameter type: string.

Unit: none

Value range: a list of users separated by commas (,), for example, **user1, user2, user3**.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements. If the users without the SYSADMIN permission do not want to be restricted by workload management when running SQL statements, they can add this parameter.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.13 Autovacuum

The autovacuum thread includes the VACUUM and ANALYZE processes to recycle the record space marked as deleted and update statistics about the table. The **autovacuum_naptime** parameter specifies the interval between them. The default interval is 10 minutes. You can set the interval based on the actual situation. The interval cannot be completely accurate. It depends on the hardware conditions and load of the environment. If a large amount of data needs to be vacuumed, the heavy load may delay the process. It also depends on the values of

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

autovacuum_naptime and **autovacuum_max_workers**. **autovacuum_naptime** specifies the execution interval. A smaller value indicates a shorter execution interval. However, data vacuuming and statistics calculation involved cleaning up the CPU usage, memory usage, and I/O overhead. **autovacuum_max_workers** specifies the maximum number of concurrent automatic cleanup threads. A larger value makes the parameter more compatible with **autovacuum_naptime**, but the CPU usage, memory usage, and I/O overhead also increase.

autovacuum

Parameter description: Specifies whether to start the autovacuum thread in the database. Ensure that the **track_counts** parameter is set to **on** before starting the autovacuum thread.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the autovacuum thread is started.
- **off** indicates that the autovacuum thread is not started.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- Set the **autovacuum** parameter to **on** if you expect the system to automatically clear up two-phase transactions after recovering from faults.
- If **autovacuum** is set to **on** and **autovacuum_max_workers** to **0**, the system does not automatically perform autovacuum. Instead, the system automatically cleans up two-phase transactions after recovering from faults.
- If **autovacuum** is set to **on** and the value of **autovacuum_max_workers** is greater than **0**, the system will automatically vacuum the two-phase transactions and processes after recovering from faults.

Risks and impacts of improper settings: If this parameter is disabled in an Astore table, too many inactive rows will exist in the table, which may affect the query performance.

autovacuum_mode

Parameter description: Specifies whether the autoanalyze and autovacuum function are enabled. This parameter is valid only when **autovacuum** is set to **on**.

Parameter type: enumerated type.

Unit: none

Value range:

- **analyze** indicates that only autoanalyze is performed.
- **vacuum** indicates that only autovacuum is performed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **mix** indicates that both autoanalyze and autovacuum are performed.
- **none** indicates that neither autoanalyze nor autovacuum is performed.

Default value: **mix**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

autoanalyze_timeout

Parameter description: Specifies the timeout interval of autoanalyze. If the duration of autoanalyze on a table exceeds the value of **autoanalyze_timeout**, the autoanalyze operation is automatically canceled.

The timeout check cannot be completely accurate. In principle, the statistics on each CN must be consistent. Therefore, the synchronization between CNs will not be interrupted even if the synchronization times out. As a result, the actual execution time may exceed the user-defined time.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483. The value **0** indicates that no timeout occurs.

Default value: **300**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set the value depending on the database load and performance requirements. If the database load is light, you can set **autoanalyze_timeout** to a larger value so that the automatic analysis operation can be completed in sufficient time. If the database is heavily loaded, set **autoanalyze_timeout** to a smaller value so that automatic analysis can be completed in a short period of time. This prevents other important database operations from being affected.

Risks and impacts of improper settings: The AUTOANALYZE operation consumes certain system resources. If the value is too large, system resources may be excessively consumed, affecting database performance. If the value is too small, the AUTOANALYZE operation may fail to be completed. As a result, the statistics may be inaccurate, affecting the execution plan and performance of the query.

autovacuum_io_limits

Parameter description: Specifies the upper limit of I/Os triggered by the autovacuum thread per second.

Parameter type: integer.

Unit: none

Value range: –1 to 1073741823. **–1** indicates that the default Cgroup is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **–1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- If the disk I/O resources of server are sufficient, you can set **autovacuum_io_limits** to a large value, which allows the autovacuum thread to complete the cleanup operation more quickly.
- If the disk I/O resources of the server are limited, you can set **autovacuum_io_limits** to a small value. This limits the disk I/O resources used by the autovacuum thread to avoid impact on other threads.

Risks and impacts of improper settings:

- If the value is too large, the autovacuum thread may use too many disk I/O resources, affecting the performance of other threads.
- If the value is too small, the autovacuum thread may fail to effectively clear table data. As a result, table data is excessively expanded, affecting database performance.

log_autovacuum_min_duration

Parameter description: Records each step performed by the autovacuum process to the server log when the execution time of the autovacuum process is greater than or equal to a certain value. This parameter helps track the autovacuum behavior.

For example, set the **log_autovacuum_min_duration** parameter to **250ms** to record the information about the autovacuum commands running longer than or equal to 250 ms.

Parameter type: integer.

Unit: ms

Value range: –1 to 2147483647

- **0** indicates that all autovacuum actions are recorded in the log.
- **–1** indicates that all autovacuum actions are not recorded in the log.
- A value greater than or equal to 0 indicates that a message is recorded when an autovacuum action is skipped due to a lock conflict. (The reason for skipping autovacuum is recorded for audit.)

Default value: **–1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **600** without a unit, **log_autovacuum_min_duration** indicates 600 ms. If the value is **10min**, **log_autovacuum_min_duration** indicates 10 minutes. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: The default value is **–1**. If you want to monitor the performance of automatic VACUUM operations, set **log_autovacuum_min_duration** to a value greater than 0 to record the automatic VACUUM operations whose duration exceeds the value of this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is set to **0** or the value is too small, a large number of logs may be recorded, affecting system performance. If this value is too large, the system may not detect that the automatic clearance time is too long in a timely manner, causing insufficient clearance speed or exceptions.

autovacuum_max_workers

Parameter description: Specifies the maximum number of autovacuum worker threads that can run at the same time. The upper limit of this parameter is related to the values of **max_connections** and **job_queue_processes**.

Parameter type: integer.

Unit: none

Value range: 0 (indicating that autovacuum is not automatically performed) to 1024. If you set this parameter to a value greater than 1024, the system automatically changes the value to **1024**. The actual maximum value is a dynamic value calculated by the following formula: Maximum value = **262143** – Value of **max_inner_tool_connections** – Value of **max_connections** – Value of **max_concurrent_autonomous_transactions** – Value of **job_queue_processes** – *Number of auxiliary threads* – *Number of autovacuum launcher threads* – 1. The number of auxiliary threads and the number of autovacuum launcher threads are specified by two macros. Their default values in the current version are **20** and **2**, respectively.

Default value: **3**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, more autovacuum processes are created and more CPU and memory resources are occupied. Therefore, you are advised not to set this parameter to a large value. Otherwise, memory cannot be allocated or too many CPU resources are occupied, causing database startup errors or affecting services. If the value is too small, the autovacuum thread may fail to clear and reclaim tablespaces that are no longer used in a timely manner, causing database expansion and performance deterioration.

autovacuum_naptime

Parameter description: Specifies the interval between activity rounds for the autovacuum process.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483.

Default value: **600** (that is, 10 minutes)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **600** without a unit,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

autovacuum_naptime indicates 600s. If the value is **10min**, **autovacuum_naptime** indicates 10 minutes. The unit must be **s**, **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value when only Ustore tables are used. For Astore tables, the setting value depends on the user's database environment and application load. If a large number of tables are updated or deleted in the database environment, you are advised to set this parameter to a short interval to ensure that useless data is deleted in a timely manner and the database space is sufficient. If there are few update or delete operations in the database environment, you can set this parameter to a long interval to reduce the overhead of the automatic cleanup thread.

Risks and impacts of improper settings:

- If **autovacuum_naptime** is set to a short interval, the overhead of the autovacuum thread may be too high, affecting the database performance.
- If **autovacuum_naptime** is set to a long interval, useless data may be accumulated, occupying database space and affecting database performance.

autovacuum_vacuum_threshold

Parameter description: Specifies the minimum number of deleted and updated tuples that trigger a VACUUM operation on an Astore table. Threshold for triggering VACUUM is calculated as follows: Value of **autovacuum_vacuum_threshold** + Value of **reltuples** (Number of tuples in the table) x **autovacuum_vacuum_scale_factor**. When the number of deleted or updated records in a table exceeds the threshold, the VACUUM operation is executed on this table.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **50**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: In an Astore table:

- If the value is too small, VACUUM operations are frequently performed, increasing system overhead and deteriorating system performance.
- If the value is too large, too many dead rows exist in the table, affecting the query performance.

autovacuum_analyze_threshold

Parameter description: Specifies the minimum number of deleted, inserted, and updated tuples that trigger an ANALYZE operation on an Astore table. Threshold for triggering ANALYZE is calculated as follows: Value of **autovacuum_analyze_threshold** + Value of **reltuples** (Number of tuples in the table) x **autovacuum_analyze_scale_factor**. When the number of deleted,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

inserted, or updated records in a table exceeds the threshold, the ANALYZE operation is executed on this table. If a global secondary index exists in a table, the ANALYZE operation is performed on the global secondary index only when the number of deleted, inserted, and updated records in the table exceeds the threshold 20 times.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **50**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings:

- If the value is too small, ANALYZE operations are frequently performed, increasing system overhead and deteriorating system performance.
- If the value is too large, the statistics in the table may be outdated. As a result, the query plan is inaccurate and the query performance is affected.

autovacuum_vacuum_scale_factor

Parameter description: Specifies the scale factor of a table when VACUUM is performed. It is used to calculate the threshold for triggering VACUUM. Threshold for triggering VACUUM is calculated as follows: Value of **autovacuum_vacuum_threshold** + Value of **reltuples** (Number of tuples in the table) x **autovacuum_vacuum_scale_factor**. When the number of deleted or updated records in a table exceeds the threshold, the VACUUM operation is executed on this table.

Parameter type: floating point.

Unit: none

Value range: 0.0 to 100.0

Default value: **0.2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The value of this parameter depends on the load and usage of an Astore table. If the write load is high, set this parameter to a smaller value so that the table can be cleared more frequently to prevent performance deterioration. If the read load is high, set this parameter to a larger value to avoid unnecessary waste of resources during read.

Risks and impacts of improper settings: In an Astore table:

- If the value is too small, the autovacuum thread may clear tables too frequently, causing performance deterioration.
- If the value is too large, the table may not be cleared in a timely manner. As a result, the table size becomes large and occupies too much disk space.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

autovacuum_analyze_scale_factor

Parameter description: Specifies the scale factor of a table when ANALYZE is performed. It is used to calculate the threshold for triggering ANALYZE. Threshold for triggering ANALYZE is calculated as follows: Value of **autovacuum_analyze_threshold** + Value of **reltuples** (Number of tuples in the table) x **autovacuum_analyze_scale_factor**. When the number of deleted, inserted, or updated records in a table exceeds the threshold, the ANALYZE operation is executed on this table.

Parameter type: floating point.

Unit: none

Value range: 0.0 to 100.0

Default value: **0.1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings:

- If the value is too small, ANALYZE operations are frequently performed, increasing system overhead and deteriorating system performance.
- If the value is too large, the frequency of performing ANALYZE operations may be too low and the statistics in the table may be outdated. As a result, the query plan is inaccurate and the query performance is affected.

autovacuum_freeze_max_age

Parameter description: Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in an Astore table. The system starts the AUTOVACUUM thread even if automatic cleanup is disabled. The cleanup operation also allows you to delete old files from the **pg_clog/** subdirectory.

Parameter type: integer.

Unit: none

Value range: 100000 to 2000000000

Default value: **4000000000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If a large number of update and deletion operations are frequently performed on the Astore table in the database, you are advised to set this parameter to a small value to reclaim garbage in a timely manner. If the Astore table in the database is seldom updated or deleted, you can set this parameter to a large value to reduce the frequency of automatic space recycling.

Risks and impacts of improper settings: In an Astore table:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the value is too small, automatic space recycling is frequently performed, increasing system overhead and deteriorating system performance.
- If this parameter is set to a large value, automatic space recycling is delayed. As a result, a large amount of invalid data may occupy disk space, affecting database performance.

autovacuum_vacuum_cost_delay

Parameter description: Specifies the value of the cost delay used in the autovacuum operation.

Parameter type: integer.

Unit: ms

Value range: –1 to 100. **–1** indicates that the regular **vacuum_cost_delay** is used.

Default value: 20

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

autovacuum_vacuum_cost_limit

Parameter description: Sets the value of the cost limit used in the autovacuum operation.

Parameter type: integer.

Unit: none

Value range: –1 to 10000. **–1** indicates that the regular **vacuum_cost_limit** is used.

Default value: **–1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cstore_prefetch_quantity

Parameter description: Specifies whether to enable VACUUM optimization and TID Store cache optimization for partitioned tables. This parameter is a temporary reuse parameter and takes effect only for the current node.

Parameter type: integer.

Unit: KB

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 1024 to 1048576

- [1024,100000): The TID Store cache optimization function and the partitioned table VACUUM optimization function are disabled at the same time.
- [100000,200000): The TID Store cache optimization function is disabled, and the VACUUM optimization function of the partitioned table is enabled.
- [200000,300000): The TID Store cache optimization function and the partitioned table VACUUM optimization function are enabled at the same time.
- [300000,1048576]: The TID Store cache optimization function is enabled, and the VACUUM optimization function of the partitioned table is disabled.

Default value: **32768**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value **32768**. In this case, the TID Store cache optimization function and the VACUUM optimization function for partitioned tables are disabled at the same time.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cstore_backwrite_max_threshold

Parameter description: Specifies whether to enable automatic primary/standby verification for all-zero pages of the primary heap table. This parameter is temporarily reused and takes effect only for the current node.

Parameter type: integer.

Unit: KB

Value range: 4096 to *INT_MAX*/2.

- [4096,3000000): The all-zero page verification function is enabled.
- [3000000,*INT_MAX*/2]: The all-zero page verification function is disabled.

Default value: **2097152**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. In this case, the all-zero page verification function is enabled. To disable this function, set this parameter to a value greater than or equal to 3000000. This function is enabled only for newly installed clusters by default. For clusters upgraded to the current version, this function is automatically disabled during the upgrade. After this function is enabled, it takes effect only on the current node and affects the performance during the first sequential scan.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

twophase_clean_workers

Parameter description: Specifies the maximum number of concurrent cleanup operations that can be performed by the gs_clean tool.

Parameter type: integer.

Unit: none

Value range: 1 to 10

Default value: **3**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

defer_csn_cleanup_time

Parameter description: Specifies the local recycling interval.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

Default value: **5000** (5s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Generally, if the system load is light, you can set **defer_csn_cleanup_time** to a long time. If the system load is heavy, you can set **defer_csn_cleanup_time** to a short time. In this case, the system can maintain good performance even when it is busy.

Risks and impacts of improper settings: The **defer_csn_cleanup_time** parameter is used to specify when to delete expired CSN information. It specifies how long the system retains expired CSN information. If this parameter is set to a small value, the system may frequently clear expired CSN information, which deteriorates system performance. If the value is too large, the system may occupy too much memory. As a result, the system slows down or breaks down.

14.3.14 Default Settings of Client Connection

14.3.14.1 Statement Behavior

This section describes related default parameters involved in the execution of SQL statements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

search_path

Parameter description: Specifies the order in which schemas are searched when an object is referenced with no schema specified.

Parameter type: string.

Unit: none

Value range: a character string consisting of one or more schema names. Different schema names are separated by commas (,).

NOTE

- When this parameter is set to **'"$user",public'**, shared use of a database (where no users have private schemas, and all share use of public), private per-user schemas, and combinations of them are supported. Other effects can be obtained by modifying the default search path setting, either globally or per-user.
- When this parameter is set to a null character string (''), the system automatically converts it into a pair of double quotation marks ("").
- If the content contains double quotation marks, the system considers them as insecure characters and converts each double quotation mark into a pair of double quotation marks.

Default value: **'"$user",public'**

NOTE

$user indicates the name of the schema with the same name as the current session user. If the schema does not exist, **$user** will be ignored.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- If schemas of temporary tables exist in the current session, the schemas can be listed in the search path by using the alias **pg_temp**, for example, **'pg_temp,public'**. The schema of temporary tables has the highest search priority and is always searched before all the other schemas specified in **pg_catalog** and **search_path**. Therefore, do not explicitly specify **pg_temp** to be searched after other schemas in **search_path**. If **pg_temp** is specified in **search_path**, this setting will not take effect and an error message will be displayed. If the alias **pg_temp** is used, the temporary schema will be searched only for tables, views, and data types, and not for functions or operators.
- The system catalog schema, pg_catalog, has the second highest search priority and is the first to be searched among all the schemas, excluding **pg_temp**, specified in **search_path**. Therefore, do not explicitly specify **pg_catalog** to be searched after other schemas in **search_path**. If **pg_catalog** is specified in **search_path**, this setting will not take effect and an error message will be displayed.
- When an object is created without a specific target schema, the object will be placed in the first valid schema listed in **search_path**. An error is reported if the search path is empty.
- The current effective value of the search path can be examined through the SQL function current_schema(). This is different from examining the value of

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

search_path, because the current_schema() function displays the first valid schema name in **search_path**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

current_schema

Parameter description: Specifies the current schema.

Parameter type: string.

Unit: none

Value range: a character string consisting of one or more schema names. Different schema names are separated by commas (,).

Default value: **'"$user",public'**

NOTE

$user indicates the name of the schema with the same name as the current session user. If the schema does not exist, **$user** will be ignored.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

default_tablespace

Parameter description: Specifies the default tablespace of the created objects (tables and indexes) when a **CREATE** command does not explicitly specify a tablespace.

NOTE

- The value of this parameter is either the name of a tablespace, or an empty string that indicates the use of the default tablespace of the current database. If a non-default tablespace is specified, users must have CREATE privilege for it. Otherwise, creation attempts will fail.
- This parameter is not used for temporary tables. For them, the **temp_tablespaces** is used instead.
- This parameter is not used when users create databases. By default, a new database inherits its tablespace setting from the template database.

Parameter type: string.

Unit: none

Value range: Specifies the name of an existing tablespace or an empty string. An empty string indicates that the default tablespace is used.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

temp_tablespaces

Parameter description: Specifies one or more tablespaces to which temporary objects (temporary tables and their indexes) will be created when a CREATE command does not explicitly specify a tablespace. Temporary files for sorting large data sets are created in these tablespaces.

The value of this parameter can be a list of names of tablespaces. When there is more than one name in the list, GaussDB chooses a random tablespace from the list upon the creation of a temporary object each time. However, within a transaction, successively created temporary objects are placed in successive tablespaces in the list. If the element selected from the list is an empty character string, GaussDB will automatically use the default tablespace of the current database instead.

Parameter type: string.

Unit: none

Value range: name of an existing tablespace or an empty string. An empty character string indicates that all temporary objects are created only in the default tablespace of the current database. For details, see **default_tablespace**.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

default_storage_nodegroup

Parameter description: Specifies the node group where a table is created by default. This parameter takes effect only for ordinary tables.

Parameter type: string.

Unit: none

Value range: an existing Node Group name or **"installation"**.

Default value: **"installation"**

- **"installation"** indicates that tables will be created in the node group created during database installation.
- Other character strings indicate that tables will be created in the node group specified by this parameter.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

check_function_bodies

Parameter description: Specifies whether to enable validation of the function body string during the execution of **CREATE FUNCTION**. Verification is occasionally disabled to avoid problems, such as forward references when you restore function definitions from a dump. After the function is enabled, the syntax of the PL/SQL in the stored procedure is verified, including the data type, statement, and expression. The SQL statements in the stored procedure are not checked in the CREATE phase. Instead, they are checked during running.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Validation of the function body string is enabled during the execution of CREATE FUNCTION.
- **off**: Validation of the function body string is disabled during the execution of CREATE FUNCTION.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

default_transaction_isolation

Parameter description: Specifies the default isolation level of each transaction.

NOTE

The current version does not support the setting of the default transaction isolation level. The default value is **read committed**. Do not change the value.

Parameter type: enumerated type.

Unit: none

Value range:

- **read committed**: The transaction is read and committed.
- **read uncommitted**: The transaction is read but not committed.
- **repeatable read**: The transaction can be read repeatedly.
- **serializable**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **repeatable read**.

Default value: read committed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

default_transaction_read_only

Parameter description: Specifies whether each new transaction is in read-only state.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the transaction is in read-only state.
- **off** indicates that the transaction is not in read-only state.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **on**, DML cannot be performed and transactions cannot be written.

default_transaction_deferrable

Parameter description: Specifies the default deferrable status of each new transaction. It currently has no effect on read-only transactions or those running at isolation levels lower than serializable.

GaussDB does not support the serializable isolation level. Therefore, the parameter takes no effect.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: delayed by default.
- **off**: no delay by default.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

session_replication_role

Parameter description: Specifies the behavior of replication-related triggers and rules for the current session.

NOTE

Modifying this parameter will discard all the cached execution plans.

Parameter type: enumerated type.

Unit: none

Value range:

- **origin**: The system copies operations such as insert, delete, and update from the current session.
- **replica**: The system copies operations such as insert, delete, and update from other places to the current session.
- **local**: The system detects the role that has logged in to the database when using the function to copy operations and performs related operations.

Default value: **origin**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

statement_timeout

Parameter description: If the statement execution time (starting from the time the server receives the command) is longer than the duration specified by the parameter, error information is displayed and the statement exits.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

Default value: **0**, indicating that the timeout error reporting function is disabled.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **2000** without a unit, **statement_timeout** indicates 2000 ms. If the value is **2s**, **statement_timeout** indicates 2s. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

vacuum_freeze_min_age

Parameter description: Specifies whether VACUUM replaces the **xmin** column (minimum time) of a record with **FrozenXID** when scanning a table (in the same transaction).

Parameter type: integer.

Unit: none

Value range: 0 to 2000000000

NOTE

Although you can set this parameter to any value, VACUUM will limit the effective value to 50% of **autovacuum_freeze_max_age** by default.

Default value: **2000000000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, the freeze time is delayed and the recycling efficiency is reduced.

vacuum_freeze_table_age

Parameter description: Specifies when VACUUM scans the whole table and freezes old tuples. VACUUM performs a full table scan if the difference between the current transaction ID and the value of **pg_class.relfrozenxid64** is greater than the specified time.

Parameter type: integer.

Unit: none

Value range: 0 to 2000000000

NOTE

Although you can set this parameter to any value, VACUUM will limit the effective value to 95% of **autovacuum_freeze_max_age** by default. Therefore, a periodic manual VACUUM has a chance to run before an anti-wraparound autovacuum is launched for the table.

Default value: **4000000000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, tablespace expansion may occur.

bytea_output

Parameter description: Specifies the output format for values of the bytea type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: enumerated type.

Unit: none

Value range:

- **hex** indicates the binary data is converted to the two hexadecimal digits per byte.
- **escape** uses ASCII character sequences to represent binary strings, and converts those binary strings that cannot be represented as ASCII characters into special escape sequences.

Default value: **hex**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

xmlbinary

Parameter description: Specifies the encoding format of binary values in XML files.

NOTE

Currently, this parameter does not support data of the XML type.

Parameter type: enumerated type.

Unit: none

Value range:

- **base64**: The Base64 encoding format is used.
- **hex**: The hex encoding format is used.

Default value: **base64**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

xmloption

Parameter description: Specifies whether XML data is treated as a document or a normal string when it is implicitly converted or serialized.

NOTE

Currently, this parameter does not support data of the XML type.

Parameter type: enumerated type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **document** indicates an HTML document.
- **content** indicates a common string.

Default value: **content**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_compile_functions

Parameter description: Specifies the maximum number of compilation results of stored procedures and functions that can be stored on a node, including system stored procedures and user-defined stored procedures and functions. If the compilation result exceeds the value of this parameter, the system automatically triggers memory eviction and deletes unused common stored procedures and functions.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647.

Default value: 1000

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value to reduce memory usage and improve system performance.

Risks and impacts of improper settings: If the number of compilation results exceeds the value of this parameter and the system cannot find the stored procedures and functions that can be deleted, a large amount of memory is occupied, causing performance deterioration.

14.3.14.2 Locale and Formatting

This section describes parameters related to the time format setting.

DateStyle

Parameter description: Specifies the display format for date and time values, as well as the rules for interpreting ambiguous date input values.

This variable contains two independent components: the output format declaration (ISO, Postgres, SQL, or German) and the input/output order of year/month/day (DMY, MDY, YMD, Euro, European, US, NonEuro, NonEuropean, or Default). The two components can be set separately or together. The keywords

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Euro and European are synonyms for DMY. The keywords US, NonEuro, and NonEuropean are synonyms for MDY.

Parameter type: string.

Unit: none

Value range: combination of the output format declaration and the input/output order of year/month/day. (The two components can be set separately.)

- Output format declaration: ISO, Postgres, SQL, or German.
- Input/Output order of year/month/day: DMY (Euro, European), MDY (US, NonEuro, NonEuropean), or YMD

Default value: **"ISO, MDY"**

NOTE

gs_initdb will initialize this parameter so that its value is the same as that of **lc_time**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Setting suggestion: The ISO format is recommended.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

IntervalStyle

Parameter description: Specifies the display format for interval values.

Parameter type: enumerated type.

Unit: none

Value range:

- **sql_standard**: Output matching SQL standards will be generated.
- **postgres**: Output matching PostgreSQL 8.4 will be generated. It is valid when the **DateStyle** parameter is set to **ISO**.
- **postgres_verbose**: Output matching PostgreSQL 8.4 will be generated. It is valid when the **DateStyle** parameter is set to **non_ISO**.
- **iso_8601**: Output matching the time interval "format with designators" defined in ISO 8601 will be generated.
- **oracle**: Output matching the numtodsinterval function in the Oracle Database. For details, see "SQL Reference > Functions and Operators > Date and Time Processing Functions and Operators > numtodsinterval" in *Developer Guide*.

NOTE

The **IntervalStyle** parameter also affects the interpretation of ambiguous interval input.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **postgres**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

TimeZone

Parameter description: Specifies the time zone for displaying and interpreting timestamps.

Parameter type: string.

Unit: none

Value range: You can query the PG_TIMEZONE_NAMES view to obtain the value range. For details, see "System Catalogs and System Views > System Views > Other System Views > PG_TIMEZONE_NAMES" in *Developer Guide*.

Default value:

NOTE

gs_initdb will set a time zone value that is consistent with the system environment.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

timezone_abbreviations

Parameter description: Specifies the time zone abbreviations that will be accepted by the server.

Parameter type: string.

Unit: none

Value range: **"India"**, **"Australia"**, and **"Default"**.

Default value: **"Default"**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

"Default" indicates an abbreviation that works in most of the world, which is applicable to most cases. There are also other abbreviations, such as **"Australia"** and **"India"** that can be defined for a particular installation.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

extra_float_digits

Parameter description: Adjusts the number of digits displayed for floating-point values, including float4, float8, and geometric data types. The parameter value is added to the standard number of digits (FLT_DIG or DBL_DIG, according to the actual situation).

Parameter type: integer.

Unit: none

Value range: –15 to 3

NOTE

- If the value is greater than 0, some key data bits are included, but the included data bits may not be valid. As a result, the output digits may not be completely valid. It is especially useful for dumping float data that needs to be restored exactly.
- If the value is less than or equal to 0, unnecessary data bits are eliminated to ensure that the output digits are valid.
- In M-compatible mode, **extra_float_digits** affects only the number of data bits displayed for the float4 data type without scale. The number of data bits displayed for the float8 data type and the float4 data type with scale is not affected by the GUC parameter.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

float_shortest_precision

Parameter description: Specifies whether to enable the minimum precision method to replace sprintf() to serialize floating point numbers. The minimum precision method is used to improve performance of a floating-point number serialization system function, that is, shorten execution time of a single thread of two system functions float4out() and float8out().

Parameter type: Boolean.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **on**: The minimum precision method is enabled.
- **off**: The minimum precision method is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 1 GUC parameters**.

Setting suggestion: You are advised to set this parameter for new sites or sites that have performance requirements for floating-point serialization.

Risks and impacts of improper settings: After this parameter is enabled, the precision of valid float digits varies according to the value of **extra_float_digits**. The value range of **extra_float_digits** is –15 to 3, the number of valid digits required for each value is as follows.

Value of extra_float_digits	Number of Required Valid Digits	
	Float4	Float8
-15	1	1
-14	1	1
-13	1	2
-12	1	3
-11	1	4
-10	1	5
-9	1	6
-8	1	7
-7	1	8
-6	1	9
-5	1	10
-4	2	11
-3	3	12
-2	4	13
-1	5	14
0	6	15
1	7	16
2	8	17

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3	9	18

NOTE

- For the original logic that calls snprintf_s(), the number of required valid digits does not mean that all output digits are valid.
  1. When the value of **extra_float_digits** is greater than 0, the output digits are not guaranteed to be completely valid.
  2. When the value of **extra_float_digits** is less than or equal to 0, the output digits are completely valid.
- For the new logic that uses the minimum precision method, only valid digits are output.
  1. When the value of **extra_float_digits** is greater than 0, it is not guaranteed that the number of output digits reaches the number of required valid digits, but all output digits are valid.
  2. When the value of **extra_float_digits** is less than or equal to 0, the output digits are completely valid.

client_encoding

Parameter description: Specifies the client-side encoding (character set).

Parameter type: string.

Unit: none

Value range: encoding types compatible with PostgreSQL. **UTF8** indicates that the database encoding is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required. The sorting rules may vary according to OSs or versions of the same OS. When application services are logically migrated between these OSs, differences and changes in OS sorting rules may cause differences in database functions such as indexes, partitions, and sorting operators. For example, data result sets returned by a same range query statement are different, or query results returned by a same sorting query statement are different. The application service needs to check whether the service data contains related characters based on the locale differences released by the OS.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- To use consistent encoding for communication within the cluster, you are advised to retain the default value of **client_encoding**. Modification to this parameter in the **gaussdb.conf** file (by using the gs_guc tool, for example) does not take effect.
- **client_encoding** can be set to **GB18030_2022**. When **client_encoding** is set to **gb18030_2022**, ensure that the GB18030 character set supported by the client OS has been upgraded to version 2022.
- If the encoding format of the database character set is UTF8, the encoding format of the region supported by the current system is GB18030, the GB18030 character set supported by the client OS has been upgraded to version 2022, and the database contains historical data stored before the GB18030 character set is upgraded, the following situations may occur:
  1. When **client_encoding** is set to **gb18030**, the character encoding of historical data in the UTF8 database returned to the client is the same as that before the client character set is upgraded. However, the font of 38 characters whose mapping changes during the character set upgrade is the same as that in version 2022.
  2. When **client_encoding** is set to **gb18030_2022**, the character encoding of historical data in the UTF8 database returned to the client are the same as that after the upgrade of the client character set and the font of characters are the same as that before the upgrade. This is because the versions of the GB18030 character set are not completely compatible, which may cause data inconsistency. Therefore, if the GB18030 character set needs to be upgraded on the client and historical data exists, you need to convert the historical data before the upgrade.
- **client_encoding** can be set to **ZHS16GBK**. The following table lists the setting methods of **server_encoding** and **client_encoding** corresponding to all ways that ZHS16GBK, GB18030, and GB18030_2022 character sets can be transformed.

server_encoding	client_encoding	locale	Setting Method
zhs16gbk	utf8	utf8	The database automatically obtains the value of **locale**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

server_encoding	client_encoding	locale	Setting Method
utf8	zhs16gbk	gbk	• Users use gsql to manually set **client_encoding** to **zhs16gbk**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **zhs16gbk**.
zhs16gbk	zhs16gbk	gbk	• When gsql is used for connection, the database automatically obtains the value of **locale**. After internal processing, **client_encoding** is automatically set to **zhs16gbk**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **zhs16gbk**.

server_encoding	client_encoding	locale	Setting Method
utf8	gb18030_2022	gb18030	• When gsql is used for connection, users manually set **client_encoding** to **gb18030_2022**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030_2022**.
gb18030	gb18030	gb18030	• The database automatically obtains the value of **locale**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

server_encoding	client_encoding	locale	Setting Method
gb18030_2022	gb18030_2022	gb18030	• When gsql is used for connection, the database automatically obtains the value of **locale**. After internal processing, **client_encoding** is automatically set to **gb18030_2022**. • When JDBC is used for connection, the URL parameter is used to set **characterEncoding** to **gb18030_2022**.

Default value: **"UTF8"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on frontend services. Try to keep the encoding consistent on the client and server to improve efficiency. You are advised to set this parameter to **"SQL_ASCII"** or **"UTF8"**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

lc_messages

Parameter description: Specifies the language in which messages are displayed.

Parameter type: string.

Unit: none

Value range: The value range is related to the system. You can run the **locale -a** command to view the value range.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- On some systems, this value range does not exist. Setting this variable will still work, but there will be no effect. In addition, translated messages for the desired language may not exist. In this case, you can still see the English messages.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.

Default value: **"C"**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

lc_monetary

Parameter description: Specifies the display format of monetary values. It affects the output of functions such as to_char(). Acceptable values are system-related.

Parameter type: string.

Unit: none

Value range: The value range is related to the system. You can run the **locale -a** command to view the value range.

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Default value: **"C"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

lc_numeric

Parameter description: Specifies the display format of numbers. It affects the output of functions such as **to_char**.

Parameter type: string.

Unit: none

Value range: The value range is related to the system. You can run the **locale -a** command to view the value range.

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

Default value: **"C"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

lc_time

Parameter description: Specifies the display format of time and locale. It affects the output of functions such as to_char().

Parameter type: string.

Unit: none

Value range: The value range is related to the system. You can run the **locale -a** command to view the value range.

NOTE

- You can run the **locale -a** command to check the system-supported locales and the corresponding encodings, and select one as required.
- By default, **gs_initdb** will initialize the setting of this parameter based on the current system environment. You can also run the **locale** command to check the current configuration environment.
- If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **"C"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

lc_time_names

Parameter description: Specifies the language used to display names and abbreviations of dates and months. The output of the DATE_FORMAT(), DAYNAME(), and MONTHNAME() functions is affected. The performance of STR_TO_DATE() and GET_FORMAT() is not affected.

Parameter type: string.

Unit: none

Value range: IETF language tags in simple format, such as **en_US** or **zh_CN**.

Default value: **"en_US"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Switch the language based on service requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

default_week_format

Parameter description: Specifies the default **mode** value of the week() function. The following table lists the value range and description.

default_week_format	First Day of a Week	Range	First Week Definition
0	Sunday	0 to 53	The first week that contains a Sunday in this year.
1	Monday	0 to 53	The first week that contains four or more days in this year.
2	Sunday	1 to 53	The first week that contains a Sunday in this year.
3	Monday	1 to 53	The first week that contains four or more days in this year.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

default_week_format	First Day of a Week	Range	First Week Definition
4	Sunday	0 to 53	The first week that contains four or more days in this year.
5	Monday	0 to 53	The first week that contains a Monday in this year.
6	Sunday	1 to 53	The first week that contains four or more days in this year.
7	Monday	1 to 53	The first week that contains a Monday in this year.

NOTE

For week 1 of a year, the number 1 indicates a week number. The week number of the first week of a year may be 0, depending on the value of **week_format**, as shown in the third column.

Parameter type: integer.

Unit: none

Value range: –2147483648 to 2147483647

- If the value is less than 0, it is forcibly changed to **0**.
- If the value is greater than 7, it is forcibly changed to **7**.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Select a mode based on service requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.14.3 Other Default Parameters

This section describes the default database loading parameters.

dynamic_library_path

Parameter description: Specifies the path that the system will search for a shared database file that is dynamically loadable. When a dynamically loadable module needs to be opened and the file name specified in the **CREATE FUNCTION** or **LOAD** command does not contain a directory, the system will search this path for the required file. Only the SYSADMIN user can access this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: string.

Unit: none

Value range: a list of absolute paths separated by colons (;) in Windows.

When the name of a path starts with the special variable *$libdir*, the variable will be replaced with the directory in which the module provided by GaussDB is installed. For example:

```
dynamic_library_path = '/usr/local/lib/gaussdb:/opt/testgs/lib:$libdir'
```

NOTE

If the value of this parameter is set to an empty character string, the automatic path search is turned off.

Default value: **"$libdir"**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The dynamic library search paths specified by **local_preload_libraries** and **shared_preload_libraries** also depend on this parameter. If this parameter is left blank or set to an invalid path, the dynamic libraries fail to be loaded, which will result in abnormal database services.

local_preload_libraries

Parameter description: Specifies one or more shared libraries that are to be preloaded at connection start. If multiple shared libraries are separated with commas (,). All library names (except the names in double quotation marks) are converted to lower case.

- Any user can change this option. Therefore, library files that can be loaded are restricted to those saved in the **plugins** subdirectory of the standard library installation directory. It is the database administrator's responsibility to ensure that libraries in this directory are all safe. Entries in **local_preload_libraries** can specify the library directory explicitly, for example, **$libdir/plugins/mylib**, or just specify the library name, for example, **mylib**. (**mylib** is equivalent to **$libdir/plugins/mylib**.)
- Unlike **shared_preload_libraries**, there are no differences in performance between loading a module at session start or doing this during the session. The intent of this feature is to allow debugging or performance-measurement libraries to be loaded into specific sessions without an explicit LOAD command. For example, debugging can be enabled under a given username by setting this parameter to **ALTER USER SET**.
- Every GaussDB-supported library has a "magic block" that is checked to guarantee compatibility. For this reason, non-GaussDB-supported libraries cannot be loaded in this way.

Parameter type: string.

Unit: none

Value range: a list of shared libraries separated by commas (,), or an empty string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: ""

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the specified library is not found, the connection fails. If the configuration is incorrect (for example, the length exceeds the limit or the directory is invalid), the process cannot be started properly.

14.3.15 Lock Management

In GaussDB, a deadlock may occur when concurrently executed transactions compete for resources. This section describes parameters used for managing transaction locks.

deadlock_timeout

Parameter description: Specifies the deadlock timeout interval. When the applied lock exceeds the preset value, the system will check whether a deadlock occurs. This parameter takes effect only for common locks.

Parameter type: integer.

Unit: ms

Value range: 1 to 2147483647

Default value: **1000** (that is, 1s)

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- The check for deadlock is relatively expensive. Therefore, the server does not check it when waiting for a lock every time. Deadlocks seldom occur when the system is running. Therefore, the system just needs to wait on the lock for a while before checking for deadlocks. Increasing the value of **deadlock_timeout** reduces the time wasted in deadlock check, but slows down reporting of real deadlock errors. On a heavily loaded server, you may need to set **deadlock_timeout** to a larger value. It is recommended that this value exceed the transaction time to avoid deadlock check before locks are released.
- When **log_lock_waits** is set to **on**, **deadlock_timeout** determines a waiting time to write the lock waiting time information during query execution to logs. To study the lock delay, you can set **deadlock_timeout** to a value smaller than the normal value.

Risks and impacts of improper settings: If the value is too large, the speed of reporting deadlock errors is slowed down. If the value is too small, deadlock detection starts before the lock is released.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

lockwait_timeout

Parameter description: Specifies the timeout for attempts to acquire a lock. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

Default value: **1200000** (20 minutes)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **900** without a unit, **lockwait_timeout** indicates 900 ms. If the value is **20min**, **lockwait_timeout** indicates 20 minutes. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value. Alternatively, set this parameter based on the service requirements.

Risks and impacts of improper settings: A larger value indicates that the blocking duration caused by lock conflicts is longer. A smaller value indicates that more lock timeout errors may be reported.

update_lockwait_timeout

Parameter description: Specifies the maximum duration that a lock waits for concurrent updates on a row to complete when the concurrent update feature is enabled in the service. If the time spent in waiting for a lock exceeds the specified time, an error is reported. This parameter takes effect only for common locks.

Parameter type: integer.

Unit: ms

Value range: 0 to 2147483647

Default value: **120000** (2 minutes)

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **900** without a unit, **update_lockwait_timeout** indicates 900 ms. If the value is **2min**, **update_lockwait_timeout** indicates 2 minutes. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Set the value based on the workload of transactions that concurrently update the same row. Generally, the execution time of TP services is less than 2 minutes. Therefore, the time for waiting for concurrent update transaction committing is short. In this case, there is a low probability that the lock times out if the default value 2 minutes is used. If a large number of concurrent transactions update the same row and the execution time exceeds 2 minutes, you can increase the value of this parameter to prevent false positives caused by lock timeout.

Risks and impacts of improper settings: A larger value indicates that the blocking duration caused by lock conflicts is longer when the same row is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

concurrently updated. A smaller value indicates that more lock timeout errors may be reported.

max_locks_per_transaction

Parameter description: Specifies the average number of object locks that each transaction can hold when the number of database connections reaches the maximum.

NOTE

This parameter does not strictly limit the maximum number of object locks that can be held by each transaction. If the number of connections does not reach the maximum value (**max_connections**), the average number of object locks that can be held by each transaction increases.

Parameter type: integer.

Unit: none

Value range: 10 to 2147483647

Default value: **256**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- The maximum number of hash tables that can be locked by a shared lock at any time is calculated based on an assumption: **max_locks_per_transaction** x (**max_connections** + **max_prepared_transactions**) and **max_locks_per_transaction** ≥ Number of concurrent service transactions x Number of object locks added by each service transaction/(**max_connections** + **max_prepared_transactions**). In this case an upper limit is determined for this parameter.
- Within the specified range, objects can be locked simultaneously at any time. You may need to increase the value of this parameter if many different tables are modified in a single transaction.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows, leading to database startup failure.
- When running a standby node, you must set this parameter to a value that is no less than that on the primary node. Otherwise, queries will not be allowed on the standby node.
- If this parameter is set to a smaller value and the standby node is faulty before the restart, the standby node fails to be restored. You are advised to set the parameters to the original values and restart the system to restore the environment.
- In specification degradation and DR scenarios, you are advised not to perform DDL operations frequently when modifying this parameter. Otherwise, a memory error will be reported.

Risks and impacts of improper settings: If the value is too large, the database may fail to be started.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_pred_locks_per_transaction

Parameter description: Specifies the average number of predicate locks that each transaction can hold when the number of database connections reaches the maximum.

NOTE

This parameter does not strictly limit the maximum number of predicate locks that can be held by each transaction. If the number of connections does not reach the maximum value (**max_connections**), the average number of predicate locks that can be held by each transaction increases.

Parameter type: integer.

Unit: none

Value range: 10 to 2147483647

Default value: **64**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- The size of the shared predicate lock table is calculated under the condition that a maximum of *N* independent objects need to be locked at any time. *N* = **max_pred_locks_per_transaction** x (**max_connections** + **max_prepared_transactions**). Objects whose amount does not exceed the preset number can be locked simultaneously at any time. You may need to increase this value if many different tables are modified in a single transaction. This parameter can only be set at server start.
- Increasing the value of this parameter may cause GaussDB to request more System V-shared memory than the OS's default configuration allows.

Risks and impacts of improper settings: If the value is too large, the database may fail to be started.

gs_clean_timeout

Parameter description: Transactions in GaussDB are committed in two phases. An unfinished two-phase transaction may hold a table-level lock, keeping tables from being locked by other connections. In this case, the database needs to call the gs_clean tool to clean unfinished two-phase transactions in cluster. **gs_clean_timeout** is used to specify the interval for the Coordinator to call the gs_clean tool. gs_clean can periodically clear residual temporary tables.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1** without a unit, **gs_clean_timeout**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

indicates 1s. If the value is **1min**, **gs_clean_timeout** indicates 1 minute. The unit must be **s**, **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, the interval for clearing two-phase transactions and residual temporary tables is prolonged. As a result, other connections may fail to be locked before the clearing.

partition_lock_upgrade_timeout

Parameter description: Specifies the timeout for attempts to upgrade an exclusive lock (read allowed) to an access exclusive lock (read/write blocked) on a partitioned table during the execution of some query statements. If there are concurrent read transactions running, the lock upgrade will need to wait. **partition_lock_upgrade_timeout** sets the waiting timeout for lock upgrade attempts.

Example: When you perform **MERGE PARTITION** and **CLUSTER PARTITION** on a partitioned table, temporary tables are used for data rearrangement and file exchange. To concurrently perform as many operations as possible on the partitions, exclusive locks are acquired for the partitions during data rearrangement and access exclusive locks are acquired during file exchange. The locking mode is attempt locking. If the locking is successful, a response is returned immediately. If the locking fails, the system waits for 50 ms and attempts to lock the next time. The locking timeout interval is specified by the session-level parameter **partition_lock_upgrade_timeout**.

Parameter type: integer.

Unit: second

Value range: –1 to 3000. **–1** indicates infinite waiting. That is, the system continuously attempts to upgrade the lock until the upgrade is successful.

Default value: **1800**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **–1**, services may be blocked when the lock cannot be upgraded for a long time.

fault_mon_timeout

Parameter description: Specifies the period for detecting lightweight deadlocks.

Parameter type: integer.

Unit: minute

Value range: 0 to 1440

Default value: **5**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, deadlocks cannot be detected in a timely manner, which slows down the speed of reporting deadlock errors.

enable_online_ddl_waitlock

Parameter description: Specifies whether to block DDL operations to wait for the release of cluster locks, such as **pg_advisory_lock** and **pgxc_lock_for_backup**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is mainly used in online OM operations and you are advised not to modify the settings.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

xloginsert_locks

Parameter description: Specifies the number of locks on concurrent write-ahead logging. This parameter is used to improve the efficiency of writing write-ahead logs.

Parameter type: integer.

Unit: none

Value range: 1 to 1000. If the CPU uses the NUMA architecture, the value must be an integer multiple of the number of NUMA nodes.

Default value: 16

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When the concurrency pressure of the Arm CPU architecture is high, performance jitter may occur due to atomic operation competition. You can decrease the value of this parameter for stable running performance.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

num_internal_lock_partitions

Parameter description: Specifies the number of internal lightweight lock partitions. It is mainly used for performance optimization in various scenarios.

NOTE

- The parameter content is organized in the KV format of keywords and numbers. Different types of locks are separated by commas (,).
- The sequence does not affect the setting result. For example, **"CLOG_PART=256,CSNLOG_PART=512"** is equivalent to **"CSNLOG_PART=512,CLOG_PART=256"**.
- If you set the same keyword repeatedly, the last setting takes effect. For example, if the setting is **"CLOG_PART=256,CLOG_PART=2"**, the value of **CLOG_PART** is **2**.

Parameter type: string.

Unit: none

Value range:

- **CLOG_PART**: number of Clog file controllers. The value ranges from 1 to 256.
- **CSNLOG_PART**: number of CSNlog file controllers. The value ranges from 1 to 512.
- **LOG2_LOCKTABLE_PART**: two pairs of ordinary table lock partitions. The minimum value is 4, that is, the number of lock partitions is 16. The maximum value is 16, that is, the number of lock partitions is 65536.
- **TWOPHASE_PART**: number of partitions of the two-phase transaction lock. The value ranges from 1 to 64.
- **FASTPATH_PART**: maximum number of locks that each thread can obtain without using the main lock table. The value ranges from 20 to 10000.

Default value:
"CLOG_PART=256,CSNLOG_PART=512,LOG2_LOCKTABLE_PART=4,TWOPHASE_PART=1,FASTPATH_PART=20"

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion:

- **CLOG_PART**: Increasing the value of this parameter improves the Clog writing efficiency and transaction commit performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing Clogs and affect the performance.
- **CSNLOG_PART**: Increasing the value of this parameter improves the CSNlog writing efficiency and transaction commit performance, but increases the memory usage. Decreasing the value of this parameter reduces the memory usage, but may increase the conflict of writing CSNlogs and affect the performance.
- **LOG2_LOCKTABLE_PART**: Increasing the value can improve the concurrency of obtaining locks in the normal process, but may increase the memory usage. When wait events occur in **LockMgrLock**, you can increase the value to improve the performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **TWOPHASE_PART**: Increasing the value of this parameter increases the number of concurrent two-phase transaction commits but increases the memory usage.
- **FASTPATH_PART**: When a partitioned table is read, updated, inserted, or deleted and the wait event is LockMgrLock, you can increase the value of this parameter to prevent LockMgrLock from being obtained and improve performance. It is recommended that the value be greater than or equal to that calculated using the following formula: Number of partitions x (1 + Number of local indexes) + Number of global indexes + 10. Increasing the value will increase the time for lock transfer and lock elimination, and increase the memory usage. The incremental FASTPATH memory (unit: bytes) is calculated as follows: (Incremental FASTPATH/20 x 8 + Incremental FASTPATH x 12) x Thread pool size.

Risks and impacts of improper settings: The database performance may be affected.

enable_wait_exclusive_lock

Parameter description: Specifies whether to enable the hang detection and cure function for the exclusive lock of ProcArrayLock.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

barrier_lock_timeout

Parameter description: Specifies the timeout interval for holding a barrier lock.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

Default value: **30**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_xid_abort_check

Parameter description: Specifies whether to verify transaction ID rollback is enabled when a transaction is committed.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_partition_ddl_lowlevel_lock

Parameter description: Locks a partitioned table during the execution of the DDL statements (ADD, DROP, TRUNCATE, EXCHANGE, MOVE, and RENAME). This parameter specifies the lock level of a table.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: adds a level-4 lock to the table. In this case, DDL/DML operations can be concurrently performed on other partitions of the table.
- **off**: adds a level-8 lock to the table. In this case, DDL/DML operations cannot be concurrently performed on other partitions of the table.

Default value: **off** for an upgraded database instance and **on** for a newly installed database instance.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings:

- If the parameter is set to **on**, DDL/DML operations can be concurrently performed on other partitions of the table, which has performance advantages. However, due to factors such as network latency, the actual execution sequence of concurrent DDL and DML operations on different DNs may be different, causing distributed deadlocks between DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If this parameter is set to **off**, DDL/DML operations cannot be concurrently performed on other partitions of the table. This has no performance advantage but no deadlock risk.

14.3.16 Version and Platform Compatibility

14.3.16.1 Compatibility with Earlier Versions

This section describes the parameters that control the backward compatibility and external compatibility of GaussDB. A backward compatible database supports applications of earlier versions. This section describes parameters used for controlling backward compatibility of a database.

array_nulls

Parameter description: Specifies whether the array input parser recognizes unquoted NULL as a null array element.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Null values can be entered in arrays.
- **off**: Old behaviors are backward compatible. Arrays containing the value **NULL** can still be created when this parameter is set to **off**.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

backslash_quote

Parameter description: Determines whether a single quotation mark can be represented by \' in a string text.

NOTE

When the string text meets the SQL standards, \ has no other meanings. This parameter only affects the handling of non-standard-conforming string texts, including escape string syntax (E'...').

Parameter type: enumerated type.

Unit: none

Value range:

- **on**: The use of \' is always allowed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off**: The use of \' is not allowed.
- **safe_encoding**: The use is allowed only when client-side encoding does not contain \ at the end of a multibyte character for an ASCII value.

Default value: **safe_encoding**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

escape_string_warning

Parameter description: Specifies whether to warn against backslash (\) escapes used in ordinary character strings.

- If you need to use a backslash (\) as an escape, you can use escape string syntax (E'...'). This is because the default behavior of ordinary character strings treats the backslash as an ordinary character in each SQL standard.
- This variable can be enabled to help locate codes that need to be changed.
- If E'...' is used as an escape, logs may be incomplete in some scenarios.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Warn against backslash escapes used in ordinary character strings.
- **off**: Do not warn against backslash escapes used in ordinary character strings.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

lo_compat_privileges

Parameter description: Specifies whether to enable backward compatibility for the privilege check of large objects.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The privilege check is disabled when large objects are read or modified.
- **off**: The privilege check is enabled for large objects.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

quote_all_identifiers

Parameter description: Specifies whether to forcibly quote all identifiers even if they are not keywords when the database generates SQL. This will affect the output of **EXPLAIN** and the results of functions, such as pg_get_viewdef. For details, see the **--quote-all-identifiers** option in "Data Import and Export Tools > gs_dump for Exporting Database Information" in *Tool Reference*.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The forcible quoting is enabled.
- **off**: The forcible quoting is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

sql_inheritance

Parameter description: Specifies the access policy of an inherited table. This parameter is set to be compatible with earlier versions.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Subtables can be accessed.
- **off**: Subtables cannot be accessed. That is, the ONLY keyword is used by default.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

standard_conforming_strings

Parameter description: Specifies whether ordinary string texts ('...') regard backslashes (\) as ordinary texts as specified in the SQL standard. Applications can check this parameter to determine how string texts will be processed. It is recommended that characters be escaped by using the escape string syntax (E'...').

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Backslashes are regarded as ordinary texts as specified in the SQL standard.
- **off**: Backslashes are regarded as escape characters in the string literal value.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

synchronize_seqscans

Parameter description: Specifies whether parallel sequence scans are synchronized with each other.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The scan may start from the middle of the table and then overwrite all rows in surround mode. The purpose is to keep synchronization with the scan that is being executed. This synchronization mechanism can improve the performance of parallel sequence scanning, but queries without using ORDER BY may return out-of-order results.
- **off**: The synchronization behavior of order scans is disabled. Each scan starts from the start position of the table. This ensures that queries without using ORDER BY return results that are consistent with the physical storage sequence, but parallel scanning efficiency may be reduced.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_beta_features

Parameter description: Specifies whether to enable some features that are not officially released and are used only for POC verification, such as GDS table join.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The features are enabled for forward compatibility.
- **off**: The features are disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Exercise caution when enabling these extended features because they may cause errors in some scenarios.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_recordtype_check_strict

Parameter description: Specifies whether to perform strict check on the record type in PL/SQL. For details, see the following description.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The record type created during compilation of stored procedures, functions, and packages is checked for unsupported functions, and the record type created by provided stored procedures and functions is checked for the NOT NULL function.
- **off**: The backward compatibility is performed and the record type is not checked.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **off**, some *record* variables that specify the NOT NULL constraint and define the default value of a column do not take effect during value assignment.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- After an upgrade from an earlier version, this parameter is set to **off** by default.
- After this parameter is enabled, the following three changes occur:
  - For the record type created in a stored procedure or function, the NOT NULL constraint of the columns takes effect.
  - If **NOT NULL** or **DEFAULT** is specified for a column of the record type created in a package, a compilation error is reported. Variables created by accessing the package.rec type do not support **NOT NULL** and **DEFAULT**.
  - If **NOT NULL** or **DEFAULT** is specified for a column of another type with a nested record type, a compilation error is reported. For a variable nested with the record type, the record element of the variable does not support **NOT NULL** and **DEFAULT**.

plsql_block_concat_typename

Parameter description: Specifies the combination mode of user-defined type names in PL/SQL subblocks.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A user-defined type in the PL/SQL subblock is used. The name of the user-defined type in the SQL statement is in the format of *OID*.[*m.n*···].*typename*, where *OID* is the OID of the stored procedure, *typename* is the name of the user-defined type, and *m* and *n* are sequence numbers of subblocks. When a plurality of layers of subblocks are nested, a plurality of layers of sequence numbers are required. If there is only a single layer of subblocks, only *m* is required.
- **off**: The backward compatibility in original mode is used. The name format is *OID.typename*.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is **off** and the user-defined types in a subblock have the same name, the SQL statement cannot distinguish the user-defined types of different subblocks.

NOTE

After an upgrade from an earlier version, this parameter is set to **off** by default.

default_with_oids

Parameter description: Specifies whether **CREATE TABLE** and **CREATE TABLE AS** include an **OID** field in newly-created tables if neither **WITH OIDS** nor **WITHOUT OIDS** is specified. It also determines whether OIDs will be included in tables created by **SELECT INTO**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that **CREATE TABLE** and **CREATE TABLE AS** can include an **OID** column in newly-created tables.
- **off** indicates that **CREATE TABLE** and **CREATE TABLE AS** cannot include any **OID** column in newly-created tables.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: It is not recommended that OIDs be used in user tables. Therefore, this parameter is set to **off** by default. When OIDs are required for a particular table, **WITH OIDS** needs to be specified during the table creation.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

system_view_version

Parameter description: Determines the version of the system view. For details, see **Table 1 System view version parameters**. All versions are backward compatible. For example, when **system_view_version** is set to **3**, all features of version 2 and version 1 are also supported.

Parameter type: integer.

Unit: none

Value range: 0 to 9999

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: In the upgrade scenario, do not change the value. In the installation scenario, set this parameter to the latest version listed in **Table 1 System view version parameters**.

Risks and impacts of improper settings: The behavior of some columns in the system view is changed. For details, see **Table 1 System view version parameters**.

Table 14-15 System view version parameters

Value	Description
0	Default behavior.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value	Description
1	When no prepared transaction exists in GaussDB, the value of the **PREPARECOUNT** column in the V$GLOBAL_TRANSACTION view changes from **NULL** to **0**.

14.3.16.2 Platform and Client Compatibility

Many platforms use the database system. External compatibility of the database system provides great convenience for platforms.

a_format_date_timestamp

Parameter description: Specifies whether to return the date and time. In ORA-compatible mode, when a transaction is started, the functions current_date(), current_timestamp(), and localtimestamp() return the timestamp when the current SQL statement is started.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Returns the timestamp when the current SQL statement is started.
- **off**: Returns the date or date and time when the transaction is started.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. This parameter can be enabled when the system time needs to be returned when a transaction is started.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

convert_string_to_digit

Parameter description: Specifies the implicit conversion priority, which specifies whether to preferentially convert strings into numbers.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that strings are preferentially converted into numbers.
- **off** indicates that strings are not preferentially converted into numbers.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is modified, the internal data type conversion rule will be modified, causing unexpected behavior. Exercise caution when performing this operation.

character_set_connection

Parameter description: Specifies the character set of constant strings. If this parameter is modified, **collation_connection** is changed to the default collation of the character set.

- This parameter takes effect when **sql_compatibility** is set to **'MYSQL'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s2'**.
- This parameter takes effect in M-compatible mode.

Parameter type: string.

Unit: none

Value range:

- A character set in the compatibility mode whose **sql_compatibility** is set to **'MYSQL'**. For details about the character sets supported in MySQL-compatible mode, see **COLLATE collation** in "SQL Reference" > "SQL Syntax" > "C" > "CREATE TABLE" in *Developer Guide*.
- In M-compatible mode, the value range is the supported character set. For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.

Default value: same as the value of **server_encoding**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the configured character set is inconsistent with the current environment, transcoding may be performed for multiple times, affecting performance.

collation_connection

Parameter description: Specifies the collation of a constant string. If this parameter is modified, **character_set_connection** is changed to the default character set of the collation.

- This parameter takes effect when **sql_compatibility** is set to **'MYSQL'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s2'**.
- This parameter takes effect in M-compatible mode.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- A character set in the compatibility mode whose **sql_compatibility** is set to **'MYSQL'**. For details about the collations supported in MySQL-compatible mode, see **COLLATE collation** in "SQL Reference" > "SQL Syntax" > "C" > "CREATE TABLE" in *Developer Guide*.
- In M-compatible mode, the value range is the supported collations. For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.

Default value: default collation of the current **server_encoding**. If it has no default collation, the value is **default**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the configured collation is inconsistent with the current environment, transcoding may be performed for multiple times, affecting performance.

character_set_client

Parameter description: Specifies the character set of the client. The meaning of this parameter is the same as that of **client_encoding**.

Parameter type: string

Unit: none

Value range: character sets supported in M-compatible mode (**sql_compatibility** set to **'M'**). For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.

Default value: same as the character set of the client.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the configured character set is inconsistent with the current environment, garbled characters may be displayed.

NOTE

This parameter does not take effect in the current version.

character_set_database

Parameter description: Specifies the character set of a database or schema.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: character sets supported in M-compatible mode (**sql_compatibility** set to **'M'**). For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.

Default value: same as the character set of the current database.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- This parameter takes effect in M-compatible mode.
- This parameter does not take effect in the current version.

collation_database

Parameter description: Specifies the collation of a database or schema.

Parameter type: string.

Unit: none

Value range: collations supported in M-compatible mode (**sql_compatibility** set to **'M'**). For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.

Default value: default collation of the current database character set. If the default collation does not exist, the value is **default**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- This parameter takes effect in M-compatible mode.
- This parameter does not take effect in the current version.

character_set_server

Parameter description: Specifies the character set for creating a database or schema.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: character sets supported in M-compatible mode (**sql_compatibility** set to **'M'**). For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.

Default value: same as the character set of the current database.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- This parameter takes effect in M-compatible mode.
- This parameter does not take effect in the current version.

collation_server

Parameter description: Specifies the collation for creating a database or schema.

Parameter type: string.

Unit: none

Value range: collations supported in M-compatible mode (**sql_compatibility** set to **'M'**). For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.

Default value: default collation of the current database character set. If the default collation does not exist, the value is **default**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- This parameter takes effect in M-compatible mode.
- This parameter does not take effect in the current version.

character_set_results

Parameter description: Specifies the character set of the returned result.

- This parameter takes effect when **sql_compatibility** is set to **'MYSQL'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s2'**.
- This parameter takes effect in M-compatible mode.

Parameter type: string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- A character set in the compatibility mode whose **sql_compatibility** is set to **'MYSQL'**. For details about the character sets supported in MySQL-compatible mode, see **COLLATE collation** in "SQL Reference" > "SQL Syntax" > "C" > "CREATE TABLE" in *Developer Guide*.
- In M-compatible mode, the value range is the supported character set. For details, see "SQL Reference > Character Sets and Collations" in *M Compatibility Developer Guide*.
- You can also set this parameter to **null** or **''**. In this case, the character set of the database is output.

Default value: same as the value of **client_encoding**.

Setting method: This is a USERSET parameter, which can only be set using method 3, and cannot be set using the GUC tools. For details about how to set this parameter, see **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the configured character set is inconsistent with the current environment, garbled characters may be displayed.

enable_multiple_charset

Parameter description: Specifies whether tables, columns, and schemas whose character sets are different from the character set of the current database can be created in M-compatible mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: You can create tables, columns, and schemas whose character sets are different from the character set of the current database.
- **off**: You cannot create tables, columns, and schemas whose character sets are different from the character set of the current database.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

lower_case_table_names

Parameter description: Specifies whether the user table names (including table aliases), user view names, schema names (internal database names), and values of the columns corresponding to the preceding objects in the information_schema system view are case-sensitive in an M-compatible database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: int

Unit: none

Value range:

- **0**: User table names, user view names, and schema names (internal database names) are stored in system catalogs in the capitalization style specified in the CREATE TABLE, CREATE VIEW, and CREATE SCHEMA (CREATE DATABASE) statements. In the information_schema system view, the values of the columns corresponding to the preceding objects are case-sensitive.
- **1**: User table names are stored in lowercase in system catalogs. Names are case-insensitive. During storage and query operations, all user table names are converted to lowercase. This behavior also applies to schema names (internal database names), table aliases, user view names, and values of the corresponding columns in the information_schema system view.

Default value: **0**

Setting method: This parameter needs to be specified during database initialization. If it is not specified, the default behavior is case-sensitive. You can use the following methods to specify the case-sensitive behavior:

```
--gsinit-parameter='--lower_case_table_names=1'; -- Case-insensitive.
--gsinit-parameter='--lower_case_table_names=0'; -- Case-sensitive.
```

Setting suggestion: Retain the default value. If the values of the columns corresponding to the preceding objects in the user table names (including table aliases), user views, schema names (internal database names), and information_schema system views queried in the M-compatible database need to be case-insensitive, set this parameter to **1**.

NOTICE

- The following scenarios may cause data loss. Exercise caution when performing these operations.
  - Do not perform import, export, logical decoding, or backup and restoration between two databases with different GUC parameters.
  - Do not perform DR backup between two primary and standby database instances with different GUC parameters.
  - This parameter is specified during database installation. Do not modify this parameter after the database is started or during the upgrade. Otherwise, data may be lost, and the correct case sensitivity of column values in the information_schema system view cannot be ensured.
- For system functions in a non-M compatibility, if the input parameters involve user table names (including table aliases), user view names, and schema names (internal database names), the correct case sensitivity cannot be ensured after the parameter is enabled.

nls_timestamp_format

Parameter description: Specifies the default timestamp format.

Parameter type: string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: a string.

Default value: **"DD-Mon-YYYY HH:MI:SS.FF AM"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

nls_timestamp_tz_format

Parameter description: Specifies the default timestamp with time zone format.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **"DD-Mon-YYYY HH:MI:SS.FF AM"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

This parameter is valid only when **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s1**.

nls_nchar_characterset

Parameter description: Specifies the national character set. This parameter is used together with the nchr(cvalue int|bigint) system function.

Parameter type: string.

Unit: none

Value range: **"AL16UTF16"** and **"UTF8"** (case-insensitive).

Default value: **"AL16UTF16"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The database does not support the national character set. This parameter is used only to be compatible with the ORA database and obtain the national character set for users.
- This GUC parameter applies only to the nchr(cvalue int|bigint) function.

group_concat_max_len

Parameter description: This parameter is used together with the group_concat() function to limit the length of the return value. If the length exceeds the limit, the return value is truncated and an error or alarm is generated. If **sql_mode** is set to a value contain **STRICT_TRANS_TABLES**, an error is reported in the DML statement. In other scenarios, an alarm is reported.

Parameter type: integer.

Unit: none

Value range: 0 to 9223372036854775807. Currently, the maximum length that takes effect is 1073741823. If the length exceeds this limit, the out of memory error is reported.

Default value: 1024

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the result returned by group_concat() may be truncated.

lastval_supported

Parameter description: Specifies whether the lastval() function can be used.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The lastval() function can be used and the nextval() function cannot be pushed down.
- **off**: The lastval() function cannot be used and the nextval() function can be pushed down.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

max_function_args

Parameter description: Specifies the maximum number of parameters allowed for a function.

Parameter type: integer.

Unit: none

Value range: **8192**

Default value: **8192**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

max_subpro_nested_layers

Parameter description: Specifies the maximum nesting depth of nested subprograms.

Parameter type: integer.

Unit: none

Value range: 0 to 100

NOTE

When this parameter is set to **0**, nested subprograms are not allowed.

Default value: **3**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the maximum nesting depth.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

transform_null_equals

Parameter description: Specifies whether expressions of the form **expr=NULL** (or **NULL=expr**) are treated as **expr IS NULL**. The correct SQL-standard-compliant behavior of **expr=NULL** is to always return **NULL** (unknown). Filtered forms in Microsoft Access generate queries that appear to use **expr=NULL** to test for null values. After you enable this option, you can use this API to access the database.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: Expressions of the form **expr=NULL** (or **NULL=expr**) are treated as **expr IS NULL** They return true if expr evaluates to the **NULL** value, and false otherwise.
- **off**: **expr=NULL** always returns **NULL** (unknown).

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

New users are always confused about the semantics of expressions involving **NULL** values. Therefore, **off** is used as the default value.

support_extended_features

Parameter description: Specifies whether extended database features are supported.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that extended database features are supported.
- **off** indicates that extended database features are not supported.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

sql_compatibility

Parameter description: Specifies the type of mainstream database with which the SQL syntax and statement behavior of the database is compatible.

Parameter type: enumerated type

Unit: none

Value range:

- **ORA**: Oracle-compatible.
- **TD**: Teradata-compatible.
- **MYSQL**: MySQL-compatible.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **PG**: PG-compatible.
- **M**: M-compatible.

Default value: **MYSQL**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

NOTE

- This parameter can be set only when you run the **CREATE DATABASE** command to create a database. For details, see "SQL Reference" > "SQL Syntax" > "C" > "CREATE DATABASE" in *Developer Guide*.
- In the database, this parameter must be set to a specific value. It can be set to **ORA** or **TD** and cannot be changed randomly. Otherwise, the setting is not consistent with the database behavior.
- In distributed database scenarios in M-compatible mode, if an alarm is generated on a CN, WARNING information is generated. If an alarm is generated on a DN, WARNING information cannot be generated.

b_format_behavior_compat_options

Parameter description: Specifies a MySQL-compatible database configuration item.

Parameter type: string.

Unit: none

Value range: Currently, only B-compatible configuration items listed in **Table 1 MySQL-compatible configuration items** are supported. Use commas (,) to separate multiple compatibility configuration items.

Default value: **""**

NOTE

If **b_format_version** is not set to **''**, **b_format_behavior_compat_options** will be set to **"all"** and cannot be modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-16 MySQL-compatible configuration items

Configuration Item	Behavior
default_collation	Specifies whether to enable forward compatibility of the default collation. • If this item is not specified, the character set or collation of a column of the character type is not explicitly specified, and the collation of a table is empty, the column uses the default collation. • If this item is specified, the collation of a column of the character type inherits the collation of a table (if it is not empty). If the collation of a table is empty, the default collation corresponding to the database is used.
all	Determines whether to enable all syntax. **all** cannot be specified together with other configuration items. In the table, specifying all configuration items except **all** that are separated by commas is equivalent to specifying **all**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determines whether some MySQL-compatible features are available. If you want to modify this parameter, make sure you understand its meaning and modify it with caution to avoid risks caused by misoperations.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

m_format_behavior_compat_options

Parameter description: Specifies the configuration items of an M-compatible database. In the multi-tenancy scenario, this parameter can be set at the PDB level.

Parameter type: string.

Unit: none

Value range: Currently, only **Table 14-17** are supported. Compatibility configuration items are separated by commas (,).

Default value: **"grant_database_nomapping"**. If this parameter is not specified for a PDB, the PDB inherits the global setting of this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-17 M-compatible configuration items

Configuration Item	Behavior
forbid_none_space_comment	The single-line comment syntax "-- " is supported. In the current version, this function does not take effect. That is, no matter whether this configuration item is set, all content after "--" (no matter whether a space is added after "--") is regarded as a single-line comment. ● If this configuration item is not set, all content after "--" (no matter whether a space is added after "--") is regarded as a single-line comment. ● If this configuration item is set, only the content after "-- " (a space following "--") is considered as a single-line comment.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

grant_database_nomapping	Configuration item of the GRANT | REVOKE ON DATABASE syntax behavior in the M-compatible database.
	• If this configuration item is not set, the GRANT | REVOKE ON DATABASE syntax is mapped to the GRANT | REVOKE ON SCHEMA behavior to grant or revoke the specified user or role's permission to access schema-level objects.
	• If this configuration item is set, the GRANT | REVOKE ON DATABASE syntax retains the behavior of the GRANT | REVOKE ON DATABASE syntax in the GaussDB of the default compatibility, and grants or revokes the access permission of a specified user or role on database objects.
	-- Create a user and a database.
	\c postgres
	DROP USER IF EXISTS testUser cascade;
	DROP DATABASE IF EXISTS m_db;
	CREATE USER testUser WITH PASSWORD 'Gauss_234';
	CREATE DATABASE m_db DBCOMPATIBILITY='M';
	\c m_db
	
	-- The option is not enabled and the schema is mapped to the grant schema. A message is displayed, indicating that the schema cannot be found.
	m_db=# SET m_format_behavior_compat_options='';
	SET
	m_db=# GRANT CREATE ON DATABASE m_db TO testUser;
	ERROR: schema "m_db" does not exist
	m_db=# SET SESSION AUTHORIZATION testUser PASSWORD 'Gauss_234';
	SET
	m_db=> CREATE SCHEMA s1;
	ERROR: Permission denied for database m_db.
	DETAIL: N/A.
	m_db=> \c -
	
	-- Enable the option. The create schema permission is granted.
	m_db=# SET m_format_behavior_compat_options='grant_database_nomapping';
	SET
	m_db=# GRANT CREATE ON DATABASE m_db TO testUser;
	GRANT
	m_db=# SET SESSION AUTHORIZATION testUser PASSWORD 'Gauss_234';
	SET
	m_db=> CREATE SCHEMA s1;
	CREATE SCHEMA
	m_db=> \c -
	
	-- Clean up.
	\c postgres
	DROP USER IF EXISTS testUser cascade;
	DROP DATABASE IF EXISTS m_db;

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

system_function_version

Parameter description: Specifies the configuration item of the database system function behavior.

Parameter type: string.

Unit: none

Value range: Currently, only compatibility configuration items listed in **Table 14-18** are supported. Use commas (,) to separate multiple compatibility configuration items, for example, **"SET system_function_version='get_hash_value_fix,pbe_trunc_fix,empty_array_fix';"**.

Default value:

- During installation: **get_hash_value_fix,pbe_trunc_fix,empty_array_fix**
- During upgrade: **""**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-18 Compatibility configuration items

Configuration Item	Behavior

get_hash_value_fix	Specifies whether to enable the dbe_utility.get_hash_value forward compatibility.
	• If this configuration item is not set, the last four bytes of the character string entered by the user are ignored. As a result, the hash values of the character strings less than four bytes are the same.
	• If this configuration item is set, the problem is resolved to ensure that the hash values are correct.
	gaussdb=# SET system_function_version = '';
	SET
	gaussdb=# SELECT dbe_utility.get_hash_value(1, 1024, 1024);
	get_hash_value
	---------------- 	
	1444
	(1 row)
	
	gaussdb=# SELECT dbe_utility.get_hash_value(2, 1024, 1024);
	get_hash_value
	---------------- 	
	1444
	(1 row)
	
	gaussdb=# SET system_function_version = 'get_hash_value_fix';
	gaussdb=# SELECT dbe_utility.get_hash_value(1, 1024, 1024);
	get_hash_value
	---------------- 	
	1785
	(1 row)
	
	gaussdb=# SELECT dbe_utility.get_hash_value(2, 1024, 1024);
	get_hash_value
	---------------- 	
	1538
	(1 row)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

pbe_trunc_fix	Specifies whether to enable the forward compatibility of the lpad/rpad/chr/round/trunc/ add_months/instrb function in the PBE scenario.
	• If this configuration item is not set, the decimal points of the input parameters of the preceding functions are rounded off to integers in the PBE scenario.
	• If this configuration item is set, the decimal points of the input parameters of the preceding functions are truncated to integers in the PBE scenario to ensure that the result is the same as the result in ORA-compatible mode.
	gaussdb=# SET a_format_version='10c';
	SET
	gaussdb=# SET a_format_dev_version='s1';
	SET
	gaussdb=# PREPARE pround1 AS SELECT round(123.456,$1);
	PREPARE
	gaussdb=# EXECUTE pround1('2.6');
	round
	--------- 	
	123.456
	(1 row)
	
	gaussdb=# SET system_function_version = 'pbe_trunc_fix';
	SET
	gaussdb=# PREPARE pround1 AS SELECT round(123.456,$1);
	PREPARE
	gaussdb=# EXECUTE pround1('2.6');
	round
	--------- 	
	123.46
	(1 row)
	NOTE
	This parameter is valid only in an ORA-compatible database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
empty_array_fix	Specifies whether to enable the forward compatibility of empty arrays. ● If this configuration item is not set, the empty array constructed by the array_positions function is different from the empty array constructed by **'{}'::int[]**. ● If this configuration item is set, the empty array constructed by the array_positions function is the same as the empty array constructed by **'{}'::int[]**. gaussdb=# SET system_function_version = 'empty_array_fix'; SET gaussdb=# SELECT array_eq(array_positions(array[1, 1, 1], 3), '{}'::int[]); array_eq ---------- t (1 row) gaussdb=# SET system_function_version = ''; SET gaussdb=# SELECT array_eq(array_positions(array[1, 1, 1], 3), '{}'::int[]); array_eq ---------- f (1 row)
regex_like_m_fix	Specifies the forward compatibility switch that controls the behavior of the regex_like_m function. (The regexp_like function calls regex_like_m, which is also affected.) ● If this configuration item is not set, the matching result is incorrect when multiple rows are matched and the regular expression rule contains |. ● If this configuration item is set, the matching result is correct when multiple rows are matched and the regular expression rule contains |. gaussdb=# SET system_function_version = 'regex_like_m_fix'; SET gaussdb=# SELECT 'abc' FROM dual WHERE regex_like_m('111 2 222','^1+$\|^2+$'); ?column? ---------- abc (1 row) gaussdb=# SET system_function_version = ''; SET gaussdb=# SELECT 'abc' FROM dual WHERE regex_like_m('111 2 222','^1+$\|^2+$'); ?column? ---------- (0 row)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. During the upgrade, the parameter is left empty by default. If you need to enable the setting, you are advised to modify the GUC configuration file to ensure that the setting is not lost when the database is restarted.

Setting suggestion: Specifies whether some system function compatibility features are available. If you want to modify this parameter, make sure you understand its meaning and modify it with caution.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

behavior_compat_options

Parameter description: Specifies the database compatibility configuration item.

Parameter type: string.

Unit: none

Value range: Currently, only compatibility configuration items listed in **Table 14-19** are supported. Use commas (,) to separate multiple compatibility configuration items, for example, **set behavior_compat_options='end_month_calculate,display_leading_zero'**.

Default value: **"enable_bpcharlikebpchar_compare,enable_crosstype_integer_operator,forbid_skip_tableof_empty_str_elem,enable_ora_joinop_in_updatestmt"**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-19 Configuration Item

Configuration Item	Behavior

display_leading_zero	Specifies how floating-point numbers are displayed. It controls the display of zeros before the decimal point of all character string types (such as char, character, nchar, varchar, character varying, varchar2, nvarchar2, text, and clob) and arbitrary-precision types (such as float4, float8, and numeric) in the numeric type, specifies whether the length of the number calculated by **length** contains zeros before the decimal point.
	● If this item is not specified, for a non-zero decimal number between –1 and +1, the 0 before the decimal point is not displayed. For example:
	gaussdb=# SELECT 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;
	a | b | c | d
	----------+----------+------+---
	.1231243 | .1231243 | .123 | 8
	(1 row)
	● If this item is specified, for a non-zero decimal number between –1 and +1, the 0 before the decimal point is displayed. For example:
	gaussdb=# select 0.1231243 as a, 0.1231243::numeric as b,0.1231243::integer(10,3) as c, length(0.1242343) as d;
	a | b | c | d
	-----------+-----------+-------+---
	0.1231243 | 0.1231243 | 0.123 | 9
	(1 row)

end_month_calculate	Specifies the calculation logic of the add_months function. This parameter does not take effect in M-compatible databases. Assume that the two parameters of the add_months function are **param1** and **param2**, and that the month of **param1** and **param2** is **result**. ● If this item is not specified, and the **Day** of **param1** indicates the last day of a month shorter than **result**, the **Day** in the calculation result will equal that in **param1**. For example: gaussdb=# select add_months('2018-02-28',3) from *sys_dummy*; add_months --------------------- 2018-05-28 00:00:00 (1 row) ● If this item is specified, and the **Day** of **param1** indicates the last day of a month shorter than **result**, the **Day** in the calculation result will equal that in **result**. For example: gaussdb=# select add_months('2018-02-28',3) from *sys_dummy*; add_months --------------------- 2018-05-31 00:00:00 (1 row)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
compat_analyze_sample	Specifies the sampling behavior of the ANALYZE operation. If this item is specified, the sample collected by the ANALYZE operation will be limited to around 30,000 records, controlling CN memory consumption and maintaining the stability of ANALYZE.
bind_schema_tablespace	Binds a schema with the tablespace with the same name. If a tablespace name is the same as *sche_name*, **default_tablespace** will also be set to *sche_name* if **search_path** is set to *sche_name*.
bind_procedure_searchpath	Specifies the search path of the database objects in a stored procedure for which no schema name is specified. If no schema name is specified for a stored procedure, the schema to which the stored procedure belongs is searched preferentially. If the stored procedure is not found, the following operations are performed: ● If this item is not specified, the system reports an error and exits. ● If this item is specified, the search continues based on the settings of **search_path**. If the issue persists, the system reports an error and exits.
skip_insert_gs_source	If this parameter is enabled, no data is inserted into the dbe_pldeveloper.gs_source table when the PL/SQL objects are created.
a_hash_bpchar	If this parameter is enabled, the hashbpchar function retains spaces at the end of a string to calculate the hash value.

correct_to_number	Specifies the compatibility of the to_number() result.
	● If this item is not set, the result of the to_number() function is the same as that in the ORA database by default.
	`gaussdb=# select '' AS to_number_14, to_number('34,50','999,99');`
	`ERROR:  invalid data.`
	`CONTEXT:  referenced column: to_number`
	● If this item is specified, the result of the to_number() function is the same as that of pg11.
	`gaussdb=# select '' AS to_number_14, to_number('34,50','999,99');`
	` to_number_14 | to_number`
	`---------------+-----------`
	`| 3450`
	`(1 row)`

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

unbind_divide_bound	Specifies the range check on the result of integer division.
	This parameter does not take effect in M-compatible databases.
	● If this item is not specified, the range of the division result is verified. For example, an out-of-bounds error is reported because the output result of *INT_MIN*/**(–1)** is greater than *INT_MAX*.
	`gaussdb=# select (-2147483648)::int4 / (-1)::int4;`
	`ERROR:  integer out of range`
	● If this item is specified, the range of the division result does not need to be verified. For example, the output result of *INT_MIN*/**(–1)** is *INT_MAX***+1**.
	`gaussdb=# select (-2147483648)::int4 / (-1)::int4;`
	`  ?column?`
	`------------`
	` 2147483648`
	`(1 row)`

convert_string_digit_to_numeric	Specifies whether to convert numeric constants of the character string type to those of the numeric type before these two types are compared.
	This parameter does not take effect in M-compatible databases.
	● If this item is not specified, the numeric constants of the character string type are not converted to those of the numeric type.
	● If this item is specified, the numeric constants of the character string type are converted to those of the numeric type.
	`gaussdb=# create table test1 (c1 int, c2 varchar);`
	`gaussdb=# insert into test1 values (2, '1.1');`
	`gaussdb=# set behavior_compat_options='';`
	`gaussdb=# select * from test1 where c2 > 1;`
	`ERROR:  invalid input syntax for type bigint: "1.1"`
	
	`gaussdb=# set behavior_compat_options='convert_string_digit_to_numeric';`
	`gaussdb=# select * from test1 where c2 > 1;`
	` c1 | c2`
	`----+-----`
	`  2 | 1.1`
	`(1 row)`
	
	`gaussdb=# drop table test1;`

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
return_null_string	Specifies how to display the empty result (empty string '') of the lpad() and rpad() functions. This parameter does not take effect in M-compatible databases. ● If this item is not specified, the empty string is displayed as **NULL**. gaussdb=# select length(lpad('123',0,'*')) from *sys_dummy*; length -------- (1 row) ● If this item is specified, the empty string is displayed as single quotation marks (''). gaussdb=# select length(lpad('123',0,'*')) from *sys_dummy*; length -------- 0 (1 row)
compat_concat_variadic	Specifies the compatibility of variadic results of the concat() and concat_ws() functions. The MySQL database does not have the variadic type. Therefore, this option has no impact on the MySQL database. ● If this item is not set and the concat function parameter is of the variadic type, the results of the Oracle and Teradata databases in compatibility mode are the same by default. gaussdb=# select concat(variadic NULL::int[]) is null; ?column? ---------- t (1 row) ● If this item is set and the concat function parameter is of the variadic type, different result formats of the ORA and TD databases in compatibility mode are retained. -- In the ORA database: gaussdb=# select concat(variadic NULL::int[]) is null; ?column? ---------- t (1 row) -- In the TD database: gaussdb=# select concat(variadic NULL::int[]) is null; ?column? ---------- f (1 row)

Configuration Item	Behavior
merge_update_multi	When MERGE INTO ... WHEN MATCHED THEN UPDATE (see "SQL Reference" > "SQL Syntax" > "M" > "MERGE INTO" in *Developer Guide*) and INSERT ... ON DUPLICATE KEY UPDATE (see "SQL Reference" > "SQL Syntax" > "I" > "INSERT" in *Developer Guide*) are used, it controls the UPDATE behavior if a piece of target data in the target table conflicts with multiple pieces of source data. ● If this item is specified and the preceding scenario exists, the system performs multiple UPDATE operations on the conflicting row. ● If this item is not specified (the default value is retained), an error is reported, indicating that the MERGE or INSERT operation fails.
plstmt_implicit_savepoint	Determines whether the execution of an UPDATE statement in a stored procedure has an independent subtransaction. If this parameter is set, the implicit savepoint is enabled before executing each UPDATE statement in the stored procedure, and the subtransaction is rolled backed to the latest savepoint in the EXCEPTION block by default, ensuring that only the modification of failed statements is rolled back. This option is used to be compatible with the EXCEPTION behavior of the ORA database.
hide_tailing_zero	Configuration item for numeric display. ● If this item is specified, the trailing zeros after the decimal point are hidden in all scenarios where numeric values are output, even if the precision format is specified. ● If this item is not specified, numeric data is displayed in the specified precision. For example: gaussdb=# set behavior_compat_options='hide_tailing_zero'; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999'); a | to_char ---------+---------- 123.123 | 123.123 (1 row) gaussdb=# set behavior_compat_options=''; gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999'); a | to_char ----------------+------------- 123.1230000000 | 123.123000 (1 row)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

truncate_numeric_tail_zero	Configuration item for numeric display.
	● If this item is specified, the trailing zeros after the decimal point are hidden in all numeric output scenarios except explicit precisions, such as to_char(numeric, format).
	● If this item is not specified, numeric data is displayed in the default precision.
	For example:
	gaussdb=# set behavior_compat_options='truncate_numeric_tail_zero';
	gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');
	  a
		to_char
		---------+-------------
		123.123
			123.123000
			(1 row)
			gaussdb=# set behavior_compat_options='';
			gaussdb=# select cast(123.123 as numeric(15,10)) as a, to_char(cast(123.123 as numeric(15,10)), '999D999999');
			  a
				to_char
				----------------+-------------
				123.1230000000
					123.123000
					(1 row)

Configuration Item	Behavior

char_coerce_compat	Specifies the behavior when the char(n) type is converted to other variable-length string types. This parameter is valid only when the **sql_compatibility** parameter is set to **ORA**. After this parameter is enabled, spaces at the end are not omitted in implicit conversion, explicit conversion, or conversion by calling the text(bpchar) function.
	• If this item is specified, spaces at the end are not omitted in conversion. In addition, if the length of the char(n) type exceeds that of other variable-length string types, an error is reported.
	• If this item is not specified, spaces at the end are omitted when the char(n) type is converted to another variable-length string type.
	gaussdb=# set behavior_compat_options='';
	gaussdb=# create table tab_1(col1 varchar(3));
	gaussdb=# create table tab_2(col2 char(3));
	gaussdb=# insert into tab_2 values(' ');
	gaussdb=# insert into tab_1 select col2 from tab_2;
	gaussdb=# select * from tab_1 where col1 is null;
	col1
	------ 	
	
	(1 row)
	gaussdb=# select * from tab_1 where col1=' ';
	col1
	------ 	
	(0 rows)
	gaussdb=# delete from tab_1;
	gaussdb=# set behavior_compat_options = 'char_coerce_compat';
	gaussdb=# insert into tab_1 select col2 from tab_2;
	gaussdb=# select * from tab_1 where col1 is null;
	col1
	------ 	
	(0 rows)
	gaussdb=# select * from tab_1 where col1=' ';
	col1
	------ 	
	
	(1 row)
	
	gaussdb=# drop table tab_1;
	gaussdb=# drop table tab_2;

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
aformat_regexp_match	Determines the matching behavior of regular expression functions. When this parameter is set and **sql_compatibility** is set to **ORA** or **MYSQL**, the meanings of the options supported by the **flags** parameter of the regular expression are as follows: 1. By default, the character **'\n'** cannot be matched. 2. If **flags** contains the **n** option, **'.'** can match the character **'\n'**. 3. The regexp_replace(source, pattern replacement) function replaces all matching substrings. 4. The regexp_replace(source, pattern, replacement, flags) function returns **null** when the value of **flags** is **''** or **null**. Otherwise, the meanings of the options supported by the **flags** parameter of the regular expression are as follows: 1. By default, the character **'\n'** can be matched. 2. The **n** option in **flags** indicates that the multi-line matching mode is used. 3. The regexp_replace(source, pattern replacement) function replaces only the first matched substring. 4. If the value of **flags** is **''** or **null**, the return value of the regexp_replace(source, pattern, replacement, flags) function is the character string after replacement.
disable_rewrite_nesttable	The distributed mode does not support this parameter.
disable_emptystr2null	In the ORA-compatible parameter binding scenario, if this parameter is enabled, the function of converting the values of parameters of the character type from an empty string to **null** by default, if any, is disabled. text, clob, blob, raw, bytea, varchar, nvarchar2, bpchar, char, name, byteawithoutorderwithqualcol, and byteawithoutordercol. This parameter is reserved for emergency. Do not set it unless necessary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
select_into_return_null	If this parameter is enabled in PG-compatible mode, **NULL** values can be assigned to the variables in the stored procedure statement **SELECT** *select_expressions* **INTO [STRICT]** *target* **FROM...** without specifying **STRICT** when the query result is empty. After this parameter is enabled, if the returned result set is empty, the **NULL** value is assigned to the variable. For example: gaussdb=# SET behavior_compat_options = 'select_into_return_null'; SET gaussdb=# CREATE TABLE t1 (a int, b int) DISTRIBUTE BY hash(a); CREATE TABLE gaussdb=# DECLARE gaussdb-# var int; gaussdb-# BEGIN gaussdb$# SELECT b INTO var FROM t1; gaussdb$# RAISE INFO '%', var; gaussdb$# END; gaussdb$# / INFO: <NULL> ANONYMOUS BLOCK EXECUTE
plsql_security_definer	• After this parameter is enabled, the definer permission is used by default when a stored procedure is created. • The default permission on a package is SECURITY INVOKER. To change the default permission to SECURITY DEFINER, set this parameter.
proc_outparam_override	Determines the overloading of output parameters of a stored procedure. After this parameter is enabled, the stored procedure can be properly created and called even if only the output parameters of the stored procedure are different. Currently, this parameter can be used only when gsql and JDBC are used to connect to the database. If this parameter is enabled for other tools to connect to the database, stored procedures with the **out** parameter cannot be called. It supports the functions that contain the **out** output parameter and returns data of the record type. Besides, a value is assigned to the **out** parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

proc_uncheck_default_param	When a function is called, the system does not check whether the default parameter is omitted.
	• If this item is not specified and a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported. For example:
	gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int
	gaussdb-# as
	gaussdb$# begin
	gaussdb$# raise info 'f1:%',f1;
	gaussdb$# raise info 'f2:%',f2;
	gaussdb$# raise info 'f3:%',f3;
	gaussdb$# raise info 'f4:%',f4;
	gaussdb$# raise info 'f5:%',f5;
	gaussdb$# return 1;
	gaussdb$# end;
	gaussdb$# /
	CREATE FUNCTION
	gaussdb=# select test(1,2);
	ERROR: function test(integer, integer) does not exist
	LINE 1: select test(1,2);
	^
	HINT: No function matches the given name and argument types. You might need to add explicit type casts.
	CONTEXT: referenced column: test
	
	gaussdb=# drop function test;
	• If this item is specified and a function with default parameters is called, input parameters are added to the function from left to right. The number of defaulted inputs depends on the number of default parameters. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter. For example:
	gaussdb=# create or replace function test(f1 int, f2 int default 20, f3 int, f4 int default 40, f5 int default 50) return int
	gaussdb-# as
	gaussdb$# begin
	gaussdb$# raise info 'f1:%',f1;
	gaussdb$# raise info 'f2:%',f2;
	gaussdb$# raise info 'f3:%',f3;
	gaussdb$# raise info 'f4:%',f4;
	gaussdb$# raise info 'f5:%',f5;
	gaussdb$# return 1;
	gaussdb$# end;
	gaussdb$# /
	CREATE FUNCTION
	gaussdb=# select test(1,2);
	INFO: f1:1
	CONTEXT: referenced column: test
	INFO: f2:2
	CONTEXT: referenced column: test
	INFO: f3:20
	CONTEXT: referenced column: test
	INFO: f4:40
	CONTEXT: referenced column: test
	INFO: f5:50

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
	CONTEXT: referenced column: test test ------ 1 (1 row) gaussdb=# drop function test; As shown above, f3 is filled with an incorrect default value. **NOTE** In this scenario, a non-default parameter is filled with the previous default value.
dynamic_sql_compat	After this parameter is enabled: • Duplicate parameters in the SQL statement template are not regarded as the same parameter, but match variables in the USING clause in sequence. • If a stored procedure is called during dynamic statement execution, the IN and OUT attributes in a stored procedure and the USING clause are not checked. **NOTE** If a stored procedure is called when a dynamic statement executes an anonymous block statement, only the **IN** parameters are corrected. If **OUT** parameters need to be checked, set the **proc_outparam_override** parameter.
dynamic_sql_check	After this parameter is enabled, an error is reported during dynamic statement execution if the number of different template parameters in the dynamic statement template SQL is different from that of variables in the USING clause. **NOTE** • If the **dynamic_sql_compat** option is enabled, the **dynamic_sql_check** option does not take effect. • If a stored procedure is called when a dynamic statement executes an anonymous block statement, only the **IN** parameters are checked. If **OUT** parameters need to be checked, set the **proc_outparam_override** parameter. • If a stored procedure is called when a dynamic statement executes an anonymous block statement and the parameter is enabled, the **IN** and **OUT** attributes in a stored procedure and the USING clause are not checked.

Configuration Item	Behavior

enable_funcname_with_argsname	If the parameter is enabled, the projection alias displays the complete function when SELECT is used to call a function.
	• If this item is not specified, the projection alias displays only the function name when SELECT is used to call a function. For example:
	gaussdb=# select power(2,3);
	power
	------- 	
	8
	(1 row)
	
	gaussdb=# select count(*) from db_ind_columns;
	count
	------- 	
	611
	(1 row)
	
	gaussdb=# select count(index_name) from db_ind_columns;
	count
	------- 	
	611
	(1 row)
	
	gaussdb=# select left('abcde', 2);
	left
	------ 	
	ab
	(1 row)
	
	gaussdb=# select pg_client_encoding();
	pg_client_encoding
	-------------------- 	
	UTF8
	(1 row)
	• If this item is specified, the projection alias displays the complete function when SELECT is used to call a function. For example:
	gaussdb=# set behavior_compat_options =
	'enable_funcname_with_argsname';
	SET
	gaussdb=# select power(2,3);
	power(2,3)
	------------ 	
	8
	(1 row)
	
	gaussdb=# select count(*) from db_ind_columns;
	count(*)
	---------- 	
	611
	(1 row)
	
	gaussdb=# select count(index_name) from db_ind_columns;
	count(index_name)
	------------------- 	
	611
	(1 row)
	
	gaussdb=# select left('abcde', 2);
	left('abcde',2)
	----------------- 	

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
	ab (1 row) gaussdb=# select pg_client_encoding(); pg_client_encoding() ---------- UTF8 (1 row)

Configuration Item	Behavior

	NOTE
	• Currently, only func_name(args_list), func_name(), and func_name(*) can be used to display complete functions and the arguments can only be character strings, numeric values, column names, and functions. A function name can contain a schema or package name. The parameter cannot contain other clauses (such as the ORDER BY clause) or be an expression. The parameter can contain only the DISTINCT keyword. If the parameter contains other keywords, complete functions cannot be displayed.
	• The displays of complete projection aliases are not supported for some special functions.
	  • In non-M-compatible databases, the following functions are included: collation for, current_date, current_time, current_timestamp, dbtimezone, localtime, localtimestamp, sysdate, sessiontimezone, rownum, current_role, current_user, session_user, user, current_catalog, current_schema, cast, extract, timestampdiff, overlay, position, substring, treat, trim, nullif, nvl, nvl2, coalesce, greatest, least, lnnvl, regexp_like, and xml.
	  • In M-compatible databases, the following functions are included: count, convert, get_format, date, time, timetsamp, date_add, date_sub, adddate, subdate, timestampadd, current_date, repeat, curdate, curtime, current_time, current_timestamp, utc_date, utc_time, utc_timestamp, localtime, localtimestamp, now, sysdate, interval, cast, extract, substr, mid, year, timestampdiff, substring, trim, coalesce, if, char, position, reverse, and default.
	  • In M-compatible databases, if this parameter is specified and **m_format_behavior_compat_options** is set to **'select_column_name'**, **'select_column_name'** takes effect preferentially.
	• If some secure encryption and decryption functions and masking functions are displayed completely by projection aliases, it may bring security problems. Therefore, only function names are displayed here, including: gs_encrypt_aes128, gs_decrypt_aes128, gs_encrypt, gs_decrypt, gs_encrypt_bytea, gs_decrypt_bytea, aes_encrypt, aes_decrypt, pg_create_physical_replication_slot_extern, dblink_connect, creditcardmasking, basicemailmasking, fullemailmasking, alldigitsmasking, shufflemasking, randommasking, regexpmasking, and gs_digest.
	• You cannot use => to specify parameters for the projection alias to display the complete function. The projection alias cannot contain double quotation marks (""), for example, **select "power"(2,3)**.
	• To enable the projection alias to display the complete function, this function is not affected by parameters such as removing 0 at the end.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

proc_outparam_transfer_length	After this parameter is enabled, the length of the **out** output parameter can be specified in the stored procedure and function, and an error is reported in the inner stored procedure or function. For example:
	gaussdb=# SET behavior_compat_options='proc_outparam_override,proc_outparam_transfer_length';
	SET
	gaussdb=# CREATE OR REPLACE PROCEDURE out_param_test1(m in int, v inout varchar2,v1 inout varchar2) is
	gaussdb$# begin
	gaussdb$# v := 'aaaddd';
	gaussdb$# v1 := 'aaaddd';
	gaussdb$# end;
	gaussdb$# /
	CREATE PROCEDURE
	gaussdb=# CREATE OR REPLACE PROCEDURE call_out_param_test1 is
	gaussdb$# v varchar2(5) := 'aabbb';
	gaussdb$# v1 varchar2(6) := 'aabb';
	gaussdb$# begin
	gaussdb$# out_param_test1(5,v,v1);
	gaussdb$# end;
	gaussdb$# /
	CREATE PROCEDURE
	gaussdb=# CALL call_out_param_test1();
	ERROR: value too long for type character varying(5)
	CONTEXT: PL/SQL function out_param_test1(integer,character varying,character varying) line 3 at assignment
	PL/SQL function call_out_param_test1() line 4 at SQL statement
	
	gaussdb=# DROP PROCEDURE call_out_param_test1;
	gaussdb=# DROP PROCEDURE out_param_test1;

allow_procedure_compile_check	This parameter is invalid in distributed mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

tableof_elem_constraints	After this parameter is enabled:
	1. For the collection type, the validity of elements will be verified.
	2. If the index is of the varchar collection type, the validity of the index length is also verified.
	For details about behavior differences and examples, see "Stored Procedure" > "Arrays, Collections, and Records" > "Collections" in *Developer Guide*.
	NOTE
	• Do not switch and use this parameter in the same session.
	• After a database is upgraded:
	  • For collection types that have been defined in stored procedures or packages, enabling the **tableof_elem_constraints** parameter does not take effect. You need to rebuild the collection type. That is, you need to rebuild the stored procedure or package by performing the CREATE OR REPLACE or DROP+CREATE operation. The parameter takes effect only after the collection type is rebuilt.
	  • If a collection type is created using the syntax: CREATE TYPE type_name IS TABLE OF data_type, you need to drop the type and rebuild it for the function to take effect.
	The following is an example of verifying the validity of elements:
	If this parameter is not enabled, the elements are not verified when the following stored procedure is called:
	`gaussdb=# CREATE OR REPLACE procedure p1 is`
	`gaussdb$#  type t1 is table of varchar(5);`
	`gaussdb$#  v t1 := t1();`
	`gaussdb$# begin`
	`gaussdb$#  v.extend();`
	`gaussdb$#  v(1) := '123456';`
	`gaussdb$#  raise info '%', v;`
	`gaussdb$# end;`
	`gaussdb$# /`
	`CREATE PROCEDURE`
	`gaussdb=# CALL p1();`
	`INFO:  {123456}`
	` p1`
	`----`
	`(1 row)`
	`gaussdb=# DROP procedure p1;`
	If this parameter is enabled, the elements are verified and an error may be reported when the following stored procedure is called:
	`gaussdb=# SET behavior_compat_options = 'tableof_elem_constraints';`
	`SET`
	`gaussdb=# CREATE OR REPLACE procedure p1 is`
	`gaussdb$#  type t1 is table of varchar(5);`
	`gaussdb$#  v t1 := t1();`
	`gaussdb$# begin`
	`gaussdb$#  v.extend();`

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

	gaussdb$# v(1) := '123456';
	gaussdb$# raise info '%', v;
	gaussdb$# end;
	gaussdb$# /
	CREATE PROCEDURE
	gaussdb=# CALL p1();
	ERROR: value too long for type character varying(5)
	CONTEXT: PL/SQL function p1() line 5 at assignment
	The following is an example of verifying the index value:
	If this parameter is not enabled, no error is reported when the index value exceeds the defined length.
	gaussdb=# CREATE OR REPLACE procedure p1 is
	gaussdb$# type t1 is table of int index by varchar(5);
	gaussdb$# v t1;
	gaussdb$# begin
	gaussdb$# v('123456') := 1;
	gaussdb$# raise info '%', v;
	gaussdb$# end;
	gaussdb$# /
	CREATE PROCEDURE
	gaussdb=# CALL p1();
	INFO: {indexbyType:varchar,"123456"=>1}
	 p1

Configuration Item	Behavior
allow_rownum_alias	After this parameter is enabled, ROWNUM can be used as a column alias in SQL statements using the AS syntax. ROWNUM is used as a common identifier and cannot be used as a pseudocolumn. This parameter does not take effect in M-compatible databases. **NOTE** You are advised not to change the status of this parameter during service execution. When the parameter is enabled, database objects (such as table names, column names, and database names) are created using ROWNUM as the name in the database. If the parameter is disabled, ambiguity occurs and the behavior is unpredictable. When the parameter is disabled, the behavior of using ROWNUM as a pseudocolumn in the database becomes invalid after the parameter is enabled and the behavior is unpredictable.
current_sysdate	If this parameter is enabled, the current OS time is obtained when the **sysdate** command is executed. gaussdb=# set behavior_compat_options='current_sysdate'; SET gaussdb=# select sysdate; current_sysdate --------------------- 2023-06-20 20:15:27 (1 row)

Configuration Item	Behavior
allow_function_procedure_replace	In the default scenario, for ORA and PG compatibility modes, when there is a stored procedure (or function) outside the package, you cannot create a function (or stored procedure) with the same name because they are of different object types, and an error is reported. After this parameter is enabled, you can use the CREATE OR REPLACE method to replace stored procedures and functions with the same names outside the package. gaussdb=# create or replace function proc_test return varchar2 as gaussdb$# begin gaussdb$# return '1'; gaussdb$# end; gaussdb$# / CREATE FUNCTION gaussdb=# create or replace procedure proc_test as gaussdb$# begin gaussdb$# null; gaussdb$# end; gaussdb$# / ERROR: cannot change routine kind DETAIL: "proc_test" is a function. gaussdb=# \df+ proc_test List of functions Schema | Name | Result data type | Argument data types | Type | Volatility | Owner | Language | Source code | Description | fencedmode | propackage | prokind --------+-----------+------------------+---------------------+---------+------------+----------+-------------+-------------+------------+--------- public | proc_test | character varying | | normal | volatile | wangxinyu | plpgsql | DECLARE +| | f | f | f | | |

Configuration Item	Behavior

enable_case_when_alias	If this parameter is enabled, the aliases of the CASE WHEN and DECODE syntaxes are character strings starting with __unnamed_.
	Example:
	gaussdb=# set behavior_compat_options='enable_case_when_alias';
	SET
	gaussdb=# create table test(c1 varchar2);
	CREATE TABLE
	gaussdb=# insert into test values('x');
	INSERT 0 1
	gaussdb=# select decode(c1,'x','0','default') from test;
	__unnamed_decode__
	--- 	
	0
	(1 row)
	
	gaussdb=# select (case c1 when 'x' then '0' else 'default' end) from test;
	__unnamed_case_when__
	--- 	
	0
	(1 row)
	
	gaussdb=# drop table test;

plsql_rollback_keep_user	Determines whether ROLLBACK and ROLLBACK TO SAVEPOINT in PL/SQL changes the current user. If this parameter is enabled, ROLLBACK in the PL/SQL does not change the current user.
	Example:
	gaussdb=# create user plsql_rollback1 password '********';
	gaussdb=# create user plsql_rollback2 password '********';
	gaussdb=# grant plsql_rollback1 to plsql_rollback2;
	gaussdb=# create or replace procedure plsql_rollback1.p1 () authid definer
	gaussdb-# as
	gaussdb$# va int;
	gaussdb$# begin
	gaussdb$# raise info 'current usr:%', current_user;
	gaussdb$# rollback;
	gaussdb$# raise info 'current usr:%', current_user;
	gaussdb$# end;
	gaussdb$# /
	CREATE PROCEDURE
	gaussdb=# set session AUTHORIZATION plsql_rollback2 PASSWORD '********';
	SET
	gaussdb=> set behavior_compat_options = 'plsql_rollback_keep_user';
	SET
	gaussdb=> call plsql_rollback1.p1 ();
	INFO: current usr:plsql_rollback1
	INFO: current usr:plsql_rollback1
	p1
	--- 	
	
	(1 row)
	NOTE
	• This parameter is valid only in the ORA-compatible mode.

Configuration Item	Behavior

enable_crosstype_integer_operator	Enables or disables the cross-type integer operator.
	• This parameter is enabled by default for a newly installed database.
	• After the database of a version earlier than 505.1.0 is upgraded, this parameter is disabled by default.
	• Involved operators: =, <>, <, >, <=, and >=
	• After this parameter is enabled, the involved cross-type integers can be compared directly without implicit conversion. Here is an example that uses (int1 op int2):
	ora_db=# SET max_datanode_for_plan=1;
	SET
	ora_db=# DROP TABLE IF EXISTS implicit_index;
	DROP TABLE
	ora_db=# CREATE TABLE implicit_index(c1 int1);
	NOTICE: The 'DISTRIBUTE BY' clause is not specified. Using 'c1' as the distribution column by default.
	HINT: Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
	CREATE TABLE
	ora_db=# SET behavior_compat_options='enable_crosstype_integer_operator';
	SET
	ora_db=# EXPLAIN (COSTS OFF) SELECT * FROM implicit_index WHERE c1 > 1::int2;
	QUERY PLAN
	---------- 	
	Data Node Scan
	Node/s: All datanodes
	
	Remote SQL: SELECT c1 FROM public.implicit_index WHERE c1 > 1::smallint
	Datanode Name: datanode1-- The node information is about the execution plan node of the current test instance, which may be different from the actual information. The actual execution information is subject to the actual information.
	Seq Scan on implicit_index
	Filter: (c1 > 1::smallint)
	
	(8 rows)
	
	ora_db=# SET behavior_compat_options='';
	SET
	ora_db=# EXPLAIN (COSTS OFF) SELECT * FROM implicit_index WHERE c1 > 1::int2;
	QUERY PLAN
	---------- 	
	Data Node Scan
	Node/s: All datanodes
	
	Remote SQL: SELECT c1 FROM public.implicit_index WHERE c1::bigint > 1::smallint
	Datanode Name: datanode1-- The node information is about the execution plan node of the current test instance, which may be different from the actual information. The actual execution information is subject to the actual information.
	Seq Scan on implicit_index
	Filter: ((c1)::bigint > 1::smallint)
	
	(8 rows)
	
	ora_db=# DROP TABLE implicit_index;
	DROP TABLE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior

	NOTE
	• This parameter takes effect only when **sql_compatibility** is set to **ORA**.
	• If this parameter is enabled, the execution plan of operators involved in the following scenarios will be affected:
	  • (int1 op int2)
	  • (int1 op int4)
	  • (int1 op int8)
	  • (int1 op int16)
	  • (int1 op numeric)
	  • (int2 op int1)
	  • (int2 op int16)
	  • (int2 op numeric)
	  • (int4 op int1)
	  • (int4 op int16)
	  • (int4 op numeric)
	  • (int8 op int1)
	  • (int8 op int16)
	  • (int8 op numeric)
	  • (int16 op int1)
	  • (int16 op int2)
	  • (int16 op int4)
	  • (int16 op int8)
	  • (numeric op int1)
	  • (numeric op int2)
	  • (numeric op int4)
	  • (numeric op int8)

forbid_package_function_with_prefix	After this parameter is enabled, an error is reported if a function with a prefix is created in a package.
	For example:
	`gaussdb=# SET behavior_compat_options='forbid_package_function_with_prefix';`
	`SET`
	`gaussdb=# CREATE SCHEMA schema1;`
	`gaussdb=# CREATE OR REPLACE package pck1`
	`  IS`
	`  procedure schema1.proc1();`
	`  END pck1;`
	`  /`
	`ERROR:  not support procedure name use *.* format in package at or near ";"`
	`CONTEXT:  compilation of PL/pgSQL package "pck1" near line 2`
	`gaussdb=# DROP SCHEMA schema1;`

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
time_constexpr_compact	If this parameter is enabled, in a scenario where the time expression is executed, the type automatically returned is with timezone or without timezone depending on whether the constant carries the time zone. Currently, the timestamp and time types are supported. -- Execute a timestamp expression without a time zone. gaussdb=# SELECT timestamp '1999-03-15 8:00:00'; timestamp --------------------- 1999-03-15 08:00:00 (1 row) -- The type timestamp with time zone is returned after a timestamp expression with a time zone is executed. gaussdb=# SELECT timestamp '1999-03-15 8:00:00 -8:00:00'; timestamptz ------------------------ 1999-03-16 00:00:00+08 (1 row)
enable_use_ora_timestamptz	After it is enabled, the date and time obtained by the TIMESTAMP AT TIME ZONE syntax are the same as those in ORA-compatible database. GaussDB can display only the session time zone, and the ORA-compatible database can display the entered time zone. If the time zones are different, the displayed results are different. After the date and time are converted to the same time zone, the same time point is displayed. -- Before enabling a parameter gaussdb=# SELECT timestamp '2024-03-20 01:30:00' at time zone 'Europe/Moscow' FROM dual; timezone ---------------------- 2024-03-20 06:30:00+08 (1 row) -- After enabling a parameter gaussdb=# SET behavior_compat_options='enable_use_ora_timestamptz'; SET gaussdb=# SELECT timestamp '2024-03-20 01:30:00' at time zone 'Europe/Moscow' FROM dual; timezone ---------------------- 2024-03-20 01:30:00+08 (1 row) **NOTE** This parameter is valid only in an ORA-compatible database.

	CONTEXT: referenced column: col2

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Adjust the parameter value based on the database-compatible objects.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a_format_version

Parameter description: Specifies the compatibility configuration item of the database platform.

Parameter type: string.

Unit: none

Value range: Table 14-20 lists the supported compatibility configuration items.

Default value: **"10c"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in Table 14-1.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

Table 14-20 Compatibility configuration items

Configuration Item	Behavior
10c	The ORA platform is compatible with the 10C version.

a_format_dev_version

Parameter description: Specifies the database platform minor version compatibility configuration item.

Parameter type: string.

Unit: none

Value range: Table 14-21 lists the supported compatibility configuration items.

Default value: **"s6"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in Table 14-1.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-21 Compatibility configuration items

Configuration Item	Behavior
s1	• Compatible minor version of the ORA platform, which affects functions TRUNC(date, fmt), ROUND(date, fmt), NVL2, LPAD, RPAD, ADD_MONTHS, MONTHS_BETWEEN, REGEXP_REPLACE, REGEXP_COUNT, TREAT, EMPTY_CLOB, INSTRB, trunc(number), greatest, least, mod, round(number), cast, to_date, to_timestamp, chr, rtrim, translate, to_char, to_number, and to_timestamp_tz. • Data type conversion: A decimal character string is rounded off when it is converted to an integer (int1/int2/int4/int8/int16). • Data type conversion: Implicit conversion from timestamp with time zone to timestamp without time zone is supported.
s2	• Compatible minor version of platform ORA, which affects functions, such as dump, to_single_byte, to_multi_byte, nls_upper, nls_lower, initcap, ascii2, asciistr, unistr, vsize, cosh, remainder, sinh, tanh, nanvl, current_date, current_timestamp, dbtimezone, numtodsinterval, numtoyminterval, new_time, sessiontimezone, sys_extract_utc, tz_offset, to_binary_double, to_binary_float, to_dsinterval, to_yminterval, lnnvl, and ora_hash. • Supports all behaviors when the compatibility configuration item is set to **s1**.
s3	• Compatible minor version of platform ORA. If the parameter is enabled, nested calling of functions without parameters is supported. • Supports all behaviors when the compatibility configuration item is set to **s2**.
s4	• Compatible minor version of platform ORA, which affects functions such as nchr(cvalue int|bigint), to_timestamp_tz, getclobval(xml), and getstringval(xml). • Supports all behaviors when the compatibility configuration item is set to **s3**.
s5	• Compatible minor version of platform Oracle. If the parameter is enabled, the composite type with the same name as a function is preferentially parsed. The sys_guid() function is affected. • Supports all behaviors when the compatibility configuration item is set to **s4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
s6	• The ORA platform is compatible with the iteration minor version. The parameter is enabled, and the function mod(text, int) is affected. • Supports all behaviors when the compatibility configuration item is set to **s5**.

b_format_version

Parameter description: Specifies the database platform compatibility behavior configuration item that controls the forward compatibility in MySQL-compatible mode.

NOTE

- **b_format_version** takes effect only when **sql_compatibility** is set to **MySQL**.
- If this parameter is set to a non-empty string, **b_format_behavior_compat_options** is set to **"ALL"** and **bytea_output** parameter is set to **"escape"** simultaneously. If this parameter is set to an empty string, **b_format_behavior_compat_options** and **bytea_output** are set to the original values.

Parameter type: string.

Unit: none

Value range: an empty string **""** or **"5.7"**

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter together with **b_format_dev_version** immediately after the installation and deployment. You do not need to change the value unless necessary.

Risks and impacts of improper settings: The behaviors of some SQL statements are affected, causing compatibility issues.

b_format_dev_version

Parameter description: Specifies the database platform minor version compatibility configuration item.

NOTE

b_format_dev_version takes effect only when **sql_compatibility** is set to **MYSQL** and **b_format_version** is set to **"5.7"**.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: an empty string **""** or a compatibility configuration item in **Table 14-22**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-22 Compatibility configuration items

Configuration Item	Behavior
s1	1. The following parameters are influenced: If this parameter is enabled, the **datetime** option in the **disable_keyword_options** parameter is removed, indicating that DATETIME is used as a non-reserved keyword. *datetime* can be used as a table name, column name, or alias, but cannot be used as a function name, stored procedure name, or parameter name of a function or stored procedure. 2. The following functions are influenced: curdate, from_days, date_format, str_to_date, current_date, datediff, timestampdiff, date_add, subtime, month, time_to_sec, to_days, to_seconds, dayname, monthname, convert_tz, sec_to_time, addtime, adddate, date_sub, timediff, last_day, weekday, from_unixtime, unix_timestamp, subdate, day, year, weekofyear, dayofmonth, dayofyear, week, yearweek, dayofweek, time_format, hour, minute, second, microsecond, quarter, utc_date, get_format, extract, makedate, period_add, timestamppadd, period_diff, utc_time, utc_timestamp, sysdate, current_timestamp, maketime, curtime, current_time, localtime, localtimestamp, now, lc_time_names, default_week_format, json_object, and substring. 3. The following types are influenced: a. Be compatible with the integer type tinyint with the value range changed to –128 to 127. b. Be compatible with the character string types char and varchar. The precision *n* of char(*n*) and varchar(*n*) is changed from the byte length to the character length. c. Be compatible with the text types tinytext, mediumtext, and longtext. These types are mapped to the text type after the parameter is enabled. d. Be compatible with binary types tinyblob, blob, mediumblob, and longblob. These types are mapped to the bytea type after the parameter is enabled. e. Be compatible with floating-point types double, float, and real. Among them, double is mapped to the float8 type, double(p, s) is mapped to the numeric type, float(p, s) is mapped to the numeric type, real is mapped to float8, and real(p, s) is mapped to the numeric type. f. Be compatible with high-precision types numeric, dec, and decimal. If the precision and scale are not specified, the default precision is changed to **10** and the scale is changed to **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
	g. Be compatible with time types datetime, timestamp, time, and date. Replace datetime[(*p*)] with a timestamp without time zone[(*p*)]. Replace timestamp[(p)] with a timestamp with time zone[(p)]. The input, output, range, and precision specifications of these types are changed. For details, see "SQL Reference" > "Data Type" in *Developer Guide*. h. Be compatible with integer types tinyint, smallint, int, and bigint. The display width and ZEROFILL attributes of these types take effect after the parameter is enabled. 4. The following syntax is influenced: The column constraint ON UPDATE update_expr can be specified. 5. The following operators are influenced: a. An error is reported when the || operator between bytea types is used. b. The REGEXP operator is supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior
s2	The compatibility behavior controlled by s1 is included. In addition, the following impacts are included: 1. The following parameters are influenced: a. When this option is enabled, **standard_conforming_strings** and **escape_string_warning** are set to **off**. b. The **collation_connection** and **character_set_connection** parameters take effect only when this option is enabled. 2. The following functions are affected: a. The like operator does not report an error when an escape character is at the end of the matching string. b. The priorities of the sorting rules for the character sets and collations will change. For details, see "SQL Reference" > "Character Sets and Collations" > "Rules for Combining Character Sets and Collations" in *Developer Guide*. c. After the parameter is enabled, the collation of foreign keys cannot be inconsistent with that of columns. 3. The following syntax is influenced: a. The CREATE TABLE table_name LIKE source_table syntax is supported. b. The syntaxes CREATE TABLE table_name LIKE source_table and CREATE TABLE table_name (LIKE source_table) cannot specify **INCLUDING** and **EXCLUDING** options. By default, **INCLUDING ALL** is specified. c. The LOAD DATA syntax is supported. Some syntax functions in gs_loader that are consistent with the LOAD DATA syntax will change. d. The syntaxes for changing table names, such as ALTER TABLE and RENAME TABLE, have impact in the following scenario: If the character string corresponding to the new table name starts with **"#MySQL50#"** and is followed by other characters, **"#MySQL50#"** will be ignored. If the old and new table names are the same, no error will be reported. e. The collate clause can be specified by set names.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Set this parameter together with **b_format_version** immediately after the installation and deployment. You do not need to change the value unless necessary.

Risks and impacts of improper settings: The behaviors of some SQL statements are affected, causing compatibility issues.

m_format_dev_version

Parameter description: Specifies the database platform minor version compatibility configuration item.

NOTE

m_format_dev_version takes effect only when **sql_compatibility** is set to **M**.

Parameter type: string.

Unit: none

Value range: compatibility configuration items in **Table 14-23**. Currently, you can set the value to **s1** only.

Table 14-23 Compatibility configuration items

Configuration Item	Behavior
s1	The following syntax is influenced: 1. Disable the SELECT FETCH FIRST ROWS ONLY syntax. 2. The TRUNCATE CASCADE/RESTRICT syntax is disabled. 3. USING INDEX TABLESPACE tablespace_name syntax cannot be specified when a primary key is defined using CREATE TABLE. 4. The semantics of CASCADE/RESTRICT syntax in DROP TABLE/VIEW/COLUMN is ignored, and the default behavior is RESTRICT. 5. If the CREATE TABLE REFERENCES syntax is used as a column constraint, its semantics is changed to ignore the foreign key definition.

Default value: **"s1"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter immediately after the installation and deployment. You do not need to change the value unless necessary.

Risks and impacts of improper settings: The behaviors of some SQL statements are affected, causing compatibility issues.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

sql_mode

Parameter description: Specifies the SQL behavior control configuration item in MySQL-compatible and M-compatible modes.

NOTE

- **sql_mode** takes effect when **sql_compatibility** is set to **MYSQL**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**, or when **sql_mode** takes effect only when **sql_compatibility** is set to **M**.
- When **SHOW sql_mode** and **SELECT @@sql_mode** are used for query, the values are displayed in uppercase based on the sequence as follows: **REAL_AS_FLOAT**, **ANSI_QUOTES**, **ONLY_FULL_GROUP_BY**, **NO_UNSIGNED_SUBTRACTION**, **NO_AUTO_VALUE_ON_ZERO**, **NO_BACKSLASH_ESCAPES**, **STRICT_TRANS_TABLES**, **STRICT_ALL_TABLES**, **NO_ZERO_IN_DATE**, **NO_ZERO_DATE**, **ALLOW_INVALID_DATES**, **ERROR_FOR_DIVISION_BY_ZERO**, **TRADITIONAL**, **NO_AUTO_CREATE_USER**, **NO_ENGINE_SUBSTITUTION**, and **PAD_CHAR_TO_FULL_LENGTH**.

Parameter type: string.

Unit: none

Value range:

- MySQL-compatible mode: an empty string **""** or a value in the range of **'strict_trans_tables,only_full_group_by,no_zero_in_date,no_zero_date,error_for_division_by_zero,no_auto_create_user,no_engine_substitution,pad_char_to_full_length,no_auto_value_on_zero'**.
- M-compatible mode: parameters supported in MySQL-compatible mode, **no_unsigned_subtraction**, **ansi_quotes**, **allow_invalid_dates**, **real_as_float**, **strict_all_tables**, and **traditional**.

The meaning of each option value is described in **Table 14-24**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-24 Compatibility configuration items

Configuration Item	Behavior	MySQL-compatible Parameter Configuration	M-compatible Parameter Configuration
strict_trans_tables	Currently, only data types and system functions in MySQL-compatible and M-compatible databases can be verified. If this parameter is set, its format and range are strictly verified. If an invalid value is entered or the value exceeds the range, an error is reported during parsing. If this parameter is not set, the format and range of the input parameter are loosely verified. If an invalid value is entered or the value exceeds the range, a warning is reported during parsing and the value **0** of the corresponding data is returned.	It can be set and canceled independently.	It can be set and canceled independently.
only_full_group_by	Projection columns that contain non-GROUP BY keys and that are not constants and aggregate functions are not allowed.	It can be set and canceled independently.	It can be set and canceled independently.
no_zero_in_date	The year, month, and day of the DATE cannot be **0**.	It can be set and canceled independently, but it does not take effect.	It can be set and canceled independently.
no_zero_date	The value of DATE cannot be **0** (**0000-00-00**).	It can be set and canceled independently, but it does not take effect.	It can be set and canceled independently.
error_for_division_by_zero	The value cannot be divided by 0.	It can be set and canceled independently, but it does not take effect.	It can be set and canceled independently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior	MySQL-compatible Parameter Configuration	M-compatible Parameter Configuration
no_auto_create_user	This item has no actual function. It is used only for compatibility that an error is not reported when the SET SQL_MODE statement contains this option.	It can be set and canceled independently.	It can be set and canceled independently.
no_engine_substitution	This item has no actual function. It is used only for compatibility that an error is not reported when the SET SQL_MODE statement contains this option.	It can be set and canceled independently.	It can be set and canceled independently.
pad_char_to_full_length	Be used for formatted output of CHAR columns in a table. If there are CHAR columns, a string with spaces at the end is output. Otherwise, a string without spaces at the end is output.	It can be set and canceled independently.	It can be set and canceled independently.
no_auto_value_on_zero	If this option is included, the value **0** inserted into the **AUTO_INCREMENT** column does not trigger auto-increment.	It can be set and canceled independently.	It can be set and canceled independently.
no_unsigned_subtraction	Unsigned numbers cannot be subtracted. If unsigned integers are subtracted and the result is negative, an error is returned.	It can be set and canceled independently, but it does not take effect.	It can be set and canceled independently.
ansi_quotes	Enables the ANSI_QUOTES mode, in which double quotation marks are treated as identifier quotes, not string quotes. In this mode, if you use double quotation marks to quote a table name or column name, you must use double quotation marks instead of backquote to quote the entire name.	It can be set and canceled independently, but it does not take effect.	It can be set and canceled independently.
allow_invalid_dates	If this option is enabled, MySQL allows invalid dates to be inserted, for example, '0000-00-00'.	It can be set and canceled independently, but it does not take effect.	It can be set and canceled independently.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Configuration Item	Behavior	MySQL-compatible Parameter Configuration	M-compatible Parameter Configuration
real_as_float	By default, the REAL type is regarded as the DOUBLE type. If this option is enabled, the REAL type is regarded as the FLOAT type.	It can be set and canceled independently, but it does not take effect.	It can be set and canceled independently.
strict_all_tables	The effect is the same as that of **strict_trans_tables**.	It can be set and canceled independently.	It can be set and canceled independently.
traditional	The effect is the same as that of setting **strict_trans_tables**, **strict_all_tables**, **no_zero_in_date**, **no_zero_date**, **error_for_division_by_zero**, **no_auto_create_user**, and **no_engine_substitution** together.	It can be set and canceled independently. **NOTE** Whether this parameter takes effect depends on whether the MySQL-compatible mode is supported.	It can be set and canceled independently.

Default value:
"strict_trans_tables,only_full_group_by,no_zero_in_date,no_zero_date,error_for_division_by_zero,no_auto_create_user,no_engine_substitution"

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

auto_increment_increment

Parameter description: Specifies the auto-increment step of an auto-increment column. The auto-increment value is calculated by the following formula: **auto_increment_offset** + *N* × **auto_increment_increment**. *N* is a positive integer.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 1 to 65535

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter as required.

Risks and impacts of improper settings: The self-increment value may not meet the expectation. If the parameter value is smaller than that of **auto_increment_offset**, an error occurs when the values in the auto-increment column automatically increase.

auto_increment_offset

Parameter description: Specifies the initial value of an auto-increment column. The auto-increment value is calculated by the following formula: **auto_increment_offset** + *N* × **auto_increment_increment**. *N* is a positive integer.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter as required.

Risks and impacts of improper settings: The self-increment value may not meet the expectation. If the parameter value is greater than that of **auto_increment_increment**, an error occurs when the values in the auto-increment column automatically increase.

auto_increment_cache

Parameter description: Specifies the number of reserved auto-increment cache values when auto-increment is triggered by batch insertion or import of auto-increment columns. When auto-increment values are reserved, the auto-increment counter value is updated to the maximum auto-increment cache value. Before the cache values are used up, the auto-increment counter value remains unchanged, and the triggered auto-increment uses the cache values.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The reserved cache values are valid only in the statement. If the reserved auto-increment cache values are used up and subsequent INSERT statements trigger auto-increment based on the auto-increment counter, the values in the auto-increment column in the table are discontinuous.
- When auto-increment is triggered by parallel import or insertion of auto-increment columns, the cache value reserved for each parallel thread is used only in the thread. If the cache value is not used up, the values of auto-increment columns in the table are discontinuous.
- When you add an auto-increment column to a table with data or modify a column to an auto-increment column, the existing data triggers auto-increment. The reserved auto-increment cache value is also affected by this parameter.
- This parameter does not affect the auto-increment column in the local temporary table.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

- If this parameter is set to **0**, the auto-increment cache values are automatically reserved.
  - When auto-increment is triggered for the first time, if the number of rows to be inserted into the auto-increment column is known, the number is the reserved value.
    - For example, the number of rows to be inserted cannot be obtained as the value of auto-increment that is triggered by INSERT INTO table SELECT ... or COPY FROM. When the ALTER TABLE statement is executed to rewrite table data, if auto-increment is triggered, reltuples in the statistics is used as the number of rows to be reserved. INSERT INTO table VALUES(...),(...),... is distributed to different DNs. Therefore, in some execution plans, DNs cannot obtain the number of rows to be inserted.
  - If the number of rows is unknown, 2^n values are reserved each time. For example, one value is reserved in the first auto-increment, two values are reserved in the second auto-increment, four values are reserved in the third auto-increment, and eight values are reserved for in fourth auto-increment. However, if the number of reserved values exceeds 65535, 65535 values are reserved.
- If this parameter is not set to **0**, the number of reserved cache values is the value of this parameter.
  - When auto-increment is triggered for the first time, if the number of rows to be inserted into the auto-increment column is known, the number is the reserved value.
  - If the number of rows is unknown, the value of **auto_increment_cache** is the number of auto-increment values reserved each time.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: The default value is recommended. However, if the auto-increment values are discontinuous in this case, you can adjust the parameter value based on the amount of data to be inserted in batches.

Risks and impacts of improper settings: A larger parameter value indicates better batch insertion performance and more likely to generate discontinuous self-increment values.

disable_keyword_options

Parameter description: Specifies database compatibility behavior. Multiple items are separated by commas (,). An identifier with this parameter set will not be used as a keyword.

Parameter type: string.

Unit: none

Value range: The keywords vary depending on compatibility modes of databases. For details, see **Table 14-25**.

Default value:

- In non-M-compatible database: **"datetime,regexp,rlike,zerofill"**
- In M-compatible database: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is enabled, some functions used as keywords will become invalid. Exercise caution when setting this parameter. If the keyword to be shielded does not exist in the to-be-shielded keyword array of the current compatibility mode database but exists in other compatibility mode databases, WARNING is generated. If the keyword to be shielded does not exist in other compatibility mode databases, ERROR is generated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

In MySQL-compatible mode, whether **datetime**, **regexp**, **rlike**, and **zerofill** are reserved keywords is determined by the system and cannot be modified or deleted by users. Specifically, in the initial state, the system adds **datetime**, **regexp**, **rlike**, and **zerofill** to the **disable_keyword_options** parameter. In this case, **datetime**, **regexp**, **rlike**, and **zerofill** are not reserved keywords. After **b_format_version** is set to **'5.7'** and **b_format_dev_version** is set to **'s1'** (or a version later than s1), the system deletes **datetime**, **regexp**, **rlike**, and **zerofill** from **disable_keyword_options**. In this case, **datetime**, **regexp**, **rlike**, and **zerofill** can be used as reserved keywords.

disable_plsql_keyword_options

Parameter description: Specifies the database compatibility behavior, that is, whether to use an identifier as a non-keyword. Values of this parameter are separated by commas (,).

Parameter type: string.

Unit: none

Value range: **PIPE**, **PIPELINED**, **RANGE**, **REPLACE**, and **SUBTYPE**.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- If this parameter is enabled, some functions used as keywords will become invalid. Exercise caution when setting this parameter.
- To cancel the function of shielding the PL/SQL keyword, leave this parameter empty.

plpgsql.variable_conflict

Parameter description: Specifies the priority of using stored procedure variables and table columns with the same name.

Parameter type: string.

Unit: none

Value range:

- **error** indicates that a compilation error is reported when the name of a stored procedure variable is the same as that of a table column.
- **use_variable** indicates that if the name of a stored procedure variable is the same as that of a table column, the variable is used preferentially.
- **use_column** indicates that if the name of a stored procedure variable is the same as that of a table column, the column name is used preferentially.

Default value: **error**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it using method 3 described in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

td_compatible_truncation

Parameter description: Specifies whether to enable features compatible with a Teradata database. You can set this parameter to **on** when connecting to a database compatible with the Teradata database, so that when you perform the INSERT operation, overlong strings are truncated based on the allowed maximum length before being inserted into char- and varchar-type columns in the target table. This ensures all data is inserted into the target table without errors reported.

NOTE

- The string truncation function cannot be used if the INSERT statement includes a foreign table.
- If inserting multi-byte character data (such as Chinese characters) to database with the character set byte encoding (such as SQL_ASCII or LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF-8, which has no character data crossing the truncation position.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that overlong strings are automatically truncated.
- **off** indicates that overlong strings are not automatically truncated.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

uppercase_attribute_name

Parameter description: Specifies whether to return column names in uppercase to the client. This parameter is used only in ORA-compatible mode.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: Column names are returned to the client in uppercase.
- **off**: Column names are not returned to the client in uppercase.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

Do not run **gs_guc reload**, **alter database set**, or **alter user set** or modify **gaussdb.conf** to modify this parameter globally.

enable_object_special_character

Parameter description: Determines whether the value of the **schema** parameter in the control file can contain any special characters in ["$'\] when the CREATE EXTENSION statement is executed and "@extschema@" is used in the script file.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the value can contain any special characters in ["$'\].
- **off** indicates that the value cannot contain any special characters in ["$'\].

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The extended function is for internal use only. You are advised not to use it.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

enable_implicit_cast_str2num

Parameter description: Specifies whether a string can be converted to a NUMERIC type when a comparison or arithmetic operator is performed between an integer data type and a string data type.

NOTE

This parameter is valid only when **a_format_version** is set to **'10c'** and **a_format_dev_version** is set to **'s1'**.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: enabled.

  Comparison operators (>, >=, <, <=, =, and <>): The string data type is implicitly converted to the NUMERIC type. If the **enable_crosstype_integer_operator** option of the **behavior_compat_options** parameter is disabled, the integer data type is implicitly converted to the NUMERIC type.

  Arithmetic operators (+, -, *, /,%, and ^): Both integer and string data types are implicitly converted to the NUMERIC type.
- **off**: disabled. The string data type will be implicitly converted to the integer data type.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

a_format_disable_func

Parameter description: Disables a specified system function. The value of this parameter consists of multiple system function OIDs separated by commas (,). The system function for which this parameter is set cannot be called. When a system function cannot meet user requirements and a user-defined function with the same name is required, you can use this function.

Parameter type: string.

Unit: none

Value range: a string consisting of multiple system function OIDs separated by commas (,).

Default value: **""**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_convert_illegal_char

Parameter description: Specifies whether invalid characters in the command output are not verified and are displayed as placeholders.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: The parameter is enabled. Invalid codes will be replaced by the symbols specified by the **convert_illegal_char_mode** parameter.
- **off**: The parameter is disabled. If the query result contains invalid characters, an error is reported after verification.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Enable this parameter only when the data contains special characters and errors should not be reported for special characters.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

1. When the database character set is utf8, zhs16gbk, gb18030, gb18030-2022, or latin1, **enable_convert_illegal_char=on** takes effect. If the character set of the database client is different from that of the database server, invalid characters are displayed as placeholders.
2. Special character range: The special characters mentioned in this document include only fully abnormal encoding and hybrid encoding. The \u0000 character is not supported. If the character code contains the \u0000 character, the character is truncated at \u0000, which affects data integrity.
3. If the character sets of the database client and server are different, when **enable_convert_illegal_char** is set to **off**, the database replaces special characters (excluding \x0000) that exceed the current character set codes with **\x3F** (displayed as **?**) and writes the special characters into the database; when **enable_convert_illegal_char** is set to **on**, only the dbe_raw.cast_to_varchar2() function can be used to insert the original invalid character into the database and display the character as a placeholder.
4. When the GUC parameter is enabled, the behaviors of the special characters in the functions and advanced package functions listed in the following table are as follows:
   - When the character sets of the client and server are the same, no error is reported during the query of special characters. The behavior is the same as that before the GUC parameter is enabled.
   - If the character sets of the client and server are different, special characters are displayed as placeholders, which use question marks (?) by default.
   - You are advised not to use functions to process character strings that contain special characters. The functions listed in the following table do not report errors when processing character strings that contain special characters, and the correctness of the results cannot be ensured.

Table 14-26 Functions and advanced package functions supporting special characters

56	DBE_OUTPUT.PUT
57	DBE_OUTPUT.PUT_LINE

fix_func_selection

Parameter description: Specifies whether to optimize the function matching policy.

The catlist sequence issue occurs in this case: If a user-defined function conflicts with a system function, the function selected by the database depends on the registration sequence of the system function in the database system.

Parameter type: string.

Unit: none

Value range: **""** and **"catlist"**.

- **""**: No optimization is performed. The value is the same as that in versions earlier than 505.1.0.
- **"catlist"**: The catlist sequence is optimized. System functions are always preferentially selected and executed.

Default value:

- **"catlist"**: default value of the newly installed database
- **""**: default value of the database in versions earlier than 505.1.0 after the database is upgraded.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_allowed_packet

Parameter description: Specifies the upper limit of the return value of a string function in M-compatible database. If the actual result exceeds the upper limit, an alarm is generated and **NULL** is returned.

Parameter type: integer.

Unit: byte

Value range: 1024 to 1073741824. The value must be a multiple of 1024. Otherwise, the value is rounded down to the nearest multiple.

Default value: **4194304**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

div_precision_increment

Parameter description: Specifies the database configuration item in M-compatible mode. This parameter specifies the precision improvement value of the division result. That is, the number of decimal places in the division result is equal to the number of decimal places in the divisor plus the value of this parameter.

Parameter type: integer.

Unit: none

Value range: 0 to 30

Default value: 4.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_m_format_hook

Parameter description: Specifies the database configuration item in M-compatible mode. This parameter specifies whether the hook in M-compatible mode takes effect.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The M-compatible database allows the corresponding parser and executor hooks to be mounted.
- **off**: The M-compatible database does not mount the corresponding parser and executor hooks.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used only for external tools that are not fully adapted and cannot be used by users.

Risks and impacts of improper settings: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gs_format_behavior_compat_options

Parameter description: Selects configuration items of GaussDB internal system functions.

Parameter type: string.

Unit: none

Value range: Currently, only the compatibility configuration items listed in **Table 14-27** are supported. Compatibility configuration items are separated by commas (,).

Default value: **"sqrt_karatsuba"**

Table 14-27 gs_format_behavior compatibility configuration items

Configuration Item	Behavior
sqrt_karatsuba	• If this parameter is set, the Karatsuba square root algorithm is used when the sqrt function is called. The Karatsuba algorithm has higher performance but its precision may be different from that of the Newton iteration algorithm in rare cases. • If this parameter is not set, the default Newton iteration algorithm is used to calculate the square root for the sqrt algorithm.

allow_textconcat_null	• If this parameter is set, the value of the corresponding character string is returned when a character string is combined with the **null** value in PG-compatible mode.
	`-- Run the following command in PG-compatible mode:`
	`gaussdb=# set gs_format_behavior_compat_options='allow_textconcat_null';`
	`SET`
	`gaussdb=# select 'a' || null || 'b';`
	` ?column?`
	`----------`
	` ab`
	`(1 row)`
	• If this parameter is not set, **NULL** is returned when a character string is combined with the **null** value in PG-compatible mode.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Determines whether some compatibility features are available. If you want to modify this parameter, make sure you understand its meaning and modify it with caution to avoid risks caused by misoperations.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

support_zero_character

Parameter description: Specifies whether the database cancels the verification of the zero character and correctly processes it without truncating the character when the data contains the character whose Unicode code is \u0000 (referred to as the zero character).

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled. The database cancels the verification of the 0 character and can correctly insert and process the 0 character so that the data is not truncated during processing.
- **off**: disabled. The database retains the verification of the 0 character. When some functions process the 0 character, an error is reported or data is truncated.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Enable this parameter only when the data contains the 0 character and the 0 character need to be correctly processed.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

1. This parameter takes effect only when the ORA-compatible database is used and **support_zero_character** is set to **on** for all nodes.
2. If you want to write character 0 to the database, ensure that **support_zero_character** is set to **on** and the setting takes effect so that character 0 can be properly inserted and stored.
3. When **support_zero_character** is set to **on** and the data type is CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), CHARACTER VARYING(n), VARCHAR2(n), NVARCHAR2(n), TEXT, or CLOB, the database can correctly insert and process 0 characters. If the string data contains 0 characters and is explicitly converted to JSON/JSONB, XML, XMLTYPE, numeric type, currency type, time type, geometric type, network address type, bit string type, text search type, HLL type, range type, object identifier type, ledger database type, aclitem type, or vector type, the string will be truncated at the 0 character. If the string is explicitly converted to the UUID type, an error is reported at the 0 character.
4. The database supports only the following modes of writing the 0 character:
   - When the database is connected through JDBC, the 0 character can be written to the database in text mode.
   - Use the dbe_raw.cast_to_varchar2 function to directly write the 0 character code to the database.
   - Use the copy/gs_loader tool to write the 0 character code to the database.
5. When the GUC parameter is enabled and different character sets are converted, the 0 character is directly returned and no error is reported.
6. The gsql client version must match the database version. When the GUC parameter is enabled, if the data received by gsql contains the 0 character, gsql converts the 0 character to a space and then prints the data. If gsql of an earlier version is used to connect to the database, data containing 0 is still truncated.
7. When the GUC parameter is enabled, the 0 character is displayed as follows in the functions listed in **Table 14-28** and advanced package functions: The functions can properly process the 0 character and do not truncate the 0 character.
8. The input parameters of some advanced package APIs are schema names or object names, which cannot contain 0 characters theoretically. Therefore, 0 character verification is added to functions in **Table 14-29**. When the input parameters contain 0 characters, an error is reported. (Originally, data is truncated after 0 characters.)
9. When **support_zero_character** is set to **on**, if the processed data does not contain 0 characters, the function performance does not deteriorate significantly. If the processed data contains 0 characters and the same number of valid characters are compared, the performance deterioration degree of the initcap, upper, lower, nls_upper, and nls_lower functions is closely related to the number of 0 characters in the data. That is, more 0 characters indicate more serious performance deterioration.
10. When **support_zero_character** is set to **on**, if the logical decoding tool reads 0 characters in the data, 0 characters are converted to a space and then printed. (Originally, the data is truncated after 0 characters are read.)

enable_case_intervaltonumeric

Parameter description: Specifies whether INTERVAL can be converted to NUMERIC in CASE statements. This parameter takes effect only in ORA-compatible mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: INTERVAL can be converted to NUMERIC in the CASE statement.
- **off**: INTERVAL cannot be converted to NUMERIC in the CASE statement.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **on** and then modified to **off**, an error may be reported for the existing CASE statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_ecpg_cursor_duplicate_operation

Parameter description: Specifies whether to allow ECPG to control a cursor can be opened or closed repeatedly in ORA-compatible mode. This parameter is valid only when ECPG is connected to ORA-compatible databases.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A cursor can be opened or closed repeatedly when ECPG connects to an ORA-compatible database.
- **off**: A cursor cannot be opened or closed repeatedly when ECPG connects to an ORA-compatible database.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **off**, an error will be reported when a cursor is opened or closed repeatedly.

NOTE

If the database of this version is directly installed, set this parameter to **on**. If an earlier version is upgraded to the current version, set this parameter is **off**.

format_pg_to_timestamp

Parameter description: Controls the behavior of the to_timestamp(string [, fmt]) function in PG-compatible mode. After this parameter is enabled, unsupported formats are automatically skipped. The current version does not support formats such as FF, FF7, FF8, FF9, RR, RRRR, SYYYY, x and X. Dates earlier than 294277-01-01 00:00:00 and negative years (converted to BC) are supported. FF1 to FF6 round off the milliseconds that exceed the precision. When the same items in the time and date conflict (for example, the days specified by DDD and DD are different), a time in the correct format is returned and no error is reported. For details about the conflict behavior, see **Table 14-30**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The preceding functions are enabled.
- **off**: The preceding functions are disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is enabled, a format that is not supported by GaussDB will become invalid.

Table 14-30 to_timestamp fmt conflicts

Type	Description
SSSSS conflicts with time.	Retain minutes and hours of time and the seconds part of SSSSS.
W and J conflict with time and date.	Priority: Overwrite J, W, and mmdd in sequence. W: indicates Wednesday by default. Default behavior: Overwrite mmdd with W.
SSSSS conflicts with SS.	Retain SS and discard SSSSS.
DDD conflicts with a date.	Discard DDD.

synonym_priv_strict_check

Parameter description: Specifies whether to check access to objects associated with a synonym when you search for an object using the synonym.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The access permission on the objects associated with the synonyms is checked when searching for objects by synonyms.
- **off**: The access permission on the objects associated with the synonyms is not checked when searching for objects by synonyms.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the parameter is set to **off**, the access permission on the objects associated with the synonyms is not checked when searching for objects by synonyms, which may cause unauthorized operations.

NOTE

If a database of the current version is directly installed, set this parameter to **on**. If a version is upgraded to the current version, set this parameter is **off**.

forbid_public_funcname_same_with_sysfunc

Parameter description: Specifies whether to forbid PUBLIC functions to have the same name as system functions in pg_catalog when creating functions and RENAME functions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: When creating a function or rename a function, the name of the PUBLIC function cannot be the same as that of a system function in pg_catalog.
- **off**: When creating a function or rename a function, the name of the PUBLIC function can be the same as that of a system function in pg_catalog.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **off**, the PUBLIC function can have the same name as a system function in pg_catalog.

NOTE

If the database of the 505.2.0 version is directly installed, set this parameter to **on**. If a version earlier than 505.2.0 is upgraded to the current version, set this parameter is **off**.

enable_cursor_with_hold

Parameter description: Specifies whether a cursor has the WITH HOLD function in ORA-compatible mode. If it is enabled, a cursor is created without the HOLD keyword, and the SELECT clause does not contain the FOR UPDATE/SHARE clause. The default value is **WITH HOLD**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: If a cursor is created without the HOLD keyword, the default value is **WITH HOLD**. After this parameter is enabled, **CURSOR cursor_name FOR query** is equivalent to **CURSOR cursor_name WITH HOLD FOR query**.
- **off**: If a cursor is created without the HOLD keyword, the default value is **WITHOUT HOLD**.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. This parameter can be set only in a session.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is **on**, all cursors are not released, which may cause memory bloat in sessions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

modify_function_property

Parameter description: Specifies the attributes of related system functions in non-M-compatible mode. In the PDB scenario, if this parameter is not set, the global setting is inherited.

Parameter type: character

Unit: none

Value range: Currently, only the configuration items listed in **Table 14-31** are supported. Compatibility configuration items are separated by commas (,).

Default value: **"3257,5562,4164,4073"** for a newly installed database. If the GUC parameter does not exist in the basic version to be upgraded, the default value is **""**. If the GUC parameter exists in the basic version to be upgraded, the original setting is retained.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The attributes of system functions are affected.

Table 14-31 System function configuration items

OID Corresponding to the System Function	Description
3257	Modifies the variability of the pg_catalog.current_timestamp(numeric) function. When the configuration item exists in the GUC parameter, the variability of the function is **'stable'**. When the configuration item does not exist, the variability of the function is **'immutable'**.
4073	Modifies the variability of the pg_catalog.text_timestamp(text) function. When the configuration item exists in the GUC parameter, the variability of the function is **'stable'**. When the configuration item does not exist, the variability of the function is **'immutable'**.
4164	Modifies the variability of the pg_catalog.text_date(text) function. When the configuration item exists in the GUC parameter, the variability of the function is **'stable'**. When the configuration item does not exist, the variability of the function is **'immutable'**.
5562	Modifies the variability of the pg_catalog.DBTimezone() function. When the configuration item exists in the GUC parameter, the variability of the function is **'stable'**. When the configuration item does not exist, the variability of the function is **'immutable'**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14.3.16.3 Product Version of the Cloud Service

This section describes the version parameters of the cloud service.

product_version

Parameter description: Specifies the version of a cloud service product.

Parameter type: string.

Unit: none

Value range: none

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The following rules must be met to avoid errors.

- The value can contain a maximum of 50 characters.
- The value cannot contain vertical bars (|), semicolons (;), ampersands (&), dollar signs ($), ampersands (>), ampersands (<), ampersands (`), backslashes (\), exclamation marks (!), or newline characters.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

hotpatch_version

Parameter description: Specifies the hot patch version of a cloud service product.

Parameter type: string.

Unit: none

Value range: none

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The following rules must be met to avoid errors.

- The value can contain a maximum of 1500 characters.
- The value cannot contain vertical bars (|), semicolons (;), ampersands (&), dollar signs ($), ampersands (>), ampersands (<), ampersands (`), backslashes (\), exclamation marks (!), or newline characters.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.17 Fault Tolerance

This section describes parameters used for controlling how the server processes an error occurring in the database system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

exit_on_error

Parameter description: If this function is enabled, errors of the ERROR level will be escalated to PANIC errors, and core stacks will be generated. It is mainly used to locate problems and test services.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Errors of the ERROR level will be escalated to PANIC errors.
- **off**: Errors of the ERROR level will not be escalated.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **17.2-Table 1 GUC parameters**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

restart_after_crash

Parameter description: If this parameter is enabled and a backend thread crashes, GaussDB automatically reinitializes the backend thread.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: GaussDB can automatically reinitialize a backend thread when the backend thread breaks down. In some circumstances (for example, when a management tool, such as xCAT, is used to manage GaussDB), setting this parameter to **on** maximizes the availability of the database.
- **off**: A management tool is enabled to obtain control permission and take proper measures when a backend thread crashes.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **17.2-Table 1 GUC parameters**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

omit_encoding_error

Parameter description: If this parameter is enabled and the client character set of the database is encoded in UTF-8 format, character encoding conversion errors will be recorded in logs. Additionally, converted characters that have conversion errors will be ignored and replaced with question marks (?).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Characters that have conversion errors will be ignored and replaced with question marks (?), and error information will be recorded in logs.
- **off**: Characters that have conversion errors cannot be converted and error information will be directly displayed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **17.2-Table 1 GUC parameters**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

If this parameter is modified by running the **gs_guc reload** command and the connection of a session on the current node is not from the client but from another node in the cluster to which the node belongs, this parameter does not take effect immediately on the session after the **gs_guc reload** command is executed. The setting takes effect only after the connection node is disconnected and then reconnected.

cn_send_buffer_size

Parameter description: Specifies the size of the data buffer used for data transmission on CNs.

Parameter type: integer.

Unit: KB

Value range: 8–128

Default value: **8**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **17.2-Table 1 GUC parameters**. For example, if this parameter is set to **100** without a unit, it indicates 100 KB. If this parameter is set to **128kB**, it indicates 128 KB. The unit must be KB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_cn_temp_file_size

Parameter description: Specifies the maximum size of temporary files used by the the primary node of the database when the SQL statement automatic retry function is enabled. The value **0** indicates that temporary files are not used.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: KB

Value range: 0 to 10485760

Default value: 5242880 (that is, 5 GB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **17.2-Table 1 GUC parameters**. For example, if this parameter is set to **100** without a unit, it indicates 100 KB. If this parameter is set to **16MB**, it indicates 16 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

data_sync_retry

Parameter description: Specifies whether to keep running the database when updated data fails to be written into disks by using the fsync function. In some OSs, no error is reported even if **fsync** fails after the second attempt. As a result, data is lost.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The retry mechanism is used to continue running the database after fsync fails to synchronize data to the disk.
- **off**: A PANIC-level error is reported and the database is stopped after fsync fails.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **17.2-Table 1 GUC parameters**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

remote_read_mode

Parameter description: Specifies whether to enable the remote read function. This function allows pages on the standby node to be read when reading pages on the primary node fails.

Parameter type: enumerated type.

Unit: none

Value range: **off**, **non_authentication**, and **authentication**

- **off**: The remote read function is disabled.
- **non_authentication**: The remote read function is enabled but certificate authentication is not required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **authentication**: The remote read function is enabled and certificate authentication is required.

Default value: **authentication**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.18 Connection Pool Parameters

When a connection pool is used to access the database, database connections are established and then stored in the memory as objects during system running. When you need to access the database, no new connection is established. Instead, an existing idle connection is selected from the connection pool. After you finish accessing the database, the database does not disable the connection but puts it back into the connection pool. The connection can be used for the next access request.

pooler_port

Parameter description: Specifies the O&M management port of internal tools, such as cm_agent and cm_ctl. This port is used by the initial user or system administrator to connect to the database through the client.

Parameter type: integer.

Unit: none

Value range: 1 to 65535.

Default Value: **6667**, if the installation does not depend on the OM component and the GUC parameter is not specified. If the OM component is installed and **port** is specified, the value of this parameter is the value of **port** plus 1. If **port** is not specified, the default value of this parameter is **8001** for CNs and **40001** for DNs.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: Generally, the value is set in the cluster installation configuration. You are advised not to change the value.

Risks and impacts of improper settings: If this parameter is modified, port numbers may conflict or be intercepted, causing database communications failures.

pooler_maximum_idle_time

Parameter description: Specifies the maximum amount of time that the connections can remain idle in a pool before being removed. After that, the automatic connection clearing mechanism is triggered to reduce the number of connections on each node to the value of **minimum_pool_size**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **600** (that is, 10 minutes)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**. For example, if this parameter is set to **100** without a unit, it indicates 100s. If this parameter is set to **20min**, it indicates 20 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the frequency of clearing idle connections in the pooler connection pool decreases and the recycling rate decreases. If the value is too small, the frequency of clearing idle connections in the pooler connection pool increases. As a result, services frequently establish connections, affecting performance.

minimum_pool_size

Parameter description: Specifies the minimum number of remaining connections on the node corresponding to each pooler connection pool after automatic pooler connection cleanup. This parameter is used by the automatic pooler connection cleanup function.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: **50**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the number of clearing idle connections in the pooler connection pool decreases and the recycling rate decreases. If the value is too small, the number of clearing idle connections in the pooler connection pool increases. As a result, services frequently establish connections, affecting performance.

max_pool_size

Parameter description: Specifies the maximum number of connections between a CN and another CN/DN in a connection pool. This parameter needs to be modified when the cluster scale changes, for example, nodes are added or deleted.

Parameter type: integer

Unit: none

Value range: 1 to 65535

Default value:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Independent deployment:

  32768 (60-core CPU/480 GB memory); **16384** (32-core CPU/256 GB memory); **8192** (16-core CPU/128 GB memory); **4096** (8-core CPU/64 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: Set this parameter based on the default value of different instance specifications. The value of this parameter must be greater than the value of **max_connections**. During the adjustment, the connections consumed by internal threads must be reserved.

Risks and impacts of improper settings: When the number of concurrent services is large, the connections from the CN to other CNs/DNs in the connection pool are consumed. If this parameter is set to a small value, an error is reported when the number of connections reaches the upper limit. As a result, services fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

persistent_datanode_connections

Parameter description: Specifies whether to release the connection for the current session.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the connection for the current session will not be released.
- **off** indicates that the connection for the current session will be released.

Default value: **off**

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this parameter is enabled, a session may hold a connection but does not run a query. As a result, other queries cannot apply for a connection and an error is reported.

max_coordinators

Parameter description: Specifies the maximum number of CNs in a cluster. This parameter may need to be modified when the cluster scale changes, for example, nodes are added or deleted. During scale-out, ensure that the value of this parameter is greater than the number of CNs in the target cluster. Otherwise, the scale-out will fail. If this parameter is set to a large value during scale-in, more memory resources are consumed when the CN is started. However, in general, the impact on the CN memory is small.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 2 to 1024

Default value: **128**

Setting method: This is a POSTMASTER parameter. You are advised not to modify it. If you need to modify it, set it based on instructions provided in **Table 14-2**.

Setting suggestion: Set this parameter based on the actual cluster specifications.

Risks and impacts of improper settings: If this parameter is set to a value less than the number of CNs in the cluster, node creation will fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

max_datanodes

Parameter description: Specifies the maximum number of DNs in a cluster. This parameter may need to be modified when the cluster scale changes, for example, nodes are added or deleted. During scale-out, ensure that the value of this parameter is greater than the total number of DN shards in the target cluster. Otherwise, the scale-out will fail. If this parameter is set to a large value during scale-in, more memory resources are consumed when the CN is started. However, in general, the impact on the CN memory is small.

Parameter type: integer.

Unit: none

Value range: 2 to 65535

Default value: **256**

Setting method: This is a POSTMASTER parameter. You are advised not to modify it. If you need to modify it, set it based on instructions provided in **Table 14-2**.

Setting suggestion: Set this parameter based on the actual cluster specifications.

Risks and impacts of improper settings: If this parameter is set to a value less than the number of DNs in the cluster, node creation will fail. When a CN is started, it allocates memory in advance based on the parameter value. Therefore, if the parameter value increases, the system consumes more memory resources. However, in general, the impact on the CN memory is small.

cache_connection

Parameter description: Specifies whether to recycle the connections of a connection pool.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The connections of a connection pool will be recycled.
- **off**: The connections of a connection pool will not be recycled.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the connections held by the session are cleared after the session execution statement ends. As a result, the service frequently establishes connections, affecting the performance. After this parameter is enabled in the multi-database scenario, if the memory size is small and the value of **max_connections** is large, the memory may be insufficient and DNs cannot be started.

enable_force_reuse_connections

Parameter description: Specifies whether a session forcibly reuses a new connection.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the new connection is forcibly used.
- **off** indicates that the current connection is used.

Default value: **off**

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After this parameter is enabled, the **reset** parameter is forcibly sent to existing connections each time before a statement is executed, which affects the performance.

pooler_connect_max_loops

Parameter description: Specifies whether to enable the connection retries to enhance stability of setting up connections in switchover scenarios. If a service fails to connect to the primary node, it will retry by attempting to connect to the standby node. If the standby node is successfully promoted to primary, the retry attempt will succeed. This parameter is used by the pooler connection retry function. This parameter specifies the total number of retry attempts. If this parameter is set to **0**, retries are disabled. The service only establishes a connection to the primary node.

Parameter type: integer.

Unit: none

Value range: 0 to 20

Default value: **1**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter is an HA parameter. If this parameter is set to **0**, the retry function is disabled, reducing the HA capability. If this parameter is set to a value greater than 1, the number of retries increases.

pooler_connect_interval_time

Parameter description: Specifies the interval between retries when **pooler_connect_max_loops** is set to a value greater than 1. This parameter is used by the pooler connection retry function. You are advised to set this parameter to a value slightly greater than the time required for primary/standby switchover in the current cluster.

Parameter type: integer.

Unit: second

Value range: 0 to 7200

Default value: **15**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**. For example, if this parameter is set to **100** without a unit, it indicates 100s. If this parameter is set to **20min**, it indicates 20 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter is an HA parameter. If this parameter is set to a large value, the retry period is prolonged and the HA capability is reduced.

pooler_timeout

Parameter description: Specifies the timeout interval of communication between each connection in a CN's connection pool and another CN/DN.

Parameter type: integer.

Unit: second

Value range: 0 to 7200

Default value: **600** (that is, 10 minutes)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-2**. For example, if this parameter is set to **100** without a unit, it indicates 100s. If this parameter is set to **20min**, it indicates 20 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, an error is reported during data transmission and reception when the network fluctuates. If the value is too large, an error is reported during data transmission and reception when the network is disconnected. As a result, the HA capability is reduced.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pooler_connect_timeout

Parameter description: Specifies the timeout interval of connecting a CN's connection pool to another CN/DN in the same cluster.

Parameter type: integer.

Unit: second

Value range: 0 to 7200

Default value: **60** (1 minute)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-2**. For example, if this parameter is set to **100** without a unit, it indicates 100s. If this parameter is set to **20min**, it indicates 20 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, an error is reported during connection setup when the network fluctuates. If the value is too large, an error is reported during connection setup when the network is disconnected. As a result, the HA capability is reduced.

pooler_cancel_timeout

Parameter description: Specifies the timeout interval of canceling a connection by a CN's connection pool during error processing. If similar timeout occurs when an exception of the subtransaction or stored procedure is captured, the transaction containing the subtransaction or the stored procedure rolls back. If the source data from the COPY FROM operation is not consistent with that of the table structure in the target table, and the parameter value is not **0**, an error is reported.

Parameter type: integer.

Unit: second

Value range: 0 to 7200. **0** (not recommended) indicates that this function is disabled and no timeout limit is set.

Default value: **15**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-2**. For example, if this parameter is set to **100** without a unit, it indicates 100s. If this parameter is set to **20min**, it indicates 20 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, an error is reported for cancel actions when the network fluctuates. If the value is too large, an error is reported for cancel actions when the network is disconnected. As a result, the HA capability is reduced.

14.3.19 Cluster Transaction Parameters

This section describes the settings and value ranges of transaction parameters for the cluster.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

transaction_isolation

Parameter description: Specifies the isolation level of the current transaction. For a new transaction that is started, the isolation level is fixed to the value of **default_transaction_isolation**.

Parameter type: string.

Unit: none

Value range: The value is a string of case-sensitive and space-sensitive characters. Only the following values are supported:

- **'serializable'**: Currently, GaussDB does not support this isolation level. Setting this isolation level has the same effect as **'repeatable read'**.
- **'read committed'**: Only data of committed transactions is read. Uncommitted data cannot be read.
- **'read uncommitted'**: The performance is the same as that of **'read committed'**.
- **'repeatable read'**: Only the data committed before a transaction starts is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
- **'default'**: The value is the same as that of **default_transaction_isolation**.

Default value: **'default'**. If the default value of **default_transaction_isolation** is **'read committed'**, the output of the **show transaction_isolation;** command is **'read committed'**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

transaction_read_only

Parameter description: Specifies whether the current transaction is a read-only transaction.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The current transaction is a read-only transaction.
- **off**: The current transaction is a read/write transaction.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

xc_maintenance_mode

Parameter description: Specifies whether the system is in maintenance mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The maintenance mode is used.
- **off**: The maintenance mode is not used.

NOTICE

Exercise caution when enabling this function. You need to avoid data inconsistencies in the cluster.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on method 3 provided in Table 14-2.

Setting suggestion: This parameter is used by maintenance personnel to locate faults. You are advised not to enable this parameter.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

allow_concurrent_tuple_update

Parameter description: Specifies whether to allow concurrent update.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Concurrent updates are allowed.
- **off**: Concurrent updates are not allowed.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in Table 14-1.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gtm_host

Parameter description: Specifies the IP address of the primary GTM process. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string

Default value: IP address of the primary GTM.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_port

Parameter description: Specifies the listening port of the primary GTM process. This parameter is visible only to the SYSADMIN user.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: specified during installation.

Setting method: This is a POSTMASTER parameter.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

gtm_host1

Parameter description: Specifies the IP address of the standby GTM process. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string

Default value: IP address of the standby GTM.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_port1

Parameter description: Specifies the listening port of the standby GTM process. This parameter is visible only to the SYSADMIN user.

NOTE

This parameter is specified in the configuration file during installation. Do not modify this parameter unless absolutely necessary. Otherwise, database communication will be affected.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: The value is specified during installation if the standby node 1 is deployed. Otherwise, the default value is **6665**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

gtm_backup_barrier

Parameter description: Specifies whether to create a restoration point for the GTM starting point.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A restoration point is created.
- **off**: No restoration point is created.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gtm_conn_check_interval

Parameter description: Sets the intervals between two consecutive performed checks on the connections between local threads and the primary GTM for the CN.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_show_any_tuples

Parameter description: This parameter is available only in a read-only transaction and is used for analysis. When this parameter is set to **on**, all versions of tuples in the table are displayed.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: All versions of tuples in the table are displayed.
- **off**: No versions of tuples in the table are displayed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

In the TOAST scenario, if DML operations (mainly INSERT+UPDATE or INSERT+DELETE) are performed before and after the REINDEX operation, and the read-only transaction is started and the GUC parameter is enabled after the REINDEX operation, historical data in the TOAST table or TOAST index table can be queried separately in the released version. However, when historical data in the TOAST column is queried in the main table, the error message "missing chunk number xxx" is displayed.

gtm_connect_timeout

Parameter description: Specifies the GTM connection timeout. If the connection time of the GTM exceeds its value, the connection times out and exits.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_connect_retries

Parameter description: Specifies the number of GTM reconnection attempts.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **30**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_rw_timeout

Parameter description: Specifies the GTM response timeout. If the time spent waiting for GTM responses exceeds its value, the operation times out and exits.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **60** (1 minute)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_redistribute

Parameter description: Specifies whether unmatched nodes are redistributed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that unmatched nodes are redistributed.
- **off** indicates that unmatched nodes are not redistributed.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

replication_type

Parameter description: Specifies whether the current database is deployed in standalone or one-primary-multiple-standby mode.

Parameter type: integer.

Unit: none

Value range: 0 to 3

- **0**: reserved parameter.
- **1**: one-primary-multiple-standby mode, covering all scenarios. This mode is recommended.
- **2**: single primary mode. In this mode, the standby node cannot be expanded.
- **3**: reserved parameter.

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. This parameter is used for CM deployment and cannot be set.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

pgxc_node_name

Parameter description: Specifies the name of a node.

When a standby node requests to replicate logs on the primary node, if the **application_name** parameter is not set, the **pgxc_node_name** parameter is used as the name of the streaming replication slot of the standby node on the primary node. The streaming replication slot is named in the following format: *Value of this parameter_IP address of the standby node_Port number of the standby node*. The IP address and port number of the standby node are obtained from the IP address and port number of the standby node specified by the **replconninfo**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

parameter. The maximum length of a streaming replication slot name is 61 characters. If the length of the concatenated string exceeds 61 characters, the truncated **pgxc_node_name** will be used for concatenation to ensure that the length of the streaming replication slot name is less than or equal to 61 characters.

Parameter type: string.

Unit: none

Value range: a string

Default value: current node name.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: After the modification, the cluster will fail to be connected.

enable_gtm_free

Parameter description: Specifies whether the GTM-free mode is enabled. In large concurrency scenarios, the snapshots delivered by the GTM increase in number and size. The network between the GTM and the CN becomes the performance bottleneck. The GTM-free mode is used to eliminate the bottleneck. In this mode, the CN communicates with DNs instead of the GTM. The CN sends queries to each DN, which locally generates snapshots and XIDs, ensuring external write consistency but not external read consistency.

NOTICE

When the GTM-free mode is used, you are advised to set **application_type** to **perfect_sharding_type** so that you can find SQL statements that may cause data inconsistency. Otherwise, the system does not intercept statements that may cause data inconsistency.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the GTM-free mode is enabled and the cluster ensures eventual read consistency.
- **off** indicates that the GTM-free mode is disabled.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Data inconsistency may occur in GTM-free mode.

enable_twophase_commit

Parameter description: Currently, the cloud database uses the GTM-free mode to solve the SDS replacement problem. To prevent unreliability caused by service abuse, the GUC parameter **enable_twophase_commit** is used to enable or disable distributed two-phase write transactions.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that distributed two-phase commit is allowed in the GTM-free mode.
- **off** indicates that distributed two-phase commit is not allowed in the GTM-free mode.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

application_type

Parameter description: valid only when **enable_gtm_free** is set to **on**. This parameter specifies the service type of a user.

Parameter type: enumerated type.

Unit: none

Value range:

- **not_perfect_sharding_type** indicates a service across nodes. If this value is used, statements across nodes can be executed.
- **perfect_sharding_type** indicates a service on a single node. If an SQL statement requires multiple nodes, an error is reported and the corresponding SQL statement is recorded in the system log. If this value is used, you can run the **/*+ multinode */ hint** command to allow SQL statements to be executed on multiple nodes. The multinode hint can be added after the select, insert, update, delete, and merge keywords.

Setting method: This parameter is a USERSET parameter and cannot be set using gs_guc. It can be set using either of the following methods:

1. Use the **gsql** client to perform session-level configuration.
2. When JDBC is used to connect to the database, set the **ApplicationType** parameter for the connection string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_host2

Parameter description: Specifies the IP address of the GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string

Default value: IP address of the GTM 2 if the GTM 2 is deployed. Otherwise, the value is **""**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_host3

Parameter description: Specifies the IP address of the GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string

Default value: IP address of the GTM 3 if the GTM 3 is deployed. Otherwise, the value is **""**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_host4

Parameter description: Specifies the IP address of the GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string

Default value: IP address of the GTM 4 if the GTM 4 is deployed. Otherwise, the value is **""**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_host5

Parameter description: Specifies the IP address of the GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string

Default value: IP address of the GTM 5 if the GTM 5 is deployed. Otherwise, the value is **""**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_host6

Parameter description: Specifies the IP address of the GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string

Default value: IP address of the GTM 6 if the GTM 6 is deployed. Otherwise, the value is **""**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

gtm_host7

Parameter description: Specifies the IP address of the GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the SYSADMIN user. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string

Default value: IP address of the GTM 7 if the GTM 7 is deployed. Otherwise, the value is **""**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_port2

Parameter description: Specifies the listening port of the standby GTM 2 if the standby GTM 2 is deployed. This parameter is visible only to the SYSADMIN user.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: The value is specified during installation if the GTM 2 is deployed. Otherwise, the value is **6666**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

gtm_port3

Parameter description: Specifies the listening port of the standby GTM 3 if the standby GTM 3 is deployed. This parameter is visible only to the SYSADMIN user.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: The value is specified during installation if the GTM 3 is deployed. Otherwise, the value is **6666**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

gtm_port4

Parameter description: Specifies the listening port of the standby GTM 4 if the standby GTM 4 is deployed. This parameter is visible only to the SYSADMIN user.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: The value is specified during installation if the GTM 4 is deployed. Otherwise, the value is **6666**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

gtm_port5

Parameter description: Specifies the listening port of the standby GTM 5 if the standby GTM 5 is deployed. This parameter is visible only to the SYSADMIN user.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: The value is specified during installation if the GTM 5 is deployed. Otherwise, the value is **6666**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

gtm_port6

Parameter description: Specifies the listening port of the standby GTM 6 if the standby GTM 6 is deployed. This parameter is visible only to the SYSADMIN user.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: The value is specified during installation if the GTM 6 is deployed. Otherwise, the value is **6666**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

gtm_port7

Parameter description: Specifies the listening port of the standby GTM 7 if the standby GTM 7 is deployed. This parameter is visible only to the SYSADMIN user.

Parameter type: integer.

Unit: none

Value range: 1 to 65535

Default value: The value is specified during installation if the GTM 7 is deployed. Otherwise, the value is **6666**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the port number is changed, the database communication will be affected.

enable_defer_calculate_snapshot

Parameter description: Delays the calculation of **xmin** and **oldestxmin** of a snapshot. The calculation is triggered only after 1000 transactions are executed or the calculation interval is 1s.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that snapshots **xmin** and **oldestxmin** are calculated with a delay.
- **off** indicates that snapshots **xmin** and **oldestxmin** are calculated in real time.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **on**, the snapshot calculation overhead can be reduced in high load scenarios. However, **oldestxmin** is pushed slowly, affecting garbage tuple collection. If this parameter is set to **off**, **xmin** and **oldestxmin** can be pushed in real time, but the overhead for calculating snapshots increases.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

seqscan_csn_cache_num

Parameter description: Specifies the size of the CSN cache. The cache is used only when the Seq Scan scans the heap table page through the MVCC snapshot to determine the visibility.

Parameter type: integer.

Unit: none

Value range: 0 to 1000. If this parameter is set to **0**, the CSN cache mechanism is not used.

Default value: **100**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

reject_gtm_address

Parameter description: Specifies the IP address of the GTM that is rejected for connection.

Parameter type: string.

Unit: none

Value range: The substrings are separated by commas (,). The format of each substring is *IP[:port]*.

NOTE

[:port] is optional.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is automatically set by the CM component in a specific process. Manual modification is not recommended.

Risks and impacts of improper settings: Improper settings may cause communication failures between the cluster and GTM, affecting cluster transactions.

14.3.20 Dual-Cluster Replication Parameters

enable_roach_standby_cluster

Parameter description: Specifies whether the instances of the standby cluster are read-only in dual-cluster mode. Only the SYSADMIN user can access this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The read-only mode is enabled for the standby cluster.
- **off**: The read-only mode is disabled for the standby cluster. In this case, the standby cluster can be read and written.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used for backup and restoration. You are advised not to change the value.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

RepOriginId

Parameter description: This is a session-level GUC parameter. In bidirectional logical replication, set it to a non-zero value to avoid infinite data replication.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on method 3 provided in **Table 14-2**.

Setting suggestion: In two-way logical replication scenarios, set this parameter to a non-zero value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

auto_csn_barrier

Parameter description: Specifies whether the barrier logging function is enabled for the primary cluster and GTM-lite cluster for streaming DR.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This function is automatically enabled during the DR process. You are advised not to manually disable this function. To enable the read function of the standby node in the GTM-lite cluster, set this parameter to **ON**.

Risks and impacts of improper settings: If this function is disabled, the data read consistency between the standby cluster for the DR and the standby node of the GTM-lite cluster will be affected.

stream_cluster_run_mode

Parameter description: Specifies whether a CN or DN belongs to the primary or standby cluster in a dual-cluster streaming DR scenario.

Parameter type: enumerated type.

Unit: none

Value range:

- **cluster_primary** indicates that the node is in the primary cluster.
- **cluster_standby** indicates that the node is in the standby cluster.

Default value: **cluster_primary**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter specifies the status of a standby cluster for DR. It is used in internal processes and can be read by users. You are advised not to modify this parameter.

Risks and impacts of improper settings: Manual modification will cause standby clusters to be abnormal.

hadr_process_type

Parameter description: Specifies a process ID of a streaming replication-based remote DR solution or intra-city dual-DC HA solution.

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: There is no process.
- **failover** indicates that a standby cluster for DR is promoted to primary.
- **switchover_promote** indicates that a standby cluster is promoted to primary during the cluster switchover.
- **switchover_demote** indicates that a primary cluster is demoted to a standby cluster during the cluster switchover.
- **dorado_failover** indicates that a Dorado standby cluster is promoted to primary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **dorado_switchover_demote** indicates that a primary cluster is demoted to a standby cluster during the Dorado cluster switchover.
- **dorado_failover_abnormal** indicates that a standby cluster is promoted to primary when a shared disk of the Dorado primary cluster is faulty.
- **dorado_failover_in_standby_stream** indicates that a Dorado standby cluster is upgraded to a Dorado primary cluster (also the remote DR-standby cluster) when the remote cluster in the streaming replication-based remote DR solution is the primary cluster.
- **dorado_failover_abnormal_in_standby_stream** indicates that the intra-city dual-DC HA solution supports streaming replication-based remote DR. In this solution, the remote cluster is the primary cluster for remote DR and the shared disk of the Dorado primary cluster (also the standby cluster for remote DR) is faulty, the Dorado standby cluster is switched to the Dorado primary cluster (also the remote DR standby cluster).

Default value: **none**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter specifies the status of a standby cluster for DR. It is used in internal processes and can be read by users. You are advised not to modify this parameter.

Risks and impacts of improper settings: Manual modification will cause standby clusters to be abnormal.

cluster_name

Parameter description: Specifies the name of the current cluster.

NOTICE

cluster_name cannot be set to **"invalid_cluster_uuid"**.

Parameter type: string.

Unit: none

Value range: valid cluster name.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used in the DR process. The standby cluster for DR identifies the cluster based on this parameter. You are advised not to modify this parameter.

Risks and impacts of improper settings: The manual modification may cause DR function exceptions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

hadr_primary_cluster_name

Parameter description: Specifies the name of the current primary cluster in the DR. This parameter is used to identify the primary cluster in the remote streaming DR deployment where one primary cluster connects to two standby clusters.

NOTICE

When **hadr_primary_cluster_name** of the main standby cluster in streaming DR mode is set to **"invalid_cluster_uuid"**, log synchronization with the primary cluster is not started, and the standby cluster is continuously disconnected.

Parameter type: string.

Unit: none

Value range: valid cluster name.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter identifies a standby cluster for DR. It is used in DR processes and can be read by users. You are advised not to modify this parameter.

Risks and impacts of improper settings: The manual modification may cause DR function exceptions.

hadr_standby_cluster_num

Parameter description: Specifies the number of standby clusters for streaming DR.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter specifies the status of a standby cluster for DR. It is used in DR processes and can be read by users. You are advised not to modify this parameter.

Risks and impacts of improper settings: The manual modification may cause DR function exceptions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14.3.21 Developer Options

allow_system_table_mods

Parameter description: Specifies whether the structure of a system catalog and the name of a system schema can be modified.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The structure of the system catalog or the name of the system schema can be modified.
- **off**: The structure of the system catalog or the name of the system schema cannot be modified.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to modify this parameter.

Risks and impacts of improper settings: If this parameter is enabled, system catalogs may be damaged or even the database cannot be started.

allow_create_sysobject

Parameter description: Specifies whether objects such as functions, stored procedures, and synonyms can be created or modified in the system schema. The system schema refers to the schema provided by the database after initialization, excluding the public schema. The OID of the system schema is usually smaller than 16384.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The initial user and system administrators can create or modify objects such as functions, stored procedures, and synonyms in the system schema. The SYSADMIN user has permissions to create or replace, alter, grant, and revoke system objects by default. For details about whether other users are allowed to create these objects, see the permission requirements of the corresponding schema.
- **off**: All users are not allowed to create or modify objects such as functions, stored procedures, and synonyms in the system schema. The SYSADMIN user does not have permissions to create or replace, alter, grant, and revoke system objects by default.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

debug_assertions

Parameter description: Specifies whether to enable various assertion checks. To use this parameter, the macro USE_ASSERT_CHECKING must be defined (through the configure option **--enable-cassert**) during the GaussDB compilation.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Various assertion checks are enabled.
- **off**: Various assertion checks are disabled.

Default value: **off**

NOTE

If you compile GaussDB with the assertion check enabled, **debug_assertions** is set to **on** by default.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This function helps debugging. When an exception or breakdown occurs, enable this function to locate program errors.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ignore_checksum_failure

Parameter description: Specifies whether to ignore data check errors.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Data check errors are ignored.
- **off**: Data check errors are reported.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to modify this parameter.

Risks and impacts of improper settings: If this parameter is enabled, the system ignores the failure (but still generates an alarm). Continuing execution may result in breakdown, damaged data being transferred or stored, failure of data recovery from remote nodes, or other serious problems.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ignore_system_indexes

Parameter description: Specifies whether to ignore system indexes when reading system catalog (but still update the indexes when modifying the tables).

NOTE

This parameter is useful for recovering data from tables whose system indexes are damaged.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: System indexes are ignored.
- **off**: System indexes are not ignored.

Default value: **off**

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

post_auth_delay

Parameter description: Specifies the delay in the connection to the server after a successful authentication. Developers can attach a debugger to the server startup process.

Parameter type: integer.

Unit: second

Value range: 0 to 2147

Default value: **0**, indicating no delay.

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **post_auth_delay** indicates 60s. If the value is **1min**, **post_auth_delay** indicates 1 minute. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment.

Risks and impacts of improper settings: If this parameter is set to a non-zero value, the cluster status may be abnormal due to a long authentication delay.

pre_auth_delay

Parameter description: Specifies the period of delaying authentication after the connection to the server is started. Developers can attach a debugger to the authentication procedure.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: second

Value Range: 0 to 60

Default value: **0**, indicating no delay.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **pre_auth_delay** indicates 60s. If the value is **1min**, **pre_auth_delay** indicates 1 minute. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: This parameter is used only for commissioning and fault locating. To prevent impact on service running, ensure that the default value **0** is used in the production environment.

Risks and impacts of improper settings: If this parameter is set to a non-zero value, the cluster status may be abnormal due to a long authentication delay.

trace_notify

Parameter description: Specifies whether to enable the function of generating debugging output for the **LISTEN** and **NOTIFY** commands. The level of **client_min_messages** or **log_min_messages** must be **debug1** or lower so that debugging output can be recorded in the client or server logs, respectively.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The output function is enabled.
- **off**: The output function is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

trace_recovery_messages

Parameter description: Specifies whether to enable logging of recovery-related debugging output. If it is not enabled, no log is recorded This parameter allows users to overwrite the normal setting of **log_min_messages**, but only for specific messages. This is intended for the use in debugging the standby node.

Parameter type: enumerated type.

Unit: none

Value range: **debug5**, **debug4**, **debug3**, **debug2**, **debug1**, and **log**. For details about the parameters, see **Table 14-12**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **log**

NOTE

- **log** indicates that recovery-related debugging information will not be logged.
- Except the default value **log**, each of the other values indicates that recovery-related debugging information at the specified level will also be logged. Common settings of **log_min_messages** enable logs to be unconditionally recorded into server logs.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to change the value of this parameter only when commissioning the standby node. In other cases, you are advised to use the default value.

Risks and impacts of improper settings: If this parameter is set to a value other than **log**, a large number of logs will be printed, occupying certain I/O resources.

trace_sort

Parameter description: Specifies whether to print information about resource usage during sorting operations. This option can be used only when the **TRACE_SORT** macro is defined during GaussDB compilation. Currently, **TRACE_SORT** can only be set to the default value and cannot be adjusted.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Information about resource usage in sorting operations is printed.
- **off**: Information about resource usage in sorting operations is not printed.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

zero_damaged_pages

Parameter description: Specifies whether to terminate the current transaction after a damaged page header that causes GaussDB to report an error is detected.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The system generates a warning instead of throwing an error, clears the damaged page, and continues processing. This behavior will destroy data, including all the rows on the damaged page. However, it allows you to bypass

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the error and retrieve rows from any undamaged pages that may be present in the table. Therefore, it is useful for restoring data if corruption has occurred due to a hardware or software error.

- If this parameter is set to **off**, the system does not fill zeros in damaged pages.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: In most cases, you are advised not to set it to **on** if you want to restore data from damaged pages.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

string_hash_compatible

Parameter description: Specifies whether to use the same method to calculate char-type hash values and varchar- or text-type hash values. Based on the setting of this parameter, you can determine whether a redistribution is required when a distribution key is converted from a char-type data distribution into a varchar- or text-type data distribution.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The same calculation method is used and a redistribution is not required.
- **off**: Different calculation methods are used and a redistribution is required.

NOTE

Calculation methods differ in the length of input strings used for calculating hash values. (For a char-type hash value, spaces following a string are not counted as the length. For a text- or varchar-type hash value, the spaces are counted.) The hash value affects the calculation result of queries. To avoid query errors, do not modify this parameter during database running once it is set.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

remotetype

Parameter description: Specifies the remote connection type.

Parameter type: enumerated type.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **application**, **coordinator**, **datanode**, **gtm**, **gtmproxy**, **internaltool**, and **gtmtool**

Default value: **application**

Setting method: This is a BACKEND parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_user_defined_exception

Parameter description: Specifies the maximum number of exceptions. The default value cannot be changed.

Parameter type: integer.

Unit: none

Value range: Currently, only the fixed value **1000** is supported.

Default value: **1000**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

enable_fast_numeric

Parameter description: Specifies whether to enable optimization for numeric data calculation. Calculation of numeric data is time-consuming. Numeric data is converted into int64- or int128-type data to improve numeric data calculation performance.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Optimization for numeric data calculation is enabled.
- **off**: Optimization for numeric data calculation is disabled.

Default value: **on**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the performance of query statements of the numeric type may deteriorate.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_fast_vecop

Parameter description: Specifies whether to enable vectorized calculation optimization. The calculation of the Timestamp, int32, int64, and float8 types in the vectorization engine is optimized, the calling cost is reduced, and automatic vectorization calculation is supported.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The vectorized operation optimization is enabled.
- **off**: The vectorized operation optimization is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the calculation performance of the Timestamp, int32, int64, and float8 types in the vectorization engine will be affected.

enable_compress_spill

Parameter description: Specifies whether to enable the compression function of writing data to disk.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The compression function is enabled.
- **off**: The compression function is disabled.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

resource_track_log

Parameter description: Specifies the log level of self-diagnosis. Currently, this parameter takes effect only on multi-column statistics.

Parameter type: enumerated type.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **summary**: Brief diagnosis information is displayed.
- **detail**: Detailed diagnosis information is displayed.

Currently, the two parameter values differ only when there is an alarm about multi-column statistics not collected. If the parameter is set to **summary**, such an alarm will not be displayed. If it is set to **detail**, such an alarm will be displayed.

Default value: **summary**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_parallel_ddl

Parameter description: Specifies whether multiple CNs can concurrently perform DDL operations on the same database object.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: DDL operations can be concurrently performed without distributed deadlocks.
- **off**: DDL operations cannot be concurrently performed as distributed deadlocks may occur.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

support_batch_bind

Parameter description: Specifies whether to batch bind and execute PBE statements through APIs such as JDBC, ODBC, and libpq.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Batch binding and execution are used.
- **off**: Batch binding and execution are not used.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

numa_distribute_mode

Parameter description: Specifies the distribution of some shared data and threads among NUMA nodes. This parameter is used to optimize the performance of large-scale Arm servers with multiple NUMA nodes. Generally, you do not need to set this parameter.

Parameter type: string.

Unit: none

Value range: **"none"** and **"all"**.

- **"none"**: This feature is disabled.
- **"all"**: Some shared data and threads are distributed to different NUMA nodes to reduce the number of remote access times and improve performance. Currently, this function applies only to Arm servers with multiple NUMA nodes. All NUMA nodes must be available for database processes. You cannot select only some NUMA nodes.

NOTE

In the current version, **numa_distribute_mode** cannot be set to **"all"** on the x86 platform.

Default value: **"none"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_pagewriter

Parameter description: Specifies whether to display the page refresh information of threads and details about incremental checkpoints after incremental checkpoints are enabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Detailed information is displayed.
- **off**: Detailed information is not displayed.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised not to set this parameter to **on**.

Risks and impacts of improper settings: If this parameter is set to **on**, more information will be displayed, affecting performance.

advance_xlog_file_num

Parameter description: Specifies the number of Xlog files on the standby node that are periodically initialized in advance in the backend.

Parameter type: integer.

Unit: none

Value range: 0 to 1000000. The value **0** indicates that initialization is not performed in advance. For example, the value **10** indicates that the background thread periodically initializes 10 Xlog files in advance based on the write location of the current Xlog.

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used to prevent the Xlog file initialization from affecting the performance during transaction commit. However, such a fault may occur only when the system is overloaded. Therefore, you do not need to set this parameter.

Risks and impacts of improper settings: If the value is too large, too much disk space is occupied. As a result, the disk usage is abnormal.

comm_sender_buffer_size

Parameter description: Specifies the size of the buffer for each interaction between CNs and DNs and between DNs in the stream plan. In some cases, different values affect the stream performance. After the value is set, the cluster needs to be restarted for the reset to take effect.

Parameter type: integer.

Unit: KB

Value range: 1 to 1024

Default value: **8**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, data is frequently transmitted and received, the delay is short, but the throughput is low. If the value is too large, the throughput increases but the delay increases.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ustore_attr

Parameter description: This parameter is used to control the information statistics of Ustore tables, rollback type, UB-tree index type, and data verification during the running of key modules (including data, indexes, rollback segments, and replay). This parameter helps R&D engineers locate faults.

Parameter type: string.

Unit: none

Value range: This parameter is set in key-value mode. The mapping between keys and values is as follows: If multiple key-value pairs are used, use semicolons (;) to separate them. For example, **ustore_attr='ustore_verify_level=FAST;ustore_verify_module=UPAGE:UBTREE:UNDO:REDO'**.

- **ustore_verify_level**: Specifies the verification level.

  Value range: a string of case-insensitive characters. For details, see the following table.

  Table 14-32 Parameter value meaning of ustore_verify_level

Parameter Value	Description
NONE	**NONE** indicates that the verification function is disabled. You are advised to enable this function to test performance.
FAST	**FAST** indicates fast verification. The verification content is small and the impact on performance is minimized.
COMPLETE	**COMPLETE** indicates complete verification. The verification content is the largest and the performance is greatly affected.

  Default value: **FAST**

- **ustore_verify_module**: Specifies a module that controls verification.

  Value range: The value can be one or more of **UPAGE**, **UBTREE**, **UNDO**, **REDO**, and **ROACH**, or it can be **ALL** or **NULL** (case-insensitive). When multiple values are used, separate them with colons (:). For example, **ustore_verify_module=UPAGE:UBTREE:UNDO:REDO**.

  When the ROACH module is enabled, the value of the **ustore_verify_level** parameter is ignored during the ROACH backup. By default, the level of verification is the highest and the performance is greatly affected. Therefore, exercise caution when using this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 14-33 Parameter value meaning of ustore_verify_module

Parameter Value	Description
UPAGE	Indicates that data page verification is enabled.
UBTREE	Indicates that UB-tree index verification is enabled.
UNDO	Indicates that rollback segment data verification is enabled.
REDO	Indicates that data page verification for the REDO process is enabled.
ROACH	This parameter is discarded. The verification has been removed from the underlying logic. **ustore_verify_module** can be set to **roach** but it does not take effect.
ALL	Indicates that data verification is enabled for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules.
NULL	Indicates that data verification for the UPAGE, UBTREE, UNDO, REDO, and ROACH modules is disabled.

Default value: **UPAGE:UBTREE:UNDO**

- **index_trace_level**: determines whether to enable index tracing and controls the printing level. After this function is enabled, information about index tuples that meet the conditions is printed based on the printing level during index scan.

  Value range: The values are described in the following table.

  Default value: **NO**

  Table 14-34 Parameter value meaning of index_trace_level

Parameter Value	Description
NO	No additional information is printed.
NORMAL	Information about visible index tuples is printed, including: ● ID and offset of the index page where the current index tuple is located ● Current tuple status ● TID and partOid corresponding to the current tuple ● xmin and xmax information corresponding to the current tuple ● Current tuple content (if **enable_log_tuple** is set to **on**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Value	Description
VISIBILITY	On the basis of **NORMAL**, the information about the index tuples that do not pass the visibility check is printed and whether the index tuples are visible is marked.
SHOWHIKEY	On the basis of **VISIBILITY**, the system tries to print the information about the HIKEY tuple on the page.
ALL	Information about all tuples on the scanned index page is printed.

- **enable_log_tuple**: specifies whether to print the contents of related tuples when printing log-level prompts for troubleshooting and locating.

  Value range: **on** or **off** (case-insensitive)

  Default value: **off**
- **enable_ustore_sync_rollback**: specifies whether to enable synchronous rollback for Ustore tables.

  Value range: Boolean

  Default value: **true**
- **enable_ustore_async_rollback**: specifies whether to enable asynchronous rollback for Ustore tables.

  Value range: Boolean

  Default value: **true**
- **enable_ustore_page_rollback**: specifies whether to enable page rollback for Ustore tables.

  Value range: Boolean

  Default value: **true**
- **enable_ustore_partial_seqscan**: specifies whether to enable partial scan for Ustore tables.

  Value range: Boolean

  Default value: **false**
- **enable_candidate_buf_usage_count**: specifies whether to enable buffer usage statistics.

  Value range: Boolean

  Default value: **false**
- **ustats_tracker_naptime**: specifies the interval for collecting statistics on Ustore tables.

  Value range: 1 to 1073741

  Default value: **20**, in seconds.
- **umax_search_length_for_prune**: specifies the maximum search depth of the prune operation on the Ustore table.

  Value range: 1 to 1073741

  Default value: **10**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> When setting **ustore_attr**, do not leave spaces or other characters before and after the equal sign (=) between key and value, for example, **ustore_attr='ustore_verify_level = FAST;**. Otherwise, the parameter is invalid during kernel code verification and the parameter setting fails.

Default value:
"ustore_verify_level=FAST;ustore_verify_module=UPAGE:UBTREE:UNDO"

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Exercise caution when setting the **ustore_attr** parameter. You are advised to modify it with the assistance of engineers.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

index_txntype

Parameter description: Determines whether the index type of UB-tree is PCR or RCR. PCR supports flashback query based on indexes, but RCR does not. An empty character string is equivalent to RCR in most scenarios. In the reindex scenario, if the value is an empty character string, the index type is not changed. If the value is **"RCR"**, the index type is forcibly rebuilt.

Parameter type: string.

Unit: none

Value range: **""**, **"PCR"**, or **"RCR"**

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If the PCR index is required, set this parameter to **"PCR"**. Otherwise, you are advised not to change the value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

default_index_kind

Parameter description: Specifies the default behavior of creating indexes for partitioned tables.

Parameter type: integer.

Unit: none

Value range: 0 to 2

- **0**: The global partitioned index function is disabled for distributed deployment.
- **1**: A local index is created by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **2**: A global index is created by default.

Default value: **2**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **0**, global partitioned indexes cannot be created.

enable_segment_remain_cleanup

Parameter description: Specifies which the residual segment-page cleanup feature is to be enabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the old type of residual segment-page cleanup is enabled.
  - Query APIs: gs_stat_remain_segment_info() and gs_local_stat_remain_segment_info().
  - Cleanup APIs: gs_free_remain_segment() and gs_local_free_remain_segment().
- **off**: indicates that the new type of residual segment-page cleanup is enabled.
  - Query APIs: gs_seg_spc_remain_segments() and gs_seg_spc_remain_extents().
  - Cleanup APIs: gs_seg_free_spc_remain_segment() and gs_seg_free_spc_remain_extent().

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Do not switch the clearing mode randomly. Otherwise, residual segment-page data may fail to be cleared or other exceptions may occur.

enable_stream_noblock_memcopy

Parameter description: Specifies whether to enable memory copy optimization for the stream operator in the vectorized engine. If this parameter is enabled, data of the local stream operator in the vectorized engine is sent in non-waiting mode, improving the execution efficiency of the local stream operator.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: Memory copy optimization is enabled for the stream operator.
- **off**: Memory copy optimization is disabled for the stream operator.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **off**, the execution efficiency of the local stream operator may decrease.

convert_illegal_char_mode

Parameter description: Specifies the placeholders of invalid characters that can be displayed on the client when the **enable_convert_illegal_char** parameter is enabled.

Parameter type: string.

Unit: none

Value range: 95 characters whose decimal codes range from 32 to 126 in the ASCII coding table.

Default value: **"?"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

default_segment

Parameter description: Specifies whether to create a segment-page table by default.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: A segment-page table is created by default when the segment field is not specified.
- **off**: A page table is created by default when the segment field is not specified.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If **--undostoragetype** is set to **'segpage'** during database initialization, the data of Ustore is forcibly stored in segment-page mode, but Astore is not affected.
- If **--undostoragetype** is set to **'page'** or is not set during database initialization, the data of Ustore is forcibly stored in page mode, but Astore is not affected.

14.3.22 Auditing

14.3.22.1 Audit Switch

audit_enabled

Parameter description: Specifies whether to enable or disable the audit thread. After the audit thread is enabled, the auditing information written by the background thread can be read from the pipe and written into audit files.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the auditing function is enabled.
- **off** indicates that the auditing function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Enabling the audit function affects the database performance. The impact depends on the audit recording frequency. If this parameter is set to **on**, set other audit items based on service and tracing requirements. If this parameter is set to **off**, historical operations cannot be traced using audit logs.

audit_directory

Parameter description: Specifies the storage directory of audit files. The path can be relative to the **data** directory or an absolute path. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: valid target path.

Default value: **"pg_audit"**. If **om** is used for cluster deployment, audit logs are stored in *$GAUSSLOG*/**pg_audit/***Instance name*.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is an invalid path or a path whose space is full, the audit function cannot be used. Different directories for storing audit files must be set for different CNs or DNs. Otherwise, audit logs will be abnormal.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

audit_data_format

Parameter description: Audits the format of log files. Currently, only the binary format is supported. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: a string.

Default value: **"binary"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Currently, only the binary format is supported. If this parameter is set to another value, the setting does not take effect.

audit_rotation_interval

Parameter description: Specifies the interval of creating an audit log file. If the difference between the current time and the time when the previous audit log file is created is greater than the value of this parameter, a new audit log file will be generated.

Parameter type: integer.

Unit: minute

Value range: 1 to 35791394 (*INT_MAX*/60)

Default value: 1d (that is, 1440 minutes)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1440** without a unit, **audit_rotation_interval** indicates 1440 minutes. If the value is **2d**, **audit_rotation_interval** indicates 2 days, that is, 2880 minutes. The unit must be **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, there will be too many files in the audit directory. If the value is too large, a single audit file will

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

be too large. Do not adjust this parameter unless necessary. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters.

audit_rotation_size

Parameter description: Specifies the maximum capacity of an audit log file. If the total number of messages in an audit log exceeds the value of this parameter, the server will generate a new audit log file.

Parameter type: integer.

Unit: KB

Value range: 1024 to 1048576

Default value: **10MB** (that is, 10240 KB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **131072** without a unit, **audit_rotation_size** indicates 131072 KB. If the value is **128MB**, **audit_rotation_size** indicates 128 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, there will be too many files in the audit directory. If the value is too large, a single audit file will be too large. Do not adjust this parameter unless necessary. Otherwise, **audit_resource_policy** may fail to take effect. To control the storage space and time of audit logs, set the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_time** parameters. If the space occupied by a single record in an audit log file exceeds the value of this parameter, the log file is regarded as an invalid log file.

audit_resource_policy

Parameter description: Specifies the policy for determining whether audit logs are preferentially stored by space or time.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Audit logs are preferentially stored by space. A maximum of **audit_space_limit** logs can be stored.
- **off**: Audit logs are preferentially stored by time. A minimum duration of **audit_file_remain_time** logs must be stored.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When selecting the space priority policy, do not adjust the following GUC parameters related to the time policy: **audit_rotation_interval** and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

audit_file_remain_time. When selecting the time priority policy, do not adjust the following GUC parameters related to the space policy: **audit_rotation_size**, **audit_space_limit**, and **audit_file_remain_threshold**.

Risks and impacts of improper settings: This parameter must be used together with other GUC parameters related to the corresponding policy. If this parameter is set to an improper value, the audit log storage policy does not meet expectations.

audit_file_remain_time

Parameter description: Specifies the minimum duration required for recording audit logs. This parameter is valid only when **audit_resource_policy** is set to **off**.

Parameter type: integer.

Unit: day

Value range: 0 to 730. The value **0** indicates no time limit.

Default value: **90**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Set this parameter according to the actual situation. If **audit_resource_policy** is set to **on**, do not change the value of this parameter.

Risks and impacts of improper settings: This parameter takes effect only when **audit_resource_policy** is set to **off**. If the value is too small, only a small number of audit logs are retained and the audit tracing duration is shortened. If the value is too large, too many audit logs are stored in the audit directory, affecting the audit query and deletion performance and occupying disk space.

audit_space_limit

Parameter description: Specifies the total disk space occupied by audit files.

Parameter type: integer.

Unit: KB

Value range: 1024 to 1073741824 (1024 GB)

Default value: **1GB** (that is, 1048576 KB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **131072** without a unit, **audit_space_limit** indicates 131072 KB. If the value is **128MB**, **audit_space_limit** indicates 128 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Set this parameter based on the actual available space of the instance and the number of audit logs to be saved.

Risks and impacts of improper settings: This parameter takes effect only when **audit_resource_policy** is set to **on**. If the value is too small, only a small number of audit logs are retained and the audit tracing duration is shortened. If the value is too large, too many audit logs are stored in the audit directory, affecting the audit query and deletion performance and occupying disk space.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This parameter takes effect only for a single process instance folder in the **pg_audit** directory. By default, the total disk space occupied by audit files on each CN or DN is 1 GB.
- In the multi-audit thread scenario, the minimum disk space occupied by audit files is the product of values of **audit_thread_num** and **audit_rotation_size**. Ensure that the value of **audit_space_limit** is greater than the product of values of **audit_thread_num** and **audit_rotation_size**.

audit_file_remain_threshold

Parameter description: Specifies the maximum number of audit files in the audit directory.

Parameter type: integer.

Unit: none

Value range: an integer ranging from 100 to 1048576

Default value: **1048576**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value and do not change the value unless necessary. To specify the storage space and time of audit logs, use the **audit_resource_policy**, **audit_space_limit**, and **audit_file_remain_threshold** parameters.

Risks and impacts of improper settings: If this parameter is incorrectly set, **audit_resource_policy** may fail to take effect.

audit_thread_num

Parameter description: Specifies the number of threads used for auditing.

Parameter type: integer.

Unit: none

Value range: 1 to 48

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When **audit_dml_state** is enabled and high performance is required, you are advised to set this parameter to a larger value to ensure that audit messages can be processed and recorded in a timely manner. In other cases, you are advised to retain the default value.

Risks and impacts of improper settings: A larger number of threads indicates a greater impact on system performance and more CPU and I/O resources are occupied.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14.3.22.2 User and Permission Audit

audit_login_logout

Parameter description: Specifies whether to audit a user's login (including login success and failure) and logout.

Parameter type: integer.

Unit: none

Value range: 0 to 7

- **0**: The function of auditing users' logins and logouts is disabled.
- **1**: Only successful user logins are audited.
- **2**: Only failed user logins are audited.
- **3**: Only successful and failed user logins are audited.
- **4**: Only user logouts are audited.
- **5**: Only successful user logouts and logins are audited.
- **6**: Only failed user logouts and logins are audited.
- **7**: Successful user logins, failed user logins, and logouts are audited.

Default value: **7**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: A smaller value indicates fewer types of user login and logout behaviors to be audited and higher risks of untraceable user login and logout behaviors. A larger value indicates more types of user login and logout behaviors to be recorded. When a large number of user login and logout behaviors exist, the database performance is affected.

audit_database_process

Parameter description: Specifies whether to audit the database startup, stop, switchover, and recovery.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The function of auditing database startup, stop, switchover, and recovery is disabled.
- **1**: The function of auditing database startup, stop, switchover, and recovery is enabled.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **0**, database startup, stop, switchover, and recovery may fail to be traced.

audit_user_locked

Parameter description: Specifies whether to audit the users' locking and unlocking.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The function of auditing user's locking and unlocking is disabled.
- **1**: The function of auditing user's locking and unlocking is enabled.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **0**, user locking and unlocking behaviors may not be traced.

audit_user_violation

Parameter description: Specifies whether to audit the access violation operations of a user.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The function of auditing the access violation operations of a user is disabled.
- **1**: The function of auditing the access violation operations of a user is enabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter to **1** if unauthorized operations need to be audited.

Risks and impacts of improper settings: If this parameter is set to **0**, user locking and unlocking behaviors may not be traced.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

audit_grant_revoke

Parameter description: Specifies whether to audit the granting and revoking of user permissions.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The function of auditing user permission granting and revoking operations is disabled.
- **1**: The function of auditing user permission granting and revoking operations is enabled.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **0**, user permission granting and revoking behaviors may not be traced. If this parameter is set to **1**, the database performance will be affected when a large number of permissions are granted and revoked.

audit_security_label

Parameter description: Specifies whether to audit the creation, deletion, and application of user security labels.

Parameter type: integer.

Unit: none

Value range: **0** or **1**

- **0**: The creation, deletion, and application of user security labels are not audited.
- **1**: The creation, deletion, and application of user security labels are audited.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **0**, the creation, deletion, and application of user security labels cannot be traced. If this parameter is set to **1**, the database performance will be affected when a large number of user security labels are created, deleted, and applied.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

audit_internal_event

Parameter description: Specifies whether to audit the connections and operations of internal tools cm_agent, gs_clean, and WDRXdb, and whether to audit the connections from CNs on DNs for the initial user.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the logins, logouts, and operations of internal tools CM Agent, gs_clean, and WDRXdb are audited, and logins and logouts from CNs are audited on DNs for the initial user.
- **off**: indicates that the logins, logouts, and operations of internal tools CM Agent, gs_clean, and WDRXdb are not audited, and logins and logouts from CNs are not audited on DNs for the initial user.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value to save space occupied by audit logs and improve audit log query performance.

Risks and impacts of improper settings: If this parameter is enabled, login and logout operations between internal tools or nodes on the database server will be recorded, causing performance deterioration.

full_audit_users

Parameter description: Specifies the full audit user list. Audit logs are recorded for all auditable operations performed by users in the list.

Parameter type: string.

Unit: none

Value range: a string. Use commas (,) to separate multiple usernames.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter when all behaviors of a specific user need to be recorded and audited.

Risks and impacts of improper settings: If there are too many users in the list, all operations performed by these users are recorded in audit logs, causing database performance deterioration.

no_audit_client

Parameter description: Specifies the names and IP addresses of clients that do not need to be audited. The IP addresses can be IPv6 addresses. The parameter

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

format is *client name*@*IP address*, which is the same as that of the **client_conninfo** column in the gs_query_audit function, for example, **cm_agent@127.0.0.1 or gs_clean@127.0.0.1**.

Parameter type: string.

Unit: none

Value range: a character string. Use commas (,) to separate multiple configuration items.

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Audit logs are generated for communication among tools or nodes in the database server. To save space occupied by audit logs and improve the query performance of audit logs, you can configure the **no_audit_client** parameter not to audit the low-risk scenarios.

Risks and impacts of improper settings: If the settings are incorrect, operations performed on a client may fail to be audited. As a result, risky operations cannot be traced.

NOTE

If the executed SQL statement meets the configuration requirements of **full_audit_users** and **no_audit_client**, the **no_audit_client** is preferentially configured.

14.3.22.3 Operation Auditing

audit_system_object

Parameter description: Specifies whether to audit the operations such as CREATE, DROP, and ALTER on database objects. Database objects include databases, users, schemas, and tables. You can change the value of this parameter to audit only the operations on required database objects. **Parameter type**: integer.

Unit: none

Value range: 0 to 536870911

- **0** indicates that the operations such as CREATE, DROP, and ALTER are not audited.
- A non-zero value indicates that the operations such as CREATE, DROP, and ALTER on a certain or some database objects are audited.

Value description:

The value of this parameter is calculated by 29 binary bits. The 29 binary bits represent 29 types of database objects. If the corresponding binary bit is set to **0**, the operations such as CREATE, DROP, and ALTER on corresponding database objects are not audited. If it is set to **1**, the operations such as CREATE, DROP, and ALTER are audited. For details about the audit contents represented by these 29 binary bits, see **Table 14-35**.

When SQL patches are audited and **audit_dml_state_select** is enabled, an SQL patch operation will be audited twice and recorded as DML and DDL operations in

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the audit log, respectively. If a remote API is called, the DDL logs are generated on the node corresponding to the input parameter, instead of on the node where the statement is issued.

Default value: **67121159** (decimal), corresponding to 0 0100 0000 0000 0011 0000 0000 0111 in binary, indicating that DDL operations on DATABASE, SCHEMA, USER, NODE GROUP, and SQLPatch are audited.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set the type of database objects to be audited based on service requirements. In the scenario where the leader node is forcibly elected, you are advised to set **audit_system_object** to the maximum value and audit all DDL objects.

Risks and impacts of improper settings: A larger number of objects to be audited indicates a greater impact on system performance and more CPU and I/O resources are occupied.

Table 14-35 Meaning of each value for the **audit_system_object** parameter

Binary Bit	Description	Value Range
Bit 0	Specifies whether to audit the CREATE, DROP, and ALTER operations on databases.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 1	Specifies whether to audit the CREATE, DROP, and ALTER operations on schemas.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 2	Specifies whether to audit the CREATE, DROP, and ALTER operations on users and user mappings.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 3	Specifies whether to audit the CREATE, DROP, ALTER, and TRUNCATE operations on tables.	• **0** indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are not audited. • **1** indicates that the CREATE, DROP, ALTER, and TRUNCATE operations on these objects are audited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Binary Bit	Description	Value Range
Bit 4	Specifies whether to audit the CREATE, DROP, and ALTER operations on indexes.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 5	Specifies whether to audit the CREATE and DROP operations on VIEW and MATVIEW objects.	• **0** indicates that the CREATE and DROP operations on these objects are not audited. • **1** indicates that the CREATE and DROP operations on these objects are audited.
Bit 6	Specifies whether to audit the CREATE, DROP, and ALTER operations on triggers.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 7	Specifies whether to audit the CREATE, DROP, and ALTER operations on procedures/functions.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 8	Specifies whether to audit the CREATE, DROP, and ALTER operations on tablespaces.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 9	Specifies whether to audit the CREATE, DROP, and ALTER operations on resource pools.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 10	Specifies whether to audit the CREATE, DROP, and ALTER operations on workloads.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Binary Bit	Description	Value Range
Bit 11	Specifies whether to audit the CREATE, DROP, and ALTER operations on server objects.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 12	Reserved.	-
Bit 13	Specifies whether to audit the CREATE and DROP operations on node groups.	• **0** indicates that the CREATE and DROP operations on these objects are not audited. • **1** indicates that the CREATE and DROP operations on these objects are audited.
Bit 14	Specifies whether to audit the CREATE, DROP, and ALTER operations on ROW LEVEL SECURITY objects.	• **0** indicates that the CREATE, DROP, and ALTER operations on these objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on these objects are audited.
Bit 15	Specifies whether to audit the CREATE, DROP, and ALTER operations on types.	• **0** indicates that the CREATE, DROP, and ALTER operations on types are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on types are audited.
Bit 16	Specifies whether to audit the CREATE, DROP, and ALTER operations on text search objects (CONFIGURATION and DICTIONARY).	• **0** indicates that the CREATE, DROP, and ALTER operations on text search objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on text search objects are audited.
Bit 17	Specifies whether to audit the CREATE, DROP, and ALTER operations on directories.	• **0** indicates that the CREATE, DROP, and ALTER operations on directories are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on directories are audited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Binary Bit	Description	Value Range
Bit 18	Specifies whether to audit the CREATE, DROP, and ALTER operations on synonyms.	• **0** indicates that the CREATE, DROP, and ALTER operations on synonyms are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on synonyms are audited.
Bit 19	Specifies whether to audit the CREATE, DROP, and ALTER operations on sequences.	• **0** indicates that the CREATE, DROP, and ALTER operations on sequences are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations are audited.
Bit 20	Specifies whether to audit the CREATE, ALTER, and DROP operations on CMKs and CEKs.	• **0** indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are not audited. • **1** indicates that the CREATE, ALTER, and DROP operations on CMKs and CEKs are audited.
Bit 21	Specifies whether to audit the CREATE, DROP, and ALTER operations on packages. (Currently, the operations on packages can be audited only in the centralized deployment scenario.)	• **0** indicates that the CREATE, DROP, and ALTER operations on packages are not audited. • **1** indicates that the operations are audited.
Bit 22	Reserved	-
Bit 23	Reserved	-
Bit 24	Specifies whether to audit the ALTER and DROP operations on the gs_global_config objects.	• **0** indicates that the ALTER and DROP operations on the **gs_global_config** objects are not audited. • **1** indicates that the ALTER and DROP operations on the **gs_global_config** objects are audited.
Bit 25	Specifies whether to audit the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects. Currently, this function is not supported.	• **0** indicates that the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects are not audited. • **1** indicates that the CREATE, DROP, and ALTER operations on FOREIGN DATA WRAPPER objects are audited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Binary Bit	Description	Value Range
Bit 26	Specifies whether to audit the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches.	• **0** indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are not audited. • **1** indicates that the CREATE, ENABLE, DISABLE, and DROP operations on SQL patches are audited.
Bit 27	Reserved	-
Bit 28	Specifies whether to audit the CREATE, ALTER, and DROP operations on database links. Currently, the database link function is not supported.	• **0** indicates that the CREATE, ALTER, and DROP operations on database links are not audited. • **1** indicates that the CREATE, ALTER, and DROP operations on database links are audited.

audit_dml_state

Parameter description: Specifies whether to audit the INSERT, UPDATE, DELETE, and MERGE operations on all tables.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The INSERT, UPDATE, DELETE, and MERGE operations on a specific table are not audited.
- **1**: The INSERT, UPDATE, DELETE, and MERGE operations on a specific table are audited.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **1**, audit logs are frequently recorded when INSERT, UPDATE, DELETE, and MERGE operations are frequently performed in the database. As a result, the database performance deteriorates.

audit_dml_state_select

Parameter description: Specifies whether to audit the SELECT operation.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **0** and **1**

- **0**: The SELECT auditing function is disabled.
- **1**: The SELECT auditing function is enabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **1**, audit logs are frequently recorded when the SELECT operation is frequently performed in the database. As a result, the database performance deteriorates.

audit_function_exec

Parameter description: Specifies whether to record the audit information during the execution of the stored procedures, anonymous blocks, or user-defined functions (excluding system functions).

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The stored procedures, anonymous blocks, or user-defined functions (excluding system functions) are not audited.
- **1**: The stored procedures, anonymous blocks, or user-defined functions (excluding system functions) are audited.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **1**, audit logs are frequently recorded when the database frequently executes stored procedures, anonymous blocks, or user-defined functions. As a result, the database performance deteriorates.

audit_system_function_exec

Parameter description: Specifies whether to record audit logs when system functions in the whitelist are executed.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The function of auditing the execution of system functions is disabled.
- **1**: The function of auditing system function execution is enabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **1**, audit logs are frequently recorded when the database frequently executes system functions in the whitelist. As a result, the database performance deteriorates.

The following table lists the whitelist of system functions that can be recorded and audited.

set_working_grand_version_num_manually	set_config	pg_terminate_backend	pg_cancel_backend	pg_cancel_session	pg_cancel_invalid_query
pg_reload_conf	pg_rotate_logfile	pg_terminate_session	pg_terminate_backend	pg_start_backup	pg_stop_backup
pg_create_restore_point	pg_switch_xlog	pg_cbm_get_merged_file	pg_cbm_recycle_file	pg_enable_delay_ddl_recycle	pg_disable_delay_ddl_recycle
pg_cbm_rotate_file	gs_roach_enable_delay_ddl_recycle	gs_roach_disable_delay_ddl_recycle	gs_roach_stop_backup	pg_last_xlog_receive_location	pg_xlog_replay_pause
pg_xlog_replay_resume	gs_roach_switch_xlog	gs_pitr_archive_slot_force_advance	gs_pitr_clean_history_global_barriers	gs_download_obs_file	gs_upload_obs_file
gs_set_obs_file_context	gs_set_obs_delete_location	gs_hadr_do_switchover	gs_set_obs_delete_location_with_slotname	gs_streaming_dr_in_switchover	pg_advisory_lock
pg_advisory_lock_shared	pg_advisory_unlock	pg_advisory_unlock_shared	pg_advisory_unlock_all	pg_advisory_xact_lock	pg_advisory_xact_lock_shared
pg_try_advisory_lock	pg_try_advisory_lock_shared	pg_try_advisory_xact_lock	pg_try_advisory_xact_lock_shared	gs_get_hadr_key_cn	pg_create_physical_replication_slot_extern

pg_create_logical_replication_slot	pg_drop_replication_slot	pg_logical_slot_peek_changes	pg_logical_slot_get_changes	pg_logical_slot_get_binary_changes	pg_replication_origin_drop
pg_replication_origin_session_reset	local_space_shrink	gs_space_shrink	global_space_shrink	pg_free_remain_segment	gs_fault_inject
sqladvisor.init	sqladvisor.set_weight_params	sqladvisor.set_cost_params	sqladvisor.assign_table_type	gs_repair_file	local_clear_bad_block_info
gs_repair_page	-	-	-	-	-

NOTE

In the audit record of the system function execution event, the value of the **object_name** column is the system function name and does not contain function parameters.

audit_copy_exec

Parameter description: Specifies whether to audit the COPY operation.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The function of auditing the COPY operation is disabled.
- **1**: The function of auditing the COPY operation is enabled.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **1**, audit logs are frequently recorded when the COPY operation is frequently performed in the database. As a result, the database performance deteriorates.

audit_set_parameter

Parameter description: Specifies whether to audit the SET operation.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **0**: The function of auditing the SET operation is disabled.
- **1**: The function of auditing the SET operation is enabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **1**, audit logs are frequently recorded when the SET operation is frequently performed in the database. As a result, the database performance deteriorates.

audit_xid_info

Parameter description: Specifies whether to record the transaction ID of the SQL statement in the **detail_info** column of the audit log.

Parameter type: integer.

Unit: none

Value range: **0** and **1**

- **0**: The function of recording transaction IDs in the audit log is disabled.
- **1**: The function of recording transaction IDs in the audit log is enabled.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

If this function is enabled, the **detail_info** information in the audit log starts with *xid*. For example:

```
detail_info: xid=14619 , create table t1(id int);
```

If transaction IDs do not exist, **xid=NA** is recorded.

enableSeparationOfDuty

Parameter description: Specifies whether the separation of three duties is enabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The separation of duties is enabled.
- **off**: The separation of duties is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **on**, the permissions of a system administrator are restricted, and some operations that can be performed before may fail.

enable_nonsysadmin_execute_direct

Parameter description: Specifies whether non-SYSADMIN and non-MONADMIN users are allowed to execute the EXECUTE DIRECT ON statement.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Any user is allowed to execute the EXECUTE DIRECT ON statement.
- **off**: Only users with the SYSADMIN or MONADMIN permission are allowed to execute the EXECUTE DIRECT ON statement.

Default value: **off**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_access_server_directory

Parameter description: Specifies whether to allow non-initial users to create, modify, and delete directories.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Non-initial users are allowed to create, modify, and delete directories.
- **off**: Non-initial users are not allowed to create, modify, or delete directories.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- To use the advanced package UTL_FILE to access files on the server, you must have the permissions on the specified directory.
- For security purposes, only the initial user can create, modify, and delete directories by default.
- If **enable_access_server_directory** is enabled, users with the SYSADMIN permission and users who inherit the permissions of the built-in role gs_role_directory_create can create directories. A user with the SYSADMIN permission, the owner of a directory, a user who is granted with the DROP permission on the directory, or a user who inherits the permissions of the built-in role gs_role_directory_drop can delete the directory. A user with the SYSADMIN permission and the owner of a directory object can change the owner of the directory, and the user must be a member of the new owner.

14.3.23 Transaction Monitoring

The automatic rollback transaction can be monitored and its statement problems can be located by setting the transaction timeout warning. In addition, the statements with long execution time can also be monitored.

transaction_sync_naptime

Parameter description: For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. The gs_clean tool is automatically triggered for cleansing when the waiting period on the CN exceeds that of **transaction_sync_naptime**. The tool will shorten the blocking time after it completes the cleansing.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483

NOTE

If the value of this parameter is set to **0**, gs_clean will not be automatically called for the cleansing before the blocking arrives the duration. Instead, the gs_clean tool is called by **gs_clean_timeout**. The default value is 5 minutes.

Default value: **30**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the time for the CN to trigger clearing is prolonged, and the blocking time in the case of inconsistency is longer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

transaction_sync_timeout

Parameter description: For data consistency, when the local transaction's status differs from that in the snapshot of GTM, other transactions will be blocked. You need to wait for a few minutes until the transaction status of the local host is consistent with that of the GTM. An exception is reported when the waiting duration on the CN exceeds the value of **transaction_sync_timeout**. Roll back the transaction to avoid system blocking due to long time of thread response failures (for example, sync lock).

Parameter type: integer.

Unit: second

Value range: 0 to 2147483

NOTE

- If the value is **0**, no error is reported when the blocking times out or the transaction is rolled back.
- If the value is not 0, the value of this parameter must be greater than that of **gs_clean_timeout**. Otherwise, unnecessary transaction rollback will probably occur due to a block timeout caused by residual transactions that have not been deleted by gs_clean on the DN.

Default value: **600** (10 minutes)

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.24 CM Parameters

Modifying CM parameters affects the running mechanism of GaussDB. You are advised to ask GaussDB engineers to do it for you. For details about how to modify CM parameters, see method 1 in **Table 14-2**.

You can view CM Agent parameters in the **cm_agent.conf** file in the CM Agent data directory and CM Server parameters in the **cm_server.conf** file in the CM Server data directory.

14.3.24.1 CM Agent Parameters

log_dir

Parameter description: Specifies the directory where CM Agent logs are stored. The value can be an absolute path, or a path relative to the CM Agent data directory.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: "*$GAUSSLOG*/**cm/cm_agent**", indicating that the CM Agent logs are generated in the CM directory in *$GAUSSLOG*.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Agent is restarted.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_file_size

Parameter description: Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record logs.

Parameter type: integer.

Unit: MB

Value range: 0 to 2047

Default value: **16**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**. For example, if this parameter is set to **16** without a unit, it indicates 16 MB. If this parameter is set to **16MB**, it indicates 16 MB. The unit must be MB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_min_messages

Parameter description: Specifies which message levels are written to the CM Agent log. Each level covers all the levels following it. A lower level indicates that fewer messages will be written into the run log on the server.

Parameter type: enumerated type.

Unit: none

Value range: **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**.

Default value: **warning**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Set this parameter based on the hard disk size.

Risks and impacts of improper settings: If the level is set to a low value, debugging information may be lost.

incremental_build

Parameter description: Specifies whether a standby DN is incrementally built.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Standby DNs are incrementally rebuilt.
- **off**: Standby DNs are fully rebuilt.

Default value: **on**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

alarm_component

Parameter description: Specifies the location of the alarm component that processes alarms.

Parameter type: string.

Unit: none

Value range: valid file path.

- If **--alarm-type** in the gs_preinstall script is set to **5**, no third-party component is connected and alarms are written into system_alarm logs. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the gs_preinstall script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **"/opt/huawei/snas/bin/snas_cm_cmd"**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **1**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, alarms may not be reported in a timely manner. If the value is too small, the CPU load may increase.

alarm_report_max_count

Parameter description: Specifies the maximum number of times an alarm is reported.

Parameter type: integer.

Unit: none

Value range: 1 to 2592000

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the CPU load may increase.

agent_report_interval

Parameter description: Specifies the interval at which CM Agent reports the instance status.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, CM fault detection and recovery cannot be performed in a timely manner.

agent_phony_dead_check_interval

Parameter description: Specifies the interval at which CM Agent checks whether the CN, DN, or GTM process is suspended.

Parameter type: integer.

Unit: second

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 2147483647

Default value: **10**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, CM fault detection and recovery cannot be performed in a timely manner. If the value is too small, the CPU load increases.

agent_check_interval

Parameter description: Specifies the interval at which the CM Agent queries the status of instances, such as the DNs, CN, and GTM.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **2**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, CM fault detection and recovery cannot be performed in a timely manner. If the value is too small, the CPU load increases.

agent_heartbeat_timeout

Parameter description: Specifies the timeout interval for CM Agent to detect the CM Server heartbeat. If CM Agent does not receive the heartbeat message from CM Server within the timeout interval, the CM Agent terminates the connection with CM Server.

Parameter type: integer.

Unit: second

Value range: 2 to 2147483647

Default value: **8**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

agent_connect_timeout

Parameter description: Specifies the time to wait before the attempt of CM Agent to connect to CM Server times out.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

agent_connect_retries

Parameter description: Specifies the number of times CM Agent retries to connect to the CM Server.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **15**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

agent_kill_instance_timeout

Parameter description: Specifies the interval from the time when CM Agent fails to connect to the primary CM Server to the time when CM Agent terminates all instances on the node.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **0**, indicating that the operation of stopping all instances on the node is not initiated.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: If you want to set this parameter to a value other than 0, ensure that the value is greater than the time required for promoting CM Server to the primary node.

Risks and impacts of improper settings: If the value is too large, CM faults may not be rectified in a timely manner.

enable_gtm_phony_dead_check

Parameter description: Specifies whether to enable the GTM zombie check function.

Parameter type: integer.

Unit: none

Value range: 0 to 1

- **0**: The GTM zombie check function is disabled.
- **1**: The GTM zombie check function is enabled.

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

security_mode

Parameter description: Specifies whether CNs and DNs are started in secure mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: CNs and DNs are started in secure mode.
- **off**: CNs and DNs are started in non-secure mode.

Default value: **off**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

upgrade_from

Parameter description: Specifies the internal version number of the cluster before an in-place upgrade. Do not modify the value of this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: none

Value range: 0 to 4294967295

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Manual modification may cause in-place upgrade failures.

process_cpu_affinity

Parameter description: Specifies whether to bind a primary DN process to a CPU core before starting the process. Only Arm is supported.

Parameter type: integer.

Unit: none

Value range: 0 to 2

- If the value is **0**, core binding is not optimized.
- If the value is greater than 0, core binding is optimized and the number of physical CPU slices is 2^n.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the cluster and CM Agent is restarted.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dilatation_shard_count_for_disk_capacity_alarm

Parameter description: Specifies the number of shards to be added in the scale-out scenario. This parameter is used to calculate the threshold for reporting a disk capacity alarm.

Parameter type: integer

Unit: none

Value range: 0 to 2147483647

- If the value is **0**, the disk scale-out alarm reporting is disabled.
- If the value is greater than 0, disk scale-out alarm reporting is enabled, and the alarm reporting threshold is calculated based on the number of shards specified by this parameter.

Default value: **1**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Set the number of shards to be the same as the actual number of shards to be added.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_threshold_check_interval

Parameter description: Specifies the interval for compressing and clearing logs.

Parameter type: integer

Unit: second

Value range: 0 to 2147483647

Default value: **1800**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

Risks and impacts of improper settings: If this parameter is set to a large value, too much disk space may be occupied.

log_max_size

Parameter description: Specifies the maximum size of a log file.

Parameter type: integer

Unit: MB

Value range: 0 to 2147483647

Default value: **10240**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_max_count

Parameter description: Specifies the maximum number of logs that can be stored on hard disks.

Parameter type: integer

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 10000

Default value: **10000**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_saved_days

Parameter description: Specifies the number of days for storing logs.

Parameter type: integer

Unit: day

Value range: 0 to 1000

Default value: **90**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust the value based on the disk space and scenario requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_log_compress

Parameter description: Specifies whether to enable the log compression function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The log compression function is enabled.
- **off**: The log compression function is disabled.

Default value: **on**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_cn_auto_repair

Parameter description: Specifies whether to enable the automatic CN repair function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The automatic CN recovery is enabled. That is, after a CN is removed, the agent automatically attempts to recover the CN and resume the CN.
- **off**: The automatic CN recovery is disabled.

Default value: **on**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Automatic CN recovery is enabled by default. If it is disabled, CNs will not be automatically resumed. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

agent_backup_open

Parameter description: Specifies whether the CM runs in the standby cluster for DR.

Parameter type: integer

Unit: none

Value range: 0 to 3

- **0**: No DR relationship is established.
- **1**: The Dorado DR relationship is established.
- **2**: The streaming replication-based DR relationship is established.
- **3**: The logical DR relationship is established.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Agent is restarted.

Setting suggestion: This parameter is internally called. You are advised not to modify it.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_xc_maintenance_mode

Parameter description: Specifies whether the pgxc_node system catalog can be modified when the cluster is in read-only mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The pgxc_node system catalog can be modified.
- **off**: The pgxc_node system catalog cannot be modified.

Default value: **on**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Agent is restarted.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

unix_socket_directory

Parameter description: Specifies the directory location of the Unix socket.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: **""**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_dcf

Parameter description: Specifies the status of the DCF mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The DCF mode is enabled.
- **off**: The DCF mode is disabled.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

disaster_recovery_type

Parameter description: Specifies the type of the DR relationship between the primary and standby clusters.

Parameter type: integer

Unit: none

Value range: 0 to 2

- **0**: No DR relationship is established.
- **1**: The Dorado DR relationship is established.
- **2**: The streaming replication-based DR relationship is established.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_e2e_rto

Parameter description: Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout interval are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance ≤ 10s; RTO for combined faults ≤ 30s).

Parameter type: integer.

Unit: none

Value range: 0 to 1

- **0**: The E2E RTO function is disabled.
- **1**: The E2E RTO function is enabled.

Default value:

Independent deployment: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust the value as required.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

environment_threshold

Parameter description: Specifies the thresholds for the physical environment and node status monitored by the agent. If the thresholds are exceeded, logs will be printed. The thresholds include the memory usage threshold, CPU usage threshold, disk usage threshold, instance memory usage threshold, and instance thread pool usage threshold.

Parameter type: string.

Unit: none

Value range: This parameter consists of five parts: memory usage threshold, CPU usage threshold, disk usage threshold, instance memory usage threshold, and instance thread pool usage threshold. The value range of each threshold is 0 to 100, in percentage (%). The value **0** indicates that the detection is disabled. Different thresholds are separated by commas (,). The value must start and end with parentheses. For example, **"(0,0,0,0,0)"** indicates that none of the five thresholds is detected.

Default value: **"(0,0,0,0,0)"**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

thread_effective_time

Parameter description: Specifies the timeout interval for a round of thread running. If the timeout occurs, the thread is suspended and automatically exits.

Parameter type: integer.

Unit: second

Value range: 0 to 1200. The value **0** indicates that the thread monitoring capability is disabled.

Default value: **60**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: You are advised not to change the parameter value. To adjust the value, contact Huawei technical support.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

ping_fault_kill_inst_timeout

Parameter description: Specifies the timeout interval for restarting a primary DN after the primary DN cannot ping all standby DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: second

Value range: 0 to 1000. The value **0** indicates that the ping fault processing capability is disabled.

Default value: **30**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

high_cpu_threshold

Parameter description: Specifies the CPU usage threshold. When the CPU usage exceeds the threshold, the CM Agent prints CPU usage information in logs at a specified check interval (1s by default).

Parameter type: integer.

Unit: %

Value range: 0 to 100

Default value: **95**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

high_mem_threshold

Parameter description: Specifies the memory usage threshold. When the memory usage exceeds the threshold, the CM Agent prints memory usage information in logs at a specified check interval (1s by default).

Parameter type: integer.

Unit: %

Value range: 0 to 100

Default value: **95**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

high_disk_threshold

Parameter description: Specifies the disk I/O threshold. When the I/O exceeds the threshold, the CM Agent prints I/O information in logs at a specified check interval (1s by default). The iostat -xm information is recorded in the **system_stat** log file for 10 consecutive times at an interval of 1s.

Parameter type: integer.

Unit: %

Value range: 0 to 100

Default value: **95**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

sys_check_interval

Parameter description: Specifies the system resource check period, that is, the interval for checking the CPU, memory, and disk I/O usage. The value **0** indicates that the check is disabled.

Parameter type: integer.

Unit: second

Value range: 0 to 10

Default value: **1**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, alarms may not be rectified in a timely manner.

network_check_concurrency

Parameter description: Specifies the number of concurrent network checks, that is, the number of network links to be checked at the same time. The value **0** indicates that the check is disabled.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 1000

Default value: **10**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, CM fault detection and recovery cannot be performed in a timely manner. If the value is too large, the CPU load increases.

network_check_interval

Parameter description: Specifies the network check interval. The value **0** indicates that the check is disabled.

Parameter type: integer.

Unit: second

Value range: 0 to 1000

Default Value: **5**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, CM fault detection and recovery cannot be performed in a timely manner. If the value is too small, the CPU load increases.

asyn_log_enable

Parameter description: Specifies whether to enable asynchronous logging. After this parameter is enabled, the CM Agent starts asynchronous logging.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The CM Agent starts asynchronous logging.
- **off**: The CM Agent does not start asynchronous logging but uses serial logging.

Default value: **on**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is disabled, logs may be lost.

asyn_log_max_buf_size

Parameter description: Specifies the size of the asynchronous log buffer. When asynchronous logs are stacked and the stacked logs exceed the buffer size, subsequent logs cannot be recorded.

Parameter type: integer.

Unit: KB

Value range: 1 to 1048576

Default value: **1024**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Adjust the value based on the memory and hard disk size.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

asyn_log_fault_solution

Parameter description: Specifies the asynchronous log processing solution after a log disk fault is identified. When the CM detects that a log disk is faulty or the asynchronous log buffer overflows, the CM processes asynchronous logs based on the configuration.

Parameter type: integer.

Unit: none

Value range: 0 to 2

- **0**: No extra processing is performed on logs. All logs are retained in the buffer until the buffer size reaches the upper limit. After the buffer size reaches the upper limit, no more logs are recorded.
- **1**: Logs are filtered. After a log disk fault is identified, only key logs, alarms, and logs at the ERROR level or higher are saved to the buffer until the buffer size reaches the upper limit. After the buffer size reaches the upper limit, no more logs are recorded.
- **2**: Logs are discarded. After a log disk fault is identified, only key logs and alarms are saved to the buffer until the buffer size reaches the upper limit. After the buffer size reaches the upper limit, no more logs are recorded.

Default value: **0**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Adjust the value based on the memory and hard disk size.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

disk_check_hung_timeout

Parameter description: Specifies the timeout interval for a disk I/O hang. When a single disk I/O check exceeds the timeout interval, the disk I/O hang occurs. The value **0** indicates that the disk hang check is disabled.

Parameter type: integer.

Unit: second

Value range: 0 to 1000

Default value: The default value is **20**. If you cannot determine whether the detected disk is striped during installation, the default value is changed to **60**.

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

disk_check_block_timeout

Parameter description: If file operations such as open are blocked due to certain reasons in the file system and the blocking duration exceeds the value of this parameter, the system determines that the disk is faulty. If this parameter is set to **0**, the determination is disabled.

Parameter type: integer.

Unit: second

Value range: 0 to 1000

Default value: **60**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

disk_check_interval

Parameter description: Specifies the traffic of disk I/O hang check, that is, the minimum duration within which specified data needs to be written. The default check interval is 5 seconds. The value **0** indicates that the disk check is disabled.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: second

Value range: 0 to 1000

Default Value: **5**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Improper settings may cause inaccurate fault detection and delayed fault rectification.

disk_check_io_size

Parameter description: Specifies the disk I/O hang check traffic, that is, the size of data written to the disk within the check duration. This is an I/O operation directly performed on the disk. By default, 512-byte data is written. If the detected disk is striped, the default value is changed to 262144 bytes (256 KB) during installation. A maximum of 1 GB data can be written. The value **0** indicates that the disk hang check is disabled. Disk detection has a whitelist, including the CM/CN/DN/GTM data directory, disk where the log directory resides, and disk where the user-defined tablespace directory resides.

Parameter type: integer.

Unit: byte

Value range: 0 to 1073741824

Default value: **512**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Improper settings may cause inaccurate fault detection and delayed fault rectification.

process_unhealthy_alarm_time

Parameter description: Specifies the detection timeout interval for triggering the process status alarm. When a process is in an abnormal state (**D**, **T**, or **Z**) for a long time exceeding the value of this parameter, a process status alarm is triggered.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647. The value **0** indicates that this function is disabled.

Default value: **50**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

enable_tblspc_disk_check

Parameter description: Specifies whether to enable the tablespace disk check function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The tablespace disk check is enabled. That is, the disk where the tablespace is located is hung and the corresponding DN is stopped.
- **off**: The tablespace disk check function is disabled.

Default value: **on**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then restart the cluster for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_network_package_loss

Parameter description: Checks the packet loss rate between the primary and standby DNs. If the packet loss rate of the primary DN exceeds the threshold, a restart is triggered.

Parameter type: integer.

Unit: %

Value range: 0 to 99. The value **0** indicates that this function is disabled.

Default value: **30**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, faults may not be rectified in a timely manner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_auto_start

Parameter description: Specifies whether CM Agent automatically starts DNs and CNs.

Parameter type: integer.

Unit: none

Value range: 0 to 1

- **0**: The automatic startup function is disabled.
- **1**: The automatic startup function is enabled.

Default value: **1**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_check_az_network

Parameter description: Specifies whether to enable AZ-level data plane network detection.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: AZ-level data plane network detection is enabled.
- **off**: AZ-level data plane network detection is disabled.

Default value: **on**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the fault detection function deteriorates.

expect_stop_az_name

Parameter description: Specifies the name of the AZ to be stopped by the AZ-level network detection function.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: name of an existing AZ in the environment. If this parameter is left empty, instances in the AZ opposite to the primary CM Server are stopped.

Default value: **""**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

check_az_network_concurrency

Parameter description: Specifies the number of concurrent AZ-level network detection tasks.

Parameter type: integer.

Unit: none

Value range: 1 to 10

Default value: **2**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, CM fault detection and recovery cannot be performed in a timely manner. If the value is too large, the CPU load increases.

cm_hadr_process_type

Parameter description: Specifies the DR process ID.

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: There is no process.
- **failover**: A standby cluster for DR is promoted to primary.
- **switchover_promote**: A standby cluster for DR is promoted to primary during the cluster switchover.
- **switchover_demote**: A primary cluster is demoted to a standby cluster for DR during the cluster switchover.

Default value: **none**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.24.2 CM Server Parameters

log_dir

Parameter description: Specifies the directory where CM Server logs are stored. The value can be an absolute path, or a path relative to the CM Server data directory.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: "*$GAUSSLOG*/**cm/cm_server**", indicating that the CM Server logs are generated in the CM directory in *$GAUSSLOG*.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_file_size

Parameter description: Specifies the size of a log file. If a log file exceeds the specified size, a new one is created to record logs.

Parameter type: integer.

Unit: MB

Value range: 0 to 2047

Default value: **16**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**. For example, if this parameter is set to **16** without a unit, it indicates 16 MB. If this parameter is set to **16MB**, it indicates 16 MB. The unit must be MB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_min_messages

Parameter description: Specifies the level of messages to be written to the CM Server log. Each level covers all the levels following it. A lower level indicates that fewer messages will be written into the run log on the server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: enumerated type.

Unit: none

Value range: **debug5**, **debug1**, **log**, **warning**, **error**, and **fatal**.

Default value: **warning**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Set this parameter based on the hard disk size.

Risks and impacts of improper settings: If the level is set to a low value, debugging information may be lost.

thread_count

Parameter description: Specifies the number of threads in the agent thread pool.

Parameter type: string.

Unit: none

Value range: This parameter consists of two parts: **'worker_thread_count** and **io_ratio**. The meanings of the two parts are as follows:

- **worker_thread_count**: specifies the number of AgentWorker threads. The value ranges from 2 to 1000.
- **io_ratio**: specifies the ratio of I/O threads to worker threads. The value *n* indicates that one AgentIO thread corresponds to *n* AgentWorker threads. The value ranges from 1 to 100. At least one AgentIO thread is required.

NOTE

If the value of **worker_thread_count**, namely the number of AgentWorker threads, is greater than the sum of the number of cluster nodes and the number of threads for processing cm_ctl requests (if the number of cluster nodes is less than 32, one thread is used by default; otherwise, four threads are used), the value that takes effect is the sum of the number of cluster nodes and the number of threads for processing cm_ctl requests.

Default value: **"(1000,1)"**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

Risks and impacts of improper settings: If this parameter is incorrectly set, CM faults may not be detected and rectified in a timely manner, and the CPU load may increase.

alarm_component

Parameter description: Specifies the location of the alarm component that processes alarms.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: string.

Unit: none

Value range: valid file path.

- If **--alarm-type** in the gs_preinstall script is set to **5**, no third-party component is connected and alarms are written into system_alarm logs. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the gs_preinstall script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **"/opt/huawei/snas/bin/snas_cm_cmd"**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **3**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, alarms may not be reported in a timely manner. If the value is too small, the CPU load may increase.

alarm_report_max_count

Parameter description: Specifies the maximum number of times an alarm is reported.

Parameter type: integer.

Unit: none

Value range: 1 to 2592000

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the CPU load may increase.

instance_failover_delay_timeout

Parameter description: Specifies the delay in CM Server failover after the primary CM Server breakdown is detected. It takes effect for GTM arbitration and for DN arbitration in primary/standby/secondary mode.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, database faults may not be rectified in a timely manner.

instance_heartbeat_timeout

Parameter description: Specifies the time to wait before the instance heartbeat times out.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **6**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

instance_keep_heartbeat_timeout

Parameter description: The CM Agent periodically checks the instance status and reports the status to the CM Server. If the instance status cannot be detected for a long time and the accumulated time exceeds the value of this parameter, the CM Server delivers a command to the CM Agent to restart the instance.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **40**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

instance_phony_dead_restart_interval

Parameter description: Specifies the interval at which the CM Agent process restarts and kills a zombie CN, DN, or GTM instance. The interval between two consecutive kill operations cannot be less than the value of this parameter. Otherwise, the CM Agent process does not deliver commands.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **21600**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

coordinator_heartbeat_timeout

Parameter description: Specifies the heartbeat timeout that triggers the automatic removal of faulty CNs. The setting of this parameter takes effect immediately, and you do not need to restart CM Server.

Parameter type: integer.

Unit: second

Value range: 0 to 2592000. **0** indicates that a faulty CN will not be automatically removed.

Default value: 25

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the CN may fail to be removed for a long time. If the value is too small, the CN may fail to be removed.

phony_dead_effective_time

Parameter description: Specifies the maximum number of times CN, DN, or GTM processes are detected as zombie. If the number of times a process is detected as

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

zombie is greater than the specified value, the process is considered as a zombie process and will be restarted.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **5**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

enable_transaction_read_only

Parameter description: Specifies whether to enable the threshold detection function of the CM Server disk. After this function is enabled, CM Server automatically sets the database to read-only when the disk usage is greater than the value of **datastorage_threshold_value_check**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The threshold detection function is enabled.
- **off**: The threshold detection function is disabled.

Default value: **on**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Disabling this function may cause high disk usage.

datastorage_threshold_check_interval

Parameter description: Specifies the interval for checking the disk usage. The system checks the disk usage at the interval specified by the user.

Parameter type: integer.

Unit: second

Value range: 1 to 2592000

Default value: **10**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, CM fault detection and recovery cannot be performed in a timely manner. If the value is too small, the CPU load increases.

datastorage_threshold_value_check

Parameter description: Specifies the usage threshold of a read-only disk in a database. When the disk usage of the data directory exceeds the specified value, the database is automatically set to read-only mode. In the read-only mode, log replay cannot be restricted and the disk usage increases. Therefore, you need to pay attention to the cluster disk capacity and handle read-only alarms in a timely manner to prevent the disk space from being used up; otherwise, the database cannot be restored quickly.

Parameter type: integer.

Unit: percentage

Value range: 1 to 99

Default value: **85**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust this parameter based on the disk space. When adjusting this parameter, you are advised to adjust the **max_size_for_xlog_retention** parameter of the DN at the same time to prevent the cluster read-only threshold from being triggered by backup operations.

Risks and impacts of improper settings: If the value is too large, the disk space usage is too high and the restoration cannot be achieved quickly.

max_datastorage_threshold_check

Parameter description: Specifies the maximum interval for checking the disk usage. After you modify the read-only mode parameter, the system automatically checks whether the disk usage reaches the threshold at the specified interval.

Parameter type: integer.

Unit: second

Value range: 1 to 2592000

Default value: **43200**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, CM fault detection and recovery cannot be performed in a timely manner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_az_auto_switchover

Parameter description: Specifies whether to enable the automatic AZ switchover function. If this function is enabled, CM Server can automatically switch over AZs. Otherwise, when a DN is faulty, services will not be automatically switched to another AZ even if the current AZ is unavailable. You can run the switchover command to manually switch services to another AZ.

Parameter type: integer.

Unit: none

Value range: 0 to 1

- **0**: The automatic AZ switchover function is disabled.
- **1**: The automatic AZ switchover function is enabled.

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this function is disabled, CM fault detection and recovery cannot be performed in a timely manner.

cmserver_ha_connect_timeout

Parameter description: Specifies the time to wait before the attempt of CM Server to connect to other CM Servers times out.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **2**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

cmserver_ha_heartbeat_timeout

Parameter description: Specifies the timeout interval for a CM Server to receive heartbeat signals from other CM Servers.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **6**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

cmserver_ha_status_interval

Parameter description: Specifies the interval between synchronizations of primary and standby CM Server status.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, CM fault detection and recovery cannot be performed in a timely manner. If the value is too small, the CPU load increases.

cmserver_self_vote_timeout

Parameter description: Specifies the time to wait before the CM Server self-voting times out. This parameter is valid only when the value of this parameter is greater than or equal to that of **cmserver_ha_heartbeat_timeout**.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **6**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large or too small, false negative and false positive may occur during fault detection.

cmserver_demote_delay_on_etcd_fault

Parameter description: Specifies the delay within which CM Server switches from the primary state to the standby state due to unhealthy ETCD.

Parameter type: integer.

Unit: second

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 1 to 2147483647

Default value: **8**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the ETCD fault detection result is false positive. If the value is too large, the CM fault cannot be rectified in a timely manner.

cm_auth_method

Parameter description: Specifies the port authentication mode of the CM module.

Parameter type: enumerated type.

Unit: none

Value range:

- **trust**: Port authentication is not configured.
- **gss**: Kerberos port authentication is used.

Default value: **trust**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: You can change the value to **"gss"** only after the Kerberos server and client are successfully installed. Otherwise, the CM cannot communicate properly, affecting the database status.

cm_krb_server_keyfile

Parameter description: Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the *${GAUSSHOME}*/**kerberos** directory and ends with keytab. The file name is the same as the name of the user who runs the cluster.

Parameter type: string.

Unit: none

Value range: absolute path of the key file of the Kerberos server.

Default value: *${GAUSSHOME}*/**kerberos/***{UserName}*.**keytab**. The default value cannot take effect and is used only as a prompt.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: This parameter is paired with the preceding parameter **cm_auth_method**. When **cm_auth_method** is set to **"gss"**,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

this parameter must be set to a correct path. Otherwise, the cluster status will be affected.

cm_server_arbitrate_delay_base_time_out

Parameter description: Specifies the basic delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: 10

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the CM Server disconnection fault is false positive. If the value is too large, the CM fault cannot be rectified in a timely manner.

cm_server_arbitrate_delay_incrememtal_time_out

Parameter description: Specifies the incremental delay duration for CM Server arbitration. If the primary CM Server is disconnected, the arbitration starts to be timed. If the disconnection duration exceeds the arbitration delay duration, a new primary CM Server will be selected. The arbitration delay duration is determined by the basic delay duration, the node index (server ID), and the incremental delay duration. The formula is as follows: Arbitration delay duration = Basic delay duration + Node index x Incremental delay duration.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **3**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the CM Server disconnection fault is false positive. If the value is too large, the CM fault cannot be rectified in a timely manner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

force_promote

Parameter description: Specifies whether CM Server enables forcible switchover (that is, when the cluster status is unknown, the basic functions of the cluster are available at the cost of data loss). This parameter applies to CNs and DNs.

Parameter type: integer.

Unit: none

Value range: 0 to 1

- **0**: The forced switching logic function is disabled.
- **1**: The forcible switchover logic function is enabled.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: If you can accept the loss of some data caused by forcible service (system) switchover, enable this parameter when the service recovery has the highest priority.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

switch_rto

Parameter description: Specifies the delay for the forcible switchover of CM Server. When **force_promote** is set to **1** and a shard in the cluster does not have primary CM Server, the system starts timing. After the delay, forcible switchover is executed.

Parameter type: integer.

Unit: second

Value range: 60 to 2147483647

Default value: **600**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the database fault is false positive. If the value is too large, the fault cannot be rectified in a timely manner.

enable_finishredo_retrieve

Parameter description: Specifies whether to retrieve data of Xlogs that are cut off by redo logs after a forcible CM Server switchover. If this parameter is set to **on**, data is automatically retrieved after a forcible switchover.

Parameter type: Boolean.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **on**: Data is retrieved.
- **off**: Data is not retrieved.

Default value: **off**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Adjust the value according to the actual situation.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

backup_open

Parameter description: Specifies whether the CM runs in the standby cluster for DR.

Parameter type: integer

Unit: none

Value range: 0 to 3

- **0**: No DR relationship is established.
- **1**: The Dorado DR relationship is established.
- **2**: The streaming replication-based DR relationship is established.
- **3**: The logical DR relationship is established.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: Do not enable this parameter for clusters that are not standby clusters for DR. This parameter is internally called. You are advised not to modify it.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

cluster_starting_aribt_delay

Parameter description: Specifies the time that CM Server waits for the static primary DN to be promoted to primary during cluster startup.

Parameter type: integer.

Unit: second

Value range: 1 to 2592000

Default value: **180**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_dcf

Parameter description: Specifies the status of the DCF mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The DCF mode is enabled.
- **off**: The DCF mode is disabled.

Default value: **off**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

install_type

Parameter description: Specifies the settings related to the standby cluster for DR to distinguish the cluster type.

Parameter type: integer

Unit: none

Value range: 0 to 2

- **0**: a cluster for which no DR relationship is established.
- **1**: a Dorado-based cluster.
- **2**: a streaming-based cluster.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: Do not enable this parameter for clusters that are not standby clusters for DR.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_ssl

Parameter description: Specifies whether to enable SSL.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The SSL certificate is enabled for encrypted communication.
- **off**: The SSL certificate is disabled for encrypted communication.

Default value: **off**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: To ensure security, you are advised not to disable it. After this function is disabled, CM does not use encrypted communication and all information is transmitted in plaintext, which may bring security risks such as eavesdropping, tampering, and spoofing.

Risks and impacts of improper settings: After this function is disabled, CM does not use encrypted communication. All information is transmitted in plaintext, which may cause security risks such as eavesdropping, tampering, and spoofing.

ssl_cert_expire_alert_threshold

Parameter description: Specifies the SSL certificate expiration alarm time. If the certificate expiration time is less than the value of this parameter, an alarm indicating that the certificate is about to expire is reported.

Parameter type: integer

Unit: day

Value range: 7–180

Default value: **90**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: Adjust the value according to the actual situation.

Risks and impacts of improper settings: If the value is too small, alarms may not be rectified in a timely manner.

ssl_cert_expire_check_interval

Parameter description: Specifies the period for checking whether the SSL certificate expires.

Parameter type: integer

Unit: second

Value range: 0 to 2147483647

Default value: **86400** (that is, one day)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: Adjust the value according to the actual situation.

Risks and impacts of improper settings: If the value is too small, the CPU load increases. If the value is too large, alarms cannot be reported in a timely manner.

delay_arbitrate_timeout

Parameter description: Specifies the waiting time for a node in the same AZ as the primary DN to be promoted to primary after redo replay.

Parameter type: integer

Unit: second

Value range: 0 to 2147483647

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, DN faults may not be rectified in a timely manner.

ddb_type

Parameter description: Specifies whether to switch between ETCD and DCC modes.

Parameter type: integer

Unit: none

Value range: 0 to 1

- **0**: The ETCD mode is enabled.
- **1**: The DCC mode is enabled.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 in **Table 14-2**. The modification takes effect only after the CM Server is restarted.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ddb_log_level

Parameter description: Specifies the DDB log level.

Parameter type: string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **"NONE"**: Disable the log function. It cannot be used together with the following log levels:
- **"RUN_ERR|RUN_WAR|RUN_INF|DEBUG_ERR|DEBUG_WAR|DEBUG_INF|TRACE|PROFILE|OPER"**: Enable the log function. You can set this parameter to one or a combination of the preceding log levels. If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty character string.

Default value: **"RUN_ERR|RUN_WAR|DEBUG_ERR|OPER|RUN_INF|PROFILE"**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ddb_log_backup_file_count

Parameter description: Specifies the maximum number of log files that can be saved.

Parameter type: integer

Unit: none

Value range: 1 to 100

Default value: **10**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ddb_max_log_file_size

Parameter description: Specifies the maximum number of bytes in a log.

Parameter type: string.

Unit: none

Value range: The value of this parameter consists of digits and a unit. The value ranges from 1 to 1000, in MB.

Default value: **"10M"**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ddb_log_suppress_enable

Parameter description: Specifies whether to enable the log suppression function.

Parameter type: integer

Unit: none

Value range: 0 to 1

- **0**: The log suppression function is disabled.
- **1**: The log suppression function is enabled.

Default value: **0**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ddb_election_timeout

Parameter description: Specifies the DCC election timeout period.

Parameter type: integer

Unit: second

Value range: 1–600

Default value: **3**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_e2e_rto

Parameter description: Specifies whether to enable the E2E RTO function. After this function is enabled, the hang-up detection period and network detection timeout interval are shortened. The CM can reach the E2E RTO indicator (RTO for a single instance ≤ 10s; RTO for combined faults ≤ 30s).

Parameter type: integer.

Unit: none

Value range: 0 to 1

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **0**: The E2E RTO function is disabled.
- **1**: The E2E RTO function is enabled.

Default value:

Independent deployment: **1**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. You can adjust the value as required.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

cma_fault_kill_instance_timeout

Parameter description: Specifies timeout interval for waiting for a DN to be reported after the internal status of the primary CM Server is set to **unknown**. The CM Server runs the **pssh** command to remotely kill the DN that fails to be reported and restart the DN process. This parameter is not added to the CM Server configuration file by default. You need to manually add it.

Parameter type: integer.

Unit: second

Value range: 0 to 21474836. **0**: disabled.

Default value: This parameter is enabled by default. The default value is (**cm_server_num** x **agent_connect_timeout** x **agent_connect_retries** + **agent_heartbeat_timeout** + 10).

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Faults may not be rectified in a timely manner.

thread_effective_time

Parameter description: Specifies the timeout interval for a round of thread running. If the timeout occurs, the thread is suspended and the process automatically exits.

Parameter type: integer.

Unit: second

Value range: 0 to 1200. The value **0** indicates that the thread monitoring capability is disabled.

Default value: **20**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: You are advised not to change the parameter value. To adjust the value, contact Huawei technical support.

Risks and impacts of improper settings: Improper settings may cause inaccurate fault detection and delayed fault rectification.

enable_synclist_single_inst

Parameter description: Specifies whether to reduce copies to one primary and zero standby. After this function is enabled, the number of copies will be reduced to one primary and zero standby. If the parameter is incorrectly set, the default value is used.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: This function is enabled.
- **off**: This function is disabled.

Default value: **off**

Setting method: This parameter is a CM parameter. For details about how to modify this parameter, see method 1 and method 2 in **Table 14-2**.

Setting suggestion: Retain the default value. To adjust the value, contact Huawei technical support.

Risks and impacts of improper settings: If this parameter is enabled and all standby nodes are faulty, the primary node automatically switches to the local submission mode. In this case, if the primary node is faulty again, unrecoverable impacts may occur.

ctl_thread_count

Parameter description: Specifies the number of threads in the ctl thread pool.

Parameter type: string.

Unit: none

Value range:

The value is a string of more than 0 characters. This parameter consists of two parts: **worker_thread_count** and **io_ratio**. The meanings of the two parts are as follows:

- **worker_thread_count**: specifies the number of CtlWorker threads. The value ranges from 0 to 1000. If the value is **0**, the number of CtlWorker threads is equal to the number of nodes in the cluster.
- **io_ratio**: specifies the ratio of I/O threads to worker threads. The value *n* indicates that one CtlIO thread corresponds to *n* CtlWorker threads. The value ranges from 1 to 100. At least one CtlIO thread is required.

Default value: **"(0,1)"**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then restart the CM Server for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: CM performance may deteriorate.

asyn_log_enable

Parameter description: Specifies whether to enable asynchronous logging. After this parameter is enabled, the CM Server starts asynchronous logging.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The CM Server starts asynchronous logging.
- **off**: The CM Server does not start asynchronous logging but uses serial logging.

Default value: **on**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, logs may be lost.

asyn_log_max_buf_size

Parameter description: Specifies the size of the asynchronous log buffer. When asynchronous logs are stacked and the stacked logs exceed the buffer size, subsequent logs cannot be recorded.

Parameter type: integer.

Unit: KB

Value range: 1 to 1048576

Default value: **1024**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Adjust the value based on the memory and hard disk size.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

asyn_log_fault_solution

Parameter description: Specifies the asynchronous log processing solution after a log disk fault is identified. When the CM detects that a log disk is faulty or the asynchronous log buffer overflows, the CM processes asynchronous logs based on the configuration.

Parameter type: integer.

Unit: none

Value range: 0 to 2

- **0**: No extra processing is performed on logs. All logs are retained in the buffer until the buffer size reaches the upper limit. After the buffer size reaches the upper limit, no more logs are recorded.
- **1**: Logs are filtered. After a log disk fault is identified, only key logs, alarms, and logs at the ERROR level or higher are saved to the buffer until the buffer size reaches the upper limit. After the buffer size reaches the upper limit, no more logs are recorded.
- **2**: Logs are discarded. After a log disk fault is identified, only key logs and alarms are saved to the buffer until the buffer size reaches the upper limit. After the buffer size reaches the upper limit, no more logs are recorded.

Default value: **0**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Adjust the value based on the memory and hard disk size.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_isolate

Parameter description: Specifies whether to isolate instances.

Parameter type: integer.

Unit: none

Value range: 0 to 1

- **0**: This function is disabled.
- **1**: This function is enabled. After this function is enabled, CM Server automatically isolates faulty instances.

Default value: **1**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

barrier_restart_threshold

Parameter description: Specifies the interval of waiting for restarting the barrier of the standby cluster for DR. When the barrier of the standby cluster for DR is suspended for a period longer than the value of this parameter, the barrier is restarted.

Parameter type: integer.

Unit: second

Value range: 0 to 2592000. **0** indicates that barrier restart is disabled.

Default value: **30**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Improper settings may cause inaccurate fault detection and delayed fault rectification.

alarm_ddb_unhealth_threshold

Parameter description: Specifies the threshold for reporting an alarm for an unhealthy DDB.

Parameter type: integer.

Unit: none

Value range: 0 to 2592000

Default value: **5**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

disk_full_threshold

Parameter description: Specifies the disk usage threshold in a database. When the disk usage of the data directory exceeds the specified value, the disk is full and the database is automatically stopped. When the disk usage is less than the value specified by **datastorage_threshold_value_check**, the database is automatically started. The value of **disk_full_threshold** takes effect only when it is greater than that of **datastorage_threshold_value_check**.

Parameter type: integer.

Unit: %

Value range: 1 to 99

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **98**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, other processes may be unavailable.

cm_hadr_process_type

Parameter description: Specifies the DR process ID.

Parameter type: enumerated type.

Unit: none

Value range:

- **none**: There is no process.
- **failover**: A standby cluster for DR is promoted to primary.
- **switchover_promote**: A standby cluster for DR is promoted to primary during the cluster switchover.
- **switchover_demote**: A primary cluster is demoted to a standby cluster for DR during the cluster switchover.

Default value: **none**

Setting method: Refer to the **set cm parameters** table in "Unified Cluster Management Tool > cm_ctl Tool Introduction" in *Tool Reference*. Then run the **reload** command for the settings to take effect.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.25 GTM Parameters

GTM parameters can be set in the **gtm.conf** file or using gs_guc.

nodename

Parameter description: Specifies the name of the primary or standby GTM.

Parameter type: string.

Unit: none

Value range: a string, which complies with the identifier naming convention

Default value: **""**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

port

Parameter description: Specifies the host port number listened by the primary or standby GTM.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647. The recommended value range is 1024 to 65535.

Default value: **6666**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_file

Parameter description: Specifies a log file name.

Parameter type: string.

Unit: none

Value range: a string, which complies with the identifier naming convention

Default value: **"gtm-***%Y-%m-%d_%H%M%S***.log"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

active_host

Parameter description: Specifies the IP address of a target GTM. For the primary GTM, it is the IP address of the standby GTM; for the standby GTM, it is the IP address of the primary GTM. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string, which complies with the identifier naming convention

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

local_host

Parameter description: Specifies the HA local address. Set this parameter based on the cluster configuration file. You do not need to manually set this parameter. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range: a string, which complies with the identifier naming convention

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

active_port

Parameter description: Specifies the port number of the target GTM server.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647. The recommended value range is 1024 to 65535.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: This parameter is specified in the configuration file during installation. Do not modify this parameter unless necessary. Otherwise, database communications will be affected after the modification.

local_port

Parameter description: Specifies the local port for HA.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647. The recommended value range is 1024 to 65535.

Default value: **0**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: This parameter is specified in the configuration file during installation. Do not modify this parameter unless necessary. Otherwise, database communications will be affected after the modification.

standby_connection_timeout

Parameter description: Specifies the timeout interval between the primary and standby GTMs. A larger value enhances the fault tolerance capability of the network between the primary and standby GTMs, but increases the duration for reporting disconnection between them.

Parameter type: integer.

Unit: second

Value range: 5 to 2147483647

Default value: **5**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impact of improper settings: If the value is too large, disconnection faults may not be detected in a timely manner.

keepalives_count

Parameter description: Specifies the maximum number of unresponsive keepalive signals that can be waited before the GTM server is disconnected from the client on an OS that supports the **TCP_KEEPCNT** socket option. This parameter takes effect only on the standby GTM.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: **0**, indicating that the connection is immediately broken if no keepalive signal from the client is received by the GTM.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

keepalives_idle

Parameter description: Specifies the interval for sending keepalive signals if no data is sent after the GTM server is connected to the client on the OS that supports the **TCP_KEEPIDLE** socket option.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

keepalives_interval

Parameter description: Specifies the interval at which the GTM server sends active signals on the OS that supports the **TCP_KEEPINTVL** socket option.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

synchronous_backup

Parameter description: Specifies whether to enable synchronization for backing up data to the standby GTM.

Parameter type: enumerated type.

Unit: none

Value range:

- **on**: Synchronization is enabled.
- **off**: Synchronization is disabled.
- **auto**: Automatic synchronization is enabled.

Default value: **auto**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

query_memory_limit

Parameter description: Specifies the limit of memory available for queries. This parameter applies only to the default resource group. For other resource groups, the memory available for queries is not limited.

Parameter type: floating point.

Unit: none

Value range: 0.0 to 1.0

Default value: **0.25**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

wlm_max_mem

Parameter description: Specifies the maximum memory for GTM execution.

Parameter type: integer.

Unit: MB

Value range: 512 to 2147483647

Default value: **2048**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

config_file

Parameter description: Specifies the name of a GTM configuration file. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: valid file name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **"gtm.conf"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

data_dir

Parameter description: Specifies the GTM data file directory.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: **""**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

listen_addresses

Parameter description: Specifies the TCP/IP address of the client for a server to listen on. The IP address can be an IPv4 or IPv6 address.

Parameter type: string.

Unit: none

Value range:

- Host name or IP address. Multiple values are separated with commas (,). IPv4 and IPv6 addresses are supported.
- An asterisk (*), indicating all IP addresses.
- If the parameter is not specified, the server does not listen on any IP address. In this case, only UDS can be used for database connections.

Default value: **"*"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

log_directory

Parameter description: Specifies the directory for storing log files when **logging_collector** is set to **on**. The value can be an absolute path, or relative to the data directory.

NOTICE

- If the value of **log_directory** in the configuration file is an invalid path (that is, the user does not have the permission to read or write this path), the cluster cannot be restarted.
- If the value of **log_directory** is changed to a valid path (that is, the user has the permission to read and write this path), logs are generated in the new path. If the specified path is invalid, log files are generated in the last valid path and the database running is not affected. The invalid value is still written into the configuration file.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: **gtm_log**, indicating that server logs will be generated in the **gtm_log/** directory under the data directory.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

log_min_messages

Parameter description: Specifies the level of messages written to GTM log files in the server log folder. When a message of the same or higher level is generated, the message is recorded in the log file. Therefore, a lower level indicates that more messages are recorded in the run log of the server.

Parameter type: enumerated type.

Unit: none

Value range: The message levels are **debug5**, **debug4**, **debug3**, **debug2** (**debug**), **debug1**, **info**, **notice**, **warning**, **error**, **log**, **fatal**, and **panic** in ascending order. For details about the parameters, see **Table 14-12**.

NOTE

- The message level **debug** is equivalent to **debug2**.
- For **log_min_messages**, the log message level is higher than **error** and lower than **fatal**.

Default value: **warning**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

alarm_component

Parameter description: Certain alarms are suppressed during alarm reporting. That is, the same alarm will not be repeatedly reported by an instance within the period specified by **alarm_report_interval**. Its default value is **10s**. In this case, the parameter specifies the location of the alarm component that is used to process alarm information.

Parameter type: string.

Unit: none

Value range:

- If **--alarm-type** in the gs_preinstall script is set to **5**, no third-party component is connected and alarms are written into the **system_alarm** log. In this case, the value of **alarm_component** is **/opt/huawei/snas/bin/snas_cm_cmd**.
- If **--alarm-type** in the gs_preinstall script is set to **1**, a third-party component is connected. In this case, the value of **alarm_component** is the absolute path of the executable program of the third-party component.

Default value: **"/opt/huawei/snas/bin/snas_cm_cmd"**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

alarm_report_interval

Parameter description: Specifies the interval at which an alarm is reported.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

standby_only

Parameter description: Specifies whether to forcibly synchronize information to standby nodes. In the mode with one primary and multiple standby nodes, information is only forcibly synchronized to the ETCD.

Parameter type: integer.

Unit: none

Value range:

- **0**: Information is not forcibly synchronized to standby nodes.
- **1**: Information is forcibly synchronized to standby nodes.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_max_trans

Parameter description: Specifies the maximum number of connections accepted by the GTM. You are advised not to change the value.

Parameter type: integer.

Unit: none

Value range: 256 to 200000

Default value: **8192**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you have to, set this parameter to a value no less than the maximum number of connections plus 100.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_connect_control

Parameter description: Specifies whether the GTM connection control is enabled to check whether a connection IP address is within the cluster.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Checks whether a connection IP address is within the cluster. If it is not, the access is rejected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **off**: Does not check whether a connection IP address is within the cluster.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_authentication_type

Parameter description: Specifies the port authentication mode of the GTM module.

Parameter type: enumerated type.

Unit: none

Value range:

- **trust**: Port authentication is not configured.
- **gss**: Kerberos port authentication is used.

> **NOTICE**
>
> Note that you can change the value to **gss** only after the Kerberos server and client are successfully installed. Otherwise, the GTM cannot communicate properly, affecting the cluster status.

Default value: **trust**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_krb_server_keyfile

Parameter description: Specifies the location of the key file on the Kerberos server. The value must be an absolute path. The file is usually stored in the *${GAUSSHOME}*/**kerberos** directory and ends with keytab. The file name is the same as the name of the user who runs the cluster. This parameter is used together with **gtm_authentication_type**. If **gtm_authentication_type** is changed to **gss**, this parameter must be configured as the correct path. Otherwise, the cluster status will be affected.

Parameter type: string.

Unit: none

Value range: valid file path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: ""

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_option

Parameter description: Specifies the GTM mode. This parameter must be configured on all GTMs, CNs, and DNs. The value must be the same. There are three GTM modes: GTM, GTM-lite, and GTM-free. The GTM and GTM-Lite modes take effect only when the **enable_gtm_free** parameter is set to **off**. The current version does not support switching between different GTM modes for installed clusters.

Parameter type: integer.

Unit: none

Value range: 0 to 2

- **0**: GTM mode.
- **1**: GTM-lite mode.
- **2**: GTM-free mode.

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

csn_sync_interval

Parameter description: Specifies the interval for synchronizing CSN between the primary and standby GTMs.

Parameter type: integer.

Unit: second

Value range: 1 to 2147483647

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

restore_duration

Parameter description: Specifies the reply interval of XID or CSN on the GTM, that is, the number of XIDs or CSNs for reply.

Parameter type: integer.

Unit: none

Value range: 1000000 to 2147483647

Default value: **1000000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_enable_threadpool

Parameter description: Specifies whether to enable the GTM thread pool function. The setting takes effect only after the GTM is restarted.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The GTM thread pool function is enabled.
- **off**: The GTM thread pool function is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gtm_num_threads

Parameter description: Specifies the number of work threads in the thread pool when the thread pool function **gtm_enable_threadpool** is enabled.

Parameter type: integer.

Unit: none

Value range: 0 to 16384. The value is related to the size of **gtm_max_trans** and cannot exceed the result of (Value of **gtm_max_trans** – 1 – Number of auxiliary threads). The number of auxiliary threads is **2** in the current version.

Default value: **1024**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

check_gtm_primary_time

Parameter description: Specifies the interval at which GTM checks the consistency between its primary node and ETCD primary node.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647. The value **0** indicates that the detection function is disabled.

Default value: **2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.26 Upgrade Parameters

IsInplaceUpgrade

Parameter description: Specifies whether an upgrade is ongoing. This parameter is an upgrade parameter and cannot be modified. Only the SYSADMIN user can access the parameter.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: An upgrade is ongoing.
- **off**: No upgrade is ongoing.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

inplace_upgrade_next_system_object_oids

Parameter description: Specifies the OID of a new system object during the in-place upgrade. This parameter is used for upgrade and cannot be modified by users.

Parameter type: string.

Unit: none

Value range: a string.

Default value: ""

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

om_operation_mode

Parameter description: Specifies whether the cluster is in the O&M or running state. This parameter is used for internal component interaction and cannot be used by users.

Parameter type: enumerated type.

Unit: none

Value range:

- **upgrade_system_object_mode**: The upgrade is in the system object update phase.
- **running_mode**: The normal running phase of the upgrade.

Default value: **running_mode**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **upgrade_system_object_mode**, the database name cannot be renamed.

upgrade_mode

Parameter description: Specifies the upgrade mode.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

- **0**: No upgrade is ongoing.
- **1**: A local upgrade is ongoing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **2**: A grayscale upgrade is ongoing.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used for upgrade. You are advised not to modify it. You are advised to use the default value.

Risks and impacts of improper settings: Do not modify this parameter during the upgrade. Otherwise, the upgrade may fail and rollback cannot be performed. In non-upgrade scenarios, modifying this parameter may cause database usage errors or other unpredictable consequences.

NOTE

Special case: When the gray upgrade is used, if the major version upgrade policy is selected, that is, the upgrade script needs to be executed and the binary package needs to be replaced, the value of **upgrade_mode** is set to **2**; if the minor version upgrade policy is selected, that is, only the binary package needs to be replaced, the value of **upgrade_mode** is not set to **2**.

14.3.27 Miscellaneous Parameters

enable_default_ustore_table

Parameter description: Specifies whether the Ustore is used by default. This parameter is valid only when **enable_ustore** is enabled. If this parameter is set to **on**, all created tables are Ustore tables by default. If this parameter is set to **off**, all created tables are Astore tables by default. In upgrade scenarios, this parameter value after upgrade is consistent with that in the source version to ensure compatibility.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The Ustore is used by default.
- **off**: The Ustore is not used by default.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: When using Ustore tables, you must enable the **track_counts** and **track_activities** parameters. Otherwise, space bloat may occur.

enable_ustore

Parameter description: Specifies whether to enable Ustore. If this parameter is set to **on**, Ustore tables can be created.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The Ustore is enabled.
- **off**: The Ustore is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used for Ustore version control. You are advised not to change the value.

Risks and impacts of improper settings: When using Ustore tables, you must enable the **track_counts** and **track_activities** parameters. Otherwise, space bloat may occur.

enable_segment_datafile_preallocate

Parameter description: Specifies whether to allocate disk space immediately during segment-page file name extension.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The immediate disk space allocation mode is enabled. During file expansion, fallocate is preferentially used to allocate disk space immediately. If the system does not support fallocate, the byte-by-byte zero write mode is used to apply for disk space.
- **off**: The immediate disk space allocation mode is disabled. In this mode, disk space is not allocated immediately when a file is expanded, and the file increases in hole mode.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

consistency_check_module

Parameter description: Specifies the module that requires consistency check.

Parameter type: string.

Unit: none

Default value: **'off(ALL)'**. That is, the verification of all modules is disabled by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: If the module is enabled (**on**), consistency check is performed. If the module is disabled (**off**), consistency check is not performed. You can use SHOW consistency_check_module to view the status.

```
ALL,on(),off(INDEX)
```

Currently, only the INDEX module supports the verification. The INDEX module verifies the consistency between index tuples and heap table tuples during the B-tree index scan of the Astore table.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

1. First, you can use SHOW consistency_check_module to check which modules support verification. The output of the verification module is as follows:
   ```
   gaussdb=# show consistency_check_module;
    consistency_check_module
   --------------------------
    ALL,on(),off(INDEX)
   (1 row)
   ```
2. Modules that can be verified are identified by uppercase letters, and the special ID **ALL** is used for setting all modules. You can use **on** or **off** to specify whether to perform verification. For example, to verify the consistency between indexes and heap tables, run the following commands:
   ```
   gaussdb=# set consistency_check_module='on(INDEX)';
   SET
   gaussdb=# show consistency_check_module;
    consistency_check_module
   --------------------------
    ALL,on(INDEX),off()
   (1 row)
   ```
   The command output shows that the INDEX check is enabled.
3. The **ALL** identifier can be used to quickly enable or disable the verification of all modules.
   ```
   gaussdb=# set consistency_check_module='off(ALL)';
   SET
   gaussdb=# show consistency_check_module;
    consistency_check_module
   --------------------------
    ALL,on(),off(INDEX)
   (1 row)

   gaussdb=# set consistency_check_module='on(ALL)';
   SET
   gaussdb=# show consistency_check_module;
    consistency_check_module
   --------------------------
    ALL,on(INDEX),off()
   (1 row)
   ```

Setting suggestion: Enable the verification of the corresponding module as required.

Risks and impacts of improper settings: If this function is enabled, consistency check is performed during SQL execution, which takes extra time or affects performance. Exercise caution when enabling this function.

reserve_space_for_nullable_atts

Parameter description: Specifies whether to reserve space for the nullable attribute of an Ustore table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Space is reserved for the nullable attribute of an Ustore table.
- **off**: Space is not reserved for the nullable attribute of an Ustore table.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

block_size

Parameter description: Specifies the block size of the current database.

Parameter type: integer.

Unit: none

Value range: **8192**

Default value: **8192**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

segment_size

Parameter description: Specifies the segment file size of the current database.

Parameter type: integer.

Unit: 8 KB

Value range: **131072**

Default value: **131072**, that is, 1 GB.

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

max_index_keys

Parameter description: Specifies the maximum number of index keys supported by the current database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: none

Value range: **32**

Default value: **32**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

integer_datetimes

Parameter description: Specifies whether the date and time are in the 64-bit integer format.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The date and time format in 64-bit integer format is supported.
- **off**: The date and time format in 64-bit integer format is not supported.

Default value: **on**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

lc_collate

Parameter description: Reports the string collation locale for the current database.

Parameter type: string.

Unit: none

Value range: a string.

Default value: Determined by the configuration during the cluster installation and deployment.

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

lc_ctype

Parameter description: Reports the locale settings for character types and case conversion in the current database. For example, it specifies what a letter and its upper-case equivalent are.

Parameter type: string.

Unit: none

Value range: a string.

Default value: Determined by the configuration during the cluster installation and deployment.

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

max_identifier_length

Parameter description: Specifies the maximum identifier length.

Parameter type: integer.

Unit: none

Value range: **63**

Default value: **63**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

server_encoding

Parameter description: Specifies the database encoding (character set).

By default, gs_initdb will initialize the setting of this parameter based on the system environment during database creation. You can also run the **locale** command to check the current configuration environment.

Parameter type: string.

Unit: none

Value range: a string.

Default value: Determined by the system environment when the database is created.

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

datanode_heartbeat_interval

Parameter description: Specifies the interval for sending heartbeat messages between heartbeat threads.

Parameter type: integer.

Unit: ms

Value range: 1000 to 60000

Default value: **1000** (that is, 1s)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1000** without a unit, **datanode_heartbeat_interval** indicates 1000 ms. If the value is **1s**, **datanode_heartbeat_interval** indicates 1s. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Set this parameter to a value less than or equal to the value of **wal_receiver_timeout**/2.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dfs_partition_directory_length

Parameter description: Specifies the maximum directory name length for the partition directory of a table partitioned by VALUE in the HDFS.

Parameter type: integer.

Unit: none

Value range: 92 to 7999

Default value: **512**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

max_concurrent_autonomous_transactions

Parameter description: Specifies the maximum number of autonomous transaction connections, that is, the maximum number of concurrent autonomous transactions executed at the same time. If this parameter is set to **0**, autonomous transactions cannot be executed.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 10000. The theoretical maximum value is **10000**, and the actual maximum value is a dynamic value. The calculation formula is 262143 – **job_queue_processes** – **autovacuum_max_workers** – **max_inner_tool_connections** – **max_connections** – **AUXILIARY_BACKENDS** – **AV_LAUNCHER_PROCS**. The values of **job_queue_processes**, **autovacuum_max_workers**, **max_inner_tool_connections**, and **max_connections** depend on the settings of the corresponding GUC parameters. **AUXILIARY_BACKENDS** indicates the number of reserved auxiliary threads and is fixed at **20**. **AV_LAUNCHER_PROCS** indicates the number of launcher threads reserved for autovacuum and is fixed at **2**.

Default value:

Independent deployment: **80** (60-core CPU/480 GB memory); **40** (32-core CPU/256 GB memory); **20** (16-core CPU/128 GB memory); **10** (8-core CPU/64 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Suggestion: Set this parameter based on actual service requirements and hardware configurations. It is recommended that this parameter be set to a value less than or equal to 1/10 of **max_connections**. If you only increase the value of this parameter but do not adjust the memory parameters in the same proportion, the memory may be insufficient and the error message "memory is temporarily unavailable" is displayed when the service load is heavy.

Risks and impacts of improper settings: If the value range of this parameter is changed during the upgrade and the value is changed before the commit operation, you need to change the value range to the value allowed before the upgrade if you roll back the upgrade. Otherwise, the database may fail to be started.

cluster_run_mode

Parameter description: Specifies whether a CN or DN belongs to the primary or standby cluster in a dual-cluster DR scenario. The default value is used for a single cluster.

Value type: enumerated type.

Unit: none

Value range:

- **cluster_primary**: The node is in the primary cluster.
- **cluster_standby**: The node is in the standby cluster.

Default value: **cluster_primary**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Mark the parameter used by the standby cluster for DR. You are advised not to set the parameter.

Risks and impacts of improper settings: After the modification, the standby cluster for DR may be abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_gpi_auto_update

Parameter description: Determines whether global indexes are updated by default in partition DDL commands.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Global indexes are updated regardless of whether the partition DDL commands contain the UPDATE GLOBAL INDEX clause.
- **off**: Global indexes are not updated unless the partition DDL commands contain the UPDATE GLOBAL INDEX clause.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements.

Risks and impacts of improper settings: If this parameter is set to **off** and the partition DDL does not contain the UPDATE GLOBAL INDEX clause, the global index is unavailable. This parameter must be set to the same value on CNs and DNs. Otherwise, the global index function may be abnormal.

enable_gpi_fast_prune

Parameter description: Controls whether the global partitioned index (GPI) of a Ustore table removes dead tuples left by previous DDL operations during DML processing.

Parameter type: Boolean

Unit: none

Value range:

- **on**: Junk tuples generated by DDL operations are cleared not only using the AUTOVACUUM thread but also when the index page space is insufficient during DML operations.
- **off**: Junk tuples generated by DDL operations are cleared only using the AUTOVACUUM thread.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements. If the service has partitioned tables and GPIs, and there are a large number of DDL and DML operations, you are advised to enable this parameter. If the partitioned table of the service does not have GPIs or DDL operations are not performed on the partitioned table, you are advised to disable this parameter.

Risks and impacts of improper settings: If this parameter is set to **off**, only the autovacuum thread handles DDL garbage, which may cause the GPI to bloat.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_cluster_resize

Parameter description: Specifies the unique identifier of the scale-out tool in the kernel. If this parameter is enabled, the current session is connected to the scale-out tool.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The current session is connected to the scale-out tool.
- **off**: The current session is not connected to the scale-out tool.

Default value: **off**

Setting method: This is a SUSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is used for internal O&M. Do not set it to **on** unless absolutely necessary.

Risks and impacts of improper settings: If this parameter is forcibly set to **on**, the kernel considers that the current session is a scale-out tool and can execute scale-out-related system functions or DDL APIs, which may cause misuse.

change_cluster_mode

Parameter description: Specifies whether the cluster is in the mode switchover process. Mode switchover refers to: A cluster with one primary and two standby nodes is switched to a cluster with one primary node, one standby node, and one log; a cluster with one primary node, one standby node, and one log is switched to a cluster with one primary and two standby nodes; standby DNs and log DNs in a cluster with one primary node, one standby node, and one log are switched to each other.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

- The value **0** indicates that the cluster mode is not being switched.
- The value **1** indicates that the cluster mode is being switched.
- Other values are meaningless and have the same effect as the value **0**.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter specifies whether the read function of the standby node in a distributed system is available. If this parameter is set to **1**, the read function of the standby node in a distributed system cannot be used. Exercise caution when setting this parameter.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_partrouting_optimization

Parameter description: Specifies whether to optimize the insertion of partitioned tables.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The insertion of partitioned tables is optimized. For the INSERT and SELECT statements, if the SELECT statement contains a constant partition key, partition routing needs to be performed only once for the INSERT statement, improving performance.
- **off**: The insertion of partitioned tables is not optimized. Before inserting each piece of data, you need to perform partition routing to determine the partitioned table to be inserted.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is disabled, the performance optimization effect brought by this parameter is not affected in some scenarios where data is inserted into partitioned tables.

NOTE

Constraints for optimizing the insertion of partitioned tables:

- Only INSERT and SELECT statements are supported.
- INSERT INTO ta SELECT FROM tb: For all partition key values inserted to table **a**, the column values in the corresponding SELECT result set must be constants. (This column is optional because the default values are constants.)
  - INSERT INTO ta SELECT c,d FROM b WHERE tb.c='1' or SELECT '1' as c, d FROM tb: The result column **tb.c** is a constant.
  - INSERT INTO ta SELECT c,d FROM b WHERE tb.c=func('1');: If func() is neither a volatile function nor a stable/immutable function that contains non-constant parameters, **tb.c** can be determined as a constant.
  - If the column value is the return value of an aggregate function, for example, INSERT INTO ta SELECT count(c),d FROM b WHERE tb.c='1' group by c, d;, the count(c) cannot be determined as a constant.
- The UPSERT clause is not supported.
- Tables that contain BEFORE and INSTEAD triggers are not supported because the data to be inserted may be changed.

enable_unique_checking_of_unusable_index

Parameter description: Specifies whether to block the insert and update operations when there is an unusable unique index in the table.

Parameter type: Boolean

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **on**: If a table contains an UNUSABLE unique index, an INSERT statement and an UPDATE statement that involves the index will report an error, prompting you to process the unusable unique index first.
- **off**: If a table contains an UNUSABLE unique index, INSERT and UPDATE statements that involve the index will not report errors.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on service requirements. You are advised to set it to **on**.

Risks and impacts of improper settings: If this parameter is enabled, a large number of errors may be reported to ensure the uniqueness constraint. If this parameter is disabled, duplicate data in the unique index column is inserted into the table. As a result, the index cannot be rebuilt.

NOTE

If this parameter is enabled:

- For an Astore table, an error is reported when an index column of a non-UNUSABLE index is updated because a new tuple is generated.
- For a Ustore non-partitioned table, no error is reported when the index column of a non-UNUSABLE index is updated. If the update is not performed in place, an error is reported when the index column of a non-UNUSABLE index is updated.
- For a Ustore partitioned table, when the UNUSABLE unique index is a global index, an error is reported if the new data and old data are not in the same partition after the partition key is updated because a new tuple is generated.
- For a Ustore partitioned table, if the UNUSABLE unique index is a local index that contains the partition key, an error is reported when the partition key is updated.

14.3.28 Wait Event

enable_instr_track_wait

Parameter description: Specifies whether to enable real-time collection of wait event information.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the function of collecting wait event information is enabled.
- **off** indicates that the function of collecting wait event information is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to set it to **on**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is disabled, wait events cannot be collected in real time, which makes it difficult to locate faults in a timely manner.

14.3.29 Query

instr_unique_sql_count

Parameter description: Specifies the maximum number of unique SQL statements that can be collected in real time.

If the value is changed from a larger one to a smaller one, the original data in the system will be cleared and re-collected (the standby node does not support this function). There is no impact if the value is changed from a smaller one to a larger one.

When the number of unique SQL records generated in the system (to view the statistics, query **dbe_perf.statement** or **dbe_perf.summary_statement**) is greater than the value of **instr_unique_sql_count**, the extra unique SQL records are not collected.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3% by enabling or disabling this parameter.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647. The value **0** indicates that the function of collecting unique SQL information is disabled.

Default value: **200000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the upper limit of the memory occupied by the dbe_perf.statement view increases. If the value is too small, the number of statements recorded in the view may be too small. As a result, no fault locating method is available, affecting the diagnosis of slow SQL statements.

instr_unique_sql_combination_options

Parameter description: Specifies the configuration items of combining unique SQL statements of the same type. The value of this parameter consists of multiple configuration items separated by commas (,).

If this feature is enabled, the IDs of unique SQL statements of the same type are normalized, and the generated unique SQL strings are normalized.

Parameter type: string.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: See **Table 14-36**.

NOTE

- When configuring the combination function, set the character string based on **Table 14-36**. Use commas (,) to separate multiple configuration items, for example, **SET instr_unique_sql_combination_options='in_clause';**.
- If this parameter is left blank, this function is disabled, for example, **SET instr_unique_sql_combination_options='';**.

Table 14-36 Configuration items of the combination function

Configuration Item	Behavior Control
in_clause	Combines only fixed parameters and prepared binding parameters in the IN clause of the SELECT IN() statement. Example 1: **select * from example_table where column in (1,2,3);** Unique SQL string after combination: **select * from example_table where column in (1…n);** Example 2: **select * from example_table where column in ($1,$2,$3);** Unique SQL string after combination: **select * from example_table where column in ($1…$n);** Example 3: **select * from example_table where column in (1,2,$1,3,$2);** Unique SQL string after combination: **select * from example_table where column in (1...n,$1...$n);** Example 4: **select * from example_table where (column1, column2) in ((1, 'a'), (2, 'b'), (3, 'c'));** Unique SQL string after combination: **select * from example_table where (column1, column2) in ((1...n));**
forbid_select_for_update	Specifies whether the FOR UPDATE clause in the SELECT statement is involved in normalization calculation. If this option is enabled, **for update**, **for share**, **for update wait n**, **for update nowait**, **for update skip locks** are displayed in the normalized view and different values of **unique_sql_id** are generated. If this option is disabled, all the preceding clauses and statements without the for update clause are normalized into the same sentence and share the same **unique_sql_id**.

Default value: **"in_clause,forbid_select_for_update"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is modified, the Unique SQL ID of the merged query statement will be changed, affecting the SQL statements for which SQLpatch has been created.

NOTE

- The default value is **""** during the upgrade and **"in_clause,forbid_select_for_update"** when a new instance is delivered.
- For values of the bigint, real, float4, blob, numeric, decimal, number, dec, or integer type, if **in()** contains a single parameter or multiple parameters, two different **unique_sql_id** values are generated.
- After the **forbid_select_for_update** option is enabled, the constant *n* in the **for update wait** *n* clause is not normalized. Different constants are recorded as different statements. (The **for update wait 0** and **for update nowait** clauses have the same semantics and are normalized to the same clause. The statement columns in the dbe_perf.statement, gs_asp, and statement_history views record the statement whose execution time is earlier.)
- After **instr_unique_sql_combination_options** is modified, **unique_sql_id** generated by the statements related to the modification is different from the original **unique_sql_id**. The original SQL patch may become invalid. You need to install the SQL patch again based on the new **unique_sql_id**.

instr_unique_sql_track_type

Parameter description: Specifies how unique SQL statements are recorded.

Parameter type: enumerated type.

Unit: none

Value range:

- **top**: Only top-level SQL statements are recorded.
- **all**: All SQL statements are recorded.

Default value: **all**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

The default value of the parameter is **all**. Compared with **top**, if the parameter is set to **all**, additional statistics about statements in the stored procedure are recorded, which causes performance loss for the execution of the stored procedure and more severe impact on the performance of statements that are executed quickly, such as simple expressions in the stored procedure.

unique_sql_retention_time

Parameter description: Specifies the interval for cleaning the unique SQL hash table. The default value is 30 minutes.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: minute

Value range: 1 to 3650

Default value: **30**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: You are advised not to modify this parameter because this parameter has no function control point in the current version.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

enable_instr_rt_percentile

Parameter description: Specifies whether to enable the function of calculating the response time of 80% and 95% SQL statements in the system.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the function is enabled.
- **off** indicates that the function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to enable the parameter.

Risks and impacts of improper settings: If this parameter is disabled, 80% and 95% SQL response time cannot be recorded. As a result, system performance cannot be directly monitored.

percentile

Parameter description: Specifies the percentage of SQL statements whose response time is to be calculated by the backend calculation thread.

Parameter type: string.

Unit: none

Value range: **"80,95"**

Default value: **"80,95"**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

instr_rt_percentile_interval

Parameter description: Specifies the interval at which the background calculation thread calculates the SQL response time.

Parameter type: integer

Unit: second

Value range: 0 to 3600

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **instr_rt_percentile_interval** indicates 60s. If the value is **1min**, **instr_rt_percentile_interval** indicates 1 minute. The unit must be **s**, **min**, or **h**, if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_instr_cpu_timer

Parameter description: Specifies whether to capture the CPU time consumed during SQL statement execution.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 3.5% by enabling or disabling this parameter.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the CPU time consumed during SQL statement execution is captured.
- **off** indicates that the CPU time consumed during SQL statement execution is not captured.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: You are advised to enable the parameter.

Risks and impacts of improper settings: If this parameter is disabled, the CPU time consumed by SQL execution in the system may not be recorded, which affects slow SQL analysis.

asp_log_directory

Parameter description: Specifies the directory for storing ASP log files on the server when **asp_flush_mode** is set to **all** or **file**. The value can be an absolute

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

path, or relative to the **data** directory. Only the SYSADMIN user can access this parameter.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: specified during installation.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter after thorough tests and verification.

Risks and impacts of improper settings: If **asp_log_directory** in the configuration file is set to an invalid path, the cluster cannot be restarted.

perf_directory

Parameter description: Specifies the directory of the output file of the performance view dotting task. Only the SYSADMIN user can access this parameter. The value can be an absolute path, or relative to the data directory.

NOTE

- Valid path: Users have read and write permissions on the path.
- Invalid path: Users do not have read or write permission on the path.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: specified during installation.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If **perf_directory** in the configuration file is set to an invalid path, the cluster cannot be restarted.

enable_stmt_track

Parameter description: Specifies whether to enable Full/Slow SQL capture.

In the x86-based centralized deployment scenario, the hardware configuration specifications are 32-core CPU and 256 GB memory. When the Benchmark SQL 5.0 tool is used to test performance, the performance fluctuates by about 1.2% by enabling or disabling this parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Full/Slow SQL capture is enabled.
- **off**: Full /Slow SQL capture is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

track_stmt_parameter

Parameter description: After **track_stmt_parameter** is enabled, the executed statements recorded in **statement_history** are not normalized. The complete SQL statement information can be displayed to help the database administrator locate faults. For a simple query, the complete statement information is displayed. For a PBE statement, the complete statement information and information about each variable value are displayed. The format is "query string; parameters: $1=value1,$2=value2, ..." This parameter is used to display full SQL information for users. To prevent query parameters from occupying too much memory when the query parameters are long character strings or large objects, the length of full SQL information is controlled by **track_activity_query_size**. When the SQL bypass logic is used for PBE statements, parameters are directly delivered to DNs. Therefore, the number of complete statements cannot be obtained by querying **statement_history** on CNs. In addition, DNs do not have query character strings. Therefore, complete statement information cannot be obtained by querying **statement_history** on DNs.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The function of displaying complete SQL statement information is enabled.
- **off**: The function of displaying complete SQL statement information is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If most SQL statements are long, more memory and disk space are occupied.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

track_stmt_session_slot

Parameter description: Specifies the maximum number of full/slow SQL statements that can be cached in a session. If the number of full/slow SQL statements exceeds this value, new statements will not be traced until the flush thread flushes the cached statements to the disk to reserve idle space.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: 1000

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: The memory of each occupied slot is about 800 bits. The specific value depends on the statement complexity. In scenarios with heavy service pressure, if the value is too large, the memory usage will increase rapidly. If the value is too small, some statements to be analyzed may be missed.

track_stmt_details_size

Parameter description: Specifies the maximum size of execution events that can be collected by a single statement. The value of this parameter affects the lock information of the **details** column in the **statement_history** table.

Parameter type: integer.

Unit: byte

Value range: 0 to 100000000

Default value: **4096**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

track_stmt_retention_time

Parameter description: Specifies the retention period of full/slow SQL statement records. This is a combination of parameters. This parameter is read every 60 seconds and records exceeding the retention period are deleted. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This parameter consists of two parts in the format of **'full sql retention time, slow sql retention time'**. The meanings of the two parts are as follows:

- **full sql retention time**: The retention period of full SQL statements. The value ranges from 0 to 86400. The unit is second.
- **slow sql retention time**: The retention period of slow SQL statements. The value ranges from 0 to 604800. The unit is second.

Default value: **"3600,604800"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the retention period is too long, a large amount of space may be occupied. If the retention period is too short, the data retention period may be too short. As a result, no fault locating method is available, affecting diagnosis.

track_stmt_stat_level

Parameter description: Determines the level of statement execution tracing.

Parameter type: string.

Unit: none

Value range:

This parameter consists of two parts in the format of **'full sql stat level, slow sql stat level'**. The meanings of the two parts are as follows:

- The first part indicates the tracing level of full SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.
- The second part indicates the tracing level of slow SQL statements. The value can be **OFF**, **L0**, **L1**, or **L2**.

NOTE

If the tracing level of full SQL statements is not **OFF**, the current SQL statement tracing level is a higher level (L2 > L1 > L0) of full and slow SQL statements. For details about the levels, see "System Catalogs and System Views > System Catalogs > Other System Catalogs > STATEMENT_HISTORY > STATEMENT_HISTORY columns" in *Developer Guide*.

Default value: **"OFF,L0"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the full SQL tracing function is enabled, the performance is affected and a large amount of disk space may be occupied.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

track_stmt_standby_chain_size

Parameter description: Specifies the maximum memory and disk space occupied by fast/slow SQL statement records on the standby node. This is a combination of parameters. Only the SYSADMIN user can access the database.

Parameter type: string.

Unit: none

Value range:

This parameter consists of four parts in the format of **'Full SQL memory size, Full SQL disk size, Slow SQL memory size, Slow SQL disk size'**. The meanings of the four parts are as follows:

Full SQL and slow SQL statements are stored in different locations. Therefore, four values are used for control.

- **Full SQL memory size**: The maximum memory space reserved for fast SQL statements. The value range is [16,1024], in MB.
- **Full SQL disk size**: The maximum disk space occupied by reserved fast SQL statements. The value range is [512,1048576], in MB.
- **Slow SQL memory size**: The maximum memory space reserved for slow SQL statements. The value range is [16,1024], in MB.
- **Slow SQL disk size**: The maximum disk space reserved for slow SQL statements. The value range is [512,1048576], in MB.

The memory size cannot be greater than the disk size.

Default value: **"32, 1024, 16, 512"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, a large amount of memory or disk space may be occupied. If the value is too small, some statements to be analyzed may be missed.

track_stmt_flush_mode

Parameter description: Specifies the storage mode of full SQL statements.

Parameter type: string.

Unit: none

Value range:

This parameter consists of two parts in the format of **'full sql flush mode, slow sql flush mode'**. The meanings of the two parts are as follows:

- The first part indicates the full SQL tracing mode. The value can be **MEMORY** or **FILE**. If this parameter is set to **MEMORY**, full SQL statements are recorded in the memory. If this parameter is set to **FILE**, full SQL statements are recorded in disk files.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The second part indicates the slow SQL tracing mode. In the current version, the value can only be **FILE**. If this parameter is set to **FILE**, slow SQL statements are recorded in disk files.

Default value: **"FILE,FILE"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **"MEMORY,FILE"**, the kernel supports full SQL statements, which occupies certain shared memory. The memory size is specified by the **track_stmt_shm_size** parameter.

track_stmt_shm_size

Parameter description: Specifies the size of the full SQL shared memory.

Parameter type: integer

Unit: byte

Value range: 134217728 to 1073741824

Default value: **134217728**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

concurrent_dml_mode

Parameter description: Specifies how to handle concurrent DML execution conflicts (lock conflicts) in a table where the function of updating distribution keys is enabled (that is, the table attribute **enable_update_distkey** is set to **on**).

This parameter takes effect only on DNs.

Parameter type: integer

Unit: none

Value range: 0 to 1

- **0**: loose mode. That is, after a conflict occurs, the DML statement that obtains the lock later does not report an error.
- **1**: strict mode. If a conflict occurs, the DML statement that obtains the lock later terminates and reports an error.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Set this parameter based on the value range. If the DML statement that obtains the lock later does not report an error after a conflict is expected, set this parameter to **0**. If the DML statement that obtains the lock later terminates and reports an error after a conflict is expected, set this parameter to **1**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.30 System Performance Snapshot

enable_perf_trigger

Parameter description: Specifies whether to enable the flame graph function for high seconds-level CPU usage.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The flame graph function is enabled for high seconds-level CPU usage.
- **off**: The flame graph function is disabled for high seconds-level CPU usage.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

perf_trigger_limit

Parameter description: Specifies the threshold for triggering flame graph collection due to high CPU usage. When the CPU usage exceeds the value of this parameter, a flame graph of high CPU usage is generated.

Parameter type: integer.

Unit: %

Value range: 0 to 100

Default value: **90**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

perf_trigger_increase

Parameter description: Specifies the threshold for triggering flame graph collection due to high seconds-level CPU usage. When the increase rate of the system CPU usage compared with that in the previous second exceeds the value of this parameter, a flame graph of high seconds-level CPU usage is generated.

Parameter type: integer.

Unit: %

Value range: 0 to 100

Default value: **30**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_wdr_snapshot

Parameter description: Specifies whether to enable the database monitoring snapshot function.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the database monitoring snapshot function is enabled.
- **off** indicates that the database monitoring snapshot function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

You are advised not to enable it in the following scenarios:

- In multi-table and multi-database scenarios, WDR snapshot records snapshots in each database in serial mode, which takes a long time. Therefore, you are advised not to enable it.
- In the multi-table scenario, the query speed of the pg_stat_all_tables is slow due to the performance problems of some internal tables. In this case, the WDR snapshot function is slow. Therefore, you are advised not to enable it.
- If WDR snapshot is performed when there are a large number of DDL statements, WDR snapshot may fail. Therefore, you are advised not to enable it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_wdr_snapshot_standby

Parameter description: Specifies whether to enable the WDR function to support distributed standby nodes. If this parameter is enabled, WDR snapshot obtains the performance data of the standby node and stores the data on the primary node. This parameter takes effect only in GTM FREE mode, that is, **enable_gtm_free** is set to **on**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The WDR function is enabled to support the distributed standby node.
- **off**: The WDR function is disabled to support the distributed standby node.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_show_standby_name

Parameter description: Specifies whether to display the names of the primary and standby nodes in the same shard. The names are used to distinguish the primary and standby nodes. This parameter is used to distinguish primary and standby DNs by **node_name** in the performance view that is queried. If this parameter is enabled, different names are returned when **dbe_perf.node_name** is queried on different nodes of the same shard.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The function of distinguishing primary and standby node names is enabled.
- **off**: The function of distinguishing primary and standby node names is disabled.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

wdr_snapshot_retention_days

Parameter description: Specifies the number of days database monitoring snapshots are retained. If the number of snapshots generated during database running exceeds the maximum number of snapshots that can be generated within the retention period (24 x 8 = 192 by default), the system deletes the snapshots with the smallest ID at an interval specified by the value of **wdr_snapshot_interval**.

NOTE

This parameter is valid only when **enable_wdr_snapshot** is set to **on**.

Parameter type: integer.

Unit: day

Value range: 1 to 30

Default value: **8**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: A larger value of this parameter indicates the higher disk usage.

wdr_snapshot_query_timeout

Parameter description: Specifies the execution timeout for the SQL statements associated with database monitoring snapshot operations. If the execution of a statement is not complete within the specified time and the result is returned, the snapshot operation fails, but some snapshots that have been generated are retained.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **100**

Setting method: This parameter is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value **0** indicates that there is no timeout limit. For example, if the value is **60** without a unit, **wdr_snapshot_query_timeout** indicates 60s. If the value is **1min**, **wdr_snapshot_query_timeout** indicates 1 minute. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Set this parameter based on the actual scenario. If you do not care about the data in the snapshot and want to quickly generate a snapshot, set this parameter to a smaller value. If you want to ensure that the data in the snapshot is complete, set this parameter to a larger value.

Risks and impacts of improper settings: If snapshot generation times out, a larger value of this parameter results in a longer timeout period. As a result, the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

snapshot generation time is prolonged, but the data in the snapshot is more complete.

wdr_snapshot_interval

Parameter description: Specifies the interval at which the backend thread snapshot automatically takes snapshots of the database monitoring data.

NOTE

This parameter is valid only when **enable_wdr_snapshot** is set to **on**.

Parameter type: integer.

Unit: minute

Value range: 10 to 60

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **wdr_snapshot_interval** indicates 60 minutes. If the value is **1h**, **wdr_snapshot_interval** indicates 1 hour. The unit must be **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: A smaller value of this parameter indicates the larger disk usage.

wdr_snapshot_space_threshold

Parameter description: Specifies the threshold at which the space used by snapshots is controlled. When the space used by snapshots reaches 50% of the value of this parameter, the control logic of the database is enabled to stabilize the space used by the snapshots.

NOTE

- This parameter is valid only when **enable_wdr_snapshot** is set to **on**.
- If this parameter is set to a value smaller than the space used by the snapshots, the space usage does not shrink. Instead, the control logic is enabled to control the snapshot growth and stabilize the space used by the snapshots.

Parameter type: integer.

Unit: KB

Value range: 0 to 107374182400

Default value: **0**, indicating that the function of controlling the space used by snapshots based on the space threshold is disabled.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **1024** without a unit, **wdr_snapshot_space_threshold** indicates 1024 KB. If the value is **1MB**, **wdr_snapshot_space_threshold** indicates 1 MB. The unit must be KB, MB, or GB if required.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Set this parameter based on the actual scenario.

Risks and impacts of improper settings: If this parameter is incorrectly set, only the latest group of snapshots is available.

wdr_snapshot_full_backup_interval

Parameter description: Specifies the interval at which a full WDR snapshot is created. The interval specified by this parameter is about a number instead of time. For example, if the parameter is set to **12**, a full snapshot and then 11 incremental snapshots are generated for each group. If the parameter is set to **1**, all snapshots generated are full snapshots.

NOTE

- This parameter is valid only when **enable_wdr_snapshot** is set to **on**.
- If you change the value of this parameter after multiple snapshots have been generated, the next snapshot will be a full snapshot. For example, after five WDR incremental snapshots have been generated, if the parameter value is changed to **10**, a full snapshot will be generated before a new interval starts.
- When a snapshot is deleted, other snapshots in the same group are deleted. The number of snapshots to be deleted depends on the value of this parameter when the earliest group of snapshots are generated and is irrelevant to the current value.

Parameter type: integer.

Unit: none

Value range: 1 to 24

Default value: **12**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the actual scenario.

Risks and impacts of improper settings: A smaller value of this parameter indicates more full snapshots and fewer snapshots that can be retained with the same space usage.

enable_asp

Parameter description: Specifies whether to enable the active session profile function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The active session profile function is enabled.
- **off**: The active session profile function is disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

asp_flush_mode

Parameter description: Specifies the mode for the ASP to update data to the disk. The value can be **"file"** (default value), **"table"** (system catalog), or **"all"** (system catalog and file). Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: **"table"**, **"file"**, and **"all"**

Default value: **"table"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

asp_flush_rate

Parameter description: When the number of samples reaches the value of **asp_sample_num**, the samples in the memory are updated to the disk based on a certain proportion. **asp_flush_rate** indicates the update proportion. If this parameter is set to **10**, it indicates that the update ratio is 10:1.

Parameter type: integer.

Unit: none

Value range: 1 to 10

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the amount of data flushed to disks increases.

asp_flush_interval

Parameter description: Specifies the interval at which ASP flushes data.

Parameter type: integer.

Unit: second

Value range: 300 to 3600

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **300**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **asp_flush_interval** indicates 60s. If the value is **1min**, **asp_flush_interval** indicates 1 minute. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

asp_log_filename

Parameter description: Generates the file name format when writing files using ASP. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range: valid character string in the file name format.

Default value: **"asp-***%Y-%m-%d_%H%M%S***.log"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

asp_retention_days

Parameter description: Specifies the maximum number of days for reserving ASP samples when they are written to the system catalog.

Parameter type: integer.

Unit: day

Value range: 1 to 7

Default value: **2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, the disk space occupied by the gs_asp system catalog increases.

asp_sample_interval

Parameter description: Specifies the sampling interval.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: second

Value range: 1 to 10

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **10** without a unit, **asp_sample_interval** indicates 10s. If the value is **10s**, **asp_sample_interval** indicates 10s. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

asp_sample_num

Parameter description: Specifies the maximum number of samples allowed in the LOCAL_ACTIVE_SESSION view. Only the SYSADMIN user can access this parameter.

Parameter type: integer.

Unit: none

Value range: 10000 to 100000

Default value: **100000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If you want to adjust the value, make sure you understand the parameter meaning and adjust the value with caution to avoid risks caused by misoperations.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gs_perf_interval

Parameter description: Specifies the interval at which the stacks are collected automatically. For details about the automatic stack collection function determined by this parameter, see "Maintainability > Built-in perf Tool" in *Feature Description*.

Parameter type: integer.

Unit: minute

Value Range: 0 to 60. **0** indicates that the function of automatically collecting stack information is disabled.

NOTE

If you attempt to set this parameter to a value ranging from 1 to 4, this parameter will be automatically adjusted to the default value **5**.

Default value: **5**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **gs_perf_interval** indicates 60 minutes. If the value is **1h**, **gs_perf_interval** indicates 1 hour. The unit must be **min**, **h**, or **d** if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

gs_perf_retention_days

Parameter description: Specifies the retention period of flame graph files. For details about the automatic stack collection function determined by this parameter, see "Maintainability > Built-in perf Tool" in *Feature Description*.

Parameter type: integer.

Unit: day

Value range: 1 to 8

Default value: **3**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.31 Black Box Parameters

blackbox_number

Parameter description: Specifies the maximum number of black box files that can be retained in the *$GAUSSLOG*/**gs_blackbox/***{nodename}* directory.

Parameter type: integer.

Unit: none

Value range: 0 to 10. **0** indicates that the black box function is disabled.

Default value: **5** (196-core CPU/1536 GB memory, 128-core CPU/1024 GB memory, 104-core CPU/1024 GB memory, 96-core CPU/1024 GB memory, 96-core CPU/768 GB memory, 80-core CPU/640 GB memory, 64-core CPU/512 GB memory, 60-core CPU/480 GB memory, 32-core CPU/256 GB memory, 16-core CPU/128 GB memory, 8-core CPU/64 GB memory, 4-core CPU/32 GB memory); **0** (4-core CPU/16 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is set to **0**, the function is disabled and black box files are not retained, which may affect performance diagnosis.

14.3.32 Security Configuration

enable_security_policy

Parameter description: Specifies whether the unified audit and dynamic data masking policies take effect.

NOTE

- Unified audit: The unified audit mechanism is a technology that implements efficient security audit management by customizing audit policies. After the administrator defines the audit object and audit behaviors, if the task executed by a user is associated with an audit policy, the corresponding audit behavior is generated and the audit log is recorded. For details, see "Database Security > Unified Audit" in *Feature Description*.
- Dynamic data masking: The dynamic data masking mechanism is a technology that protects privacy data by customizing masking policies. It can effectively prevent unauthorized users from accessing sensitive information while retaining original data. For details, see "Database Security > Dynamic Data Masking" in *Feature Description*.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The security policy is enabled.
- **off**: The security policy is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to **on**, system resources will be occupied and system performance will be affected.

use_elastic_search

Parameter description: Specifies whether to send unified audit logs to Elasticsearch. If **enable_security_policy** and this parameter are enabled, unified audit logs are sent to Elasticsearch through HTTP or HTTPS (used by default).

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Unified audit logs are sent to Elasticsearch.
- **off**: Unified audit logs are not sent to Elasticsearch.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. This parameter is enabled when unified audit logs need to be sent to the Elasticsearch system.

Risks and impacts of improper settings: If this parameter enabled, you need to ensure that Elasticsearch specified by **elastic_search_ip_addr** can be properly connected. Otherwise, the process fails to be started.

elastic_search_ip_addr

Parameter description: Specifies the IP address of the Elasticsearch system. If HTTPS is used, the format is **https://***ip*:*port*:*username*. If HTTP is used, the format is **http://***ip*:*port*. In the preceding command, *ip* indicates the IP address of the Elasticsearch server. *port* indicates the listening port for Elasticsearch HTTP communication, and the value ranges from 9200 to 9299. *username* indicates the username used for registering an Elasticsearch account. The initial user is **elastic**. If HTTPS is used, related certificates need to be configured. For details, see "Unified Auditing" in the *Security Hardening Guide*.

Parameter type: string.

Unit: none

Value range: valid IP address string or empty string.

Default value: **""**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. This parameter is set when unified audit logs need to be sent to the Elasticsearch system and **use_elastic_search** is set to **on**.

Risks and impacts of improper settings: You need to ensure that the specified Elasticsearch can be properly connected. Otherwise, the process fails to be started.

is_sysadmin

Parameter description: Specifies whether the current user is an initial user.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The user is an initial user.
- **off**: The user is not an initial user.

Default value: **off**

Setting method: This is a fixed INTERNAL parameter. It can be viewed but cannot be modified.

Setting suggestion: This parameter can only be viewed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: none

tde_index_default_encrypt

Parameter description: After this parameter is enabled, if you create an index whose base table is an encrypted table, the database automatically sets the index as an encrypted index, copies encryption parameters such as the encryption algorithms and keys of the base table for the index, and encrypts the data of the index before storing it.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Encryption parameters are automatically set for indexes of encrypted tables.
- **off**: Encryption parameters are not automatically set for indexes in encrypted tables.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If indexes of all encrypted tables need to be encrypted, enable this parameter. You do not need to manually set indexes to encrypted indexes.

Risks and impacts of improper settings: If this parameter is set to **on**, indexes created in encrypted tables are automatically encrypted, affecting index query performance.

block_encryption_mode

Parameter description: Specifies the block encryption mode used by the aes_encrypt and aes_decrypt functions for encryption and decryption.

Value type: enumerated type

Unit: none

Value range: **aes-128-cbc**, **aes-192-cbc**, **aes-256-cbc**, **aes-128-cfb1**, **aes-192-cfb1**, **aes-256-cfb1**, **aes-128-cfb8**, **aes-192-cfb8**, **aes-256-cfb8**, **aes-128-cfb128**, **aes-192-cfb128**, **aes-256-cfb128**, **aes-128-ofb**, **aes-192-ofb**, and **aes-256-ofb**. **aes** indicates the encryption or decryption algorithm. **128**, **192**, and **256** indicate the key length (unit: bit). **cbc**, **cfb1**, **cfb8**, **cfb128**, and **ofb** indicate the block encryption or decryption mode.

Default value: **aes-128-cbc**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: The use of the aes_encrypt and aes_decrypt functions is affected.

enable_mac_check

Parameter description: Specifies whether label-based mandatory access control takes effect.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Label-based mandatory access control takes effect.
- **off**: Label-based mandatory access control does not take effect.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_rls_match_index

Parameter description: Specifies whether indexes of a base table can be scanned based on target predicate conditions in row-level security scenarios. Target scenario: The row level security (RLS) policies are set and enabled in the base table, and the query predicate contains the unleakproof system function or like operator.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Base table indexes can be scanned in the target scenario.
- **off**: Base table indexes cannot be scanned in the target scenario.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. If hotspot query statements belong to the target scenario and there are few row-level access policies in the base table, enabling this function significantly improves query performance.

Risks and impacts of improper settings: If this parameter is set to **on**, the bitmap scanning operator is switched to the lossy mode, and there are a large number of RLS policies, filtering predicates will be executed repeatedly, affecting performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The modification of this parameter affects the generation of the execution plan in the target scenario. You can manually invalidate the cache plan by reconnecting to the system or creating operators.
- If this parameter is enabled, the generation of the bitmap scanning operator is affected, and the RLS policy predicate is inserted into the Recheck filter condition. Therefore, when the operator is switched to the lossy mode and there are many RLS policies, the performance is affected.

restrict_nonsystem_relation_kind

Parameter description: Specifies whether the relationship object types created by users can be accessed.

Parameter type: string.

Unit: none

Value range:

- **""**: There is no restriction.
- **"view"**: The access to views created by the user is disabled.
- **"foreign-table"**: The access to foreign tables created by the user is disabled.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

When gs_dump is used to export data, access to views and foreign tables created by users must be disabled to prevent malicious attacks. The tool sets this parameter to **'view, foreign-table'** at the session level. You do not need to manually configure this parameter.

tde_dkcache_remain_time

Parameter description: Specifies the validity period of the TDE key cache.

Parameter type: integer.

Unit: hour

Value range: 0 to 1440

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If this parameter is set to **0** or a large value, the TDE key cache that is not used may remain in the database memory for a long time.

NOTE

- If this parameter is set to **0**, the TDE key cache takes effect permanently and is not cleared from the memory.
- If this parameter is set to a non-zero value, the TDE key cache is cleared from the memory only when it is not used for more than **tde_dkcache_remain_time** hours. (The cache is cleared every hour.)

14.3.33 HyperLogLog

hll_default_log2m

Parameter description: Specifies the number of buckets for HLL data. The number of buckets affects the precision of distinct values calculated by HLL. More buckets indicate a smaller deviation. The deviation range is as follows: [$-1.04/2^{log2m*1/2}$, $+1.04/2^{log2m*1/2}$]

Parameter type: integer.

Unit: none

Value range: 10 to 16

Default value: **14**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

Risks and impacts of improper settings: If the value is too small, the required precision cannot be met. If the value is too large, resources may be wasted.

hll_default_log2explicit

Parameter description: Specifies the default threshold for switching from the explicit mode to the sparse mode.

Parameter type: integer.

Unit: none

Value range: 0 to 12

- **0**: The explicit mode is skipped.
- 1 to 12: The mode is switched when the base value reaches $2^{hll_default_log2explicit}$.

Default value: **10**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

Risks and impacts of improper settings: If the value is too small, the required precision cannot be met. If the value is too large, resources may be wasted.

hll_default_log2sparse

Parameter description: Specifies the default threshold for switching from the **sparse** mode to the **full** mode.

Parameter type: integer.

Unit: none

Value range: 0 to 14

- **0**: The explicit mode is skipped.
- 1 to 14: The mode is switched when the base value reaches $2^{hll_default_log2sparse}$.

Default value: **12**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

Risks and impacts of improper settings: If the value is too small, the required precision cannot be met. If the value is too large, resources may be wasted.

hll_duplicate_check

Parameter description: Specifies whether duplicatecheck is enabled by default.

Parameter type: integer.

Unit: none

Value range: 0 to 1

- **0**: The function is disabled by default.
- **1**: The function is enabled by default.

Default value: **0**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value or adjust the value based on service requirements.

Risks and impacts of improper settings: If this parameter is enabled, more resources may be consumed for duplicate check, but the accuracy of distinct value calculation is improved.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14.3.34 User-defined Functions

udf_memory_limit

Parameter description: Specifies the maximum physical memory that can be used when each CN or DN executes UDFs. This parameter does not take effect in the current version.

Parameter type: integer.

Unit: KB

Value range: 200 x 1024 to 2147483647

Default value: **204800** (that is, 200 MB)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **204800** without a unit, it indicates 204800 KB. If this parameter is set to **300MB**, it indicates 300 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.35 Scheduled Jobs

job_queue_processes

Parameter description: Specifies the number of jobs that can be concurrently executed.

Parameter type: integer.

Unit: none

Value range: 0 to 1000

- Setting **job_queue_processes** to **0** indicates that the scheduled job function is disabled and that no job will be executed. (Enabling scheduled jobs may affect the system performance. At sites where this function is not required, you are advised to disable it.)
- Setting **job_queue_processes** to a value that is greater than **0** indicates that the scheduled job function is enabled and this value is the maximum number of jobs that can be concurrently processed.

After the scheduled job function is enabled, the job_scheduler thread polls the **pg_job** system catalog at a scheduled interval. The scheduled job check is performed every second by default.

Too many concurrent jobs consume many system resources, so you need to set the number of concurrent jobs to be processed. If the current number of concurrent jobs reaches the value of **job_queue_processes** and some of them expire, these jobs will be postponed to the next polling period. Therefore, you are advised to set the polling interval (the **Interval** parameter of the submit API) based on the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

execution duration of each job to avoid the problem that jobs in the next polling period cannot be properly processed because of overlong job execution time.

Default value: **10**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: If there are a large number of concurrent jobs at the same time, a small parameter value will cause job waiting, and a large parameter value will consume more system resources. Therefore, you are advised to set this parameter to **100**. You can adjust the parameter value based on system resource usage.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_prevent_job_task_startup

Parameter description: Specifies whether to start the job thread.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the job thread is not started.
- **off** indicates that the job thread is started.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.36 Thread Pool

enable_thread_pool

Parameter description: Specifies whether to enable the thread pool function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The thread pool function is enabled.
- **off**: The thread pool function is disabled.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: In low-concurrency persistent connection performance-sensitive scenarios, you are advised to disable this parameter. In other scenarios, you are advised to enable this parameter.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

thread_pool_attr

Parameter description: Specifies the detailed attributes of the thread pool function. This parameter is valid only when **enable_thread_pool** is set to **on**. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range:

This parameter consists of three parts: **'thread_num'**, **'group_num'**, and **'cpubind_info'**. The meanings of the three parts are as follows:

- **thread_num** is the total number of initial threads in the thread pool, which can be dynamically expanded. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **thread_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **thread_num** = Number of CPU cores x 3 to 5. The maximum value of **thread_num** is **4096**.
- **group_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group_num**.
- **cpubind_info** specifies whether the thread pool is bound to a core. The available configuration modes are as follows: 1. **'(nobind)'**: The thread is not bound to a core. 2. '(allbind)': Use all CPU cores that can be queried in the current system to bind threads. 3. **'(nodebind: 1, 2)'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. **'(cpubind: 0-30)'**: Use CPU cores 0 to 30 to bind threads. 5. **'(numabind: 0-30)'**: Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive.

Default value:

- Independent deployment: '1024,2,(nobind)' (60-core CPU/480 GB memory, and 32-core CPU/256 GB memory); '512,2,(nobind)' (16-core CPU/128 GB memory); '256,2,(nobind)' (8-core CPU/64 GB memory)

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When the memory is sufficient and the CPU performance is good, increase the value of this parameter if the service requires more connections.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: The default value is the recommended value. You are advised not to change it. Before changing the values, check the specifications of the parameters and ensure that the hardware resources are sufficient. Otherwise, the cluster may be abnormal.

NOTE

Ensure that the sum of the number of threads specified by **thread_pool_attr** and the number of threads specified by **static_thread_pool_num** does not exceed min(4096, **max_connections**), and the value of **static_thread_pool_num** must be greater than the number of DN shards multiplied by the value of **group_num**. Otherwise, the static pool cannot be created.

static_thread_pool_num

Parameter description: Specifies the number of threads used to create a static thread pool (static pool). This parameter takes effect only on distributed CNs after **enable_thread_pool** is enabled.

Parameter type: integer.

Unit: none

Value range: 0 to 1024

Default value: 10% x **group_num** x **thread_num**. For details about **group_num** and **thread_num**, see **thread_pool_attr**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- A static thread pool is created to prevent DNs from exhausting threads of the CN thread pool and ensure that available threads are connected to DNs to execute services.
- Ensure that the sum of the number of threads specified by **thread_pool_attr** and the number of threads specified by **static_thread_pool_num** does not exceed min(4096, **max_connections**), and the value of **static_thread_pool_num** must be greater than the number of DN shards multiplied by the value of **group_num**. Otherwise, the static pool cannot be created.
- **static_thread_pool_num** is a virtual value and does not take effect immediately after being set. When the CN thread pool is fully loaded or exhausted, the CN creates a number of threads specified by **static_thread_pool_num**. These threads make up a static pool.
- The CN static pool is used for single-DN connection services and evenly allocates threads to each DN shard in the cluster. The calculation formula is as follows: **static_thread_pool_num**/*n* (*n* indicates the number of DN shards). If the number of threads used exceeds the calculated fixed quota, an error is reported.
- If the static pool thread is held by the multi-DN connection service, an error is reported and the threads are returned.
- Non-default thread groups cannot be created in a static pool in multi-tenant mode.
- If **static_thread_pool_num** is set to **0**, the static pool function is disabled. If you do not want the static pool to control multiple DN connections, disable this function.
- Restrictions on creating a static thread pool: The prerequisite is that the thread pool is enabled on the distributed CN. The current function resolves DN shard faults and ensures that the CN has available threads for services to ensure continuous services. If the design does not include the solution for the fully occupied thread pool due to single-CN query, querying services only on a single CN at the same time are not controlled or counted in statistics.

thread_pool_stream_attr

Parameter description: Specifies the detailed attributes of the stream thread pool function. This parameter is valid only when **enable_thread_pool** is set to **on** and only takes effect on DNs. Only the SYSADMIN user can access this parameter.

Parameter type: string.

Unit: none

Value range:

This parameter consists of four parts: **'stream_thread_num'**, **'stream_proc_ratio'**, **'group_num'**, and **'cpubind_info'**. The meanings of the four parts are as follows:

- **stream_thread_num** indicates the total number of threads in the stream thread pool. The value ranges from 0 to 4096. The value **0** indicates that the database automatically configures the number of threads in the thread pool based on the number of CPU cores. If the value is greater than **0**, the number of threads in the thread pool is the same as the value of **stream_thread_num**. You are advised to set the thread pool size based on the hardware configuration. The formula is as follows: Value of **stream_thread_num** = Number of CPU cores x 3 to 5. The maximum value of **stream_thread_num** is **4096**.
- **stream_proc_ratio** indicates the ratio of proc resources reserved for stream threads. The value is a floating-point number. The default value is **0.2**. The reserved proc resources are calculated as follows: Value of **stream_proc_ratio** x Value of **stream_thread_num**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **group_num** indicates the number of thread groups in the thread pool. The value ranges from 0 to 64. The value **0** indicates that the database automatically configures the number of thread groups in the thread pool based on the number of NUMA groups. If the value is greater than **0**, the number of thread groups in the thread pool is the same as the value of **group_num**. The value of **group_num** in **thread_pool_stream_attr** must be the same as that in **thread_pool_attr**. If they are set to different values, the value of **group_num** in **thread_pool_attr** is used.
- **cpubind_info** specifies whether the thread pool is bound to a core. The available configuration modes are as follows: 1. **'(nobind)'**: The thread is not bound to a core. 2. '(allbind)': Use all CPU cores that can be queried in the current system to bind threads. 3. **'(nodebind: 1, 2)'**: Use the CPU cores in NUMA groups 1 and 2 to bind threads. 4. **'(cpubind: 0-30)'**: Use CPU cores 0 to 30 to bind threads. 5. **'(numabind: 0-30)'**: Use CPU cores 0 to 30 in the NUMA group to bind threads. This parameter is case-insensitive. The value of **cpubind_info** in **thread_pool_stream_attr** must be the same as that in **thread_pool_attr**. If they are set to different values, the value of **cpubind_info** in **thread_pool_attr** is used.

Default value:

- **stream_thread_num**: **16**
- **stream_proc_ratio**: **0.2**
- **group_num** and **cpubind_info**: For details, see **thread_pool_attr**.

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: When the memory is sufficient and the CPU performance is good, increase the value of this parameter if the service requires more concurrent performance.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

resilience_threadpool_reject_cond

Parameter description: Specifies the percentage of thread pool usage for escape from overload. This parameter takes effect only when the GUC parameters **enable_thread_pool** and **use_workload_manager** are enabled.

Parameter type: string

Unit: none

Value range:

This parameter consists of two parts: **recover_threadpool_percent** and **overload_threadpool_percent**. The meanings of the two parts are as follows:

- **recover_threadpool_percent**: specifies the thread pool usage when the thread pool recovers to the normal state. When the thread pool usage is less than the value of this parameter, the escape from overload function is disabled and new connections are allowed. The value ranges from 0 to *INT_MAX*. The value indicates a percentage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **overload_threadpool_percent**: specifies thread pool usage when the thread pool is overloaded. If the thread pool usage is greater than the value of this parameter, the current thread pool is overloaded. In this case, the escape from overload function is enabled to kill sessions and forbid new connections. The value ranges from 0 to *INT_MAX*. The value indicates a percentage.

Example:

```
resilience_threadpool_reject_cond = '50,90'
```

When the thread pool usage exceeds 90%, new connections are forbidden and stacked sessions are killed. When the thread pool usage decreases to 50%, session killing is stopped and new connections are allowed.

Default value: **'0,0'**, indicating that the thread pool escape function is disabled.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTE

- The thread pool usage can be queried in the DBE_PERF.local_threadpool_status view. The initial number of threads in the thread pool can be obtained by querying the **thread_pool_attr** parameter.
- If this parameter is set to a small value, the thread pool escape from overload process is frequently triggered. As a result, ongoing sessions are forcibly logged out, and new connections fail to be connected for a short period of time. Therefore, exercise caution when setting this parameter based on the actual thread pool usage.
- The values of **recover_threadpool_percent** and **overload_threadpool_percent** can be **0** at the same time. In addition, the value of **recover_threadpool_percent** must be smaller than that of **overload_threadpool_percent**. Otherwise, the setting does not take effect.
- If the **use_workload_manager** parameter is disabled and the **bypass_workload_manager** parameter is enabled, this parameter also takes effect. The **bypass_workload_manager** parameter is of the SIGHUP type; therefore, after the reload mode is set, you need to restart the database for the setting to take effect.

14.3.37 Backup and Restoration

operation_mode

Parameter description: Specifies whether the system enters the backup and restoration mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The backup and restoration mode is entered.
- **off**: The backup and restoration mode is not entered.

Default value: **off**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

enable_cbm_tracking

Parameter description: Specifies whether to enable the CBM tracing function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The cbm tracking is enabled.
- **off**: The cbm tracking is disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Enable this parameter to perform full or incremental backup for the cluster by using Roach. Otherwise, the backup will fail.

Risks and impacts of improper settings: If this parameter is disabled, incremental backup will fail.

max_size_for_xlog_retention

Parameter description: Specifies when to forcibly update the backup replication slot or logical replication slot to prevent the disk from being full and the cluster from being read-only because logs cannot be recycled during backup or logical decoding.

Parameter type: integer

Unit: none

Value range: –100 to 2147483647

- The value **0** indicates that this function is disabled.
- A negative value indicates that the backup replication slot or logic replication slot is forcibly updated when the disk usage exceeds the threshold and logs are recycled due to blocked backup operation or logical decoding. For example, **–80** indicates that the disk usage exceeds 80% of the threshold.
- A positive value indicates that the backup replication slot or logic replication slot is forcibly updated when the size of stacked logs exceeds the threshold and logs are recycled due to blocked backup operation or logical decoding. For example, **32** indicates that the backup replication slot lags behind the redo location of the current checkpoint by more than 32 log segments. (The size of each log segment is 16 MB.)

Default value: **–80**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter to a value slightly smaller than that of **datastorage_threshold_value_check** of the CM Server component to prevent the cluster from entering the read-only state.

Risks and impacts of improper settings: If the value is too small, backup may fail frequently.

max_cbm_retention_time

Parameter description: Specifies the interval at which CBM backup files are forcibly recycled. If CBM files cannot be recycled during backup, the disk will be full and the cluster will be read-only.

Parameter type: integer

Unit: second

Value range: 86400 to 2147483647

Default value: **1209600** (that is, 14 days)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **86400** without a unit, it indicates 86400s. If this parameter is set to **1d**, it indicates 1 day. The unit must be **s**, **min**, **h**, or **d** if required.

Setting suggestion: Set this parameter based on the full backup interval.

Risks and impacts of improper settings: If the value is too small, backup may fail frequently.

enable_standby_move_buckets

Parameter description: Specifies whether a CN is allowed to connect to a standby node to move buckets. This parameter is used only for cluster-level restoration. When restoring the backup set generated during hash bucket redistribution, this parameter is used to establish a connection with the standby DN when the CN sends the buckets migration command to the DN. This parameter takes effect only in this connection. In other cases, the value is **off**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The standby node can receive connections.
- **off**: The standby node cannot receive connections.

Default value: **off**

Setting method: This is a BACKEND parameter and cannot be set or reloaded using gs_guc. This parameter does not take effect when written into the configuration file. It is used only as an O&M parameter for data restoration.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Changing the value of this parameter may cause unexpected results in the cluster. Retain the default value.

14.3.38 Undo

The GUC parameter of undo is valid only for the Ustore.

undo_space_limit_size

Parameter description: Specifies the threshold for forcibly recycling undo space. When the undo space usage reaches 80% of the threshold, forcible recycling starts. You are advised to set **undo_space_limit_size** to a value greater than or equal to that of **undo_limit_size_per_transaction**.

Parameter type: integer.

Unit: page (8 KB)

Value range: 102400 to 2147483647. The default unit is page.

Default value: **33554432** (that is, 256 GB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, the value **1000000** indicates 1,000,000 pages, and the value **1000000kB** indicates 1,000,000 KB. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

Setting suggestion: Retain the default value. If the disk space is too small to meet the default value requirements, set this parameter to a smaller value. If long transactions or large transactions exist in your service, set **undo_space_limit_size** to a larger value based on the disk usage. For details about the value setting, see the **info** column of the gs_stat_undo system function in "SQL Reference > Functions and Operators > System Administration Functions > Undo System Functions > gs_stat_undo parameters" in *Developer Guide*.

Risks and impacts of improper settings: If this parameter is set to a small value when undo records cannot be reclaimed in a timely manner, undo records may be forcibly reclaimed. As a result, there is an extremely low probability that the error message "snapshot too old! the undo record has been forcibly discard" is displayed. If this parameter is set to a large value when the disk space is insufficient and undo records cannot be reclaimed in a timely manner, a large number of undo records may be retained in the database system. As a result, the undo records occupy the physical disk space with other data, and services may be affected when the disk space is insufficient.

undo_limit_size_per_transaction

Parameter description: Specifies the undo space threshold of a single transaction. If the threshold is reached, the transaction is rolled back due to an error. You are advised to set **undo_limit_size_per_transaction** to a value less than or equal to that of **undo_space_limit_size**. If the value of **undo_limit_size_per_transaction** is greater than that of **undo_space_limit_size**, the displayed value is the same as the configured value when you run the **show undo_limit_size_per_transaction** command to query the parameter value. The only difference is that the smaller value between **undo_space_limit_size** and **undo_limit_size_per_transaction** is used as the actual undo space threshold of a single transaction.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: integer.

Unit: page (8 KB)

Value range: 256 to 2147483647. The default unit is page. If this parameter is set to a value greater than 134217728 (that is, 1 TB), the value **134217728** takes effect.

Default value: **4194304** (32 GB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, the value **10000** indicates 10000 pages, and the value **10000KB** indicates 10000 KB. If the value contains a unit, the value can be KB, MB, or GB, but cannot be TB.

Setting suggestion: Retain the default value. If the disk or memory space is too small to meet the requirements of the default value, set this parameter to a smaller value. If long transactions or large transactions exist in your service, and the number of Undo records generated in a single transaction is greater than the value of this parameter, set **undo_limit_size_per_transaction** to a larger value based on the disk usage. For details about the value setting, see the info column of the gs_stat_undo system function in "SQL Reference > Functions and Operators > System Administration Functions > Undo System Functions > gs_stat_undo parameters" in *Developer Guide*. If **undo_limit_size_per_transaction** is set to a value greater than 1 TB, the system performance and stability may be affected. Therefore, if the parameter is set to a value greater than 134217728 (that is, 1 TB), the configured value is displayed when you run the **show undo_limit_size_per_transaction** command to query the parameter value, but the value **134217728** takes effect.

Risks and impacts of improper settings: If the parameter is set to small value, the number of undo records generated in a single transaction may exceed the threshold. As a result, the error message "undo size of the transaction exceeds the threshold" is displayed and the transaction is rolled back.

14.3.39 DCF Parameters Settings

enable_dcf

Parameter description: Specifies whether to enable the DCF mode.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The current log replication mode is DCF.
- **off**: The current log replication mode is not DCF.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: To use the DCF log replication mode, set **enable_dcf** to **on**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_ssl

Parameter description: This parameter is no longer used. The DCF reuses the GUC parameter **ssl**. For details, see **Security and Authentication**.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: SSL is used.
- **off**: SSL is not used.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_config

Parameter description: Specifies the DCF cluster configuration information, which is configured by the OM during installation and cannot be modified after installation.

Parameter type: string.

Unit: none

Value range: a string.

Default value: configured by the OM during installation.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

dcf_data_path

Parameter description: Specifies the DCF data path, which is configured by the OM during installation and cannot be modified after installation.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: **dcf_data** in the DN data directory

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

dcf_log_path

Parameter description: Specifies the DCF log path, which is configured by the OM during installation and cannot be modified after installation.

Parameter type: string.

Unit: none

Value range: valid path of a directory.

Default value: **dcf_log** in the DN data directory

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter can only be viewed.

Risks and impacts of improper settings: none

dcf_node_id

Parameter description: Specifies the ID of the DN where the DCF is located. This parameter is defined by the user during installation and mode switching.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: specified by users during installation.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_max_workers

Parameter description: Specifies the largest number of DCF callback function threads. The DCF needs to apply for the shared memory and semaphore before it calls the function registered by the DN with the DCF through the callback function.

Parameter type: integer.

Unit: none

Value range: 0 to 262143

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **40**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, resources may be insufficient and the cluster installation may fail.

dcf_truncate_threshold

Parameter description: Specifies the threshold for a DN to truncate DCF logs.

Parameter type: integer.

Unit: none

Value range: 1 to 2147483647

Default value: **100000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the threshold is too large, logs may not be truncated for a long time, occupying memory.

dcf_election_timeout

Parameter description: Specifies the timeout interval for selecting the DCF leader and follower. The election timeout interval depends on the status of the network between DNs. If the timeout interval is short and the network quality is poor, timeout occurs. After the network recovers, the election becomes normal. You are advised to set a proper timeout interval based on the current network status. Restriction on the DCF node clock: The maximum clock difference between DCF nodes is less than half of the election timeout interval. In DCF manual election mode, to ensure timely CM election, do not modify this parameter. Instead, use the default election timeout interval.

Parameter type: integer.

Unit: second

Value range: 1 to 600

Default value: **3**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **60** without a unit, **dcf_election_timeout** indicates 60s. If the value is **1min**, **dcf_election_timeout** indicates 1 minute. The unit must be second or minute if required.

Setting suggestion: Set a proper timeout interval based on the current network status.

Risks and impacts of improper settings: If the network environment is poor and the timeout period is short, timeout election may occur.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

dcf_enable_auto_election_priority

Parameter description: Specifies whether the DCF priority is allowed to be automatically adjusted.

Parameter type: integer.

Unit: none

Value range:

- **0**: not allowed.
- **1**: allowed.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_election_switch_threshold

Parameter description: Specifies the DCF threshold for preventing frequent switchover to primary. It is recommended that this parameter be set based on the maximum fault duration acceptable for user services.

Parameter type: integer.

Unit: second

Value range: 0 to 2147483647

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Set this parameter based on the maximum fault duration acceptable to services.

Risks and impacts of improper settings: If this parameter is set to a large value, services may be unavailable for a long time.

dcf_run_mode

Parameter description: Specifies the DCF election mode, including the automatic election mode, manual election mode, and disabling the election mode. Currently, the election mode can be disabled only in minority restoration scenarios. If the election mode is disabled, the database instance will become unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> The working mode of a cluster can be switched only when the cluster is running properly. Otherwise, the cluster is still abnormal after the switching. The DCF working mode configured in GUC parameters must be the same as that configured by using cm_ctl. That is, both DCF working modes must be set to manual or automatic at the same time.
>
> For example, to set the DCF manual mode, run the following command:
>
> ```
> cm_ctl set --param --server -k dn_arbitrate_mode=quorum
> cm_ctl reload --param --server
> gs_guc reload -Z datanode -I all -N all  -c "dcf_run_mode=1"
> ```
>
> To set the DCF automatic mode, run the following command:
>
> ```
> cm_ctl set --param --server -k dn_arbitrate_mode=paxos
> cm_ctl reload --param --server
> gs_guc reload -Z datanode -I all -N all  -c "dcf_run_mode=0"
> ```

Parameter type: enumerated type

Unit: none

Value range: **0**, **1**, and **2**

- **0**: automatic election mode.
- **1**: manual election mode.
- **2**: disabling the election mode.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Currently, disabling the election mode applies only to minority recovery scenarios. If the election mode is disabled, the database instance will be unavailable.

dcf_log_level

Parameter description: Specifies the DCF log level.

Parameter type: string.

Unit: none

Value range:

- To disable the log function, set this parameter to **"NONE"**, which cannot be used together with the following log levels:
- To enable the log function, set this parameter to one or a combination of the following log levels: **"RUN_ERR|RUN_WAR|RUN_INF|DEBUG_ERR|DEBUG_WAR|DEBUG_INF|TRACE|PROFILE|OPER"**.

  If two or more log levels are used together, separate them with vertical bars (|). The log level cannot be set to an empty character string.

Default value: **"RUN_ERR|RUN_WAR|DEBUG_ERR|OPER|RUN_INF|PROFILE"**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the log level is too low, log information may be missing.

dcf_log_backup_file_count

Parameter description: Specifies the number of DCF run log backups.

Parameter type: integer.

Unit: none

Value range: 1 to 1000

Default value: **100**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, the number of backup files is small and logs are lost.

dcf_max_log_file_size

Parameter description: Specifies the maximum size of a DCF run log file.

Parameter type: integer.

Unit: MB

Value range: 1 to 1000.

Default value: **10**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **10** without a unit, **dcf_max_log_file_size** indicates 10 MB. If the value is **10MB**, **dcf_max_log_file_size** indicates 10 MB. The unit must be MB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, a single log file may be opened and the query efficiency may decrease.

dcf_socket_timeout

Parameter description: Specifies the timeout interval for the DCF communication module to connect to the socket. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

Parameter type: integer.

Unit: ms

Value range: 10 to 600000 (10 minutes)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **5000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **5000** without a unit, **dcf_socket_timeout** indicates 5000 ms. If the value is **1min**, **dcf_socket_timeout** indicates 1 minute (that is, 60000 ms). The unit must be millisecond, second, or minute if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: When the network environment is poor, a small timeout period may cause a connection setup failure.

dcf_connect_timeout

Parameter description: Specifies the timeout interval for the DCF communication module to set up a connection. This parameter takes effect upon the system restart. In an environment where the network quality is poor, if the timeout interval is set to a small value, a connection may fail to be set up. In this case, you need to increase the value.

Parameter type: integer.

Unit: ms

Value range: 10 to 600000 (10 minutes)

Default value: 60000

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **5000** without a unit, **dcf_connect_timeout** indicates 5000 ms. If the value is **1min**, **dcf_connect_timeout** indicates 1 minute (that is, 60000 ms). The unit must be millisecond, second, or minute if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: When the network environment is poor, a small timeout period may cause a connection setup failure.

dcf_mec_fragment_size

Parameter description: Specifies the fragment size of the DCF communication module. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: KB

Value range: 32 to 10240

Default value: **64**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

dcf_stg_pool_max_size

Parameter description: Specifies the maximum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: MB

Value range: 32 to 2147483647

Default value: **2048**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **2048** without a unit, **dcf_stg_pool_max_size** indicates 2048 MB. If the value is **5GB**, **dcf_stg_pool_max_size** indicates 5 GB (that is, 5120 MB). The unit must be MB or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, memory resources may be insufficient. If the value is too small, storage module resources may be insufficient.

dcf_stg_pool_init_size

Parameter description: Specifies the minimum size of the memory pool of the DCF storage module. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: MB

Value range: 32 to 2147483647

Default value: **32**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **2048** without a unit, **dcf_stg_pool_init_size** indicates 2048 MB. If the value is **5GB**, **dcf_stg_pool_init_size** indicates 5 GB (that is, 5120 MB). The unit must be MB or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, memory resources may be insufficient. If the value is too small, storage module resources may be insufficient.

dcf_mec_pool_max_size

Parameter description: Specifies the maximum size of the memory pool of the DCF communication module. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: MB

Value range: 32 to 2147483647

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **200**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **2048** without a unit, **dcf_mec_pool_max_size** indicates 2048 MB. If the value is **5GB**, **dcf_mec_pool_max_size** indicates 5 GB (that is, 5120 MB). The unit must be MB or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, memory resources may be insufficient. If the value is too small, communications module resources may be insufficient.

dcf_flow_control_disk_rawait_threshold

Parameter description: Specifies the disk waiting threshold for DCF flow control.

Parameter type: integer.

Unit: μs

Value range: 0 to 2147483647

Default value: **100000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, the performance may deteriorate and the memory usage may increase.

dcf_flow_control_net_queue_message_num_threshold

Parameter description: Specifies the threshold for the number of messages in a network queue for DCF flow control.

Parameter type: integer.

Unit: none

Value range: 0 to 2147483647

Default value: 1024

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the performance may deteriorate severely.

dcf_flow_control_cpu_threshold

Parameter description: Specifies the threshold for DCF CPU flow control.

Parameter type: integer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: 0 to 2147483647

Default value: **100**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the performance may deteriorate severely.

dcf_mec_batch_size

Parameter description: Specifies the number of batch messages for DCF communication. When the value is **0**, the DCF automatically adjusts the value based on the network and the amount of data to be written. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: none

Value range: 0 to 1024

Default value: **0**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the communications efficiency between nodes decreases.

dcf_mem_pool_max_size

Parameter description: Specifies the maximum DCF memory. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: MB

Value range: 32 to 2147483647

Default value: **2048**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **2048** without a unit, **dcf_mem_pool_max_size** indicates 2048 MB. If the value is **5GB**, **dcf_mem_pool_max_size** indicates 5 GB (that is, 5120 MB). The unit must be MB or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the cluster installation will fail.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

dcf_mem_pool_init_size

Parameter description: Specifies the initial size of the DCF memory. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: MB

Value range: 32 to 2147483647

Default value: **32**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **2048** without a unit, **dcf_mem_pool_init_size** indicates 2048 MB. If the value is **5GB**, **dcf_mem_pool_init_size** indicates 5 GB (that is, 5120 MB). The unit must be MB or GB if required.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the cluster installation will fail.

dcf_compress_algorithm

Parameter description: Specifies the compression algorithm for DCF run log transmission.

Parameter type: integer.

Unit: none

Value range:

- **0**: no compression.
- **1**: LZ4 compression algorithm.

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: To enable the LZ4 compression algorithm, set **dcf_compress_algorithm** to **1**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_compress_level

Parameter description: Specifies the compression level for DCF log transmission. Before this parameter takes effect, a valid compression algorithm must be configured, that is, the **dcf_compress_algorithm** parameter is set.

Parameter type: integer.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 1 to 22. If compression is disabled, the configured compression level does not take effect.

Default value: **1**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_mec_channel_num

Parameter description: Specifies the number of DCF communication channels. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: none

Value range: 1 to 64

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a small value, the communications efficiency between nodes may decrease.

dcf_rep_append_thread_num

Parameter description: Specifies the number of DCF log replication threads. This parameter takes effect upon the system restart.

Parameter type: integer.

Unit: none

Value range: 1 to 1000

Default value: **2**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, threads may be idle and the resource usage may decrease.

dcf_mec_agent_thread_num

Parameter description: Specifies the number of DCF communication working threads. This parameter takes effect upon the system restart. It is recommended

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

that the value of **dcf_mec_agent_thread_num** be greater than or equal to 2 x Number of nodes x Value of **dcf_mec_channel_num**.

Parameter type: integer.

Unit: none

Value range: 1 to 1000

Default value: **10**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: It is recommended that the value be greater than or equal to 2 x Number of nodes x **dcf_mec_channel_num**.

Risks and impacts of improper settings: If this parameter is set to a large value, threads may be idle and the resource usage may decrease.

dcf_mec_reactor_thread_num

Parameter description: Specifies the number of reactor threads used by the DCF. This parameter takes effect upon the system restart. It is recommended that the ratio of the value of **dcf_mec_reactor_thread_num** to the value of **dcf_mec_agent_thread_num** be 1:40.

Parameter type: integer.

Unit: none

Value range: 1 to 100

Default value: **1**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: It is recommended that the ratio of the value of **dcf_mec_reactor_thread_num** to the value of **dcf_mec_agent_thread_num** be 1:40.

Risks and impacts of improper settings: If this parameter is set to a large value, threads may be idle and the resource usage may decrease.

dcf_log_file_permission

Parameter description: Specifies the attribute of the DCF run log file. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access logs, ensure that all parent directories can be accessed by other users in the same group. That is, if **dcf_log_path_permission** is set to **750**, **dcf_log_file_permission** can only be set to **600** or **640**. If **dcf_log_path_permission** is set to **700**, **dcf_log_file_permission** must be set to **600**.

Parameter type: enumerated type.

Unit: none

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **600** and **640**

Default value: **600**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The permission of **dcf_log_path_permission** must be higher than that of **dcf_log_file_permission**.

Risks and impacts of improper settings: Improper settings may cause user access failures.

dcf_log_path_permission

Parameter description: Specifies the attribute of the DCF run log directory. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. To allow other users in the same group to access the log path, set this parameter to **750**. Otherwise, set this parameter to **700**.

Parameter type: enumerated type.

Unit: none

Value range: **700** and **750**

Default value: **700**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: To allow other users in the same group to access the log path, set this parameter to **750**. Otherwise, set this parameter to **700**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_majority_groups

Parameter description: Sets the DCF policy-based majority function. For a group that requires this parameter, at least one standby node in the group receives logs. That is, there is a synchronous standby node in the group. If nodes are added to or deleted from the DCF instance or the group value of a node in the instance is changed, you need to modify the configuration accordingly. When modifying this parameter, ensure that the value of **group** exists and is valid.

Parameter type: string.

Unit: none

Value range:

- To disable the policy-based majority function, enter an empty string **""**.
- To enable the function, configure valid group values separated by commas (,). The group values must exist in **dcf_config**. For example, if the group values 1 and 2 are added to the DCF policy-based majority configuration, you can set this parameter to **"1,2"**. If the group value does not exist in **dcf_config** or

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

other characters are configured, the DCF considers the configured group invalid.

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

NOTICE

If all nodes in a group are faulty after the parameter is configured, you need to remove the group from the parameter list when performing node build operations (node recovery or node replacement without changing the IP address) on a node. After the node recovers, you can configure the group again.

dcf_node_id_map

Parameter description: Specifies the dictionary mapping between standby DN names and DCF node IDs. The parameter setting takes effect after the system is restarted. This parameter is configured during installation and cannot be modified. This parameter is used in DCF cluster installation, upgrade, and node replacement scenarios. The value of **standby_name** configured in the GUC parameter **synchronous_standby_names** must be included in this dictionary.

Parameter type: string.

Unit: none

Value range: The setting format is **'standby_name1:dcf_node_id1,standby_name2:dcf_node_id2'**. The values of standby DN names and the corresponding DCF node IDs are separated by commas (,).

Default value: ""

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Improper settings may cause cluster installation and upgrade failures.

dcf_candidate_names

Parameter description: Specifies the DCF candidate list. That is, names of DNs that may be selected as the primary node. In DCF automatic mode, the election policy is controlled by this parameter. DNs not in the list cannot be elected as a primary node.

Parameter type: string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range: a value in the format of **'dn_name1,dn_name2,dn_name3'**. The parameter depends on **dcf_node_id_map**. DN names must be in **dcf_node_id_map** and separated by commas (,).

Default value: **""**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_thread_effective_time

Parameter description: Specifies the effective time of the DCF flushing thread. This parameter is used to determine whether the disk I/O hangs. If the DCF control log cannot update and I/O resources cannot be accessed within the period specified by this parameter, the DCF considers that the thread I/O hangs and the switchover is triggered. If this parameter is set to **0**, the I/O hang detection is disabled.

Parameter type: integer.

Unit: second

Value range: 0 to 1000

Default value: 160

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

dcf_pri_leader_timeout

Parameter description: Specifies the timeout interval for priority-based leader election. In DCF automatic mode, after priority-based leader election is enabled, the backup node triggers priority-based leader election. If the backup node is not elected as the leader within the timeout interval, the election is canceled. If this parameter is set to **0**, the priority-based selection of the primary node waits until the election is successful.

Parameter type: integer.

Unit: second

Value range: 0 to 3600

Default value: **60**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, the cluster may be in the no-primary state for a long time.

dcf_static_leader_timeout

Parameter description: Specifies the timeout interval for preferentially electing the old leader. In DCF automatic mode, after the cluster is restarted, the old leader is preferentially elected. If the election fails within the timeout interval, the election is canceled.

Parameter type: integer.

Unit: second

Value range: 0 to 600

Default value: **60**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If this parameter is set to a large value, the cluster may be in the no-primary state for a long time.

14.3.40 Flashback

This section describes parameters related to the flashback function. In this version, only the Ustore supports flashback, while the Astore does not support flashback.

enable_recyclebin

Parameter description: Specifies whether the recycle bin is enabled or disabled in real time.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The recycle bin is enabled in real time.
- **off**: The recycle bin is disabled in real time.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: To use the flashback table function, set **enable_recyclebin** to **on**.

Risks and impacts of improper settings: When this parameter is disabled, the flashback function cannot be used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

recyclebin_retention_time

Parameter description: Specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

Parameter type: integer

Unit: second

Value range: 1 to 2147483647

Default value: **900** (that is, 15 minutes)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **900** without a unit, **recyclebin_retention_time** indicates 900s. If the value is **15min**, **recyclebin_retention_time** indicates 15 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Set the retention period of objects in the recycle bin as required.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

undo_retention_time

Parameter description: Specifies the period for retaining undo logs of earlier versions.

Parameter type: integer

Unit: second

Value range: 0 to 259200

Default value: **0**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if the value is **900** without a unit, **undo_retention_time** indicates 900s. If the value is **15min**, **undo_retention_time** indicates 15 minutes. If the unit is required, the value must be **s**, **min**, **h**, or **d**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is out of the range or the value contains a unit other than **s**, **min**, **h**, and **d**, an error message is displayed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If this parameter is set to **0** during the Ustore flashback query, the snapshot information at the flashback point will be cleared. In earlier versions, no flashback query can be performed. When a flashback query is performed, the error message "cannot find the restore point" is displayed.
- If the time within which the undo logs of earlier versions need to be retained is time1 and the SQL statement execution time for the flashback query is time2, you need to set **undo_retention_time** to a value greater than time1 + time2. That is, set **undo_retention_time** to a value greater than time1 + time2 + 3s. You are advised to set **undo_retention_time** to a value equal to time1 + 1.5 x time2. For example, if you want to retain the logs of earlier versions within the latest 3 hours, and the SQL statement execution time for the flashback query is 1 hour, set **undo_retention_time** to a value equal to 3 hours + 1.5 x 1 hour, that is, 4.5 hours.

14.3.41 Rollback Parameters

max_undo_workers

Parameter description: Specifies the number of undo worker threads called during asynchronous rollback. The parameter setting takes effect after the system is restarted.

Parameter type: integer

Unit: none

Value range: 1 to 100

Default value: **5**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Only the maximum number of threads that can concurrently perform asynchronous rollback is affected. If the value is too small, the asynchronous rollback speed may be slow. When a large number of transactions that require asynchronous rollback exist in the system, there is an extremely low probability that the undo reclamation speed is affected. If the host configuration is not high and a large number of transactions that require asynchronous rollback exist in the system, a large number of asynchronous rollback threads will be started at the same time, occupying certain system resources.

14.3.42 AI Features

enable_ai_stats

Parameter description: Specifies whether to create or use intelligent statistics.

Parameter type: Boolean.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Unit: none

Value range:

- **on**: Intelligent statistics are created and used.
- **off**: Intelligent statistics are not created or used.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If you modify the settings during database running, the plan may deteriorate.

multi_stats_type

Parameter description: Specifies the type of statistics to be created when **enable_ai_stats** is set to **on**.

Value type: enumerated type.

Unit: none

Value range: **"BAYESNET"**, **"MCV"**, and **"ALL"**

- **"BAYESNET"**: Only intelligent statistics are created.
- **"MCV"**: Only traditional statistics are created.
- **"ALL"**: Both traditional statistics and intelligent statistics are created.

Default value: **"BAYESNET"**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ai_stats_cache_limit

Parameter description: Specifies the maximum number of models that can be cached when **enable_ai_stats** is set to **on**.

Parameter type: integer.

Unit: none

Value range: 30 to 1000

Default value: **100**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Set this parameter based on the number of multi-column statistics models.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the value is too large, unnecessary memory is occupied. If the value is too small, models are frequently read from hard disks, deteriorating system performance.

enable_operator_prefer

Parameter description: Specifies whether to enable the operator preference rule. If the estimated costs are similar, the parameterized path is preferred for table join.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Parameterized path preference is enabled.
- **off**: Parameterized path preference is disabled.

Default value: **off**

NOTE

There are two prerequisites for this parameter to take effect:

- The parameterized path is generated.
- The estimated cost of the parameterized path is similar to that of other index scan operators.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. You are advised to specify this parameter only in sessions or hints.

Risks and impacts of improper settings: If this parameter is modified, the plan may deteriorate.

enable_ai_watchdog

Parameter description: Enables or disables the AI watchdog function.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Enabling this function occupies system resources.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

enable_ai_watchdog_forcible_oom_detection

Parameter description: Forcibly enables or disables the OOM detection function of the AI watchdog. If this parameter is disabled, the system automatically determines whether to enable the OOM detection function based on the current database specifications. In automatic determination mode, the OOM detection function is enabled only when **max_process_memory** is set to **64GB** or a larger value. The OOM detection function depends on the information obtained by the memory management module. Therefore, if the memory management module is disabled or invalid, the OOM detection function is not enabled.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Enabling this function occupies system resources.

enable_ai_watchdog_healing

Parameter description: Enables or disables the self-healing function of the AI watchdog.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ai_watchdog_max_cpu_usage

Parameter description: Specifies the expected upper limit of the database CPU usage. The value is normalized based on the multi-core situation. If this parameter is set to **0**, the system does not check the CPU usage.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter type: floating point.

Unit: none

Value range: 0 to 1

Default value: **0.8**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, exceptions may not be detected in a timely manner.

ai_watchdog_oom_dynamic_used_threshold

Parameter description: Specifies the expected upper limit of the dynamic memory usage of the database.

Parameter type: floating point.

Unit: none

Value range: 0 to 1

Default value: 0.95

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too large, exceptions may not be detected in a timely manner.

ai_watchdog_oom_growth_confidence

Parameter description: Specifies the confidence level of the OOM detection algorithm.

Parameter type: floating point.

Unit: none

Value range: 0.1 to 1

Default value: 0.95

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ai_watchdog_oom_malloc_failures

Parameter description: Specifies the maximum number of consecutive memory allocation failures tolerated. If the number of consecutive memory allocation failures exceeds this value, the OOM detection function may be triggered.

Parameter type: integer.

Unit: none

Value range: 1 to 32000

Default value: **50**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, alarms are frequently generated. If this value is too large, exceptions cannot be detected in a timely manner.

ai_watchdog_oom_other_used_memory_threshold

Parameter description: Specifies the expected upper limit of memory usage of other parts of the database.

Parameter type: integer.

Unit: MB

Value range: –1 to 1048576

Default value:

- If this parameter is set through the OM installation, the default value is **–1**.

  NOTE

  - When the value is **–1**, the upper limit of the other parts of the memory usage is specified based on the following rules:
    - If the value of **max_process_memory** is less than 300 GB, the upper limit of the other parts of the memory usage is 20 GB.
    - If the value of **max_process_memory** is greater than or equal to 300 GB and less than 600 GB, the upper limit of the other parts of the memory usage is 40 GB.
    - If the value of **max_process_memory** is greater than or equal to 600 GB, the upper limit of the other parts of the memory usage is 60 GB.
  - If the default value **–1** is not used, the upper limit of the other parts of the memory usage is the value set by the user.
- If this parameter is not set through the OM installation, the default value is **20480**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Risks and impacts of improper settings: If the value is too small, alarms are frequently generated. If this value is too large, exceptions cannot be detected in a timely manner.

ai_watchdog_oom_process_threshold

Parameter description: Specifies the expected percentage of the database process usage to the value of **max_process_memory**. When the threshold is reached, memory leakage determination is triggered.

Parameter type: floating point.

Unit: none

Value range: 0 to 10

Default value:

- If this parameter is set through the OM installation, the default value is **1**.
- If this parameter is not set through the OM installation, the default value is **1.1**.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ai_watchdog_oom_shared_threshold

Parameter description: Specifies the expected upper limit of the shared memory usage of the database.

Parameter type: floating point.

Unit: none

Value range: 0 to 1

Default value: 0.4

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ai_watchdog_rto_restriction_time

Parameter description: Specifies the RTO threshold of the AI watchdog self-healing function. If the RTO threshold is exceeded, self-healing is not performed.

Parameter type: integer.

Unit: second

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 36000

Default value: **600**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ai_watchdog_tolerance_times

Parameter description: Specifies the maximum number of consecutive abnormal events that can be tolerated by the AI watchdog before self-healing is started. This parameter can be used to avoid incorrect operations.

Parameter type: integer.

Unit: none

Value range: 0 to 100

Default value: 4

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

ai_watchdog_tps_threshold

Parameter description: Specifies the lower limit of the expected TPS usage of the database instance. If the TPS usage is lower than the value of this parameter, the exception determination logic is triggered.

Parameter type: integer.

Unit: none

Value range: 0 to 32000

Default value: **2**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ai_watchdog_wait_time

Parameter description: Adjusts the waiting time. To prevent the database from frequently performing self-healing operations, the database waits for a period of time after startup.

Parameter type: integer.

Unit: second

Value range: 0 to 36000

Default value: **1800**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. The value cannot contain a unit.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If the value is too small, false alarms may be reported when the database is just started. If the value is too large, exceptions within the waiting time may not be detected.

ai_watchdog_warning_retention

Parameter description: Specifies the maximum number of alarm records that the AI watchdog can retain in the dbe_perf.ai_watchdog_detection_warnings view.

Parameter type: integer.

Unit: none

Value range: 0 to 32000

Default value: 20

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.43 Global SysCache Parameters

enable_global_syscache

Parameter description: Specifies whether to enable the global system cache function.

Parameter type: Boolean.

Unit: none

Value range:

- **on** indicates that the global system cache function is enabled.
- **off** indicates that the global system cache function is disabled.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **on**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value. Enabling the global system cache function can reduce the system cache memory usage and improve the concurrent expansion capability. If this parameter is enabled, **global_syscache_threshold** must be used together. In this case, the thread pool mode is recommended. After this parameter is enabled, you are advised to set **wal_level** of the standby node to **hot_standby** or higher level if you need to access the standby node.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

global_syscache_threshold

Parameter description: Specifies the maximum memory usage of the global system cache. To use this parameter, you need to enable the **enable_global_syscache** parameter.

Parameter type: integer

Unit: KB

Value range: 16384 to 1073741824

Default value: **163840** (160 MB)

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **163840** without a unit, it indicates 163840 KB. If this parameter is set to **160MB**, it indicates 160 MB. The unit must be KB, MB, or GB if required.

Setting suggestion: Set it to the smaller value of the number of hot databases and the number of threads multiplied by the memory size allocated to each database, that is, **global_syscache_threshold** = **min(count(hot dbs),count(threads))** x **memofdb**.

The number of hot databases is the number of databases that are frequently accessed. In thread pool mode, the number of threads is the sum of the number of threads in the thread pool and the number of background threads. In non-thread pool mode, the number of hot databases is used.

memofdb indicates the average memory allocated to each database. The background noise memory of each database is 2 MB. Each time a table or index is added, 11 KB memory is added.

Risks and impacts of improper settings: If the value is too small, memory is frequently evicted, and a large number of memory fragments cannot be recycled. As a result, memory control fails.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

14.3.44 Read Parameters of the Standby Node in a Distributed System

enable_standby_read

Parameter description: Specifies whether to enable the read function of the standby node for a session.

NOTICE

This function can be enabled only in GTM-free, GTM-lite, non-standby cluster for DR, non-transaction block, and hot-standby modes.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The read function of the standby node in a distributed system is enabled for the session.
- **off**: The read function of the standby node in a distributed system is disabled for the session.

Default value: **off**

Setting method: This parameter is a USERSET parameter and can be set only at the session level (**enable_standby_read** is set to **on**). It cannot be set using gs_guc set/reload.

Setting suggestion: This parameter cannot be set using gs_guc. If you need to query the standby node, enable it in the session.

Risks and impacts of improper settings: If this parameter is set at a non-session level (for example, enabling this parameter in the configuration file), the cluster cannot be started when a parameter conflict occurs. If no parameter conflict occurs, the read function of the standby node in a distributed system is also enabled for backend threads such as autovacuum and WorkloadMonitor. As a result, DDL and DML operations are affected and errors are reported.

enable_direct_standby_datanodes

Parameter description: Specifies whether to enable the EXECUTE DIRECT ON extension capability for a session. If this parameter is enabled, the EXECUTE DIRECT ON statement can be used to connect to any standby DN or all standby DNs in a shard to execute queries. For details about the execute direct on syntax, see "SQL Reference > SQL Syntax > E > EXECUTE DIRECT" in *Developer Guide*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- This function can be enabled only in GTM-free mode, non-transaction block, and hot-standby mode.
- In the same session, an error is reported if **enable_direct_standby_datanodes** is set to **on** after **enable_standby_read** is set to **on**. An error is also reported if **enable_standby_read** is set to **on** after **enable_direct_standby_datanodes** is set to **on**.
- After this parameter is enabled, the current session is read-only, and DDL and DML jobs are affected and errors are reported.
- After this parameter is enabled, you can use EXECUTE DIRECT ON to query only system DFX information such as system views, system functions, and system catalogs. Common user tables cannot be queried.
- After the **enable_direct_standby_datanodes** parameter is enabled, EXECUTE DIRECT ON supports distributed standby node query. Before using this function during the upgrade, ensure that the CN and DN instance processes have been replaced with the latest binary files. Otherwise, packet verification fails and an error is reported.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The EXECUTE DIRECT ON extension capability is enabled for the session.
- **off**: The EXECUTE DIRECT ON extension capability is disabled for the session.

Default value: **off**

Setting method: This parameter is a USERSET parameter and can be set only at the session level (**enable_direct_standby_datanodes** is set to **on**). It cannot be set using gs_guc set/reload.

Setting suggestion: This parameter is used to specify whether to enable EXECUTE DIRECT ON to perform the connection behavior in the distributed standby node read scenario. This function is mainly used for WDR, database test, and O&M. You are advised not to enable this function in other scenarios. This parameter cannot be set using gs_guc. If you need to query the standby node, enable it in the session.

Risks and impacts of improper settings: If this parameter is enabled in the configuration file, the database node cannot be started.

standby_read_delay

Parameter description: Specifies the maximum difference between the primary and standby nodes when data is read from the standby node. If the difference exceeds the value of this parameter, data cannot be read from the standby node.

Parameter type: integer.

Unit: ms

Value range: –1 to 2147483647

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **–1**: The difference between the primary and standby nodes does not need to be verified when data is read from the standby node.
- **0**: Data can be read from the standby node only when there is no difference between the primary and standby nodes.

Default value: **10000000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **86400** without a unit, it indicates 86400 ms. If this parameter is set to **1d**, it indicates 1 day. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Set this parameter based on service requirements.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

standby_read_rto

Parameter description: Specifies the maximum RTO of the system when data is read from the standby node. If the RTO exceeds the value of this parameter, data cannot be read from the standby node.

Parameter type: integer.

Unit: ms

Value range: –1 to 2147483647

- **–1**: The system RTO does not need to be verified when data is read from the standby node.
- **0**: Data can be read from the standby node only when the RTO of at least one standby node is 0.

Default value: **60000**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**. For example, if this parameter is set to **86400** without a unit, it indicates 86400 ms. If this parameter is set to **1d**, it indicates 1 day. The unit must be **ms**, **s**, **min**, **h**, or **d** if required.

Setting suggestion: Set this parameter based on service requirements.

Risks and impacts of improper settings: Change the parameter value after you fully understand the parameter meaning and test the parameter.

14.3.45 Restoring Data on the Standby Node

standby_page_repair

Parameter description: Specifies whether to automatically repair the page after a fault is detected on the replay target page during replay on the standby node. The current version supports three types of rectification: CRC failure, uninitialized page, and page LSN error. Bad blocks of VM, Xlog, Clog, MOT, and UNDO metadata cannot be repaired, and LSN errors of FSM cannot be repaired. UNDO records can be repaired only when CRC fails. Temporary tables, global temporary tables, and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

unlogged tables do not involve primary and standby restoration. The page file-level loss cannot be repaired.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: The standby node automatically detects and repairs pages during replay.
- **off**: The standby node does not automatically detect and repair pages during replay.

Default value: **on**

NOTICE

If a large number of bad blocks exist due to a standby node exception, the replay performance of the standby node is affected, and Xlogs may be stacked on the standby node. In addition, an exception log is printed each time the Xlog is replayed to the bad block.

To ensure the consistency between the primary and standby nodes, if the standby node instance has unrepaired bad blocks, the checkpoint needs to be stopped. As a result, Xlogs may be stacked, and the replay on the bad blocks will be suspended, which may cause inconsistency between the primary and standby nodes. If a bad block exists when the standby node is restarted or promoted to primary, the instance exits abnormally. Before the instance exits, the Xlog chain on the bad block is collected, which may prolong the RTO.

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: If automatic repair is disabled, bad blocks will be stored in the bad block table once bad blocks are detected, causing the adverse impact described in NOTICE.

14.3.46 Creating an Index Online

delete_cctmp_table

Parameter description: Specifies whether to delete temporary tables generated during Ustore online index creation or rebuilding.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: indicates that the temporary tables are deleted.
- **off**: indicates that the temporary tables are retained.

Default value: **on**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is enabled by default. Set this parameter to **off** if you want to retain temporary tables generated during online index creation or rebuilding.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_bypass_insert_sequence

Parameter description: Specifies whether SQL Bypass is supported when an INSERT statement of a table that contains auto-increment columns.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: SQL Bypass optimization is supported.
- **off**: SQL Bypass optimization is not supported.

Default value: **on**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: This parameter is enabled by default. Set it to **off** if the INSERT statements containing auto-increment lists do not require SQL Bypass optimization.

14.3.47 Online DDL Operations

enable_online_ddl

Parameter description: This parameter is used together with the ONLINE or OFFLINE keyword to specify whether to enable an online DDL or VACUUM operation. For details about the keywords, see "SQL Reference > SQL Syntax > A > ALTER TABLE" and "SQL Reference > SQL Syntax > V > VACUUM" in *Developer Guide*.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: Online DDL is enabled and does not take effect in the current version.
- **off**: Online DDL is disabled and does not take effect in the current version.

Default value: **off**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**. The setting of this parameter does not take effect in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting suggestion: You are advised to disable this parameter. If this parameter is enabled, it does not take effect in the current version. If you need to use the new online DDL features in 505.2, add the keyword ONLINE to the syntax.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.48 Data Lifecycle Management: OLTP Table Compression

enable_ilm

Parameter description: Specifies whether to enable the OLTP table compression of data lifecycle management.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **off**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value is **off**. To enable this feature, set this parameter to **on**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.49 Session-level Transaction Pushdown and Related Parameters

session_type

Parameter description: Specifies the type of the current session. The value is case-insensitive. An execution plan is generated based on the actual value.

Parameter type: enumerated type

Unit: none

Value range:

- **single_node**: single-node session. Read and write operations can be pushed down. Nodes to be pushed down are determined and an execution plan is generated based on the GUC parameter **exec_target_node**.
- **global_read_only**: cross-node read-only session. A distributed plan is generated normally, but distributed write operations are forbidden.
- **normal**: default session, which is the same as the original behavior. The plan is executed based on the original logic of the database.

Default value: **normal**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**. Note that this parameter cannot be set globally using gs_guc.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: When data is inserted in single-node session mode (**session_type** is set to **single_node**), correct data distribution is ensured by the application layer. If an incorrect node is specified, data may be inconsistent.

exec_target_node

Parameter description: Specifies the name of the DN where DML statements and some DDL statements (TRUNCATE and ALTER TABLE...TRUNCATE PARTITION...) of the current session are executed. The name is case-sensitive. If the DN name is invalid, an error is reported during the setting.

NOTE

This parameter is valid only when the GUC parameter **session_type** is set to **single_node**.

Parameter type: string.

Unit: none

Value range: names of all DNs in the current cluster. You can obtain the names of all DNs by querying the PGXC_NODE system catalog.

Default value: **""**

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-2**. Note that this parameter cannot be set globally using gs_guc.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: In single-node session mode, if the parameters are not used according to the restrictions, data inconsistency may occur.

NOTE

The single-node session mode has the following restrictions:

- The router function does not take effect in this scenario.
- The DN specified by **node_name hint** does not take effect and is delivered by **exec_target_node**.
- Statements involving row-level security are not supported.
- Reading on the distributed standby node is not supported.
- Advanced package statements are not supported.
- GPC is not supported. When the **enable_global_plancache** parameter is enabled, if PBE is executed, an error is reported.
- In single-node session mode, when the PBE statement is used, the plan type is directly set to **GPlan**. If the single-node session mode is specified after a plan is generated, the original plan type remains unchanged.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
gaussdb=# SET log_min_messages = debug2;
gaussdb=# SET logging_module = 'on(opt_choice)';
gaussdb=# CREATE TABLE t1(a int ,b int);
gaussdb=# PREPARE x(int) AS SELECT * FROM t1;
gaussdb=# EXPLAIN EXECUTE x(10);
NOTICE:  [Choosing C/G/A Plan]: GPlan, reason: Using pbe optimization.
NOTICE:  [Choosing C/G/A Plan]: CPlan, reason: First 5 times using CPlan.
                  QUERY PLAN
---------------------------------------------------
 Data Node Scan  (cost=0.00..0.00 rows=0 width=0)
   Node/s: All datanodes
(2 rows)
gaussdb=# DEALLOCATE x;

gaussdb=# PREPARE x(int) AS SELECT * FROM t1;
gaussdb=# SET session_type=single_node;
gaussdb=# SET exec_target_node=datanode1;
gaussdb=# EXPLAIN EXECUTE x(10);
NOTICE:  [Choosing C/G/A Plan]: GPlan, reason: Using pbe optimization.
NOTICE:  [Choosing C/G/A Plan]: GPlan, reason: Using pbe optimization.
                  QUERY PLAN
---------------------------------------------------
 Data Node Scan  (cost=0.00..0.00 rows=0 width=0)
   Node/s: datanode1
(2 rows)
gaussdb=# DEALLOCATE x;
gaussdb=# DROP TABLE t1;
```

14.3.50 Enhanced TOAST

enable_enhance_toast_table

Parameter description: Specifies whether the enhanced TOAST out-of-line storage table is used.

Parameter type: Boolean.

Unit: none

Value range:

- **on**: enabled.
- **off**: disabled.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: The default value of this parameter is **on**. To disable the enhanced TOAST out-of-line storage function, set this parameter to **off**.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

14.3.51 Global Temporary Table

max_active_global_temporary_table

Parameter description: Specifies whether global temporary tables can be created. The value of this parameter determines the memory reserved in the shared cache

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

for hash tables required by global temporary tables. The total number of active global temporary tables in all sessions is not forcibly limited.

Parameter type: integer.

Unit: none

Value range: 0 to 1000000

- **0**: The global temporary table function is disabled.
- > 0: The global temporary table function is enabled.

Default value: **1000**

Setting method: This is a POSTMASTER parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

vacuum_gtt_defer_check_age

Parameter description: Specifies the difference between the minimum value of **relfrozenxid** of all global temporary tables and that of all ordinary tables in the current database after VACUUM is executed. If the minimum value of **relfrozenxid** of all global temporary tables is greater than the specified value, the alarm "global temp table oldest relfrozenxid %lu is the oldest in the entire db" is generated to remind users to manually execute VACUUM. Otherwise, Clogs may not be recycled.

Parameter type: integer.

Unit: none

Value range: 0 to 1000000

Default value: **10000**.

Setting method: This is a USERSET parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

enable_gtt_concurrent_truncate

Parameter description: Specifies whether to support concurrent execution of TRUNCATE TABLE and DML operations on global temporary tables and concurrent execution of TRUNCATE TABLE on global temporary tables.

Parameter type: Boolean.

Unit: none

Value range:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **on**: The preceding operations can be performed concurrently.
- **off**: The preceding operations cannot be performed concurrently.

Default value: **on**

Setting method: This is a SIGHUP parameter. Set it based on instructions provided in **Table 14-1**.

Setting suggestion: Retain the default value.

Risks and impacts of improper settings: Change the parameter value after fully understanding the parameter meaning and verifying it through testing.

global_gtt_cn_session_key

Parameter description: Specifies the ID of the current session, that is, the global unique session ID of a distributed global temporary table.

Parameter type: string.

Unit: none

Value range: a string.

Default value: none

Setting method: This is an internal parameter and cannot be set by users. No query result is returned.

Setting suggestion: No setting is allowed.

Risks and impacts of improper settings: none

14.3.52 Reserved Parameters

NOTE

The parameters below are reserved and do not take effect in this version.

15 FAQs

15.1 What is the maximum number of columns in a single GaussDB table?

Answer: 1600. The value varies according to the column type. The column type is not verified during table creation but is verified during data storage. For example, for a column of the bigint type, each column stores 8-byte data. If there are 1600 columns, 12800 bytes need to be stored, which exceeds 8 KB on a page, and an error is reported during insertion.

NOTE

If the data length of a column exceeds the maximum allowed, the data may be stored in a TOAST table. The logic is as follows:

1. If the total length of a tuple exceeds 2 KB, the column containing the longest data is compressed first.
2. Toast table storage is enabled only when the data length of a column exceeds the size limit after compression and is larger than the TOAST metadata overhead (24 bytes).
3. A TOAST table stores the full data of each column, while the main table stores only query metadata.
4. After compression, an error is reported if the total length of a single row exceeds the size of a single page (8 KB) regardless of whether a TOAST table is used. If a TOAST table is used, the main table stores its metadata; otherwise, it stores the compressed column data.

15.2 How do I query the partition and index information of a partitioned table?

Answer: You can use either of the following methods:

- You can use the pg_get_tabledef() function to view the definition of a table. The returned information includes table creation SQL statements, comments, indexes, and constraints.

  Example:

```
gaussdb=# SELECT pg_get_tabledef('table_name');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- You can query the pg_partition view for partition information and the pg_indexes view for index information.

15.3 What is OID?

Answer: Object identifiers (OIDs) are the unique identifiers of database objects.

The object can be a database, table, index, or view.

15.4 What is UDF?

Answer: Short for user defined function.

You can define a function and embed it in GaussDB to implement specific functions to meet different service scenarios.

15.5 What wildcards are supported in GaussDB? How do I use them?

Answer: GaussDB supports the following three types of wildcards:

- %: indicates any number of characters, including 0. It is used in the LIKE and NOT LIKE statements.
- _: indicates a character, which is used in LIKE and NOT LIKE statements.
- *: indicates any number of characters, including 0. It is used in some meta-commands.

  Examples:

```
-- Use wildcards to indicate any number of characters and query the tbl_test table for the data that starts with col1 and ends with ab.
gaussdb=# SELECT * FROM tbl_test WHERE col1 LIKE 'ab%';

-- Use a wildcard to query the data of any single character string starting with a and ending with b in the col1 column of the tbl_test table.
gaussdb=# SELECT * FROM tbl_test WHERE col1 LIKE 'a_b';

-- Query all tables whose names start with tbl.
gaussdb=# \dt tbl*
```

15.6 Is there a limit on the length of a database object name?

Answer: The database object name contains a maximum of 63 bytes.

If the length of an object name exceeds 63 bytes, the database truncates the last byte instead of character. As a result, the object name may contain a truncated character.

15.7 How do I view the creation time of a table?

Answer: See the value of the **created** column in the PG_TABLES system view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
-- Create a table.
gaussdb=# CREATE TABLE test(id int, name varchar(10));

-- Query the time when the test table is created.
gaussdb=# SELECT tablename,created FROM pg_tables WHERE tablename = 'test';
 tablename |            created
-----------+-------------------------------
 test      | 2024-01-12 14:50:59.611988+08
(1 row)
```

15.8 How do I create indexes in parallel?

Answer: GaussDB supports parallel index creation to improve the index creation efficiency.

Example:

```
-- Set maintenance_work_mem based on the actual situation.
gaussdb=# SET maintenance_work_mem = '8GB';

-- Create a table.
gaussdb=# CREATE TABLE table_name (col1 int, col2 int);

-- Change the number of threads for creating indexes for a table based on the actual situation.
gaussdb=# ALTER TABLE table_name SET (parallel_workers=4);

-- Create an index.
gaussdb=# CREATE INDEX index_name ON table_name(col1);

-- Reset the parallel_workers parameter for the table.
gaussdb=# ALTER TABLE table_name RESET (parallel_workers);

-- Delete the index.
DROP INDEX index_name;

-- Drop the table.
gaussdb=# DROP TABLE table_name;
```

15.9 How do I create an auto-increment column?

Answer: GaussDB supports the creation of auto-increment columns. You can specify the SERIAL data type when creating a table.

Example:

```
gaussdb=# CREATE TABLE table_name(id serial, name varchar(20));
```

You can also use the following method:

```
--Create a sequence.
gaussdb=# CREATE SEQUENCE tbl_person_id_seq;
-- Create the tbl_persion table. The value of the id column is automatically increased based on the sequence specified by tbl_person_id_seq.
gaussdb=# CREATE TABLE tbl_persion(
    id int NOT NULL DEFAULT nextval('tbl_person_id_seq'::regclass),
    name varchar(20));
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.10 Can I query the GaussDB memory usage through SQL statements?

Answer: You can query the context name, level, total size, and available size of the shared memory in the pg_shared_memory_detail view.

Example:

```
gaussdb=# SELECT * FROM pg_shared_memory_detail;
```

15.11 What are the differences between LIMIT 2, LIMIT 2,3 and LIMIT 2 OFFSET 3?

Answer: LIMIT and OFFSET are keywords used to limit the number of query results returned in the SELECT statement.

- **LIMIT 2**: Only the first two rows of data are returned.
- **LIMIT 2,3**: A total of three rows of data from the third row are returned.
- **LIMIT 2 OFFSET 3**: A total of two rows of data from the fourth row are returned.

15.12 How do I create a column whose default value is the current time?

Answer: When creating a table, set the default value of the column to **CURRENT_TIMESTAMP**.

Example:

```
gaussdb=# CREATE TABLE tbl (id int, modtime date DEFAULT CURRENT_TIMESTAMP);
```

15.13 How do I determine whether a column is null?

Answer: Use IS NUL and IS NOT NULL to determine whether a column is null.

Example:

```
gaussdb=# SELECT * FROM tab WHERE col1 IS NULL;
```

15.14 How do I obtain the username for connecting to a database?

Answer: Use either of the following methods:

- Method 1:
  ```
  gaussdb=# SELECT current_user;
  ```
- Method 2:
  ```
  gaussdb=# SELECT session_user;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.15 How do I query the time difference between two time points?

Answer: You can use the following method to calculate the time difference:

- Use the age() function to calculate the time difference between two time points.

```
gaussdb=# SELECT age(timestamp '2001-04-10 14:00:00', timestamp '2001-04-06 13:00:00');
      age
-----------------
 4 days 01:00:00
(1 row)
```

- Convert strings to the date type and then subtract them.

```
gaussdb=# SELECT ('2001-04-10 14:00:00'::date - '2001-04-06 13:00:00'::date);
 ?column?
----------
        4
(1 row)
```

- Use the date_part() function to obtain the value of the subdomain in a date or time value.

```
gaussdb=# SELECT date_part('day', '2001-04-10 14:00:00'::timestamp - '2001-04-06
13:00:00'::timestamp);
 date_part
-----------
         4
(1 row)
```

15.16 What are the types of SQL languages?

Answer: SQL languages are classified into the following types:

- Data definition language (DDL) is used to define or modify an object in a database, such as a table, an index, or a view.
- Data manipulation language (DML) is used to perform operations on data in database tables, such as inserting, updating, querying, or deleting data.
- Data control language (DCL) is used to set or change the permissions of database users or roles.

15.17 What is the function of a trigger?

Answer: A trigger is a special stored procedure that is triggered and executed by events.

- Constraints can be strengthened to maintain data integrity and consistency.
- Operations in the database can be traced. Unauthorized updates and changes are not allowed.
- Concatenated operations can be performed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.18 What are the four characteristics of correctly executing database transactions?

Answer: During data write or update, the database management system (DBMS) must meet the following requirements: Atomicity, Consistency, Isolation, and Durability (ACID) to ensure that transactions are correctly executed.

- Atomicity: also called indivisibility. All operations in a transaction are either completed or not completed, and do not end in an intermediate phase. If an error occurs during transaction execution, the transaction is rolled back to the state before the transaction starts, just as if the transaction has never been executed.
- Consistency: The database integrity is not damaged before and after a transaction starts. This means that the written data must fully comply with all preset rules, including the accuracy of the data, the serialization of the data, and the spontaneous completion of the scheduled work by the subsequent database.
- Isolation: also called independence. Transactions are often executed concurrently. Isolation ensures that concurrent execution of transactions leaves the database in the same state that would have been obtained if the transactions were executed sequentially. Transaction isolation is divided into different levels, including read uncommitted, read committed, repeatable read, and serializable.
- Durability: Once a transaction has been committed, it will remain committed even in the case of a system failure.

15.19 What are the differences between the DROP, TRUNCATE, and DELETE methods in GaussDB?

Answer: The differences between the DROP, TRUNCATE, and DELETE methods lie in the deletion speed and scope. The details are as follows:

- The DROP statement can be used to delete an entire table, including the table structure, data, indexes, and permissions.
- The deletion speed of the TRUNCATE statement is medium. The TRUNCATE statement can delete all data in a table but does not delete the table structure.
- The deletion speed of the DELETE statement is the slowest. You can delete data from a table based on conditions, excluding the table structure.

15.20 How many bytes does a Chinese character occupy in GaussDB?

Answer: It depends on the encoding mode for character sets of the database.

- For the GBK character set, a Chinese character occupies two bytes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For the UTF8 character set, a Chinese character occupies three bytes.

15.21 What Are the Differences Between Unique Constraints and Unique Indexes?

Answer: The differences between unique constraints and unique indexes are as follows:

- The concepts of a unique constraint and a unique index are different.

  A unique constraint specifies that the values in a column or a group of columns are all unique. If **DISTRIBUTE BY REPLICATION** is not specified, the column table that contains only unique values must contain distribution columns. A unique index is used to ensure the uniqueness of a field value or the value combination of multiple fields. **CREATE UNIQUE INDEX** creates a unique index.
- The functions of a unique constraint and a unique index are different.

  Constraints are used to ensure data integrity, and indexes are used to facilitate query.
- The usages of a unique constraint and a unique index are different.
  - When a unique constraint is created, a unique index with the same name is automatically created. The index cannot be deleted separately. When the constraint is deleted, the index is automatically deleted. A unique constraint uses a unique index to ensure data uniqueness.
  - A created unique index is independent and can be deleted separately.
  - If you want to have both a unique constraint and a unique index on a column, and they can be deleted separately, you can create a unique index and then a unique constraint with the same name.
  - If a field in a table is to be used as a foreign key of another table, the field must have a unique constraint (or it is a primary key). If the field has only a unique index, an error is reported.

15.22 How Do I Create a Weak Password in GaussDB?

Answer: In the GaussDB database, the weak password dictionary is empty by default. You can manually add one or more weak passwords to the gs_global_config system catalog.

Example:

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password1');

-- Insert multiple weak passwords into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('password2'),('password3');

-- Check weak passwords in the gs_global_config system catalog.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
      name       |     value
-----------------+----------------
 weak_password   | password1
 weak_password   | password2
 weak_password   | password3
(3 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.23 What is Dirty Read, Phantom Read, and Non-repeatable Read?

Answer: Dirty read, phantom read, and non-repeatable read are problems of concurrent transactions.

- Dirty read: Transaction A reads data that has been modified by transaction B but has not been submitted, and transaction B is rolled back.
- Phantom read: If the same data is read in two consecutive periods, inconsistent results may occur.
- Non-repeatable read: The data queried twice in the same transaction is different.

15.24 What Is MVCC?

Answer: MVCC refers to Multi-Version Concurrency Control. MVCC is a database concurrency control protocol. A write transaction does not modify the tuple content immediately. Each operation creates a target version based on the source version and retains the source version. When a transaction needs to read data, the database system selects a version that meets the transaction isolation level requirement from all versions.

A main advantage of the MVCC is that MVCC does not cause conflicts between lock requests for data reading and writing and keep them unaffected by each other.

15.25 Which Date/Time Types Contain the Time Zone and Which Do Not?

Answer: The date, time, timestamp, and smalldatetime types do not contain the time zone, and the timetz and timestamptz types contain the time zone.

Example:

```
--The timestamp type does not contain the time zone.
gaussdb=# SELECT '2019-01-01'::timestamp;
     timestamp
---------------------
 2019-01-01 00:00:00
(1 row)

--The timestamptz type contains the time zone.
gaussdb=# SELECT '2019-01-01'::timestamptz;
      timestamptz
------------------------
 2019-01-01 00:00:00+08
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.26 What Is the Difference Between count(*) and count(column)?

Answer: The count() function is an aggregate function used to calculate the number of rows. The differences are as follows:

- count(*) collects statistics on the number of rows in all columns. Data whose value is **NULL** is not ignored during statistics collection.
- count(column) contains only the column name column. Data whose value is **NULL** is ignored during statistics collection.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test(c1 int);
gaussdb=# INSERT INTO test VALUES(1),(2),(3);
gaussdb=# INSERT INTO test VALUES(NULL);

--count(*) counts the number of rows and does not ignore the data whose value is NULL.
gaussdb=# SELECT count(*) FROM test;
 count
-------
     4
(1 row)

--count(column) counts the number of rows and does not ignore the data whose value is NULL.
gaussdb=# SELECT count(c1) from test;
 count
-------
     3
(1 row)

-- Delete.
gaussdb=# DROP TABLE test;
```

15.27 What Is the Relationship Between an Empty String and NULL?

Answer: Whether an empty string in GaussDB is NULL depends on the compatibility mode of the database.

- A null string is judged as NULL in ORA-compatible mode.

  ```
  gaussdb=# CREATE DATABASE db_test1 DBCOMPATIBILITY = 'ORA';
  gaussdb=# \c db_test1
  db_test1=# SELECT '' IS NULL;
   ?column?
  ----------
   t
  (1 row)
  ```

- A null string is not judged as NULL in MySQL-compatible mode.

  ```
  gaussdb=# CREATE DATABASE db_test2 DBCOMPATIBILITY = 'MYSQL';
  gaussdb=# \c db_test2
  db_test2=# SELECT '' IS NULL;
   ?column?
  ----------
   f
  (1 row)
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

15.28 What Are WALs and Log File Paths?

Answer: In a system using write-ahead logs (WALs or Xlogs), all data modifications are written to a log before they are applied. That is, the corresponding log must be written into a permanent memory before a data file is modified. They are also called redo logs.

WALs can be used to restore a damaged database when the system breaks down due to database damage. The path is *Data directory*/**pg_xlog**. Take one DN as an example. Its directory is **/gaussdb/data/data_dn/pg_xlog**, where **/gaussdb/data/data_dn** indicates the data directory of the cluster node.

15.29 What Are the Schemas, Users, and Roles in GaussDB?

Answer: A schema is a logical division of a database. All database objects are created under certain schemas. Schemas and users are loosely bound. When you create a user, a schema with the same name as the user will be created automatically. You can also create a schema or specify another schema.

Users and roles are used to control the access to databases. A database may be used by many users, and users are grouped into a database role for easy management. A role can be a database user or a group of database users, depending on role settings. The difference between roles and users is that a role does not have the LOGIN permission by default. In service design, you are advised to use a role to configure permissions rather than accessing databases.

15.30 Does GaussDB Supports Dynamic Memory Management?

Answer: Yes. The dynamic memory usage is based on the memory context management. In terms of the memory context mechanism, the logical memory management mechanism is introduced, and multiple views are provided to trace the memory usage. Currently, the memory management of GaussDB Kernel is divided into two levels:

- Node-level memory control: You can set **max_process_memory** to determine the maximum available memory of DNs.
- Memory job-level control: You can limit the maximum memory that can be used by a single query statement.

15.31 What Is the Schema Starting with pg_temp or pg_toast_temp?

Answer: When you query the schemas, the query result contains schemas starting with pg_temp or pg_toast_temp, as shown in the following information.

```
gaussdb=# SELECT nspname FROM pg_namespace WHERE nspname LIKE 'pg_t%' AND nspname != 'pg_toast';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
          nspname
--------------------------------
 pg_temp_cn_5001_3_2_3795
 pg_toast_temp_cn_5001_3_2_3795
(2 rows)
```

Tables starting with pg_temp or pg_toast_temp are created when temporary tables are created. The schema starting with pg_temp in each session is visible only to the current session. Therefore, you are advised not to manually delete schemas starting with pg_temp or pg_toast_temp during routine operations.

Temporary tables are visible only in the current session and are automatically deleted after the session ends. The corresponding schemas are also deleted.

15.32 What Are the Differences Between Functions and Stored Procedures?

Answer: Functions and stored procedures are two common objects in databases. Both of them can encapsulate a series of SQL statements to complete certain specific operations. For details about the differences, see **Table 15-1**.

Table 15-1 Differences between functions and stored procedures

Function	Stored Procedure
The identifier of a function is **FUNCTION**.	The identifier of the stored procedure is **PROCEDURE**.
A function must have a return value.	A stored procedure can have or not have a return value.
Functions can input and output parameters.	Stored procedures can input and output parameters.
Functions can only call SELECT statements and cannot modify data in tables.	Stored procedures can modify data in tables, such as UPDATE, DELETE, and INSERT.
Stored procedures cannot be called in functions.	Functions and stored procedures can be called in stored procedures. A series of complex statements can be simplified.
Functions are used to return single values, for example, a data calculation result, a string processing result, or a table.	Stored procedures are used for DML operations, for example, inserting, updating, and deleting data in batches.

15.33 Why Can a User Log In to the Database After the CONNECT ON DATABASE Permission Is Granted to the REVOKE User?

Answer: After you run the **REVOKE CONNECT ON DATABASE dbname FROM u1** command to revoke the u1 permission, you need to specify **public** because the CONNECT permission of the database is granted to **public**.

- GaussDB provides an implicitly defined group **public** that contains all roles. By default, all new users and roles have the permissions of **public**. To revoke permissions of **public** from a user or role, or re-grant these permissions to them, add the public keyword in the REVOKE or GRANT statement.
- GaussDB grants the permissions on certain types of objects to **public**. By default, permissions on the following objects are granted to **public**:
  - CONNECT permission for databases
  - CREATE TEMP TABLE permission
  - EXECUTE permission for functions
  - USAGE permission for languages and data types (including domains)
- An object owner can revoke the default permissions granted to **public** users and grant permissions to other users as needed.

Example:

1. Create the **u1** user and the **db_test** database.
   ```
   gaussdb=# CREATE USER u1 PASSWORD '********';
   gaussdb=# CREATE DATABASE db_test;
   ```
2. The **u1** user can connect to the **test** database. Log out of the database.
   ```
   gsql -d db_test -h xxx.xxx.xxx.xxx -p xxxx -U u1 -W '********'
   ```
3. Run the **REVOKE** command to revoke the **public** user's permission to connect to **db_test**.
   ```
   gaussdb=# REVOKE CONNECT ON DATABASE db_test FROM public;
   ```
4. Verify the result and connect to the database as the **u1** user. The result shows that the **u1** user cannot connect to the database.
   ```
   gsql -d db_test -h xxx.xxx.xxx.xxx -p xxxx -U u1 -W '********'
   gsql: FATAL:  permission denied for database "db_test"
   DETAIL:  User does not have CONNECT privilege.

   -- Drop.
   gaussdb=# DROP USER u1;
   gaussdb=# DROP DATABASE db_test;
   ```

15.34 How Do I Improve the Efficiency when the Entire Table Is Associated with UPDATE?

Answer: The efficiency can be improved by eliminating the subplans. There are two update modes. In the first mode, a subplan exists in the plan. In the second mode, the subplan is eliminated, and the modification speed is greatly increased.

- Perform pre-operations: creating tables and inserting data.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a table.
gaussdb=# CREATE TABLE t1(id int, name varchar(50));
gaussdb=# CREATE TABLE t2(id int, name varchar(50));

-- Insert data.
gaussdb=# INSERT INTO t1 (id)  VALUES (generate_series(1,10000));
gaussdb=# INSERT INTO t2 VALUES (generate_series(1,30000),'name'||generate_series(1,30000));
```

- Method 1:

```
-- Part of the execution plan in method 1 is as follows:
gaussdb=# EXPLAIN ANALYZE UPDATE t1 SET name = (SELECT name FROM t2 WHERE id = t1.id);
 id |                 operation                  |        A-time         | A-rows   | E-rows |  Peak Memory  | A-
width | E-width | E-costs
----+--------------------------------------------+-----------------------+----------+--------+---------------
+---------+---------+---------
  1 | ->  Streaming (type: GATHER)               | 36683.710             |        0 |      1 | 70KB          |

```
gaussdb=# DROP TABLE t1,t2;
```

15.35 How Do I Ignore Case When Using LIKE for Fuzzy Search?

Answer: You can change LIKE to ILIKE or use the upper or lower function.

Example:

```
-- Perform pre-operations: creating tables and inserting data.
gaussdb=# CREATE TABLE tbl_test1(c1 varchar);
gaussdb=# INSERT INTO tbl_test1 VALUES ('EEE'),('ABC'),('abc'),('aabccd');

-- When LIKE is used for fuzzy query, all uppercase character strings are filtered out, which does not meet the expectation.
gaussdb=# SELECT * FROM tbl_test1 WHERE c1 LIKE 'ab%';
 c1
-----
 abc
(1 row)

-- Use ILIKE for fuzzy search.
gaussdb=# SELECT * FROM tbl_test1 WHERE c1 ILIKE 'ab%';
 c1
-----
 ABC
 abc
(2 rows)

-- Use the upper() function.
gaussdb=# SELECT * FROM tbl_test1 WHERE upper(c1) LIKE 'AB%';
 c1
-----
 ABC
 abc
(2 rows)

-- Delete.
gaussdb=# DROP TABLE tbl_test1;
```

15.36 After the String Processing Function Is Used, the Query Does Not Use the Index. What Should I Do?

Answer: After a function is used to process an index column, the standard index is not used. You can create an expression index.

Example:

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test (c1 varchar);
gaussdb=# INSERT INTO tbl_test VALUES (generate_series(1,10000));

-- The lpad() function is used for a common index, and the index is not used for query.
gaussdb=# CREATE INDEX idx_test_c1 ON tbl_test(c1);
gaussdb=# SET enable_fast_query_shipping TO off;
-- Part of the execution plan is as follows:
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# EXPLAIN ANALYZE SELECT * FROM tbl_test WHERE lpad(c1,5,'0') = '00324';
 id |          operation           |    A-time     | A-rows | E-rows | Peak Memory | A-width | E-width | E-costs
----+------------------------------+---------------+--------+--------+-------------+---------+---------+---------
  1 | ->  Streaming (type: GATHER) | 10.594        |      1 |      1 | 79KB        |         |       4 | 63.12
  2 |    ->  Seq Scan on tbl_test  | [1.674,2.418] |      1 |      1 | [15KB,56KB] |         |       4 | 62.99
(2 rows)

         Predicate Information (identified by plan id)
-------------------------------------------------------------------
   2 --Seq Scan on tbl_test
         Filter: (lpad((c1)::text, 5, '0'::text) = '00324'::text)
         Rows Removed by Filter: 9999
(3 rows)

-- After the index is changed to an expression index, the index is used for query.
gaussdb=# DROP INDEX idx_test_c1;
gaussdb=# CREATE INDEX idx_test_c1 ON tbl_test(lpad(c1,5,'0'));
gaussdb=# EXPLAIN ANALYZE SELECT * FROM tbl_test WHERE lpad(c1,5,'0') = '00324';
 id |                    operation                    |    A-time     | A-rows | E-rows | Peak Memory | A-width | E-width |
E-costs
----+-------------------------------------------------+---------------+--------+--------+-------------+---------+---------
+---------
  1 | ->  Streaming (type: GATHER)                    | 4.632         |      1 |      1 | 80KB        |         |       4 | 8.39
  2 |    ->  Index Scan using idx_test_c1 on tbl_test | [0.168,0.194] |      1 |      1 | [70KB,70KB] |         |       4 |
8.27
(2 rows)

           Predicate Information (identified by plan id)
-----------------------------------------------------------------------
   2 --Index Scan using idx_test_c1 on tbl_test
         Index Cond: (lpad((c1)::text, 5, '0'::text) = '00324'::text)
(2 rows)
-- Delete.
gaussdb=# DROP INDEX idx_test_c1;
gaussdb=# DROP TABLE tbl_test;
```

15.37 Why Cannot the Table Name or Column Name Be Identified During Query?

Answer: The most common cause is that the table name or column name is enclosed in double quotation marks (") during the creation. When double quotation marks are used, table names and column names (called identifiers) are case-sensitive in storage. Therefore, double quotation marks must be used during query and the case must match that during creation. Some APIs or applications automatically introduce double quotation marks when they are created. Therefore, you are advised to use lowercase letters when creating APIs or applications.

Example:

```
-- Create a table.
gaussdb=# CREATE TABLE "TB_test" ("Tid" int, num int);

-- If double quotation marks are not added when a table is queried, lowercase letters are used by default.
As a result, an error is reported.
gaussdb=# SELECT * FROM TB_test;
ERROR:  relation "tb_test" does not exist
LINE 1: SELECT * FROM TB_test;

gaussdb=# SELECT Tid FROM "TB_test";
ERROR:  Column "tid" does not exist
LINE 1: SELECT Tid FROM "TB_test"

-- Add double quotation marks during query.
gaussdb=# SELECT "Tid"  FROM  "TB_test";
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 Tid
-----
(0 rows)

-- Drop the table.
gaussdb=# DROP TABLE "TB_test";
```

15.38 If No Distribution Key Is Specified, How Will Data Be Stored?

Answer: If no distribution key is specified during table creation, data is stored as follows:

- If the primary key or unique constraint is included during table creation, hash distribution is selected. The distribution key is the column corresponding to the primary key or unique constraint.

```
gaussdb=# CREATE TABLE tb_test1
(
    W_WAREHOUSE_SK            INTEGER            PRIMARY KEY,
    W_WAREHOUSE_ID            CHAR(16)             NOT NULL,
    W_WAREHOUSE_NAME          VARCHAR(20)
);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "tb_test1_pkey" for table "tb_test1"
CREATE TABLE

gaussdb=# SELECT getdistributekey('tb_test1');
 getdistributekey
------------------
 w_warehouse_sk
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE tb_test1;
```

- If the primary key or unique constraint is not included during table creation but there are columns whose data types can be used as distribution keys, hash distribution is selected. The distribution key is the first column whose data type can be used as a distribution key.

```
gaussdb=# CREATE TABLE tb_test2
(
    W_WAREHOUSE_SK            INTEGER                    ,
    W_WAREHOUSE_ID            CHAR(16)             NOT NULL,
    W_WAREHOUSE_NAME          VARCHAR(20)
);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'w_warehouse_sk' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# SELECT getdistributekey('tb_test2');
 getdistributekey
------------------
 w_warehouse_sk
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE tb_test2;
```

- If the primary key or unique constraint is not included during table creation and no column whose data type can be used as a distribution key exists, round-robin distribution is selected.

```
gaussdb=# CREATE TABLE tb_test3
(
    W_WAREHOUSE_ID            CHAR(16)             NOT NULL,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    W_WAREHOUSE_NAME          VARCHAR(20)
);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'w_warehouse_id' as the distribution
column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# SELECT getdistributekey('tb_test3');
 getdistributekey
------------------
 w_warehouse_id
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE tb_test3;
```

15.39 What Is Data Skew and How Do I Check Data Skew?

Answer: Data skew indicates that data is unevenly distributed on multiple DNs. For a hash table, an inappropriate distribution key may cause data skew or poor efficiency on certain DNs. Therefore, you need to periodically check or monitor the table to ensure that data is evenly distributed on each DN. Run the following statement to check the number of tuples on each DN:

```
gaussdb=# SELECT a.count,b.node_name FROM (SELECT count(*) AS count,xc_node_id FROM tablename
GROUP BY xc_node_id) a, pgxc_node b WHERE a.xc_node_id=b.node_id ORDER BY a.count DESC;
```

If tuple numbers vary greatly (several times or tenfold) in each DN, a data skew occurs. Change the data distribution key. ALTER TABLE cannot change distribution keys. Therefore, you need to rebuild a table when changing its distribution keys.

15.40 What Are the Application Scenarios of Replication Tables?

Answer: A replication table replicates all data in the table to each DN in the cluster. That is, each DN has a replica. You are advised to use replication tables in the following scenarios:

- Smaller tables (less than 2 GB), such as dimension data tables in the star structure.
- Tables that do not frequently insert, update, or delete data.
- Tables where simple queries are frequently performed. You are advised not to use replication tables for complex queries (conditions include LIKE or NOT LIKE). This complex query calculates each row of the table. In this case, the performance is the best when the calculation is distributed on all nodes. If the table is a replication table, the calculation runs only on one node.
