  - The **eol** parameter supports only the TEXT format for data import and export and does not support the CSV or FIXED format for data import. For forward compatibility, the **EOL** parameter can be set to **0x0D** or **0x0D0A** for data export in the CSV or FIXED format.
  - The value of **EOL** cannot be the same as that of the **delimiter** or **null** parameter.
  - The **EOL** parameter value cannot contain the following characters: .abcdefghijklmnopqrstuvwxyz0123456789.

- fix

  Specifies the length of fixed-length data. The unit is byte. This syntax is available only for READ ONLY foreign tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: less than 1 GB, and greater than or equal to the total length specified by **POSITION** (The total length is the sum of **offset** and **length** in the last column of the table definition.)

- out_fix_alignment

  Specifies how the columns of the types BYTEAOID, CHAROID, NAMEOID, TEXTOID, BPCHAROID, VARCHAROID, NVARCHAR2OID, and CSTRINGOID are aligned during fixed-length export.

  Value range: **align_left** and **align_right**

  Default value: **align_right**

NOTICE

The bytea data type must be in hexadecimal format (for example, \XXXX) or octal format (for example, \XXX\XXX\XXX). The data to be imported must be left-aligned (that is, the column data starts with either of the two formats instead of spaces). Therefore, if the exported file needs to be imported using a GDS foreign table and the file data length is less than that specified by the foreign table formatter, the exported file must be left aligned. Otherwise, an error is reported during the import.

- date_format

  Specifies the DATE format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid DATE value. For details, see **Date and Time Processing Functions and Operators**.

  NOTE

  If Oracle is specified as the compatible database, the DATE format is **TIMESTAMP**. For details, see **timestamp_format** below.

- time_format

  Specifies the TIME format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid TIME value. Time zones are not supported. For details, see **Date and Time Processing Functions and Operators**.

- timestamp_format

  Specifies the TIMESTAMP format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid TIMESTAMP value. Time zones cannot be used. For details, see **Date and Time Processing Functions and Operators**.

- smalldatetime_format

  Specifies the SMALLDATETIME format for data import. This syntax is available only for READ ONLY foreign tables.

  Value range: a valid SMALLDATETIME value. For details, see **Date and Time Processing Functions and Operators**.

- compatible_illegal_chars

  Specifies whether to tolerate invalid characters during data import. This syntax is available only for READ ONLY foreign tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **true**/**on** or **false**/**off**. The default value is **false**/**off**.

- **true** or **on**: No error message is reported and data import is not interrupted when there are invalid characters. Invalid characters are converted into valid ones, and then imported to the database.
- **false** or **off**: An error occurs when there are invalid characters, and the import stops.

NOTE

The rules for converting invalid characters are as follows:

- Invalid characters are converted to the characters specified by the GUC parameter **convert_illegal_char_mode**. The default value is **?**.
- Setting **compatible_illegal_chars** to **true** /**on** enables toleration of invalid characters. If **NULL**, **DELIMITER**, **QUOTE**, and **ESCAPE** are set to spaces or question marks, error messages like "illegal chars conversion may confuse COPY escape 0x20" will be displayed to prompt you to modify parameters that may cause confusion, preventing importing errors.
- If the GUC parameter **copy_special_character_version** is set to **'no_error'**, invalid characters will not be checked during data import and query, and will be imported in the original format and displayed as garbled characters in query results. Therefore, exercise caution when setting this parameter.
- When **copy_special_character_version** is set to **'no_error'**, its priority is higher than that when **compatible_illegal_chars** is set to **true**.

- **READ ONLY**

  Specifies whether a foreign table is read-only. This parameter is available only for data import.

- **WRITE ONLY**

  Specifies whether a foreign table is write-only. This parameter is available only for data import.

- **WITH error_table_name**

  Specifies the table where data format errors generated during parallel data import are recorded. You can query the error information table after data is imported to obtain error details. This parameter is available only after **reject_limit** is set.

  NOTE

  To be compatible with PG open-source APIs, you are advised to replace this syntax with **LOG INTO**.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **LOG INTO error_table_name**

  Specifies the table where data format errors generated during parallel data import are recorded. You can query the error information table after data is imported to obtain error details.

  NOTE

  This parameter is available only after **PER NODE REJECT LIMIT** is set.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **REMOTE LOG 'name'**

  Specifies that the data format error information is saved as files in GDS. **name** is the prefix of the error data file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **PER NODE REJECT LIMIT 'value'**

  Specifies the maximum number of data format errors allowed on each DN during data import. If the number of errors exceeds the specified value on any DN, data import fails, an error is reported, and the system exits data import.

  NOTICE

  This syntax specifies the error tolerance of a single node.

  Data format errors include the following: a column is lost, an extra column exists, a data type is incorrect, and encoding is incorrect. Once a non-data-format error occurs, the whole data import process is stopped.

  Value range: an integer or **unlimited**. The default value is 0, indicating that error information is returned immediately.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  Currently, **TO GROUP** is not supported. **TO NODE** is used for internal scale-out tools.

Examples

```
-- Create a foreign table to import data from GDS servers 192.168.0.90 and 192.168.0.91 in text format. Record errors that occur during data import to the err_HR_staffS table.
gaussdb=# CREATE FOREIGN TABLE foreign_HR_staffS
(
  staff_ID       NUMBER(6) ,
  FIRST_NAME     VARCHAR2(20),
  LAST_NAME      VARCHAR2(25),
  EMAIL          VARCHAR2(25),
  PHONE_NUMBER   VARCHAR2(20),
  HIRE_DATE      DATE,
  employment_ID  VARCHAR2(10),
  SALARY         NUMBER(8,2),
  COMMISSION_PCT NUMBER(2,2),
  MANAGER_ID     NUMBER(6),
  section_ID  NUMBER(4)
) SERVER gsmpp_server OPTIONS (location 'gsfs://192.168.0.90:5000/* | gsfs://192.168.0.91:5000/*', format 'TEXT', delimiter E'\x20',  null '') WITH err_HR_staffS;

-- Create a foreign table to import data from GDS servers 192.168.0.90 and 192.168.0.91 in text format and record error messages in the import process to the err_HR_staffS table. A maximum of two data format errors are allowed during the import.
gaussdb=# CREATE FOREIGN TABLE foreign_HR_staffS_ft3
(
  staff_ID       NUMBER(6) ,
  FIRST_NAME     VARCHAR2(20),
  LAST_NAME      VARCHAR2(25),
  EMAIL          VARCHAR2(25),
  PHONE_NUMBER   VARCHAR2(20),
  HIRE_DATE      DATE,
  employment_ID  VARCHAR2(10),
  SALARY         NUMBER(8,2),
  COMMISSION_PCT NUMBER(2,2),
  MANAGER_ID     NUMBER(6),
  section_ID  NUMBER(4)
) SERVER gsmpp_server OPTIONS (location 'gsfs://192.168.0.90:5000/* | gsfs://192.168.0.91:5000/*', format 'TEXT', delimiter E'\x20',  null '',reject_limit '2') WITH err_HR_staffS_ft3;

-- Create a foreign table to import all files in the input_data directory in CSV format.
gaussdb=# CREATE FOREIGN TABLE foreign_HR_staffS_ft1
(
  staff_ID       NUMBER(6) ,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  FIRST_NAME     VARCHAR2(20),
  LAST_NAME      VARCHAR2(25),
  EMAIL          VARCHAR2(25),
  PHONE_NUMBER   VARCHAR2(20),
  HIRE_DATE      DATE,
  employment_ID  VARCHAR2(10),
  SALARY         NUMBER(8,2),
  COMMISSION_PCT NUMBER(2,2),
  MANAGER_ID     NUMBER(6),
  section_ID     NUMBER(4)
) SERVER gsmpp_server OPTIONS (location 'file:///input_data/*', format 'csv', mode 'private', delimiter ',')
WITH err_HR_staffS_ft1;

-- Create a foreign table to export data to the output_data directory in CSV format.
gaussdb=# CREATE FOREIGN TABLE foreign_HR_staffS_ft2
(
  staff_ID       NUMBER(6) ,
  FIRST_NAME     VARCHAR2(20),
  LAST_NAME      VARCHAR2(25),
  EMAIL          VARCHAR2(25),
  PHONE_NUMBER   VARCHAR2(20),
  HIRE_DATE      DATE,
  employment_ID  VARCHAR2(10),

  section_ID  NUMBER(4)
) SERVER gsmpp_server OPTIONS (location 'file:///output_data/', format 'csv', delimiter '|', header 'on')
WRITE ONLY;

-- Delete the foreign table.
gaussdb=# DROP FOREIGN TABLE foreign_HR_staffS;
gaussdb=# DROP FOREIGN TABLE foreign_HR_staffS_ft1;
gaussdb=# DROP FOREIGN TABLE foreign_HR_staffS_ft2;
gaussdb=# DROP FOREIGN TABLE foreign_HR_staffS_ft3;
```

Helpful Links

DROP FOREIGN TABLE

Suggestions

- delimiter
  - A delimiter cannot be **\r** or **\n**, or the same as the null value. The delimiter of CSV data cannot be same as the **quote** value.
  - The data length of a single row should be less than 1 GB. A row that has many columns using long delimiters cannot contain much valid data.
  - You are advised to use a multi-character, such as the combination of the dollar sign ($), caret (^), and ampersand (&), or invisible characters, such as 0x07, 0x08, and 0x1b as the delimiter.
- quote
  - The value of **quote** cannot be the same as that of the **delimiter** or null parameter. The value must be a single-byte character.
  - Invisible characters are recommended, such as 0x07, 0x08, and 0x1b.
- mode Normal
  - Supports all file types (including CSV, TEXT, and FIXED). To import data, you need to enable GDS on the data server.
- mode Shared

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Supports the TEXT format. It does not need assistance from GDS, but requires that all the user data be mounted to the same path of the same nodes through NFS.
- mode Private
  - This mode is used when user data has been stored in the same local directories of DNs.

7.12.9.22 CREATE FUNCTION

Description

Creates a function.

Precautions

- If the parameters or return values of a function have precision, the precision is not checked.
- When creating a function, you are advised to explicitly specify the schemas of tables in the function definition. Otherwise, the function may fail to be executed.
- **current_schema** and **search_path** specified by SET during function creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- If a function has output parameters, the GUC parameter **behavior_compat_options** must be set to **'proc_outparam_override'** for the output parameters to take effect. When the function is called using SELECT or CALL, an argument must be provided in the position of the output parameter. Otherwise, the function fails to be called.
- Only the functions compatible with PG or those with the PACKAGE attribute can be overloaded. After **REPLACE** is specified, a new function is created instead of replacing a function if the number of parameters, parameter type, or return value is different.
- You cannot create overloaded functions with different formal parameter names (the function name and parameter list type are the same).
- You cannot create a function that has the same name and parameter list as a stored procedure.
- Formal parameters cannot be overloaded if only the custom ref cursor type is different from the sys_refcursor type.
- Function overloading is not supported if only the returned data types are different.
- Function overloading is not supported if only the default values are different.
- When an overloaded function is called, the variable type must be specified.
- ORA-compatible functions are created for ORA-compatible databases and PG-compatible functions are created for PG-compatible databases. Hybrid creation is not recommended.
- If a function supports overloading, you need to add the keyword PACKAGE.
- If an undeclared variable is used in a function, an error is reported when the function is called.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- You can use the SELECT statement to specify different parameters using identical functions, but cannot use the CALL statement to call identical functions without the PACKAGE attribute.
- When you create a function, you cannot insert other agg functions out of the avg function or other functions.
- In common cluster mode, return values, parameters, and variables cannot be set to the tables of the node groups that are not installed in the system by default. The internal statements of SQL functions cannot be executed on such tables.
- By default, the permissions to execute new functions are granted to PUBLIC users. For details, see **GRANT**. By default, a user inherits the permissions of the PUBLIC role. Therefore, the user has the permission to execute a function and view the definition of the function. In addition, to execute the function, the user must have the USAGE permission on the schema to which the function locates. You can revoke the default execution permissions from the PUBLIC role when creating a function and grant the function execution permission to users as needed. To avoid the time window during which new functions can be accessed by all users, create functions and set function execution permissions in a transaction. After the database object isolation attribute is enabled, common users can view only the definitions of functions that they have permission to execute.
- If a function is defined as **IMMUTABLE** or **SHIPPABLE**, avoid **INSERT**, **UPDATE**, **DELETE**, **MERGE**, and **DDL** operations in the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur. If DDL operations are performed on a function of the IMMUTABLE or SHIPPABLE type, database objects on each node may be inconsistent. To resolve this problem, create the VOLATILE PL/SQL function on the CN, run the EXECUTE statement in the function definition to dynamically execute the DDL operation for repairing system objects, and then use the EXECUTE DIRECT ON syntax to call the repair function on the specified DN.
- When functions without parameters are called inside another function, you can omit brackets and call functions using their names directly.
- If the GUC parameter **behavior_compat_options** is not set to **'proc_outparam_override'**, the **OUT** and **IN OUT** output parameters of the function directly called by an anonymous block or stored procedure cannot be of the composite type, and the return value is used as the first value of the **OUT** output parameter. As a result, the calling fails. To correctly use the **OUT** and **IN OUT** output parameters, set the parameter **behavior_compat_options** to **'proc_outparam_override'**. For details, see the example.
- When other functions with output parameters are called in a function and an assignment expression, set the GUC parameter **behavior_compat_options** to **'proc_outparam_override'**, define variables of the same type as the output parameters in advance, and use the variables as output parameters to call other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the called functions will be ignored.
- After the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**, if the return type of the function is setof, the output parameter will not take effect.
- Oracle-compatible functions support viewing, exporting, and importing parameter comments.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Oracle-compatible functions support viewing, exporting, and importing comments between IS/AS and plsql_body.
- Users with the CREATE ANY FUNCTION permission can create or replace functions in the user schemas.
- The default permission on a function is SECURITY INVOKER. To change the permission to SECURITY DEFINER, set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**.
- When creating a function, you cannot use the function itself as the default value of input parameter.
- The function with **OUT** parameter cannot be called by SQL statement.
- The function with **OUT** parameter cannot be called by SELECT INTO syntax.
- Functions with **OUT** parameters cannot be called in nested mode.

  Example:

  ```
  b := func(a,func(c,1));
  ```

  Should be changed to:

  ```
  tmp := func(c,1); b := func(a,tmp);
  ```
- When a function is created, the type of the return value of the function is not checked.
- If a function with the definer specified is created in a schema of another user, the function will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: The execute immediate sqlv using func syntax is used to execute a function. The select func into syntax is used to execute a function. DML statements such as INSERT and UPDATE are used to execute a function. The select where a=func() statement is used. When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- In the RETURN statement of a function, when the constructor of the composite type is called, if the actual return type is different from the defined return type, the result can be implicitly converted to the defined return type. Cross-schema call is supported, for example: **RETURN schema.record;**. Cross-database call is not supported, for example, **RETURN package.schema.record;**. In the RETURN statement of a function, when the function is called, the function with the OUT parameter in an expression of an arithmetic operation is not supported, for example, **RETURN func(c out) + 1**.
- When the complex function is called, for example, func(x).a, a composite type is returned. Cross-schema call is supported, but the database.schema.package.func(x).b call is not supported.
- When a stored procedure with the **out** parameter is called, you can set the GUC parameter **behavior_compat_options** to **'proc_outparam_transfer_length'** to pass the parameter length. The specifications and constraints are as follows:

  a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).

  b. If the **out** parameter does not take effect (for example, **perform**), the length does not need to be passed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.

d. Regardless of whether the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**, the parameter length can be passed.

e. If you need to pass the length of elements of the collection type and the length of elements of the array type nested by the collection type, you need to set the GUC parameter **behavior_compat_options** to **tableof_elem_constraints**.

- Functions contain syntax and functions that use GUC parameters to control features. If GUC parameters are modified in a session, the result may be inconsistent with the expected result. If the parameters are modified, the function may retain the behavior before the modification. Therefore, exercise caution when modifying GUC parameters.
- Only the initial user can perform the REPLACE operation on the functions of the initial user.

Syntax

- PG-compatible syntax for creating a user-defined function:

```
CREATE [ OR REPLACE  ] FUNCTION function_name
   ( [  { argname [ argmode  ] argtype [  { DEFAULT  | :=  | =  } expression  ]}  [, ...]  ] )
   [ RETURNS rettype [ DETERMINISTIC  ]  | RETURNS TABLE (  { column_name column_type  }
[, ...] )]
   LANGUAGE lang_name
   [
     {IMMUTABLE  | STABLE  | VOLATILE }
      | {SHIPPABLE | NOT SHIPPABLE}
      | WINDOW
      | [ NOT  ] LEAKPROOF
      | {CALLED ON NULL INPUT  | RETURNS NULL ON NULL INPUT | STRICT }
      | {[ EXTERNAL  ] SECURITY INVOKER | [ EXTERNAL  ] SECURITY DEFINER | AUTHID DEFINER  |
AUTHID CURRENT_USER}
      | {fenced | not fenced}
      | {PACKAGE}
      | COST execution_cost
      | ROWS result_rows
      | SET configuration_parameter { {TO | =} value | FROM CURRENT }
   ][...]
   {
      AS 'definition'
      | AS 'obj_file', 'link_symbol'
   };
```

- O-style syntax for creating a user-defined function:

```
CREATE [ OR REPLACE  ] FUNCTION function_name
   ( [  { argname [ argmode  ] argtype [  { DEFAULT | := | =  } expression  ] }  [, ...]  ] )
   RETURN rettype [ DETERMINISTIC  ]
   [
      {IMMUTABLE  | STABLE  | VOLATILE }
      | {SHIPPABLE | NOT SHIPPABLE}
      | {PACKAGE}
      | {FENCED | NOT FENCED}
      | [ NOT  ] LEAKPROOF
      | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
      | {[ EXTERNAL  ] SECURITY INVOKER  | [ EXTERNAL  ] SECURITY DEFINER | AUTHID DEFINER |
AUTHID CURRENT_USER}
      | COST execution_cost
      | ROWS result_rows
      | SET configuration_parameter { {TO | =} value  | FROM CURRENT }
      | LANGUAGE lang_name
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  ][...]
  {
    IS  | AS
  } plsql_body
/
```

Parameters

- **function_name**

  Specifies the name of the function to be created (optionally schema-qualified).

  Value range: a string that complies with the **Identifier Naming Conventions**. The value contains a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function name.

  NOTE

  You are advised not to create a function with the same name as a system function. Otherwise, you need to specify the schema of the function when calling the function.

- **argname**

  Specifies the parameter name of the function.

  Value range: a string that complies with the **Identifier Naming Conventions**. The value contains a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the function parameter name.

- **argmode**

  Specifies the parameter mode of the function.

  Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in the function definition of RETURNS TABLE.

  NOTE

  VARIADIC specifies parameters of the array type.

- **argtype**

  Specifies the data type of a function parameter. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type. For details, see **Variable Definition Statements**.

- **expression**

  Specifies the default expression of a parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- If **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
- It is recommended that you define all default parameters after all non-default parameters.
- If a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
- If **proc_uncheck_default_param** is enabled and a function with default parameters is called, input parameters are added to the function from left to right. These inputs can be set to default values. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
- When **a_format_version** is set to **10c**, **a_format_dev_version** is set to **s1**, **proc_outparam_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.

- **rettype**

  Specifies the return data type. Same as **argtype**, **%TYPE** or **%ROWTYPE** can also be used to indirectly reference types.

  When there is **OUT** or **INOUT** parameter, the RETURNS clause can be omitted. If the clause is not omitted, the result type of the clause must be the same as that of the output parameter. If there are multiple output parameters, the result type of the clause is RECORD. Otherwise, the result type of the clause is the same as that of a single output parameter.

  The SETOF modifier indicates that the function will return a set of items, rather than a single item.

- **column_name**

  Specifies the column name.

- **column_type**

  Specifies the column type.

  NOTE

  When the return type of the function is RETURNS TABLE, each column is regarded as an **out** parameter. When the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**, you must call functions using SELECT and CALL based on the actual parameters provided by the corresponding column. Otherwise, an error is reported, indicating that the function does not exist.

- **definition**

  Specifies a string constant defining a function. Its meaning depends on the language. It can be an internal function name, a path pointing to a target file, an SQL query, or text in a procedural language.

- **DETERMINISTIC**

  Specifies an API compatible with the SQL syntax. You are advised not to use it.

- **LANGUAGE lang_name**

  Specifies the name of the language that is used to implement the function. It can be **SQL**, **C**, **internal**, or the name of a customized process language. To ensure downward compatibility, the name can use single quotation marks. Contents in single quotation marks must be capitalized.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Due to compatibility issues, no matter which language is specified when an ORA-style database is created, the language used is plpgsql.

NOTE

- When an internal function is defined, if AS specifies the function as an internal system function, the parameter type, number of parameters, and return value type of the new function must be the same as those of the internal system function, and the user who creates the internal function must have the permission to execute the internal system function.
- Only users with the SYSADMIN permission can create internal functions.

- **WINDOW**

  Specifies that the function is a window function. This is currently only useful for functions written in C. The **WINDOW** attribute cannot be changed when replacing an existing function definition.

NOTICE

For a customized window function, the value of **LANGUAGE** can only be **internal**, and the referenced internal function must be a window function.

- **IMMUTABLE**

  Specifies that the function always returns the same result if the parameter values are the same.

- **STABLE**

  Specifies that the function cannot modify the database, and that within a single table scan it will consistently return the same result for the same parameter value, but its result varies by SQL statements.

- **VOLATILE**

  Specifies that the function value can change in a single table scan and no optimization is performed.

- **SHIPPABLE**

  NOT SHIPPABLE

  Specifies whether the function can be pushed down to DNs for execution.

  – Functions of the IMMUTABLE type can always be pushed down to DN.

  – Functions of the STABLE or VOLATILE type can be pushed down to DN only if their attribute is **SHIPPABLE**.

NOTICE

- The function or stored procedure of the SHIPPABLE/IMMUTABLE type cannot contain EXCEPTION or call functions or stored procedures that contain EXCEPTION.
- If the result of a function depends on the scanning of data tables or a function has modified data or performed DDL operations on data tables, do not set the function attribute to **IMMUTABLE** or **SHIPPABLE**. Otherwise, database execution may be abnormal.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **PACKAGE**

  Specifies whether the function can be overloaded.

  - All PACKAGE and non-PACKAGE functions cannot be overloaded or replaced.
  - PACKAGE functions do not support parameters of the VARIADIC type.
  - The **PACKAGE** attribute of functions cannot be modified.

- **LEAKPROOF**

  Specifies that the function has no side effects. **LEAKPROOF** can be set only by system administrators.

- **CALLED ON NULL INPUT**

  Declares that some parameters of the function can be called in normal mode if the parameter values are null. This parameter can be omitted.

- **RETURNS NULL ON NULL INPUT**

  STRICT

  Specifies that the function always returns null whenever any of its parameters is null. If this parameter is specified, the function is not executed when there are null parameters; instead a null result is returned automatically.

  RETURNS NULL ON NULL INPUT and **STRICT** have the same functions.

- **EXTERNAL**

  The purpose is to be compatible with SQL statements and it is optional. This feature applies to all functions, not only external functions.

- **SECURITY INVOKER**

  AUTHID CURRENT_USER

  Specifies that the function will be executed with the permissions of the user who calls it. This parameter can be omitted.

  SECURITY INVOKER and **AUTHID CURRENT_USER** have the same functions.

- **SECURITY DEFINER**

  AUTHID DEFINER

  Specifies that the function will be executed with the permissions of the user who created it.

  AUTHID DEFINER and **SECURITY DEFINER** have the same functions.

- **FENCED**

  NOT FENCED

  Specifies whether the function is executed in fenced mode or not fenced mode. In **NOT FENCED** mode, a function is executed in a CN or DN process. In **FENCED** mode, a function is executed in a new fork process, which does not affect CN or DN processes.

  Application scenarios:

  - Develop or debug a function in **FENCED** mode and execute it in **NOT FENCED** mode. This reduces the overhead of the fork process and communication.
  - Perform complex OS operations, such as opening a file, and processing signals and threads in FENCED mode; otherwise, the GaussDB database execution may be affected.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Customize PL/SQL functions. If this parameter is not specified, the default value **NOT FENCED** is used and the **FENCED** execution mode is not supported.

- **COST execution_cost**

  Estimates the execution cost of a function.

  The unit of **execution_cost** is **cpu_operator_cost**.

  Value range: ≥ 0

- **ROWS result_rows**

  Estimates the number of rows returned by the function. This is only allowed when the function is declared to return a set.

  Value range: ≥ 0. The default value is **1000**.

- **configuration_parameter**

  - **value**

    Sets a specified database session parameter to a specified value. If the value is **DEFAULT** or **RESET**, the default setting is used in the new session. **OFF** disables the setting.

    Value range: a string

    - **DEFAULT**
    - **OFF**
    - RESET
    - Specified default value

  - **FROM CURRENT**

    Uses the value of **configuration_parameter** of the current session.

- **plsql_body**

  Specifies the PL/SQL stored procedure body.

  When a stored procedure is created, the **PLSQL_BODY** can end with "END;" or "END function_name;".

  NOTE

  The constraints for storage procedures ending with "END function_name;" are the same as those specified in section "CREATE PROCEDURE". For details, see the **constraints for storage procedures ending with "END procedure_name;"**.

NOTICE

When you are performing operations in the function body related to password or key, such as creating a user, changing a password, encrypting or decrypting, the system catalog and log record plaintext information about the password or key. To prevent sensitive information leakage, you are advised not to perform operations on the function body related to sensitive information, such as passwords or keys.

ALTER FUNCTION and **DROP FUNCTION**

Suggestions

- analyse | analyze
  - Do not run **ANALYZE** in a transaction or anonymous block.
  - Do not run **ANALYZE** in a function or stored procedure.

7.12.9.23 CREATE GLOBAL INDEX

Description

A global secondary index (GSI) is created on a specified table.

The GSIs allow users to define indexes that are inconsistent with the distribution of base tables. In this way, single-node plans for querying non-distributed keys of base tables and UNIQUE/PRIMARY KEY constraints on non-distributed keys of base tables are achieved.

NOTE

You are advised to create GSIs on a base table as ordinary indexes to improve IUD execution efficiency. In addition, after the GSIs are created on the base table, the IUD performance is affected and deteriorates.

Precautions

- Similar to the base table constraints, the distribution key of GSIs does not support the UPDATE or MERGE INTO operation.
- The GSI can be created only in GTM-lite mode. If a GSI is created in other GTM modes, an error is reported.
- Astore does not support the creation of UB-tree other than GSI and does not support the creation of partitions for GSI.
- The GSI whose distribution is the same as that of the base table cannot be created. Otherwise, an error will be reported during the execution.
- CREATE GSI CONCURRENTLY can be executed only for Ustore tables. If CREATE GSI CONCURRENTLY is executed for Astore tables, a syntax error is reported. CREATE GSI CONCURRENTLY cannot be executed for expression indexes and partial indexes. Otherwise, a syntax error is reported.
- Hash-based GSIs can be created for row-store Astore tables, Ustore tables, partitioned tables, hash bucket tables, and segment-page tables whose base tables are hash-based. Base tables cannot be replication tables, level-2 partitioned tables, or list/range distribution tables. GSIs support hash-based distribution only.
- GSIs cannot be created for a base table when any column name, such as **ctid**, **xc_node_hash**, **xmin**, **xmax**, **tableoid** (for a partitioned table), and

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

tablebucketid (for a hash bucket table) of the base table is duplicate with an existing column name after it is suffixed with "_new$$" or "_NEW$$."

- If the base table is a partitioned non-hash bucket table, the GSI allows a maximum of 27 columns. If the base table is a non-partitioned hash bucket table, the GSI allows a maximum of 27 columns. If the base table is a partitioned hash bucket table, the GSI allows a maximum of 26 columns. If the base table is a non-partitioned non-hash bucket table, the GSI allows a maximum of 28 columns (including index keys and distribution keys).
- For GSI creation, GSI rebuild, and operations related to GSI rebuild, for example, partitioning operations (such as DROP, TRUNCATE, MERGE, SPLIT and EXCHANGE PARTITION) on a partitioned table, UPDATE DISTRIBUTED GLOBAL INDEX, ALTER TABLE involving data rebuild, as well as ALTER SET TABLESPACE and MOVE PARTITION operations on a hash bucket table, you are advised to enable the STREAM mode to achieve optimal performance. To enable the STREAM mode, set **enable_stream_operator** to **ON** and **create_gsi_opt** to **build**.
- UPSERT is not supported. IUD returning is not supported in the base table where a GSI is created.
- If the VACUUM FULL, CLUSTER, or REINDEX operation on a table is interrupted, the GSI on the table may turn to the **UNUSABLE** state. In this case, an error will be reported when the GSI is queried. You are advised to run **REINDEX INDEX** to rebuild the GSI.
- When executing **COPY** or **GDS** to import data to a base table with a GSI, the **enable_stream_operator** parameter must be enabled to achieve optimal data import performance.
- The following operations will invalidate GSIs: database-level REINDEX, database-level/partition-level CLUSTER, ALTER TABLE PARTITION (DROP, TRUNCATE, MERGE, SPLIT, and EXCHANGE PARTITION). If **UPDATE DISTRIBUTED GLOBAL INDEX** is not specified, all GSIs on the partitioned table will be invalidated. If **UPDATE DISTRIBUTED GLOBAL INDEX** is not specified for EXCHANGE PARTITION, all GSIs on the ordinary table will be invalidated.
- TABLE ACCESS BY INDEX ROWID supports STREAM and non-STREAM distributed plans. The STREAM distributed plans inherit STREAM-related constraints. Considering the STREAM communication latency, when the selectivity is too low or the number of predicate hit rows is small, the performance is not optimal. In this case, you are advised not to use TABLE ACCESS BY INDEX ROWID. Instead, you are advised to use ordinary indexes. For a non-STREAM distributed plan, GSI table hints are required. This plan is applicable to scenarios where the number of predicate hit rows is small. If the performance of the STREAM distributed plan is not optimal, you can use a non-STREAM distributed plan. For details, see **Global Secondary Index Scanning for Table Access by Index Row ID**.
- In the INSERT INTO SELECT scenario, you are advised to enable the **enable_stream_operator** parameter to insert and execute the STREAM plan. (If the base table is a segment-page table, hash bucket table, or tamper-proof table, the CN plan is still used.) If **enable_stream_operator** is disabled, the execution plan goes back to the CN, and the performance is poor (similar to the performance of creating GSIs in version 503.1.0).
- For INSERT, UPDATE, and DELETE, the execution plan is executed in distributed mode, which causes performance loss. In batch UPDATE/DELETE

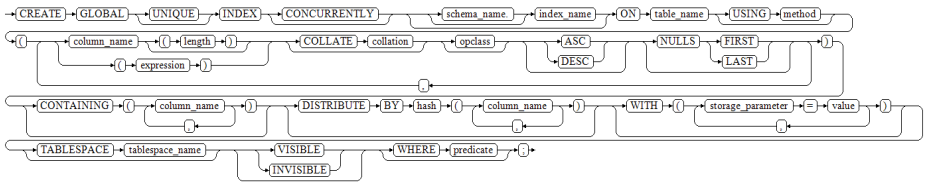
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

scenarios, the execution plan goes back to the CN, which causes poor performance.

- GSIs can contain expressions but have the following constraints:
  - Similar to the base table constraints, distribution keys cannot contain expressions. In addition, GSIs whose index column contains only an expression cannot be created either because the distribution key must be an expression. If such GSI is created, a syntax error is reported.
  - Similar to ordinary index constraints, the **CONTAINING** column cannot contain expressions. Otherwise, a syntax error will be reported.
  - If any column name is prefixed with "expr", no GSI containing an expression can be created. Otherwise, a syntax error will be reported.
- When **ENABLE_PBE_OPTIMIZATION** is disabled, the GSI layer of the INSERT, UPDATE, DELETE, and MERGE INTO operations uses a gplan.

Syntax

```
CREATE GLOBAL [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schema_name.]index_name ] ON table_name
[ USING method ]
    ({ { column_name [ ( length ) ] | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ]
[ NULLS { FIRST | LAST } ] }[, ...] )
    [CONTAINING (column_name [ ,... ])] [DISTRIBUTE BY hash(column_name [ ,... ])][ WITH
( {storage_parameter = value} [, ... ] )]
    [ TABLESPACE tablespace_name ] [ VISIBLE | INVISIBLE ] [ WHERE predicate];
```



Parameters

- **UNIQUE**

  Creates a unique index. In this way, the system checks whether new values are unique in the index column. If the inserted or updated value causes duplicate records, an error is reported.

- **CONCURRENTLY**

  Creates an index (with ShareUpdateExclusiveLock) in a mode that does not block DML statements. When an index is created, other statements cannot access the table on which the index depends. If this keyword is specified, DML statements are not blocked during the creation.
  - The CREATE GLOBAL INDEX statement can be run within a transaction, but CREATE GLOBAL INDEX CONCURRENTLY cannot.
  - An index may fail to be created online. The possible causes are as follows: The user instructs to terminate the online creation command. The definition of the index is modified. The definition of the base table is modified and the definition of the index is affected. For a non-critical error, an error message is displayed when online index building fails and the system attempts to automatically clear the index. For a critical error, such as FATAL, PANIC, and database fault, and a clearing failure, an unusable index is left. This index is ignored by queries, but it still consumes the IUD overhead. Therefore, you are advised to use the DROP

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

INDEX IF EXISTS syntax to delete the index and create the index online, or use the REINDEX/REBUILD syntax to rebuild the index.

- Do not use CREATE GLOBAL INDEX CONCURRENTLY together with other DDL operations. Otherwise, deadlocks or errors may occur. In this case, reconnect to the client and try again.

- **schema_name**

  Specifies the schema name.

  Value range: an existing schema name.

- **index_name**

  Specifies the name of the index to be created. No schema name can be included here; the index is always created in the same schema as its parent table.

  Value range: a string. It must comply with the **naming convention**.

- **table_name**

  Specifies the name of the table to be indexed (optionally schema-qualified).

  Value range: an existing table name.

- **USING method**

  Specifies the name of the index method to be used.

  Value range: UB-tree. The multi-version B-tree index is provided. The index page contains transaction information.

- **column_name**

  Specifies the name of the column on which an index is to be created.

  If the index mode supports composite indexes, multiple columns can be declared. A maximum of 28 columns can be declared for a non-partitioned base table, and a maximum of 27 columns can be declared for a partitioned base table.

- **column_name (length)**

  Specifies the supported prefix key. For details, see **column_name (length)**.

  As an expression index, the prefix index has the same constraints as the expression key in GSI.

- **expression**

  Specifies an expression based on one or more columns of the table. The expression usually must be written with surrounding parentheses, as shown in the syntax. However, the parentheses can be omitted if the expression has the form of a function call. The expression index can be used to obtain fast access to data based on some transformation of the basic data. For example, an index computed on upper(col) would allow the WHERE upper(col) = 'JIM' clause to use an index. If an expression contains the IS NULL clause, the index for this expression is invalid. In this case, you are advised to create a partial index.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **select * from pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **opclass**

  Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column.

- **ASC**

  Specifies an ascending (default) sort order.

- **DESC**

  Specifies a descending sort order.

- **NULLS FIRST**

  Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.

- **NULLS LAST**

  Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.

- **CONTAINING**

  Specifies the base table attributes other than index keys contained in the GSI.

- **CONTAINING (column_name [, ...])**

  Specifies the base table attributes other than the index keys contained in the GSI.

- **DISTRIBUTE BY**

  Specifies the distribution key of the GSI, which is different from that of the base table, and only the hash distribution can be used.

- **DISTRIBUTE BY hash(column_name [,...])**

  Specifies the distribution key of the GSI.

  It needs to be included in the index key.

- **WITH ({storage_parameter = value} [, ...])**

  Specifies the storage parameters of the GSI.

  Value range:

  – FILLFACTOR

    The fill factor of an index is a percentage between 10 and 100.

    Value range: 10–100

  – STORAGE_TYPE

    Specifies the GSI storage type.

    Value range: **USTORE**

  – INDEXSPLIT

    Controls the method of selecting a proper split point for UB-tree, which is the same as that for B-tree.

    Value range: **DEFAULT** or **INSERTPT**

- **TABLESPACE tablespace_name**

  Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.

  Value range: an existing tablespace name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **VISIBLE**

  Sets the index to be visible. This is the default option.

  NOTE

  - VISIBLE can be set only in the ORA-compatible database (that is, **sql_compatibility** = **'ORA'**).
  - When **disable_keyword_options** is set to **"visible"**, this keyword cannot be used.
  - This keyword is not supported in the upgrade uncommitted phase.

- **INVISIBLE**

  Sets the index to be invisible.

  NOTE

  - INVISIBLE can be set only in the ORA-compatible database (that is, **sql_compatibility** = **'ORA'**).
  - When **disable_keyword_options** is set to **"invisible"**, this keyword cannot be used.
  - This keyword is not supported in the upgrade uncommitted phase.

- **WHERE predicate**

  Creates a partial index. A partial index contains entries for only a portion of a table, usually a portion that is more useful for indexing than the rest of the table. For example, if you have a table that contains both billed and unbilled orders where the unbilled orders take up a small fraction of the total table and yet that is an often used portion, you can improve performance by creating an index on just that portion. In addition, the WHERE clause with a UNIQUE constraint can be used to enforce uniqueness over a subset of a table.

  Value range: The predicate expression can only refer to columns of the underlying table, but it can use all columns, not just the ones being indexed. Currently, subqueries and aggregate expressions are forbidden in the WHERE clause. You are advised not to use a predicate of numeric types such as int, because such types can be implicitly converted to Boolean values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

Examples

```
-- Create a base table test1 that contains three columns.
gaussdb=# CREATE TABLE test1(c1 int, c2 int, c3 int);

-- Create a GSI on the c2 column of the test table containing the c3 column based on the hash distribution of the c2 column.
gaussdb=# CREATE GLOBAL INDEX idx_gsi_1 ON test1(c2) CONTAINING(c3) DISTRIBUTE BY HASH(c2);

-- Create a base table test2 that contains three columns.
gaussdb=# CREATE TABLE test2(c1 int, c2 int, c3 int);

-- Create a GSI on the c2 column of the test2 table containing the c3 column based on the hash distribution of the c2 column.
gaussdb=# CREATE GLOBAL INDEX idx_gsi_2 ON test2(c2) CONTAINING(c3);

-- Create a base table test3 that contains three columns.
gaussdb=# CREATE TABLE test3(c1 int, c2 int, c3 int);

-- Create a GSI in UNIQUE form on the c2 column of the test3 table, which is based on the hash distribution of the c2 column by default.
gaussdb=# CREATE GLOBAL UNIQUE INDEX idx_gsi_3 ON test3(c2) DISTRIBUTE BY HASH(c2);
```

ALTER INDEX, **CREATE INDEX**, and **DROP INDEX**

7.12.9.24 CREATE GROUP

Description

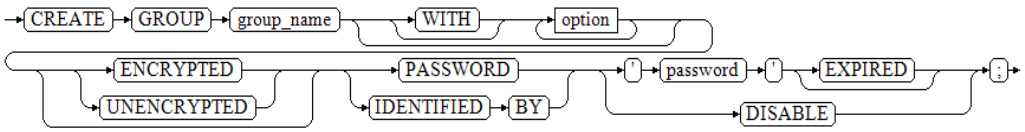
Creates a user group.

Precautions

CREATE GROUP is an alias for CREATE ROLE, and it is not a standard SQL syntax and not recommended. Users can use CREATE ROLE directly.

Syntax

```
CREATE GROUP group_name [ [ WITH ] option [ ... ] ]
    [ ENCRYPTED | UNENCRYPTED ] { PASSWORD | IDENTIFIED BY } { 'password' [ EXPIRED ] | DISABLE };
```



The syntax of the option clause (optional) is as follows:

```
{SYSADMIN | NOSYSADMIN}
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
    | {AUDITADMIN | NOAUDITADMIN}
    | {CREATEDB | NOCREATEDB}
    | {USEFT | NOUSEFT}
    | {CREATEROLE | NOCREATEROLE}
    | {INHERIT | NOINHERIT}
    | {LOGIN | NOLOGIN}
    | {REPLICATION | NOREPLICATION}
    | {PERSISTENCE | NOPERSISTENCE}
    | CONNECTION LIMIT connlimit
    | VALID BEGIN 'timestamp'
    | VALID UNTIL 'timestamp'
    | RESOURCE POOL 'respool'
    | USER GROUP 'groupuser'
    | PERM SPACE 'spacelimit'
    | TEMP SPACE 'tmpspacelimit'
    | SPILL SPACE 'spillspacelimit'
    | NODE GROUP logic_group_name
    | IN ROLE role_name [, ...]
    | IN GROUP role_name [, ...]
    | ROLE role_name [, ...]
    | ADMIN role_name [, ...]
    | USER role_name [, ...]

7.12.9.25 CREATE INCREMENTAL MATERIALIZED VIEW

Description

CREATE INCREMENTAL MATERIALIZED VIEW creates a fast-refresh materialized view, and you can refresh the data of the materialized view by using REFRESH MATERIALIZED VIEW (complete-refresh) and REFRESH INCREMENTAL MATERIALIZED VIEW (fast-refresh).

CREATE INCREMENTAL MATERIALIZED VIEW is similar to CREATE TABLE AS, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

Precautions

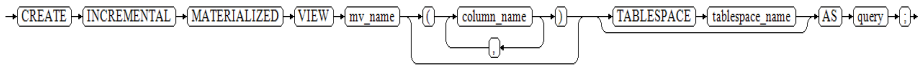
- Fast-refresh materialized views cannot be created on database link tables, temporary tables, or global temporary tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Fast-refresh materialized views support only simple filter queries and UNION ALL queries of base tables.
- Fast-refresh materialized views do not support clauses WITH, GROUP BY, ORDER BY, LIMIT, and WINDOW. Operators DISTINCT and AGG are not supported. Subqueries except UNION ALL are not supported.
- The distribution key cannot be specified when a fast-refresh materialized view is created.
- After a fast-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- The IUD operation cannot be performed on fast-refresh materialized views.
- After a fast-refresh materialized view is created, you need to run the **REFRESH** command to synchronize the materialized view with the base table when the base table data changes.
- The Ustore does not support the creation and use of materialized views.

Syntax

```
CREATE INCREMENTAL MATERIALIZED VIEW mv_name
    [ (column_name [, ...] ) ]
    [ TABLESPACE tablespace_name ]
    AS query;
```



Parameters

- **mv_name**

  Name (optionally schema-qualified) of the materialized view to be created.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as the number of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.

  Value range: a string. It must comply with the **naming convention**.

- **TABLESPACE tablespace_name**

  (Optional) Tablespace to which the new materialized view belongs. If the tablespace is not specified, the default tablespace is used.

- **AS query**

  SELECT or **TABLE** command. This query will be run in a security-constrained operation.

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv (col1,col2) TABLESPACE tbs_data1 AS
SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1);

-- Query fast-refresh materialized view data.
gaussdb=# SELECT * FROM my_imv;
 col1 | col2
------+------
(0 rows)

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- Query fast-refresh materialized view data.
gaussdb=# SELECT * FROM my_imv;
 col1 | col2
------+------
    1 |    1
(1 row)

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;

-- Delete the tablespace.
gaussdb=# DROP TABLESPACE tbs_data1;
```

7.12.9.26 CREATE INDEX

Description

Defines a new index.

Indexes are primarily used to enhance database performance (though inappropriate use can result in database performance deterioration). You are advised to create indexes on:

- Columns that are often queried
- Join conditions. For a query on joined columns, you are advised to create a composite index on the columns. For example, for **select * from t1 join t2 on t1.a=t2.a and t1.b=t2.b**, you can create a composite index on columns **a** and **b** in table **t1**.
- Columns having filter criteria (especially scope criteria) of a WHERE clause.
- Columns that appear after ORDER BY, GROUP BY, and DISTINCT

Partitioned tables do not support partial index creation (when indexes contain the GLOBAL or LOCAL keyword or the created index is a GLOBAL index). If the GLOBAL/LOCAL keyword is declared during index creation, the index of the corresponding type is created. If the partition name is specified during index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

creation, a LOCAL index is created. If the index is a unique index, the index must contain a partition key. In this case, a local index is created. Otherwise, a global index is created by default.

Precautions

- If the base table is a hash-distributed table, to create a primary key or unique index that does not contain the distribution key of the base table, use a GSI (using CREATE GLOBAL INDEX); to create a primary key or unique index that contains the distribution key of the base table, use an ordinary index (using CREATE INDEX). In single-DN deployment mode, both the GSI and ordinary index can be successfully created. If the base table is a non-hash-distributed table, you can only create the primary key or unique index as an ordinary index (using CREATE INDEX). That is, the index key must contain the distribution key of the base table.
- Indexes consume storage and computing resources. Creating too many indexes has negative impact on database performance (especially the performance of data import. Therefore, you are advised to import the data before creating indexes). Therefore, create indexes only when they are necessary.
- All functions and operators used in an index definition must be immutable, that is, their results must depend only on their parameters and never on any outside influence (such as the contents of another table or the current time). This restriction ensures that the behavior of the index is well-defined. To use a user-defined function in an index or WHERE clause, mark it as an immutable function.
- Partitioned table indexes are classified into local indexes and global indexes. A local index binds to a specific partition, and a global index corresponds to the entire partitioned table.
- A user with the CREATE ANY INDEX permission can create indexes in both the public and user schemas.
- Other users are not allowed to create expression indexes that contain user-defined functions on tables of the initial user.
- If the base table is distributed in HASH, RANGE, or LIST mode, the distribution key of the base table must be included when a unique index is created, and no expression is allowed.
- If a user-defined function is called in the expression index, the expression index function is executed based on the permission of the function creator.
- Data of the XML type cannot be used as ordinary indexes, unique indexes, global indexes, local indexes, or partial indexes.
- Only B-tree and UB-tree indexes can be created online. Only ordinary indexes of non-partitioned tables, as well as global and local indexes of partitioned tables can be created. PCR UB-tree indexes, level-2 partitions, and GSIs are not supported. Only ordinary indexes, global indexes, and local indexes of Astore and Ustore can be created online in parallel.
- Creating an index using CREATE INDEX may change the table access mode. As a result, the query execution plan changes.
- If the SQL statement for creating an index is too long (greater than or equal to 5250 characters), a warning is reported. You are advised to shorten the SQL statement for creating an index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> If the SQL statement for creating an index is too long, it may cause failures during index backup and restoration. The statement for creating an index during backup and restoration is exported by gs_dump. When gs_dump exports the index definition, it adds quotation marks, parentheses, and column types to the function name, condition, and column name. Therefore, the original SQL statement becomes longer. As a result, the pg_index tuple corresponding to the statement cannot be stored on a page, and the index fails to be created.

Syntax

- Create an index on a table.

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ IF NOT EXISTS ] [ [schema_name.] index_name ]
ON table_name [ USING method ]
    ({ { column_name [ ( length ) ] | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ]
[ NULLS { FIRST | LAST } ] }[, ...] )
    [ INCLUDE ( column_name [, ...] ) ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ TABLESPACE tablespace_name ]
    { [ COMMENT 'string' ] [ ... ] }
    [ { VISIBLE | INVISIBLE } ]
    [ WHERE predicate ];
```

- Create an index on a partitioned table.

```
CREATE [ UNIQUE ] INDEX [ CONCURRENTLY ] [ [schema_name.] index_name ] ON table_name
[ USING method ]
    ( { { column_name [ ( length ) ] | ( expression ) } [ COLLATE collation ] [ opclass ] [ ASC | DESC ]
[ NULLS LAST ] } [, ...] )
    [ LOCAL
        [ ( { PARTITION index_partition_name [ FOR { partition_name | ( partition_value [, ...] ) } ]
[ TABLESPACE index_partition_tablespace ]
                [ ( [SUBPARTITION index_subpartition_name] [ FOR { partition_name | ( partition_value
[, ...] ) } ]  [ TABLESPACE index_partition_tablespace ]
                    [, ...] ) ]
            [, ...] } ) ]
      | GLOBAL ]
    [ INCLUDE ( column_name [, ...] ) ]
    [ WITH ( { storage_parameter = value } [, ...] ) ]
    [ TABLESPACE tablespace_name ]
    { [ COMMENT 'string' ] [ ... ] }
    [ { VISIBLE | INVISIBLE } ];
```

Parameters

- **UNIQUE**

  Creates a unique index. In this way, the system checks whether new values are unique in the index column. Attempts to insert or update data which would result in duplicate entries will generate an error.

  Currently, only B-tree indexes and UB-tree indexes in row-store tables support unique indexes.

- **CONCURRENTLY**

  Creates an index (with ShareUpdateExclusiveLock) in a mode that does not block DML statements. When an index is created, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the creation.

  – This option can only specify a name of one index.

  – The CREATE INDEX statement can be run within a transaction, but CREATE INDEX CONCURRENTLY cannot.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- For temporary tables, you can use CONCURRENTLY to create indexes. However, indexes are created in blocking mode because no other sessions concurrently access the temporary tables and the blocking mode is more cost-effective.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- This keyword is specified when an index is created. The Astore needs to scan the entire table twice to build it. During the first scan, an index is created and the read and write operations are not blocked. During the second scan, changes that have occurred since the first scan are merged and updated. The Ustore needs to scan the entire table only once. During the scan, the data generated by concurrent DML operations is inserted into the temporary table **index_oid_cctmp**. After the scan is complete, the data in the temporary table is merged to the primary index and the temporary table is deleted, the index is created. You can use the GUC parameter **delete_cctmp_table** to specify whether to delete temporary tables after indexes are created online. The default value of this parameter is **on**, indicating that temporary tables are deleted by default. If this parameter is set to **off**, temporary tables are retained.
- For Astore, the table needs to be scanned and built twice, and all existing transactions that may modify the table must be completed. This means that the creation of the index takes a longer time than normal. In addition, the CPU and I/O consumption also affects other services. Although the Ustore only needs to scan the entire table once to create indexes, the preceding consumption also exists.
- Exceptions may occur during online index creation (for example, manual cancellation, duplicate index key values, insufficient resources, thread startup failure, and lock timeout). As a result, online index creation fails. In this case, indexes in the **not valid** state may be retained to avoid occupying system resources, the system automatically clears the failed index. Before clearing the failed index, wait until the transaction in the table ends. If a long transaction exists, the system may keep waiting. If you cancel the thread, the failed index remains. If the user cancels the online index creation thread, the process of clearing the failed index is started first. If the user cancels the thread again, the process of clearing the failed index is ended, and the failed index remains. For critical errors, such as FATAL, PANIC, and database faults, you need to manually clear indexes and temporary tables. If both online index creation and automatic residual clearing fail, indexes that are not valid are retained. The residual indexes may be ready or not ready (depending on the phase in which the online index creation fails. For example, the index failed in the first phase is not ready, and the index failed in the third phase is ready). If the residual indexes are ready, the DML statements still maintain the residual indexes. During the maintenance, other errors may occur (for example, the size of the index column exceeds the maximum value or the unique index constraint is violated). To prevent residual indexes from occupying system resources and generating unexpected errors, you need to manually delete them as soon as possible. In the distributed system, failed indexes in DNs are automatically cleared and those in CNs need to be manually cleared. If a critical error occurs, the metadata of the failed indexes cannot be found on some nodes in the distributed system. The DROP INDEX statement cannot be used to delete these indexes. You need to use the DROP INDEX IF EXISTS statement to delete them.
- For Astore, after the second scan, index creation must wait for any transaction that holds a snapshot earlier than the snapshot taken by the second scan to terminate. In addition, the ShareUpdateExclusiveLock (level 4) added during index creation conflicts with a lock whose level is greater than or equal to 4. Therefore, when such an index is created, the system is prone to hang or deadlock. Example:
  - If two sessions create an index by using CONCURRENTLY for the same table, a deadlock occurs.
  - If a session creates an index by using CONCURRENTLY for a table and another session drops a table, a deadlock occurs.
  - There are three sessions. Session 1 locks table **a** and does not commit it. Session 2 creates an index by using CONCURRENTLY for table **b**. Session 3 writes data to table **a**. Before the transaction of session 1 is committed, session 2 is blocked.
  - When an index is created by using CONCURRENTLY for a table concurrently with the TRUNCATE operation on the same table, a deadlock occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

    - The transaction isolation level is set to repeatable read (read committed by default). Two sessions are started. Session 1 writes data to table **a** and does not commit it. Session 2 creates an index by using CONCURRENTLY for table **b**. Before the transaction of session 1 is committed, session 2 is blocked.
  - When an index is being created or fails to be created, you need to check the index progress or status. You can query the gs_get_index_status('schema_name', 'index_name') function to check the index status on all nodes. The input parameters **schema_name** and **index_name** are used to specify the index schema name and index name, respectively. The return values are **node_name**, **indisready**, and **indisvalid**, indicating the node name, whether the index can be inserted on the node, and whether the index is available on the node. The index is available only when **indisready** and **indisvalid** on all nodes are set to **true**; otherwise, wait until the index creation is complete. If the index fails to be created, delete the index and create it again.
  - When the I/O and CPU resources are not limited, the service performance deterioration caused by online index creation can be controlled within 10%. However, in special scenarios, the service performance deterioration may exceed 10%. This is because online index creation is a long transaction that consumes a large number of I/O and CPU resources. It consumes more resources than offline index creation. The longer the online index creation transaction lasts, the greater the impact on service performance. The time for creating indexes online is positively correlated with the data volume of base tables and the data volume generated by concurrent DML statements. When the I/O and CPU resources are not limited, the time for creating indexes online is about two to six times that for creating indexes offline. However, when the number of concurrent transactions is large (> 10000 TPS) or resource contention occurs, the time may be even longer. If a long transaction exists during online index creation, the long transaction running time must be added. In Astore and Ustore modes, you can create indexes in parallel to shorten the index creation time. The performance of online parallel index creation increases to a certain value and becomes stable as the number of parallel worker threads increases. Compared with the performance of creating indexes in serial mode, the performance of creating indexes in parallel online is improved by about 30%. You are advised to create indexes online during off-peak hours to avoid great impact on services. In addition, do not execute long transactions during online index creation. Although online index creation provides the capability of uninterrupted services to some extent, it still needs to be implemented with caution.
  - When a unique index is created online (by using CREATE UNIQUE INDEX CONCURRENTLY), the table is scanned to check whether the data in the table is unique. If the data in the table is not unique, an error is reported and the online index creation exits. During online index creation, whether data in the table is unique may change. Whether the creation fails depends on whether duplicate data is scanned. Consider the following situations: 1. Tuple A and tuple B are inserted during table scanning, and their index columns are the same. If both tuple A and tuple B are scanned during online index scan, a uniqueness violation may be reported. However, if tuple B is deleted later, in this case, an error may be reported during online index creation, indicating that the uniqueness is violated. However, after the online index creation fails and exits, the data in the table is found to be unique. 2. During online index creation, if tuple A is inserted, deleted, and then inserted, and SnapshotNow is used to scan the table, tuple A may be scanned twice, which may violate the uniqueness constraint. During online index creation, Astore uses SnapshotMVCC to scan tables, and Ustore uses SnapshotNow to scan tables.

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating an index. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **schema_name**

  Specifies the schema name.

  Value range: an existing schema name

- **index_name**

  Specifies the name of the index to be created. No schema name can be included here; the index is always created in the same schema as its parent table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **table_name**

  Specifies the name of the table to be indexed (optionally schema-qualified).

  Value range: an existing table name

- **USING method**

  Specifies the name of the index method to be used.

  Value range:

  – **btree**: B-tree indexes store key values of data in a B+ tree structure. This structure helps users to quickly search for indexes. B-tree is applicable to comparison query and range query.

  – **ubtree**: Multi-version B-tree index used only for Ustore tables. The index page contains transaction information and can be recycled. By default, the INSERTPT function is enabled for UB-tree indexes.

  Row-store tables (Astore) support the index type: **btree** (default). Row-store tables (Ustore) support the index type: **ubtree**.

  NOTICE

  B-tree and UB-tree are closely related to the table storage type Astore or Ustore. When an index is created, if the specified index type does not correspond to the main table, the index type is automatically converted.

- **column_name**

  Specifies the name of the column on which an index is to be created.

  Multiple columns can be specified if the index method supports multi-column indexes. A global index supports a maximum of 31 columns, and other indexes support a maximum of 32 columns.

- **column_name (length)**

  Creates a prefix key index based on a column in the table. **column_name** indicates the column name of the prefix key, and **length** indicates the prefix length.

  The prefix key uses the prefix of the specified column data as the index key value, which reduces the storage space occupied by the index. Indexes can be used for partial filter and join conditions that contain prefix key columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The prefix key supports the following index methods: B-tree and UB-tree.
- The data type of the prefix key column must be binary or character (excluding special characters).
- The prefix length must be a positive integer that does not exceed 2676 and cannot exceed the maximum length of the column. For the binary type, the prefix length is measured in bytes. For non-binary character types, the prefix length is measured in characters. The actual length of the key value is restricted by the internal page. If a column contains multi-byte characters or an index has multiple keys, the length of the index row may exceed the upper limit. As a result, an error is reported. Consider this situation when setting a long prefix length.
- In the CREATE INDEX syntax, the following keywords cannot be used as prefix keys for column names: COALESCE, EXTRACT, GREATEST, LEAST, LNNVL, NULLIF, NVL, NVL2, OVERLAY, POSITION, REGEXP_LIKE, SUBSTRING, TIMESTAMPDIFF, TREAT, TRIM, XMLCONCAT, XMLELEMENT, XMLEXISTS, XMLFOREST, XMLPARSE, XMLPI, XMLROOT and XMLSERIALIZE.
- The prefix key is a special expression key. Some constraints and restrictions that are not described are the same as those of the expression key. For details, see the description of the expression index.
- As an expression index, the prefix index is the same as the expression index and cannot be used as the unique index or primary key in distributed mode.

- **expression**

  Specifies an expression based on one or more columns of the table. The expression usually must be written with surrounding parentheses, as shown in the syntax. However, the parentheses can be omitted if the expression has the form of a function call.

  Expression can be used to obtain fast access to data based on some transformation of the basic data. For example, an index computed on upper(col) would allow the WHERE upper(col) = 'JIM' clause to use an index.

  If an expression contains the IS NULL clause, the index for this expression is invalid. In this case, you are advised to create a partial index.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

  NOTE

  In MySQL-compatible mode (that is, **sql_compatibility** set to **'MYSQL'**), when the MySQL compatible collation is used, ensure that the index collation is the same as the column collation. Otherwise, the index fails to be created and an error is reported.

- **opclass**

  Specifies the name of an operator class. An operator class can be specified for each column of an index. The operator class identifies the operators to be used by the index for that column. For example, a B-tree index on the type int4 would use int4_ops; this operator class includes comparison functions for values of type int4. In practice, the default operator class for the column's data type is sufficient. The operator class applies to data with multiple sorts. For example, users might want to sort a complex-number data type either by absolute value or by real part. They could do this by defining two operator

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

classes for the data type and then selecting the proper class when making an index. In addition, if the value of **COLLATE** of an index of the string type (such as varchar, varchar2, and text) is not **C** or **POSIX**, but you want the index to support prefix matching, you need to specify the **varchar_pattern_ops** option.

- **ASC**

  Specifies an ascending (default) sort order.

- **DESC**

  Specifies a descending sort order.

- **NULLS FIRST**

  Specifies that null values appear before non-null values in the sort ordering. This is the default when **DESC** is specified.

- **NULLS LAST**

  Specifies that null values appear after non-null values in the sort ordering. This is the default when **DESC** is not specified.

- **LOCAL**

  Specifies that the partitioned index to be created is a local index.

- **GLOBAL**

  Specifies the partitioned index to be created as a global index. If no keyword is specified, a global index is created by default.

- **INCLUDE (column_name [, ...]**)

  The optional INCLUDE clause specifies that some non-key columns are included in indexes. Non-key columns cannot be used as search criteria for accelerating index scans, and they are omitted when the UNIQUE constraints of the indexes are checked.

  An index-only scan can directly return content in the non-key columns without accessing the heap table corresponding to the indexes.

  Exercise caution when adding non-key columns as INCLUDE columns, especially for wide columns. If the size of an index tuple exceeds the maximum size allowed by the index type, data insertion fails. Note that in any case, adding non-key columns to an index increases the space occupied by the index, which may slow down the search speed.

  Currently, only UB-tree indexes access mode supports this feature. Non-key columns are stored in the index leaf tuple corresponding to the heap tuple and are not included in the tuple on the upper-layer index page.

- **PARTITION clause**

  ```
  PARTITION index_partition_name [ FOR { partition_name | ( partition_value [, ...] ) } ] [ TABLESPACE index_partition_tablespace ]
  ```

  If **for partition_name** or **partition_value** is specified in the PARTITION clause, the created partitioned index has the sparsely partitioned index attribute. If **for partition_name** or **partition_value** is not specified, the number of PARTITION clauses must be the same as the number of partitions in the target table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- A sparsely partitioned index is a type of local index for partitioned table. It is created only on a single partition, whereas an ordinary local index needs to be created on every partition of the table.
- The sparsely partitioned index can be created only on a single partition.
- The sparsely partitioned index supports only B-tree and UB-tree indexes.
- The sparsely partitioned index does not support the UNIQUE attribute.
- Currently, the global index is not supported.
- Currently, level-2 partitions are not supported.
- The created sparsely partitioned index contains the **sparsely_partitioned=true** option. Note that the CREATE TABLE or ALTER TABLE statement cannot be used to explicitly specify a non-sparsely partitioned index as a sparsely partitioned index in this option. If the created index is a sparsely partitioned index, **sparsely_partitioned=false** will be ignored.
- If a version earlier than 505.0.0 is upgraded to 505.0.0 or later, sparsely partitioned indexes cannot be created during upgrade observation.

  – **PARTITION index_partition_name**

    Specifies the name of an index partition.

    Value range: a string that complies with the **Identifier Naming Conventions**.

  – **FOR partition_name**

    Specifies the name of the target partition. If the specified partition does not exist, an error is reported.

  – **FOR (partition_value [, ...])**

    Specifies the value of the specified partition key. The partition key value must be placed in the partition key value FOR list. If there are multiple columns of partition keys, multiple **partition_value** values must be specified.

  – **TABLESPACE index_partition_tablespace**

    Specifies the tablespace of an index partition.

    Value range: If this parameter is not specified, the value of **index_tablespace** is used.

- **WITH ({storage_parameter = value} [, ...])**

  Specifies the storage parameter used for an index.

  Value range:

  Indexes except for psort support the **FILLFACTOR** parameter. Only UB-tree indexes support **INDEXSPLIT**. Only non-partitioned B-tree indexes support the **DEDUPLICATION** parameter. Only UB-tree indexes support **INDEX_TXNTYPE**.

  – **STORAGE_TYPE**

    Storage engine type of the table where the index is located. If **storage_type** specified by the index conflicts with the index type, the storage engine type is automatically changed to the correct one. Only B-tree and UB-tree are supported. You cannot modify this parameter after it is set.

    Value range: **USTORE**, indicating that the table where the index is located uses the in-place update storage engine. **ASTORE**: indicates that the table where the index is located is an append-only storage engine.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Default value: **USTORE** for Ustore tables and **ASTORE** for Astore tables.

- **FILLFACTOR**

  The fill factor of an index is a percentage from 10 to 100. In the scenario where a large number of concurrent insertions are performed and the key value range is dense, the contention of the same index page is high during the insertion. Therefore, a smaller fill factor is more appropriate.

  Value range: 10–100

- CROSSBUCKET

  Specifies whether cross-hash bucket indexes are used. Only B-tree indexes are supported. This is a lab feature. Contact Huawei technical support before using it.

  Value range: **ON** and **OFF**

  Default value: **OFF**

- **ACTIVE_PAGES**

  Specifies the number of index pages, which may be less than the actual number of physical file pages and can be used for optimization. Currently, this parameter is valid only for the local index of the Ustore partitioned table and will be updated by VACUUM and ANALYZE (including AUTOVACUUM). You are advised not to manually set this parameter because it is invalid in distributed mode.

- **DEDUPLICATION**

  Specifies whether to deduplicate and compress tuples with duplicate key values. This is an index parameter. When there are a large number of indexes with duplicate key values, enabling this parameter can effectively reduce the space occupied by indexes. This parameter does not take effect for primary key indexes and unique indexes. If non-unique indexes are used and the index key value duplication rate is low or the index key values are unique, enabling this parameter will slightly deteriorate the index insertion performance. Currently, local and global indexes of partitioned tables are not supported.

  Value range: Boolean value. The default value is the value of the GUC parameter **enable_default_index_deduplication** (the default value is **off**).

- **INDEXSPLIT**

  Specifies the splitting policy of UB-tree indexes. The **DEFAULT** policy is the same as the splitting policy of B-tree indexes. The **INSERTPT** policy can significantly reduce the index space usage in some scenarios.

  Value range: **INSERTPT** and **DEFAULT**

  Default value: **INSERTPT**

- **INDEX_TXNTYPE**

  Specifies the UB-tree index type (only UB-tree indexes support **INDEX_TXNTYPE**). When the value is **PCR**, flashback queries can be performed using UB-tree. PCR UB-tree indexes do not support online index creation, GSIs, ultimate RTO replay, and standby node read. If **INDEX_TXNTYPE** is not specified, the GUC parameter **index_txntype** specifies the type of the index to be created. **INDEX_TXNTYPE** cannot be modified by using ALTER INDEX INDEX_NAME SET (INDEX_TXNTYPE=PCR or RCR).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Type: character string (case-insensitive)

Value range: **RCR** and **PCR**

Default value: **RCR**

For example:

```
CREATE UNIQUE INDEX t2_b_pkey ON t(b) WITH(index_txntype='pcr');
```

– STAT_STATE

Determines whether index statistics are locked. If locked, the index statistics cannot be updated. This parameter is invalid in distributed mode.

Value range: **locked** and **unlock**.

Default value: **unlock**.

– **LPI_PARALLEL_METHOD**

Index parameter, which is used to set the parallel creation mode of local indexes for partitioned tables.

Type: String

Value range: **PAGE**, **PARTITION**, and **AUTO PAGE** creates indexes for pages in parallel. Multiple worker threads are started to scan and sort data. Each worker thread processes a data page at a time. After scanning and sorting, the main thread combines the sorting results in serial mode and inserts tuples into the indexes. **PARTITION** creates indexes at the partition level in parallel and starts multiple worker threads. Each worker thread scans, sorts, and inserts indexes into a partition. **AUTO** estimates the cost of parallel index creation at the page level and partition level based on the partitioned table statistics, and selects the parallel index creation mode with a lower cost. (The statistics may be different from the actual data, resulting in inaccurate calculation results.)

Default value: **PAGE**

Setting suggestion: Set this parameter to **PARTITION** if the partitioned table data is evenly distributed in each partition. This parameter supports only the B-tree local index of Astore partitioned tables. It does not support the global index of partitioned tables, non-partitioned table indexes, segment-page table indexes, hash bucket table indexes, or online index creation.

For example:

```
CREATE INDEX idx ON tbl(col) WITH (lpi_parallel_method = 'partition');
```

- **TABLESPACE tablespace_name**

  Specifies the tablespace for an index. If no tablespace is specified, the default tablespace is used.

  Value range: an existing tablespace name.

- **WHERE predicate**

  Creates a partial index. A partial index is an index that contains entries for only a portion of a table, usually a portion that is more useful for indexing than the rest of the table. For example, if you have a table that contains both billed and unbilled orders where the unbilled orders take up a small fraction of the total table and yet that is an often used portion, you can improve performance by creating an index on just that portion. In addition, the WHERE clause with a UNIQUE constraint can be used to enforce uniqueness over a subset of a table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: The predicate expression can only refer to columns of the underlying table, but it can use all columns, not just the ones being indexed. Currently, subqueries and aggregate expressions are forbidden in WHERE. You are advised not to use numeric types such as int for predicate, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

For a partitioned table index, if the created index contains the GLOBAL keyword or the created index is a GLOBAL index, the WHERE clause cannot be used to create an index.

- **COMMENT 'string'**

  COMMENT 'string' is used to add comments to an index.

  NOTICE

  - This parameter is valid only in a MySQL-compatible database (that is, **sql_compatibility** set to **'MYSQL'**).
  - An index-level comment can contain a maximum of 1024 characters.

- **VISIBLE**

  Sets the index to be visible. This is the default option.

  NOTE

  - VISIBLE can be set only in an ORA-compatible database (that is, **sql_compatibility** set to **'ORA'**).
  - When **disable_keyword_options** is set to **"visible"**, this keyword cannot be used.
  - This keyword is not supported in the upgrade uncommitted phase.

- **INVISIBLE**

  Sets the index to be invisible.

  NOTE

  - INVISIBLE can be set only in an ORA-compatible database (that is, **sql_compatibility** set to **'ORA'**).
  - When **disable_keyword_options** is set to **"invisible"**, this keyword cannot be used.
  - This keyword is not supported in the upgrade uncommitted phase.

Examples

- **Ordinary index**

```
-- Create the tbl_test1 table.
gaussdb=# CREATE TABLE tbl_test1(
    id int,           -- User ID
    name varchar(50), -- Username
    postcode char(6)  -- Postal code
);

-- Create the tbs_index1 tablespace.
gaussdb=# CREATE TABLESPACE tbs_index1 RELATIVE LOCATION 'test_tablespace/tbs_index1';

-- Create the idx_test1 index for the tbl_test1 table and specify a tablespace.
gaussdb=# CREATE INDEX idx_test1 ON tbl_test1(name) TABLESPACE tbs_index1;

-- Query information about the idx_test1 index.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT indexname,tablename,tablespace FROM pg_indexes WHERE indexname =
'idx_test1';
 indexname | tablename | tablespace
-----------+-----------+------------
 idx_test1 | tbl_test1 | tbs_index1
(1 row)

-- Drop the index.
gaussdb=# DROP INDEX idx_test1;

-- Drop the tablespace.
gaussdb=# DROP TABLESPACE tbs_index1;
```

- **Unique index**

```
-- Create the unique index idx_test2 for the tbl_test1 table.
gaussdb=# CREATE UNIQUE INDEX idx_test2 ON tbl_test1(id);

-- Query index information.
gaussdb=# \d tbl_test1
           Table "public.tbl_test1"
  Column  |          Type          | Modifiers
----------+------------------------+-----------
 id       | integer                |
 name     | character varying(50) |
 postcode | character(6)           |
Indexes:
    "idx_test2" UNIQUE, btree (id) TABLESPACE pg_default

-- Drop the index.
gaussdb=# DROP INDEX idx_test2;
```

- **Expression index**

```
-- Create an expression index for the tbl_test1 table.
gaussdb=# CREATE INDEX idx_test3 ON tbl_test1(substr(postcode,2));

-- Query index information.
gaussdb=# \d tbl_test1
           Table "public.tbl_test1"
  Column  |          Type          | Modifiers
----------+------------------------+-----------
 id       | integer                |
 name     | character varying(50) |
 postcode | character(7)           |
Indexes:
    "idx_test3" btree (substr(postcode::text, 2)) TABLESPACE pg_default

-- Drop the index.
gaussdb=# DROP INDEX idx_test3;
```

- **Partial index**

```
-- Create an index for data whose ID is not empty in the tbl_test1 table.
gaussdb=# CREATE INDEX idx_test4 ON tbl_test1(id) WHERE id IS NOT NULL;

-- Drop the index.
gaussdb=# DROP INDEX idx_test4;

-- Drop the table.
gaussdb=# DROP TABLE tbl_test1;
```

- **Partitioned index**

```
-- Create a table.
gaussdb=# CREATE TABLE student(id int, name varchar(20)) PARTITION BY RANGE (id) (
    PARTITION p1 VALUES LESS THAN (200),
    PARTITION pmax VALUES LESS THAN (MAXVALUE)
);

-- Create a local partitioned index without specifying the index partition name.
gaussdb=# CREATE INDEX idx_student1 ON student(id) LOCAL;

-- Check the index partition information. It is found that the number of local index partitions is the
same as the number of table partitions.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student1'::regclass;
   relname
-------------
 p1_id_idx
 pmax_id_idx
(2 rows)

-- Drop the local partitioned index.
gaussdb=# DROP INDEX idx_student1;

-- Create a global index.
gaussdb=# CREATE INDEX idx_student2 ON student(name) GLOBAL;

-- Check the index partition information. It is found that the number of global index partitions is
different from the number of table partitions.
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student2'::regclass;
 relname
---------
(0 rows)

-- Drop the global partitioned index.
gaussdb=# DROP INDEX idx_student2;

-- Create a local expression index without specifying the index partition name.
gaussdb=# CREATE INDEX idx_student3 ON student(lower(name)) LOCAL;

-- Check the index partition information. It is found that the number of local index partitions is the
same as the number of table partitions.
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student3'::regclass;
   relname
-------------
 p1_id_idx
 pmax_id_idx
(2 rows)

-- Drop the expression index of the LOCAL partition.
gaussdb=# DROP INDEX idx_student3;

-- Create a global expression index.
gaussdb=# CREATE INDEX idx_student4 ON student(lower(name)) GLOBAL;

-- Check the index partition information. It is found that the number of global expression index
partitions is different from the number of table partitions.
gaussdb=# SELECT relname FROM pg_partition WHERE parentid = 'idx_student4'::regclass;
 relname
---------
(0 rows)

-- Drop the expression index of the global partition.
gaussdb=# DROP INDEX idx_student4;

-- Drop the table.
gaussdb=# DROP TABLE student;
```

Helpful Links

ALTER INDEX and **DROP INDEX**

Suggestions

- create index

  Constraints:

  – An index of an ordinary table supports a maximum of 32 columns. A GLOBAL index of a partitioned table supports a maximum of 31 columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The size of a single index cannot exceed the size of the index page (8 KB). The size of a B-tree or UB-tree index cannot exceed one-third of the page size.
- Partial indexes cannot be created in a partitioned table.
- When a GLOBAL index is created on a partitioned table, the following constraints apply:
  - Expression indexes and partial indexes are not supported.
  - Only B-tree indexes are supported.
- In the same attribute column, the local index and global index of a partition cannot coexist.
- If the ALTER statement does not contain UPDATE GLOBAL INDEX, the original global index is invalid. In this case, other indexes are used for query. If the ALTER statement contains UPDATE GLOBAL INDEX, the original global index is still valid and the index function is correct.

7.12.9.27 CREATE LANGUAGE

Function

Defines a new procedural language.

Precautions

In the current version, you cannot create procedural language features, so this syntax cannot be used.

7.12.9.28 CREATE MASKING POLICY

Description

Creates a masking policy.

Precautions

- Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.
- The masking policy takes effect only after the security policy is enabled, that is, the GUC parameter **enable_security_policy** is set to **on**.

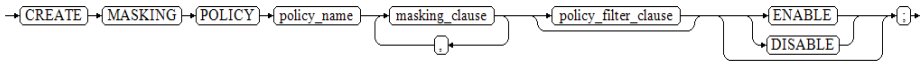
CAUTION

When you use database links to perform operations on remote objects, the client initiates a database link request. The actual sender is the server, and the attributes such as the IP address of the sender are the values of the server. For details, see **DATABASE LINK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

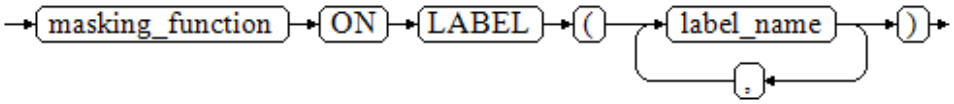
Syntax

```
CREATE MASKING POLICY policy_name masking_clause[, ...] [ policy_filter_clause ] [ENABLE | DISABLE];
```



- masking_clause

  ```
  masking_function ON LABEL(label_name[, ...])
  ```

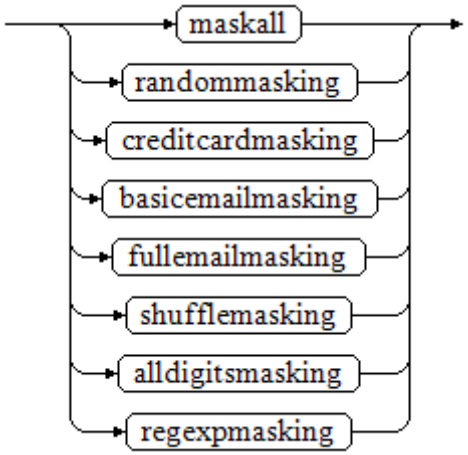
  


- masking_function

  maskall is not a preset function and cannot be displayed by running **\df**.

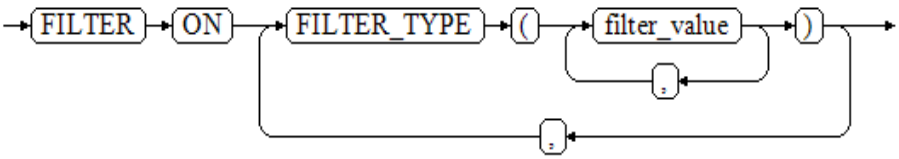
  The masking methods during presetting are as follows:

  ```
  { maskall | randommasking | creditcardmasking | basicemailmasking | fullemailmasking |
  shufflemasking | alldigitsmasking | regexpmasking }
  ```

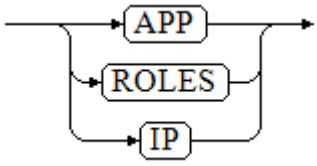
- policy_filter_clause:

  ```
  FILTER ON { FILTER_TYPE ( filter_value [, ... ] ) } [, ...]
  ```

- FILTER_TYPE:

  ```
  { APP | ROLES | IP }
  ```

Parameters

- **policy_name**

  Specifies the masking policy name, which must be unique.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the masking policy name. If a masking policy name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a masking policy name that contains uppercase letters, enclose the masking policy name with double quotation marks ("").

NOTE

The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **label_name**

  Specifies the resource label name.

- **masking_clause**

  Specifies the masking function to be used to anonymize database resources labeled by **label_name**. **schema.function** can be used to specify the masking function.

- **policy_filter**

  Specifies the users for which the masking policy takes effect. If this parameter is left empty, the masking policy takes effect for all users.

- **FILTER_TYPE**

  Specifies the types of information to be filtered by the policy, including **IP**, **APP**, and **ROLES**.

- **filter_value**

  Indicates the detailed information to be filtered, such as the IP address, app name, and username.

- **ENABLE|DISABLE**

  Enables or disables the masking policy. If **ENABLE|DISABLE** is not specified, **ENABLE** is used by default.

Examples

- Create a masking policy using maskall. (All values of the character string type are masked as **x**, and other types are displayed as the default values of this type.)

```
-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text,
col6 text, col7 text,col8 text);

-- Insert data into the tb_for_masking table.
gaussdb=# INSERT INTO tb_for_masking VALUES(1, '9876543210', 'usr321usr', 'abc@huawei.com',
'abc@huawei.com', '1234-4567-7890-0123', 'abcdef 123456 ui 323 jsfd321 j3k2l3',
'4880-9898-4545-2525', 'this is a llt case');

-- View data.
gaussdb=# SELECT * FROM tb_for_masking;
 idx |    col1    |   col2    |      col3      |      col4      |       col5        |              col6
     |       col7        |       col8
-----+------------+-----------+----------------+----------------+-------------------
+-------------------------------
------+--------------------+--------------------
   1 | 9876543210 | usr321usr | abc@huawei.com | abc@huawei.com | 1234-4567-7890-0123 | abcdef
123456 ui 323 jsfd321 j

ALTER MASKING POLICY and **DROP MASKING POLICY**

7.12.9.29 CREATE MATERIALIZED VIEW

CREATE MATERIALIZED VIEW creates a complete-refresh materialized view, and you can use REFRESH MATERIALIZED VIEW (full refresh) to refresh the data in the materialized view.

CREATE MATERIALIZED VIEW is similar to CREATE TABLE AS, but it remembers the query used to initialize the view, so it can refresh data later. A materialized view has many attributes that are the same as those of a table, but does not support temporary materialized views.

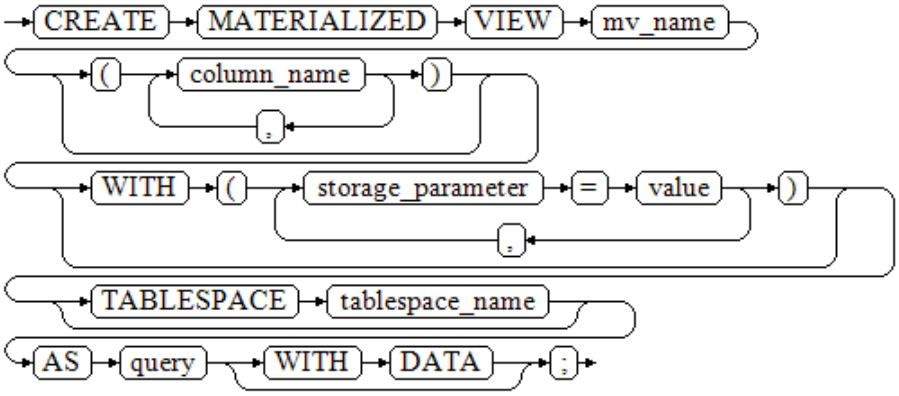
Precautions

- Complete-refresh materialized views cannot be created in temporary tables or global temporary tables.
- Complete-refresh materialized views do not support node groups.
- After a complete-refresh materialized view is created, most DDL operations in the base table are no longer supported.
- IUD operations cannot be performed on complete-refresh materialized views.
- After a complete-refresh materialized view is created, if the base table data changes, you need to run the refresh command to synchronize the materialized view with the base table.
- The Ustore does not support the creation and use of materialized views.
- The segment-page does not support the creation and use of materialized views.

Syntax

```
CREATE MATERIALIZED VIEW mv_name
    [ (column_name [, ...] ) ]
    [ WITH ( {storage_parameter = value} [, ... ] ) ]
    [ TABLESPACE tablespace_name ]
    AS query
    [ WITH DATA ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **mv_name**

  Name (optionally schema-qualified) of the materialized view to be created.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Specifies a column name in the new materialized view. The materialized view supports specified columns. The number of specified columns must be the same as that of columns in the result of the subsequent query statement. If no column name is provided, the column name is obtained from the output column name of the query.

  Value range: a string. It must comply with the **naming convention**.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. For details, see **CREATE TABLE**.

- **TABLESPACE tablespace_name**

  Tablespace to which the new materialized view belongs. If not specified, the default tablespace is used.

- **AS query**

  A **SELECT**, **TABLE**, or **VALUES** command. This query will be run in a security-constrained operation.

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_data1 RELATIVE LOCATION 'tablespace1/tbs_data1';

-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a complete-refresh materialized view.
gaussdb=# CREATE MATERIALIZED VIEW my_mv TABLESPACE tbs_data1 AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Query the complete-refresh materialized view.
gaussdb=# SELECT * FROM my_mv;
 c1 | c2
----+----
(0 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Query the complete-refresh materialized view.
gaussdb=# SELECT * FROM my_mv;
 c1 | c2
----+----
  1 |  1
  2 |  2
(2 rows)

-- Delete the complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the ordinary table my_table.
gaussdb=# DROP TABLE my_table;

-- Delete the tablespace.
gaussdb=# DROP TABLESPACE tbs_data1;
```

Helpful Links

ALTER MATERIALIZED VIEW, **CREATE INCREMENTAL MATERIALIZED VIEW**, **CREATE TABLE**, **DROP MATERIALIZED VIEW**, **REFRESH INCREMENTAL MATERIALIZED VIEW**, and **REFRESH MATERIALIZED VIEW**

7.12.9.30 CREATE MODEL

Description

Trains a machine learning model and saves the model.

Precautions

This syntax is not supported because the model training function is not supported in the current version.

7.12.9.31 CREATE NODE

Description

Creates a cluster node.

Precautions

CREATE NODE is an API of the cluster management tool. You are advised not to use this API, because doing so affects the cluster. Only the administrator has the permission to use this API.

Syntax

```
CREATE NODE nodename WITH
 (
   [ TYPE = nodetype,]
   [ HOST = hostname,]
   [ PORT = portnum,]
   [ HOST1 = 'hostname',]
   [ PORT1 = portnum,]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  [ HOSTPRIMARY [ = boolean ],]
  [ PRIMARY [ = boolean ],]
  [ PREFERRED [ = boolean ],]
  [ SCTP_PORT = portnum,]
  [ CONTROL_PORT = portnum,]
  [ SCTP_PORT1 = portnum,]
  [ CONTROL_PORT1 = portnum, ]
  [ NODEIS_CENTRAL [= boolean], ]
  [ NODEIS_ACTIVE [= boolean] ]
);
```

NOTE

The port whose number is specified by **PORT** is used for internal communications between nodes. Unlike the port connecting to an external client, it can be queried in the **pgxc_node** table.

Parameters

- **nodename**

  Specifies the node name.

  Value range: a string. It must comply with the **naming convention**.

- **TYPE = nodetype**

  Specifies the type of a node.

  Value range:

  - 'coordinator'
  - 'datanode'

- **HOST = hostname**

  Specifies the host name or IP address of a node.

- **PORT = portnum**

  Specifies the port number of the primary node to which a node is bound.

- **HOST1 = hostname**

  Specifies the name or IP address of the standby node corresponding to a node.

- **PORT1 = portnum**

  Specifies the port number of the standby node to which a node is bound.

- **HOSTPRIMARY**

  Specifies whether the host name or IP address is the primary one.

  Value range:

  - **true**
  - **false** (default value)

- **PRIMARY = boolean**

  Specifies whether the node is a primary node or not. A primary node allows read/write operations. A non-primary node allows only read operations.

  Value range:

  - **true**
  - **false** (default value)

- **PREFERRED = boolean**

  Specifies whether the node is a preferred node for read operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **true**
- **false** (default value)

- **SCTP_PORT = portnum**

  Specifies the port used by the TCP proxy communications library of the primary node to listen on the data transmission channel. TCP is used to listen on connections.

- **CONTROL_PORT = portnum**

  Specifies the port used by the TCP proxy communications library of the primary node to listen on the control transmission channel. The TCP protocol is used to listen on connections.

- **SCTP_PORT1 = portnum**

  Specifies the port used by the TCP proxy communications library of the standby node to listen on the data transmission channel. TCP is used to listen on connections.

- **CONTROL_PORT 1= portnum**

  Specifies the port used by the TCP proxy communications library of the standby node to listen on the control transmission channel. The TCP protocol is used to listen on connections.

- **NODEIS_CENTRAL**

  Specifies whether the current node is a central control node. It is used only for CNs and is invalid for DNs.

  - **true**
  - **false** (default value)

- **NODEIS_ACTIVE**

  Specifies whether the current node is normal. It is used to mark whether the CN is removed and is invalid for DNs.

  - **true**
  - **false** (default value)

NOTE

If there are multiple CNs, cluster nodes are created only on the currently connected CNs and will not be synchronized to other CNs. Cluster nodes must be created on all CNs. To drop a cluster node, you only need to connect to one CN. If cluster nodes are created on only one CN, you need to define the current CN name and drop the cluster node on the current CN. For details, see **DROP NODE**.

Examples

```
-- Create cluster nodes and execute them on all CNs.
gaussdb=# CREATE NODE datanode1 WITH(
  TYPE = datanode,
  PREFERRED = false
);
gaussdb=# CREATE NODE datanode2 WITH(
  TYPE = datanode,
  PREFERRED = false
);

-- Query the initial cluster DN status.

ALTER NODE and **DROP NODE**

7.12.9.32 CREATE NODE GROUP

Description

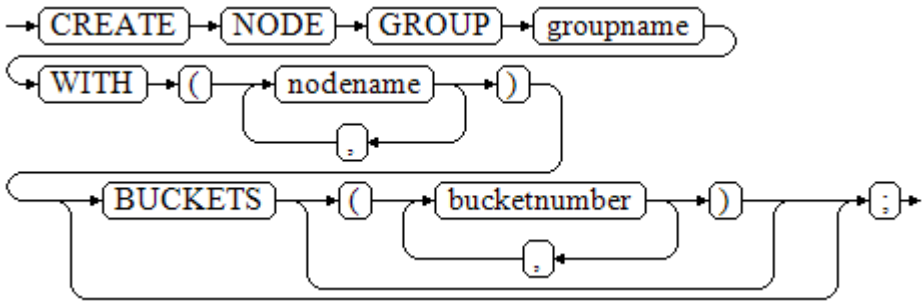
Creates a cluster node group.

Precautions

- CREATE NODE GROUP is an API of the cluster management tool.
- Only a system administrator has the permission.

Syntax

```
CREATE NODE GROUP groupname
   WITH ( nodename [, ... ] )
   [ BUCKETS [ ( bucketnumber [, ... ] ) ] ];
```



Parameters

- **groupname**

  Specifies the name of a node group.

  Value range: a string. It must comply with the **naming convention**. A value can contain a maximum of 63 characters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

A node group name supports all ASCII characters, but you are advised to name a node group according to the naming convention.

- **nodename**

  Specifies the node name.

  Value range: a string. It must comply with the **naming convention**. A value can contain a maximum of 63 characters.

- **BUCKETS [(bucketnumber [, ...])]**

  The BUCKETS clause is an internal use of the cluster management tool and can be called only during scale-out.

Examples

```
-- Query the initial cluster DN status.
gaussdb=# SELECT node_name, nodeis_preferred FROM pgxc_node WHERE node_type = 'D' ORDER BY 1;
 node_name | nodeis_preferred
-----------+------------------
 dn_6001_6002_6003 | f
 dn_6004_6005_6006 | f
 dn_6007_6008_6009 | f
(3 rows)

-- Create a node group and replace dn_6001_6002_6003 with the actual node name obtained in the previous step.
gaussdb=# CREATE NODE GROUP test_group WITH ( dn_6001_6002_6003 );

-- Query the node group.
gaussdb=# SELECT group_name, group_members FROM pgxc_group;
   group_name   |   group_members
----------------+-------------------
 group_version1 | 16384 16388 16394
 test_group     | 16384
(2 rows)

-- Drop the node group.
gaussdb=# DROP NODE GROUP test_group;
```

Helpful Links

ALTER NODE GROUP and **DROP NODE GROUP**

7.12.9.33 CREATE PACKAGE

Description

Creates a package.

Precautions

- In the current version, PACKAGE can be used only in an ORA-compatible database.
- The functions or stored procedures declared in the package specification must be defined in the package body.
- When a stored procedure is created, a write lock is added only to the CREATE stored procedure or package, and a read lock is added only to the functions

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

and packages on which the functions depend during compilation and execution.

- During instantiation, the stored procedure with COMMIT or ROLLBACK cannot be called.
- Package functions cannot be called in triggers.
- Variables in a package cannot be directly used in external SQL statements.
- Private variables and stored procedures in a package cannot be called outside the package.
- Usage that stored procedures do not support are not supported. For example, if COMMIT or ROLLBACK cannot be called in a function, COMMIT or ROLLBACK cannot be called in the function of a package.
- The name of a schema cannot be the same as that of a package.
- Only ORA-version stored procedures and function definitions are supported.
- Variables with the same name in a package, including parameters with the same name in a package, are not supported.
- The global variables in a package are at the session level. The variables in packages cannot be shared in different sessions.
- When a function of an autonomous transaction is called in a package, the cursor variables in the package and recursive functions that use the cursor variables in the package are not allowed.
- The package does not declare the ref cursor variables.
- The default permission on a package is SECURITY INVOKER. To change the default permission to SECURITY DEFINER, set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**.
- A user with the CREATE ANY PACKAGE permission can create packages in the public and user schemas.
- If the name of a package to be created contains special characters, the special characters cannot contain spaces. You are advised to set the GUC parameter **behavior_compat_options** to **"skip_insert_gs_source"**. Otherwise, an error may occur.
- When you create a package function, the default parameter value can contain variables in the package but cannot contain cross-package variables.
- When the complex function is called in a package, for example, func(x).a, a composite type is returned. Cross-schema call is supported, but the database.schema.package.func(x).b call is not supported.
- When a stored procedure in a package is created, if the stored procedure name is in the *schema*.*func* or *package*.*func* format, only the value of *func* is obtained, and the declaration of *schema* or *package* is invalid. To disable this behavior by default, set the GUC parameter **behavior_compat_options** to **'forbid_package_function_with_prefix'**.
- **view %rowtype** cannot be used as a function parameter.
- Composite records cannot be used in INSERT VALUES in stored procedures or functions.
- In distributed mode, SAVE EXCEPTIONS (used in called stored procedures) is not supported.
- Expressions do not support COMMIT/ROLLBACK.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Parentheses cannot be omitted for functions without parameters.
- User-defined variables cannot be pushed down.
- When a stored procedure in a package is created, if the input parameters of the stored procedure contain pseudo-type parameters (for example, **anyelement**), variable-length parameters cannot be specified during a call.
- Cursors created in a package or cursors in functions with parameters can be referenced (%RowType) and opened across packages. The restrictions are as follows:
  a. Currently, cursors cannot be called in database.schema.package.cursor mode.
  b. In distributed mode, cursors cannot be defined as function parameters.
  c. **cursor %RowType** is not supported when a cursor is referenced.
- If the PRAGMA AUTONOMOUS_TRANSACTION syntax is declared in PACKAGE SPECIFICATION or PACKAGE BODY SPECIFICATION, a package can be created, but the autonomous transaction does not take effect.
- Only the initial user can perform the REPLACE operation on the packages of the initial user.

Syntax

- CREATE PACKAGE SPECIFICATION

```
CREATE [ OR REPLACE ] PACKAGE [ schema ] package_name
  [ invoker_rights_clause ] { IS | AS } item_list_1 END [ package_name ];
```

  – invoker_rights_clause can be declared as AUTHID DEFINER or AUTHID CURRENT_USER, which indicate the definer permission and caller permission, respectively.
  – **item_list_1** can be a declared variable, stored procedure, or function.
  – The **package_name** after END can be omitted. (In the SQL file generated by **gs_dump**, the name after END is automatically added to the package definition.)

  PACKAGE SPECIFICATION (header) declares public variables, functions, and exceptions in a package, which can be called by external functions or stored procedures. It can only declare stored procedures and functions but cannot define them.

- CREATE PACKAGE BODY

```
CREATE [ OR REPLACE ] PACKAGE BODY [ schema ] package_name
  { IS | AS } declare_section [ initialize_section ] END [ package_name ];
```

  The **package_name** after END can be omitted. (In the SQL file generated by **gs_dump**, the name after END is automatically added to the package definition.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

PACKAGE BODY defines private variables and functions in a package. If a variable or function is not declared by the package specification, it is a private variable or private function.

The package body also has an initialization part to initialize the package. For details, see the example.

Examples

- CREATE PACKAGE

```
-- Create a database.
gaussdb=# CREATE DATABASE test DBCOMPATIBILITY 'ORA';
gaussdb=# \c test

-- Create a test table tbl_test.
test=# CREATE TABLE tbl_test(uid varchar(6) PRIMARY KEY, area_id varchar(5), level int);

-- Create a package header.
test=# CREATE OR REPLACE PACKAGE pkg_test AS
    -- Public stored procedures can be called by external systems.
    PROCEDURE proc_ist_tbl_test(v_uid in varchar, v_area_id varchar, v_level int);
    PROCEDURE proc_del_tbl_test(v_uid in varchar);
    PROCEDURE proc_upd_tbl_test(v_uid in varchar, v_area_id varchar, v_level int);
END pkg_test;
/

-- Create a package body.
test=# CREATE OR REPLACE PACKAGE BODY pkg_test AS
    PROCEDURE proc_ist_tbl_test(v_uid in varchar, v_area_id varchar, v_level int) AS
    BEGIN
        INSERT INTO tbl_test VALUES (v_uid, v_area_id, v_level);
    END;
    PROCEDURE proc_del_tbl_test(v_uid in varchar) AS
    BEGIN
        DELETE FROM tbl_test WHERE uid = v_uid;
    END;
    PROCEDURE proc_upd_tbl_test(v_uid in varchar, v_area_id varchar, v_level int) AS
    BEGIN
        UPDATE tbl_test SET area_id = v_area_id, level = v_level WHERE uid = v_uid;
    END;
    var4 int := 10;
    -- The instantiation starts.
BEGIN
    var4 := 10;
    dbe_output.print_line(var4);
END pkg_test;
/
```

- Calling a package

```
-- Use CALL to call the stored procedure of a package.
test=# CALL pkg_test.proc_ist_tbl_test('0A00B1','01001',24);
test=# SELECT * FROM tbl_test;
  uid   | area_id | level
--------+---------+---------
 0A00B1 | 01001   |     24
(1 row)

-- Use SELECT to call the stored procedure of a package.
test=# SELECT pkg_test.proc_upd_tbl_test('0A00B1','01001','26');
test=# SELECT * FROM tbl_test;
  uid   | area_id | level
--------+---------+-------
 0A00B1 | 01001   |    26
(1 row)

-- Call a stored procedure of a package in an anonymous block.
test=# BEGIN
pkg_test.proc_del_tbl_test('0A00B1');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
/
test=# SELECT * FROM tbl_test;
 uid | area_id | level
-----+---------+-------
(0 rows)

-- Drop.
test=# DROP TABLE tbl_test;
test=# DROP PACKAGE pkg_test;
-- Switch to the default database and delete the test database. Change the database name as
required.
test=# \c postgres
gaussdb=# DROP DATABASE test;
```

Helpful Links

ALTER PACKAGE and **DROP PACKAGE**

7.12.9.34 CREATE PROCEDURE

Description

Creates a stored procedure.

Precautions

- If the parameters or return values of a stored procedure have precision, the precision is not checked.
- When creating a stored procedure, you are advised to explicitly specify the schemas of all operations on table objects in the stored procedure definition. Otherwise, the stored procedure may fail to be executed.
- When a stored procedure is created, a write lock is added only to the CREATE stored procedure or package, and a read lock is added only to the functions and packages on which the functions depend during compilation and execution.
- **current_schema** and **search_path** specified by SET during stored procedure creation are invalid. **search_path** and **current_schema** before and after function execution should be the same.
- When the function is called by SELECT or CALL, an argument must be provided in the output parameter. The argument does not take effect.
- A stored procedure with the **PACKAGE** attribute can use overloaded functions.
- Do not create an overloaded stored procedure with different parameter names but same stored procedure name and parameter list type.
- Do not create a stored procedure that has the same name and parameter list as the function.
- Do not overload stored procedures with different default values.
- Only the in, out, and inout parameters of the stored procedure cannot be reloaded after the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**. They can be reloaded after the parameter is disabled.
- ORA-compatible functions are created for ORA-compatible databases and PG-compatible functions are created for PG-compatible databases. Hybrid creation is not recommended.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If a function supports overloading, you need to add the keyword **PACKAGE**.
- When an overloaded stored procedure is called, the variable type must be specified.
- If an undeclared variable is used in a stored procedure, an error is reported when the stored procedure is called.
- When you create a procedure, you cannot insert aggregate functions or other functions out of the average function.
- If a function is defined as IMMUTABLE or SHIPPABLE, avoid INSERT, UPDATE, DELETE, MERGE, and DDL operations in the function because the CN needs to determine the execution node for these operations. Otherwise, an error may occur.
- The stored procedure does not support operations that will return a set.
- When stored procedures without parameters are called in another stored procedure, you can omit brackets and call stored procedures using their names directly.
- When other functions with output parameters are called in a stored procedure and an assignment expression, set the GUC parameter **behavior_compat_options** to **'proc_outparam_override'**, define variables of the same type as the output parameters in advance, and use the variables as output parameters to call other functions with output parameters for the output parameters to take effect. Otherwise, the output parameters of the called functions will be ignored.
- The stored procedure supports viewing, exporting, and importing parameter comments.
- The stored procedure supports viewing, exporting, and importing parameter comments between IS/AS and plsql_body.
- Users with the CREATE ANY FUNCTION permission can create or replace stored procedures in the user schemas.
- **out/inout** must be set to a variable but not a constant.
- The default permission on a stored procedure is SECURITY INVOKER. To change the default permission to SECURITY DEFINER, set the GUC parameter **behavior_compat_options** to **'plsql_security_definer'**.
- If a stored procedure with the definer specified is created in a schema of another user, the stored procedure will be executed by another user, which may cause unauthorized operations. Therefore, exercise caution when performing this operation.
- If the **out** parameter is used as the output parameter in an expression, the expression does not take effect in the following scenarios: The execute immediate sqlv using func syntax is used to execute a function. The select func into syntax is used to execute a function. DML statements such as INSERT and UPDATE are used to execute a function. When a function with the **out** output parameter is used as an input parameter, that is, **fun (func (out b), a)**, the **out b** parameter does not take effect.
- When the complex function is called in a stored procedure, for example, **func(x).a**, a composite type is returned. Cross-schema call is supported, but the **database.schema.package.func(x).b** call is not supported.
- When a stored procedure with the **out** parameter is called, you can set the GUC parameter **behavior_compat_options** to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

'proc_outparam_transfer_length' to pass the parameter length. The specifications and constraints are as follows:

a. The following types are supported: CHAR(n), CHARACTER(n), NCHAR(n), VARCHAR(n), VARYING(n), VARCHAR2(n), and NVARCHAR2(n).

b. If the out parameter does not take effect (for example, **perform**), the length does not need to be transferred.

c. The following types do not support precision transfer: NUMERIC, DECIMAL, NUMBER, FLOAT, DEC, INTEGER, TIME, TIMESTAMP, INTERVAL, TIME WITH TIME ZONE, TIMESTAMP WITH TIME ZONE, TIME WITHOUT TIME ZONE, and TIMESTAMP WITHOUT TIME ZONE.

d. Regardless of whether the GUC parameter **behavior_compat_options** is set to **'proc_outparam_override'**, the parameter length can be passed.

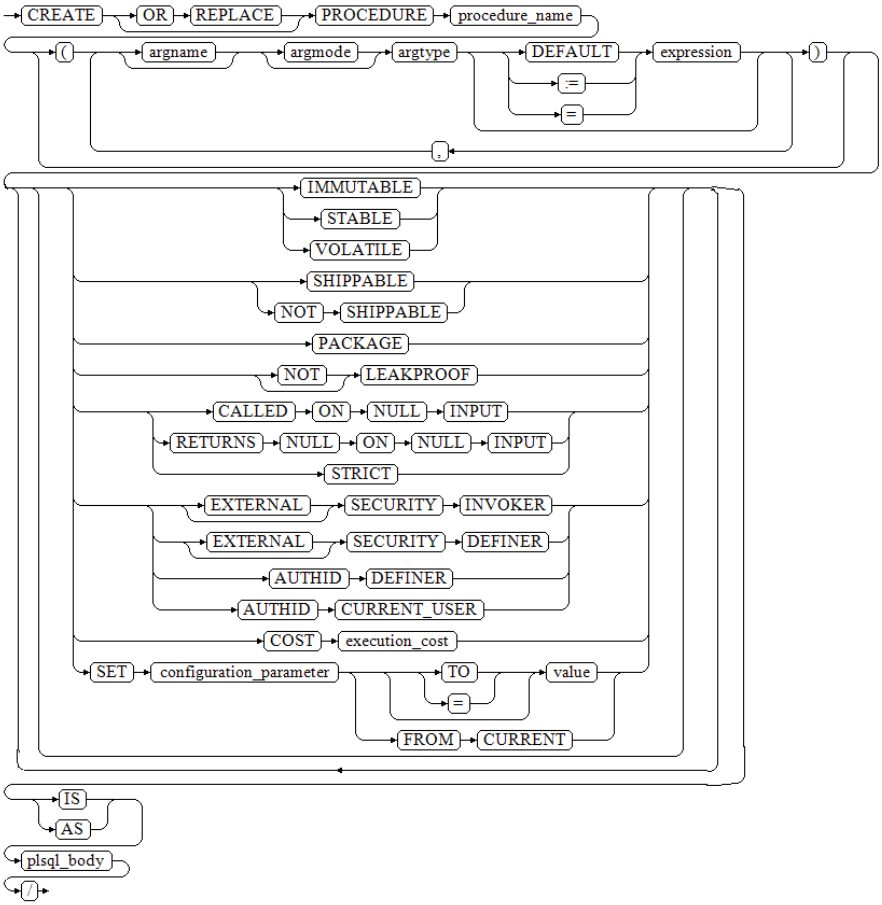
e. To pass the length of elements of the collection type and the length of elements of the array type nested by the collection type, you need to set the GUC parameter **behavior_compat_options** to **tableof_elem_constraints**.

- Functions contain syntax and functions that use GUC parameters to control features. If GUC parameters are modified in a session, the function may retain the behavior before the modification. Therefore, exercise caution when modifying GUC parameters.
- Only the initial user can perform the REPLACE operation on the stored procedures of the initial user.

Syntax

```
CREATE [ OR REPLACE ] PROCEDURE procedure_name
    [ ( {[ argname ] [ argmode ] argtype [ { DEFAULT | := | = } expression ]}[,...]) ]
    [
      { IMMUTABLE | STABLE | VOLATILE }
      | { SHIPPABLE | NOT SHIPPABLE }
      | {PACKAGE}
      | [ NOT ] LEAKPROOF
      | { CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
      | {[ EXTERNAL ] SECURITY INVOKER | [ EXTERNAL ] SECURITY DEFINER | AUTHID DEFINER | AUTHID
CURRENT_USER}
      | COST execution_cost
      | SET configuration_parameter { [ TO | = ] value | FROM CURRENT }
    ][ ... ]
 { IS | AS }
plsql_body
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **OR REPLACE**

  Replaces the original definition when two stored procedures are with the same name.

- **procedure_name**

  Specifies the name of the stored procedure that is created (optionally with schema names).

  Value range: a string that complies with the **Identifier Naming Conventions**.

  NOTE

  You are advised not to create a function with the same name as a system function. Otherwise, you need to specify the schema of the function when calling the function.

- **argmode**

  Specifies the mode of an argument.

  NOTICE

  VARIADIC specifies parameters of the array type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **IN**, **OUT**, **INOUT**, and **VARIADIC**. The default value is **IN**. Only the parameter of the **OUT** mode can be followed by **VARIADIC**. The parameters of **OUT** and **INOUT** cannot be used in procedure definition of **RETURNS TABLE**.

- **argname**

  Specifies the argument name.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **argtype**

  Specifies the type of an argument. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.

  Value range: a valid data type

  NOTE

  No specific order is applied to **argname** and **argname**. The following order is advised: **argname**, **argmode**, and **argtype**.

- **expression**

  Specifies the default expression of a parameter.

  NOTE

  - If **a_format_version** is set to **10c** and **a_format_dev_version** is set to **s2**, the default expression is not supported when the parameter is in INOUT mode.
  - It is recommended that you define all default parameters after all non-default parameters.
  - If a function with default parameters is called, input parameters are added to the function from left to right. If inputs of non-default parameters are missing, an error is reported.
  - If **proc_uncheck_default_param** is enabled and a function with default parameters is called, input parameters are added to the function from left to right. These inputs can be set to default values. If an input of a non-default parameter is missing, the previous default value is used to fill this parameter.
  - When **a_format_version** is set to **10c**, **a_format_dev_version** is set to **s1**, **proc_outparam_override** is disabled, and the function parameters include the output parameter **out** and **default**, the default value cannot be used.

- **IMMUTABLE, STABLE,**...

  Specifies a constraint. The function of each parameter is similar to that of CREATE FUNCTION. For details, see **CREATE FUNCTION**.

- **plsql_body**

  Specifies the PL/SQL stored procedure body.

  When a stored procedure is created, the **PLSQL_BODY** can end with "END;" or "END procedure_name;".

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

Constraints for storage procedures ending with "END procedure_name;":

1. It is supported only in ORA-compatible mode (database level).
2. Only the ORA-style creation syntax is supported.
3. Only the scenario where the stored procedure name is set after END is supported.
4. In the **DBE_PLDEVELOPER.gs_source**, **my_source**, **db_source** and **adm_source** views, the definition of the stored procedure stays consistent (if the created procedure is "END+name", it is displayed as "END+name"). In the **pg_proc** and **\sf** views, the outermost END is not followed by a name in any case. The innermost END is displayed as defined during creation (if the created procedure is "END +name", it is displayed as "END+name").
5. The stored procedure cannot retain the name following the outermost END in the SQL file generated by **gs_dump**.
6. If a stored procedure is named IF/LOOP or a subprogram is nested, the stored procedure cannot be ended with END IF/LOOP.

NOTICE

When you perform password-related operations, such as user creation, password change, and encryption/decryption, in a stored procedure, the password will be recorded in the system catalogs and logs in plaintext. To prevent sensitive information leakage, you are advised not to perform password-related operations in a stored procedure.

Examples

- Create a stored procedure.

```
-- Create a stored procedure and return the sum of the input parameters.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add(i int, j int)
AS
BEGIN
    dbe_output.print_line('result is: '|| i+j);
END;
/

-- Use CALL to call a stored procedure.
gaussdb=# CALL proc_add(16,17);

-- Use a program block to call a stored procedure.
gaussdb=# BEGIN
   proc_add(16,17);
END;
/

-- Drop.
gaussdb=# DROP PROCEDURE proc_add;
```

- Create a stored procedure ending with END in an ORA-compatible database.

```
Create a stored procedure.
-- Create a stored procedure and print the sum of the input parameters.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add(i int, j int)
AS
BEGIN
    dbe_output.print_line('result is: '|| i+j);
END proc_add;
/

-- Use CALL to call a stored procedure.
gaussdb=# CALL proc_add(16,17);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Use a program block to call a stored procedure.
gaussdb=# BEGIN
    proc_add(16,17);
END;
/

-- Drop.
gaussdb=# DROP PROCEDURE proc_add;
```

- Create a stored procedure whose parameter model is VARIADIC.

```
-- Create the stored procedure pro_variadic.
gaussdb=# CREATE OR REPLACE PROCEDURE pro_variadic (var1 VARCHAR2(10) DEFAULT 'hello!',var4
VARIADIC int4[])
AS
BEGIN
    dbe_output.print_line(var1);
    for i in 1..array_length(var4,1) loop
        dbe_output.print_line(var4[i]);
    end loop;
END;
/

-- Execute the stored procedure.
gaussdb=# SELECT pro_variadic(var1=>'hello', VARIADIC var4=> array[3,5,11,2]);

-- Drop.
gaussdb=# DROP PROCEDURE pro_variadic;
```

- Parameter models: **IN** and **OUT**
  - **IN** (default) indicates that the parameter is an input parameter.
  - **OUT** indicates that the parameter is an output parameter.
  - **IN OUT** indicates that the parameter is an input and output parameter

```
-- Create the stored procedure proc_add1. num1 and num2 are input parameters, and num3 is an
output parameter.
gaussdb=# CREATE PROCEDURE proc_add1 (num1 in int, num2 in int, num3 out int)
AS
BEGIN
    num3 := num1 + num2;
END;
/

-- Use a program block to call the stored procedure and use variable c to receive the parameters sent
by the stored procedure.
gaussdb=# DECLARE
    a int := 20;
    b int := 32;
    c int := 0;
BEGIN
    proc_add1(a,b,c);
    dbe_output.put_line(c);
END;
/

-- Drop.
gaussdb=# DROP PROCEDURE proc_add1;
```

DROP PROCEDURE

Suggestions

- analyse | analyze

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Do not run **ANALYZE** in a transaction or anonymous block.
- Do not run **ANALYZE** in a function or stored procedure.

7.12.9.35 CREATE RESOURCE LABEL

Description

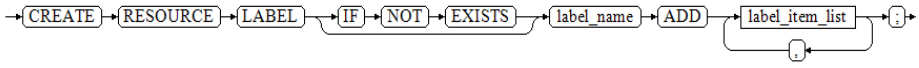
CREATE RESOURCE LABEL is used to create a resource label.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

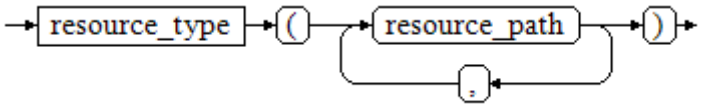
Syntax

```
CREATE RESOURCE LABEL [IF NOT EXISTS] label_name ADD label_item_list[, ...];
```



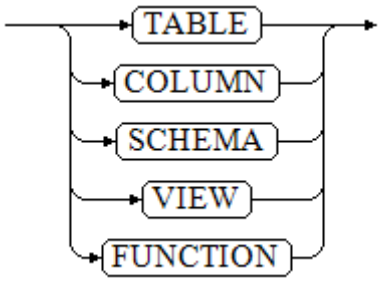
- label_item_list

  ```
  resource_type(resource_path[, ...])
  ```

- resource_type

  ```
  { TABLE | COLUMN | SCHEMA | VIEW | FUNCTION }
  ```

Parameters

- **IF NOT EXISTS**

  If a resource label with the same name already exists, no error is generated. Instead, a message is displayed, indicating that the resource label already exists.

- **label_name**

  Specifies the resource label name, which must be unique.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the resource label name. If a resource label name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

To create a resource label name that contains uppercase letters, enclose the resource label name with double quotation marks ("").

NOTE

The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **resource_type**

  Specifies the type of database resources to be labeled.

  Value range: **TABLE**, **COLUMN**, **SCHEMA**, **VIEW**, and **FUNCTION**.

- **resource_path**

  Specifies the path of database resources.

Examples

```
-- Create table tb_for_label.
gaussdb=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);

-- Create a resource label based on a table.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create an existing table resource label again and compare the differences between adding IF NOT EXISTS and not adding IF NOT EXISTS.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);
NOTICE:  table_label label already defined, skipping
CREATE RESOURCE LABEL
gaussdb=# CREATE RESOURCE LABEL table_label add TABLE(public.tb_for_label);
ERROR:  table_label label already defined

-- Create a resource label based on columns.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add COLUMN(public.tb_for_label.col1);

-- Create schema schema_for_label.
gaussdb=# CREATE SCHEMA schema_for_label;

-- Create a resource label based on a schema.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create view view_for_label.
gaussdb=# CREATE VIEW view_for_label AS SELECT 1;

-- Create a resource label based on a view.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

-- Create function func_for_label.
gaussdb=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$ LANGUAGE SQL;

-- Create a resource label based on a function.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS func_label add FUNCTION(func_for_label);

-- Drop the table resource label table_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS table_label;

-- Drop the column resource label column_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS column_label;

-- Drop the function resource label func_for_label.
gaussdb=# DROP FUNCTION func_for_label;

-- Drop the view resource label view_for_label.
gaussdb=# DROP VIEW view_for_label;

-- Drop the schema resource label schema_for_label.
gaussdb=# DROP SCHEMA schema_for_label;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the tb_for_label table.
gaussdb=# DROP TABLE tb_for_label;
```

ALTER RESOURCE LABEL and **DROP RESOURCE LABEL**

7.12.9.36 CREATE RESOURCE POOL

Description

Creates a resource pool and specifies the Cgroup of the resource pool.

Precautions

Only users with the SYSADMIN permission, or the initial user can perform this operation.

This syntax is not supported during upgrade.

Syntax

```
CREATE RESOURCE POOL pool_name
    [WITH ({MEM_PERCENT=pct | CONTROL_GROUP="group_name" | ACTIVE_STATEMENTS=stmt |
MAX_DOP = dop | MEMORY_LIMIT="memory_size" | io_limits=io_limits | io_priority="io_priority" |
max_worker=max_worker | max_connections=max_connections |
max_dynamic_memory="max_dynamic_memory"| max_shared_memory="max_shared_memory" |
max_concurrency=concurrency}[, ... ])];
```

Parameters

- **pool_name**

  Specifies the name of a resource pool.

  The name of the resource pool cannot be same as that of an existing resource pool.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **group_name**

  Specifies the name of a Cgroup.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- You can use either double quotation marks ("") or single quotation marks (') in the syntax when setting the name of a Cgroup.
- The value of **group_name** is case-sensitive.
- If **group_name** is not specified, the string "Medium" will be used by default in the syntax, indicating the **Medium** Timeshare Cgroup under **DefaultClass**.
- If an administrator specifies a Workload Cgroup under Class, for example, **control_group** set to **class1:workload1**, the resource pool will be associated with the **workload1** Cgroup under **class1**. The level of **Workload** can also be specified. For example, **control_group** is set to **class1:workload1:1**.
- If a database user specifies the Timeshare string (**Rush**, **High**, **Medium**, or **Low**) in the syntax, for example, **control_group** is set to **High**, the resource pool will be associated with the **High** Timeshare Cgroup under **DefaultClass**.
- In multi-tenant scenarios, the Cgroup associated with a group resource pool is a Class Cgroup, and that associated with a service resource pool is a Workload Cgroup. Additionally, switching Cgroups between different resource pools is not allowed.

Value range: a string. It must comply with the rule in the description, which specifies the created Cgroup.

- **dop**

  Specifies the maximum statement concurrency degree for a resource pool, equivalent to the number of threads that can be created for executing a statement.

  Value range: numeric data ranging from 1 to 2147483647.

- **memory_size**

  Specifies the maximum memory size of a resource pool.

  Value range: a string from 1 KB to 2047 GB

- **mem_percent**

  Specifies the proportion of available resource pool memory to the total memory or group user memory.

  In multi-tenant scenarios, **mem_percent** of group users or service users ranges from 1 to 100. The default value is **20**.

  In common scenarios, **mem_percent** of common users ranges from 0 to 100. The default value is **0**.

  NOTE

  When both of **mem_percent** and **memory_limit** are specified, only **mem_percent** takes effect.

- **io_limits**

  Specifies the upper limit of IOPS in a resource pool.

  The unit of row store is 10,000.

- **io_priority**

  Specifies the I/O priority set for jobs that consume many I/O resources. It takes effect when the I/O usage reaches 90%.

  There are three priorities: **Low**, **Medium**, and **High**. If you do not want to control I/O resources, use the default value **None**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> The settings of **io_limits** and **io_priority** are valid only for complex jobs, such as batch import (using **INSERT INTO SELECT**, **COPY FROM**, or **CREATE TABLE AS**), complex queries involving over 500 MB data on each DN, and **VACUUM FULL**.

- **max_worker**

  Concurrency in a table during data redistribution. This column is used only for scaling.

- **max_connections**

  Limits the maximum number of connections that can be used by a resource pool.

  > NOTE
  >
  > The total maximum number of connections in all resource pools cannot exceed the maximum number of connections specified by the GUC parameter **max_connections** of the entire GaussDB process.

- **max_dynamic_memory**

  Specifies the maximum dynamic memory that can be used by a resource pool.

- **max_shared_memory**

  Specifies the maximum shared memory that can be used by a resource pool.

- **max_concurrency**

  Specifies the maximum concurrent requests that can be used by a resource pool.

Examples

This example assumes that Cgroups have been created by users in advance. Contact an administrator to create a Cgroup.

```
-- Create a default resource pool, and associate it with the Medium Timeshare Cgroup under Workload under DefaultClass.
gaussdb=# CREATE RESOURCE POOL pool1;

-- Create a resource pool and specify the High Timeshare Workload Cgroup under the DefaultClass Cgroup.
gaussdb=# CREATE RESOURCE POOL pool2 WITH (CONTROL_GROUP="High");

-- Create a resource pool, and associate it with the Low Timeshare Cgroup under Workload under class1.
gaussdb=# CREATE RESOURCE POOL pool3 WITH (CONTROL_GROUP="class1:Low");

-- Create a resource pool, and associate it with the wg1 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool4 WITH (CONTROL_GROUP="class1:wg1");

-- Create a resource pool, and associate it with the wg2 Workload Cgroup under class1.
gaussdb=# CREATE RESOURCE POOL pool5 WITH (CONTROL_GROUP="class1:wg2:3");

-- Drop resource pools.
gaussdb=# DROP RESOURCE POOL pool1;
gaussdb=# DROP RESOURCE POOL pool2;
gaussdb=# DROP RESOURCE POOL pool3;
gaussdb=# DROP RESOURCE POOL pool4;
gaussdb=# DROP RESOURCE POOL pool5;
```

7.12.9.37 CREATE ROLE

Description

Creates a role.

A role is an entity that owns database objects and permissions. In different environments, a role can be considered a user, a group, or both.

Precautions

- If a role is added to the database, the role does not have the login permission.
- Only the user who has the CREATE ROLE permission or a system administrator is allowed to create roles.

Syntax

```
CREATE ROLE role_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD |
IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```

The syntax of role information configuration clause **option** is as follows:

```
{SYSADMIN | NOSYSADMIN}
   | {MONADMIN | NOMONADMIN}
   | {OPRADMIN | NOOPRADMIN}
   | {POLADMIN | NOPOLADMIN}
   | {AUDITADMIN | NOAUDITADMIN}
   | {CREATEDB | NOCREATEDB}
   | {USEFT | NOUSEFT}
   | {CREATEROLE | NOCREATEROLE}
   | {INHERIT | NOINHERIT}
   | {LOGIN | NOLOGIN}
   | {REPLICATION | NOREPLICATION}
   | {PERSISTENCE | NOPERSISTENCE}
   | CONNECTION LIMIT connlimit
   | VALID BEGIN 'timestamp'
   | VALID UNTIL 'timestamp'
   | RESOURCE POOL 'respool'
   | USER GROUP 'groupuser'
   | PERM SPACE 'spacelimit'
   | TEMP SPACE 'tmpspacelimit'
   | SPILL SPACE 'spillspacelimit'
   | NODE GROUP logic_cluster_name
   | IN ROLE role_name [, ...]
   | IN GROUP role_name [, ...]
   | ROLE role_name [, ...]
   | ADMIN role_name [, ...]
   | USER role_name [, ...]
   | SYSID uid
   | DEFAULT TABLESPACE tablespace_name
   | PROFILE DEFAULT
   | PROFILE profile_name
   | PGUSER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **role_name**

  Specifies the name of a role.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the role name. If a role name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a role name that contains uppercase letters, enclose the role name with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **password**

  Specifies the login password.

  A new password must:

  – Contain at least eight characters. This is the default length.

  – Differ from the role name or the role name spelled backward.

  – Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#$%^&*()-_=+\|[{}];:,<.>/?).

  – The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

  – Be enclosed by single quotation marks when a role is created.

  Value range: a character string that cannot be empty.

- **EXPIRED**

  When creating a user, you can select **EXPIRED**. That is, you can create a user whose password is invalid. The user cannot perform simple query or extended query. The statement can be executed only after the password is changed.

- **DISABLE**

  By default, you can change your password unless it is disabled. To disable the password of a user, use this parameter. After the password of a user is disabled, the password will be deleted from the system. The user can connect to the database only through external authentication, for example, Kerberos authentication. Only administrators can enable or disable a password. Common users cannot disable the password of an initial user. To enable a password, run **ALTER USER** and specify the password.

- **ENCRYPTED | UNENCRYPTED**

  Controls whether the password is stored encrypted in the system catalogs. According to product security requirement, the password must be stored encrypted. Therefore, **UNENCRYPTED** is forbidden in GaussDB. If the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

password string has already been encrypted in the SHA256 format, it is stored encrypted as it was, regardless of whether **ENCRYPTED** or **UNENCRYPTED** is specified (since the system cannot decrypt the specified encrypted password string). This allows reloading of encrypted passwords during dump/restore.

- **SYSADMIN | NOSYSADMIN**

  Specifies whether a new role is a system administrator. Roles with the SYSADMIN attribute have the highest permission.

  Value range: If not specified, **NOSYSADMIN** is the default.

  When separation of duties is disabled, users with the SYSADMIN permission can create users with the SYSADMIN, REPLICATION, CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.

  When separation of duties is enabled, users with the SYSADMIN permission do not have the permission to create users.

- **MONADMIN | NOMONADMIN**

  Specifies whether a role is a monitor administrator.

  Value range: If not specified, **NOMONADMIN** is the default.

- **OPRADMIN | NOOPRADMIN**

  Specifies whether a role is an O&M administrator.

  Value range: If not specified, **NOOPRADMIN** is the default.

- **POLADMIN | NOPOLADMIN**

  Specifies whether a role is a security policy administrator.

  Value range: If not specified, **NOPOLADMIN** is the default.

- **AUDITADMIN | NOAUDITADMIN**

  Specifies whether a role has the audit and management attributes.

  If not specified, **NOAUDITADMIN** is the default.

- **CREATEDB | NOCREATEDB**

  Specifies a role's permission to create databases.

  A new role does not have the permission to create databases.

  Value range: If not specified, **NOCREATEDB** is the default.

- **USEFT | NOUSEFT**

  This parameter is reserved and not used in this version.

- **CREATEROLE | NOCREATEROLE**

  Specifies whether a role will be permitted to create new roles (that is, execute **CREATE ROLE** and **CREATE USER**). A role with the CREATEROLE permission can also modify and delete other roles.

  Value range: If not specified, **NOCREATEROLE** is the default.

  - When separation of duties is disabled, users with the CREATEROLE permission can create users with the CREATEROLE, AUDITADMIN, MONADMIN, POLADMIN, or CREATEDB permission and common users.
  - When separation of duties is enabled, users with the CREATEROLE permission can create users with the CREATEROLE, MONADMIN, POLADMIN, or CREATEDB permission and common users.

- **INHERIT | NOINHERIT**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies whether a role "inherits" the permissions of roles in the same group. It is not recommended.

- **LOGIN | NOLOGIN**

  Specifies whether a role is allowed to log in to a database. A role having the **LOGIN** attribute can be considered as a user.

  Value range: If not specified, **NOLOGIN** is the default.

- **REPLICATION | NOREPLICATION**

  Specifies whether a role is allowed to initiate streaming replication or put the system in and out of backup mode. A role having the **REPLICATION** attribute is specific to replication.

  If not specified, **NOREPLICATION** is the default.

- **PERSISTENCE | NOPERSISTENCE**

  Defines a permanent user. Only the initial user is allowed to create, modify, and delete permanent users with the PERSISTENCE attribute.

- **CONNECTION LIMIT connlimit**

  Specifies how many concurrent connections the role can make.

  NOTICE

  - The system administrator is not restricted by this parameter.
  - **connlimit** is calculated for each CN. The number of connections in a cluster is calculated using the following formula: Number of connections in a cluster = **connlimit** x Number of normal CNs.

  Value range: an integer in the range [–1, 2^{31} – 1]. The default value **–1** means no limit.

- **VALID BEGIN 'timestamp'**

  Sets the timestamp when a role takes effect. If this clause is omitted, the role has no valid start time. **timestamp** indicates the start time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **VALID UNTIL 'timestamp'**

  Sets a date and time after which the role's password is no longer valid. If this clause is omitted, the role has no valid end time. **timestamp** indicates the end time. The format is 'YYYY-MM-DD HH:mm:ss'.

- **RESOURCE POOL 'respool'**

  Sets the name of resource pool used by the role. The name belongs to the system catalog pg_resource_pool.

- **USER GROUP 'groupuser'**

  Creates a sub-user.

- **PERM SPACE 'SPACELIMIT'**

  Sets the space available for a user.

- **TEMP SPACE 'tmpspacelimit'**

  Sets the space allocated to the temporary table of a user.

- **SPILL SPACE 'spillspacelimit'**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Sets the operator disk flushing space of a user.

- **IN ROLE role_name**

  Lists one or more existing roles whose permissions will be inherited by a new role. It is not recommended.

- **IN GROUP role_name**

  Specifies an obsolete spelling of IN ROLE. It is not recommended.

- **ROLE role_name**

  Lists one or more existing roles which are automatically added as members of the new role.

- **ADMIN role_name**

  Similar to ROLE. However, ADMIN grants permissions of new roles to other roles.

- **USER role_name**

  Specifies an obsolete spelling of the ROLE clause.

- **SYSID uid**

  The SYSID clause is ignored.

- **DEFAULT TABLESPACE tablespace_name**

  The DEFAULT TABLESPACE clause is ignored.

- **PROFILE profile_name**

  The PROFILE clause is ignored.

- **PGUSER**

  In the current version, this attribute is reserved only for forward compatibility.

Examples

- Differences between CREATE ROLE and CREATE USER:

```
-- Run CREATE ROLE to create role test_role.
gaussdb=# CREATE ROLE test_role PASSWORD '********';
-- Run CREATE USER to create user test_user.
gaussdb=# CREATE USER test_user PASSWORD '********';

-- View the information. Roles created by CREATE ROLE are not allowed to log in to the database by
default.
gaussdb=# \du test*
           List of roles
 Role name |  Attributes  | Member of
-----------+--------------+-----------
 test_role | Cannot login | {}
 test_user |              | {}

-- Enable the test_role role to log in to the database.
gaussdb=# ALTER ROLE test_role WITH LOGIN;

gaussdb=# \du test*
           List of roles
 Role name | Attributes | Member of
-----------+------------+-----------
 test_role |            | {}
 test_user |            | {}

-- View schema information. When CREATE USER is executed to create a user, a schema with the
same name is automatically created.
gaussdb=# \dn test*
    List of schemas
   Name    |   Owner
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----------+-----------
 test_user | test_user
(1 row)

-- Delete.
gaussdb=# DROP ROLE test_role;
gaussdb=# DROP USER test_user;
```

- Creating roles with permissions for the separation of duties.

```
-- Create user lisa with the OPRADMIN permission and user bob with the SYSADMIN permission.
gaussdb=# CREATE ROLE lisa WITH OPRADMIN PASSWORD '*********';
gaussdb=# CREATE ROLE bob WITH SYSADMIN PASSWORD '*********';

-- Query the permissions.
gaussdb=# \du lisa;
                   List of roles
 Role name |         Attributes          | Member of
-----------+-----------------------------+-----------
 lisa      | Cannot login, Operatoradmin | {}

gaussdb=# \du bob
                List of roles
 Role name |       Attributes       | Member of
-----------+------------------------+-----------
 bob       | Cannot login, Sysadmin | {}

-- Create role role11 with the CREATEDB permission.
gaussdb=# CREATE ROLE role11 CREATEDB PASSWORD '********';
CREATE ROLE

-- Query the permissions.
gaussdb=# \du role11
                 List of roles
 Role name |       Attributes        | Member of
-----------+-------------------------+-----------
 role11    | Create DB, Cannot login | {}

-- Create role role12 using the ADMIN clause.
gaussdb=# CREATE ROLE role12 WITH  CREATEDB  ADMIN role11  PASSWORD '********';
CREATE ROLE
-- Query the permissions.
gaussdb=# \du role11
                 List of roles
 Role name |       Attributes        | Member of
-----------+-------------------------+-----------
 role11    | Create DB, Cannot login | {role12}

gaussdb=# \du role12
                 List of roles
 Role name |       Attributes        | Member of
-----------+-------------------------+-----------
 role12    | Create DB, Cannot login | {}

-- Delete the roles.
gaussdb=# DROP ROLE role11;
gaussdb=# DROP ROLE role12;
gaussdb=# DROP ROLE lisa;
gaussdb=# DROP ROLE bob;

-- Separation-of-duties configuration: If enableSeparationOfDuty is set to on, the separation of duties is enabled to restrict the permissions of system administrators. System administrators are not allowed to create or modify user configurations.

-- Check whether the separation of duties is enabled.
gaussdb=# SHOW enableSeparationOfDuty;
 enableSeparationOfDuty
------------------------
 off
(1 row)
-- Run the following statement to modify parameters:
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gs_guc set -Z coordinator -Z datanode -N all -I all -c "enableSeparationOfDuty = on"

-- After the setting is successful, the setting takes effect after a restart.
gs_om -t stop
gs_om -t start

-- Check the separation of duties again.
gaussdb=# SHOW enableSeparationOfDuty;
 enableSeparationOfDuty
------------------------
 on
(1 row)
```

- Create a role whose password is invalid.

```
-- Create the password invalidation role test_role2.
gaussdb=# CREATE ROLE test_role2 PASSWORD '********' EXPIRED;
gaussdb=# ALTER ROLE test_role2 WITH LOGIN;

-- test_role2 cannot perform any operation after logging in to the database. You can perform operations only after changing the password as prompted.
gaussdb=# SET ROLE test_role2 PASSWORD '********';
gaussdb=> \d
ERROR:  Please use "ALTER ROLE user_name IDENTIFIED BY 'password' REPLACE 'old password';" to modify the expired password of user test_role2 before operation!

-- Change the password of role test_role2.
gaussdb=> ALTER ROLE test_role2 IDENTIFIED BY '********' REPLACE '********';

-- Delete.
gaussdb=> RESET ROLE;
gaussdb=# DROP ROLE test_role2;
```

- Creating a role and specifying the effective date and expiration date:

```
-- Create a role with its validity from January 1, 2015 to January 1, 2026.
gaussdb=# CREATE ROLE test_role3 WITH LOGIN PASSWORD '********' VALID BEGIN '2015-01-01' VALID UNTIL '2026-01-01';
-- Delete.
gaussdb=# DROP ROLE test_role3;
```

Helpful Links

SET ROLE, **ALTER ROLE**, **DROP ROLE**, **GRANT**, and **REVOKE**

7.12.9.38 CREATE ROW LEVEL SECURITY POLICY

Description

Creates a row-level security policy for a table.

The policy takes effect only after row-level security is enabled (by running ALTER TABLE ... ENABLE ROW LEVEL SECURITY). Otherwise, this statement does not take effect.

Currently, row-level security affects the read (SELECT, UPDATE, and DELETE) of data tables and does not affect the write (INSERT and MERGE INTO) of data tables. The table owner or system administrators can create an expression in the USING clause. When the client reads the data table, the database server combines the expressions that meet the condition and applies it to the execution plan in the statement rewriting phase of a query. For each tuple in a data table, if the USING expression returns **TRUE**, the tuple is visible to the current user; if the USING expression returns **FALSE** or **NULL**, the tuple is invisible to the current user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

A row-level security policy name is specific to a table. A data table cannot have row-level security policies with the same name. Different data tables can have the same row-level security policy.

Row-level security policies can be applied to specified operations (**SELECT**, **UPDATE**, **DELETE**, and **ALL**). **ALL** indicates that SELECT, UPDATE, and DELETE will be affected. For a new row-level security policy, the default value **ALL** will be used if you do not specify the operations that will be affected.

Row-level security policies can be applied to a specified user (role) or to all users (**PUBLIC**). For a new row-level security policy, the default value **PUBLIC** will be used if you do not specify the user who will be affected.

Precautions

- Row-level security policies can be defined for row-store tables, row-store partitioned tables, replication tables, unlogged tables, and hash tables.
- Row-level security policies cannot be defined for foreign tables and temporary tables.
- Row-level security policies cannot be defined for views.
- A maximum of 100 row-level security policies can be defined for a table.
- System administrators are not affected by row-level security policies and can view all data in a table.
- Tables queried by using SQL statements, views, functions, and stored procedures are affected by row-level security policies.
- The data type of a table column to which a row-level security policy has been added cannot be changed.

Syntax

```
CREATE [ ROW LEVEL SECURITY ] POLICY policy_name ON table_name
    [ AS { PERMISSIVE | RESTRICTIVE } ]
    [ FOR { ALL | SELECT | UPDATE | DELETE } ]
    [ TO { role_name | PUBLIC | CURRENT_USER | SESSION_USER } [, ...] ]
    USING ( using_expression );
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **policy_name**

  Specifies the name of a row-level security policy to be created. The names of row-level security policies for a table must be unique.

- **table_name**

  Specifies the name of a table to which a row-level security policy is applied.

- **PERMISSIVE | RESTRICTIVE**

  PERMISSIVE enables the permissive policy for row-level security. The conditions of the permissive policy are joined through the OR expression. **RESTRICTIVE** enables the restrictive policy for row-level security. The conditions of the restrictive policy are joined through the AND expression. The join methods are as follows:

  (using_expression_permissive_1 OR using_expression_permissive_2 ...) AND (using_expression_restrictive_1 AND using_expression_restrictive_2 ...)

  The default value is **PERMISSIVE**.

- **command**

  Specifies the SQL operations affected by a row-level security policy, including **ALL**, **SELECT**, **UPDATE**, and **DELETE**. If this parameter is not specified, the default value **ALL** will be used, covering SELECT, UPDATE, and DELETE.

  If **command** is set to **SELECT**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be queried. The operations that are affected include SELECT, SELECT FOR UPDATE/SHARE, UPDATE ... RETURNING, and DELETE ... RETURNING.

  If **command** is set to **UPDATE**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be updated. The operations that are affected include UPDATE, UPDATE ... RETURNING, and SELECT ... FOR UPDATE/SHARE.

  If **command** is set to **DELETE**, only tuple data that meets the condition (the return value of **using_expression** is **TRUE**) can be deleted. The operations that are affected include DELETE and DELETE ... RETURNING.

  For the relationship between row-level security policies and SQL statements, see **Table 7-268**.

  Table 7-268 Relationship between the ROW LEVEL SECURITY policy and SQL statements

Command	SELECT/ALL Policy	UPDATE/ALL Policy	DELETE/ALL Policy
SELECT	Existing row	No	No
SELECT FOR UPDATE/SHARE	Existing row	Existing row	No
UPDATE	No	Existing row	No
UPDATE RETURNING	Existing row	Existing row	No

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Command	SELECT/ALL Policy	UPDATE/ALL Policy	DELETE/ALL Policy
DELETE	No	No	Existing row
DELETE RETURNING	Existing row	No	Existing row

- **role_name**

  Specifies database users affected by a row-level security policy.

  CURRENT_USER indicates the username in the current execution environment. **SESSION_USER** indicates the session username. If this parameter is not specified, the default value **PUBLIC** is used, indicating that all database users are affected. You can specify multiple affected database users.

  NOTICE

  System administrators are not affected by row-level security.

- **using_expression**

  Specifies an expression defined for a row-level security policy (return type: Boolean).

  The expression cannot contain aggregate functions or window functions. In the statement rewriting phase of a query, if row-level security for a data table is enabled, the expressions that meet the specified conditions will be added to the plan tree. The expression is calculated for each tuple in the data table. For SELECT, UPDATE, and DELETE, row data is visible to the current user only when the return value of the expression is **TRUE**. If the expression returns **FALSE**, the tuple is invisible to the current user. In this case, the user cannot view the tuple through the SELECT statement, update the tuple through the UPDATE statement, or delete the tuple through the DELETE statement.

Examples

```
-- Create user alice.
gaussdb=# CREATE USER alice PASSWORD '*********';

-- Create user bob.
gaussdb=# CREATE USER bob PASSWORD '*********';

-- Create data table all_data.
gaussdb=# CREATE TABLE public.all_data(id int, role varchar(100), data varchar(100));

-- Insert data into the data table.
gaussdb=# INSERT INTO all_data VALUES(1, 'alice', 'alice data');
gaussdb=# INSERT INTO all_data VALUES(2, 'bob', 'bob data');
gaussdb=# INSERT INTO all_data VALUES(3, 'peter', 'peter data');

-- Grant the read permission on the all_data table to users alice and bob.
gaussdb=# GRANT SELECT ON all_data TO alice, bob;

-- Enable the row-level security policy.
gaussdb=# ALTER TABLE all_data ENABLE ROW LEVEL SECURITY;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a row-level security policy to specify that the current user can view only their own data.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- View information about the all_data table.
gaussdb=# \d+ all_data
                          Table "public.all_data"
 Column |          Type          | Modifiers | Storage  | Stats target | Description
--------+------------------------+-----------+----------+--------------+-------------
 id     | integer                |           | plain    |              |
 role   | character varying(100) |           | extended |              |

   2 --Seq Scan on all_data
        Filter: ((role)::name = "current_user"())
 Notice: This query is influenced by row level security feature
(3 rows)

-- Insert data. An error will be reported if the INSERT permission is not granted.
gaussdb=> INSERT INTO all_data VALUES(4, 'test', 'test data');
ERROR:  Permission denied for relation all_data.
DETAIL:  N/A.

-- Grant the INSERT permission on the all_data table to user alice.
gaussdb=> RESET ROLE;
gaussdb=# GRANT INSERT ON all_data TO alice;

-- Switch to user alice and insert data.
gaussdb=# SET ROLE alice PASSWORD '********';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=> INSERT INTO all_data VALUES(4, 'alice', 'test data');
INSERT 0 1

-- Query the all_data table.
gaussdb=> SELECT * FROM all_data;
 id | role  |    data
----+-------+------------
  1 | alice | alice data
  4 | alice | test data
(2 rows)

-- Delete a row-level security policy.
gaussdb=> RESET ROLE;
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE public.all_data;

-- Delete users alice and bob.
gaussdb=# DROP USER alice, bob;
```

DROP ROW LEVEL SECURITY POLICY

7.12.9.39 CREATE SCHEMA

Description

Creates a schema.

Named objects are accessed either by "qualifying" their names with the schema name as a prefix, or by setting a search path that includes the desired schema. When creating named objects, you can also use the schema name as a prefix.

Optionally, CREATE SCHEMA can include sub-commands to create objects within the new schema. The sub-commands are treated essentially the same as separate commands issued after creating the schema. If the AUTHORIZATION clause is used, all the created objects are owned by this user.

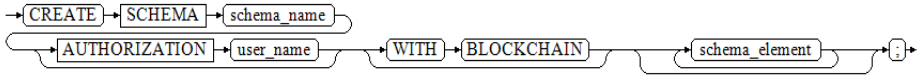
Precautions

- Only a user with the CREATE permission on the current database can perform this operation.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

Syntax

- Create a schema based on a specified name.

```
CREATE SCHEMA schema_name
   [ AUTHORIZATION user_name ] [WITH BLOCKCHAIN] [ schema_element [ ... ] ];
```



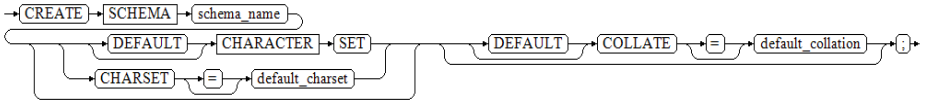
- Create a schema based on a username.

```
CREATE SCHEMA AUTHORIZATION user_name [ schema_element [ ... ] ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Create a schema and specify the default character set and collation.

```
CREATE SCHEMA schema_name
   [ [DEFAULT] CHARACTER SET | CHARSET [ = ] default_charset ] [ [DEFAULT] COLLATE [ = ] default_collation ];
```



Parameters

- **schema_name**

  Specifies the schema name.

  NOTICE

  - The schema name must be unique in the current database.
  - The schema name cannot be the same as the initial username of the current database.
  - The schema name cannot start with **pg_**.
  - The schema name cannot start with **gs_role_**.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **AUTHORIZATION user_name**

  Specifies the owner of a schema. If **schema_name** is not specified, **user_name** will be used as the schema name. In this case, **user_name** can only be a role name.

  Value range: an existing username or role name

- **WITH BLOCKCHAIN**

  Specifies the tamper-proof attribute of a schema. A common row-store table in tamper-proof mode is a tamper-proof user table.

  NOTE

  To create a tamper-proof schema, set the GUC parameter **enable_ledger** to **on**. The default value is **off**, and the level is SIGHUP.

- **schema_element**

  Specifies an SQL statement defining an object to be created within the schema. Currently, only the CREATE TABLE, CREATE VIEW, CREATE INDEX, CREATE TABLE PARTITION, CREATE SEQUENCE, CREATE TRIGGER, and GRANT clauses are supported.

  Objects created by sub-commands are owned by the user specified by AUTHORIZATION.

NOTE

If objects in the schema on the current search path are with the same name, specify the schemas for different objects. You can run **SHOW SEARCH_PATH** to check the schemas on the current search path.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **default_charset**

  Specifies the default character set of a schema. If this parameter is specified separately, the default collation of the schema is set to the default collation of the specified character set.

  This syntax is supported only in MySQL-compatible mode (that is, **sql_compatibility** set to **'MYSQL'**).

- **default_collation**

  Specifies the default collation of a schema. If this parameter is specified separately, the default character set of the schema is set to the character set corresponding to the specified collation.

  This syntax is supported only in MySQL-compatible mode (that is, **sql_compatibility** set to **'MYSQL'**). For details about the supported collation, see **Table 7-267**.

Examples

```
-- Create the role1 role.
gaussdb=# CREATE ROLE role1 IDENTIFIED BY '********';

-- Create a schema named role1 for the role1 role. The owner of the films and winners tables created by the clause is role1.
gaussdb=# CREATE SCHEMA AUTHORIZATION role1
    CREATE TABLE films (title text, release date, awards text[])
    CREATE VIEW winners AS SELECT title, release FROM films WHERE awards IS NOT NULL;

-- Create role role2.
gaussdb=# CREATE ROLE role2 IDENTIFIED BY '********';

-- Create a schema based on the name.
gaussdb=# CREATE SCHEMA schema1 AUTHORIZATION role2;
CREATE SCHEMA

-- Before modifying the tamper-proof attribute, set the enable_ledger parameter. The default value of enable_ledger is off, and set enable_ledger to on using gs_guc.
gs_guc reload -Z coordinator -Z datanode -N all -I all -c "enable_ledger=on";

-- After setting, check whether the parameter status is on. If the setting is successful, configure the tamper-proof attribute.
gaussdb=# SHOW enable_ledger;
 enable_ledger
---------------
 on
(1 row)

-- Create a schema with the tamper-proof attribute specified.
gaussdb=# CREATE SCHEMA ledgernsp WITH BLOCKCHAIN;
CREATE SCHEMA

-- Drop schemas.
gaussdb=# DROP SCHEMA role1 CASCADE;
gaussdb=# DROP SCHEMA schema1 CASCADE;
gaussdb=# DROP SCHEMA ledgernsp  CASCADE;

-- Drop users.
gaussdb=# DROP USER role1 CASCADE;
gaussdb=# DROP USER role2 CASCADE;
```

ALTER SCHEMA and **DROP SCHEMA**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.40 CREATE SECURITY LABEL

Description

CREATE SECURITY LABEL creates a security label for the specified security policy in the current database.

Precautions

An initial user, a user with the SYSADMIN permission, or a user who inherits permissions of the built-in role gs_role_seclabel can create security labels.

Syntax

```
CREATE SECURITY LABEL label_name 'label_content';
```

Parameters

- **label_name**

  Security label name, which must be unique in the database.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the security label name. If a security label name contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a security label name that contains uppercase letters, enclose the security label name with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **label_content**

  Security label content. The requirements are as follows:

  A security label consists of only one level and at least one range, which are separated by a colon (:). The format is "level:range", for example, "L1:G2,G41,G6-G27".

  - There are 1024 levels named Li, where 1 ≤ i ≤ 1024. The levels meet a partial order relationship (if i ≤ j, then Li ≤ Lj). For example, L1 is lower than L3.
  - There are 1024 ranges named Gi, where 1 ≤ i ≤ 1024. You cannot compare sizes between ranges, but you can perform set operations. Multiple ranges are separated by commas (,), and a hyphen (-) is used to specify the interval. For example, {G2-G5} indicates {G2,G3,G4,G5}. {G1} is a subset of {G1, G6}.
  - The letters L and G must be capitalized and followed by at least one non-zero digit. Other characters are not allowed. In the {Gxxx-Gyyy} format, yyy must be greater than or equal to xxx.
  - If the input levels and ranges do not meet the requirements, the system reports an error.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

CAUTION

Example:
gaussdb=# CREATE SECURITY LABEL sec_label3 'L3:'; // The label must contain at least one content range category.
ERROR: in label text "L3:", there at least have one level and one group

Examples

```
-- Create a security label sec_label.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G4';

-- Create security label sec_label with the content of 'L1:G2,G4'.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G2,G4';
ERROR:  security label "sec_label" already exists
-- Create security label sec_label1 with the content of 'L1:G2,G4'.
gaussdb=# CREATE SECURITY LABEL sec_label1 'L1:G2,G4';

-- Create security label sec_label2 with the content of 'L3:G1-G5'.
gaussdb=# CREATE SECURITY LABEL sec_label2 'L3:G1-G5';

-- View the security labels created in the system.
gaussdb=# SELECT * FROM gs_security_label;
 label_name | label_content
------------+---------------
 sec_label  | L1:G4
 sec_label1 | L1:G2,G4
 sec_label2 | L3:G1-G5
(3 rows)

-- Delete the existing security labels sec_label, sec_label1, and sec_label2.
gaussdb=# DROP SECURITY LABEL sec_label;
gaussdb=# DROP SECURITY LABEL sec_label1;
gaussdb=# DROP SECURITY LABEL sec_label2;

-- View the security labels created in the system again.
gaussdb=# SELECT * FROM gs_security_label;
 label_name | label_content
------------+---------------
(0 rows)
```

Helpful Links

DROP SECURITY LABEL and **SECURITY LABEL ON**

7.12.9.41 CREATE SEQUENCE

Description

CREATE SEQUENCE adds a sequence to the current database. The owner of a sequence is the user who creates the sequence.

Precautions

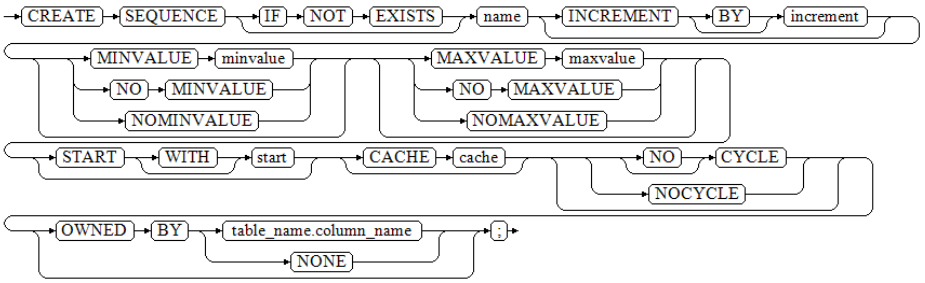
- A sequence is a special table that stores arithmetic progressions. It has no actual meaning and is usually used to generate unique identifiers for rows or tables.
- If a schema name is given, the sequence is created in the specified schema; otherwise, it is created in the current schema. The sequence name must be different from the names of other sequences, tables, indexes, views, or foreign tables in the same schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- After the sequence is created, functions nextval() and generate_series(1,N) insert data to the table. Make sure that the number of times for calling nextval is greater than or equal to N+1. Otherwise, errors will be reported because the number of times for calling function generate_series() is N+1.
- A user granted the CREATE ANY SEQUENCE permission can create sequences in the public and user schemas.

Syntax

```
CREATE SEQUENCE [ IF NOT EXISTS ] name [ INCREMENT [ BY ] increment ]
    [ MINVALUE minvalue | NO MINVALUE | NOMINVALUE ] [ MAXVALUE maxvalue | NO MAXVALUE |
NOMAXVALUE]
    [ START [ WITH ] start ] [ CACHE cache ] [ [ NO ] CYCLE | NOCYCLE ]
    [ OWNED BY { table_name.column_name | NONE } ];
```



Parameters

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating a sequence. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

- **name**

  Specifies the name of a sequence to be created.

  Value range: a string containing only lowercase letters, uppercase letters, special characters #_$, and digits.

- **increment**

  Optional. Specifies the step for a sequence. A positive number generates an ascending sequence, and a negative number generates a decreasing sequence.

  The default value is **1**.

  NOTE

  In MySQL-compatible mode, if the step is a floating-point number, the value is automatically converted to an integer. In other modes, this parameter cannot be set to a floating-point number.

- **MINVALUE minvalue | NO MINVALUE| NOMINVALUE**

  Optional. Specifies the minimum value of the sequence. If **MINVALUE** is not declared, or **NO MINVALUE** is declared, the default value of the ascending sequence is **1**, and that of the descending sequence is **$-2^{63}-1$**. **NOMINVALUE** is equivalent to **NO MINVALUE**.

- **MAXVALUE maxvalue | NO MAXVALUE| NOMAXVALUE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Optional. Specifies the maximum value of the sequence. If **MAXVALUE** is not declared, or **NO MAXVALUE** is declared, the default value of the ascending sequence is 2^{63}**-1**, and that of the descending sequence is **-1**. **NOMAXVALUE** is equivalent to **NO MAXVALUE**.

- **start**

  Optional. Specifies the start value of the sequence. The default value for an ascending sequence is **minvalue** and that for a descending sequence is **maxvalue**.

- **cache**

  Optional. Specifies the number of sequences stored in the memory for quick access purposes.

  Default value **1** indicates that one sequence can be generated each time.

  NOTE

  - It is not recommended that you define **cache** and **maxvalue** or **minvalue** at the same time. The continuity of sequences cannot be ensured after **cache** is defined because unacknowledged sequences may be generated, causing waste of sequences. If there are requirements on the concurrency performance, see the GUC parameter **session_sequence_cache**.
  - cache specifies the value that a single CN/DN applies for from the GTM at a time. **session_sequence_cache** specifies the value of the cache that a single session applies for from the CN/DN at a time. The value is automatically discarded after the session ends.

- **CYCLE**

  Optional. Recycles sequences after the number of sequences reaches **maxvalue** or **minvalue**.

  If **NO CYCLE** is specified, any call of nextval would return an error after the number of sequences reaches **maxvalue** or **minvalue**.

  - **NOCYCLE** is equivalent to **NO CYCLE**. The default value is **NO CYCLE**.
  - If **CYCLE** is specified, the sequence uniqueness cannot be ensured.

- **OWNED BY**

  Optional. Associates a sequence with a specified column included in a table. In this way, the sequence will be deleted when you delete its associated column or the table where the column belongs to. The associated table and sequence must be owned by the same user and in the same schema. OWNED BY only establishes the association between a table column and the sequence. Sequences on the column do not increase automatically when data is inserted.

  The default value **OWNED BY NONE** indicates that such association does not exist.

NOTICE

You are advised not to use the sequence created using OWNED BY in other tables. If multiple tables need to share a sequence, the sequence must not belong to a specific table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

- Create an ascending sequence named **seq1**. The sequence starts from 101 and the step is 10.

```
gaussdb=# CREATE SEQUENCE seq1
    START 101
    INCREMENT 10;

-- Select the next number from the sequence.
gaussdb=# SELECT nextval('seq1');
 nextval
---------
     101
(1 row)
gaussdb=# SELECT nextval('seq1');
 nextval
---------
     111

-- Delete the sequence.
gaussdb=# DROP SEQUENCE seq1;
```

- Implement the auto-increment column.

```
-- Create a table.
gaussdb=# CREATE TABLE test1(id int PRIMARY KEY, name varchar(20));

-- Create a sequence joined with the table.
gaussdb=# CREATE SEQUENCE test_seq2
    START 1
    NO CYCLE
    OWNED BY test1.id;

-- Set the default value of a column.
gaussdb=# ALTER TABLE test1 ALTER COLUMN id SET DEFAULT nextval('test_seq2'::regclass);

-- Insert data.
gaussdb=# INSERT INTO test1 (name) values ('Joe'),('Scott'),('Ben');

-- Query.
gaussdb=# SELECT * FROM test1;
 id | name
----+-------
  3 | Ben
  1 | Joe
  2 | Scott
(3 rows)

-- Delete the sequence and the table.
gaussdb=# DROP SEQUENCE test_seq2 CASCADE;
gaussdb=# DROP TABLE test1;
```

- Create a cycle sequence.

```
-- Create ascending sequence seq_test1. The maximum value is 3 and the sequence can be cycled.
gaussdb=# CREATE SEQUENCE seq_test1
    START 1
    MAXVALUE 3
    CYCLE;

-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test1(
    c1 int DEFAULT nextval('seq_test1'),
    c2 varchar
);
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');
gaussdb=# INSERT INTO tbl_test1 (c2) values ('test');

-- Query table data. When the value of ascending sequence seq_test reaches the maximum value, the
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
value starts from the minimum value again.
gaussdb=# SELECT ctid,* FROM tbl_test1 ORDER BY 1,2;
 ctid  | c1 |  c2
-------+----+------
 (0,1) |  1 | test
 (0,1) |  3 | test
 (0,2) |  2 | test
 (0,3) |  1 | test
 (0,4) |  2 | test
(5 rows)

-- Delete the table and sequence.
gaussdb=# DROP TABLE tbl_test1;
gaussdb=# DROP SEQUENCE seq_test1;
```

Helpful Links

DROP SEQUENCE and **ALTER SEQUENCE**

7.12.9.42 CREATE SERVER

Description

Creates a foreign server. A foreign server stores other homogeneous cluster information.

Precautions

Only a system administrator and users with permission to use a specified FOREIGN DATA WRAPPER can create a foreign server. The authorization syntax is as follows:

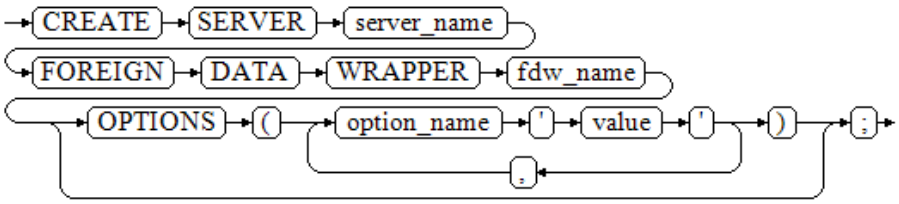
```
GRANT USAGE ON FOREIGN DATA WRAPPER fdw_name TO username
```

fdw_name is the name of the FOREIGN DATA WRAPPER, and **username** is the name of the user creating a foreign server.

When multi-layer quotation marks are used for sensitive columns (such as **password**) in **OPTIONS**, the semantics is different from that in the scenario where quotation marks are not used. Therefore, sensitive columns are not identified for anonymization.

Syntax

```
CREATE SERVER server_name
    FOREIGN DATA WRAPPER fdw_name
    [ OPTIONS ( { option_name ' value ' } [, ...] ) ];
```



Parameters

- **server_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the server name.

Value range: a string containing no more than 63 bytes.

- **FOREIGN DATA WRAPPER fdw_name**

  Specifies the name of the foreign data wrapper.

  Value range: **fdw_name** is the data wrapper created by the system during database initialization. Currently, **fdw_name** can only be **gc_fdw** for other homogeneous clusters. You can also create **dist_fdw**, **file_fdw**, and **log_fdw**. **log_fdw** is used only for syntax compatibility and can be used to create foreign tables, but it is meaningless. **dist_fdw** is used to import GDS data. You do not need to manually create a server using **dist_fdw** because **gsmpp_server** is already built in.

- **OPTIONS ({ option_name ' value ' } [, ...])**

  Specifies the parameters of a foreign server.

  – address

    Address of the foreign server.

  – dbname

    Database name of the foreign server.

  – username

    Username of a foreign server.

  – password

    Password of the foreign server.

Examples

Create a server, in which **file_fdw** is the FOREIGN DATA WRAPPER existing in the database.

```
-- Create a server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER file_fdw;

-- Delete the server.
gaussdb=# DROP SERVER my_server;
```

You are advised to create another server in the homogeneous cluster, where **gc_fdw** is the foreign data wrapper in the database.

```
-- Create a server.
gaussdb=# CREATE SERVER server_remote FOREIGN DATA WRAPPER GC_FDW OPTIONS
    (address '10.146.187.231:8000,10.180.157.130:8000' ,
  dbname 'test',
  username 'test',
  password '********'
);

-- Delete the server.
gaussdb=# DROP SERVER server_remote;
```

Helpful Links

ALTER SERVER and **DROP SERVER**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.43 CREATE SLICEGROUP

Description

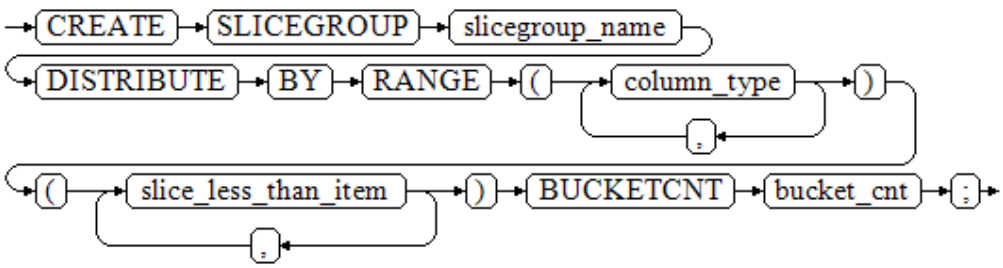
Creates a group of distribution rules for the usage of range bucket tables and persist the rules to the gs_slicegroup system catalog.

Precautions

- Multiple slices cannot be distributed to the same bucket. When creating a slice group, you need to set **bucketcnt** to a value greater than or equal to the number of slices.
- When a slice group is created, a slice can only be distributed to only one DN.
- The number of **bucketcnt** allocated to a slice group cannot exceed 1024. A slice group is a library-level concept. The total number of buckets allocated to all slice groups in a database cannot exceed 4096.
- When creating a slice group, you cannot specify the distribution key type or the character set.
- The slice definition supports only the LESS THAN syntax but does not support START END and REFERENCE.
- If gs_dump is used to export data from a range bucket table and gs_restore is used to import data to the table, you need to manually create a slice group before import. When the audit function is enabled, you can search for the creation statement in the audit log.

Syntax

```
CREATE SLICEGROUP slicegroup_name
   DISTRIBUTE BY RANGE ( column_type [, ...] )
   ( slice_less_than_item [, ...] ) BUCKETCNT bucket_cnt;
```



Parameters

- **slicegroup_name**

  Name of the distribution rule to be created. The name must be unique in the same database and different from the node group name.

  Value range: a string, which can contain lowercase letters (a-z), uppercase letters (A-Z), underscores (_), digits (0-9), and dollar signs ($). The value must start with a letter or underscore.

- **column_type**

  Distribution key type. A maximum of four distribution keys are supported.

- **slice_less_than_item**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Slice definition using the LESS THAN syntax.

```
For slice_less_than_item:
SLICE name VALUES LESS THAN ({ expression | MAXVALUE } [, ...]) [ DATANODE datanode_name ]
```

Value range of *name*: a string, which can contain lowercase letters (a-z), uppercase letters (A-Z), underscores (_), digits (0-9), and dollar signs ($), and must start with a letter or underscore.

- **bucket_cnt**

  Total number of buckets to be maintained by the distribution rule created.

  Value range: [1,1024]

Examples

```
-- Create a slice group.
gaussdb=# CREATE SLICEGROUP sg DISTRIBUTE BY RANGE(INT,CHAR(5),TIMESTAMP,TEXT)
(SLICE s1 VALUES LESS THAN (1000,'3700x','2012-5-5 10:52:12','customer') DATANODE datanode3,
 SLICE s2 VALUES LESS THAN (1000,'3701x','2012-5-5 10:52:12','customer'),
 SLICE s3 VALUES LESS THAN (1000,'3702x','2012-5-5 10:52:12','customer')) bucketcnt 3;

-- Query the slice group.
gaussdb=# SELECT * FROM gs_slicegroup;
 slicename | type | strategy | bucketgroup | bucketcnt | sgroupoid | sindex | nodeid | redis_nodeid | bucket |
slicecnt | contained | specified | sliceorder |                boundaries
     | bucketversion | bucketcsn | bucketxid | distributetype
-----------+------+----------+-------------+-----------+-----------+--------+--------+--------------+--------+----------
+-----------+-----------+-----------+-------------------------------------
-----+---------------+-----------+-----------+-----------------
 sg        | t    | r       |          1 |         3 |     16394 |      0 |     -1 |           -1 |     -1 |        3 | f         | f
|         -1 |
     |             |           |           | 23 1042 1114 25
 s1        | s    | r       |          1 |         1 |     16394 |      0 |      2 |           -1 |   2048 |       -1 | f         | t
|          0 | {1000,3700x,"2012-5-5 10:52:12",custo
mer} |              |           |           |
 s2        | s    | r       |          1 |         1 |     16394 |      0 |      0 |           -1 |   2049 |       -1 | f         | f
|          1 | {1000,3701x,"2012-5-5 10:52:12",custo
mer} |              |           |           |
 s3        | s    | r       |          1 |         1 |     16394 |      0 |      1 |           -1 |   2050 |       -1 | f         | f
|          2 | {1000,3702x,"2012-5-5 10:52:12",custo
mer} |              |           |           |
(4 rows)

-- Drop a slice group.
gaussdb=# DROP SLICEGROUP sg;
```

Helpful Links

DROP SLICEGROUP

7.12.9.44 CREATE SYNONYM

Description

Creates a synonym object. A synonym is an alias of a database object and is used to record the mapping between database object names. You can use synonyms to access associated database objects.

Precautions

- The user who creates the synonym will be the owner of the synonym.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the schema name is specified, create a synonym in the specified schema. Otherwise, a synonym is created in the current schema.
- Database objects that can be accessed using synonyms include tables, views, types, packages, functions, stored procedures, sequences, or other synonyms.
- To use synonyms, you must have the required permissions on associated objects.
- The following DML statements support synonyms: SELECT, INSERT, UPDATE, DELETE, EXPLAIN, and CALL.
- The CREATE SYNONYM statement of an associated function or stored procedure cannot be used in a stored procedure. You are advised to use synonyms existing in the pg_synonym system catalog in the stored procedure.
- You are advised not to create synonyms for temporary tables. To create a synonym, you need to specify the schema name of the target temporary table. Otherwise, the synonym cannot be used normally. In addition, you need to run the **DROP SYNONYM** command before the current session ends.
- After an original object is deleted, the synonym associated with the object will not be deleted in cascading mode. If you continue to access the synonym, for accessed tables, a message is displayed indicating that the synonym has expired; for accessed functions, stored procedures, and packages, a message is displayed indicating that the objects do not exist.
- Users granted the CREATE ANY SYNONYM permission can create synonyms in user schemas.
- Synonyms cannot be created for encrypted tables that contain encrypted columns and views, functions, and stored procedures based on encrypted tables.
- A synonym can be associated with a package, but not with a function in a package. You can use synonyms associated with a package to access functions and variables in the package.
- If the schema of a synonym is the schema to which the user belongs, the owner of the synonym is also the owner of the schema. In other scenarios, the owner of the synonym is the creator of the synonym by default.
- If **SEARCH_PATH** is set and no synonym schema is specified, for stored procedures and functions, the PG_PROC table is preferentially searched by name. If no function with the same name exists, synonyms are searched based on **SEARCH_PATH**. For other objects, **SEARCH_PATH** is preferentially searched, if their schemas are the same as that of synonyms, the objects are accessed prior to synonyms.
- Objects associated with synonyms cannot be accessed using DDL statements, such as CREATE, DROP, and ALTER.
- Nested synonyms are supported. When you search for a synonym, if the synonym is associated with another synonym, the system continues to search for the associated synonym until the last associated object is found.
- You cannot use \d, \df, or \sf to access information about associated objects through synonyms.
- The process of searching for synonyms is as follows:
  - If the schema of the search object **SCHEMA1.OBJECT1** is specified in the SQL statements:

    The system checks whether **SCHEMA1.OBJECT1** exists. If the object does not exist, it checks whether the synonym **SCHEMA1.OBJECT1** exists. If

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

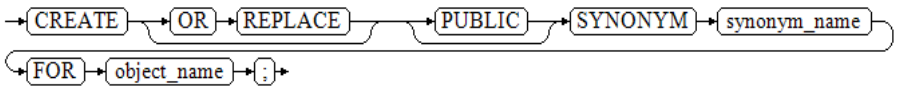
the synonym **SCHEMA1.OBJECT1** exists, it searches for the object **SCHEMA2.OBJECT2** associated with the synonym. If neither the object **SCHEMA2.OBJECT2** nor the synonym **SCHEMA2.OBJECT2** exists and **SCHEMA2** is a username, the system searches for the synonym **OBJECT2** in PUBLIC.

- If the schema of the search object **OBJECT1** is not specified in the SQL statements:

  The system traverses **SEARCH_PATH** and searches for the **SCHEMA.OBJECT1** object under the specified schema. If the **SCHEMA.OBJECT1** object does not exist, it searches for the synonym **SCHEMA.OBJECT1**. If the synonym **SCHEMA.OBJECT1** does not exist and the schema to be searched for is a username, the system searches for the synonym **OBJECT1** in PUBLIC.

Syntax

```
CREATE [ OR REPLACE ] [PUBLIC] SYNONYM synonym_name
    FOR object_name;
```



Parameters

- **OR REPLACE**

  (Optional) Redefines the synonym if it already exists.

- **PUBLIC**

  (Optional) Creates a PUBLIC synonym.

  NOTE

  - PUBLIC synonyms must be unique in the same database.
  - If the database is upgraded from a version that does not support PUBLIC synonyms to a version that supports PUBLIC synonyms, PUBLIC synonyms cannot be created or deleted before the upgrade is committed.
  - All users can access PUBLIC synonyms. Except the initial user and system administrators, you must have the CREATE PUBLIC SYNONYM and DROP PUBLIC SYNONYM permissions to create and delete PUBLIC synonyms, respectively.
  - For the PUBLIC synonym, the values of **synnamespace** and **synowner** in the PG_SYNONYM system catalog are **0**, the value of **owner** in the ADM_SYNONYMS and DB_SYNONYMS system views is **PUBLIC**, and the value of **schema_name** is **NULL**.
  - If no synonym schema is specified, the system searches for objects with the same name to determine whether the objects exist. Then, the system searches for synonyms by **SEARCH_PATH**. Finally, the system searches for PUBLIC synonyms. If a synonym schema is specified, PUBLIC synonyms are not retrieved.

- **synonym_name**

  Specifies the name of the synonym to be created, which can contain the schema name.

  Value range: a string. It must comply with the **naming convention**.

- **object_name**

  Specifies the name of an object that is associated (optionally with schema names).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: a string. It must comply with the **naming convention**.

NOTE

- **object_name** can be the name of an object that does not exist.
- **object_name** can be the name of a remote object accessed by using a database link. For details about how to use database links, see **DATABASE LINK**.

CAUTION

Do not create aliases for functions that contain passwords and other sensitive information, such as the encryption functions gs_encrypt and gs_encrypt_bytea, and the decryption functions gs_decrypt and gs_decrypt_bytea or use aliases to call the functions to prevent sensitive information leakage.

Examples

```
-- Create schema ot.
gaussdb=# CREATE SCHEMA ot;

-- Create a table ot.test_tbl1.
gaussdb=# CREATE TABLE ot.test_tbl1(c1 INT, c2 INT);
gaussdb=# INSERT INTO ot.test_tbl1 values(1,1);

-- View the current value of search_path.
gaussdb=# SHOW search_path;
  search_path
----------------
 "$user",public
(1 row)

-- The current value of search_path does not contain ot, and the current user is not ot. Therefore, an error is reported when you directly view the table name.
gaussdb=# SELECT * FROM test_tbl1;
ERROR:  relation "test_tbl1" does not exist
LINE 1: SELECT * FROM test_tbl1;
                      ^
-- Create a synonym.
gaussdb=# CREATE OR REPLACE SYNONYM test_tbl1 FOR ot.test_tbl1;

-- Use the synonym.
gaussdb=# SELECT * FROM test_tbl1;
 c1 | c2
----+----
  1 |  1
(1 row)
gaussdb=# INSERT INTO test_tbl1 VALUES (2,2);

-- Query a created synonym.
gaussdb=# SELECT synname,synobjschema,synobjname FROM pg_synonym WHERE synname = 'test_tbl1';
  synname  | synobjschema | synobjname
-----------+--------------+------------
 test_tbl1 | ot           | test_tbl1
(1 row)

-- Delete.
gaussdb=# DROP SYNONYM test_tbl1;
gaussdb=# DROP TABLE ot.test_tbl1;
gaussdb=# DROP SCHEMA ot CASCADE;
```

ALTER SYNONYM and **DROP SYNONYM**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.45 CREATE TABLE

Description

Creates an initially empty table in the current database. The table will be owned by the creator. Row-store tables are created by default.

Precautions

- If a PRIMARY KEY constraint or UNIQUE constraint is added to a non-distribution key, a global secondary index is created by default.
- By default, **HASH(column_name)** is used in a distributed system. **column_name** is the primary key column or UNIQUE constraint column (if any) of the table, or the first column of a data type that can be used as the distribution key. The priority is as follows: primary key column > UNIQUE constraint column > first column of a data type that can be used as the distribution key. If a primary key column and multiple UNIQUE constraint columns exist and the distribution mode of the table is not specified, GSIs are created for other UNIQUE constraint columns by default after the distribution key of the table is determined based on the priority.

  NOTE

  In MySQL-compatible mode (**sql_compatibility** set to **'MYSQL'**), if a distribution key of the character type is used, you are advised not to use case-insensitive collations (such as utf8mb4_general_ci, utf8mb4_unicode_ci, and utf8mb4_0900_ai_ci). Otherwise, data skew may occur and data cannot be evenly distributed. The utf8mb4_bin collation is recommended.
- Distribution keys can be updated only when **enable_update_distkey** is set to **on** or K-means distribution is used, and constraints are met. Otherwise, distribution keys do not support the UPDATE operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The constraints on updating distribution keys are as follows:

- Distribution keys can be updated only when **enable_update_distkey** is set to **on** or K-means distribution is used.
- The UPDATE statement cannot be pushed down to DNs for execution. The PGXC plan is directly generated and is not changed based on the values before and after the distribution key is updated.
- Tables with row-level UPDATE TRIGGER are not supported. Otherwise, the execution fails and an error message is displayed. The row-level INSERT/DELETE TRIGGER does not take effect, and the update-statement-level TRIGGER is executed normally.
- Concurrent update of the same row is not supported. You need to obtain a lock first. The result (returning **0** or reporting an error) of obtaining a lock on DNs depends on the setting of the GUC parameter **concurrent_dml_mode**. An error will be reported in the following cases: (1) The error message "update distribute column conflict" is displayed. (2) When the time spent for obtaining a lock exceeds the threshold, an error message is displayed, indicating that the lock times out.
- Tables with global secondary indexes (GSIs) are not supported. Otherwise, an error is reported.
- Only Hash or K-means distribution is supported. LIST/RANGE distributed tables are not supported. Otherwise, an error is reported.
- MERGE INTO and UPSERT cannot be used to update distribution keys. Otherwise, an error is reported.
- GTM_FREE is not supported. Otherwise, an error is reported.
- UPDATE RETURNING is not supported. Otherwise, an error is reported.
- Statements with joined tables are not supported. Otherwise, an error is reported.
- UPDATE+LIMIT is not supported. Otherwise, an error is reported.

- If an error occurs during table creation, after it is fixed, the system may fail to delete the empty disk files (whose size is 0) created before the last automatic clearance. This problem seldom occurs and does not affect system running of the database.
- When JDBC is used, the **DEFAULT** value can be set through **PreparedStatement**.
- Row-store tables do not support foreign key as the table-level constraint.
- A user with the CREATE ANY TABLE permission can create tables in the public and user schemas. To create a table that contains serial columns, you must also obtain the CREATE ANY SEQUENCE permission to create sequences.
- The XML type cannot be used as a primary key or foreign key.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

NOTE

Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in MYSQL-compatible mode, uppercase conversion will be unavailable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

If the database creates unlimited tables, CNs may be affected as follows:

- Resource exhaustion: Each table occupies certain disk space. Unlimited table creation will occupy a large amount of memory and disk space, which may exhaust CN resources. As a result, the system breaks down or becomes unstable.
- Performance deterioration: Unlimited table creation causes a large number of I/O operations and CPU computing, and the metadata information of the database becomes large, which may deteriorate the CN performance, including operations such as insert, query, update, and deletion. As a result, the system responds slowly or cannot meet service requirements.
- Security issues: Excessive tables make database management and maintenance difficult. Creating unlimited tables may cause security issues such as data leakage or data loss. Database stability decreases, causing immeasurable loss to enterprises.

Therefore, plan the number and size of tables in the database properly to avoid unlimited table creation and ensure system stability, reliability, and security.

- The number of table constraints cannot exceed 32,767.

Syntax

- Create a table.

```
CREATE [ [ GLOBAL | LOCAL ] { TEMPORARY | TEMP } | UNLOGGED ] TABLE [ IF NOT EXISTS ]
table_name
   { ( { column_name data_type [ CHARACTER SET | CHARSET charset ]  [ compress_mode ]
[ COLLATE collation ] [ column_constraint [ ... ] ]
       | table_constraint
       | LIKE source_table [ like_option [...] ] }
       [, ... ] )
   | LIKE source_table }
   [ table_option [ [ , ] ... ] ]
   [ htap_option ]
   [ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ ON COMMIT { PRESERVE ROWS | DELETE ROWS } ]
   [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF
NO MODIFICATION [ ON ( EXPR )]]
   [ TABLESPACE tablespace_name ]
   [ DISTRIBUTE BY { REPLICATION | HASH ( column_name [, ...] )
   | MURMURHASH ( expression )
   | KMEANS ( column_name ) distance_type
   | RANGE ( column_name [, ...] ) { TO SLICEGROUP slicegroupname | SLICE REFERENCES tablename
| ( slice_less_than_item [, ...] )
   | ( slice_start_end_item [, ...] ) }
   | LIST ( column_name [, ...] ) { SLICE REFERENCES tablename | ( slice_values_item [, ...] ) }
   } ]
   [ TO { GROUP groupname | NODE ( nodename [, ... ] ) } ];
```

  - **table_option** is as follows:

```
{ COMMENT [ = ] 'string' |
  AUTO_INCREMENT [ = ] value |
  [ DEFAULT ] CHARACTER SET | CHARSET [ = ] default_charset |
  [ DEFAULT ] COLLATE [ = ] default_collation |
  ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" } }
```

  - **htap_option** is as follows:

```
{ COLVIEW [ PRIORITY { HIGH | LOW | NONE } ] |
  NOCOLVIEW [ PRIORITY { HIGH | LOW | NONE } ]}
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **column_constraint** is as follows:

```
[ CONSTRAINT constraint_name ]
{ NOT NULL |
  NULL |
  CHECK ( expression ) |
  DEFAULT default_expr |
  ON UPDATE update_expr |
  AUTO_INCREMENT |
  COMMENT 'string' |
  COLVIEW |
  NOCOLVIEW |
  UNIQUE [KEY] index_parameters |
  PRIMARY KEY index_parameters |
  ENCRYPTED WITH ( COLUMN_ENCRYPTION_KEY = column_encryption_key,
ENCRYPTION_TYPE = encryption_type_value ) |
  REFERENCES reftable [ ( refcolumn ) ] [ MATCH FULL | MATCH PARTIAL | MATCH SIMPLE ]
     [ ON DELETE action ] [ ON UPDATE action ] }
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
```

- **compress_mode** of a column is as follows:

```
{ DELTA | PREFIX | DICTIONARY | NUMSTR | NOCOMPRESS }
```

- **table_constraint** is as follows:

```
[ CONSTRAINT [ constraint_name ] ]
{ CHECK ( expression ) |
  UNIQUE [ index_name ] [ USING method ] ( { { column_name [ ( length ) ] | ( expression ) }
[ ASC | DESC ] }[, ... ] ) index_parameters |
  PRIMARY KEY [ USING method ] ( { column_name [ ASC | DESC ] } [, ... ] ) index_parameters
[ DEFERRABLE | NOT DEFERRABLE | INITIALLY DEFERRED | INITIALLY IMMEDIATE ]
{ [ COMMENT 'string' ] [ ... ] }
```

- **like_option** is as follows:

```
{ INCLUDING | EXCLUDING } { DEFAULTS | GENERATED | CONSTRAINTS | INDEXES | STORAGE |
COMMENTS | PARTITION | RELOPTIONS | DISTRIBUTION | UPDATE | ILM | ALL }
```

- **index_parameters** is as follows:

```
[ WITH ( {storage_parameter = value} [, ... ] ) ]
[ USING INDEX TABLESPACE tablespace_name ]
```

- **distance_type** is as follows:

```
{ L2 | COSINE | HAMMING }
```

- Range distribution rules

```
For slice_less_than_item:
SLICE name VALUES LESS THAN ({ expression | MAXVALUE } [, ...]) [ DATANODE
datanode_name | ( datanode_name_list [, ... ] ) ]
For slice_start_end_item:
SLICE name {
{ START ( expression ) END ( expression ) EVERY ( expression ) } |
{ START ( literal ) END ( { literal | MAXVALUE } ) } |
{ START ( literal ) } |
{ END ( { literal | MAXVALUE } ) }
}
```

- The LIST distribution rule **slice_values_item** is as follows:

```
[ ( SLICE name VALUES (expression [, ... ]) [DATANODE datanode_name |
( datanode_name_list )]
 [, ... ] ) |
  ( SLICE name VALUES (DEFAULT) [DATANODE datanode_name] | ( datanode_name_list ) )
]
```

- **update_expr** is as follows:

```
{ CURRENT_TIMESTAMP | LOCALTIMESTAMP | NOW() }
```

Parameters

- **UNLOGGED**

  If this keyword is specified, the created table is an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

automatically truncated after conflicts, OS restart, database restart, switchover, power-off, or abnormal shutdown, incurring data loss risks. Contents of an unlogged table are also not replicated to standby nodes. Any indexes created on an unlogged table are not automatically logged as well.

Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

  When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, it creates a local temporary table.

- **TEMPORARY | TEMP**

  If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

  The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view or modify the data committed by itself. Global temporary tables can be created using ON COMMIT PRESERVE ROWS or ON COMMIT DELETE ROWS. The former creates session-level tables, where user data is automatically cleared when a session ends; the latter creates transaction-level tables, where user data is automatically cleared when a COMMIT or ROLLBACK operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema when creating a global temporary table.

  A local temporary table is visible only in the current session and is automatically dropped at the end of the session. Therefore, you can create and use temporary tables in the current session as long as the connected CN in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised not to perform operations on temporary tables in DDL statements. **TEMP** is equivalent to **TEMPORARY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Local temporary tables are visible to the current session through a schema starting with pg_temp. Therefore, do not delete schemas starting with pg_temp or pg_toast_temp.
- If you do not specify **TEMPORARY** or **TEMP** when creating a table but set its schema to that starting with pg_temp in the current session, a temporary table will be created.
- If global temporary tables and indexes are being used by other sessions, do not perform ALTER or DROP (except the **ALTER INDEX index_name REBUILD** command).
- The DDL of a global temporary table affects only the user data and indexes of the current session. For example, TRUNCATE, REINDEX, and ANALYZE are valid only for the current session.
- You can set the GUC parameter **max_active_global_temporary_table** to determine whether to enable the global temporary table function. If **max_active_global_temporary_table** is set to **0**, the global temporary table function is disabled.
- A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
- Temporary tables do not support DN faults or primary/standby switchovers.
- Global temporary tables do not respond to automatic vacuum. In long link scenarios, you are advised to use global temporary tables of ON COMMIT DELETE ROWS or manually execute **VACUUM** periodically. Otherwise, Clogs may not be recycled. (You can set **vacuum_gtt_defer_check_age** to generate an alarm if global temporary tables are not cleared for a long time.)
- Global temporary tables do not support the following scenarios:
  - Global temporary sequences cannot be created. Global temporary tables of each session use shared sequences, which can only ensure uniqueness but not continuity.
  - Global temporary views cannot be created.
  - Partitioned tables cannot be created.
  - Hash bucket tables cannot be created.
  - Extended statistics are not supported.
  - The ON COMMIT DROP attribute is not supported.
  - GSIs are not supported.
  - M compatibility is not supported.
  - Reading on the distributed standby node is not supported.
  - Stream plans are not supported.
  - Scaling is not supported, because scaling rollback may cause data loss and the data will be cleared after scaling.
  - If a DN switchover, DN fault, or CN fault occurs, data may be lost. (Global temporary tables do not have Xlogs, so data is not synchronized between primary and standby nodes.)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **IF NOT EXISTS**

  Sends a notice, but does not throw an error, if a table with the same name exists.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store. For example, CREATE TABLE t1 (a int) ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER 3 DAY OF NO MODIFICATION ON (a != 0) indicates that the **t1** table is created and the advanced compression policy is added: rows that are not modified in three days and **a != 0** is specified.

  - AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.
  - ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

    NOTE

    Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in MYSQL-compatible mode, uppercase conversion will be unavailable.

- **table_name**

  Specifies the name of the table to be created.

  NOTICE

  Some processing logic of materialized views determines whether a table is the log table of a materialized view or a table associated with a materialized view based on the table name prefix. Therefore, do not create a table whose name prefix is **mlog_** or **matviewmap_**. Otherwise, some functions of the table are affected.

- **column_name**

  Specifies the name of a column to be created in the new table.

- **data_type**

  Specifies the data type of the column.

- **compress_mode**

  Specifies whether to compress a table column. The option specifies the algorithm preferentially used by table columns. This parameter is available only to column-store compression.

  Value range: **DELTA**, **PREFIX**, **DICTIONARY**, **NUMSTR**, and **NOCOMPRESS**

- **CHARACTER SET | CHARSET charset**

  Specifies the character set of a table column. If this parameter is specified separately, the collation of the table column is set to the default collation of the specified character set.

  This syntax is supported only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result. In a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**), **utf8mb4_bin**, **utf8mb4_general_ci**, **utf8mb4_unicode_ci**, **binary**, **gbk_chinese_ci**, **gbk_bin**, **gb18030_chinese_ci**, and **gb18030_bin** are also supported.

  NOTE

  - Only the character type supports the specified character set. If the binary character set or collation is specified, the character type is converted to the corresponding binary type. If the type mapping does not exist, an error is reported. Currently, only the mapping from the TEXT type to the BLOB type is available.
  - Except the binary character set and collation, only the character set that is the same as the database encoding can be specified.
  - If the character set or collation of a column is not explicitly specified and the default character set or collation of the table is specified, the character set or collation of the column is inherited from the table. If the default character set or collation of a table does not exist, the character set and collation of table columns inherit the character set and collation of the current database when **b_format_behavior_compat_options** is set to **'default_collation'**.

  Table 7-269 Character sets and collation supported in MYSQL-compatible mode (sql_compatibility set to 'MYSQL')

Collation	Character Set	Description
utf8mb4_general_ci	utf8mb4 (utf8)	The general collation is used, which is case-insensitive.
utf8mb4_unicode_ci	utf8mb4 (utf8)	The general collation is used, which is case-insensitive.
utf8mb4_bin	utf8mb4 (utf8)	The binary collation is used, which is case-sensitive.
binary	binary	The binary collation is used.
gbk_chinese_ci	gbk	The Chinese collation is used.
gbk_bin	gbk	The binary collation is used, which is case-sensitive.
gb18030_chinese_ci	gb18030	The Chinese collation is used.
gb18030_bin	gb18030	The binary collation is used, which is case-sensitive.
utf8mb4_0900_ai_ci	utf8mb4	The unicode collation algorithm (UCA) rule is used, which is case-insensitive.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Collation	Character Set	Description
utf8_general_ci	utf8	The general collation is used, which is case-insensitive.
utf8_bin	utf8	The binary collation is used, which is case-sensitive.

- **LIKE source_table [like_option ...]**

  Specifies a table from which the new table automatically inherits all column names, their data types, and their NOT NULL constraints, as well as the default expression declared as serial.

  The target table and the source table are decoupled after creation is complete. Changes to the source table will not be applied to the target table, and it is not possible to include data of the target table in scans of the source table.

  The copied columns and constraints are not merged with similarly named columns and constraints. If the same name is explicitly specified or is included in another LIKE clause, an error will be reported.

  - The default expressions are copied from the source table to the target table only if **INCLUDING DEFAULTS** is specified. The **serial** column is not copied. The default behavior is to exclude default expressions, resulting in the copied columns in the target table having default values **NULL**.
  - If **INCLUDING UPDATE** is specified, the ON UPDATE CURRENT_TIMESTAMP attribute of the source table column is copied to the target table column. By default, the generated expression is not copied.
  - The **CHECK** constraints are copied from the source table to the new table only when **INCLUDING CONSTRAINTS** is specified. A not-null constraint is always copied to the new table. Other types of constraints are never copied to the new table. These rules also apply to column constraints and table constraints.
  - Any indexes on the source table will not be created on the target table, unless **INCLUDING INDEXES** is specified.
  - STORAGE settings for the source column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude STORAGE settings.
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the target table, and the target table no longer uses the PARTITION BY clause. By default, the partition definition of the source table is not copied.
  - If **INCLUDING RELOPTIONS** is specified, the target table will copy the storage parameter (that is, WITH clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If **INCLUDING DISTRIBUTION** is specified, the distribution information of the source table is copied to the target table, including distribution type and key, and the target table will no longer use the DISTRIBUTE BY clause. The default behavior is to exclude distribution information of the source table. For K-means distributed tables, the center point information (PGXC_SLICE) of a source table is not copied. You need to import data again and create a center point.
- If **INCLUDING ILM** is specified, the ILM policy information of a source table is copied to the target table. To copy the ILM policy information of partition objects in the source table, specify **INCLUDING PARTITION**.
- **INCLUDING ALL** contains the content of **INCLUDING DEFAULTS**, **INCLUDING UPDATE**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, **INCLUDING DISTRIBUTION**, and **INCLUDING ILM**.

NOTICE

- If the source table contains a sequence with the serial, bigserial, or smallserial data type, or a column in the source table is a sequence by default and the sequence is created for this table (created by using CREATE SEQUENCE ... OWNED BY), these sequences will not be copied to the target table, and another sequence specific to the target table will be created. This is different from earlier versions. To share a sequence between the source table and target table, create a shared sequence (do not use **OWNED BY**) and set a column in the source table to this sequence.
- You are advised not to set the default value of a column in the source table to the sequence specific to another table especially when the table is distributed in specific node groups, because doing so may result in CREATE TABLE ... LIKE execution failures. In addition, doing so may cause the sequence to become invalid in the source sequence because the sequence will also be deleted from the source table when it is deleted from the table that the sequence is specific to. To share a sequence among multiple tables, you are advised to create a shared sequence for them.
- The CREATE TABLE table_name LIKE source_table syntax is supported only when **sql_compatibility** is set to **'MYSQL'** (MYSQL-compatible database), **b_format_version** is set to **5.7**, and **b_format_dev_version** is set to **s2**.
- In a MYSQL-compatible database, if **b_format_version** is set to **5.7** and **b_format_dev_version** is set to **s2**, **INCLUDING** and **EXCLUDING** cannot be specified. In this case, it is equivalent to specify **INCLUDING ALL** by default.

- **AUTO_INCREMENT [=] value**

  This clause specifies an initial value for an auto-increment column. The value must be a positive number and cannot exceed $2^{127} - 1$.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

This clause takes effect only when **sql_compatibility** is set to **'MYSQL'**.

- **COMMENT [=] 'string'**
  - The COMMENT [=] 'string' clause is used to add comments to a table.
  - COMMENT 'string' in **column_constraint** indicates that comments are added to a column.
  - COMMENT 'string' in **table_constraint** indicates that comments are added to the indexes corresponding to the primary key and unique key.

NOTICE

- This clause is valid only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**).
- A table-level comment can contain a maximum of 2048 characters, and a column-level or index-level comment can contain a maximum of 1024 characters.
- Comments in **table_constraint** support only primary keys and unique keys.

- **ENGINE**

  Supported in MYSQL-compatible mode and used only for syntax adaptation. Only InnoDB can be set and no actual effect is achieved.

NOTICE

The ENGINE syntax cannot be used in the CREATE TABLE table_name LIKE source_table syntax.

- **COLVIEW | NOCOLVIEW**

  Specifies whether to create IMCV table metadata for a table, column, or partition. To create an IMCV table, you should enable the **enable_htap** parameter.

- **PRIORITY { HIGH | LOW | NONE }**

  Specifies the priority for loading data into the IMCV table. It can be set to **HIGH**, **LOW**, or the default value.

- **WITH ({ storage_parameter = value } [, ...])**

  Specifies an optional storage parameter for a table or an index. The WITH clause used for tables can also contain **OIDS=FALSE** to specify that rows of the new table should not contain OIDs. The WITH clause does not support the OIDS=TRUE syntax.

  NOTE

  When using **Numeric** of arbitrary precision to define a column, specify precision **p** and scale **s**. When precision and scale are not specified, the input will be displayed.

  The description of parameters is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- FILLFACTOR

  The fill factor of a table is a percentage from 10 to 100. **100** (complete filling) is the default value. If Ustore is used, the default value is **92**. When a smaller fill factor is specified, **INSERT** operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

  Value range: 10 to 100

- ORIENTATION

  Specifies the storage mode of table data. This parameter cannot be modified once it is set.

  Value range:

  - **ROW** indicates that table data is stored in rows.

    Row store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row store can improve the efficiency.

  Default value:

  If an ordinary tablespace is specified, the default is **ROW**.

- STORAGE_TYPE

  Specifies the storage engine type. This parameter cannot be modified once it is set.

  Value range:

  - **USTORE** indicates that tables support the in-place update storage engine. Note that the **track_counts** and **track_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
  - **ASTORE** indicates that tables support the append-only storage engine.

  Default value:

  If this parameter is not specified, the **enable_default_ustore_table** parameter determines the storage engine mode, which is inplace-update storage by default.

- INIT_TD

  Specifies the number of TDs to be initialized when a Ustore table is created. This parameter can be modified by running the **ALTER TABLE** command. Note that this parameter affects the maximum size of a single tuple stored on the data page. The conversion method is MAX_TUPLE_SIZE = BLCKSZ – INIT_TD * TD_SIZE. For example, if you change the number of INIT_TD from 4 to 8, the maximum size of a single tuple decreases by 4 x INIT_TD.

  Value ranges: 2–128. The default value is **4**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- COMPRESSION

  Specifies the compression level of the table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded. This parameter is available only to column-store compression.

  Value range: **YES** or **NO** for row-store tables.

  Default value: **NO**

- COMPRESSLEVEL

  Specifies the table data compression ratio and duration at the same compression level. This divides a compression level into sublevels, providing more choices for compression ratio and duration. As the value becomes greater, the compression ratio becomes higher and duration longer at the same compression level.

  Value range: 0 to 3

  Default value: **0**

- segment

  The data is stored in segment-page mode. This parameter supports only row-store tables. Protection against unauthorized deletion and damage of physical files 1 to 5 is not supported.

  Value range: **on** and **off**

  Default value: **off**

- hashbucket

  Creates a hash table that uses buckets. This parameter supports only row-store tables.

  Value range: **on** and **off**

  Default value: **off**

  NOTICE

  - When creating a hash bucket table, ensure that the current database is bound to the default node group of the cluster. For details about how to bind a database to a group, see **ALTER DATABASE**.
  - In current version, DDL operations on hash bucket tables are affected. Therefore, you are advised not to frequently perform DDL operations on hash bucket tables.
  - Hash bucket tables are bound to segmented paging storage, that is, when **hashbucket** is set to **on**, **segment** is set to **on**.
  - You are advised not to create a small table (ordinary table: < 8 MB; partitioned table: < 8 MB x Number of partitions) as a hash bucket table. The sequential scan performance deteriorates twice that of an ordinary table.

- hasuids

  If this parameter is set to **on**, a unique table-level ID is allocated to a tuple when the tuple is updated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **on** and **off**

Default value: **off**

- logical_repl_node

  Name of the DN that returns logical logs to the CN during logical decoding of a distributed replication table. For the replication table, if this parameter is not specified, the first node in the node group where the current table is located is used by default. When the RESET operation is performed on this option, **logical_repl_node** is reset to the first node of current table.

  Value range: a string

  Default value: For the non-replication table, this parameter is empty by default. For the replication table, this parameter is set to the name of the first node by default.

- skip_logical_deparse

  The kernel skips the table during logical decoding. Users are advised not to use this parameter. If it is used improperly, logical decoding may miss some content.

  Value range: **on** and **off**

  Default value: **off**

- STAT_STATE

  Determines whether table statistics are locked. If locked, the table statistics cannot be updated. This parameter is invalid in distributed mode.

  Value range: **locked** and **unlock**

  Default value: **unlock**

- statistic_granularity

  Records the default **partition_mode** when the table analyzes statistics. For details about **partition_mode**, see **Parameters**. This parameter is invalid for non-partitioned tables.

  Value range: See the value range of **partition_mode**.

  Default value: **AUTO**

- distribute_accu_rate

  Specifies whether to automatically perform redistribution for K-means distributed tables when the cluster data distribution accuracy falls below the threshold.

  Value range: 0 to 1

  Default value: **0.9**

- autovacuum_enabled

  Specifies whether the autovacuum function is enabled for the table.

  Value range: **on** and **off**

  Default value: **on**

- autovacuum_vacuum_threshold

  Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 2147483647

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.

- autovacuum_analyze_threshold

  Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0 to 2147483647

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.

- autovacuum_vacuum_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.

- autovacuum_analyze_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

- autovacuum_freeze_min_age

  Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

  Value range: 0 to 1000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

- autovacuum_freeze_max_age

  Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

  Value range: 100000 to 2000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

- autovacuum_freeze_table_age

  Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0 to 2000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - enable_update_distkey

    Determines whether the table supports the UPDATE operation on distribution keys. Distribution keys can be updated only when this parameter is set to **on** or K-means distribution is used, and constraints are met. Otherwise, distribution keys do not support the UPDATE operation.

    Value range: **on** and **off**

    Default value: **off**

    NOTE

    For details about the constraints on updating distributed columns, see **Precautions**.

- **WITHOUT OIDS**

  It is equivalent to **WITH(OIDS=FALSE)**.

- **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**

  ON COMMIT determines what to do when you commit a temporary table creation operation. Currently, **PRESERVE ROWS** and **DELETE ROWS** are supported.

  - **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
  - **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.

- **TABLESPACE tablespace_name**

  Specifies the tablespace where the new table is created. If it is not specified, the default tablespace is used.

- **DISTRIBUTE BY**

  Specifies how the table is distributed or replicated between DNs.

  Value range:

  - **REPLICATION**: Each row in the table exists on all DNs, that is, each DN has complete table data.
  - **HASH (column_name)**: Each row of the table will be placed into specified DNs based on the hash value of the specified column.
  - **MURMURHASH (diskey_expr)**: Hash operations are performed on specified columns. The MURMURHASH algorithm is used to distribute data to corresponding DNs through mapping. **diskey_expr** can be a single column name or a column name modified by the **lpad_s(string text, length int [, fill text])** function. When this function is used, only the first parameter can be a column name, for example, lpad_s(a,10,'0'). When **lpad_s** is used as a distribution key expression, the third parameter cannot be omitted.
  - **KMEANS(column_name)**: performs KMEANS clustering on a specified column and distributes data to the DN where the nearest center point is located.
  - **RANGE(column_name)**: maps a specified column based on the range and distributes data to the corresponding DNs.
  - **LIST(column_name)**: maps a specified column based on a specific value and distributes data to the corresponding DNs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- For HASH distribution, the maximum number of distribution keys is the same as that of columns. A maximum of 1600 distribution keys are supported. For MURMURHASH distribution, the distribution key supports only one column (an expression or a column in a table). For RANGE (VALUE LESS THAN) and LIST distributions, the distribution key supports a maximum of four columns. For RANGE (START END) distribution, the distribution key supports only one column.
- Only the MURMURHASH distribution supports an expression as the distribution key. The distribution key expression supports only the **lpad_s(string text, length int [, fill text])** function.
- The restrictions on MURMURHASH distribution are as follows:
  - The stream plan, FQS plan, and PGXC plan are not supported.
  - Scaling, hash bucket tables, GSIs, and materialized views are not supported.
  - When two hash tables are joined and the distribution key has an INNER JOIN condition, the FQS plan is not supported.
  - A node group (user-defined node group) must be specified for a MURMURHASH distributed table, and the node group must be a non-installation node group.
  - Tables cannot be created using CREATE TABLE AS.
  - The distribution key of the MURMURHASH distributed table must contain the NOT NULL constraint.
- MURMURHASH distribution is used to ensure that the data distribution remains unchanged when the legacy system that uses the MURMURHASH algorithm is migrated. Currently, scale-out and stream plans are not supported. You are advised to use the hash distribution algorithm.
- For a RANGE distribution policy using the VALUE LESS THAN clause, the distribution rules are as follows:
  - The comparison starts from the first column of values to be inserted.
  - If the value of the inserted first column is smaller than the boundary value of the current column in the local slice, the values are directly inserted.
  - If the value of the inserted first column is equal to the boundary value of the current column in the local slice, compare the value of the inserted second column with the boundary value of the next column in the local slice. If the value of the inserted second column is smaller than the boundary value of the next column in the local slice, the values are directly inserted. If they are equal, the comparison of the next columns between the source and target continues.
  - If the value of the inserted first column is greater than the boundary value of the current column in the local slice, compare the value with that in the next slice.
- If the shard of the RANGE distributed table corresponds to multiple DNs, the hash value of the distribution key is calculated to perform modulo operation on the number of DN and map a new DN. For details, see the examples.
- If the shard of the LIST distributed table corresponds to multiple DNs, the hash value of the distribution key is calculated for the default shards. Then, use the calculated hash value to perform modulo operation on the number of DN and map a new DN. For non-default shards, the round robin method is used to map values in the values list to DNs. For details, see the examples.
- The RANGE/LIST distributed tables support only scale-out but not scale-in. For details about the slice scale-out rule, contact the administrator.
- In a K-means distributed table, only the vector type can be used as a distribution key. Only a single column can be used as a distribution key. GSI is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

not supported. In the current version, after K-means distributed tables are scaled in or out, you need to manually call system functions gs_vector_distrib_update_centroids and gs_vector_distrib_redistribute_new_centroids to recalculate and distribute center points.

- For a replication table, the following sufficient and necessary conditions must be met for pushing down:
  - Different types of window functions have different sufficient and necessary conditions for pushing down. There are four types:
    1. Unconditional pushdown is supported for functions such as the RANK series functions and RATIO_TO_REPORT functions. These window functions return consistent values for rows with the same PARTITION BY and ORDER BY values, regardless of the data relative sequence.
    2. Pushdown is supported when the projected columns exclude fields outside of PARTITION BY and ORDER BY or when PARTITION BY and ORDER BY form a primary key together, for example, window functions like ROW_NUMBER and NTILE. Otherwise, when the projection column has the same value (but other column values are different), due to issues with relative sequence, the results returned by the window function on different DNs are different. As a result, data is inconsistent.
    3. Pushdown is supported when the value of **offset** is **0**. For the LAG and LEAD functions, when **offset** is **0**, a column is queried and does not depend on the relative data sequence. If the value of **offset** is greater than **0**, different tuples with the same value may be NULL due to different relative sequences.
    4. Pushdown is supported when the fields in the parameter expression are PARTITION BY columns, ORDER BY columns, or PARTITION BY and ORDER BY columns that form a primary key, for example, functions such as FIRST_VALUE, LAST_VALUE, and NTH_VALUE.
  - If the query of the replication table contains system columns and volatile functions, the query is not pushed down.
  - In the context of concatenating aggregate functions, the sufficient and necessary condition for pushing down is that the columns to be concatenated matches the ORDER BY columns, or the ORDER BY columns form a primary key.
  - If the UPDATE or DELETE statement uses the WHERE CURRENT OF cursor_name syntax, the query is not pushed down.

For the hash distribution, **column_name** supports the following data types:

- Integer types: TINYINT, SMALLINT, INT, BIGINT, and NUMERIC/DECIMAL
- Character types: CHAR, BPCHAR, VARCHAR, VARCHAR2, NVARCHAR2, and TEXT
- Date/time types: DATE, TIME, TIMETZ, TIMESTAMP, TIMESTAMPTZ, INTERVAL, and SMALLDATETIME

For the MURMURHASH distribution, the data type of the column name in **diskey_expr** must be one of the following:

- Integer types: TINYINT, SMALLINT, INT, and BIGINT
- Character types: CHAR, BPCHAR, VARCHAR, VARCHAR2, and NVARCHAR2

For the RANGE (VALUES LESS THAN) or LIST distribution, **column_name** supports the following data types:

- Integer types: TINYINT, SMALLINT, INT, BIGINT, and NUMERIC/DECIMAL
- Character types: CHAR, BPCHAR, VARCHAR, VARCHAR2, NVARCHAR2, and TEXT

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

– Date/time types: DATE, TIMESTAMP, and TIMESTAMPTZ

For the range (start end) distribution, the data type of column_name must be one of the following:

– Integer types: TINYINT, SMALLINT, INT, BIGINT, and NUMERIC/DECIMAL
– Date/time types: DATE, TIMESTAMP, and TIMESTAMPTZ

NOTE

When you create a table, the choices of distribution keys and partition keys have major impact on SQL query performance. Therefore, select appropriate distribution keys and partition keys with strategies.

- Select appropriate distribution keys.

  A hash table's distribution key should evenly distribute data on each DN to prevent skewing the data or distributing it unevenly across DNs. Determine appropriate distribution keys based on the following principles:

  1. Determine whether data is skewed.

     Connect to the database and check the number of tuples on each DN. Replace *tablename* with the actual name of the table to be analyzed.

     ```
     gaussdb=# SELECT a.count,b.node_name FROM (SELECT count(*) AS count,xc_node_id FROM tablename GROUP BY xc_node_id) a, pgxc_node b WHERE a.xc_node_id=b.node_id ORDER BY a.count DESC;
     ```

     If tuple numbers vary greatly (several times or tenfold) on each DN, a data skew occurs. Change the data distribution key based on the following principles:

  2. Rebuild a table to change its distribution keys. ALTER TABLE cannot change distribution keys. Therefore, you need to rebuild a table when changing its distribution keys.

     Principles for selecting distribution keys are as follows:

     The value of the distribution key should be discrete so that data can be evenly distributed on each DN. You can select the primary key of the table as the distribution key. For example, for a person information table, choose the ID card number column as the distribution key.

     With the above principles met, you can select join conditions as distribution keys so that join tasks can be pushed down to DNs, reducing the amount of data transferred between the DNs.

- Select appropriate partition keys.

  In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

  Modify partition keys to make the query result stored in the same or least partitions (partition pruning). Obtain consecutive I/O to improve the query performance.

  In actual services, time is often used to filter query objects. Therefore, you can use time as a partition key, and change the key value based on the total data volume and data volume of a single query.

- RANGE/LIST distribution

  If no DN is specified for the shards of a RANGE/LIST distributed table, the database uses the Round Robin algorithm to allocate DNs to the shards. In addition, if RANGE/LIST distribution is used, you are advised to define as many shards as possible when creating a table for future capacity expansion. If the defined number of shards is less than the number of DNs before scale-out, data redistribution cannot be performed on new DNs. Note that the sharding rules are designed by users. In some extreme cases, scale-out may not solve the problem of insufficient storage space.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  TO GROUP specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **CONSTRAINT [constraint_name]**

  Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed.

  There are two ways to define constraints:

  – A column constraint is defined as part of a column definition, and it is bound to a particular column. You cannot add a constraint name to the clause AUTO_INCREMENT | COMMENT 'string' | ENCRYPTED WITH (COLUMN_ENCRYPTION_KEY = column_encryption_key, ENCRYPTION_TYPE = encryption_type_value).

  – A table constraint is not bound to a particular column but can apply to more than one column.

  NOTICE

  For a table constraint, **constraint_name** is optional in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**). In other databases, **constraint_name** must be added.

- **NOT NULL**

  Forbids NULL values in columns.

- **NULL**

  Allows to contain NULL values. This is the default setting.

  This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (expression)**

  Specifies an expression producing a Boolean result where the INSERT or UPDATE operation on rows can succeed only when the expression result is true or unknown; otherwise, an error is thrown and the database is not altered.

  A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

  NOTE

  <>NULL and **!=NULL** are invalid in an expression. Change them to **IS NOT NULL**.

- **DEFAULT default_expr**

  Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ON UPDATE update_expr**

  The ON UPDATE clause is an attribute constraint of a column.

  When an UPDATE operation is performed on a tuple in a table, if new values of updated columns are different from old values in the table, column values with this attribute but not in updated columns are automatically updated to the current timestamp. If new values of updated columns are the same as old values in the table, column values with this attribute but not in updated columns remain unchanged. If columns with this attribute are in updated columns, column values are updated according to the specified update value.

  NOTE

  - This attribute can be specified in a MYSQL-compatible database of version 5.7 (that is, **sql_compatibility** is set to **'MYSQL'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**) and in a PG-compatible database (this syntax is not supported during upgrade observation).
  - In terms of syntax, **update_expr** supports three keywords: CURRENT_TIMESTAMP, LOCALTIMESTAMP, and NOW(). You can also optionally specify the precision of a keyword with parentheses. The three types of keywords are synonyms of each other and have the same attribute effect. For example, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE CURRENT_TIMESTAMP(5), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE LOCALTIMESTAMP(6). If the keyword does not contain parentheses or contains empty parentheses, the precision is 0. The NOW keyword cannot contain parentheses. In PG-compatible mode, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE NOW(5) are not supported.
  - This attribute can be specified only for columns of the following types: timestamp, datetime, date, time without time zone, smalldatetime, and abstime.
  - If the CREATE TABLE AS syntax is used, the column attributes will not be inherited.
  - The CREATE TABLE LIKE syntax can use **INCLUDING UPDATE** or **EXCLUDING UPDATE** to inherit or exclude a constraint. In PG-compatible mode, only **EXCLUDING UPDATE** can be used to exclude a constraint. The **INCLUDING ILM** option is added to copy the ILM policy information of a source table. This option is used together with the **INCLUDING PARTITION** option to copy the policy information of partition objects in a source table.
  - The precision specified by this attribute can be different from the precision specified by the type in the corresponding column. After the column value is updated through this attribute, the minimum precision is displayed. For example, **CREATE TABLE t1 (col1 timestamp(6) ON UPDATE CURRENT_TIMESTAMP(3));**. If the UPDATE syntax triggers the attribute to take effect, three decimal places in the value of **col1** are displayed after the update.
  - The same column cannot be specified for this attribute and the generated column constraint at the same time.
  - This attribute cannot be specified for the partition key in a partitioned table.
  - In distributed scenarios, this attribute cannot be specified for distribution keys and primary keys.

- **AUTO_INCREMENT**

  Specifies an auto-increment column.

  Currently, the auto-increment column is a local auto-increment column by default. The auto-increment column increases independently on each DN and does not affect each other. The auto-increment column is not unique globally.

  If the value of this column is not specified (or the value of this column is set to **0**, **NULL**, or **DEFAULT**), the value of this column is automatically increased by the auto-increment counter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If this column is inserted or updated to a value greater than the current auto-increment counter, the auto-increment counter is updated to this value after the command is executed successfully.

The initial auto-increment value is set by the AUTO_INCREMENT [=] value clause. If it is not set, the default value **1** is used.

NOTE

- The auto-increment column can be specified only when **sql_compatibility** is set to **'MYSQL'**.
- The data type of the auto-increment column can only be integer, 4-byte or 8-byte floating point, or Boolean.

  An error occurs if the auto-increment continues after an auto-increment value reaches the maximum value of a column data type.
- Each table can have only one auto-increment column.
- It is recommended that the local auto-increment column be the first column of a non-global secondary index. Otherwise, errors may occur when some operations are performed on a table that contains auto-increment columns, for example, ALTER TABLE EXCHANGE PARTITION.
- The DEFAULT value cannot be specified for an auto-increment column.
- The expression of the CHECK constraint cannot contain auto-increment columns.
- You can specify that the auto-increment column can be NULL. If it is not specified, the auto-increment column contains the NOT NULL constraint by default.
- When a table containing a local auto-increment column is created, a sequence that depends on the column is created on each DN as an auto-increment counter. You are not allowed to modify or delete the sequence using sequence-related functions. You can view the value of the sequence. Do not make other sequences depend on or join with this auto-increment column.
- The auto-increment and refresh operations of the auto-increment counter are not rolled back.
  - Before data is inserted into a table, **0** or **NULL** triggers auto-increment. After data is inserted or updated to a table, the auto-increment counter is updated. If an error is reported after auto-increment, and data is not inserted or updated to the table, the auto-increment counter does not roll back. Subsequent insert statements trigger auto-increment based on the auto-increment counter. As a result, the values of the auto-increment columns in the table are discontinuous.
  - If you insert or import reserved auto-increment cache values in batches, the values in the auto-increment column may be discontinuous. For details, see the description of the **auto_increment_cache** parameter.
- An auto-increment column cannot be used as a distribution key.
- Currently, local temporary tables do not support auto-increment columns.
- DISTRIBUTE BY REPLICATION does not support auto-increment columns.

- **UNIQUE [KEY] index_parameters**

  Specifies that a group of one or more columns of a table can contain only unique values.

  For the purpose of a UNIQUE constraint, NULL is not considered equal.

  UNIQUE KEY can be used only when **sql_compatibility** is set to **'MYSQL'**, which has the same semantics as UNIQUE.

- **UNIQUE [index_name][USING method] ({ {column_name | (expression) } [ASC | DESC] }[, ...]) index_parameters**

  Specifies that a group of one or more columns of a table can contain only unique values.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For the purpose of a UNIQUE constraint, NULL is not considered equal.

index_name indicates the index name.

NOTICE

- The **index_name** parameter is supported only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**).
- If both **constraint_name** and **index_name** are specified for the UNIQUE KEY constraint, the value of **index_name** will be used as the index name.

- **PRIMARY KEY index_parameters**

  PRIMARY KEY [USING method] ({ column_name [ASC | DESC] } [, ...]) index_parameters

  Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-**NULL** values.

  Only one primary key can be specified for a table.
- **REFERENCES**

  The current version does not support the REFERENCES clause.
- **USING method**

  Specifies the name of the index method to be used.

  For details about the value range, see the USING method in **Parameters**.

NOTICE

- The USING method is supported only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**).
- In MYSQL-compatible mode, if USING method is not specified, the default index method is B-tree for Astore or UB-tree for Ustore.
- For the constraint of building a global secondary index by default, the bottom layer of the global secondary index uses UB-tree storage, even if the storage mode specified by the user is B-tree.
- If the storage mode of a table is Ustore and the constraint in the SQL statement is specified as USING BTREE, the underlying layer automatically creates the constraint as USING UBTREE.

- **ASC | DESC**

  ASC specifies an ascending (default) sort order. **DESC** specifies a descending sort order.

NOTICE

ASC|DESC is supported only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**).

- **expression**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies an expression index constraint based on one or more columns of the table. It must be written in parentheses.

NOTICE

Expression indexes in the UNIQUE constraint are supported only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**).

- **DEFERRABLE | NOT DEFERRABLE**

  Determines whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only **UNIQUE** and **PRIMARY KEY** constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint.

  - If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.
  - If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

  The constraint check time can be altered using the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace_name**

  Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If not specified, the index is created in **default_tablespace**. If **default_tablespace** is empty, the default tablespace of the database is used.

- **ENCRYPTION_TYPE = encryption_type_value**

  For the encryption type in the ENCRYPTED WITH constraint, the value of **encryption_type_value** is **DETERMINISTIC** or **RANDOMIZED**.

- **[DEFAULT] CHARACTER SET | CHARSET [=] default_charset**

  Specifies the default character set of a table. If you specify a character set separately, the default collation of the table is set to the default collation of the specified character set.

  This syntax is supported only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**).

- **[DEFAULT] COLLATE [=] default_collation**

  Specifies the default collation of a table. If you specify a collation separately, the default character set of the table is set to the character set corresponding to the specified collation.

  This syntax is supported only in a MYSQL-compatible database (that is, **sql_compatibility** is set to **'MYSQL'**). For details about the collation, see **Table 7-269**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> If the character set or collation of a table is not explicitly specified and the default character set or collation of the schema is specified, the character set or collation of the table is inherited from the schema. If the default character set or collation of a schema does not exist, the character set and collation of the table inherit the character set and collation of the current database when **b_format_behavior_compat_options** contains **'default_collation'**.

Examples

- Create an ordinary table.

```
gaussdb=# CREATE TABLE tbl_test1(
    id       int,
    name     varchar(50),
    province varchar (60), -- Province
    country  varchar (60) DEFAULT 'China' -- Country
);

gaussdb=# DROP TABLE tbl_test1;
```

- **The WITH clause adds storage parameters to a table or index.**

```
-- Create a table and specify fill factors.
gaussdb=# CREATE TABLE tbl_test2(
    id       int,
    name     varchar(50),
    province varchar (60), -- Province
    country  varchar (60) DEFAULT 'China' -- Country
) WITH (FILLFACTOR = 70);

-- Create a table and specify a storage engine.
gaussdb=# CREATE TABLE tbl_test3(
    id       int,
    name     varchar(50),
    province varchar (60), -- Province
    country  varchar (60) DEFAULT 'China' -- Country
) WITH (STORAGE_TYPE = ASTORE);

-- Drop.
gaussdb=# DROP TABLE tbl_test2;
gaussdb=# DROP TABLE tbl_test3;
```

- Use a temporary table.

```
-- Create a temporary table and specify that this table is deleted when the transaction is committed.
gaussdb=# CREATE TEMPORARY TABLE test_t2(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
) ON COMMIT DELETE ROWS;
gaussdb=# DROP TABLE test_t2;
```

- Specify a character set and collation during table creation.

```
-- Create a frontend database.
gaussdb=# CREATE DATABASE testdb1 ENCODING = 'UTF8';
gaussdb=# \c testdb1

-- Create table t1. Set the default character set of t1 to utf8mb4 and the default collation to utf8mb4_bin. Set the character set and collation of the c1 column to the default values of the table. Set the character set of the c2 column to utf8mb4, and its collation to utf8mb4_unicode_ci.
testdb1=# CREATE TABLE t1(c1 text, c2 text charset utf8mb4 collate utf8mb4_unicode_ci) charset utf8mb4 collate utf8mb4_bin;

-- Drop.
testdb1=# DROP TABLE t1;
testdb1=# \c postgres
gaussdb=# DROP DATABASE testdb1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- IF NOT EXISTS keyword

  If this keyword is used, NOTICE is reported when the table does not exist. If this keyword is not used, ERROR is reported. In either case, the table fails to be created.

```
gaussdb=# CREATE TABLE test_t3(id INT);
-- Create a table named test_t3.
gaussdb=# CREATE TABLE test_t3(id INT);
ERROR:  Relation test_t3 already exists in schema public.
DETAIL:  Creating new table with existing name in the same schema.

-- Use the IF NOT EXISTS keyword.
gaussdb=# CREATE TABLE IF NOT EXISTS test_t3(id INT);
NOTICE:  Relation test_t3 already exists, skipping.
CREATE TABLE

-- Drop the table.
gaussdb=# DROP TABLE test_t3;
```

- Specifying a tablespace during table creation

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE ds_tbs1 RELATIVE LOCATION 'tablespace/tablespace_1';

-- Specify a tablespace when creating a table.
gaussdb=# CREATE TABLE test(id CHAR(7), name VARCHAR(20)) TABLESPACE ds_tbs1;

-- Drop the table and tablespace.
gaussdb=# DROP TABLE test;
gaussdb=# DROP TABLESPACE ds_tbs1;
```

- Specifying the AUTO_INCREMENT column during table creation

```
-- The local auto-increment column is not used as the distribution key. The value starts from 10 for each DN. (Change the DN name by running SELECT node_name FROM pgxc_node WHERE node_type = 'D' based on the actual situation.)
gaussdb=# CREATE TABLE local_autoinc(col int AUTO_INCREMENT, col1 int) AUTO_INCREMENT = 10 DISTRIBUTE BY LIST(col1)(
    SLICE s1 VALUES (1) DATANODE datanode1,
    SLICE s2 VALUES (2) DATANODE datanode2
);

-- You are advised to use the auto-increment column as the first column of the index to create an index.
gaussdb=# CREATE INDEX local_autoinc_ai ON local_autoinc(col);

-- Distribute data to DN1. The value NULL triggers auto-increment, and the auto-increment value is 10.
gaussdb=# INSERT INTO local_autoinc(col, col1) VALUES(NULL,1);

-- Distribute data to DN2. The value 0 triggers auto-increment, and the auto-increment value is 10.
gaussdb=# INSERT INTO local_autoinc(col, col1) VALUES(1 - 1,2);

-- Distribute data to DN1. The value 100 does not trigger auto-increment. After data is inserted successfully, the auto-increment value is updated to 100.
gaussdb=# INSERT INTO local_autoinc(col, col1) VALUES(100,1);

-- Distribute data to DN1. The value 0 triggers auto-increment, and the auto-increment value is 101.
gaussdb=# INSERT INTO local_autoinc(col, col1) VALUES(0,1);

-- Distribute data to DN2. The value DEFAULT triggers auto-increment, and the auto-increment value is 11.
gaussdb=# INSERT INTO local_autoinc(col, col1) VALUES(DEFAULT,2);

gaussdb=# SELECT col,col1 FROM local_autoinc ORDER BY 2,1;
 col | col1
-----+------
  10 |    1
 100 |    1
 101 |    1
  10 |    2
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 11 |    2
(5 rows)

-- Drop.
gaussdb=# DROP TABLE local_autoinc;
```

- Creating a table using CREATE TABLE ... LIKE

```
-- Create the source table t1.
gaussdb=# CREATE TABLE t1(col INT);
CREATE TABLE

gaussdb=# \d t1
      Table "public.t1"
 Column |  Type   | Modifiers
--------+---------+-----------
 col    | integer |

-- Create the target table t2.
gaussdb=# CREATE TABLE t2(LIKE t1);
CREATE TABLE

gaussdb=# \d t2
      Table "public.t2"
 Column |  Type   | Modifiers
--------+---------+-----------
 col    | integer |

-- Drop.
gaussdb=# DROP TABLE t1,t2;
```

Examples of Creating a Table and Adding Constraints to the Table

- NOT NULL constraints

  If no value is specified for a column with a NOT NULL constraint when data is added, an error is reported. You can add NOT NULL constraints to multiple columns in a table.

```
-- Create a table and add a NOT NULL constraint to the id column.
gaussdb=# CREATE TABLE test_t4(
    id       CHAR(7) NOT NULL,
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'       -- Country
);

-- If the value of id is not specified or is NULL during data insertion, the NOT NULL constraint is triggered. As a result, the insertion fails.
gaussdb=# INSERT INTO test_t4 (name,province) VALUES ('scott','Shanghai');
ERROR:  Null value in column id violates not-null constraint.
DETAIL:  Failing row contains (null, scott, Shanghai, China).

-- Drop the table.
gaussdb=# DROP TABLE test_t4;
```

- UNIQUE constraint

  The keyword UNIQUE is used to add a UNIQUE constraint to a column. When data is inserted, the constraint is triggered if the column is duplicate. Multiple **NULL** values are not duplicate values. When a UNIQUE constraint is added, a unique index is automatically added. You can add UNIQUE constraints to multiple columns in a table.

```
-- Create a table to add UNIQUE constraints.
gaussdb=# CREATE TABLE test_t5(
    id       CHAR(7) UNIQUE USING INDEX TABLESPACE pg_default,
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'       -- Country
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- You can also use the following method to name a UNIQUE constraint and add constraints for
multiple columns:
gaussdb=# CREATE TABLE test_t6(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                       -- Province
    country   VARCHAR(30) DEFAULT 'China',        -- Country
    CONSTRAINT unq_test_id UNIQUE (id,name)
);
-- When data with duplicate IDs is inserted, constraints are triggered. As a result, the insertion fails.
gaussdb=# INSERT INTO test_t5(id) VALUES('0000010');
INSERT 0 1
gaussdb=# INSERT INTO test_t5(id) VALUES('0000010');
ERROR:  Duplicate key value violates unique constraint "test_t5_id_key".
DETAIL:  Key (id)=(0000010) already exists.
-- The constraint is not triggered when data whose id is NULL is inserted for multiple times.
gaussdb=# INSERT INTO test_t5(id) VALUES (NULL);
INSERT 0 1
gaussdb=# INSERT INTO test_t5(id) VALUES (NULL);
INSERT 0 1

-- Drop tables.
gaussdb=# DROP TABLE test_t5;
gaussdb=# DROP TABLE test_t6;
```

- Primary key constraints

  The keyword PRIMARY KEY is used to add a UNIQUE constraint to a column. The column must be unique and cannot be empty. When a PRIMARY KEY constraint is added, a unique index is automatically created for the table, and a NOT NULL constraint is automatically added for the column.

  Only one PRIMARY KEY constraint can be defined in each table.

```
-- Create a table and add a PRIMARY KEY constraint to the table.
gaussdb=# CREATE TABLE test_t6(
    id       CHAR(7) PRIMARY KEY,
    name     VARCHAR(20),
    province VARCHAR(60),                       -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
);
gaussdb=# INSERT INTO test_t6 (id,name,province) VALUES ('0000001','july','Beijing');

-- You can also use the following method to manually name a UNIQUE constraint and add constraints
for multiple columns:
gaussdb=# CREATE TABLE test_t7(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                       -- Province
    country   VARCHAR(30) DEFAULT 'China',        -- Country
    CONSTRAINT pk_test_t6_id PRIMARY KEY (id,name)
);
-- Insert data whose id is NULL to trigger the constraint.
gaussdb=# INSERT INTO test_t6 (id,name,province) VALUES (NULL,'july','Beijing');
ERROR:   Null value in column id violates not-null constraint.
DETAIL:  Failing row contains (null, july, Beijing, China).

-- Insert data with duplicate id values to trigger the constraint.
gaussdb=# INSERT INTO test_t6 (id,name,province) VALUES ('0000001','ben','Shanghai');
ERROR:  Duplicate key value violates unique constraint "test_t6_pkey"
DETAIL:  Key (id)=(0000001) already exists.
-- Drop the table.
gaussdb=# DROP TABLE test_t6;
gaussdb=# DROP TABLE test_t7;
```

- Check constraints

  The keyword CHECK adds a constraint to a column. The CHECK constraint must reference one or more columns in the table, and the result returned by

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

the expression must be a Boolean value. Currently, expressions cannot contain subqueries. Both CHECK and NOT NULL constraints can be defined for the same column.

```
-- Create a table and add a CHECK constraint.
gaussdb=# CREATE TABLE test_t8 (
    id       CHAR(7),
    name     VARCHAR(20),
    age      INT CHECK(age > 0 AND age < 150)
);

-- Or run the following SQL statements to manually name CHECK constraints and add CHECK
constraints for one or more columns.
gaussdb=# CREATE TABLE test_t9 (
    id       CHAR(7),
    name     VARCHAR(20),
    age      INT,
    CONSTRAINT chek_test_t8_age CHECK(age > 0 AND age < 150)
);
-- If a value that does not comply with the expression is inserted, the CHECK constraint is triggered.
As a result, the insertion fails.
gaussdb=# INSERT INTO test_t8 (id,name,age) VALUES ('0000007','scott',200);
ERROR:  New row for relation test_t8 violates check constraint test_t8_age_check.
DETAIL:  N/A
-- Drop the table.
gaussdb=# DROP TABLE test_t8;
gaussdb=# DROP TABLE test_t9;
```

Table Data Distribution Examples

- **REPLICATION**

```
gaussdb=# CREATE TABLE test_replication(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
)DISTRIBUTE BY REPLICATION;

-- Query table information.
gaussdb=# \d+ test_replication
                                  Table "public.test_replication"
  Column  |         Type          |             Modifiers              | Storage  | Stats target | Description
----------+-----------------------+------------------------------------+----------+--------------+-------------
 id       | character(7)          |                                    | extended |              |
 name     | character varying(20) |                                    | extended |              |
 province | character varying(60) |                                    | extended |              |
 country  | character varying(30) | default 'China'::character varying | extended |              |
Has OIDs: no
Distribute By: REPLICATION
Location Nodes: ALL DATANODES
Options: orientation=row, logical_repl_node=-1, compression=no, storage_type=USTORE, segment=off

-- Drop.
gaussdb=# DROP TABLE test_replication;
```

- **HASH**

```
-- Define a hash table.
gaussdb=# CREATE TABLE test_hash(
    id       CHAR(7),
    name     VARCHAR(20),
    province VARCHAR(60),                    -- Province
    country   VARCHAR(30) DEFAULT 'China'        -- Country
)DISTRIBUTE BY HASH(id);

-- Insert data.
gaussdb=# INSERT INTO test_hash VALUES ('0000001', 'Bob',   'Shanghai', 'China'),
                            ('0000002', 'Jack',  'Beijing',  'China'),
                            ('0000003', 'Scott', 'Beijing',  'China');
```

-- Drop the table.
gaussdb=# DROP TABLE test_list;
```

Helpful Links

ALTER TABLE, **DROP TABLE**, and **CREATE TABLESPACE**

Suggestions

- UNLOGGED
  - The unlogged table and its indexes do not use the WAL mechanism during data writing. Their write speed is much higher than that of ordinary tables. Therefore, they can be used for storing intermediate result sets of complex queries to improve query performance.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The unlogged table has no primary/standby mechanism. In case of system faults or abnormal breakpoints, data loss may occur. Therefore, the unlogged table cannot be used to store basic data.
- TEMPORARY | TEMP
  - A temporary table is automatically dropped at the end of a session.
  - The temporary table is visible only to the current CN.
- LIKE
  - The target table automatically inherits all column names, data types, and NOT NULL constraints from this table. The target table is irrelevant to the source table after the creation.
- LIKE INCLUDING DEFAULTS
  - The default expressions are copied from the source table to the target table only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the target table having default values **NULL**.
- LIKE INCLUDING CONSTRAINTS
  - The CHECK constraints are copied from the source table to the target table only when **INCLUDING CONSTRAINTS** is specified. Other types of constraints are never copied to the target table. NOT NULL constraints are always copied to the target table. These rules also apply to column constraints and table constraints.
- LIKE INCLUDING INDEXES
  - Any indexes on the source table will not be created on the target table, unless **INCLUDING INDEXES** is specified.
- LIKE INCLUDING STORAGE
  - **STORAGE** settings for the copied column definitions are copied only if **INCLUDING STORAGE** is specified. The default behavior is to exclude **STORAGE** settings.
- LIKE INCLUDING COMMENTS
  - If **INCLUDING COMMENTS** is specified, comments for the copied columns, constraints, and indexes are copied. The default behavior is to exclude comments.
- LIKE INCLUDING PARTITION
  - If **INCLUDING PARTITION** is specified, the partition definitions of the source table are copied to the target table, and the target table no longer uses the PARTITION BY clause. By default, the partition definition of the source table is not copied.
- LIKE INCLUDING RELOPTIONS
  - If **INCLUDING RELOPTIONS** is specified, the target table will copy the storage parameter (that is, WITH clause) of the source table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- LIKE INCLUDING DISTRIBUTION
  - If **INCLUDING DISTRIBUTION** is specified, the distribution information of the source table is copied to the target table, including distribution type and key, and the target table will no longer use the DISTRIBUTE BY

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

clause. The default behavior is to exclude distribution information of the source table.

- LIKE INCLUDING ALL
  - **INCLUDING ALL** contains the content of **INCLUDING DEFAULTS**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING PARTITION**, **INCLUDING RELOPTIONS**, **INCLUDING DISTRIBUTION**, and **INCLUDING ILM**.
- ORIENTATION ROW
  - Creates a row-store table. Row store applies to the OLTP service, which has many interactive transactions. An interaction involves many columns in the table. Using row store can improve the efficiency.
- DISTRIBUTE BY
  - It is recommended that a fact table or dimension table containing a large amount of data be created as a distributed table. Each row of the table will be placed into specified DNs based on the hash value of the specified column. The syntax is DISTRIBUTE BY HASH(column_name).
  - It is recommended that a dimension table containing a small amount of data be created as a replication table. Each row in the table exists on all DNs. That is, each DN has complete table data. The syntax is DISTRIBUTE BY REPLICATION.

7.12.9.46 CREATE TABLESPACE

Description

Creates a tablespace in a database.

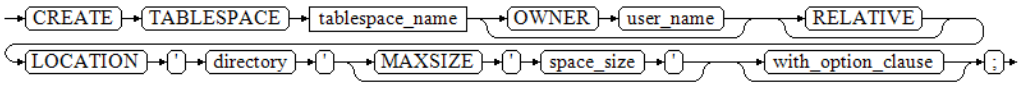
Precautions

- A system administrator or a user who inherits permissions of the built-in role gs_role_tablespace can create a tablespace.
- Do not run **CREATE TABLESPACE** in a transaction block.
- If running **CREATE TABLESPACE** fails but the internal directory (or file) has been created, the directory (or file) will remain. You need to manually clear it before creating the tablespace again. If there are residual files of soft links for the tablespace in the data directory, delete the residual files, and then perform O&M operations.
- **CREATE TABLESPACE** cannot be used for two-phase transactions. If it fails on some nodes, the execution cannot be rolled back.
- The tablespace creation operation is executed sequentially on each node. If a remote node fails to execute the operation, the error message source is reported: "CONTEXT: Error message received from nodes: *Node name*."

Syntax

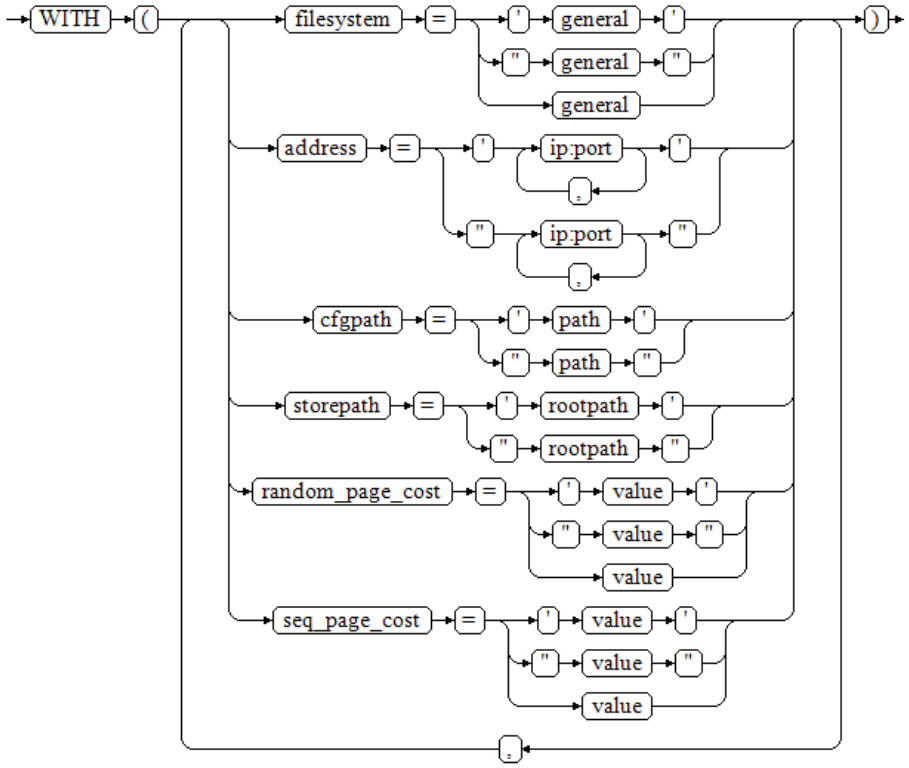
```
CREATE TABLESPACE tablespace_name
    [ OWNER user_name ] [ RELATIVE ] LOCATION 'directory' [ MAXSIZE 'space_size' ]
    [with_option_clause];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



with_option_clause for creating an ordinary tablespace is as follows:

```
WITH ({filesystem= { ' general ' | " general " | general } | address = { ' ip:port [, ... ] ' | " ip:port [, ... ] " } | cfgpath = { ' path ' | " path " } | storepath = { ' rootpath ' | " rootpath " } | random_page_cost = { ' value ' | " value " | value } | seq_page_cost = { ' value ' | " value " | value }}[, ... ])
```



Parameters

- **tablespace_name**

  Specifies name of the tablespace to be created.

  The tablespace name must be distinct from the name of any existing tablespace in the database and cannot start with "pg", which are reserved for system catalogs.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **OWNER user_name**

  Specifies the name of the user who will own the tablespace. If omitted, the default owner is the current user.

  Only system administrators can create tablespaces, but they can use the OWNER clause to assign ownership of tablespaces to non-system-administrators.

  Value range: a string. It must be an existing user.

- **RELATIVE**

  Specifies a relative path. The **LOCATION** directory is relative to each CN/DN data directory.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Directory hierarchy: relative path of the CNs and DNs directory **/pg_location/**. A relative path contains a maximum of two levels.

If this parameter is not specified, the absolute tablespace path is used. The **LOCATION** directory must be an absolute path.

- **LOCATION directory**

  Specifies the directory for the table space. When creating an absolute tablespace path, ensure that the directory meets the following requirements:

  – The system user must have the read and write permissions on the directory, and the directory must be empty. If the directory does not exist, the system automatically creates it.

  – The directory must be an absolute path, and does not contain special characters, such as dollar sign ($) and greater-than sign (>).

  – The directory cannot be specified under the database data directory.

  – The directory must be a local path.

  Value range: a string. It must be a valid directory.

- **MAXSIZE 'space_size'**

  Specifies the maximum size of a tablespace on a single DN.

  Value range: a string consisting of a positive integer and unit. The unit can be KB, MB, GB, TB, or PB currently. The unit of parsed value is KB and cannot exceed the range that can be expressed in 64 bits, which is 1 KB to 9007199254740991 KB.

- **address**

  Specifies the IP address and port number.

- **cfgpath**

  Specifies the configuration file path.

- **storepath**

  Specifies the root path.

- **filesystem**

  Specifies the file system used by the tablespace.

  Value range:

  general: general file system.

  hdfs: Hadoop distributed file system. It is not supported in the current version.

  Default value: **general**

- **random_page_cost**

  Specifies the time and resources required for randomly reading pages.

  Value range: 0 to 1.79769e+308

  Default value: value of the GUC parameter **random_page_cost**

- **seq_page_cost**

  Specifies the time and resources required for reading pages in sequence.

  Value range: 0 to 1.79769e+308

  Default value: value of GUC parameter **seq_page_cost**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_location1 RELATIVE LOCATION 'test_tablespace/test_tablespace_1';

-- Create a tablespace and specify the maximum value.
gaussdb=# CREATE TABLESPACE tbs_location2 RELATIVE LOCATION 'test_tablespace/test_tablespace_2'
MAXSIZE '10G';

-- Query tablespace information.
gaussdb=# SELECT * FROM pg_tablespace WHERE spcname = 'tbs_location2';
    spcname     | spcowner | spcacl | spcoptions | spcmaxsize | relative
----------------+----------+--------+------------+------------+----------
 tbs_location2 |       10 |        |            | 10485760 K | t
(1 row)

-- Create user joe.
gaussdb=# CREATE ROLE joe IDENTIFIED BY '********';

-- Create a tablespace and set its owner to user joe.
gaussdb=# CREATE TABLESPACE tbs_location3 OWNER joe RELATIVE LOCATION 'test_tablespace/
test_tablespace_3';

-- Create a tablespace and specify an absolute path. (Change the path based on the actual situation.)
gaussdb=# CREATE TABLESPACE tbs_location4 LOCATION '/tmp/tbs_location4';

-- Delete tablespaces and users.
gaussdb=# DROP TABLESPACE tbs_location1;
gaussdb=# DROP TABLESPACE tbs_location2;
gaussdb=# DROP TABLESPACE tbs_location3;
gaussdb=# DROP TABLESPACE tbs_location4;
gaussdb=# DROP ROLE joe;
```

CREATE DATABASE, **CREATE TABLE**, **CREATE INDEX**, **DROP TABLESPACE**, and **ALTER TABLESPACE**

Suggestions

You are advised not to create tablespaces in a transaction using CREATE TABLESPACE.

7.12.9.47 CREATE TABLE AS

Description

Creates a table from the results of a query.

It creates a table and fills it with data obtained using SELECT. The table columns have the names and data types associated with the output columns of SELECT (except that you can override the SELECT output column names by giving an explicit list of new column names).

CREATE TABLE AS queries a source table once and writes the data in a new table. This table will not change according to the source table. In contrast, the view re-computes and defines its SELECT statement at each query.

Precautions

- The table created in this way inherits only the names and data types of the SELECT output columns.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- This statement cannot be used to create a partitioned table.
- If an error occurs during table creation, after it is fixed, the system may fail to delete the disk files that are created before the last automatic clearance and whose size is not 0. This problem seldom occurs and does not affect system running of the database.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in MySQL-compatible mode, uppercase conversion will be unavailable.

Syntax

```
CREATE [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] TABLE [ IF NOT EXISTS ] table_name
   [ (column_name [, ...] ) ]
   [ { ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" } } [ [ , ] ... ] ]
   [ WITH ( {storage_parameter = value} [, ... ] ) ]
   [ ON COMMIT { PRESERVE ROWS | DELETE ROWS } ]
   [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]]
   [ TABLESPACE tablespace_name ]
   [ DISTRIBUTE BY { REPLICATION | { [HASH ] ( column_name ) } } ]
   [ TO { GROUP groupname | NODE ( nodename [, ... ] ) } ]
   AS query
   [ WITH [ NO ] DATA ];
```

For details about each column, see **Syntax**.

Parameters

- **UNLOGGED**

  Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, they are not crash-safe. An unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

  - Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.
  - Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

- **GLOBAL | LOCAL**

  When creating a temporary table, you can specify the **GLOBAL** or **LOCAL** keyword before **TEMP** or **TEMPORARY**. If the keyword **GLOBAL** is specified, GaussDB creates a global temporary table. Otherwise, it creates a local temporary table.

- **TEMPORARY | TEMP**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If **TEMP** or **TEMPORARY** is specified, the created table is a temporary table. Temporary tables are classified into global temporary tables and local temporary tables. If the keyword **GLOBAL** is specified when a temporary table is created, the table is a global temporary table. Otherwise, the table is a local temporary table.

The metadata of the global temporary table is visible to all sessions. After the sessions end, the metadata still exists. The user data, indexes, and statistics of a session are isolated from those of another session. Each session can only view or modify the data committed by itself. Global temporary tables can be created using ON COMMIT PRESERVE ROWS or ON COMMIT DELETE ROWS. The former creates session-level tables, where user data is automatically cleared when a session ends; the latter creates transaction-level tables, where user data is automatically cleared when a COMMIT or ROLLBACK operation is performed. If the **ON COMMIT** option is not specified during table creation, the session level is used by default. Different from local temporary tables, you can specify a schema that does not start with pg_temp_ when creating a global temporary table.

A local temporary table is visible only in the current session and is automatically dropped at the end of the session. Therefore, you can create and use temporary tables in the current session as long as the connected CN in the session is normal. Temporary tables are created only in the current session. If a DDL statement involves operations on temporary tables, a DDL error will be generated. Therefore, you are advised to not to perform operations on temporary tables in DDL statements. TEMP is equivalent to TEMPORARY.

NOTICE

- Temporary tables are visible to the current session through a schema starting with **pg_temp**. Therefore, do not delete schemas starting with **pg_temp** or **pg_toast_temp**.
- If **TEMPORARY** or **TEMP** is not specified when you create a table but its schema is set to that starting with **pg_temp** in the current session, the table will be created as a temporary table.
- A temporary table is visible only to the current session. Therefore, it cannot be used together with **\parallel on**.
- Temporary tables do not support DN faults or primary/standby switchovers.
- If global temporary tables or indexes are being used by other sessions, do not perform ALTER or DROP on the tables or indexes.
- DDL operations on global temporary tables affect only the user data and indexes of the current session. For example, TRUNCATE, REINDEX, and ANALYZE are valid only for the current session.

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating a table. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **table_name**

  Specifies the name of the table to be created.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **column_name**

  Optional. Specifies the name of a column to be created in the new table. If no column name is specified, the columns in the new table are the same as those entered in the SELECT statement.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **ENGINE**

  Supported in MySQL-compatible mode and used only for syntax adaptation. Only InnoDB can be set and no actual effect is achieved.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. See details of parameters below.

  – FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. If the Ustore is used, the default value is **92**. **100** (complete filling) is the default value. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter is only valid for row–store tables.

    Value range: 10–100

  – ORIENTATION

    Value range:

    ROW (default value): The data will be stored in rows.

  – COMPRESSION

    Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.

    Value range:

    This parameter is available only to column-store compression.

  – autovacuum_enabled

    Specifies whether the autovacuum function is enabled for the table.

    Value range: **on** and **off**

    Default value: **on**

  – autovacuum_vacuum_threshold

    Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 2147483647

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.

- autovacuum_analyze_threshold

  Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0 to 2147483647

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.

- autovacuum_vacuum_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.

- autovacuum_analyze_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

- autovacuum_freeze_min_age

  Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

  Value range: 0 to 1000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

- autovacuum_freeze_max_age

  Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

  Value range: 100000 to 2000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

- autovacuum_freeze_table_age

  Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0 to 2000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - hashbucket

    Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

    Value range: **on** and **off**

    Default value: **off**

    NOTICE

    In current version, DDL operations on hash bucket tables are affected. Therefore, you are advised not to frequently perform DDL operations on hash bucket tables.

- **ON COMMIT { PRESERVE ROWS | DELETE ROWS }**

  ON COMMIT determines what to do when you commit a temporary table creation operation. Currently, only **PRESERVE ROWS** and **DELETE ROWS** are supported.

  - **PRESERVE ROWS** (default): No special action is taken at the ends of transactions. The temporary table and its table data are unchanged.
  - **DELETE ROWS**: All rows in the temporary table will be deleted at the end of each transaction block.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store.

  - AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.
  - ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

    NOTE

    Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in MySQL-compatible mode, uppercase conversion will be unavailable.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

  For details, see **DISTRIBUTE BY**.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  TO GROUP specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **AS query**

  Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **[WITH [NO] DATA]**

  Specifies whether the data produced by the query should be copied to the new table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

Examples

- If no column name is specified, the columns in the new table are the same as those queried in the SELECT statement.

```
-- Create the test1 table and insert two records into the table.
gaussdb=# CREATE TABLE test1(col1 int PRIMARY KEY,col2 varchar(10));
gaussdb=# INSERT INTO test1 VALUES (1,'col1'),(101,'col101');
-- Query the data whose col1 is less than 100 in the table.
gaussdb=# SELECT * FROM test1 WHERE col1 < 100;
 col1 | col2
------+------
    1 | col1
(1 row)

-- Create the test2 table and insert the queried data into the table.
gaussdb=# CREATE TABLE test2 AS SELECT * FROM test1 WHERE col1 < 100;

-- Query the structure of the test2 table.
gaussdb=# \d test2;
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 col1   | integer               |
 col2   | character varying(10) |
```

- Specify column names for the new table.

```
-- Use test1 to copy a new table test3 and specify column names.
gaussdb=# CREATE TABLE test3(c1,c2) AS SELECT * FROM test1;

-- Query the structure of the test3 table.
gaussdb=# \d test3
            Table "public.test3"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 c1     | integer               |
 c2     | character varying(10) |

-- Drop.
gaussdb=# DROP TABLE test1,test2,test3;
```

- Create a table with the ILM policy enabled.

```
-- Create an ORA-compatible database.
gaussdb=# CREATE DATABASE ilmtabledb WITH dbcompatibility = 'ORA';
gaussdb=# \c ilmtabledb

-- Enable the ILM feature of the database.
ilmtabledb=#  ALTER DATABASE SET ILM = on;

-- Create a table ilm_table with the ILM policy enabled and insert the value of old_table.
ilmtabledb=# CREATE TABLE old_table (a int);
ilmtabledb=# CREATE TABLE ilm_table
  ILM ADD POLICY ROW STORE COMPRESS ADVANCED
  ROW AFTER 3 MONTHS OF NO MODIFICATION
  AS (SELECT * FROM old_table);

-- Drop.
ilmtabledb=# DROP TABLE old_table,ilm_table;
ilmtabledb=# \c postgres
gaussdb=# DROP DATABASE ilmtabledb;
```

CREATE TABLE and **SELECT**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.9.48 CREATE TABLE PARTITION

Description

Creates a partitioned table. Partitioning refers to splitting what is logically one large table into smaller physical pieces based on specific schemes. The table based on the logic is called a partitioned table, and each physical piece is called a partition. Data is stored on these physical partitions, instead of the logical partitioned table.

The common forms of partitioning include range partitioning, interval partitioning, hash partitioning, list partitioning, and value partitioning. Currently, row-store tables support range partitioning, hash partitioning, and list partitioning.

In range partitioning, a table is partitioned based on ranges defined by one or more columns, with no overlap between the ranges of values assigned to different partitions. Each range has a dedicated partition for data storage.

The partitioning policy for range partitioning refers to how data is inserted into partitions.

In range partitioning, a table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned. Range partitioning is the most commonly used partitioning policy.

In hash partitioning, a modulus and a remainder are specified for each partition based on a column in the table, and records to be inserted into the table are allocated to the corresponding partition, the rows in each partition must meet the following condition: The value of the partition key divided by the specified modulus generates the remainder specified for the partition key.

In hash partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

List partitioning is to allocate the records to be inserted into a table to the corresponding partition based on the key values in each partition. The key values do not overlap in different partitions. Create a partition for each group of key values to store corresponding data.

In list partitioning, table is partitioned based on partition key values. If a record can be mapped to a partition, it is inserted into the partition; if it cannot, an error message is returned.

Partitioning can provide several benefits:

- Query performance can be improved drastically in certain situations, particularly when most of the heavily accessed rows of the table are in a single partition or a small number of partitions. Partitioning narrows the range of data search and improves data access efficiency.
- When you query or update most of the records in a partition, performance can be improved by taking advantage of continuous scan of that partition instead of partitions scattered across the whole table.
- Frequent loading or deletion operations on records in a separate partition can be accomplished by reading or deleting that partition. This not only improves

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

performance but also avoids the VACUUM overload caused by bulk DELETE operations (hash partitions cannot be deleted).

Precautions

- If the constraint key of the UNIQUE constraint and PRIMARY KEY constraint contains all partition keys, a local index is created for the constraints. Otherwise, a global index is created.
- Currently, hash partitioning supports only single-column partition keys, and does not support multi-column partition keys.
- In the PARTITION FOR (values) syntax for partitioned tables, values can only be constants.
- In the PARTITION FOR (values) syntax for partitioned tables, if data type conversion is required for values, you are advised to use forcible type conversion to prevent the implicit type conversion result from being inconsistent with the expected result.
- The maximum number of partitions is 104,8575. Generally, it is impossible to create so many partitions, because too many partitions may cause insufficient memory. Create partitions based on the value of **local_syscache_threshold**. The memory used by the partitioned tables is about (number of partitions x 3/1024) MB. Theoretically, the memory occupied by the partitions cannot be greater than the value of **local_syscache_threshold**. In addition, some space must be reserved for other functions.
- Considering the impact on performance, it is recommended that the maximum number of partitions in a single table be less than or equal to 2000 and the number of subpartitions multiplied by (Number of local indexes + 1) be less than or equal to 10000.
- If the memory is insufficient due to too many partitions, the performance deteriorates sharply.
- Currently, the statement specifying a partition cannot perform global index scan.
- Data of the XML type cannot be used as partition keys or level-2 partition keys.
- When UPDATE or DELETE is performed on a partitioned table, if the generated plan is not an FQS or Stream plan, the statement execution efficiency is low. You are advised to check statements and eliminate factors that cannot be pushed down to generate FQS or Stream plans.
- If you add a row-level expression when adding or changing an ILM policy for a data object, note that the row-level expression supports only the functions listed in the whitelist. For details about the whitelist function list, see **Row Expression Function Whitelist**.

  NOTE

  Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in MySQL-compatible mode, uppercase conversion will be unavailable.

Syntax

```
CREATE TABLE [ IF NOT EXISTS ] partition_table_name
{ ( [
```

- update_expr:

```
{ CURRENT_TIMESTAMP | LOCALTIMESTAMP | NOW() }
```

Parameters

- **IF NOT EXISTS**

  Sends a notice instead of throwing an error, if a table with the same name exists.

- **partition_table_name**

  Specifies the name of a partitioned table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **column_name**

  Specifies the name of a column to be created in the new table.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **data_type**

  Specifies the data type of the column.

- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation;** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

- **CONSTRAINT constraint_name**

  Specifies the name of a column or table constraint. The optional constraint clauses specify constraints that new or updated rows must satisfy for an INSERT or UPDATE operation to succeed. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

  There are two ways to define constraints:

  – A column constraint is defined as part of a column definition, and it is bound to a particular column. You cannot add a constraint name to the clause AUTO_INCREMENT | COMMENT 'string' | ENCRYPTED WITH (COLUMN_ENCRYPTION_KEY = column_encryption_key, ENCRYPTION_TYPE = encryption_type_value).

  – A table constraint is not bound to a particular column but can apply to more than one column.

- **LIKE source_table [like_option ...]**

  Specifies a table from which a new table automatically copies all column names, their data types, and their NOT NULL constraints.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The new table and original table are decoupled after creation is complete. Changes to the original table will not be applied to the new table, and it is not possible to include data of the new table in scans of the original table.

- Default expressions for the copied column definitions will be copied only if **INCLUDING DEFAULTS** is specified. The default behavior is to exclude default expressions, resulting in the copied columns in the new table having default values **NULL**.
- NOT NULL constraints are always copied to the new table. CHECK constraints will only be copied if **INCLUDING CONSTRAINTS** is specified; other types of constraints will never be copied. These rules also apply to column constraints and table constraints.

The copied columns and constraints are not merged with similarly named columns and constraints. If the same name is specified explicitly or in another **LIKE** clause, an error is reported.

- If **INCLUDING UPDATE** is specified, the **ON UPDATE CURRENT_TIMESTAMP** attribute of the original table column is copied to the new table column. By default, this attribute is not copied.
- Any indexes on the original table will not be created on the new table, unless the **INCLUDING INDEXES** clause is specified.
- If **INCLUDING STORAGE** is specified, the **STORAGE** setting of the original table column is also copied. By default, the **STORAGE** setting is not included.
- If **INCLUDING COMMENTS** is specified, comments of the original table columns, constraints, and indexes are also copied. The default behavior is to exclude comments.
- If **INCLUDING RELOPTIONS** is specified, the storage parameters (WITH clauses) of the original table are also copied to the new table. The default behavior is to exclude partition definition of the storage parameter of the original table.
- If **INCLUDING DISTRIBUTION** is specified, the new table will copy the distribution information of the original table, including distribution type and key, and the new table cannot use the DISTRIBUTE BY clause. The default behavior is to exclude distribution information of the original table.
- If **INCLUDING ILM** is specified, the ILM policy information of a source table is copied to the new table. To copy the ILM policy information of partition objects in the source table, specify **INCLUDING PARTITION**.
- **INCLUDING ALL** contains the meaning of **INCLUDING DEFAULTS**, **INCLUDING UPDATE**, **INCLUDING CONSTRAINTS**, **INCLUDING INDEXES**, **INCLUDING STORAGE**, **INCLUDING COMMENTS**, **INCLUDING RELOPTIONS**, **INCLUDING DISTRIBUTION**, and **INCLUDING ILM**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The CREATE TABLE table_name LIKE source_table syntax is supported only when **sql_compatibility** is set to **'MYSQL'** (MySQL-compatible database), **b_format_version** is set to **5.7**, and **b_format_dev_version** is set to **s2**.
- In a MySQL-compatible database, if **b_format_version** is set to **5.7** and **b_format_dev_version** is set to **s2**, **INCLUDING** and **EXCLUDING** cannot be specified. In this case, it is equivalent to specify **INCLUDING ALL** by default.

- **AUTO_INCREMENT [=] value**

  This clause specifies an initial value for an auto-increment column. The value must be a positive number and cannot exceed $2^{127} - 1$.

NOTICE

This clause takes effect only when **sql_compatibility** is set to **'MYSQL'**.

- **COMMENT [=] 'string'**
  - The COMMENT [=] 'string' clause is used to add comments to a table.
  - The COMMENT 'string' in column_constraint indicates that comments are added to a column.
  - The COMMENT 'string' in table_constraint indicates that comments are added to the indexes corresponding to the primary key and unique key.

  For details, see **COMMENT [=] 'string'**.
- **CHARACTER SET | CHARSET charset**

  Specifies the character set of a table column. If this parameter is specified separately, the collation of the table column is set to the default collation of the specified character set.

  This syntax is supported only in a MySQL-compatible database (that is, **sql_compatibility** set to **'MYSQL'**).
- **COLLATE collation**

  Assigns a collation to the column (which must be of a collatable data type). If no collation is specified, the default collation is used. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result. In a MySQL-compatible database (that is, **sql_compatibility** set to **'MYSQL'**), **utf8mb4_bin**, **utf8mb4_general_ci**, **utf8mb4_unicode_ci**, **binary**, **gbk_chinese_ci**, **gbk_bin**, **gb18030_chinese_ci**, and **gb18030_bin** are also supported.
- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. Optional parameters are as follows:
  - FILLFACTOR

    The fill factor of a table is a number from 10 to 100. **100** (complete filling) is the default value. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate.

Value range: 10 to 100

- ORIENTATION

  Determines the data storage mode of the table.

  Value range:

  - **ROW** (default value): The data will be stored in rows.

  NOTICE

  ORIENTATION cannot be modified.

- STORAGE_TYPE

  Specifies the storage engine type. This parameter cannot be modified once it is set.

  Value range:

  - **USTORE** indicates that tables support the in-place update storage engine. Note that the **track_counts** and **track_activities** parameters must be enabled when the Ustore table is used. Otherwise, space bloating may occur.
  - **ASTORE** indicates that tables support the append-only storage engine.

  Default value:

  If this parameter is not specified, the **enable_default_ustore_table** parameter determines the storage engine mode, which is inplace-update storage by default.

- COMPRESSION

  - This parameter is available only to column-store compression.

- statistic_granularity

  Specifies the default **partition_mode** of a table during statistics analysis. For details about **partition_mode**, see **Parameters**. This parameter is invalid for non-partitioned tables.

  Value range: See the value range of **partition_mode**.

  Default value: **AUTO**.

- autovacuum_enabled

  Specifies whether the autovacuum function is enabled for the table.

  Value range: **on** and **off**

  Default value: **on**

- autovacuum_vacuum_threshold

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

Value range: 0 to 2147483647

The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.

- autovacuum_analyze_threshold

  Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0 to 2147483647

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.

- autovacuum_vacuum_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.

- autovacuum_analyze_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

- autovacuum_freeze_min_age

  Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

  Value range: 0 to 1000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

- autovacuum_freeze_max_age

  Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

  Value range: 100000 to 2000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

- autovacuum_freeze_table_age

  Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: 0 to 2000000000

The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

– hashbucket

Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

Value range: **on** and **off**

Default value: **off**

NOTICE

In current version, DDL operations on hash bucket tables are affected. Therefore, you are advised not to frequently perform DDL operations on hash bucket tables.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

- **DISTRIBUTE BY**

  Specifies how the table is distributed or replicated between nodes.

  For the value range and details, see **DISTRIBUTE BY**.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  TO GROUP specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **PARTITION BY RANGE [COLUMNS] (partition_key)**

  Creates a range partition. **partition_key** is the name of the partition key.

  The COLUMNS keyword can be used only when **sql_compatibility** is set to **'MYSQL'**. The semantics of PARTITION BY RANGE COLUMNS is the same as that of PARTITION BY RANGE.

  (1) Assume that the VALUES LESS THAN syntax is used.

  NOTICE

  If the VALUE LESS THAN clause is used, a range partitioning policy supports a partition key with up to 16 columns.

  Data types supported by the partition keys are as follows: TINYINT, SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, FLOAT4, FLOAT8, DOUBLE PRECISION, CHARACTER VARYING(n), VARCHAR(n), CHARACTER(n), CHAR(n), CHARACTER, CHAR, TEXT, NVARCHAR2, NAME, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE.

  (2) Assume that the START END syntax is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

In this case, only one partition key is supported.

Data types supported by the partition key are as follows: TINYINT, SMALLINT, INTEGER, BIGINT, DECIMAL, NUMERIC, REAL, FLOAT4, FLOAT8, DOUBLE PRECISION, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE.

- **PARTITION partition_name VALUES LESS THAN {({ partition_value | MAXVALUE } [,...]) | MAXVALUE }**

  Specifies the information of partitions. **partition_name** is the name of a range partition. **partition_value** is the upper limit of a range partition, and the value depends on the type of **partition_key**. *MAXVALUE* usually specifies the upper limit of the last range partition.

  NOTICE

  - Each partition requires an upper limit.
  - The data type of the upper limit must be the same as that of the partition key.
  - In a partition list, partitions are arranged in ascending order of upper limits. A partition with a smaller upper limit value is placed before another partition with a larger one.
  - MAVALUE that is not in parentheses can be used only when **sql_compatibility** is set to **'MYSQL'** and can have only one partition key.

- **PARTITION partition_name {START (partition_value) END (partition_value) EVERY (interval_value)} | {START (partition_value) END (partition_value|MAXVALUE)} | {START(partition_value)} | {END (partition_value | MAXVALUE)}**

  Specifies the information of partitions.

  - **partition_name**: name or name prefix of a range partition. It is the name prefix only in the following cases (assuming that **partition_name** is **p1**):
    - If **START**+**END**+**EVERY** is used, the names of partitions will be defined as **p1_1**, **p1_2**, and the like. For example, if **PARTITION p1 START(1) END(4) EVERY(1)** is defined, the generated partitions are [1, 2), [2, 3), and [3, 4), and their names are **p1_1**, **p1_2**, and **p1_3**. In this case, **p1** is a name prefix.
    - If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition, and its name will be **p1_0**. The other partitions are then named **p1_1**, **p1_2**, and the like. For example, if **PARTITION p1 START(1), PARTITION p2 START(2)** is defined, generated partitions are (*MINVALUE*, 1), [1, 2), and [2, *MAXVALUE*), and their names will be **p1_0**, **p1_1**, and **p2**. In this case, **p1** is a name prefix and **p2** is a partition name. **MINVALUE** means the minimum value.
  - **partition_value**: start value or end value of a range partition. The value depends on **partition_key** and cannot be *MAXVALUE*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **interval_value**: width of each partition for dividing the [**START**, **END**) range. It cannot be *MAXVALUE*. If the value of (**END** – **START**) divided by **EVERY** has a remainder, the width of only the last partition is less than the value of **EVERY**.
- *MAXVALUE* usually specifies the upper limit of the last range partition.

NOTICE

1. If the defined statement is in the first place and has **START** specified, the range (*MINVALUE*, **START**) will be automatically used as the first actual partition.
2. The **START END** syntax must comply with the following rules:
   - The value of **START** (if any, same for the following situations) in each **partition_start_end_item** must be smaller than that of **END**.
   - In two adjacent **partition_start_end_item** statements, the value of the first **END** must be equal to that of the second **START**.
   - The value of **EVERY** in each **partition_start_end_item** must be a positive number (in ascending order) and must be smaller than **END** minus **START**.
   - Each partition includes the start value (unless it is *MINVALUE*) and excludes the end value. The format is as follows: [**START**, **END**).
   - Partitions created by the same **partition_start_end_item** belong to the same tablespace.
   - If **partition_name** is a name prefix of a partition, the length must not exceed 57 bytes. If there are more than 57 bytes, the prefix will be automatically truncated.
   - When creating or modifying a partitioned table, ensure that the total number of partitions in the table does not exceed the maximum value **1048575**.
3. In statements for creating partitioned tables, START END and LESS THAN cannot be used together.
4. The START END syntax in a partitioned table creation SQL statement will be replaced by the VALUES LESS THAN syntax when gs_dump is executed.

- **PARTITION BY LIST [COLUMNS] (partition_key)**

  Create a list partition. **partition_key** is the name of the partition key.

  The COLUMNS keyword can be used only when **sql_compatibility** is set to **'MYSQL'**. The semantics of PARTITION BY LIST COLUMNS is the same as that of PARTITION BY LIST.

  - A list partitioning policy supports a partition key with up to 16 columns.
  - For the clause syntax VALUES [IN] (list_values), if **list_values** contains the key values of the corresponding partition, it is recommended that the number of key values of each partition be less than or equal to 64.
  - The clause VALUES IN can be used only when **sql_compatibility** is set to **'MYSQL'**. The semantics is the same as that of **VALUES**.

  Partition keys support the following data types: TINYINT, SMALLINT, INTEGER, BIGINT, NUMERIC, VARCHAR(n), CHAR, BPCHAR, NVARCHAR2,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITION BY HASH(partition_key)**

  Create a hash partition. **partition_key** is the name of the partition key.

  For **partition_key**, the hash partitioning policy supports only one column of partition keys.

  Partition keys support the following data types: TINYINT, SMALLINT, INTEGER, BIGINT, NUMERIC, VARCHAR(n), CHAR, BPCHAR, TEXT, NVARCHAR2, TIMESTAMP[(p)] [WITHOUT TIME ZONE], TIMESTAMP[(p)] [WITH TIME ZONE], and DATE. The number of partitions cannot exceed 1048575.

- **PARTITIONS integer**

  Specifies the number of partitions.

  integer indicates the number of partitions. The value must be an integer greater than 0 and cannot be greater than 1048575.

  – When this clause is specified after the range and list partitions, each partition must be explicitly defined, and the number of defined partitions must be equal to the integer value. This clause can be specified after the range and list partitions only when **sql_compatibility** is set to **'MYSQL'**.

  – When this clause is specified after the hash and key partitions, if the definition of each partition is not listed, an *integer* number of partitions are automatically generated. The automatically generated partition name is "p+number", and the number ranges from 0 to *integer* minus 1. The tablespace of the partition is the tablespace of the table by default. If each partition definition is explicitly defined, the number of defined partitions must be the same as the value of *integer*. If neither the partition definition nor the number of partitions is specified, a unique partition is created.

- **{ ENABLE | DISABLE } ROW MOVEMENT**

  Sets row movement.

  If the tuple value is updated on the partition key during the UPDATE operation, the partition where the tuple is located is altered. Setting this parameter enables error messages to be reported or movement of the tuple between partitions.

  Value range:

  – **ENABLE**: Row movement is enabled.

  – **DISABLE** (default value): Row movement is disabled.

  If the row movement is enabled, an error may be reported when UPDATE and DELETE operations are performed concurrently. The causes are as follows:

  The old data is marked as deleted in the UPDATE and DELETE operations. If the row movement is enabled, the cross-partition update occurs when the partition key is updated. The kernel marks the old data in the old partition as deleted and adds a data to the new partition. As a result, the new data cannot be found by querying the old data.

  If data in the same row is concurrently operated, the cross-partition and non-cross-partition data results have different behaviors in the following three concurrency scenarios: UPDATE and UPDATE concurrency, DELETE and DELETE concurrency, as well as UPDATE and DELETE concurrency.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a. For non-cross-partition data, no error is reported for the second operation after the first operation is performed.

   If the first operation is UPDATE, the latest data can be found and operated after the second operation is performed.

   If the first operation is DELETE, the second operation is terminated if the current data is deleted and the latest data cannot be found.

b. For the cross-partition data result, an error is reported for the second operation after the first operation is performed.

   If the first operation is UPDATE, the second operation cannot find the latest data because the new data is in the new partition. Therefore, the second operation fails and an error is reported.

   If the first operation is DELETE, performing the second operation can find that the current data is deleted and the latest data cannot be found, but cannot determine whether the operation of deleting the old data is UPDATE or DELETE. If the operation is UPDATE, an error is reported. If the operation is DELETE, the operation is terminated. To ensure the data correctness, an error is reported.

If the UPDATE and UPDATE concurrency, and UPDATE and DELETE concurrency are performed, the error can be solved only when the operations are performed serially. If the DELETE and DELETE concurrency are performed, the error can be solved by disabling the row movement.

- **NOT NULL**

  Forbids NULL values in columns. **ENABLE** can be omitted.

- **NULL**

  Allows to contain NULL values. This is the default setting.

  This clause is only provided for compatibility with non-standard SQL databases. It is not recommended.

- **CHECK (condition) [NO INHERIT]**

  Specifies an expression producing a Boolean result where the INSERT or UPDATE operation of new or updated rows can succeed only when the expression result is **TRUE** or **UNKNOWN**; otherwise, an error is thrown and the database is not altered.

  A CHECK constraint specified as a column constraint should reference only the column's value, while an expression in a table constraint can reference multiple columns.

  A constraint marked with **NO INHERIT** will not propagate to child tables.

  ENABLE can be omitted.

- **DEFAULT default_expr**

  Assigns a default data value to a column. The value can be any variable-free expressions. (Subqueries and cross-references to other columns in the current table are not allowed.) The data type of the default expression must match the data type of the column.

  The default expression will be used in any insert operation that does not specify a value for the column. If there is no default value for a column, then the default value is **NULL**.

- **ON UPDATE update_expr**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The ON UPDATE clause is an attribute constraint of a column.

When an UPDATE operation is performed on a tuple in a table, if new values of updated columns are different from old values in the table, column values with this attribute but not in updated columns are automatically updated to the current timestamp. If new values of updated columns are the same as old values in the table, column values with this attribute but not in updated columns remain unchanged. If columns with this attribute are in updated columns, column values are updated according to the specified update value.

NOTE

- This attribute can be specified only in MySQL 5.7 (that is, **sql_compatibility** is set to **'MYSQL'**, **b_format_version** is set to **'5.7'**, and **b_format_dev_version** is set to **'s1'**).
- In terms of syntax, **update_expr** supports three keywords: CURRENT_TIMESTAMP, LOCALTIMESTAMP, and NOW(). You can also specify or not specify the precision of a keyword with parentheses. For example, ON UPDATE CURRENT_TIMESTAMP(), ON UPDATE CURRENT_TIMESTAMP(5), ON UPDATE LOCALTIMESTAMP(), and ON UPDATE LOCALTIMESTAMP(6). If the keyword does not contain parentheses or contains empty parentheses, the precision is 0. The NOW keyword cannot contain parentheses. The three types of keywords are synonyms of each other and have the same attribute effect.
- This attribute can be specified only for columns of the following types: timestamp, datetime, date, time without time zone, smalldatetime, and abstime.
- The CREATE TABLE AS syntax does not inherit the column attributes.
- The CREATE TABLE LIKE syntax can use INCLUDING UPDATE or EXCLUDING UPDATE to inherit or exclude a constraint. The INCLUDING ILM option is added to copy the ILM policy information of the old table. This option is used together with the INCLUDING PARTITION option to copy the policy information of partition objects in the old table.
- The precision specified by this attribute can be different from the precision specified by the type in the corresponding column. After the column value is updated through this attribute, the minimum precision is displayed. For example, **CREATE TABLE t1 (col1 timestamp(6) ON UPDATE CURRENT_TIMESTAMP(3));**. If the UPDATE syntax triggers the attribute to take effect, three decimal places in the value of **col1** are displayed after the update.
- The same column cannot be specified for this attribute and the generated column constraint at the same time.
- This attribute cannot be specified for the partition key in a partitioned table.
- In distributed scenarios, this attribute cannot be specified for distribution keys and primary keys.

- **AUTO_INCREMENT**

  Specifies an auto-increment column.

  For details, see **AUTO_INCREMENT**.

- **UNIQUE [KEY] index_parameters**

  UNIQUE (column_name [, ...]) index_parameters

  Specifies that a group of one or more columns of a table can contain only unique values.

  For the purpose of a UNIQUE constraint, NULL is not considered equal.

  UNIQUE KEY can be used only when **sql_compatibility** is set to **'MYSQL'**, which has the same semantics as UNIQUE.

- **PRIMARY KEY index_parameters**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

PRIMARY KEY (column_name [, ...]) index_parameters

Specifies that a column or columns of a table can contain only unique (non-duplicate) and non-**NULL** values.

Only one primary key can be specified for a table.

- **DEFERRABLE | NOT DEFERRABLE**

  Determines whether the constraint can be deferred. A constraint that is not deferrable will be checked immediately after every command. Checking of constraints that are deferrable can be postponed until the end of the transaction using the **SET CONSTRAINTS** command. **NOT DEFERRABLE** is the default value. Currently, only UNIQUE and PRIMARY KEY constraints accept this clause. All the other constraints are not deferrable.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If a constraint is deferrable, this clause specifies the default time to check the constraint.

  – If the constraint is **INITIALLY IMMEDIATE** (default value), it is checked after each statement.

  – If the constraint is **INITIALLY DEFERRED**, it is checked only at the end of the transaction.

  The constraint check time can be altered using the **SET CONSTRAINTS** command.

- **USING INDEX TABLESPACE tablespace_name**

  Specifies a tablespace in which an index associated with a UNIQUE or PRIMARY KEY constraint will be created. If not specified, the index is created in **default_tablespace**. If **default_tablespace** is empty, the default tablespace of the database is used.

Range Partitioning

- VALUES LESS THAN

```

ALTER TABLE PARTITION and **DROP TABLE**

7.12.9.49 CREATE TABLE PARTITION AS

Description

Creates a partitioned table from the results of a query.

CREATE TABLE PARTITION AS creates a partitioned table and fills it with data obtained using SELECT. Data is partitioned based on the specified partitioning policy. The table columns have the names and data types associated with the output columns of SELECT (except that you can override the SELECT output column names by giving an explicit list of new column names).

Syntax

```
CREATE  TABLE [ IF NOT EXISTS ] partition_table_name
    [ (column_name [, ...] ) ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  [ { ENGINE [ = ] { InnoDB | 'InnoDB' | "InnoDB" } } [ [ , ] ... ] ]
  [ WITH ( {storage_parameter = value} [, ... ] ) ]
  [ ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO
MODIFICATION [ ON ( EXPR )]]
  [ TABLESPACE tablespace_name ]
  [ DISTRIBUTE BY { REPLICATION | { [HASH ] ( column_name ) } } ]
  [ TO { GROUP groupname | NODE ( nodename [, ... ] ) } ]
  PARTITION BY partition_clause partition_definition_list
  AS query
  [ WITH [ NO ] DATA ];
```

For details about each column, see **Syntax**.

Parameters

- **IF NOT EXISTS**

  When IF NOT EXISTS is specified, the system checks whether a relationship with the same name already exists in the current schema before creating a table. It is not created and a NOTICE is returned if a relationship with the same name already exists. When IF NOT EXISTS is not specified and a relationship with the same name exists in the schema, an ERROR is returned.

- **partition_table_name**

  Specifies the name of the partitioned table to be created.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **column_name**

  Optional. Specifies the name of a column to be created in the new table. If no column name is specified, the columns in the new table are the same as those entered in the SELECT statement.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **ENGINE**

  Supported in MySQL-compatible mode and used only for syntax adaptation. Only InnoDB can be set and no actual effect is achieved.

- **WITH (storage_parameter [= value] [, ...])**

  Specifies an optional storage parameter for a table or an index. See details of parameters below.

  – FILLFACTOR

    The fill factor of a table is a percentage from 10 to 100. If the Ustore is used, the default value is **92**. **100** (complete filling) is the default value. When a smaller fill factor is specified, INSERT operations fill table pages only to the indicated percentage. The remaining space on each page is reserved for updating rows on that page. This gives UPDATE a chance to place the updated copy of a row on the same page, which is more efficient than placing it on a different page. For a table whose entries are never updated, setting the fill factor to **100** (complete filling) is the best choice, but in heavily updated tables a smaller fill factor would be appropriate. The parameter is only valid for row–store tables.

    Value range: 10–100

  – ORIENTATION

    Value range:

    ROW (default value): The data will be stored in rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- COMPRESSION

  Specifies the compression level of table data. It determines the compression ratio and time. Generally, the higher the level of compression, the higher the ratio, the longer the time; and the lower the level of compression, the lower the ratio, the shorter the time. The actual compression ratio depends on the distribution mode of table data loaded.

  Value range:

  This parameter is available only to column-store compression.

- autovacuum_enabled

  Specifies whether the autovacuum function is enabled for the table.

  Value range: **on** and **off**

  Default value: **on**

- autovacuum_vacuum_threshold

  Specifies the minimum number of tuples required to be updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0 to 2147483647

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_threshold**.

- autovacuum_analyze_threshold

  Specifies the minimum number of tuples required to be inserted, updated, or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0 to 2147483647

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_threshold**.

- autovacuum_vacuum_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger VACUUM for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_vacuum_scale_factor**.

- autovacuum_analyze_scale_factor

  Specifies the ratio of tuples required to be inserted, updated or deleted in the table to trigger ANALYZE for the autovacuum function.

  Value range: 0.0 to 100.0

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_analyze_scale_factor**.

- autovacuum_freeze_min_age

  Specifies the minimum age of a row version for the autovacuum function. Only rows older than the minimum age are frozen.

  Value range: 0 to 1000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_min_age**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- autovacuum_freeze_max_age

  Specifies the number of transactions after which the VACUUM operation is forcibly performed for the **pg_class.relfrozenxid** column in the table for the autovacuum function. The system starts the AUTOVACUUM process even if autovacuum is disabled. The autovacuum operation also allows old files to be deleted from the **pg_clog/** subdirectory. It takes effect only for Astore tables.

  Value range: 100000 to 2000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **autovacuum_freeze_max_age**.

- autovacuum_freeze_table_age

  Specifies the amount of time that a table remains unchanged if it is marked as not requiring autovacuum for the autovacuum function. It takes effect only for Astore tables.

  Value range: 0 to 2000000000

  The default value is **–1**, which is the same as the value of the GUC parameter **vacuum_freeze_table_age**.

- hashbucket

  Creates a hash table that uses buckets. This parameter supports only row-store tables, including row-store range tables.

  Value range: **on** and **off**

  Default value: **off**

  NOTICE

  In current version, DDL operations on hash bucket tables are affected. Therefore, you are advised not to frequently perform DDL operations on hash bucket tables.

- **[ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW AFTER n { day | month | year } OF NO MODIFICATION [ON (EXPR)]]**

  When creating a table, you can call ILM ADD POLICY ROW STORE COMPRESS ADVANCED ROW to add an advanced compression policy for row store.

  - AFTER n { day | month | year } OF NO MODIFICATION: indicates the rows that are not modified in *n* days, months, or years.
  - ON (EXPR): indicates the row-level expression, which is used to determine whether a row is hot or cold.

    NOTE

    Compatibility parameters may affect the output of some functions supported by the ON(EXPR) row-level expression of the ILM policy. For example, after **b_format_version** and **b_format_dev_version** are set to **'5.7'** and **'s2'** respectively for the upper function in MySQL-compatible mode, uppercase conversion will be unavailable.

- **TABLESPACE tablespace_name**

  Specifies that the new table will be created in the **tablespace_name** tablespace. If not specified, the default tablespace is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **DISTRIBUTE BY**

  For details, see **DISTRIBUTE BY**.

- **TO { GROUP groupname | NODE (nodename [, ...]) }**

  TO GROUP specifies the node group to which the table to be created belongs. **TO NODE** is used for internal scale-out tools.

- **PARTITION BY**

  For details about the columns of partition_clause and partition_definition_list, see **Parameters**.

- **AS query**

  Specifies a **SELECT** or **VALUES** command, or an **EXECUTE** command that runs a prepared **SELECT** or **VALUES** query.

- **[WITH [NO] DATA]**

  Specifies whether the data produced by the query should be copied to the new partitioned table. By default, the data will be copied. If the value **NO** is used, only the table structure will be copied.

Example

Create a level-1 partitioned table and fill it with data obtained through subqueries.

```
-- Create source table t1 and insert three data records.
gaussdb=# CREATE TABLE t1(a int, b int) DISTRIBUTE BY HASH(a);
gaussdb=# INSERT INTO t1 VALUES(8, 2);
gaussdb=# INSERT INTO t1 VALUES(18, 3);
gaussdb=# INSERT INTO t1 VALUES(28, 4);

-- Create a level-1 partitioned table using CREATE TABLE PARTITION AS and fill it with data obtained through subqueries.
gaussdb=# CREATE TABLE t1_part_dup DISTRIBUTE BY HASH(a) PARTITION BY RANGE(a)
(
    PARTITION p1 VALUES LESS THAN(10),
    PARTITION p2 VALUES LESS THAN(20),
    PARTITION p3 VALUES LESS THAN(MAXVALUE)
) AS SELECT * FROM t1;
gaussdb=# \d+ t1_part_dup;
          Table "create_table_as_partition_by.t1_part_dup"
 Column |  Type   | Modifiers | Storage | Stats target | Description
--------+---------+-----------+---------+--------------+-------------
 a      | integer |           | plain   |              |
 b      | integer |           | plain   |              |
Partition By RANGE(a)
Number of partitions: 3 (View pg_partition to check each partition range.)
Has OIDs: no
Distribute By: HASH(a)
Location Nodes: ALL DATANODES
Options: orientation=row, compression=no

gaussdb=# SELECT a, b FROM t1_part_dup PARTITION(p1) ORDER BY a;
 a | b
---+---
 8 | 2
(1 row)

gaussdb=# SELECT a, b FROM t1_part_dup PARTITION(p2) ORDER BY a;
 a  | b
----+---
 18 | 3
(1 row)

gaussdb=# SELECT a, b FROM t1_part_dup PARTITION(p3) ORDER BY a;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 a  | b
----+---
 28 | 4
(1 row)
gaussdb=# DROP TABLE t1, t1_part_dup;
```

CREATE TABLE AS and **CREATE TABLE PARTITION**

7.12.9.50 CREATE TRIGGER

Description

CREATE TRIGGER is used to create a trigger. A trigger is a special type of stored procedure, and is used for complex service rules and requirements and help ensure reference integrity. A trigger is associated with a specified table or view and executes a specified function under specific conditions, this allows you to retain the relationships defined in the table when you add, update, or delete rows in the table.

Precautions

- Currently, triggers can be created only on ordinary row-store tables, instead of on temporary tables or unlogged tables.
- If multiple triggers of the same kind are defined for the same event, they will be fired in alphabetical order by name.
- Triggers are usually used for data association and synchronization between multiple tables. SQL execution performance is greatly affected. Therefore, you are advised not to use this statement when a large amount of data needs to be synchronized and performance requirements are high.
- When a trigger meets the following conditions, the trigger statement and trigger itself can be pushed together down to a DN for execution, improving the trigger execution performance:
  - The GUC parameters **enable_trigger_shipping** and **enable_fast_query_shipping** are enabled.
  - The trigger function used by the source table is a PL/pgSQL function (recommended).
  - The source and target tables have the same type and number of distribution keys, are both row-store tables, and belong to the same node group.
  - The **INSERT**, **UPDATE**, or **DELETE** statement on the source table contains an expression about equality comparison between all the distribution keys and the *NEW* or *OLD* variable.
  - The INSERT, UPDATE, or DELETE statement on the source table can be used to query shipping without a trigger.
  - There are only six types of triggers on the source table: **BEFORE INSERT FOR EACH ROW**, **AFTER INSERT FOR EACH ROW**, **BEFORE UPDATE FOR EACH ROW**, **AFTER UPDATE FOR EACH ROW**, **BEFORE DELETE FOR EACH ROW**, and **AFTER DELETE FOR EACH ROW**. All triggers can be pushed down.

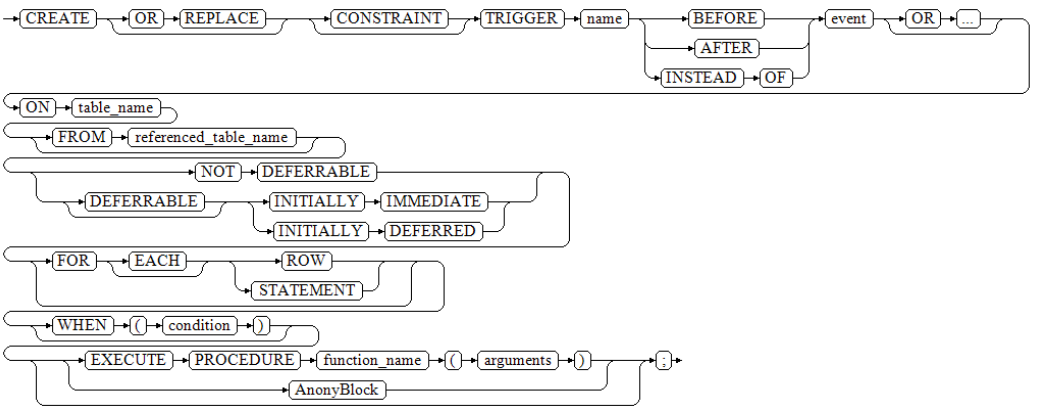
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When a trigger statement is executed, the permission is determined by the trigger creator.
- To create a trigger, you must have the TRIGGER permission on the specified table or have the CREATE ANY TRIGGER permission.
- A row-level trigger function triggered by BEFORE can return a **NULL** value, indicating that operations on the row are ignored. Subsequent triggers will not be executed and no INSERT, UPDATE, or DELETE action will be generated on the row.

  The return value of the trigger function triggered by AFTER is not affected.
- In the case of a BEFORE DELETE trigger, the return value **NEW** of the trigger function indicates **NULL**. In the case of a BEFORE INSERT trigger, the return value **OLD** of the trigger function indicates **NULL**. In the case of a BEFORE UPDATE trigger, the return value of the trigger function is **NULL** only when it is displayed as **NULL**.
- For a trigger function whose event is INSERT or UPDATE, the normal return value is **NEW**. If a non-NULL row is returned, the inserted or updated row is modified. For a trigger function whose event is DELETE, the normal return value is **OLD**.
- INSTEAD OF triggers can only work on views. Their trigger functions can also return **NULL**, indicating that subsequent triggers will not be executed.

Syntax

```
CREATE [OR REPLACE] [ CONSTRAINT ] TRIGGER name { BEFORE | AFTER | INSTEAD OF } { event [ OR ... ] }
   ON table_name
   [ FROM referenced_table_name ]
   { NOT DEFERRABLE | [ DEFERRABLE ] { INITIALLY IMMEDIATE | INITIALLY DEFERRED } }
   [ FOR [ EACH ] { ROW | STATEMENT } ]
   [ WHEN ( condition ) ]
   [ EXECUTE PROCEDURE function_name ( arguments ) | AnonyBlock ];
```

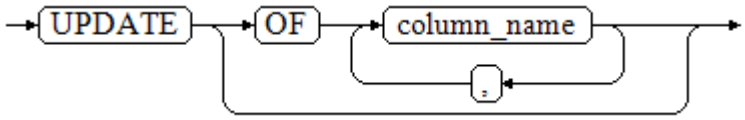


Events include:

```
INSERT
```

```
UPDATE [ OF column_name [, ... ] ]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



DELETE

TRUNCATE

Parameters

- **OR REPLACE**

  (Optional) If this parameter is specified, the existing trigger will be modified.

  Constraint triggers and internal triggers cannot be created or modified using the OR REPLACE syntax. A constraint trigger is a trigger created using CREATE CONSTRAINT TRIGGER. An internal trigger is a trigger implicitly created by some SQL statements. For example, if a foreign key constraint is added to a table, four triggers are implicitly created. The four triggers are internal triggers.

- **CONSTRAINT**

  (Optional) Creates a constraint trigger. That is, the trigger is used as a constraint. This is the same as a regular trigger except that the timing of the trigger firing can be adjusted using SET CONSTRAINTS. Constraint triggers must be AFTER ROW triggers.

- **name**

  Specifies the name of the trigger to be created. This must be distinct from the name of any other trigger for the same table. The name cannot be schema-qualified — the trigger inherits the schema of its table. For a constraint trigger, this is also the name to use when modifying the trigger's behavior using **SET CONSTRAINTS**.

  Value range: a string, which complies with the **naming convention**. A value can contain a maximum of 63 characters.

- **BEFORE**

  Specifies that the function is called before the event.

- **AFTER**

  Specifies that the function is called after the event. A constraint trigger can only be specified as **AFTER**.

- **INSTEAD OF**

  Specifies that the function is called instead of the event.

- **event**

  Specifies the event that will fire the trigger. Values are **INSERT**, **UPDATE**, **DELETE**, and **TRUNCATE**. Multiple events can be specified using **OR**.

  For UPDATE events, it is possible to specify a list of columns using this syntax:

  ```
  UPDATE OF column_name1 [, column_name2 ... ]
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The trigger will only fire if at least one of the listed columns is mentioned as a target of the UPDATE statement. INSTEAD OF UPDATE events do not allow a list of columns. If the column specified by UPDATE OF contains a generated column, the trigger is also fired when the column on which the generated column depends is the target column of the UPDATE statement.

- **table_name**

  Specifies the name of the table for which the trigger is created.

  Value range: name of an existing table in the database

- **referenced_table_name**

  Specifies the name of another table referenced by the constraint. This option is used for foreign-key constraints. It can only be specified for constraint triggers. Because foreign keys are not supported currently, this option is not recommended for general use.

  Value range: name of an existing table in the database

- **DEFERRABLE | NOT DEFERRABLE**

  Specifies the start time of the trigger. It can only be specified for constraint triggers. They determine whether the constraint is deferrable.

  For details, see **CREATE TABLE**.

- **INITIALLY IMMEDIATE | INITIALLY DEFERRED**

  If the constraint is deferrable, the two clauses specify the default time to check the constraint. It can only be specified for constraint triggers.

  For details, see **CREATE TABLE**.

- **FOR EACH ROW | FOR EACH STATEMENT**

  Specifies the frequency of firing the trigger.

  - **FOR EACH ROW** indicates that the trigger should be fired once for every row affected by the trigger event.
  - **FOR EACH STATEMENT** indicates that the trigger should be fired just once per SQL statement.

  If neither is specified, the default is **FOR EACH STATEMENT**. Constraint triggers can only be marked as **FOR EACH ROW**.

- **condition**

  Specifies whether the trigger function will actually be executed. If WHEN is specified, the function will be called only when **condition** returns **true**.

  In FOR EACH ROW triggers, the WHEN condition can refer to columns of the old and/or new row values by writing **OLD.***column name* or **NEW.***column name* respectively. In addition, INSERT triggers cannot refer to OLD, and DELETE triggers cannot refer to NEW.

  INSTEAD OF triggers do not support WHEN conditions.

  Currently, WHEN expressions cannot contain subqueries.

  Note that for constraint triggers, evaluation of the WHEN condition is not deferred, but occurs immediately after the row update operation is performed. If the condition does not evaluate to **true**, then the trigger is not queued for deferred execution.

- **function_name**

  Specifies a user-defined function, which must be declared as taking no parameters and returning type trigger. This is executed when a trigger fires.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **arguments**

  Specifies an optional comma-separated list of parameters to be provided to the function when the trigger is executed. The parameters are literal string constants. Simple names and numeric constants can also be written here, but they will all be converted to strings. Check the description of the implementation language of the trigger function to find out how these parameters can be accessed within the function.

  NOTE

  The following details trigger types:

  - INSTEAD OF triggers must be marked as FOR EACH ROW and can be defined only on views.
  - BEFORE and AFTER triggers on a view must be marked as FOR EACH STATEMENT.
  - TRUNCATE triggers must be marked as FOR EACH STATEMENT.

Table 7-270 Types of triggers supported on tables and views

When	Event	Row-Level	Statement-Level
BEFORE	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
AFTER	INSERT/UPDATE/DELETE	Tables	Tables and views
	TRUNCATE	Not supported.	Tables
INSTEAD OF	INSERT/UPDATE/DELETE	Views	Not supported.
	TRUNCATE	Not supported.	Not supported.

Table 7-271 Special variables in PL/pgSQL functions

Variable	Description
NEW	New tuple for INSERT and UPDATE operations. This variable is **NULL** for **DELETE** operations and statement-level triggers.
OLD	Old tuple for UPDATE and DELETE operations. This variable is **NULL** for **INSERT** operations and statement-level triggers.
TG_NAME	Trigger name.
TG_WHEN	Trigger timing (**BEFORE**, **AFTER**, or **INSTEAD OF**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Variable	Description
TG_LEVEL	Trigger frequency (**ROW** or **STATEMENT**).
TG_OP	Trigger event (**INSERT**, **UPDATE**, **DELETE**, or **TRUNCATE**).
TG_RELID	OID of the table where the trigger resides.
TG_RELNAME	Name of the table where the trigger resides. (This variable has been replaced by **TG_TABLE_NAME**.)
TG_TABLE_NAME	Name of the table where the trigger resides.
TG_TABLE_SCHEMA	Schema of the table where the trigger resides.
TG_NARGS	Number of parameters for the trigger function.
TG_ARGV[]	List of parameters for the trigger function.

Examples

```
-- Create a source table and a destination table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);
```

Using the INSERT trigger

```
-- Create an INSERT trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
        END
        $$ LANGUAGE plpgsql;

-- Create an INSERT trigger.
gaussdb=# CREATE TRIGGER insert_trigger
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_insert_func();

-- Execute the INSERT event and check the trigger results.
gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----+-----+-----
 100 | 200 | 300
(1 row)
```

Using the UPDATE trigger

```
-- Create an UPDATE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
RETURN OLD;
END
$$ LANGUAGE plpgsql;

-- Create an UPDATE trigger.
gaussdb=# CREATE TRIGGER update_trigger
        AFTER UPDATE ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_update_func();

-- Execute the UPDATE event and check the trigger results.
gaussdb=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)
```

Using the DELETE trigger

```
-- Create a DELETE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
                RETURN OLD;
        END
        $$ LANGUAGE plpgsql;

-- Create a DELETE trigger.
gaussdb=# CREATE TRIGGER delete_trigger BEFORE DELETE ON test_trigger_src_tbl FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();

-- Execute the DELETE event and check the trigger results.
gaussdb=# DELETE FROM test_trigger_src_tbl WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
(0 rows)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
(0 rows)
```

Renaming a trigger

```
-- Rename a trigger.
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Disabling a trigger

```
-- Disable insert_trigger.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // View that the trigger does not take effect.
 id1 | id2 | id3
-----+-----+-----
(0 rows)

-- Disable all triggers on the current table.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;
```

Dropping triggers

```
gaussdb=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

Dropping functions

```
gaussdb=# DROP FUNCTION tri_insert_func;

gaussdb=# DROP FUNCTION tri_update_func;

gaussdb=# DROP FUNCTION tri_delete_func;
-- Drop the source table and target table.
gaussdb=# DROP TABLE test_trigger_src_tbl;
gaussdb=# DROP TABLE test_trigger_des_tbl;
```

Helpful Links

ALTER TRIGGER, **DROP TRIGGER**, and **ALTER TABLE**

7.12.9.51 CREATE TYPE

Description

Defines a new data type for use in the current database. The user who defines a type becomes its owner. Types are designed only for row-store tables.

The following data types can be created: composite type, base type, shell type, enumerated type, and set type.

- Composite type

  A composite type is specified by a list of attribute names and data types. If the data type of an attribute is collatable, the attribute's collation rule can also be specified. This is essentially the same as the row type of a table, but using CREATE TYPE avoids the need to create an actual table when all that is wanted is to define a type. A stand-alone composite type is useful as the parameter or return type of a function.

  To create a composite type, you must have the USAGE permission on all of its attribute types.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Base type

  You can create a base type (scalar type). Generally, the functions required by a base type have to be coded in C or another low-level language.

- Shell type

  A shell type is simply a placeholder for a type to be defined later; it is created by issuing CREATE TYPE with no parameters except for the type name. Shell types are needed as forward references when base types are created.

- Enumerated type

  An enumerated type is a list of one or more quoted labels, each of which must be 1 to 64 bytes long.

- Collection type

  It is similar to an array but has no length limit. It is mainly used in stored procedures.

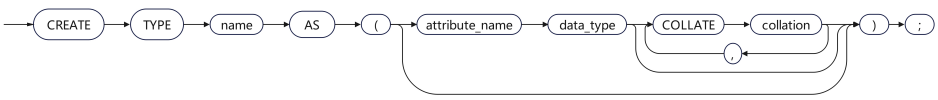
- A user with the CREATE ANY TYPE permission can create types in the public and user schemas.

Precautions

- If a schema name is given then the type is created in the specified schema. Otherwise, it is created in the current schema. The type name must be distinct from the name of any existing type or domain in the same schema. (Because tables have associated data types, the type name must also be distinct from the name of any existing table in the same schema.)
- When creating a non-system type by associating a function, the user needs to understand the definition of the type and the function associated with the type. If this function is not properly used, permissions may be exploited due to the associated function.

Syntax

```
CREATE TYPE name AS
    ( [ attribute_name data_type [ COLLATE collation ] [, ... ] ] );
```



```
CREATE TYPE name (
    INPUT = input_function,
    OUTPUT = output_function
    [ , RECEIVE = receive_function ]
    [ , SEND = send_function ]
    [ , TYPMOD_IN = type_modifier_input_function ]
    [ , TYPMOD_OUT = type_modifier_output_function ]
    [ , ANALYZE = analyze_function ]
    [ , INTERNALLENGTH = { internallength | VARIABLE } ]
    [ , PASSEDBYVALUE ]
    [ , ALIGNMENT = alignment ]
    [ , STORAGE = storage ]
    [ , LIKE = like_type ]
    [ , CATEGORY = category ]
    [ , PREFERRED = preferred ]
    [ , DEFAULT = default ]
    [ , ELEMENT = element ]
    [ , DELIMITER = delimiter ]
    [ , COLLATABLE = collatable ]
);
```

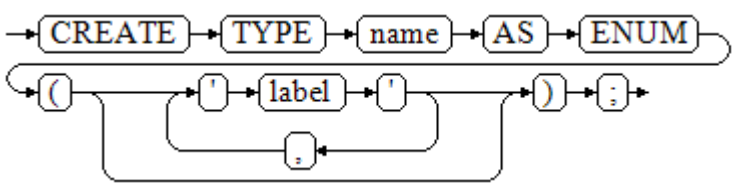
```
CREATE TYPE name;
```

```
CREATE TYPE name AS ENUM
    ( [ 'label' [, ... ] ] );
```



```
CREATE TYPE name AS TABLE OF data_type;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

Composite type

- **name**

  Specifies the name (optionally schema-qualified) of the type to be created.

- **attribute_name**

  Specifies the name of an attribute (column) for the composite type.

- **data_type**

  Specifies the name of an existing data type to become a column of the composite type. You can use **%ROWTYPE** to indirectly reference the type of a table, or **%TYPE** to indirectly reference the type of a column in a table or composite type.

- **collation**

  Specifies the name of an existing collation rule to be associated with a column of the composite type. You can run the **SELECT * FROM pg_collation** command to query collation rules from the pg_collation system catalog. The default collation rule is the row starting with **default** in the query result.

  NOTE

  The constructor of the composite type can use the => to assign values. The restrictions are as follows:

  - The => function is used when the constructor of a composite type assigns values. This function is supported only in an ORA-compatible database (**sql_compatibility** set to **'ORA'**).
  - The constructor of the composite type uses the => function to assign values. This function is supported only when => is consecutively used to assign values to input parameters, for example, **composite_name(elename1 => val1, elename2 => val2, elename3 => val3)** or **composite_name(val1, elename2 => val2, elename3 => val3)**. Discontinuous use of => or => is not supported. The last input parameter, for example, **composite_name(elename1 => val1, elename2 => val2, val3)** or **composite_name(val1, elename2 => val2, val3)**, is not assigned a value.

Base type

When creating a base type, you can place parameters in any order. The **input_function** and **output_function** parameters are required, and other parameters are optional.

- **input_function**

  Specifies the name of a function that converts data from the type's external textual form to its internal form.

  The input function may be declared as taking one parameter of type cstring or taking three parameters of types cstring, oid, and integer.

  - The cstring-type parameter is the input text as a C string.
  - The oid-type parameter is the type's own OID (except for array types, which instead receive their element type's OID).
  - The integer-type parameter is typmod of the destination column, if known (**–1** will be passed if not known).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The input function must return a value of the data type itself. Usually, an input function should be declared as **STRICT**. Otherwise, when a **NULL** input value is read and the input function is called, the first parameter is **NULL**. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain input functions, which might need to reject **NULL** inputs.)

NOTE

- The input and output functions can be declared to have results or parameters of the new type, when they have to be created before the new type can be created. The type should first be defined as a shell type, which is a placeholder type that has no attributes except a name and an owner. This is done by issuing the **CREATE TYPE** *name* statement, with no additional parameters. Then, the I/O functions written in C can be defined as referencing the shell type. Finally, CREATE TYPE with a full definition replaces the shell entry with a complete, valid type definition, after which the new type can be used normally.
- If the input and output functions are internal functions and are specified as internal system functions, the parameter types of the input and output functions must be the same, and the parameter types of **INTERNALLENGTH** and **PASSEDBYVALUE** of the new type must be the same as those of the input and output functions.

- **output_function**

  Specifies the name of a function that converts data from the type's internal form to its external textual form.

  The output function must be declared as taking one parameter of the new data type. The output function must return type cstring. Output functions are not called for **NULL** values.

- **receive_function**

  (Optional) Specifies the name of a function that converts data from the type's external binary form to its internal form.

  If this function is not supplied, the type cannot participate in binary input. The binary representation should be chosen to be cheap to convert to internal form, while being reasonably portable. (For example, the standard integer data types use network byte order as the external binary representation, while the internal representation is in the machine's native byte order.) The receive function should perform adequate checking to ensure that the value is valid.

  The receive function may be declared as taking one parameter of type internal or taking three parameters of types internal, oid, integer.

  – The internal-type parameter is a pointer to a StringInfo buffer holding the received byte strings.

  – The oid- and integer-type parameters are the same as those of the text input function.

  The receive function must return a value of the data type itself. Usually, a receive function should be declared as **STRICT**. Otherwise, when a **NULL** input value is read and the receive function is called, the first parameter is **NULL**. The function must still return **NULL** in this case, unless it raises an error. (This case is mainly meant to support domain receive functions, which might need to reject **NULL** inputs.)

- **send_function**

  (Optional) Specifies the name of a function that converts data from the type's internal form to its external binary form.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If this function is not supplied, the type cannot participate in binary output. The send function must be declared as taking one parameter of the new data type. The send function must return type bytea. Send functions are not called for **NULL** values.

- **type_modifier_input_function**

  (Optional) Specifies the name of a function that converts an array of modifiers for a type to its internal format.

- **type_modifier_output_function**

  (Optional) Specifies the name of a function that converts the internal format of modifiers for a type to its external text format.

  NOTE

  type_modifier_input_function and **type_modifier_output_function** are needed if the type supports modifiers, that is optional constraints attached to a type declaration, such as char(5) or numeric(30,2). GaussDB allows user-defined types to take one or more simple constants or identifiers as modifiers. However, this information must be capable of being packed into a single non-negative integer value for storage in the system catalogs. Declared modifiers are passed to **type_modifier_input_function** in the cstring array format. It must check the values for validity (throwing an error if they are wrong), and if they are correct, return a single non-negative integer value that will be stored as the column "typmod". Type modifiers will be rejected if the type does not have a **type_modifier_input_function**. The **type_modifier_output_function** converts the internal integer typmod value back to the correct form for user display. It must return a cstring value that is the exact string to append to the type name. For example, a numeric function may return (30,2). It is allowed to omit the **type_modifier_output_function**, in which case the default display format is just the stored typmod integer value enclosed in parentheses.

- **analyze_function**

  (Optional) Specifies the name of a function that performs statistical analysis for the data type.

  By default, ANALYZE will attempt to gather statistics using the type's "equals" and "less-than" operators, if there is a default B-tree operator class for the type. For non-scalar types, this behavior is likely to be unsuitable, so it can be overridden by specifying a custom analysis function. The analysis function must be declared to take one parameter of type internal and return a Boolean result.

- **internallength**

  (Optional) Specifies the length in bytes of the new type's internal representation. The default assumption is that it is variable-length.

  While the details of the new type's internal representation are only known to the I/O functions and other functions you create to work with the type, there are several attributes of the internal representation that must be declared to GaussDB. Foremost of these is **internallength**. Base data types can be fixed-length, in which case **internallength** is a positive integer, or variable length, indicated by setting **internallength** to **VARIABLE**. (Internally, this is represented by setting **typlen** to **–1**.) The internal representation of all variable-length types must start with a 4-byte integer giving the total length of this value of the type.

- **PASSEDBYVALUE**

  (Optional) Indicates that values of this data type are passed by value, rather than by reference. You cannot pass by value types whose internal

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

representation is larger than the size of the Datum type (4 bytes on most machines, 8 bytes on a few).

- **alignment**

  (Optional) Specifies the storage alignment requirement of the data type. If specified, it must be **char**, **int2**, **int4**, or **double**; the default is **int4**.

  The allowed values equate to alignment on 1, 2, 4, or 8 byte boundaries. Note that variable-length types must have an alignment of at least 4, since they necessarily contain an int4 as their first component.

- **storage**

  (Optional) Specifies the storage strategy for the data type.

  If specified, it must be **plain**, **external**, **extended**, or **main**; the default is **plain**.

  - **plain** specifies that data of the type will always be stored in-line and not compressed. (Only **plain** is allowed for fixed-length types.)
  - **extended** specifies that the system will first try to compress a long data value, and will move the value out of the main table row if it is still too long.
  - **external** allows the value to be moved out of the main table, but the system will not try to compress it.
  - **main** allows compression, but discourages moving the value out of the main table. (Data items with this storage strategy might still be moved out of the main table if there is no other way to make a row fit, but they will be kept in the main table preferentially over **extended** and **external** items.)

    All **storage** values other than **plain** imply that the functions of the data type can handle values that have been toasted. The specific other value given merely determines the default TOAST storage strategy for columns of a TOAST data type; users can pick other strategies for individual columns using ALTER TABLE SET STORAGE.

- **like_type**

  (Optional) Specifies the name of an existing data type that the new type will have the same representation as. The values of **internallength**, **passedbyvalue**, **alignment**, and **storage** are copied from that type, unless overridden by explicit specification elsewhere in this CREATE TYPE statement.

  Specifying representation in this way is especially useful when the underlying implementation of a new type references an existing type.

- **category**

  (Optional) Specifies the category code (a single ASCII character) for this type. The default is **U** for a user-defined type. You may also choose other ASCII characters to create custom categories.

- **preferred**

  (Optional) Specifies whether a type is preferred within its type category. If it is, the value will be **TRUE**, else **FALSE**. The default is **FALSE**. Be very careful about creating a preferred type within an existing type category, as this could cause surprising changes in behavior.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The **category** and **preferred** parameters can be used to help control which implicit cast will be applied in ambiguous situations. Each data type belongs to a category named by a single ASCII character, and each type is either preferred or not within its category. The parser will prefer casting to preferred types (but only from other types within the same category) when this rule is helpful in resolving overloaded functions or operators. For types that have no implicit casts to or from any other types, it is sufficient to leave these settings at the defaults. However, for a group of related types that have implicit casts, it is often helpful to mark them all as belonging to a category and select one or two of the most general types as being preferred within the category. The **category** parameter is especially useful when adding a user-defined type to an existing built-in category, such as the numeric or string types. However, it is also possible to create entirely-user-defined type categories. Select any ASCII character other than an uppercase letter to name such a category.

- **default**

  (Optional) Specifies the default value for the data type. If this is omitted, the default is null.

  A default value can be specified, in case a user wants columns of the data type to default to something other than the null value. Specify the default with the DEFAULT keyword. (Such a default can be overridden by an explicit DEFAULT clause attached to a particular column.)

- **element**

  (Optional) Specifies the type of array elements when an array type is created. For example, to define an array of 4-byte integers (int4), specify **ELEMENT = int4**.

- **delimiter**

  (Optional) Specifies the delimiter character to be used between values in arrays made of this type.

  delimiter can be set to a specific character. The default delimiter is the comma (,). Note that the delimiter is associated with the array element type, not the array type itself.

- **collatable**

  (Optional) Specifies whether this type's operations can use collation information. If they can, the value will be **TRUE**, else **FALSE** (default).

  If **collatable** is **TRUE**, column definitions and expressions of the type may carry collation information through use of the COLLATE clause. It is up to the implementations of the functions operating on the type to actually make use of the collation information; this does not happen automatically merely by marking the type collatable.

- **label**

  (Optional) Represents the textual label associated with one value of an enumerated type. It is a string of 1 to 63 characters.

NOTE

Whenever a user-defined type is created, GaussDB automatically creates an associated array type whose name consists of the element type's name prefixed with an underscore (_).

Examples

```
-- Create a composite type, create a table, insert data, and make a query.
gaussdb=# CREATE TYPE compfoo AS (f1 int, f2 text);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE t1_compfoo(a int, b compfoo);
gaussdb=# CREATE TABLE t2_compfoo(a int, b compfoo);
gaussdb=# INSERT INTO t1_compfoo values(1,(1,'demo'));
gaussdb=# INSERT INTO t2_compfoo SELECT * FROM t1_compfoo;
gaussdb=# SELECT (b).f1 FROM t1_compfoo;
gaussdb=# SELECT * FROM t1_compfoo t1 JOIN t2_compfoo t2 ON (t1.b).f1=(t1.b).f1;

-- Rename the data type.
gaussdb=# ALTER TYPE compfoo RENAME TO compfoo1;

-- Change the owner of the user-defined type compfoo1 to usr1.
gaussdb=# CREATE USER usr1 PASSWORD '********';
gaussdb=# ALTER TYPE compfoo1 OWNER TO usr1;

-- Change the schema of the user-defined type compfoo1 to usr1.
gaussdb=# ALTER TYPE compfoo1 SET SCHEMA usr1;

-- Add a new attribute to the data type.
gaussdb=# ALTER TYPE usr1.compfoo1 ADD ATTRIBUTE f3 int;

-- Drop the compfoo1 type.
gaussdb=# DROP TYPE usr1.compfoo1 CASCADE;

-- Drop related tables and users.
gaussdb=# DROP TABLE t1_compfoo;
gaussdb=# DROP TABLE t2_compfoo;
gaussdb=# DROP SCHEMA usr1;
gaussdb=# DROP USER usr1;

-- Create an enumerated type.
gaussdb=# CREATE TYPE bugstatus AS ENUM ('create', 'modify', 'closed');

-- Add a label.
gaussdb=# ALTER TYPE bugstatus ADD VALUE IF NOT EXISTS 'regress' BEFORE 'closed';

-- Rename a label.
gaussdb=# ALTER TYPE bugstatus RENAME VALUE 'create' TO 'new';

-- Create a set type.
gaussdb=# CREATE TYPE bugstatus_table AS TABLE OF bugstatus;

-- Drop a set type.
gaussdb=# DROP TYPE bugstatus_table;
-- Drop an enumerated type.
gaussdb=# DROP TYPE bugstatus CASCADE;
-- Create an ORA-compatible database and switch to this database.

ALTER TYPE and **DROP TYPE**

7.12.9.52 CREATE USER

Description

Creates a user with a specified password. A user is a basic element for GaussDB authentication. You can use the correct username and password to log in to the GaussDB and grant different permissions to different users so that different users can perform different operations.

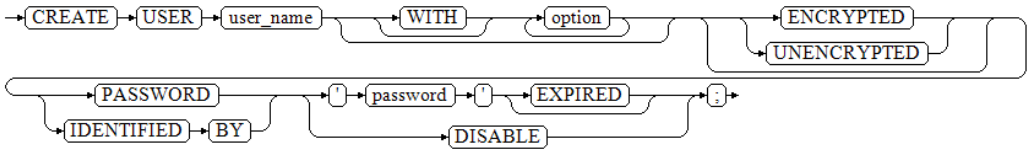
Precautions

- A user created using the CREATE USER statement has the LOGIN permission by default.
- When you run the **CREATE USER** command to create a user, the system creates a schema with the same name as the user in the database where the command is executed.
- The owner of an object created by a system administrator in a schema with the same name as a common user is the common user, not the system administrator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
CREATE USER user_name [ [ WITH ] option [ ... ] ] [ ENCRYPTED | UNENCRYPTED ] { PASSWORD |
IDENTIFIED BY } { 'password' [EXPIRED] | DISABLE };
```



The option clause is used to configure information, including permissions and properties.

```
{SYSADMIN | NOSYSADMIN}
    | {MONADMIN | NOMONADMIN}
    | {OPRADMIN | NOOPRADMIN}
    | {POLADMIN | NOPOLADMIN}
    | {AUDITADMIN | NOAUDITADMIN}
    | {CREATEDB | NOCREATEDB}
    | {USEFT | NOUSEFT}
    | {CREATEROLE | NOCREATEROLE}
    | {INHERIT | NOINHERIT}
    | {LOGIN | NOLOGIN}
    | {REPLICATION | NOREPLICATION}
    | {PERSISTENCE | NOPERSISTENCE}
    | CONNECTION LIMIT connlimit
    | VALID BEGIN 'timestamp'
    | VALID UNTIL 'timestamp'
    | RESOURCE POOL 'respool'
    | USER GROUP 'groupuser'
    | PERM SPACE 'spacelimit'
    | TEMP SPACE 'tmpspacelimit'
    | SPILL SPACE 'spillspacelimit'

    | SYSID uid
    | DEFAULT TABLESPACE tablespace_name
    | PROFILE DEFAULT
    | PROFILE profile_name
    | PGUSER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **user_name**

  Name of the user to be created.

  Value range: a string. It must comply with **Identifier Naming Conventions** and contain a maximum of 63 characters. If the value contains more than 63 characters, the database truncates it and retains the first 63 characters as the username. If a username contains uppercase letters, the database automatically converts the uppercase letters into lowercase letters. To create a username that contains uppercase letters, enclose the username with double quotation marks ("").

  NOTE

  The identifier must be lowercase letters, uppercase letters, underscores (_), digits (0–9), or dollar signs ($) and must start with a letter or underscore (_).

- **password**

  Specifies the login password.

  The new password must:

  – Contain at least eight characters. This is the default length.

  – Differ from the username or the username spelled backward.

  – Contain at least three of the following character types: uppercase characters, lowercase characters, digits, and special characters (limited to ~!@#$%^&*()-_=+\|[{}];:,<.>/?). If the password contains characters other than the preceding characters, an error will be reported during statement execution.

  – The password can also be a ciphertext character string that meets the format requirements. This mode is mainly used to import user data. You are advised not to use it directly. If a ciphertext password is used, the user must know the plaintext corresponding to the ciphertext password and ensure that the plaintext password meets the complexity requirements. The database does not verify the complexity of the ciphertext password. Instead, the security of the ciphertext password is ensured by the user.

  – Be enclosed by single quotation marks when a user is created.

  Value range: a string

For details about other parameter values of CREATE USER, see **Parameters**.

Examples

```
-- Create user jim whose login password is ********.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Create user kim whose login password is ********.
gaussdb=# CREATE USER kim IDENTIFIED BY '********';

-- Create user tom.
gaussdb=# CREATE USER TOM PASSWORD '********';

-- Create user TOM.
gaussdb=# CREATE USER "TOM" PASSWORD '********';

-- To create a user with the CREATEDB permission, add the CREATEDB keyword.
gaussdb=# CREATE USER dim CREATEDB PASSWORD '********';

-- Query the permissions of the dim user.
```

```

Helpful Links

ALTER USER, **CREATE ROLE**, and **DROP USER**

7.12.9.53 CREATE VIEW

Description

Creates a view. A view is a virtual table, not a base table. Only view definition is stored in the database and view data is not. The data is stored in a base table. If data in the base table changes, the data in the view changes accordingly. In this sense, a view is like a window through which users can know their interested data and data changes in the database.

- You can define frequently used data as views to encapsulate complex query SQL statements, which simplifies operations.
- You can query only data defined in a view, which is secure. Columns in a base table are hidden to protect the data structure of the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

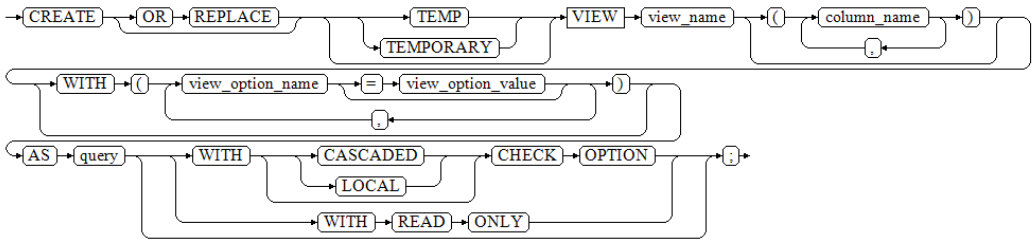
- User permission management is simplified. Only the permission to use views is granted to users.

Precautions

A user granted the CREATE ANY TABLE permission can create views in the public and user schemas.

Syntax

```
CREATE [ OR REPLACE ] [ TEMP | TEMPORARY ] VIEW view_name [ ( column_name [, ...] ) ]
    [ WITH ( {view_option_name [= view_option_value]} [, ... ] ) ]
    AS query
    [ WITH [ CASCADED | LOCAL ] CHECK OPTION  | WITH READ ONLY ];
```



NOTE

You can use WITH(security_barrier) to create a relatively secure view. This prevents attackers from printing base table data by using the RAISE statement of low-cost functions.

After a view is created, you are not allowed to use REPLACE to modify column names in the view or delete the columns.

Parameters

- **OR REPLACE**

  Optional. Redefines the view if it already exists.

- **TEMP | TEMPORARY**

  (Optional) Creates a temporary view. The view is automatically deleted when the current session ends. If any table referenced by a view is a temporary table, the view is created as a temporary view (regardless of whether **TEMP| TEMPORARY** is specified in the SQL statement).

- **view_name**

  Specifies the name (optionally schema-qualified) of the view to be created.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Specifies an optional list of names to be used for columns of the view. If not given, the column names are deduced from the query.

  Value range: a string. It must comply with the **naming convention**.

- **view_option_name [= view_option_value]**

  Specifies an optional parameter for a view.

  Currently, view_option_name supports only **security_barrier** and **check_option**.

  security_barrier: This parameter is used when the view attempts to provide row-level security. Value range: Boolean (**true** or **false**).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

check_option: Controls the behavior of updating a view. Value range: **CASCADED** and **LOCAL**.

- **query**

  Specifies a SELECT or VALUES statement that will provide the columns and rows of the view.

  NOTICE

  If **query** contains a clause specifying the partition of a partitioned table, the OID of the specified partition is hardcoded to the system catalog when the view is created. If a DDL operation that will change the OID of the specified partition is used, for example, DROP, SPLIT, or MERGE, the view is unavailable. In this case, you need to create a view.

- **WITH [CASCADED | LOCAL] CHECK OPTION**

  Controls the behavior of updatable views. INSERT and UPDATE on the view will be checked to ensure that new rows meet the view-defining condition, that is, the new rows are visible through the view. If the check fails, the modification is rejected. If this option is not added, INSERT and UPDATE on the view are allowed to create rows that are not visible through the view. When DELETE is performed on a view, if the base table from which data is to be deleted is duplicate in a multi-table join view and the duplicate base tables are not all key-preserved tables in the view, data cannot be deleted when **WITH CHECK OPTION** is specified. The **WITH CHECK OPTION** option can be specified as **CASCADED** or **LOCAL**.

  CASCADED: New rows are checked against the conditions of the view and all underlying views. If **CHECK OPTION** is specified, and neither **LOCAL** nor **CASCADED** is specified, then **CASCADED** is used by default.

  LOCAL: Only the conditions directly defined by the view itself are checked. If **CHECK OPTION** is also defined in the underlying views, the conditions defined in the underlying views are checked.

- **WITH READ ONLY**

  A read-only view is defined. You cannot insert, update, or delete data in the view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The concepts involved in the constraints on updating, inserting, and deleting views are described as follows:
  - Join view: view created with multiple tables using JOIN.
  - Key-preserved table: Insertion, update, and deletion of multi-table join views are restricted by key-preserved tables. In a multi-table view, if each row in the source table corresponds to each row in the view, and a row in the source table does not correspond to multiple rows in the view after the JOIN, the source table is a key-preserved table.
  - Relationship between the top layer and the bottom layer: A view may be nested at multiple layers. For example, a view consists of one or more views or subqueries. The view that is directly operated by the DML is called the top layer. The tables and views that form the view and the tables and views in the WITH clause are called the corresponding bottom layer.
  - Columns that can be updated: Columns that are not system columns or whole-row references and directly reference user columns in the base table can be updated. You can query the **is_updatable** column in **information_schema.columns** to check whether a column in a view or table can be updated.
  - Updatable view: view that can be inserted, updated, or deleted. Updatable views do not contain DISTINCT, GROUP BY, HAVING, LIMIT, OFFSET, UNPIVOT, FOR UPDATE, FETCH and START WITH CONNECT BY clauses, set operations (UNION, INTERSECT, and EXCEPT), aggregate functions, window functions, and return set functions (array_agg, json_agg, and generate_series), and flashback. **WITH CHECK OPTION** can be defined only on updatable views. To check whether a view can be updated, query the **is_updatable** and **is_insertable_into** columns in **information_schema.views** or the **information_schema.tables.is_insertable_into** column. In **information_schema.views**, **is_updatable** specifies whether a view can be updated or deleted, **is_insertable_into** specifies whether data can be inserted into a view, and **information_schema.tables.is_insertable_into** specifies whether data can be inserted into a relationship.
- If an updatable view has an INSTEAD OF trigger or INSTEAD rule, using CHECK OPTION does not check the conditions on that view.
- If an underlying view of an updatable view has an INSTEAD OF trigger and the updatable view defines the **CHECK OPTION** option of the CASCADED type, in non-ORA-compatible mode, the conditions of the underlying view with the INSTEAD OF trigger are recursively checked, and the conditions of the underlying view with the trigger are not checked. In ORA-compatible mode, the **CHECK OPTION** option of all views is invalid and no check is performed.
- If an updatable view or any of its underlying relationships has an INSTEAD rule that causes INSERT or UPDATE rewriting, specifying **CHECK OPTION** will not check the conditions on all views.
- If **CASCADED CHECK OPTION** is defined in the upper-layer view and **LOCAL CHECK OPTION** is defined in the lower-layer view, **LOCAL CHECK OPTION** in the lower-layer view is overwritten by **CASCADED CHECK OPTION** in the upper-layer view.
- If **CHECK OPTION** is specified, insert and update operations cannot be performed on join columns in multi-table join views or multi-table join subqueries.
- If **CHECK OPTION** is specified, duplicate base tables exist in a multi-table join view or multi-table join subquery, and the duplicate base tables are not all key-preserved tables, the view or subquery cannot be deleted.

Examples

- Common view

7.12.9.54 CREATE WEAK PASSWORD DICTIONARY

Description

CREATE WEAK PASSWORD DICTIONARY creates a weak password dictionary, which is empty by default. You can use this syntax to add one or more weak passwords to the gs_global_config system catalog.

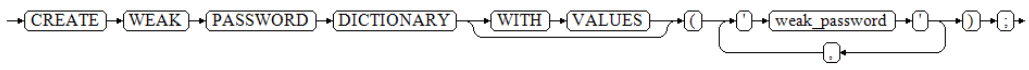
Precautions

- Only the initial user, system administrator, and security administrator have the permission to execute this syntax.
- Passwords in the weak password dictionary are stored in the gs_global_config system catalog.
- The weak password dictionary is empty by default. You can use this syntax to add one or more weak passwords.
- When a user attempts to execute this syntax to insert a weak password that already exists in the gs_global_config catalog, only one weak password is retained in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
CREATE WEAK PASSWORD DICTIONARY
    [WITH VALUES] ( {'weak_password'} [, ...] );
```



Parameters

- **weak_password**

  Specifies a weak password.

  Value range: a string.

Examples

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('********');

-- Check weak passwords in the gs_global_config system catalog.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
     name       |    value
----------------+--------------
 weak_password   | ********
(1 rows)

-- Insert multiple weak passwords into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('********'),('********');

-- Check the weak password in the gs_global_config system catalog again. The asterisk (*) in a weak
password does not represent the password content.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
     name       |     value
----------------+----------------
 weak_password   | ********
 weak_password   | ********
 weak_password   | ********
(3 rows)

-- Clear all weak passwords in the gs_global_config system catalog.
gaussdb=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
 name | value
------+-------
(0 rows)
```

DROP WEAK PASSWORD DICTIONARY

7.12.9.55 CURSOR

Description

This statement is used to create a cursor and retrieve specified rows of data from a query.

To process SQL statements, the stored procedure thread assigns a memory segment to store context association. Cursors are handles or pointers pointing to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

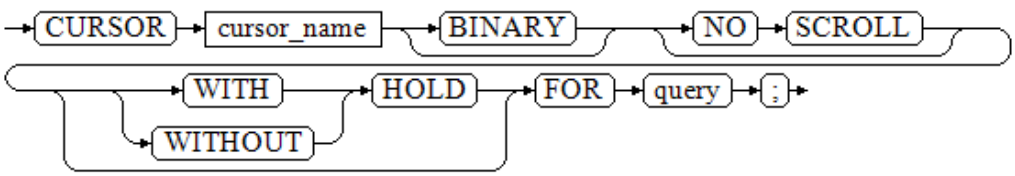
context regions. With cursors, stored procedures can control alterations in context regions.

Precautions

- CURSOR is used only in transaction blocks.
- Generally, CURSOR and SELECT both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. FETCH implements conversion between binary data and text data.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte field containing the internal representation of the value (in big-endian byte order).
- Parameters can be defined for static cursors. The parameters support default values. However, the default value of a parameter cannot be a variable outside the package. You can define a variable in the package, assign the variable outside the package to the defined variable, and use the variable as the default value.
- The definition of a cursor generates a query object. Currently, packages or stored procedures do not support the creation of dependencies on query objects.

Syntax

```
CURSOR cursor_name
    [ BINARY ]  [ NO SCROLL ]  [ { WITH | WITHOUT } HOLD ]
    FOR query;
```



Parameters

- **cursor_name**

  Specifies the name of the cursor to be created.

  Value range: a string. It must comply with the naming convention.

- **BINARY**

  Specifies that data retrieved by a cursor will be returned in binary format, not in text format.

- **NO SCROLL**

  Specifies how the cursor retrieves rows.

  – **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.

- **WITH HOLD | WITHOUT HOLD**

  Specifies whether a cursor can be used after the transaction that created it ends.

  - **WITH HOLD**: The cursor can be used after the transaction that created it ends.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.
  - Cross-node transactions (for example, DDL-contained transactions created in a cluster with multiple Coordinators) do not support **WITH HOLD**.

- **query**

  Uses the SELECT or VALUES clause to specify the rows to be returned by a cursor.

  Value range: SELECT or VALUES clause

Examples

Example 1:

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test(c1 int);
gaussdb=# INSERT INTO tbl_test VALUES (generate_series(1,20));

-- Set up cursor1.
gaussdb=# BEGIN;
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tbl_test ORDER BY 1;

-- Run the FETCH command to retrieve three rows of data.
gaussdb=# FETCH FORWARD 3 FROM cursor1;
 c1
----
  1
  2
  3
(3 rows)

-- Run the MOVE command to move the cursor backwards by two rows. No result is returned.
gaussdb=# MOVE FORWARD 2 FROM cursor1;
MOVE 2

-- Run the FETCH command to retrieve two rows of data.
gaussdb=# FETCH FORWARD 2 FROM cursor1;
 c1
----
  6
  7
(2 rows)

-- Close the cursor and end the transaction.
gaussdb=# CLOSE cursor1;
gaussdb=# END;
```

Example 2: Cursor with the WITH HOLD attribute

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Set up a WITH HOLD cursor named cursor2.
gaussdb=# BEGIN;
gaussdb=# CURSOR cursor2 WITH HOLD FOR SELECT * FROM tbl_test ORDER BY 1;

-- Run the FETCH command to retrieve three rows of data.
gaussdb=# FETCH FORWARD 3 FROM cursor2;
 c1
----
  1
  2
  3
(3 rows)

-- Different from common cursors, cursors with the WITH HOLD attribute can still be used after a
transaction ends.
gaussdb=# END;
gaussdb=# FETCH FORWARD 2 FROM cursor2;
 c1
----
  4
  5
(2 rows)

-- Close the cursor.
gaussdb=# CLOSE cursor2;

-- Delete.
gaussdb=# DROP TABLE tbl_test;
```

7.12.10 D

7.12.10.1 DEALLOCATE

Description

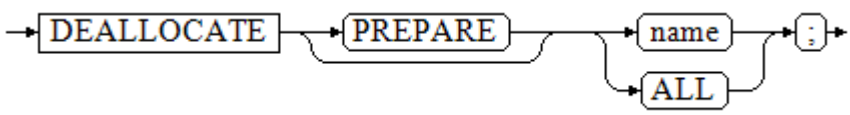
Deallocates prepared statements.

Precautions

- If you do not explicitly deallocate a prepared statement, the statement is deallocated when the session ends.
- The PREPARE keyword in the syntax is always ignored.

Syntax

```
DEALLOCATE [ PREPARE ] { name | ALL };
```



Parameters

- **name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the name of a prepared statement to be deallocated.

- **ALL**

  Deallocates all prepared statements.

Examples

```
-- View existing prepared statements.
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name | statement | parameter_types
------+-----------+-----------------
(0 rows)

-- Create four prepared statements q1, q2, q3, and q4.
gaussdb=# PREPARE q1 AS SELECT 1 AS a;
PREPARE
gaussdb=# PREPARE q2 AS SELECT 1 AS a;
PREPARE
gaussdb=# PREPARE q3 AS SELECT 1 AS a;
PREPARE
gaussdb=# PREPARE q4 AS SELECT 1 AS a;
PREPARE

-- View existing prepared statements again.
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name |          statement          | parameter_types
------+-----------------------------+-----------------
 q1   | PREPARE q1 AS SELECT 1 AS a; | {}
 q4   | PREPARE q4 AS SELECT 1 AS a; | {}
 q3   | PREPARE q3 AS SELECT 1 AS a; | {}
 q2   | PREPARE q2 AS SELECT 1 AS a; | {}
(4 rows)

-- Delete the prepared statements q4 and view the remaining prepared statements.
gaussdb=# DEALLOCATE q4;
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name |          statement          | parameter_types
------+-----------------------------+-----------------
 q1   | PREPARE q1 AS SELECT 1 AS a; | {}
 q3   | PREPARE q3 AS SELECT 1 AS a; | {}
 q2   | PREPARE q2 AS SELECT 1 AS a; | {}
(3 rows)

-- Delete all prepared statements and view the remaining prepared statements.
gaussdb=# DEALLOCATE ALL;
DEALLOCATE ALL
gaussdb=# SELECT name, statement, parameter_types FROM pg_prepared_statements;
 name | statement | parameter_types
------+-----------+-----------------
(0 rows)
```

7.12.10.2 DECLARE

Description

DECLARE defines a cursor to retrieve a small number of rows at a time out of a larger query and can be the start of an anonymous block.

This section describes usage of cursors. The usage of anonymous blocks is available in **BEGIN**.

To process SQL statements, the stored procedure thread assigns a memory segment to store context association. Cursors are handles or pointers pointing to context areas. With cursors, stored procedures can control alterations in context areas.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Generally, CURSOR and SELECT both have text returns. Since data is stored in binary format in the system, the system needs to convert the data from the binary format to the text format. If data is returned in text format, client applications need to convert the data back to the binary format for processing. FETCH implements conversion between binary data and text data.

Precautions

- CURSOR is used only in transaction blocks.
- Binary cursors should be used carefully. Text usually occupies larger space than binary data. A binary cursor returns internal binary data, which is easier to operate. A text cursor returns text, which is easier to retrieve and therefore reduces workload on the client. As an example, if a query returns a value of one from an integer column, you would get a string of 1 with a default cursor, whereas with a binary cursor you would get a 4-byte value containing the internal representation of the value (in big-endian byte order).

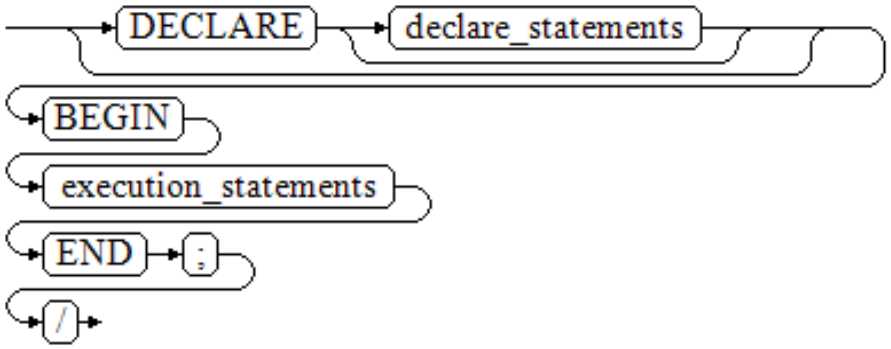
Syntax

- Define a cursor.

```
DECLARE cursor_name [ BINARY ] [ NO SCROLL ]
    CURSOR [ { WITH | WITHOUT } HOLD ] FOR query;
```

- Enable an anonymous block.

```
[DECLARE [declare_statements]]
BEGIN
execution_statements
END;
/
```



Parameters

- **cursor_name**

  Specifies the name of the cursor to be created.

  Value range: a string. It must comply with the naming convention.

- **BINARY**

  Specifies that data retrieved by a cursor will be returned in binary format, not in text format.

- **NO SCROLL**

  Specifies how the cursor retrieves rows.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **NO SCROLL**: specifies that the cursor cannot be used to retrieve rows in a nonsequential fashion.
  - Unspecified: Based on the query's execution plan, the system automatically determines whether the cursor can be used to retrieve rows in a nonsequential fashion.

- **WITH HOLD**

  WITHOUT HOLD

  Specifies whether a cursor can be used after the transaction that created it ends.
  - **WITH HOLD**: The cursor can be used after the transaction that created it ends.
  - **WITHOUT HOLD**: The cursor cannot be used outside of the transaction that created it.
  - If neither **WITH HOLD** nor **WITHOUT HOLD** is specified, the default is **WITHOUT HOLD**.

  NOTICE

  For a cursor declared as **WITH HOLD**, all data of the cursor is cached when a transaction ends. If the cursor has a large amount of data, this process may take a long time.

- **query**

  Uses the SELECT or VALUES clause to specify the rows to be returned by a cursor.

  Value range: **SELECT** or **VALUES** clause

- **declare_statements**

  Declares a variable, including its name and type, for example, **sales_cnt int**.

- **execution_statements**

  Specifies the statement to be executed in an anonymous block.

  Value range: an existing function name

Examples

For details about how to start an anonymous block, see **Examples**.

For details about how to define a cursor, see **Examples**.

7.12.10.3 DELETE

Description

Deletes rows that satisfy the WHERE clause from the specified table. If the WHERE clause is absent, the effect is to delete all rows in the table. The result is a valid, but an empty table.

Precautions

- The owner of a table, users granted the DELETE permission on the table or the DELETE ANY TABLE permission can delete data from the table. When separation of duties is disabled, system administrators have this permission by default. To perform the DELETE operation, you must have the SELECT permission on the table referenced by the USING clause and the table read in the condition.
- For row-store replication tables, DELETE can be performed only in the following two scenarios:
  - Scenarios with primary key constraints.
  - Scenarios where the execution plan can be pushed down.
- For a DELETE statement whose subquery is a STREAM plan, UPDATE cannot be performed on the deleted row data.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
DELETE [/*+ plan_hint */] [FROM] [ ONLY ] {table_name [ * ] subquery [ [ AS ] alias ] | view_name [ [ AS ] alias ]}
   [ USING using_list ]
   [ WHERE condition | WHERE CURRENT OF cursor_name ]
   [ ORDER BY {expression [  ASC | DESC | USING operator ] } ]
   [ LIMIT row_count ]
   [ RETURNING { * | { output_expr [ [ AS ] output_name ] } [, ...] } ];
```

- Format of **with_query**:

  ```
  with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]
  ( {select | values | insert | update | delete} )
  ```

- Format of **subquery**:

  ```
  [ WITH [ RECURSIVE ] with_query [, ...] ]
  SELECT [/*+ plan_hint */] [ ALL ]
  { * | {expression [ [ AS ] output_name ]} [, ...] }
  [ into_option ]
  [ FROM from_item [, ...] ]
  [ WHERE condition ]
  [ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
  [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST | LAST } ]} [, ...] ]
  [ OFFSET start [ ROW | ROWS ] ]
  [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
  [ into_option ];
  ```

  - The specified subquery source **from_item**:

    ```
    {[ ONLY ] {table_name | view_name} [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
    |( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
    |with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
    |from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
    ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If RECURSIVE is specified, it allows a SELECT subquery to reference itself by name.

  - **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a SELECT, VALUES, INSERT, UPDATE, or DELETE statement.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE.
    - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
    - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan_hint**

  Follows the **DELETE** keyword in the **/*+ */** format. It is used to optimize the plan of a **DELETE** statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **ONLY**

  If **ONLY** is specified before the table name, matching rows are deleted from the named table only. If **ONLY** is not specified, matching rows are also deleted from any tables inheriting from the named table.

- **table_name**

  Specifies the name (optionally schema-qualified) of the target table.

  Value range: an existing table name

  NOTE

  You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **subquery**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The object to be deleted can be a subquery. When data in a subquery is deleted, the subquery is regarded as a temporary view. The **CHECK OPTION** option can be added to the end of the subquery.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [/*+ plan_hint */] [ ALL ]
{ * | {expression [ [ AS ] output_name ]} [, ...] }
[ into_option ]
[ FROM from_item [, ...] ]
[ WHERE condition ]
[ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } ]} [, ...] ]
[ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
[ into_option ];
```

The specified subquery source **from_item** is as follows:

```
{[ ONLY ] {table_name | view_name} [ * ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
|with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
```

If there is only one table in the subquery, the table is deleted. If there are multiple tables or nested tables in the subquery, the system determines whether the table can be deleted by checking whether there is a key-preserved table. For details about key-preserved tables and **WITH CHECK OPTION**, see **CREATE VIEW**.

- **view_name**

  Name of the target view.

  NOTE

  The restrictions on deleting views and subqueries are as follows:

  - The DELETE operation can be performed only on columns that directly reference user columns in the base table.
  - A subquery or view must contain at least one updatable column. For details about updatable columns, see **CREATE VIEW**.
  - Views and subqueries that contain the DISTINCT, GROUP BY, HAVING, LIMIT or OFFSET clause at the top layer are not supported.
  - Views and subqueries that contain set operations (UNION, INTERSECT, EXCEPT, and MINUS) at the top layer are not supported.
  - Views and subqueries whose target lists contain aggregate functions, window functions, or return set functions (such as array_agg, json_agg, and generate_series) are not supported.
  - Views with BEFORE or AFTER triggers but without INSTEAD OF triggers or INSTEAD rules are not supported.
  - Table types supported in views and subqueries include ordinary tables, temporary tables, global temporary tables, partitioned tables, level-2 partitioned tables, Ustore tables, and Astore tables.
  - A join view or subquery can delete only the key-preserved tables in the view or subquery. If there is only one key-preserved table, the data in the table is deleted. If there are multiple key-preserved tables, only the data in the first key-preserved table following FROM is deleted.
  - If the **CHECK OPTION** option is specified in the join view or subquery, the base table is duplicate, and the duplicate base table has attributes inconsistent with the key-preserved table in the view or subquery, rows cannot be deleted from the join view or subquery. For details about the key-preserved table, see **CREATE VIEW**.
  - System views cannot be deleted.
  - Deleting multiple tables is not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **alias**

  Specifies a substitute name for the target table.

  Value range: a string. It must comply with the **naming convention**.

- **using_list**

  Specifies the USING clause.

- **condition**

  Specifies an expression that returns a value of type Boolean. Only rows for which this expression returns **true** will be deleted. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor_name**

  When the cursor points to a row in a table, you can use this syntax to delete the row. For details about the restrictions, see **UPDATE**.

- **ORDER BY**

  For details about the keywords, see **SELECT**.

- **LIMIT**

  For details about the keywords, see **SELECT**.

- **output_expr**

  Specifies an expression to be computed and returned by the DELETE statement after each row is deleted. The expression can use any column names of the table. Write ***** to return all columns.

- **output_name**

  Specifies a name to use for a returned column.

  Value range: a string. It must comply with the **naming convention**.

Examples

- Deleting some data records

```
-- Create a table.
gaussdb=# CREATE TABLE test_t1(col1 INT,col2 INT);
gaussdb=# INSERT INTO test_t1 VALUES (1, 1), (2, 2), (3, 3), (4, 4), (4, 6);

-- Delete some data records from the table.
gaussdb=# DELETE FROM test_t1 WHERE col1 = 4;

-- Query.
gaussdb=# SELECT * FROM test_t1;
 col1 | col2
------+------
    1 |    1
    2 |    2
    3 |    3
(3 rows)
```

- Deleting all data

```
-- Delete all data.
gaussdb=# DELETE FROM test_t1;

-- Query.
gaussdb=# SELECT * FROM test_t1;
 col1 | col2
------+------
(0 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the table.
gaussdb=# DROP TABLE test_t1;
```

- **WITH [RECURSIVE] with_query [, ...]**

```
-- Create a student table.
gaussdb=# CREATE TABLE student(id INT,name varchar(50));

-- Create a score table.
gaussdb=# CREATE TABLE grade(id INT,score CHAR);

gaussdb=# INSERT INTO student VALUES (1, 'tom'), (2, 'jerry'), (3, 'david');
gaussdb=# INSERT INTO grade VALUES (1, 'A'), (2, 'B'), (3, 'b');

-- Delete the data whose id is 2 from the student table and delete the data of the student from the grade table.
gaussdb=# WITH del_stu AS(DELETE FROM student WHERE id = 2 RETURNING id)
    DELETE FROM grade WHERE id = (SELECT id FROM del_stu);

-- Query data.
gaussdb=# SELECT * FROM student;
 id | name
----+-------
  1 | tom
  3 | david
(2 rows)

gaussdb=# SELECT * FROM grade;
 id | score
----+-------
  1 | A
  3 | b
(2 rows)

-- Drop the table.
gaussdb=# DROP TABLE grade;
gaussdb=# DROP TABLE student;
```

- Deleting a view or subquery

  Example 1: Deleting a subquery

```
-- Create a schema.
gaussdb=# CREATE SCHEMA del_subqry;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = 'del_subqry';
SET

-- Create tables and insert data into the tables.
gaussdb=# CREATE TABLE t1 (x1 int, y1 int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'x1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# CREATE TABLE t2 (x2 int PRIMARY KEY, y2 int);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "t2_pkey" for table "t2"
CREATE TABLE
gaussdb=# CREATE TABLE tdata (x INT PRIMARY KEY, y INT);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "tdata_pkey" for table "tdata"
CREATE TABLE
gaussdb=# CREATE TABLE tinfo (z INT PRIMARY KEY, comm VARCHAR2(20));
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "tinfo_pkey" for table "tinfo"
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES (1, 1), (2, 2), (3, 3), (5, 5);
INSERT 0 4
gaussdb=# INSERT INTO t2 VALUES (1, 1), (2, 2), (3, 3), (5, 5);
INSERT 0 4
gaussdb=# INSERT INTO tdata VALUES (1, 1), (2, 2), (3, 3);
INSERT 0 3
gaussdb=# INSERT INTO tinfo VALUES (1,'one'), (2, 'two'), (3, 'three'), (5, 'wrong three');
INSERT 0 4
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Delete data from t1 using a subquery.
gaussdb=# DELETE FROM (SELECT * FROM t1) where y1 = 3;
DELETE 1

-- The subquery is read-only, and data cannot be deleted.
gaussdb=# DELETE FROM (SELECT * FROM t1 WITH READ ONLY) WHERE y1 = 1;
ERROR:  cannot perform a DML operation on a read-only subquery.

-- Delete a subquery of a multi-table join.
gaussdb=# SELECT * FROM t1, t2 WHERE x1 = x2;
 x1 | y1 | x2 | y2
----+----+----+----
  1 |  1 |  1 |  1
  2 |  2 |  2 |  2
  5 |  5 |  5 |  5
(3 rows)

gaussdb=# DELETE FROM (SELECT * FROM t1, t2 WHERE x1 = x2) WHERE y2 = 5;
DELETE 1
gaussdb=# SELECT * FROM t1, t2 WHERE x1 = x2;
 x1 | y1 | x2 | y2
----+----+----+----
  1 |  1 |  1 |  1
  2 |  2 |  2 |  2
(2 rows)

-- The subquery contains CHECK OPTION, and the tdata table is duplicate. td1 is not a key-preserved table, and td2 is a key-preserved table.
gaussdb=# DELETE FROM (SELECT td1.x x1, td1.y y1, td2.x x2, td2.y y2 FROM tdata td1, tdata td2, tinfo WHERE td2.y=tinfo.z AND td1.x=td2.y WITH CHECK OPTION) WHERE y1 = 2;
ERROR:  cannot delete from view without exactly one key-preserved table

-- If CHECK OPTION is not specified, a subquery with the same structure is created and deleted successfully.
gaussdb=# DELETE FROM (SELECT td1.x x1, td1.y y1, td2.x x2, td2.y y2 FROM tdata td1, tdata td2, tinfo WHERE td2.y=tinfo.z AND td1.x=td2.y) WHERE y1 = 2;
DELETE 1
-- Delete a schema.
gaussdb=# RESET CURRENT_SCHEMA;
RESET
gaussdb=# DROP SCHEMA del_subqry CASCADE;
NOTICE:  drop cascades to 5 other objects
DETAIL:  drop cascades to table del_subqry.t1
drop cascades to table del_subqry.t2
drop cascades to table del_subqry.tdata
drop cascades to table del_subqry.tinfo
drop cascades to view del_subqry.vv_wco
DROP SCHEMA
```

Example 2: Deleting a view

```
-- Create a schema.
gaussdb=# CREATE SCHEMA del_view;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = 'del_view';
SET

-- Create tables and insert data into the tables.
gaussdb=# CREATE TABLE t1 (x1 int, y1 int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'x1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# CREATE TABLE t2 (x2 int PRIMARY KEY, y2 int);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "t2_pkey" for table "t2"

drop cascades to view del_view.vv_dup
drop cascades to view del_view.vv_dup_wco
DROP SCHEMA
```

Suggestions

To delete all records in a table, use the TRUNCATE syntax.

7.12.10.4 DO

Description

Executes anonymous code blocks.

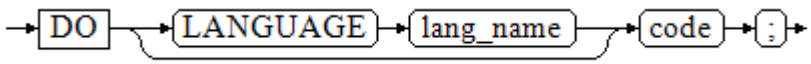
A code block is regarded as a function body without parameters. The return value type is void. It is parsed and executed a single time.

Precautions

- Before using a procedural language, you must install it in the current database by running the **CREATE LANGUAGE** command. PL/pgSQL is installed by default. To install another language, you must specify it.
- To use an untrusted language, you must have the USAGE permission on the programming language or the system administrator permission.

Syntax

```
DO [ LANGUAGE lang_name ] code;
```



Parameters

- **lang_name**

  Specifies the name of the procedural language the code is written in. If omitted, the default is **plpgsql**.

- **code**

  Specifies the programming language code that can be executed. The value must be a character string.

Examples

```
-- Create the webuser user.
gaussdb=# CREATE USER webuser PASSWORD '********';

-- Grant all permissions on all views in the tpcds schema to the webuser user.
gaussdb=# DO $$DECLARE r record;
BEGIN
    FOR r IN SELECT c.relname,n.nspname FROM pg_class c,pg_namespace n
            WHERE c.relnamespace = n.oid AND n.nspname = 'tpcds' AND relkind IN ('r','v')
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    LOOP
        EXECUTE 'GRANT ALL ON ' || quote_ident(r.table_schema) || '.' || quote_ident(r.table_name) || ' TO
webuser';
    END LOOP;
END$$;

-- Delete the webuser user.
gaussdb=# DROP USER webuser CASCADE;
```

7.12.10.5 DROP AGGREGATE

Description

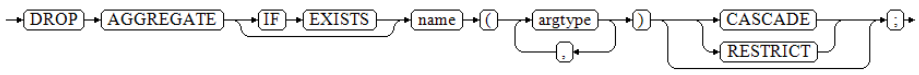
Drops an aggregate function.

Precautions

DROP AGGREGATE deletes an existing aggregate function. Only the owner of the aggregate function can run this command.

Syntax

```
DROP AGGREGATE [ IF EXISTS ] name ( argtype [ , ... ] ) [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  If the specified aggregate function does not exist, a NOTICE prompt is generated, but no error is generated.

- **name**

  Name of an existing aggregate function (optionally schema-qualified).

- **argtype**

  Input data type of the aggregate function. To reference a zero-parameter aggregate function, replace the input data type list using *.

- **CASCADE**

  Cascade deletes objects that depend on the aggregate function.

- **RESTRICT**

  Refuses to delete the aggregate function if any objects depend on it. This is a default processing.

Examples

```
-- Create a user-defined function.
gaussdb=# CREATE OR REPLACE FUNCTION int_add(int,int)
    RETURNS int AS $BODY$
DECLARE
BEGIN
    RETURN $1 + $2;
END;
$BODY$ language plpgsql;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create an aggregate function.
gaussdb=# CREATE AGGREGATE myavg (int)
(
    sfunc = int_add,
    stype = int,
    initcond = '0'
);

-- Drop the aggregate function myavg of the int type.
gaussdb=# DROP AGGREGATE myavg(int);

-- Drop the user-defined function.
gaussdb=# DROP FUNCTION int_add(int,int);
```

Helpful Links

ALTER AGGREGATE and **CREATE AGGREGATE**

Compatibility

The SQL standard does not provide the **DROP AGGREGATE** statement.

7.12.10.6 DROP AUDIT POLICY

Description

Drops an audit policy.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

Syntax

```
DROP AUDIT POLICY [IF EXISTS] policy_name;
```

Parameters

- **policy_name**

  Specifies the audit policy name, which must be unique.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **IF EXISTS**

  Checks whether the audit policy exists. If it exists, the deletion is successful. Otherwise, a NOTICE message is sent.

Examples

```
-- Create the adt1 policy.
gaussdb=# CREATE AUDIT POLICY adt1 PRIVILEGES CREATE;
CREATE AUDIT POLICY

-- Drop the audit policy adt1.
gaussdb=# DROP AUDIT POLICY adt1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DROP AUDIT POLICY

-- When you delete the audit policy adt0 that does not exist, the system displays a message indicating that the deletion fails because the audit policy does not exist.
gaussdb=# DROP AUDIT POLICY adt0;
ERROR:  adt0 policy does not exist, drop failed
```

Helpful Links

CREATE AUDIT POLICY and **ALTER AUDIT POLICY**

7.12.10.7 DROP CLIENT MASTER KEY

Description

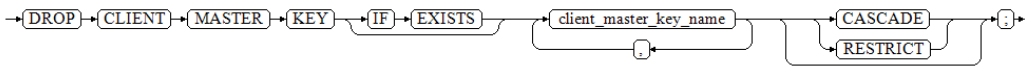
Deletes a CMK.

Precautions

- Only the CMK owner or a user who has been granted the DROP permission can run this command. By default, the system administrator has this permission.
- This command can only be used to delete the metadata information recorded in the system catalog of the database, but cannot be used to delete the CMK file. You need to use keytool to delete the CMK file.

Syntax

```
DROP CLIENT MASTER KEY [ IF EXISTS ] client_master_key_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  If a specified CMK does not exist, a notice rather than an error is issued.
- **client_master_key_name**

  Specifies the name of a CMK to be deleted.

  Value range: a string. It is the name of an existing CMK.
- **CASCADE** | **RESTRICT**

  Allows/Restricts to cascadingly delete objects that depend on the CMK.

Helpful Links

CREATE CLIENT MASTER KEY

7.12.10.8 DROP COLUMN ENCRYPTION KEY

Description

Deletes a column encryption key (CEK).

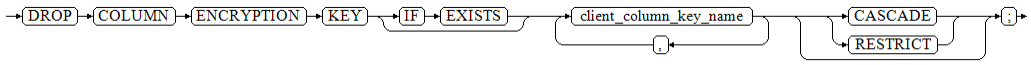
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

Only the CEK owner or a user who has been granted the DROP permission can run this command. System administrators have this permission by default.

Syntax

```
DROP COLUMN ENCRYPTION KEY [ IF EXISTS ] client_column_key_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  If a specified CEK does not exist, a notice rather than an error is issued.

- **client_column_key_name**

  Name of a CEK to be deleted.

  Value range: a string. It is the name of an existing CEK.

- **CASCADE** |**RESTRICT**

  For fully-encrypted databases, this syntax is high-risk operation. Actually, encrypted columns that depend on CEKs cannot be deleted.

Helpful Links

ALTER COLUMN ENCRYPTION KEY and **CREATE COLUMN ENCRYPTION KEY**

7.12.10.9 DROP DATABASE

Description

Deletes a database.

Precautions

- Only the database owner or a user granted the DROP permission can run the **DROP DATABASE** command. The system administrator has this permission by default.
- The preinstalled POSTGRES, TEMPLATE0, TEMPLATE1, and TEMPLATEA databases are protected and therefore cannot be deleted. To check databases in the current service, run the gsql statement **\l**.
- If any users are connected to the database, the database cannot be deleted. You can view the DV_SESSIONS view to check the database connections.
- **DROP DATABASE** cannot be executed within a transaction block.
- Before deleting a database, run the **CLEAN CONNECTION TO ALL FORCE FOR DATABASE** *XXXX* command to forcibly stop the existing user connections and backend threads, preventing database deletion failures caused by running backend threads. Forcibly stopping backend threads may cause data inconsistency in the current database. Therefore, execute this command only when you are sure to delete the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If DROP DATABASE fails to be run and the transaction is rolled back, run DROP DATABASE IF EXISTS again.

NOTICE

DROP DATABASE cannot be undone.

Syntax

```
DROP DATABASE [ IF EXISTS ] database_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified database does not exist.
- **database_name**

  Specifies the name of the database to be deleted.

  Value range: an existing database name

Examples

```
-- Create a database.
gaussdb=# CREATE DATABASE testdb1;

-- Delete the database.
gaussdb=# DROP DATABASE testdb1;
```

Helpful Links

CREATE DATABASE

Suggestions

- DROP DATABASE

  Do not delete databases during transactions.

7.12.10.10 DROP DATABASE LINK

Description

Deletes database link objects.

Syntax

```
DROP [ PUBLIC ] DATABASE LINK [ IF EXISTS ] dblink_name;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **dblink_name**

  Name of a connection object.

- **IF EXISTS**

  Reports a notice instead of an error if the specified **DATABASE LINK** does not exist.

- **PUBLIC**

  Specifies the connection type. If **PUBLIC** is not specified, the database link is private by default.

Examples

```
-- Create an ORA-compatible database.
gaussdb=# CREATE DATABASE ora_test_db DBCOMPATIBILITY 'ORA';

-- Switch to another database.
gaussdb=# \c ora_test_db

-- Create a user with the SYSADMIN permission.
ora_test_db=# CREATE USER user1 WITH SYSADMIN PASSWORD '********';
ora_test_db=# SET ROLE user1 PASSWORD '********';

-- Create a private database link. host can be an IPv6 address.
ora_test_db=# CREATE DATABASE LINK private_dblink CONNECT TO 'user1' IDENTIFIED BY '********' USING
(host '192.168.11.11',port '54399',dbname 'db01');

-- Drop the private database link.
ora_test_db=# DROP DATABASE LINK private_dblink;

-- Create a public database link. host can be an IPv6 address.
ora_test_db=# CREATE PUBLIC DATABASE LINK public_dblink CONNECT TO 'user1' IDENTIFIED BY '********'
USING (host '192.168.11.11',port '54399',dbname 'db01');

-- Drop the public database link.
ora_test_db=# DROP PUBLIC DATABASE LINK public_dblink;

-- Drop the created user.
ora_test_db=# RESET ROLE;
ora_test_db=# DROP USER user1;

-- Switch back to the initial database and delete the test database. Replace postgres with the actual
database name.
ora_test_db=# \c postgres
gaussdb=# DROP DATABASE ora_test_db;
```

Helpful Links

ALTER DATABASE LINK and **CREATE DATABASE LINK**

7.12.10.11 DROP DIRECTORY

Description

Deletes a directory.

Precautions

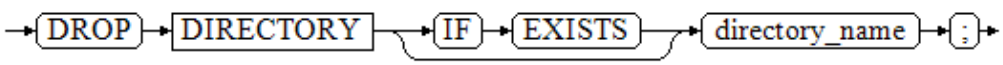
- When **enable_access_server_directory** is set to **off**, only the initial user is allowed to delete the directory object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When **enable_access_server_directory** is set to **on**, a user with the SYSADMIN permission, a directory object owner, a user granted the DROP permission for a directory, or a user who inherits permissions from the built-in role gs_role_directory_drop can delete a directory object.

Syntax

```
DROP DIRECTORY [ IF EXISTS ] directory_name;
```



Parameters

- **directory_name**

  Specifies the name of the directory to be deleted.

  Value range: an existing directory name

- **IF EXISTS**

  Does not report an error if the specified directory object does not exist. A notice is issued in this case.

Examples

```
-- Create a directory object.
gaussdb=# CREATE OR REPLACE DIRECTORY  dir  as '/tmp/';

-- Delete the directory object.
gaussdb=# DROP DIRECTORY dir;
```

Helpful Links

CREATE DIRECTORY and **ALTER DIRECTORY**

7.12.10.12 DROP EXTENSION

NOTICE

The extended function is for internal use only. You are advised not to use it. Currently, DROP EXTENSION can be performed only on postgis, postgis_sfcgal, postgis_raster, postgis_topology, yukon_geomodel, yukon_geogridcoder, pkg_bpchar_opc, and tablefunc.

Description

Deletes an extension.

Precautions

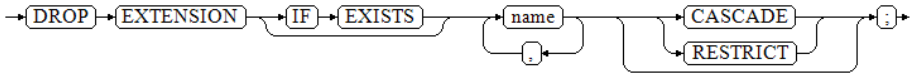
- The **DROP EXTENSION** command drops an extension from the database. When you drop an extension, the components that make up the extension are also deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The **DROP EXTENSION** command can be used only by the owner of the extension or the initial user.

Syntax

```
DROP EXTENSION [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  If the **IF EXISTS** parameter is used and the extension does not exist, no error is reported. Instead, a notice is generated.

- **name**

  Specifies the name of an installed extension.

- **CASCADE**

  Automatically deletes objects that depend on the extension.

- **RESTRICT**

  If any object depends on an extension, the extension cannot be deleted (unless all its member objects and other extension objects are deleted at a time using the **DROP** command). This is a default processing.

Helpful Links

CREATE EXTENSION

7.12.10.13 DROP FOREIGN DATA WRAPPER

Description

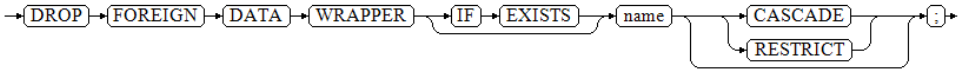
Deletes a specified foreign data wrapper.

Precautions

The DROP statement can be successfully executed only when **support_extended_features** is set to **on**.

Syntax

```
DROP FOREIGN DATA WRAPPER [ IF EXISTS ] name [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Sends a notification instead of throwing an error if the foreign data wrapper does not exist.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **name**

  Specifies the name of an existing foreign data wrapper.
- **CASCADE**

  Automatically drops objects (such as servers) that depend on the foreign data wrapper.
- **RESTRICT**

  If there are objects that depend on the foreign data wrapper, the foreign data wrapper cannot be deleted. This is the default behavior.

Example

```
-- Delete the foreign data wrapper dbi.
gaussdb=# DROP FOREIGN DATA WRAPPER dbi;
```

Helpful Links

CREATE FOREIGN DATA WRAPPER and **ALTER FOREIGN DATA WRAPPER**

7.12.10.14 DROP FOREIGN TABLE

Description

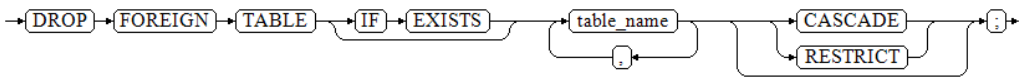
Drops a foreign table.

Precautions

DROP FOREIGN TABLE forcibly deletes a specified table. After a table is deleted, all indexes that depend on the table are deleted, and the functions and stored procedures using this table cannot be executed.

Syntax

```
DROP FOREIGN TABLE [ IF EXISTS ] table_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified table does not exist.
- **table_name**

  Specifies the name of the table to be deleted.

  Value range: an existing table name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the table.
  - **RESTRICT**: refuses to drop the table if any objects depend on it. This is the default action.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

For details, see **Examples**.

Helpful Links

CREATE FOREIGN TABLE

7.12.10.15 DROP FUNCTION

Description

Deletes a function.

Precautions

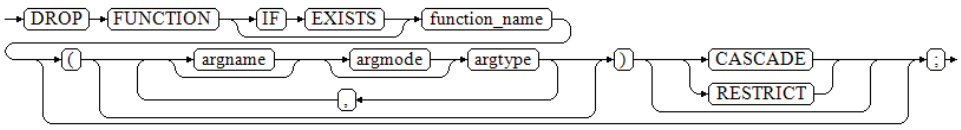
If a function involves operations on temporary tables, DROP FUNCTION cannot be used.

Only the function owner or a user with the DROP permission can run the **DROP FUNCTION** command. By default, system administrators have the permission.

Only the initial user has the permission to perform the DROP operation on the functions of the initial user.

Syntax

```
DROP FUNCTION [ IF EXISTS ] function_name
[ ( [ { [ argname ] [ argmode ] argtype} [, ...] ] ) [ CASCADE | RESTRICT ] ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified function does not exist.
- **function_name**

  Specifies the name of the function to be deleted.

  Value range: an existing function name
- **argmode**

  Specifies the parameter mode of the function.
- **argname**

  Specifies the parameter name of the function.
- **argtype**

  Specifies the parameter type of the function.
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **RESTRICT**: refuses to delete the function if any objects depend on it. This is the default action.

Examples

- Delete the list of parameters that can be omitted when a function.

```
-- Create a function.
gaussdb=# CREATE FUNCTION func_test(varchar) RETURN VARCHAR AS
BEGIN
    RETURN $1||_'test';
END;
/

-- Delete the function.
gaussdb=# DROP FUNCTION func_test;
```

- Delete a function with the same name.

  If a function with the same name exists, add a parameter list when deleting the function. Otherwise, an error is reported.

```
-- Create a function.
gaussdb=# CREATE FUNCTION func_add(int) RETURNS int AS $$
BEGIN
    RETURN $1+10;
END;
$$ LANGUAGE PLPGSQL;

-- func_add is an overloaded function.
gaussdb=# CREATE FUNCTION func_add(int,int) RETURNS int AS $$
BEGIN
    RETURN $1+$2;
END;
$$ LANGUAGE PLPGSQL;

-- Delete the function.
gaussdb=# DROP FUNCTION func_add(int);
gaussdb=# DROP FUNCTION func_add(int,int);
```

Helpful Links

ALTER FUNCTION and **CREATE FUNCTION**

7.12.10.16 DROP GLOBAL CONFIGURATION

Description

Drops parameter values from the gs_global_config system catalog.

Precautions

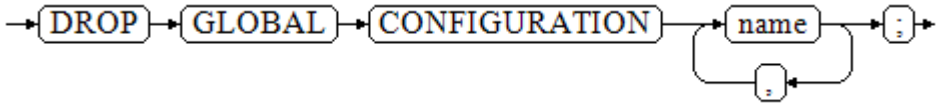
- Only the initial database user can run this command.
- The parameter name cannot be **weak_password** or **undostoragetype**.
- If the name of parameter for redistribution after scale-out is used, set the GUC parameter **enable_cluster_resize** to **on**. The involved parameters are **lockwait_timeout**, **lockwait_interval**, **trylock_threshold**, **enable_cancel**, **last_catchup_threshold**, **catchup_times**, **write_error_mode**, **catchup_query_dop**, **parallel_catchup_threshold**, **parallel_reindex_jobs**, **redis_retry_times**, **redis_retry_interval**, **redis_bucket_expansion**, **redis_bucket_batchsize**, **redis_bucket_log_level**, **redis_bucket_lockhold_timeout**, **redis_bucket_timeout_penalty**,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

redis_bucket_max_lockwait_timeout_retry, **redis_bucket_max_lockhold_timeout_retry**, **redis_bucket_strategy_history_capacity**, **redis_bucket_strategy_recent_threshold**, **redis_bucket_workload_rule**, **redis_bucket_lsn_rule**, **redis_bucket_tx_bucket_min**, **redis_bucket_tx_bucket_max**, **redis_max_expected_tps**, **redis_bucket_sender_concurrency**, **redis_bucket_receiver_concurrency**, **redis_bucket_parse_redo_num**, **redis_bucket_workers_per_paser**, and **redis_bucket_keep_bucketxlogs**.

Syntax

```
DROP GLOBAL CONFIGURATION name [, ...];
```



Parameters

name

The parameter must exist in the gs_global_config system catalog. If you delete a parameter that does not exist, an error will be reported.

NOTE

If the name of parameter for redistribution after scale-out is used, set the GUC parameter **enable_cluster_resize** to **on**.

Examples

See **Examples**.

Helpful Links

ALTER GLOBAL CONFIGURATION

7.12.10.17 DROP GROUP

Description

Deletes a user group. DROP GROUP is an alias for DROP ROLE.

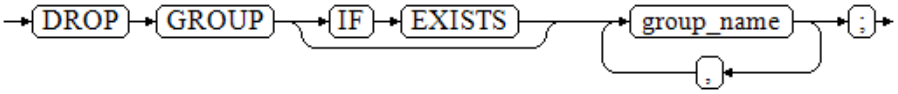
Precautions

It is available only to users with the CREATE ROLE permission granted by the administrator.

Syntax

```
DROP GROUP [ IF EXISTS ] group_name [, ...];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **IF EXISTS**

  If a role does not exist, no error is reported. Instead, a notification is sent, indicating that the role does not exist.

- **group_name**

  Specifies the name of the role to be deleted.

  Value range: an existing role name.

Helpful Links

CREATE GROUP, **ALTER GROUP**, and **DROP ROLE**

7.12.10.18 DROP INDEX

Description

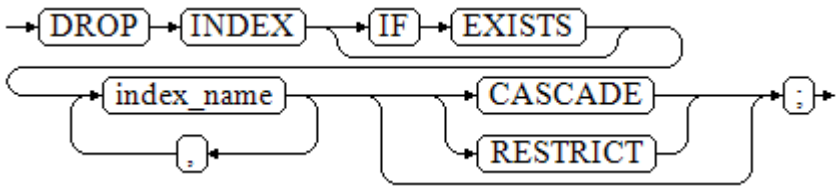
Deletes an index.

Precautions

Only the index owner, owner of the schema where the index resides, a user who has the INDEX permission on the table where the index resides, or a user who has the DROP ANY INDEX permission can run the **DROP INDEX** command. When separation of duties is disabled, system administrators have this permission by default.

Syntax

```
DROP INDEX [ IF EXISTS ]
    index_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified index does not exist.

- **index_name**

  Specifies the name of the index to be deleted.

  Value range: an existing index

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **CASCADE | RESTRICT**
  - **CASCADE**: cascadingly deletes the objects that depend on the index.
  - **RESTRICT**: refuses to delete the index if any objects depend on it. This is the default action.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE test1_index (id INT, name VARCHAR(20));

-- Create an index.
gaussdb=# CREATE INDEX idx_test1 (id);

-- Delete the index.
gaussdb=# DROP INDEX IF EXISTS idx_test1 CASCADE;

-- Delete the table.
gaussdb=# DROP TABLE test1_index;
```

Helpful Links

ALTER INDEX and **CREATE INDEX**

7.12.10.19 DROP LANGUAGE

Function

Deletes a procedural language.

Precautions

In the current version, you cannot delete the procedural language features created, so this syntax cannot be used.

7.12.10.20 DROP MASKING POLICY

Description

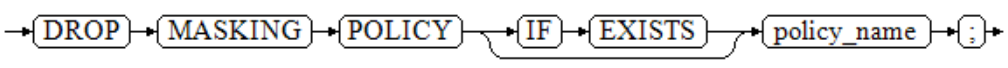
Deletes a masking policy.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

Syntax

```
DROP MASKING POLICY [ IF EXISTS ] policy_name;
```



Parameters

- **policy_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the audit policy name, which must be unique.

Value range: A string indicating an existing policy name.

Examples

```
-- Create table tb_for_masking.
gaussdb=# CREATE TABLE tb_for_masking(idx int, col1 text, col2 text, col3 text, col4 text, col5 text, col6
text, col7 text,col8 text);

-- Insert data into the tb_for_masking table.
gaussdb=# INSERT INTO tb_for_masking VALUES(1, '9876543210', 'usr321usr', 'abc@huawei.com',
'abc@huawei.com', '1234-4567-7890-0123', 'abcdef 123456 ui 323 jsfd321 j3k2l3', '4880-9898-4545-2525',
'this is a llt case');

-- Create a resource label for sensitive column col1.
gaussdb=# CREATE RESOURCE LABEL mask_lb1 ADD COLUMN(tb_for_masking.col1);

-- Create a resource label for sensitive column col2.
gaussdb=# CREATE RESOURCE LABEL mask_lb2 ADD COLUMN(tb_for_masking.col2);

-- Create a resource label for sensitive column col3.
gaussdb=# CREATE RESOURCE LABEL mask_lb3 ADD COLUMN(tb_for_masking.col3);

-- Create a data masking policy named maskpol1.
gaussdb=# CREATE MASKING POLICY maskpol1 maskall ON LABEL(mask_lb1);

-- Create a data masking policy named maskpol2.
gaussdb=# CREATE MASKING POLICY maskpol2 randommasking ON LABEL(mask_lb2);

-- Create a data masking policy named maskpol3.
gaussdb=# CREATE MASKING POLICY maskpol3 basicemailmasking ON LABEL(mask_lb3);

-- Delete a masking policy.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol1;

-- Delete a group of masking policies.
gaussdb=# DROP MASKING POLICY IF EXISTS maskpol2, maskpol3;

-- Delete a resource label.
gaussdb=# DROP RESOURCE LABEL mask_lb1;
gaussdb=# DROP RESOURCE LABEL mask_lb2;
gaussdb=# DROP RESOURCE LABEL mask_lb3;

-- Delete the table.
gaussdb=# DROP TABLE tb_for_masking;
```

Helpful Links

ALTER MASKING POLICY and **CREATE MASKING POLICY**

7.12.10.21 DROP MATERIALIZED VIEW

Function

Deletes an existing materialized view from the database.

Precautions

The owner of a materialized view, owner of the schema of the materialized view, users granted the DROP permission on the materialized view, or users granted the DROP ANY TABLE permission can run the **DROP MATERIALIZED VIEW** command. By default, the system administrator has the permission to run the command.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP MATERIALIZED VIEW [ IF EXISTS ] mv_name [, ...] [ CASCADE | RESTRICT ];
```

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified materialized view does not exist.

- **mv_name**

  Name of the materialized view to be deleted.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on a materialized view.
  - **RESTRICT**: refuses to delete a materialized view if any objects depend on it. This is the default value.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int)
WITH(STORAGE_TYPE=ASTORE);

-- Create a materialized view named my_mv.
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Delete the materialized view named my_mv.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the table.
gaussdb=# DROP TABLE my_table;
```

Helpful Links

ALTER MATERIALIZED VIEW, **CREATE INCREMENTAL MATERIALIZED VIEW**, **CREATE MATERIALIZED VIEW**, **CREATE TABLE**, **REFRESH INCREMENTAL MATERIALIZED VIEW**, and **REFRESH MATERIALIZED VIEW**

7.12.10.22 DROP MODEL

Description

Drops a specified training model.

Precautions

This syntax is not supported because the model training function is not supported in the current version.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.23 DROP NODE

Description

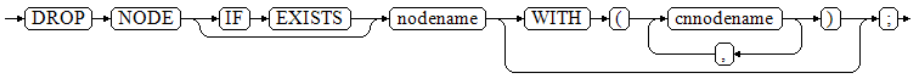
Drops nodes from a cluster.

Precautions

DROP NODE is an API of the cluster management tool. You are advised not to use this API, because doing so affects the cluster. Only the administrator has the permission to use this API.

Syntax

```
DROP NODE [ IF EXISTS ] nodename [WITH ( cnnodename [, ... ] )];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified node does not exist.

- **nodename**

  Specifies the name of the node to be dropped.

  Value range: an existing node name.

- **cnnodename**

  Specifies the CN name. If this parameter is defined, the cluster nodes under the currently connected CN and the defined CN are dropped.

  Value range: an existing CN name

NOTE

If there are multiple CNs, cluster nodes are created only on the currently connected CNs and will not be synchronized to other CNs. You need to create cluster nodes on all CNs. To drop a cluster node, you only need to connect to one CN. If cluster nodes are created on only one CN, you need to define the current CN name and drop the cluster node on the CN.

Examples

```
-- Create cluster nodes on all CNs.
gaussdb=# CREATE NODE datanode1 WITH(
   TYPE = datanode,
   PREFERRED = false
);

-- Drop cluster nodes and connect to only one CN.
gaussdb=# DROP NODE datanode1;
```

Helpful Links

- **CREATE NODE**
- **ALTER NODE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.24 DROP NODE GROUP

Description

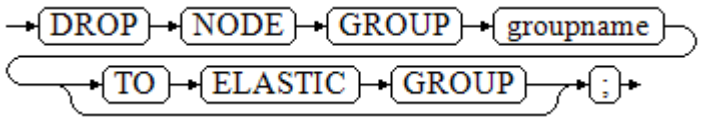
Deletes a node group.

Precautions

- DROP NODE GROUP is an API of the cluster management tool.
- Only the system administrator or a user who has the DROP permission can perform this operation.

Syntax

```
DROP NODE GROUP groupname
   [TO ELASTIC GROUP];
```



Parameters

groupname

Specifies the name of the node group to be deleted.

Value range: an existing node group name

Examples

```
-- Query the initial cluster DN status.
gaussdb=# SELECT node_name, nodeis_preferred FROM pgxc_node WHERE node_type = 'D' ORDER BY 1;
 node_name | nodeis_preferred
-----------+------------------
 dn_6001_6002_6003 | f
 dn_6004_6005_6006 | f
 dn_6007_6008_6009 | f
(3 rows)

-- Create a node group and replace dn_6001_6002_6003 with the actual node name obtained in the previous step.
gaussdb=# CREATE NODE GROUP test_group WITH ( dn_6001_6002_6003 );

-- Delete the node group.
gaussdb=# DROP NODE GROUP test_group;
```

Helpful Links

ALTER NODE GROUP and **CREATE NODE GROUP**

7.12.10.25 DROP OWNED

Function

Deletes the database objects owned by a database role.

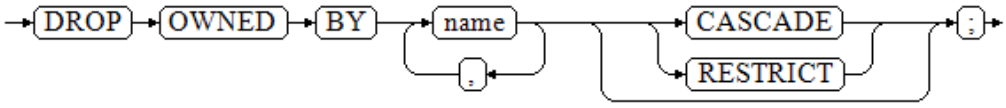
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- This interface will revoke the role's permissions on all objects in the current database and shared objects (databases and tablespaces).
- DROP OWNED is often used to prepare for removing one or more roles. Because DROP OWNED affects only the objects in the current database, you need to run this statement in each database that contains the objects owned by the role to be removed.
- Using the **CASCADE** option may cause this statement to recursively remove objects owned by other users.
- The databases and tablespaces owned by the role will not be removed.
- Private database links owned by a role can be deleted only after the **CASCADE** option is added.

Syntax

```
DROP OWNED BY name [, ...] [ CASCADE | RESTRICT ];
```



Parameter Description

- **name**

  Specifies the role name.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the objects to be deleted.
  - **RESTRICT** (default): refuses to delete the object if any objects depend on it.

Examples

```
-- Create user jim.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Revoke user jim's permissions on all objects in the current database and on shared objects (databases and tablespaces).
gaussdb=# DROP OWNED BY jim;

-- Delete user jim.
gaussdb=# DROP USER jim;
```

Helpful Links

REASSIGN OWNED

7.12.10.26 DROP PACKAGE

Description

Deletes an existing package or package body.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

After a package body is dropped, the stored procedures and functions in the package become invalid.

Only the initial user has the permission to perform the DROP operation on the packages of the initial user.

Syntax

```
DROP PACKAGE [ IF EXISTS ] package_name;
```

```
DROP PACKAGE BODY [ IF EXISTS ] package_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified stored procedure does not exist.

- **package_name**

  Specifies the name of the package to be deleted.

  Value range: an existing package name.

Examples

```
-- Create an ORA-compatible database.
gaussdb=# CREATE DATABASE ora_compat_db DBCOMPATIBILITY 'ORA';
CREATE DATABASE
gaussdb=# \c ora_compat_db

-- Create a package.
gaussdb=# CREATE OR REPLACE PACKAGE emp_bonus IS
var1 INT:=1;-- Public variable
var2 INT:=2;
PROCEDURE testpro1(var3 INT);-- Public stored procedure, which can be called by external systems.
END emp_bonus;
/

-- Delete the package.
gaussdb=# DROP PACKAGE emp_bonus;

-- Switch back to the initial database and delete the ORA-compatible database. Replace postgres with the actual database name.
gaussdb=# \c postgres
gaussdb=# DROP DATABASE ora_compat_db;
```

Helpful Links

ALTER PACKAGE and **CREATE PACKAGE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.27 DROP PROCEDURE

Description

Deletes a stored procedure.

Precautions

Only the initial user has the permission to perform the DROP operation on the stored procedures of the initial user.

Syntax

```
DROP PROCEDURE [ IF EXISTS ] procedure_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified stored procedure does not exist.

- **procedure_name**

  Specifies the name of the stored procedure to be deleted.

  Value range: an existing stored procedure name

Examples

See **Examples**.

Helpful Links

CREATE PROCEDURE

7.12.10.28 DROP RESOURCE LABEL

Description

DROP RESOURCE LABEL is used to delete a resource label.

Precautions

Only users with the POLADMIN or SYSADMIN permission, or the initial user can perform this operation.

Syntax

```
DROP RESOURCE LABEL [IF EXISTS] label_name[, ...];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **label_name**

  Specifies the resource label name.

  Value range: a string that complies with the **Identifier Naming Conventions**.

Examples

```
-- Create table tb_for_label.
gaussdb=# CREATE TABLE tb_for_label(col1 text, col2 text, col3 text);

-- Create a resource label based on a table.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);

-- Create an existing table resource label again and compare the differences between adding IF NOT EXISTS and not adding IF NOT EXISTS.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS table_label add TABLE(public.tb_for_label);
NOTICE:  table_label label already defined, skipping
CREATE RESOURCE LABEL
gaussdb=# CREATE RESOURCE LABEL table_label add TABLE(public.tb_for_label);
ERROR:  table_label label already defined

-- Create a resource label based on columns.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS column_label add COLUMN(public.tb_for_label.col1);

-- Create schema schema_for_label.
gaussdb=# CREATE SCHEMA schema_for_label;

-- Create a resource label based on a schema.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS schema_label add SCHEMA(schema_for_label);

-- Create view view_for_label.
gaussdb=# CREATE VIEW view_for_label AS SELECT 1;

-- Create a resource label based on a view.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS view_label add VIEW(view_for_label);

-- Create function func_for_label.
gaussdb=# CREATE FUNCTION func_for_label RETURNS TEXT AS $$ SELECT col1 FROM tb_for_label; $$ LANGUAGE SQL;

-- Create a resource label based on a function.
gaussdb=# CREATE RESOURCE LABEL IF NOT EXISTS func_label add FUNCTION(func_for_label);

-- Drop the table resource label table_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS table_label;

-- Drop the column resource label column_label.
gaussdb=# DROP RESOURCE LABEL IF EXISTS column_label;

-- Drop the function resource label func_for_label.
gaussdb=# DROP FUNCTION func_for_label;

-- Drop the view resource label view_for_label.
gaussdb=# DROP VIEW view_for_label;

-- Drop the schema resource label schema_for_label.
gaussdb=# DROP SCHEMA schema_for_label;

-- Drop the tb_for_label table.
gaussdb=# DROP TABLE tb_for_label;
```

Helpful Links

ALTER RESOURCE LABEL and **CREATE RESOURCE LABEL**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.29 DROP RESOURCE POOL

Description

Drops a resource pool.

NOTE

The resource pool cannot be deleted if it is associated with a role.

Precautions

Only users with the SYSADMIN permission, or the initial user can perform this operation.

This syntax is not supported during upgrade.

Syntax

```
DROP RESOURCE POOL [ IF EXISTS ] pool_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified resource pool does not exist.

- **pool_name**

  Specifies the name of the resource pool to be deleted.

  Value range: a string that complies with the **Identifier Naming Conventions**.

NOTE

In a multi-tenant scenario, deleting a group resource pool also deletes the related service resource pools. A resource pool can be deleted only when it is not associated with any users.

Examples

See **Examples**.

Helpful Links

7.13.6.25-ALTER RESOURCE POOL and **7.13.8.37-CREATE RESOURCE POOL**

7.12.10.30 DROP ROLE

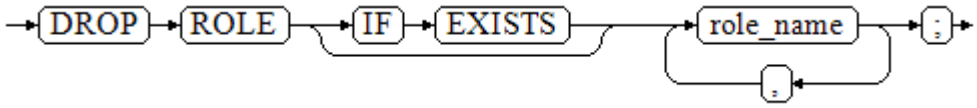
Description

Deletes a role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
DROP ROLE [ IF EXISTS ] role_name [, ...];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified role does not exist.
- **role_name**

  Specifies the name of the role to be deleted.

  Value range: an existing role name

Examples

```
-- Create role role11.
gaussdb=# CREATE ROLE role11  PASSWORD '********';
CREATE ROLE

-- Delete role role11.
gaussdb=# DROP ROLE IF EXISTS role11;
DROP ROLE

-- Delete role role12 that does not exist.
gaussdb=# DROP ROLE IF EXISTS role12;
NOTICE:  role "role12" does not exist, skipping
DROP ROLE
```

Helpful Links

CREATE ROLE, **ALTER ROLE**, and **SET ROLE**

7.12.10.31 DROP ROW LEVEL SECURITY POLICY

Function

Deletes a row-level security policy from a table.

Precautions

Only the table owner or administrators can delete a row-level security policy from the table.

Syntax

```
DROP [ ROW LEVEL SECURITY ] POLICY [ IF EXISTS ] policy_name ON table_name [ CASCADE | RESTRICT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter Description

- **IF EXISTS**

  Reports a notice instead of an error if the specified row-level security policy does not exist.

- **policy_name**

  Specifies the name of the row-level security policy to be deleted.

- **table_name**

  Specifies the name of the table containing the row-level security policy.

- **CASCADE | RESTRICT**

  Currently, no objects depend on row-level security policies. Therefore, **CASCADE** is equivalent to **RESTRICT**, and they are reserved to ensure backward compatibility.

Examples

```
-- Create the data table all_data.
gaussdb=# CREATE TABLE all_data(id int, role varchar(100), data varchar(100));

-- Create a row-level security policy.
gaussdb=# CREATE ROW LEVEL SECURITY POLICY all_data_rls ON all_data USING(role = CURRENT_USER);

-- Delete the row-level security policy.
gaussdb=# DROP ROW LEVEL SECURITY POLICY all_data_rls ON all_data;

-- Delete the all_data table.
gaussdb=# DROP TABLE all_data;
```

Helpful Links

ALTER ROW LEVEL SECURITY POLICY and **CREATE ROW LEVEL SECURITY POLICY**

7.12.10.32 DROP SCHEMA

Description

Drops a schema from the current database.

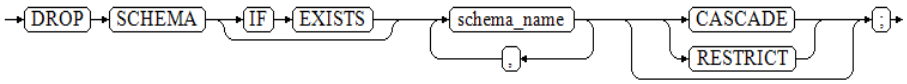
Precautions

- Only the owner of a schema or a user granted the DROP permission for a schema has the permission to run the **DROP SCHEMA** command. If separation of duties is disabled, the system administrator has this permission by default.
- Users except the initial user and O&M administrator cannot drop the schema of the O&M administrator.
- You are not allowed to delete DBE_PLDEVELOPER when **allow_system_table_mods** is disabled.
- Only the initial user has the permission to delete system schemas.

Syntax

```
DROP SCHEMA [ IF EXISTS ] schema_name [, ...] [ CASCADE | RESTRICT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified schema does not exist.
- **schema_name**

  Specifies the schema name.

  Value range: an existing schema name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes all the objects contained in the schema.
  - **RESTRICT**: refuses to delete the schema if the schema contains objects. This is the default action.

NOTICE

Schemas beginning with **pg_temp** or **pg_toast_temp** are for internal use. Do not delete them. Otherwise, unexpected consequences may be incurred.

NOTE

The schema currently being used cannot be deleted. To delete it, switch to another schema first.

Examples

```
-- Create role role2.
gaussdb=# CREATE ROLE role2 IDENTIFIED BY '********';

-- Create a schema based on the name.
gaussdb=# CREATE SCHEMA schema1 AUTHORIZATION role2;
CREATE SCHEMA

-- Drop the schema.
gaussdb=# DROP SCHEMA schema1 CASCADE;

-- Drop the user.
gaussdb=# DROP USER role2 CASCADE;
```

Helpful Links

ALTER SCHEMA and **CREATE SCHEMA**

7.12.10.33 DROP SECURITY LABEL

Description

DROP SECURITY LABEL is used to delete security labels from the current database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

An initial user, a user with the SYSADMIN permission, or a user who inherits permissions of the built-in role gs_role_seclabel can delete security labels.

Syntax

```
DROP SECURITY LABEL label_name;
```

Parameters

- **label_name**

  Security label name. The security label to be deleted must exist in the database.

Examples

```
-- Create a security label sec_label.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G4';

-- Delete the security label sec_label2 that does not exist.
gaussdb=# DROP SECURITY LABEL sec_label2;
ERROR:  security label "sec_label2" does not exist

-- Delete the existing security label sec_label.
gaussdb=# DROP SECURITY LABEL sec_label;
```

Helpful Links

CREATE SECURITY LABEL and **SECURITY LABEL ON**

7.12.10.34 DROP SEQUENCE

Description

Deletes a sequence from the current database.

Precautions

Only the owner of a sequence, the owner of the schema to which the sequence belongs, or a user granted the DROP permission on a sequence or a user granted the DROP ANY SEQUENCE permission can delete a sequence. When separation of duties is disabled, a system administrator has this permission by default.

Syntax

```
DROP SEQUENCE [ IF EXISTS ] { [schema.] sequence_name } [ , ... ] [ CASCADE | RESTRICT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified sequence does not exist.
- **sequence_name**

  Specifies the name of the sequence to be deleted.
- **CASCADE**

  Cascadingly deletes the objects that depend on the sequence.
- **RESTRICT**

  Refuses to delete the sequence if any objects depend on it. This is the default action.

Examples

```
-- Create an ascending sequence named serial, starting from 101.
gaussdb=# CREATE SEQUENCE serial START 101;

-- Delete a sequence.
gaussdb=# DROP SEQUENCE serial;
```

Helpful Links

ALTER SEQUENCE and **DROP SEQUENCE**

7.12.10.35 DROP SERVER

Description

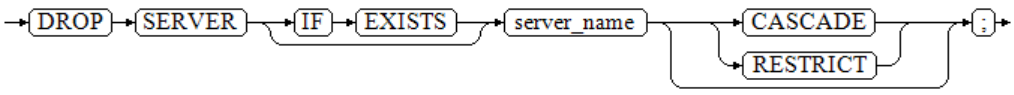
Deletes an existing data server.

Precautions

Only the server owner or a user granted the DROP permission can run the **DROP SERVER** command. A system administrator has this permission by default.

Syntax

```
DROP SERVER [ IF EXISTS ] server_name [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified data server does not exist.
- **server_name**

  Specifies the name of the data server to be deleted.
- **CASCADE | RESTRICT**
  - **CASCADE**: cascadingly deletes the objects that depend on the data server.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **RESTRICT**: refuses to delete the server if any objects depend on it. This is the default action.

Example

```
-- Create a server.
gaussdb=# CREATE SERVER my_server FOREIGN DATA WRAPPER log_fdw;
CREATE SERVER

-- Delete the server.
gaussdb=# DROP SERVER my_server;
DROP SERVER
```

Helpful Links

ALTER SERVER and **CREATE SERVER**

7.12.10.36 DROP SLICEGROUP

Description

Drops a specified slice group.

Precautions

If a range bucket table is bound to a slice group, the slice group can be dropped only after the range bucket table is dropped.

Syntax

```
DROP SLICEGROUP slicegroup_name;
```

Parameters

- **slicegroup_name**

  Name of the slice group to be dropped. If the slice group does not exist, an exception is thrown.

Examples

```
-- Drop a slice group.
gaussdb=# DROP SLICEGROUP sg;
```

Helpful Links

CREATE SLICEGROUP

7.12.10.37 DROP SYNONYM

Description

Deletes a synonym.

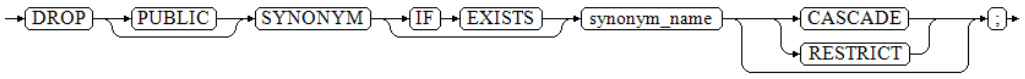
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

Only the synonym owner or a user with the DROP ANY SYNONYM permission can run the **DROP SYNONYM** command. System administrators have this permission by default.

Syntax

```
DROP [PUBLIC] SYNONYM [ IF EXISTS ] synonym_name [ CASCADE | RESTRICT ];
```



Parameters

- **PUBLIC**

  (Optional) Deletes PUBLIC synonyms.

- **IF EXISTS**

  Reports a notice instead of an error if the specified synonym does not exist.

- **synonym_name**

  Specifies the name (optionally schema-qualified) of the synonym to be deleted.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as views) that depend on the synonym.
  - **RESTRICT**: refuses to delete the synonym if any objects depend on it. This is the default action.

Examples

```
-- Create a synonym.
gaussdb=# CREATE OR REPLACE SYNONYM test_tbl1 FOR test_tbl1;
-- Delete the synonym.
gaussdb=# DROP SYNONYM test_tbl1;
```

Helpful Links

ALTER SYNONYM and **CREATE SYNONYM**

7.12.10.38 DROP TABLE

Description

Deletes a table.

Precautions

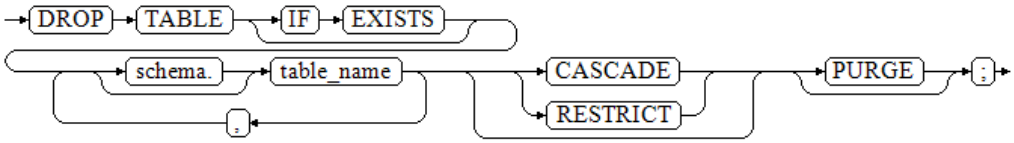
- After DROP TABLE deletes the table, the indexes depending on the table are deleted, and the functions and stored procedures that need to use this table cannot be executed. Deleting a partitioned table also deletes all partitions in the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The owner of a table, the owner of the schema of the table, users with the DROP permission on the table, or users with the DROP ANY TABLE permission can delete the specified table. When separation of duties is disabled, system administrators have this permission by default.

Syntax

```
DROP TABLE [ IF EXISTS ]
   { [schema.]table_name } [, ...] [ CASCADE | RESTRICT ] [ PURGE ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified table does not exist.

- **schema**

  Specifies the schema name.

- **table_name**

  Specifies the table name.

- **CASCADE | RESTRICT**
  - **CASCADE**: allows cascade deletion of the objects that depend on the table, such as views, triggers, and indexes. Note that associated table objects cannot be deleted cascadingly.
  - **RESTRICT**: refuses to delete the table if any objects depend on it. This is the default action.

- **PURGE**

  Specifies that even if the recycle bin function is enabled, the table is physically dropped instead of being moved to the recycle bin when you use DROP TABLE to delete tables.

Examples

```
-- Create the test table.
gaussdb=# CREATE TABLE test(c1 int, c2 int);
-- Drop the test table.
gaussdb=# DROP TABLE IF EXISTS test;

-- Create the test1 table.
gaussdb=# CREATE TABLE test1(c1 int, c2 int);
-- Create the v_test1 view.
gaussdb=# CREATE VIEW v_test1 AS SELECT * FROM test1 WHERE c1 < 20;
-- An error is reported when the table is deleted.
gaussdb=# DROP TABLE test1;
ERROR:  table test1 cannot be dropped because other objects depend on it.
DETAIL:  view v_test1 depends on table test1
HINT:  Use DROP ... CASCADE to drop the dependent objects.

-- Use the CASCADE parameter to drop the test1 table, which will automatically delete the views.
gaussdb=# DROP TABLE test1 CASCADE;
NOTICE:  drop cascades to view v_test1
DROP TABLE
```

ALTER TABLE and **CREATE TABLE**

7.12.10.39 DROP TABLESPACE

Description

Deletes a tablespace.

Precautions

- Only the tablespace owner or a user granted the DROP permission can run the **DROP TABLESPACE** command. The system administrator has this permission by default.
- The tablespace to be deleted should not contain any database objects. Otherwise, an error will be reported.
- DROP TABLESPACE cannot be rolled back and therefore cannot be run in transaction blocks.
- During execution of DROP TABLESPACE, database queries by other sessions using **\db** may fail and need to be reattempted.
- If DROP TABLESPACE fails to be executed, execute DROP TABLESPACE IF EXISTS.

Syntax

```
DROP TABLESPACE [ IF EXISTS ] tablespace_name;
```

Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified tablespace does not exist.
- **tablespace_name**

  Specifies the name of the tablespace to be deleted.

  Value range: an existing tablespace name

Examples

```
-- Create a tablespace.
gaussdb=# CREATE TABLESPACE tbs_location1 RELATIVE LOCATION 'test_tablespace/test_tablespace_1';

-- Delete the tablespace.
gaussdb=# DROP TABLESPACE tbs_location1;
```

Helpful Links

ALTER TABLESPACE and **CREATE TABLESPACE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Suggestions

Do not delete tablespaces during transactions using DROP TABLESPACE.

7.12.10.40 DROP TRIGGER

Description

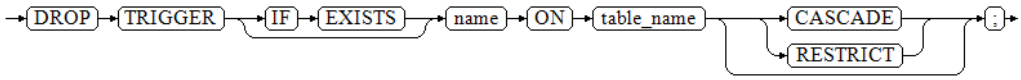
DROP TRIGGER is used to delete a trigger.

Precautions

Only the trigger owner or a user granted the DROP ANY TRIGGER permission can run the **DROP TRIGGER** command. System administrators have this permission by default.

Syntax

```
DROP TRIGGER [ IF EXISTS ] name ON table_name [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified trigger does not exist.
- **trigger_name**

  Specifies the name of the trigger to be deleted.

  Value range: an existing trigger name
- **table_name**

  Specifies the name of the table containing the trigger.

  Value range: name of the table containing the trigger
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects that depend on the trigger.
  - **RESTRICT**: refuses to delete the trigger if any objects depend on it. This is the default action.

Examples

```
-- Create a source table and a destination table.
gaussdb=# CREATE TABLE test_trigger_src_tbl(id1 INT, id2 INT, id3 INT);
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 INT, id2 INT, id3 INT);
```

Using the INSERT trigger

```
-- Create an INSERT trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_insert_func() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                INSERT INTO test_trigger_des_tbl VALUES(NEW.id1, NEW.id2, NEW.id3);
                RETURN NEW;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
        END
        $$ LANGUAGE plpgsql;

-- Create an INSERT trigger.
gaussdb=# CREATE TRIGGER insert_trigger
        BEFORE INSERT ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_insert_func();

-- Execute the INSERT event and check the trigger results.
gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)
```

Using the UPDATE trigger

```
-- Create an UPDATE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION tri_update_func() RETURNS TRIGGER AS
$$
DECLARE
BEGIN
UPDATE test_trigger_des_tbl SET id3 = NEW.id3 WHERE id1=OLD.id1;
RETURN OLD;
END
$$ LANGUAGE plpgsql;

-- Create an UPDATE trigger.
gaussdb=# CREATE TRIGGER update_trigger
        AFTER UPDATE ON test_trigger_src_tbl
        FOR EACH ROW
        EXECUTE PROCEDURE tri_update_func();

-- Execute the UPDATE event and check the trigger results.
gaussdb=# UPDATE test_trigger_src_tbl SET id3=400 WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 400
(1 row)
```

Using the DELETE trigger

```
-- Create a DELETE trigger function.
gaussdb=# CREATE OR REPLACE FUNCTION TRI_DELETE_FUNC() RETURNS TRIGGER AS
        $$
        DECLARE
        BEGIN
                DELETE FROM test_trigger_des_tbl WHERE id1=OLD.id1;
                RETURN OLD;
        END
        $$ LANGUAGE plpgsql;

-- Create a DELETE trigger.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TRIGGER delete_trigger BEFORE DELETE ON test_trigger_src_tbl FOR EACH ROW
EXECUTE PROCEDURE tri_delete_func();

-- Execute the DELETE event and check the trigger results.
gaussdb=# DELETE FROM test_trigger_src_tbl WHERE id1=100;

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
(0 rows)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // Check whether the trigger operation takes effect.
 id1 | id2 | id3
-----+-----+-----
(0 rows)
```

Renaming a trigger

```
-- Rename a trigger.
gaussdb=# ALTER TRIGGER delete_trigger ON test_trigger_src_tbl RENAME TO delete_trigger_renamed;
```

Disabling a trigger

```
-- Disable insert_trigger.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER insert_trigger;

gaussdb=# INSERT INTO test_trigger_src_tbl VALUES(100,200,300);

gaussdb=# SELECT * FROM test_trigger_src_tbl;
 id1 | id2 | id3
-----+-----+-----
 100 | 200 | 300
(1 row)

gaussdb=# SELECT * FROM test_trigger_des_tbl; // View that the trigger does not take effect.
 id1 | id2 | id3
-----+-----+-----
(0 rows)

-- Disable all triggers on the current table.
gaussdb=# ALTER TABLE test_trigger_src_tbl DISABLE TRIGGER ALL;
```

Dropping triggers

```
gaussdb=# DROP TRIGGER insert_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER update_trigger ON test_trigger_src_tbl;

gaussdb=# DROP TRIGGER delete_trigger_renamed ON test_trigger_src_tbl;
```

Dropping functions

```
gaussdb=# DROP FUNCTION tri_insert_func;

gaussdb=# DROP FUNCTION tri_update_func;

gaussdb=# DROP FUNCTION tri_delete_func;
-- Drop the source table and target table.
gaussdb=# DROP TABLE test_trigger_src_tbl;
gaussdb=# DROP TABLE test_trigger_des_tbl;
```

Helpful Links

CREATE TRIGGER, **ALTER TRIGGER**, and **ALTER TABLE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.10.41 DROP TYPE

Description

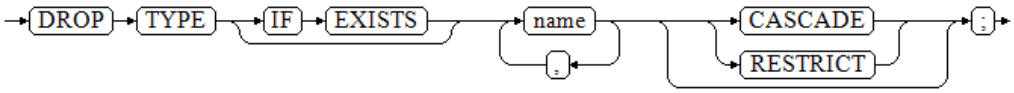
Drops a user-defined data type.

Precautions

Only the owner of a type, a user granted the DROP permission on a type, or a user granted the DROP ANY TYPE permission on a sequence can run the **DROP TYPE** command. When separation of duties is disabled, a system administrator has this permission by default.

Syntax

```
DROP TYPE [ IF EXISTS ] name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified type does not exist.
- **name**

  Specifies the name (optionally schema-qualified) of the type to be deleted.
- **CASCADE**

  Automatically deletes the objects (such as columns, functions, and operators) that depend on the type.
- **RESTRICT**

  Refuses to delete the type if any objects depend on it. This is the default action.

Examples

For details, see **Examples**.

Helpful Links

CREATE TYPE and **ALTER TYPE**

7.12.10.42 DROP USER

Description

DROP USER deletes users in GaussDB. This permission can be executed only when you have the permission to create users. After the command for deleting a user is executed successfully, the schema with the same name is deleted.

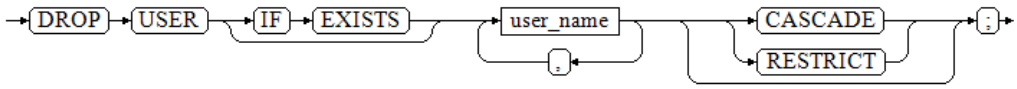
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- **CASCADE** is used to delete the objects (excluding databases) that depend on the user. It cannot delete locked objects unless the objects are unlocked or the threads locking the objects are terminated.
- If the dependent objects are other databases or reside in other databases, manually delete them before deleting the user from the current database. DROP USER cannot delete objects across databases.
- Before deleting a user, you need to delete all the objects owned by the user and revoke the user's permissions on other objects. Alternatively, you can specify **CASCADE** to delete the objects owned by the user and the granted permissions.
- In a multi-tenant scenario, the service user will also be deleted when you delete a user group. If you want to use **CASCADE**, set **CASCADE** for the service user as well. If any error is reported for one user, other users cannot be deleted either.
- If the user has an error table specified when the GDS foreign table is created, the user cannot be deleted by specifying the **CASCADE** keyword in the DROP USER statement.

Syntax

```
DROP USER [ IF EXISTS ] user_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  When this parameter is used, if the specified user does not exist, a notice instead of an error is sent. Therefore, this parameter can be used to avoid errors.

- **user_name**

  Specifies the name of the user to be deleted.

  Value range: an existing username in the database.

- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes objects that depend on the user and revokes the permissions granted to the user.
  - **RESTRICT**: refuses to delete the user if any objects depend on it. This is the default action.

    NOTE

    In GaussDB, the **enable_kill_query** configuration parameter exists in the **gaussdb.conf** file. This parameter affects **CASCADE**.

    - If **enable_kill_query** is **on** and **CASCADE** is used, the statement automatically kills the threads locking dependent objects and then deletes the specified user.
    - If **enable_kill_query** is **off** and **CASCADE** is used, the statement waits until the threads locking dependent objects end and then deletes the specified user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create user jim whose login password is ********.
gaussdb=# CREATE USER jim PASSWORD '********';

-- Delete user tom that does not exist.
gaussdb=# DROP USER IF EXISTS tom;
NOTICE:  role "tom" does not exist, skipping
DROP ROLE

-- Delete the user.
gaussdb=# DROP USER jim CASCADE;
```

Helpful Links

ALTER USER and **CREATE USER**

7.12.10.43 DROP VIEW

Description

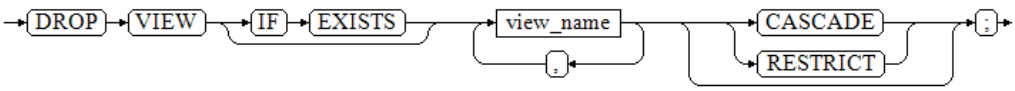
DROP VIEW deletes a view from a database.

Precautions

The owner of a view, owner of the schema of the view, users granted the DROP permission on the view, or users granted the DROP ANY TABLE permission can run the **DROP VIEW** command. When separation of duties is disabled, system administrators have this permission by default.

Syntax

```
DROP VIEW [ IF EXISTS ] view_name [, ...] [ CASCADE | RESTRICT ];
```



Parameters

- **IF EXISTS**

  Reports a notice instead of an error if the specified view does not exist.
- **view_name**

  Specifies the name of the view to be deleted.

  Value range: an existing view name
- **CASCADE | RESTRICT**
  - **CASCADE**: automatically deletes the objects (such as other views) that depend on the view.
  - **RESTRICT**: refuses to delete the view if any objects depend on it. This is the default action.

Examples

```
-- Create the test_tb1 table and insert 100 data records into the table.
gaussdb=# CREATE TABLE test_tb1(col1 int, col2 int);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# INSERT INTO test_tb1 VALUES (generate_series(1,100),generate_series(1,100));

-- Create a view whose value of col1 is less than 3.
gaussdb=# CREATE VIEW test_v1 AS SELECT * FROM test_tb1 WHERE col1 < 3;

-- Query the view.
gaussdb=# SELECT * FROM test_v1;
 col1 | col2
------+------
    1 |    1
    2 |    2
(2 rows)

-- Delete the table and the view.
gaussdb=# DROP VIEW test_v1;
gaussdb=# DROP TABLE test_tb1;
```

Helpful Links

ALTER VIEW and **CREATE VIEW**

7.12.10.44 DROP WEAK PASSWORD DICTIONARY

Description

DROP WEAK PASSWORD DICTIONARY is used to clear the weak password dictionary. You can run this statement to clear all weak passwords in the gs_global_config system catalog.

Precautions

Only the initial user, system administrators, and security administrators have the permission to execute this syntax.

Syntax

```
DROP WEAK PASSWORD DICTIONARY;
```

Examples

```
-- Insert a single weak password into the gs_global_config system catalog.
gaussdb=# CREATE WEAK PASSWORD DICTIONARY WITH VALUES ('********');

-- Check weak passwords in the gs_global_config system catalog.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
      name       |    value
-----------------+--------------
 weak_password   | ********
(1 rows)

-- Clear all weak passwords in the gs_global_config system catalog.
gaussdb=# DROP WEAK PASSWORD DICTIONARY;

-- View existing weak passwords.
gaussdb=# SELECT * FROM gs_global_config WHERE NAME LIKE 'weak_password';
 name | value
------+-------
(0 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Helpful Links

CREATE WEAK PASSWORD DICTIONARY

7.12.11 E

7.12.11.1 EXECUTE

Description

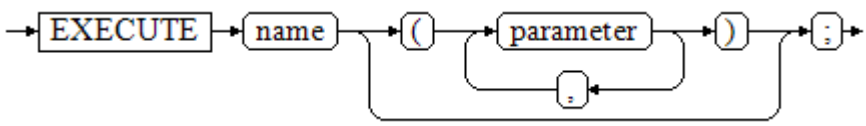
Executes a prepared statement. Because a prepared statement exists only in the lifetime of the session, the prepared statement must be created earlier in the current session by using the PREPARE statement.

Precautions

If the PREPARE statement declares some parameters when the prepared statement is created, the parameter set passed to the EXECUTE statement must be compatible. Otherwise, an error occurs.

Syntax

```
EXECUTE name [ ( parameter [, ...] ) ];
```



Parameters

- **name**

  Specifies the name of the prepared statement to be executed.

- **parameter**

  Specifies a parameter of the prepared statement. It must be an expression that generates a value compatible with the data type of the parameter specified when the prepared statement was created. **ROWNUM** cannot be used as a parameter.

Examples

```
-- Create the reason table.
gaussdb=# CREATE TABLE reason (
    CD_DEMO_SK          int NOT NULL,
    CD_GENDER           varchar(10),
    CD_MARITAL_STATUS   varchar(10)
);

-- Create a prepared statement for an INSERT statement and execute the prepared statement.
gaussdb=# PREPARE insert_reason(int,varchar(10),varchar(10)) AS INSERT INTO reason VALUES($1,$2,$3);
gaussdb=# EXECUTE insert_reason(52, 'AAAAAAAADD', 'reason 52');

-- Query data.
gaussdb=# SELECT * FROM reason;
 cd_demo_sk | cd_gender  | cd_marital_status
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------+------------+--------------------
        52 | AAAAAAAADD | reason 52
(1 row)

-- Drop the reason table.
gaussdb=# DROP TABLE reason;
```

Helpful Links

PREPARE and **DEALLOCATE**

7.12.11.2 EXECUTE DIRECT

Description

Executes an SQL statement on a specified node. Generally, the cluster automatically allocates an SQL statement to proper nodes. EXECUTE DIRECT is mainly used for database maintenance and testing.

Precautions

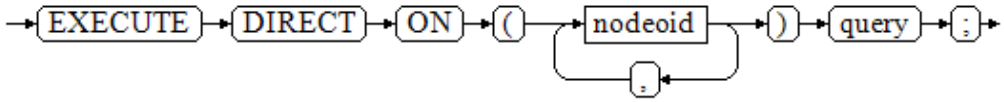
- When **enable_nonsysadmin_execute_direct** is **off**, only a system administrator has the EXECUTE DIRECT permission.
- To ensure data consistency across nodes, only the SELECT statement can be used. Transaction statements, DDL, and DML cannot be used.
- When the stddev aggregation calculation is performed on the specified DN using such statements, the result set is returned in triplet. For example, {3, 8, 30} indicates that the count result is 3, the sum result is 8, and the sum of squares is 30. When the AVG aggregation calculation is performed on the specified DN using such statements, the result set is returned in a binary tuple, for example, {4,2}. The result of count is 4, and that of sum is 2.
- When multiple nodes are specified, aggregate functions are not supported. If the query contains an aggregate function, the message "EXECUTE DIRECT on multinode not support agg functions." is returned.
- CN nodes do not store user table data. Therefore, do not execute SELECT for querying user tables on a CN.
- If the SQL statement to be executed is also EXECUTE DIRECT, do not nest it into EXECUTE DIRECT; instead, directly execute the inner EXECUTE DIRECT.
- The query result of the **agg** function is inconsistent with that on the CN. Multiple pieces of information are returned. The **array_avg** function is not supported.
- If the **nodeoid** or **nodeoid list** parameter is specified, this parameter takes effect only when the **enable_direct_standby_datanodes** parameter is successfully set in distributed mode. To query data on a specified DN, invalid or duplicate **nodeoid** values are not supported, and **nodeoid** and **nodename** cannot be used together.

Syntax

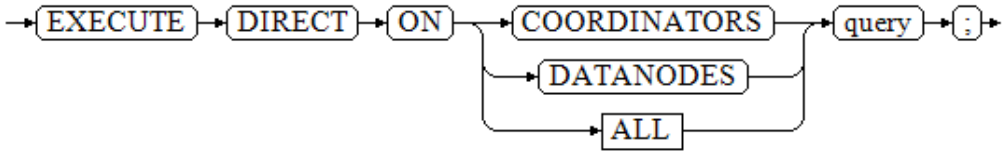
```
EXECUTE DIRECT ON ( nodename [, ... ] ) query ;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
EXECUTE DIRECT ON ( nodeoid [, ... ] ) query;
```



```
EXECUTE DIRECT ON { COORDINATORS | DATANODES | ALL } query;
```



Parameters

- **nodename**

  Node name.

  Value range: an existing node name

- **nodeoid**

  Node OID.

  Value range: an existing DN OID, which can be obtained from the **PGXC_NODE** system catalog.

- **query**

  Specifies the SQL statement to be executed.

- **COORDINATORS**

  Runs the query statement on all CNs.

- **DATANODES**

  Runs the query statement on all DNs.

- **ALL**

  Runs the query statement on all CNs and DNs.

Examples

```
-- Query the name of the current node in the cluster.
gaussdb=# SELECT node_name,oid FROM pgxc_node WHERE node_type IN ('C','D') ORDER BY 1;
     node_name     |  oid
-------------------+-------
 cn_5001           | 15517
 cn_5002           | 16387
 cn_5003           | 16391
 dn_6001_6002_6003 | 16384
 dn_6004_6005_6006 | 16388
 dn_6007_6008_6009 | 16392
(6 rows)

-- Create a range-distributed table and insert data into the table.
gaussdb=# CREATE TABLE tbl_range(
  id       INT,
  name     VARCHAR(20),
  province VARCHAR(60),                    -- Province
  country   VARCHAR(30) DEFAULT 'China'       -- Country
)DISTRIBUTE BY RANGE(id)(
  SLICE s1 VALUES LESS THAN (100) DATANODE dn_6001_6002_6003,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 SLICE s2 VALUES LESS THAN (200) DATANODE dn_6004_6005_6006,
 SLICE s3 VALUES LESS THAN (MAXVALUE) DATANODE dn_6007_6008_6009
);
gaussdb=# INSERT INTO tbl_range VALUES (52,'Bob','Beijing','China'),
                                       (100,'Ben','Shanghai','China'),
                                       (150,'Scott','Guangzhou','China'),
                                       (300,'Jordan','Beijing','China');

-- Query the table data distributed on the dn_6007_6008_6009 node.
gaussdb=# EXECUTE DIRECT ON(dn_6007_6008_6009) 'SELECT * FROM tbl_range';
 id  |  name  | province | country
-----+--------+----------+---------
 300 | Jordan | Beijing  | China
(1 row)

-- Delete the tbl_range table.
gaussdb=# DROP TABLE tbl_range;
```

7.12.11.3 EXPDP DATABASE

Description

EXPDP DATABASE exports all physical files in a database.

Syntax

```
EXPDP DATABASE db_name LOCATION = 'directory';
```

Parameters

- **db_name**

  Name of the database to be exported.
- **directory**

  Directory for storing exported files.

Examples

```
-- The EXPDP DATABASE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you call it directly, the error message "ERROR: Only auxdb is allowed to execute expdp cmd." is displayed.
gaussdb=# EXPDP DATABASE test LOCATION = '/data1/expdp/database';
```

7.12.11.4 EXPDP TABLE

Description

Exports all table-related index, sequence, partition, TOAST, and TOAST index files.

Syntax

```
EXPDP TABLE table_name LOCATION = 'directory';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **table_name**

  Name of the table to be exported.

- **directory**

  Directory for storing exported files.

Examples

```
-- The EXPDP TABLE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you call it directly, the error message "ERROR: Only auxdb is allowed to execute expdp cmd." is displayed.
gaussdb=# EXPDP TABLE test_t LOCATION = '/data1/expdp/table0';
```

7.12.11.5 EXPLAIN

Description

Shows the execution plan of an SQL statement.

The execution plan shows how the tables referenced by the SQL statement will be scanned, for example, by plain sequential scan or index scan. If multiple tables are referenced, the execution plan also shows what join algorithms will be used to bring together the required rows from each input table.

The most critical part of the display is the estimated statement execution cost, influencing the planner's guess at how long it will take to run the statement.

The **ANALYZE** option causes the statement to be actually executed, not only planned. The total elapsed time expended within each plan node (in milliseconds) and total number of rows it actually returned are added to the display. This is useful for determining whether the planner's estimates are close to reality.

Precautions

The statement is actually executed when ANALYZE is used. If you want to use EXPLAIN ANALYZE on an INSERT, UPDATE, DELETE, CREATE TABLE AS, or EXECUTE statement without letting the statement affect your data, use this approach:

```
START TRANSACTION;
EXPLAIN ANALYZE ...;
ROLLBACK;
```

Syntax

- Display the execution plan of an SQL statement, which supports multiple options and has no requirements for the order of options.

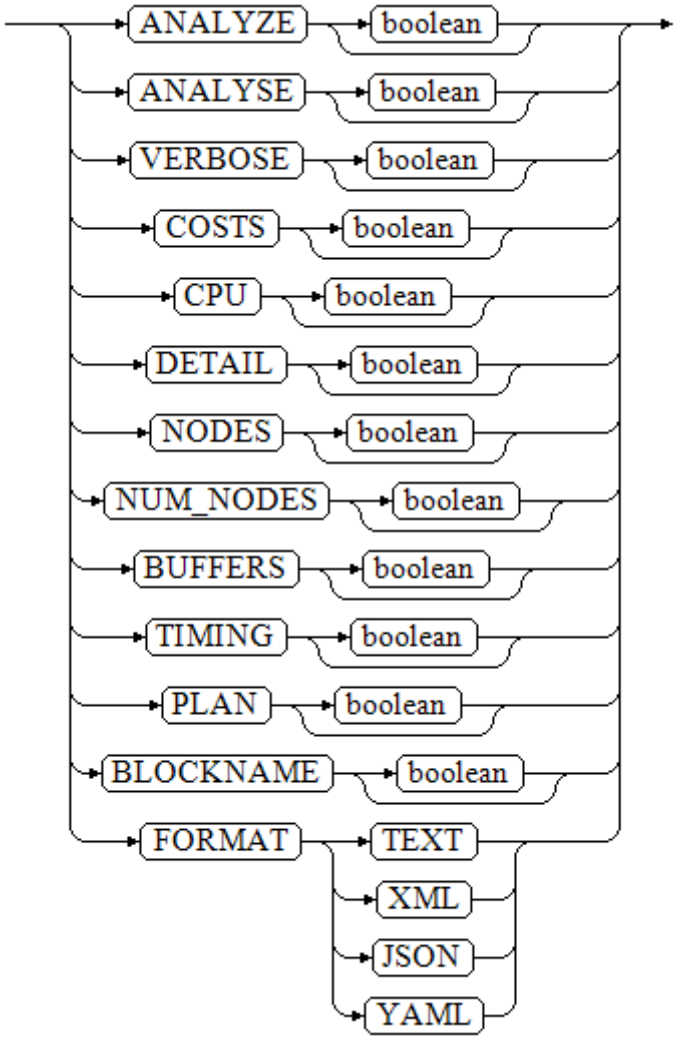
  ```
  EXPLAIN [ ( option [, ...] ) ] statement;
  ```

  
  The syntax of the **option** clause is as follows:

  ```
  ANALYZE [ boolean ] |
      ANALYSE [ boolean ] |
  ```

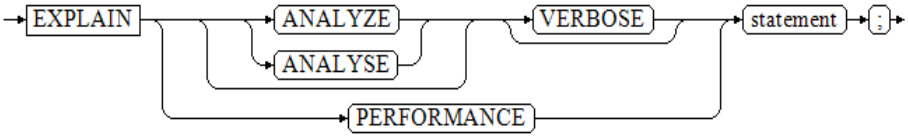
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
VERBOSE [ boolean ] |
COSTS [ boolean ] |
CPU [ boolean ] |
DETAIL [ boolean ] |
NODES [ boolean ] |
NUM_NODES [ boolean ] |
BUFFERS [ boolean ] |
TIMING [ boolean ] |
PLAN [ boolean ] |
BLOCKNAME [ boolean ] |
FORMAT { TEXT | XML | JSON | YAML }
```



- Display the execution plan of an SQL statement, where options are in order.

```
EXPLAIN { [ ANALYZE | ANALYSE ] [ VERBOSE ] | PERFORMANCE } statement;
```



Parameters

- **statement**

  Specifies the SQL statement to explain.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **ANALYZE boolean | ANALYSE boolean**

  Specifies whether to display actual run times and other statistics. When two parameters are used at the same time, the latter option takes effect.

  Value range:

  – **TRUE** (default): displays them.

  – **FALSE**: does not display them.

- **VERBOSE boolean**

  Specifies whether to display additional information regarding the plan.

  Value range:

  – **TRUE** (default): displays it.

  – **FALSE**: does not display it.

- **COSTS boolean**

  Specifies whether to display the estimated total cost of each plan node, estimated number of rows, estimated width of each row.

  Value range:

  – **TRUE** (default): displays them.

  – **FALSE**: does not display them.

- **CPU boolean**

  Specifies whether to display CPU usage. This parameter must be used together with ANALYZE or ANALYSE.

  Value range:

  – **TRUE** (default): displays it.

  – **FALSE**: does not display it.

- **DETAIL boolean**

  Specifies whether to display DN information. This parameter must be used together with ANALYZE or ANALYSE.

  Value range:

  – **TRUE** (default): displays it.

  – **FALSE**: does not display it.

- **NODES boolean**

  Specifies whether to display information about the nodes executed by query.

  Value range:

  – **TRUE** (default): displays it.

  – **FALSE**: does not display it.

- **NUM_NODES boolean**

  Specifies whether to display the number of executing nodes.

  Value range:

  – **TRUE** (default): displays it.

  – **FALSE**: does not display it.

- **BUFFERS boolean**

  Specifies whether to display buffer usage. This parameter must be used together with ANALYZE or ANALYSE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- **TRUE**: displays it.
- **FALSE** (default): does not display it.

- **TIMING boolean**

  Specifies whether to display the actual startup time and time spent on the output node. This parameter must be used together with ANALYZE or ANALYSE.

  Value range:

  - **TRUE** (default): displays them.
  - **FALSE**: does not display them.

- **PLAN boolean**

  Specifies whether to store the execution plan in **PLAN_TABLE**. If this parameter is set to **on**, the execution plan is stored in **PLAN_TABLE** and is not displayed on the screen. Therefore, this parameter cannot be used together with other parameters when it is set to **on**.

  Value range:

  - **TRUE** (default): The execution plan is stored in **PLAN_TABLE** and not displayed on the screen. If the plan is stored successfully, "EXPLAIN SUCCESS" is returned.
  - **FALSE**: The execution plan is not stored but is printed on the screen.

- **BLOCKNAME boolean**

  Specifies whether to display the query block where each operation of the plan is located. When this option is enabled, the name of the query block where each operation is performed is displayed in the **Query Block** column. This helps users obtain the query block name and use hints to modify the execution plan.

  - **TRUE** (default value): When the plan is displayed, the name of the query block where each operation is located is displayed in the **Query Block** column. This option must be used in the pretty mode. For details, see **Hint Specifying the Query Block Where the Hint Is Located**.
  - **FALSE**: The plan display is not affected.

- **FORMAT**

  Specifies the output format.

  Value range: **TEXT**, **XML**, **JSON**, and **YAML**

  Default value: **TEXT**

- **PERFORMANCE**

  Prints all relevant information in execution. Some information is described as follows:

  - **ex c/r**: indicates the average number of CPU cycles used by each row, which is equal to **(ex cyc) / (ex row)**.
  - **ex row**: indicates the number of executed rows.
  - **ex cyc**: indicates the number of used CPU cycles.
  - **inc cyc**: indicates the total number of CPU cycles used by subnodes.
  - **shared hit**: indicates the shared buffer hits of the operator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **loops**: indicates the number of operator loop execution times.
- **total_calls**: indicates the total number of generated elements.
- **remote query poll time stream gather**: indicates the operator used to listen to the network poll time when data on each DN reaches the CN.
- **deserialize time**: indicates the time required for deserialization.
- **estimated time**: indicates the estimated time.
- **Network Poll Time**: indicates the duration for the libcomm receiver to wait for data during distributed stream network communication.
- **Stream Send time**: indicates the time consumed by libcomm or libpq to send data during distributed stream network communication.
- **OS Kernel Send time**: indicates the time required for the OS layer to send data during distributed stream network communication. This parameter is displayed only when the value is greater than **0**.
- **Wait Quota time**: indicates the duration for libcomm to wait for the peer end to send the quota traffic control size during distributed stream network communication. This parameter is displayed only when the value is greater than **0**.
- **Data Serialize time**: indicates the data serialization time during distributed stream network communication.
- **Data Copy time**: indicates the data replication time during distributed stream network communication. This parameter is displayed only when the value is greater than **0**.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.customer_address table.
gaussdb=# CREATE TABLE tpcds.customer_address
(
ca_address_sk         INTEGER           NOT NULL,
ca_address_id         CHARACTER(16)     NOT NULL
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.customer_address VALUES (5000, 'AAAAAAAABAAAAAAA'),(10000,
'AAAAAAAACAAAAAAA');

-- Create the tpcds.customer_address_p1 table.
gaussdb=# CREATE TABLE tpcds.customer_address_p1 AS TABLE tpcds.customer_address;

-- Change the value of explain_perf_mode to normal.
gaussdb=# SET explain_perf_mode=normal;

-- Display an execution plan for simple queries in the table.
gaussdb=# EXPLAIN SELECT * FROM tpcds.customer_address_p1;
QUERY PLAN
--------------------------------------------------
Data Node Scan  (cost=0.00..0.00 rows=0 width=0)
Node/s: All datanodes
(2 rows)

-- Use the ANALYZE option to add runtime statistics to the output.
gaussdb=# EXPLAIN ANALYZE SELECT * FROM tpcds.customer_address_p1;
                                  QUERY PLAN
-------------------------------------------------------------------------------------------
 Data Node Scan  (cost=0.00..0.00 rows=0 width=0) (actual time=1.754..3.218 rows=2 loops=1)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  Node/s: All datanodes
 Total runtime: 3.272 ms
(3 rows)

-- Use the ANALYZE and CPU options to output the CPU usage information.
gaussdb=# EXPLAIN (ANALYZE,CPU)SELECT * FROM tpcds.customer_address_p1;
                                  QUERY PLAN
-------------------------------------------------------------------------------------------------

7.12.11.6 EXPLAIN PLAN

Description

EXPLAIN PLAN saves information about an execution plan into the **PLAN_TABLE** table. Different from the EXPLAIN statement, EXPLAIN PLAN only saves plan information and does not print information on the screen.

Precautions

- EXPLAIN PLAN cannot be executed on a DN.
- Plan information cannot be collected for SQL statements that failed to be executed.
- Data in **PLAN_TABLE** is in a session-level lifecycle. Sessions are isolated from users, and therefore users can only view the data of the current session and current user.
- **PLAN_TABLE** cannot be joined with GDS foreign tables.
- For a query that cannot be pushed down, only such information as **REMOTE_QUERY** and **CTE** can be collected from **PLAN_TABLE** after **EXPLAIN PLAN** is executed. For details, see **Example 2**.
- **PLAN**: saves plan information into **PLAN_TABLE**. If information is stored successfully, "EXPLAIN SUCCESS" is returned.
- **STATEMENT_ID**: tags each query. The tag information will be stored in **PLAN_TABLE**.
- After the EXPLAIN PLAN statement is executed, plan information is automatically stored in **PLAN_TABLE**. INSERT, UPDATE, and ANALYZE cannot be performed on **PLAN_TABLE**. For details about **PLAN_TABLE**, see **PLAN_TABLE**.

Syntax

```
EXPLAIN PLAN
[ SET STATEMENT_ID = name ]
FOR statement ;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **name**

  Specifies a query tag.

  Value range: a string

  NOTE

  If **STATEMENT_ID** is not set when the EXPLAIN PLAN statement is executed, **STATEMENT_ID** is left empty by default. In addition, the value of **STATEMENT_ID** cannot exceed 30 bytes. Otherwise, an error will be reported.

- **statement**

  Specifies the SQL statement to explain.

Example 1

```
-- Create tables foo1 and foo2.
gaussdb=# CREATE TABLE foo1(f1 int, f2 text, f3 text[]);
gaussdb=# CREATE TABLE foo2(f1 int, f2 text, f3 text[]);

-- Run EXPLAIN PLAN.
gaussdb=# EXPLAIN PLAN SET STATEMENT_ID = 'TPCH-Q4' FOR SELECT f1, count(*) FROM foo1 WHERE f1
> 1 AND f1 < 3 AND EXISTS (SELECT * FROM foo2) GROUP BY f1;

-- Query PLAN_TABLE.
gaussdb=# SELECT * FROM plan_table;

-- Delete data from the PLAN_TABLE table and delete tables foo1 and foo2.
gaussdb=# DELETE FROM plan_table WHERE STATEMENT_ID = 'TPCH-Q4';
gaussdb=# DROP TABLE foo1;
gaussdb=# DROP TABLE foo2;
```

Example 2

```
-- Disable enable_stream_recursive so that associated WITH RECURSIVE queries cannot be pushed down.
gaussdb=# SET enable_stream_recursive = off;

-- Create the chinamap table.
gaussdb=# CREATE TABLE chinamap
(
  id integer,
  pid integer,
  name text
) DISTRIBUTE BY hash(id);

-- Plan collected by plan_table.
gaussdb=# EXPLAIN PLAN SET statement_id = 'cte can not be push down'
FOR
WITH RECURSIVE rq AS
(
  SELECT id, name FROM chinamap WHERE id = 11
  UNION ALL
  SELECT origin.id, rq.name || ' > ' || origin.name
  FROM rq JOIN chinamap origin ON origin.pid = rq.id
)
SELECT id, name FROM rq ORDER BY 1;

-- Query PLAN_TABLE.
gaussdb=# SELECT * FROM plan_table;

-- Delete the chinamap table.
gaussdb=# DROP TABLE chinamap;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.12 F

7.12.12.1 FETCH

Description

FETCH retrieves rows using a previously created cursor.

A cursor has an associated position, which is used by FETCH. The cursor position can be before the first row of the query result, on any particular row of the result, or after the last row of the result.

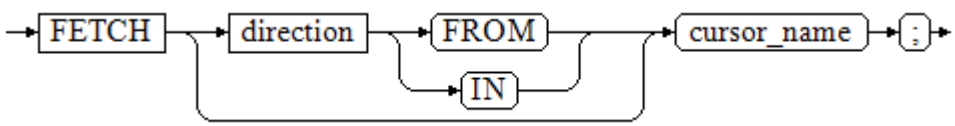
- When created, a cursor is positioned before the first row.
- After fetching some rows, the cursor is positioned on the row most recently retrieved.
- If FETCH runs off the end of the available rows then the cursor is left positioned after the last row, or before the first row if fetching backward.
- FETCH ALL or FETCH BACKWARD ALL will always leave the cursor positioned after the last row or before the first row.

Precautions

- If the cursor is declared with **NO SCROLL**, backward fetches like FETCH BACKWARD are not allowed.
- The forms **NEXT**, **PRIOR**, **FIRST**, **LAST**, **ABSOLUTE**, and **RELATIVE** fetch a single row after moving the cursor appropriately. If there is no such row, an empty result is returned, and the cursor is left positioned before the first row (backward fetch) or after the last row (forward fetch) as appropriate.
- The forms using **FORWARD** and **BACKWARD** retrieve the indicated number of rows moving in the forward or backward direction, leaving the cursor positioned on the last-returned row or after (backward fetch)/before (forward fetch) all rows if the **count** exceeds the number of rows available.
- **RELATIVE 0**, **FORWARD 0**, and **BACKWARD 0** all request fetching the current row without moving the cursor, that is, re-fetching the most recently fetched row. This action will succeed unless the cursor is positioned before the first row or after the last row. If the cursor is positioned before the first row or after the last row, no row is returned.
- If the cursor of FETCH involves a non-system catalog, backward fetches like **BACKWARD**, **PRIOR**, and **FIRST** are not allowed.

Syntax

```
FETCH [ direction { FROM | IN } ] cursor_name;
```

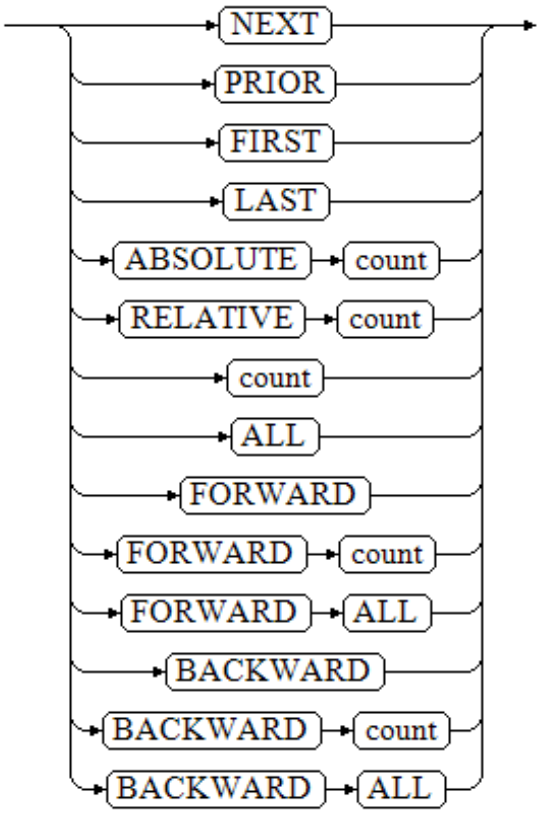


The direction clause specifies optional parameters.

```
NEXT
  | PRIOR
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
| FIRST
| LAST
| ABSOLUTE count
| RELATIVE count
| count
| ALL
| FORWARD
| FORWARD count
| FORWARD ALL
| BACKWARD
| BACKWARD count
| BACKWARD ALL
```



Parameters

- **direction**

  Defines the fetch direction.

  Value range:

  - **NEXT** (default value)

    Fetches the next row.
  - **PRIOR**

    Fetches the prior row.
  - **FIRST**

    Fetches the first row of the query (same as **ABSOLUTE 1**).
  - **LAST**

    Fetches the last row of the query (same as **ABSOLUTE -1**).
  - **ABSOLUTE** *count*

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Fetches the *count*'th row of the query.

ABSOLUTE fetches are not any faster than navigating to the desired row with a relative move: the underlying implementation must traverse all the intermediate rows anyway.

Value range: a possibly-signed integer

- If *count* is positive, the *count*'th row of the query will be fetched. If *count* is less than the current cursor position, rewind is required, which is currently not supported.
- If *count* is negative or 0, backward scan is required, which is currently not supported.

– RELATIVE count

Fetches the *count*'th succeeding row or the *count*'th prior row if count is negative.

Value range: a possibly-signed integer

- If *count* is positive, the *count*th succeeding row will be fetched.
- If *count* is negative or 0, backward scan is required, which is currently not supported.
- If the current row contains no data, **RELATIVE 0** returns null.

– count

Fetches the next *count* rows (same as **FORWARD** *count*).

– ALL

Fetches all remaining rows (same as **FORWARD ALL**).

– FORWARD

Fetches the next row (same as **NEXT**).

– FORWARD count

Fetches the next or prior *count* rows (same as **RELATIVE** *count*).

– FORWARD ALL

Fetches all remaining rows.

– BACKWARD

Fetches the prior row (same as **PRIOR**).

– BACKWARD count

Fetches the prior *count* rows (scanning backwards).

Value range: a possibly-signed integer

- If **count** is a positive integer, fetches the (count)'th prior row.
- If **count** is a negative integer, fetches the abs(count)'th succeeding row.
- **BACKWARD 0** re-fetches the current row, if any.

– BACKWARD ALL

Fetches all prior rows (scanning backwards).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **{ FROM | IN } cursor_name**

  Specifies the cursor name using the keyword **FROM** or **IN**.

  Value range: an existing cursor name

Examples

```
-- Create the test table and insert 20 data records into the table.
gaussdb=# CREATE TABLE test(c1 int, c2 int);
gaussdb=# INSERT INTO test VALUES (generate_series(1,20),generate_series(1,20));

-- Start a transaction and create a cursor named cursor1.
gaussdb=# START TRANSACTION;
gaussdb=# CURSOR cursor1 FOR SELECT * FROM test ORDER BY 1;

-- The cursor retrieves three rows of data from the associated position.
gaussdb=# FETCH FORWARD 3 FROM cursor1;
 c1 | c2
----+----
  1 |  1
  2 |  2
  3 |  3
(3 rows)

-- Close the cursor and commit the transaction.
gaussdb=# CLOSE cursor1;
gaussdb=# END;

-- Delete the table.
gaussdb=# DROP TABLE test;
```

CLOSE, **MOVE**, and **CURSOR**

7.12.13 G

7.12.13.1 GRANT

Description

Grants permissions to roles and users.

GRANT is used in the following scenarios:

- **Granting system permissions to roles or users**

  System permissions are also called user attributes, including SYSADMIN, CREATEDB, CREATEROLE, AUDITADMIN, MONADMIN, OPRADMIN, POLADMIN, INHERIT, REPLICATION, and LOGIN.

  They can be specified only by the CREATE ROLE or ALTER ROLE statement. The SYSADMIN permissions can be granted and revoked using GRANT ALL PRIVILEGE and REVOKE ALL PRIVILEGE, respectively. System permissions cannot be inherited by a user from a role, and cannot be granted using PUBLIC.

- **Granting database object permissions to roles or users**

  Grant permissions on a database object (table, view, column, database, function, schema, or tablespace) to a role or user.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GRANT gives specific permissions on a database object to one or more roles. These permissions are added to those already granted, if any.

The keyword PUBLIC indicates that the permissions are to be granted to all roles, including those that might be created later. PUBLIC can be thought of as an implicitly defined group that always includes all roles. Any particular role will have the sum of permissions granted directly to it, permissions granted to any role it is presently a member of, and permissions granted to PUBLIC.

If WITH GRANT OPTION is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. This option cannot be granted to PUBLIC, which is a unique GaussDB attribute.

GaussDB grants the permissions on certain types of objects to PUBLIC. By default, permissions on tables, columns, sequences, foreign data sources, foreign servers, schemas, and tablespaces are not granted to PUBLIC, but the following permissions are granted to PUBLIC: CONNECT and CREATE TEMP TABLE permissions on databases, EXECUTE permission on functions, and USAGE permission on languages and data types (including domains). An object owner can revoke the default permissions granted to PUBLIC and grant permissions to other users as needed. For security purposes, you are advised to create an object and set its permissions in the same transaction so that other users do not have time windows to use the object. These default permissions can be modified by running the **ALTER DEFAULT PRIVILEGES** command.

By default, an object owner has all permissions on the object. For security purposes, the owner can discard some permissions. However, the ALTER, DROP, COMMENT, INDEX, VACUUM, and re-grantable permissions of the object are inherent permissions implicitly owned by the owner.

- **Granting the permissions of one role or user to others**

  Grant the permissions of one role or user to others. In this case, every role or user can be regarded as a set of one or more database permissions.

  If WITH ADMIN OPTION is specified, the recipients can in turn grant the permissions to other roles or users or revoke the permissions they have granted to other roles or users. If recipients' permissions are changed or revoked later, the grantees' permissions will also change.

  When separation of duties is disabled, the system administrator can grant or revoke the permissions of any non-permanent user, O&M administrator, or private user role. Security administrators can grant or revoke permissions of any non-system administrator, built-in role, permanent user, O&M administrator, or private user role.

- **Granting ANY permissions to roles or users**

  Grant ANY permissions to a specified role or user. For details about the value range of the ANY permissions, see the syntax. If WITH ADMIN OPTION is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users. The ANY permissions can be inherited by a role but cannot be granted to PUBLIC. An initial user and the system administrator when separation of duties is disabled can grant the ANY permissions to or revoke them from any role or user.

  Currently, the following ANY permissions are supported: CREATE ANY TABLE, ALTER ANY TABLE, DROP ANY TABLE, SELECT ANY TABLE, INSERT ANY TABLE,

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

UPDATE ANY TABLE, DELETE ANY TABLE, CREATE ANY SEQUENCE, CREATE ANY INDEX, CREATE ANY FUNCTION, EXECUTE ANY FUNCTION, CREATE ANY PACKAGE, EXECUTE ANY PACKAGE, CREATE ANY TYPE, ALTER ANY TYPE, DROP ANY TYPE, ALTER ANY SEQUENCE, DROP ANY SEQUENCE, SELECT ANY SEQUENCE, ALTER ANY INDEX, DROP ANY INDEX, CREATE ANY SYNONYM, DROP ANY SYNONYM, CREATE ANY TRIGGER, ALTER ANY TRIGGER, and DROP ANY TRIGGER. For details about the ANY permission scope, see **Table 7-272**.

Precautions

- It is not allowed to grant the ANY permissions to PUBLIC or revoke the ANY permissions from PUBLIC.
- The ANY permissions are database permissions and are valid only for database objects that are granted the permissions. For example, SELECT ANY TABLE only allows a user to view all user table data in the current database, but the user does not have the permission to view user tables in other databases.
- The ANY permissions and the original permissions do not affect each other.
- If a user is granted the CREATE ANY TABLE permission, the owner of a table created in a schema with the same name as the user is the creator of the schema. When the user performs other operations on the table, the user needs to be granted the corresponding operation permission. Similarly, if a user is granted the CREATE ANY FUNCTION, CREATE ANY PACKAGE, CREATE ANY TYPE, CREATE ANY SEQUENCE, or CREATE ANY INDEX permission, the owner of an object created in a schema with the same name is the owner of the schema. If a user is granted the CREATE ANY TRIGGER or CREATE ANY SYNONYM permission, the owner of an object created in a schema with the same name is the creator.
- Exercise caution when granting the CREATE ANY FUNCTION or CREATE ANY PACKAGE permission to users to prevent other users from using DEFINER functions or PACKAGE for privilege escalation.
- When GRANT is used to grant a user the permission to use a table, if the permission is not properly used, ALTER may be used to add expressions to the default values and constraints of the table, or indexes may be created to add expressions to INDEX. In this case, the permission may be exploited.
- When GRANT is used to grant the TRIGGER permission, if the permission is not properly used, the WHEN condition may be used to create expressions. When the trigger is triggered, the permission may be exploited.
- When granting permissions to users, pay special attention to the definer permission on functions/packages. The definer permission is executed as the owner of the functions/packages. If the permission is not properly granted (including GRANT ROLE TO ROLE), the permission may be exploited.
- Do not grant object permissions to too many users. You can use roles or PUBLIC based on service requirements.

Syntax

- Grant the table or view access permission to a user or role.

```
GRANT { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | TRIGGER | ALTER | DROP
| COMMENT | INDEX | VACUUM } [, ...]
    | ALL [ PRIVILEGES ] }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  ON { [ TABLE ] table_name [, ...]
    | ALL TABLES IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the column access permission to a user or role.

```
GRANT { {{ SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] )} [, ...]
    | ALL [ PRIVILEGES ] ( column_name [, ...] ) }
  ON [ TABLE ] table_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

  NOTE

  If you have the permission to access a table, you have the permission to access all columns in the table by default. To grant only the access permission on a column in a table, you need to revoke the access permission on the table.

- Grant the sequence access permission to a specified user or role.

```
GRANT { { SELECT | UPDATE | USAGE | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
  ON { [ SEQUENCE ] sequence_name [, ...]
    | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the database access permission to a user or role.

```
GRANT { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
  ON DATABASE database_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the domain access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON DOMAIN domain_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

  NOTE

  In the current version, the domain access permission cannot be granted.

- Grant the CMK access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON CLIENT_MASTER_KEY client_master_key
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the column encryption key (CEK) access permission to a specified user or role.

```
GRANT { { USAGE | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON COLUMN_ENCRYPTION_KEY column_encryption_key
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the foreign data source access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON FOREIGN DATA WRAPPER fdw_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the foreign server access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON FOREIGN SERVER server_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the function access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON { FUNCTION {function_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the procedural procedure access permission to a user or role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON PROCEDURE {proc_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the procedural language access permission to a user or role.

```
GRANT { USAGE | ALL [ PRIVILEGES ] }
  ON LANGUAGE lang_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

In the current version, all users can create C functions, whereas only users with the sysadmin permission can create Java and internal functions.

- When a user with the sysadmin permission grants the permission for creating C functions to others, the user must specify a recipient and cannot use GRANT USAGE ON LANGUAGE c TO PUBLIC.
- When a user with the sysadmin permission grants the permission for creating C functions to others, the user cannot specify WITH GRANT OPTION.

- Grant the sub-cluster access permission to a user or role.

```
GRANT { { CREATE | USAGE | COMPUTE | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON NODE GROUP group_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

When the CREATE permission of a sub-cluster is granted to a specified user or role, the USAGE and COMPUTE permissions are granted to the specified user or role by default.

- Grant the schema access permission to a user or role.

```
GRANT { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON SCHEMA schema_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

When you grant table or view permissions to other users, you also need to grant the USAGE permission on the schema that the tables and views belong to. Without the USAGE permission, the users with table or view permissions can only see the object names, but cannot access them.

- Grant the tablespace access permission to a user or role.

```
GRANT { { CREATE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON TABLESPACE tablespace_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

- Grant the type access permission to a user or role.

```
GRANT { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON TYPE type_name [, ...]
  TO { [ GROUP ] role_name | PUBLIC } [, ...]
  [ WITH GRANT OPTION ];
```

NOTE

In the current version, the type access permission cannot be granted.

- Grant the DIRECTORY permission to a role.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
GRANT { { READ | WRITE | ALTER | DROP } [, ...] | ALL [PRIVILEGES] }
  ON DIRECTORY directory_name [, ...]
  TO { [GROUP] role_name | PUBLIC } [, ...]
  [WITH GRANT OPTION];
```

- Grant the PACKAGE permission to a role.

```
GRANT { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
  ON PACKAGE package_name [, ...]
  TO { [GROUP] role_name | PUBLIC } [, ...]
  [WITH GRANT OPTION];
```

- Grant a role's permissions to another user or role.

```
GRANT role_name [, ...]
  TO role_name [, ...]
  [ WITH ADMIN OPTION ];
```

- Grant the SYSADMIN permission to a role.

```
GRANT ALL { PRIVILEGES | PRIVILEGE }
  TO role_name;
```

- Grant the ANY permissions to another user or role.

```
GRANT { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE |
INSERT ANY TABLE | UPDATE ANY TABLE | DELETE ANY TABLE | CREATE ANY SEQUENCE |
CREATE ANY INDEX | CREATE ANY FUNCTION | EXECUTE ANY FUNCTION | CREATE ANY PACKAGE |
EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY TYPE |
ALTER ANY SEQUENCE | DROP ANY SEQUENCE | SELECT ANY SEQUENCE | ALTER ANY INDEX |
DROP ANY INDEX | CREATE ANY SYNONYM | DROP ANY SYNONYM | CREATE ANY TRIGGER | ALTER
ANY TRIGGER |
  DROP ANY TRIGGER } [, ...]
  TO [ GROUP ] role_name [, ...]
  [ WITH ADMIN OPTION ];
```

- Grant the database link object permission to a specified user.

```
GRANT { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK TO role_name;
```

  NOTE

  - **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and used only as a compatible API. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
  - When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.
  - In addition to the statement for directly granting the database link permission, you can also obtain the database link permission by inheriting permission and granting permission to an administrator.
  - For details about database links, see **DATABASE LINK**.

- Grant the permission to create PUBLIC synonyms to a specified user.

```
GRANT { CREATE | DROP } PUBLIC SYNONYM TO role_name [ WITH ADMIN OPTION ];
```

  Built-in roles (gs_role_public_synonym_create and gs_role_public_synonym_drop) can also be used to grant users the permission to create and delete PUBLIC synonyms.

  – Grant the permission to create PUBLIC synonyms to a user.

```
GRANT gs_role_public_synonym_create TO role_name;
```

  – Grant the permission to delete PUBLIC synonyms to a user.

```
GRANT gs_role_public_synonym_drop TO role_name;
```

Parameters

GRANT permissions are classified as follows:

- **SELECT**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Allows SELECT from any table, view, or sequence. The SELECT permission on the corresponding column is also required for UPDATE or DELETE.

- **INSERT**

  Allows INSERT of a new row into a table.

- **UPDATE**

  Allows you to execute the UPDATE statement on any column in the specified table. The UPDATE statement also requires the SELECT permission to query which rows need to be updated. SELECT ... FOR UPDATE and SELECT ... FOR SHARE also require this permission on at least one column, in addition to the SELECT permission.

- **DELETE**

  Allows DELETE of a row from a table. DELETE also requires the SELECT permission to query which rows need to be deleted.

- TRUNCATE

  Allows TRUNCATE on a table.

- **REFERENCES**

  Allows to create a foreign key constraint referencing a table. This permission is required on both referencing and referenced tables. This function is not supported in distributed mode.

- **TRIGGER**

  Allows the creation of a trigger on the specified table.

- **CREATE**
  - For databases, allows new schemas to be created within the database.
  - For schemas, allows new objects to be created within the schema. To rename an existing object, you must own the object and have the CREATE permission on the schema of the object.
  - For tablespaces, allows tables to be created within the tablespace, and allows databases and schemas to be created that have the tablespace as their default tablespace.
  - For sub-clusters, allows tables to be created within the sub-cluster.

- **CONNECT**

  Allows the grantee to connect to the database.

- **EXECUTE**

  Allows calling a function, including use of any operators that are implemented on top of the function.

- **USAGE**
  - For procedural languages, allows use of the language for the creation of functions in that language.
  - For schemas, allows access to objects contained in the schema. Without this permission, it is still possible to see the object names.
  - For sequences, allows use of the nextval function.
  - For sub-clusters, allows users who can access objects contained in the schema to access tables in the sub-cluster.
  - For a key object, USAGE is the permission to use the key.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **COMPUTE**

  For computing sub-clusters, allows users to perform elastic computing in the sub-cluster that they have the compute permission on.

- **ALTER**

  Allows users to modify the attributes of a specified object, excluding the owner and schema of the object.

- **DROP**

  Allows users to delete specified objects.

- **COMMENT**

  Allows users to define or modify comments of a specified object.

- **INDEX**

  Allows users to create indexes on specified tables, manage indexes on the tables, and perform REINDEX and CLUSTER operations on the tables.

- **VACUUM**

  Allows users to perform ANALYZE and VACUUM operations on specified tables.

- **ALL PRIVILEGES**

  Grants all available permissions to a user or role at a time. Only a system administrator has the GRANT ALL PRIVILEGES permission.

GRANT parameters are as follows:

- **role_name**

  Specifies the username.

- **table_name**

  Specifies the table name.

- **column_name**

  Specifies the column name.

- **schema_name**

  Specifies the schema name.

- **database_name**

  Specifies the database name.

- **function_name**

  Specifies the function name.

- **sequence_name**

  Specifies the sequence name.

- **domain_name**

  Specifies the domain type name.

- **fdw_name**

  Specifies the foreign data wrapper name.

- **lang_name**

  Specifies the language name.

- **type_name**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Specifies the type name.

- **group_name**

  Specifies the sub-cluster name.

- **argmode**

  Specifies the parameter mode.

  Value range: a string. It must comply with the **naming convention**.

- **arg_name**

  Specifies the parameter name.

  Value range: a string. It must comply with the **naming convention**.

- **arg_type**

  Specifies the parameter type.

  Value range: a string. It must comply with the **naming convention**.

- **loid**

  Specifies the identifier of the large object that includes this page.

  Value range: a string. It must comply with the **naming convention**.

- **tablespace_name**

  Specifies the tablespace name.

- **client_master_key**

  Name of the CMK.

  Value range: a string. It must comply with the **naming convention**.

- **column_encryption_key**

  Name of the column encryption key.

  Value range: a string. It must comply with the **naming convention**.

- **directory_name**

  Specifies the directory name.

  Value range: a string. It must comply with the **naming convention**.

- **WITH GRANT OPTION**

  If WITH GRANT OPTION is specified, the recipient of the permission can in turn grant it to others. Without a grant option, the recipient cannot do that. Grant options cannot be granted to PUBLIC.

When a non-owner of an object attempts to grant permissions on the object:

- The statement will fail outright if the user has no permissions whatsoever on the object.
- As long as some permission is available, the statement will proceed, but it will grant only those permissions for which the user has grant options.
- The GRANT ALL PRIVILEGES forms will issue a warning message if no grant options are held, while the other forms will issue a warning if grant options for any of the permissions specifically named in the statement are not held.

NOTE

When separation of duties is disabled, database administrators can access all objects, regardless of object permission settings. It is unwise to operate as a system administrator except when necessary.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **WITH ADMIN OPTION**

  If WITH ADMIN OPTION is specified for a role, the grantee can grant the role to other roles or users or revoke the role from other roles or users.

  For the ANY permissions, if WITH ADMIN OPTION is specified, the grantee can grant the ANY permissions to or revoke them from other roles or users.

Table 7-272 ANY permissions

Permission	Description
CREATE ANY TABLE	Users can create tables or views in the public and user schemas. The users must be granted the permission to create sequences to create a table that contains serial columns.
ALTER ANY TABLE	Users' ALTER permission on tables or views in the public and user schemas. If the users want to modify the unique index of a table to add a primary key constraint or unique constraint to the table, the users must be granted the index permission on the table.
DROP ANY TABLE	Users' DROP permission on tables or views in the public and user schemas.
SELECT ANY TABLE	Users' SELECT permission on tables or views in the public and user schemas, which is still subject to row-level security.
UPDATE ANY TABLE	Users' UPDATE permission on tables or views in the public and user schemas, which is still subject to row-level security.
INSERT ANY TABLE	Users' INSERT permission on tables or views in the public and user schemas.
DELETE ANY TABLE	Users' DELETE permission on tables or views in the public and user schemas, which is still subject to row-level security.
CREATE ANY FUNCTION	Users can create functions or stored procedures in the user schemas.
EXECUTE ANY FUNCTION	Users' EXECUTE permission on functions or stored procedures in the public and user schemas.
CREATE ANY PACKAGE	Users' permission to create packages in the public and user schemas.
EXECUTE ANY PACKAGE	Users' EXECUTE permission on packages in the public and user schemas.
CREATE ANY TYPE	Users can create types in the public and user schemas.
CREATE ANY SEQUENCE	Users can create sequences in the public and user schemas.
CREATE ANY INDEX	Users can create indexes in the public and user schemas. The users must be granted the permission to create tablespaces to create a partitioned table index in a tablespace.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Permission	Description
ALTER ANY TYPE	Users have the ALTER permission on types in public and user schemas, excluding modifying the owner of a type or modifying the schema of a type.
DROP ANY TYPE	Users' DROP permission on types in the public and user schemas.
ALTER ANY SEQUENCE	Users have the ALTER permission on sequences in public and user schemas, excluding modifying the owner of a sequence.
DROP ANY SEQUENCE	Users' DROP permission on sequences in the public and user schemas.
SELECT ANY SEQUENCE	Users' SELECT, USAGE, and UPDATE permissions on sequences in the public and user schemas.
ALTER ANY INDEX	Users' ALTER permission on indexes in the public and user schemas. To rename an index, users also need the permission to create objects in the schema where the index is located. If tablespace operations are involved, users need to have the corresponding operation permission on the tablespace. To set an index to **UNUSABLE**, users must have the DROP ANY INDEX permission.
DROP ANY INDEX	Users' DROP permission on indexes in the public and user schemas.
CREATE ANY TRIGGER	Users can create triggers in the public and user schemas.
ALTER ANY TRIGGER	Users' ALTER permission on triggers in the public and user schemas.
DROP ANY TRIGGER	Users' DROP permission on triggers in the public and user schemas.
CREATE ANY SYNONYM	Users can create synonyms in user schema.
DROP ANY SYNONYM	Users' DROP permission on synonyms in the public and user schemas.

NOTE

If a user is granted any ANY permission, the user has the USAGE permission on the public and user schemas but does not have the USAGE permission on the system schemas except public listed in **Table 13-1**.

Examples

Example 1: Grant system permissions to a user or role.

Create the **joe** user and grant the sysadmin permission to it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE USER joe PASSWORD 'xxxxxxxxxx';
gaussdb=# GRANT ALL PRIVILEGES TO joe;
```

Then **joe** has the sysadmin permission.

Example 2: Grant object permissions to a user or role.

1. Revoke the sysadmin permission from the **joe** user. Grant the usage permission of the **tpcds** schema and all permissions on the **tpcds.reason** table to **joe**.

   ```
   gaussdb=# CREATE SCHEMA tpcds;
   gaussdb=# CREATE TABLE tpcds.reason (
   r_reason_sk         INTEGER      NOT NULL,
   r_reason_id         CHAR(16)     NOT NULL,
   r_reason_desc       VARCHAR(20)
   );
   gaussdb=# REVOKE ALL PRIVILEGES FROM joe;
   gaussdb=# GRANT USAGE ON SCHEMA tpcds TO joe;
   gaussdb=# GRANT ALL PRIVILEGES ON tpcds.reason TO joe;
   ```

   Then **joe** has all permissions on the **tpcds.reason** table, including create, retrieve, update, and delete.

2. Grant the retrieve permission of **r_reason_sk**, **r_reason_id**, and **r_reason_desc** columns and the update permission of the **r_reason_desc** column in the **tpcds.reason** table to **joe**.

   ```
   gaussdb=# GRANT select (r_reason_sk,r_reason_id,r_reason_desc),update (r_reason_desc) ON
   tpcds.reason TO joe;
   ```

   Then **joe** has the retrieve permission on the **r_reason_sk**, **r_reason_id**, and **r_reason_desc** columns in the **tpcds.reason** table. To enable **joe** to grant these permissions to other users, execute the following statement:

   ```
   gaussdb=# GRANT select (r_reason_sk, r_reason_id) ON tpcds.reason TO joe WITH GRANT OPTION;
   ```

   Grant the connection and schema creation permissions of the **testdb** database to **joe**, and allow **joe** to grant these permissions to other users.

   ```
   gaussdb=# CREATE DATABASE testdb;
   gaussdb=# GRANT create,connect on database testdb TO joe WITH GRANT OPTION;
   ```

   Create the **tpcds_manager** role, grant the access and object creation permissions of the **tpcds** schema to **tpcds_manager**, but do not allow **tpcds_manager** to grant these permissions to others.

   ```
   gaussdb=# CREATE ROLE tpcds_manager PASSWORD 'xxxxxxxxxx';
   gaussdb=# GRANT USAGE,CREATE ON SCHEMA tpcds TO tpcds_manager;
   ```

   Grant all permissions on the **tpcds_tbspc** tablespace to **joe**, but do not allow **joe** to grant these permissions to others.

   ```
   gaussdb=# CREATE TABLESPACE tpcds_tbspc RELATIVE LOCATION 'tablespace/tablespace_1';
   gaussdb=# GRANT ALL ON TABLESPACE tpcds_tbspc TO joe;
   ```

   Grant the PUBLIC synonym permission on creating the **tpcds.reason** table to **joe** using the built-in role (**gs_role_public_synonym_create**).

   ```
   gaussdb=# CREATE OR REPLACE SYNONYM t1 FOR tpcds.reason;
   gaussdb=# GRANT gs_role_public_synonym_create TO joe;
   ```

3. Create the fun1 function in the tpcds schema, and grants the ALTER permission of the fun1 function to **joe**.

   ```
   gaussdb=# CREATE or replace FUNCTION tpcds.fun1() RETURN boolean AS
   BEGIN
   SELECT current_user;
   RETURN true;
   END;
   /
   gaussdb=# GRANT ALTER ON FUNCTION tpcds.fun1() TO joe;
   ```

Example 3: Grant a user's or role's permissions to other users or roles.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. Create the **manager** role, grant **joe**'s permissions to **manager**, and allow **manager** to grant these permissions to others.
```
gaussdb=# CREATE ROLE manager PASSWORD 'xxxxxxxxxx';
gaussdb=# GRANT joe TO manager WITH ADMIN OPTION;
```
2. Create the **senior_manager** user and grant **manager**'s permissions to it.
```
gaussdb=# CREATE ROLE senior_manager PASSWORD 'xxxxxxxxxx';
gaussdb=# GRANT manager TO senior_manager;
```
3. Revoke permissions and delete users.
```
gaussdb=# REVOKE joe FROM manager;
gaussdb=# REVOKE manager FROM senior_manager;
gaussdb=# DROP USER manager;
gaussdb=# DROP DATABASE testdb;
```

Example 4: Grant the CMK or CEK permission to other users or roles.

1. Connect to an encrypted database.
```
-- Use the -C parameter to enable the encrypted database function.
gsql -p 57101 postgres -r -C
gaussdb=#  CREATE CLIENT MASTER KEY MyCMK1 WITH ( KEY_STORE = xxx , KEY_PATH = xxx , ALGORITHM = AES_256_CBC);
CREATE CLIENT MASTER KEY
gaussdb=# CREATE COLUMN ENCRYPTION KEY MyCEK1 WITH VALUES (CLIENT_MASTER_KEY = MyCMK1, ALGORITHM = AEAD_AES_256_CBC_HMAC_SHA256);
CREATE COLUMN ENCRYPTION KEY
```
2. Create a role **newuser** and grant the key permission to **newuser**.
```
gaussdb=# CREATE USER newuser PASSWORD 'xxxxxxxxx';
CREATE ROLE
gaussdb=# GRANT ALL ON SCHEMA public TO newuser;
GRANT
gaussdb=# GRANT USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 to newuser;
GRANT
gaussdb=# GRANT USAGE ON CLIENT_MASTER_KEY MyCMK1 to newuser;
GRANT
```
3. Set the user to connect to a database and use a CEK to create an encrypted table.
```
gaussdb=# SET ROLE newuser PASSWORD 'xxxxxxxxx';
gaussdb=>  CREATE TABLE acltest1 (x int, x2 varchar(50) ENCRYPTED WITH (COLUMN_ENCRYPTION_KEY = MyCEK1, ENCRYPTION_TYPE = DETERMINISTIC));
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'x' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=> SELECT has_cek_privilege('newuser', 'MyCEK1', 'USAGE');
 has_cek_privilege
-------------------
 t
(1 row)
```
4. Revoke permissions and delete users.
```
gaussdb=> RESET ROLE;
gaussdb=# REVOKE USAGE ON COLUMN_ENCRYPTION_KEY MyCEK1 FROM newuser;
gaussdb=# REVOKE USAGE ON CLIENT_MASTER_KEY MyCMK1 FROM newuser;
gaussdb=# DROP TABLE newuser.acltest1;
gaussdb=# DROP COLUMN ENCRYPTION KEY MyCEK1;
gaussdb=# DROP CLIENT MASTER KEY MyCMK1;
gaussdb=# DROP SCHEMA IF EXISTS newuser CASCADE;
gaussdb=# REVOKE ALL ON SCHEMA public FROM newuser;
gaussdb=# DROP ROLE IF EXISTS newuser;
```

Example 5: Revoke permissions and delete roles and users.

```
gaussdb=# REVOKE gs_role_public_synonym_create FROM joe;
gaussdb=# REVOKE ALTER ON FUNCTION tpcds.fun1() FROM joe;
gaussdb=# REVOKE ALL PRIVILEGES ON tpcds.reason FROM joe;
gaussdb=# REVOKE ALL PRIVILEGES ON SCHEMA tpcds FROM joe;
gaussdb=# REVOKE ALL ON TABLESPACE tpcds_tbspc FROM joe;
gaussdb=# DROP TABLESPACE tpcds_tbspc;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# REVOKE USAGE,CREATE ON SCHEMA tpcds FROM tpcds_manager;
gaussdb=# DROP ROLE tpcds_manager;
gaussdb=# DROP ROLE senior_manager;
gaussdb=# DROP USER joe CASCADE;
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP SYNONYM t1;
gaussdb=# DROP FUNCTION tpcds.fun1();
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

REVOKE and **ALTER DEFAULT PRIVILEGES**

7.12.14 I

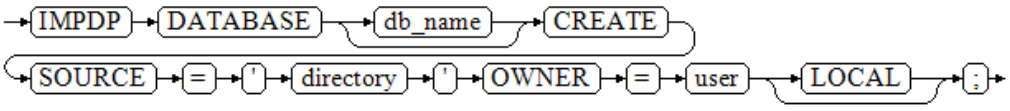
7.12.14.1 IMPDP DATABASE CREATE

Description

Specifies the preparation phase for importing a database.

Syntax

```
IMPDP DATABASE [db_name] CREATE SOURCE = 'directory' OWNER = user [LOCAL];
```



Parameters

- **db_name**

  Name of the new database after the import. If this parameter is not specified, the original database name is retained after the import.

- **directory**

  Data source directory of the imported database.

- **user**

  Owner of the imported database.

- **LOCAL**

  If this column is specified, data is imported to the original cluster. If this column is not specified, data is imported to a new cluster.

Examples

```
-- The IMPDP DATABASE CREATE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, an error message may be displayed, indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP DATABASE test CREATE SOURCE = '/data1/impdp/database' OWNER = admin;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

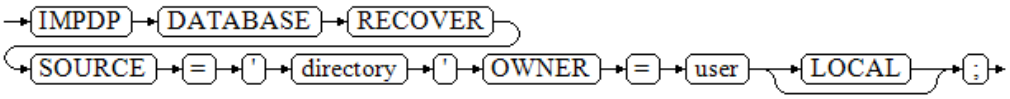
7.12.14.2 IMPDP RECOVER

Description

Specifies the execution phase of importing a database.

Syntax

```
IMPDP DATABASE RECOVER SOURCE = 'directory' OWNER = user [LOCAL];
```



Parameters

- **directory**

  Data source directory of the imported database.
- **user**

  Owner of the imported database.
- **LOCAL**

  If this column is specified, data is imported to the original cluster. If this column is not specified, data is imported to a new cluster.

Examples

```
-- The IMPDP DATABASE RECOVER syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, an error message may be displayed, indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP DATABASE RECOVER SOURCE = '/data1/impdp/database' owner=admin;
```

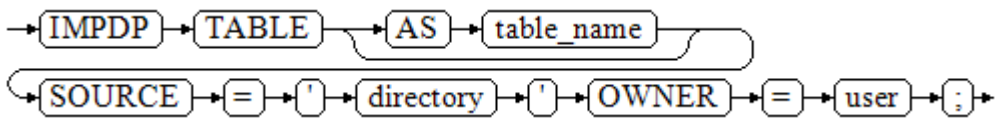
7.12.14.3 IMPDP TABLE

Description

Specifies the execution phase of importing a table.

Syntax

```
IMPDP TABLE [AS table_name] SOURCE = 'directory' OWNER = user;
```



Parameters

- **table_name**

  Name of the new table after the import. If this parameter is not specified, the original table name is retained after the import.
- **directory**

  Data source directory of the imported table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **user**

  Owner of the imported table.

Examples

```
-- The IMPDP TABLE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, an error message may be displayed, indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP TABLE SOURCE = '/data1/impdp/table0' OWNER=admin;
```

7.12.14.4 IMPDP TABLE PREPARE

Description

Specifies the preparation phase for importing a table.

Syntax

```
IMPDP TABLE PREPARE SOURCE = 'directory' OWNER = user;
```

Parameters

- **directory**

  Data source directory of the imported table.

- **user**

  Owner of the imported table.

Examples

```
-- The IMPDP TABLE PREPARE syntax is used for fine-grained backup and restoration and is called by the backup and restoration tool. If you directly call the syntax, an error message may be displayed, indicating that the directory does not exist. Therefore, you are advised not to directly call the syntax.
gaussdb=# IMPDP TABLE PREPARE SOURCE = '/data1/impdp/table0' OWNER=admin;
```

7.12.14.5 INSERT

Description

Inserts one or more rows of data into a table.

Precautions

- The owner of a table, users with the INSERT permission on the table, or users with the INSERT ANY TABLE permission can insert data into the table. System administrators have the permission to insert data into the table by default when separation of duties is disabled.
- Use of the RETURNING clause requires the SELECT permission on all columns mentioned in RETURNING.
- If ON DUPLICATE KEY UPDATE is used, you must have the INSERT and UPDATE permissions on the table and the SELECT permission on the columns of the UPDATE clause.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If you use the query clause to insert rows from a query, you need to have the SELECT permission on any table or column used in the query.
- If you use the query clause to insert data from the dynamic data anonymization column, the inserted result is the anonymized value and cannot be restored.
- When you connect to a database compatible to Teradata and **td_compatible_truncation** is **on**, a long string will be automatically truncated. If later INSERT statements (not involving foreign tables) insert long strings to columns of CHAR- and VARCHAR-typed columns in the target table, the system will truncate the long strings to ensure no strings exceed the maximum length defined in the target table.

  NOTE

  If inserting multi-byte character data (such as Chinese characters) to a database with the character set byte encoding (SQL_ASCII, LATIN1), and the character data crosses the truncation position, the string is truncated based on its bytes instead of characters. Unexpected result will occur in tail after the truncation. If you want correct truncation result, you are advised to adopt encoding set such as UTF8, which has no character data crossing the truncation position.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
INSERT [/*+ plan_hint */] [ IGNORE ] INTO table_name [ { [alias_name] [ ( column_name [, ...] ) ] } |
{ [partition_clause] [ AS alias ] [ ( column_name [, ...] ) ] } ]
    { DEFAULT VALUES
    | { VALUES | VALUE } {( { expression | DEFAULT } [, ...] ) }[, ...]
    | query }
    [ { ON DUPLICATE KEY UPDATE { NOTHING | { column_name = { expression | DEFAULT } } [, ...]
[ WHERE condition ] } }
 | { [ ON CONFLICT [ conflict_target ] conflict_action ] } ]
    [ RETURNING {* | {output_expression [ [ AS ] output_name ] }[, ...]} ];
```

Insert subqueries and views.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
INSERT [/*+ plan_hint */] INTO {subquery | view_name} [ AS alias ] [ ( column_name [, ...] ) ]
    { DEFAULT VALUES
    | { VALUES | VALUE } {( { expression | DEFAULT } [, ...] ) }[, ...]
    | query }
    [ RETURNING {* | {output_expression [ [ AS ] output_name ] }[, ...]} ];
```

- Detailed information of **subquery**:

  ```
  [ WITH [ RECURSIVE ] with_query [, ...] ]
  SELECT [/*+ plan_hint */] [ ALL ]
  { * | {expression [ [ AS ] output_name ]} [, ...] }
  [ into_option ]
  [ FROM from_item [, ...] ]
  [ WHERE condition ]
  [ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
  [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
  { FIRST | LAST } ]} [, ...] ]
  [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
  [ into_option ];
  ```

- The specified subquery source **from_item** is as follows:

  ```
  {[ ONLY ] {table_name | view_name} [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
  |with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
  ```

- Detailed information of **with_query**:

  ```
  with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ]
  ( {SELECT | VALUES | INSERT | UPDATE | DELETE} )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Detailed information of partition_clause:
  ```
  PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) }
  ```
- Detailed information of **conflict_target**:
  ```
  ( { index_column_name | ( index_expression ) } [, ...] ) [ WHERE index_predicate ]
  ```
- Detailed information of **conflict_action**:
  ```
  DO NOTHING |
  DO UPDATE SET { column_name = { expression | DEFAULT } | ( column_name [, ...] ) = ( { expression | DEFAULT } [, ...] ) } [, ...] [ WHERE condition ]
  ```

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table.

  If **RECURSIVE** is specified, a SELECT subquery can be referenced by name.

  with_query:

  – **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.

  -- **column_name** specifies the column name displayed in the subquery result set.

  – Each subquery can be a SELECT, VALUES, INSERT, UPDATE or DELETE statement.

  NOTICE

  If a subquery is a DML statement with a RETURNING statement, the number of command output records of the INSERT statement is determined by the subquery. Assume that table **T1** exists. Run the following statement:

  ```
  WITH CTE AS (INSERT INTO T1 VALUES(1,2) RETURNING *) INSERT INTO T1 SELECT * FROM CTE;
  ```

  The number of command output records of the preceding statement is determined by the following part instead of the entire statement. That is, the command output is "INSERT 0 1" instead of "INSERT 0 2".

  ```
  INSERT INTO T1 VALUES(1,2) RETURNING *
  ```

  – You can use MATERIALIZED or NOT MATERIALIZED to modify the CTE.

  – If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

  – If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the trunk statement to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> NOTE
>
> INSERT ON DUPLICATE KEY UPDATE does not support the WITH or WITH RECURSIVE clauses.

- plan_hint clause

  Follows the INSERT keyword in the **/*+ */** format. It is used to optimize the plan of an INSERT statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **IGNORE**

  When the INSERT statement uses the IGNORE keyword, some ERROR-level errors can be degraded to WARNING-level errors, and invalid values can be adjusted to the closest values based on error scenarios. GaussDB supports the following error codes for error downgrade:

  - Damage to the NOT NULL constraint
  - UNIQUE KEY conflict
  - No partition found for the inserted value
  - Unmatch between the inserted data and the specified partition
  - Multiple rows returned for a subquery
  - Oversized data
  - Time function overflow
  - Division by 0
  - Incorrect value

  > NOTE
  >
  > 1. INSERT IGNORE is supported only when **sql_compatibility** is set to **'MySQL'**, **b_format_version** set to **'5.7'**, and **b_format_dev_version** set to **'s1'**.
  > 2. INSERT IGNORE does not support encrypted tables and foreign tables.
  > 3. INSERT IGNORE does not support PRIMARY KEY constraints or UNIQUE KEY constraints that take effect with a delay.
  > 4. The OIDs of each data type that supports damage to NOT NULL constraints with NULL values are TIMESTAMPOID, TIMESTAMPTZOID, TIMEOID, TIMETZOID, RELTIMEOID, INTERVALOID, TINTERVALOID, SMALLDATETIMEOID, DATEOID, NAMEOID, POINTOID, PATHOID, POLYGONOID, CIRCLEOID, LSEGOID, BOXOID, JSONOID, JSONBOID, XMLOID, XMLTYPEOID, VARBITOID, NUMERICOID, CIDROID, INETOID, MACADDROID, NUMRANGEOID, INT8RANGEOID, INT4RANGEOID, TSRANGEOID, TSTZRANGEOID, DATERANGEOID, ABSTIMEOID, BOOLOID, INT8OID, INT4OID, INT2OID, INT1OID, FLOAT4OID, FLOAT8OID, CASHOID, UINT1OID, UINT2OID, UINT4OID, UINT8OID, BPCHAROID, VARCHAROID, NVARCHAR2OID, CHAROID, BYTEAOID, RAWOID, BLOBOID, CLOBOID, TEXTOID, and YEAROID. **Table 7-273** lists the zero values of each data type.
  > 5. When the default zero value is used for calculation, exercise caution when using IGNORE to ignore the NOT NULL constraint.
  > 6. INSERT IGNORE does not support tables with global secondary indexes.
  > 7. An error generated on a CN is degraded to the warning information while an error generated on a DN is not degraded to the warning information.

Table 7-273 Default zero values for the data type

OID of Each Data Type	Default Zero Value
INT8OID, INT4OID, INT2OID, INT1OID, UINT1OID, UINT2OID, UINT4OID, UINT8OID, FLOAT4OID, FLOAT8OID, NUMERICOID	0 or 0.00 (The number of 0s after the decimal point is specified by a parameter.)
BPCHAROID, VARCHAROID, CHAROID, BYTEAOID, RAWOID, BLOBOID, NVARCHAR2OID, CLOBOID, TEXTOID, VARBITOID, NAMEOID	Empty string
NUMRANGEOID, INT8RANGEOID, INT4RANGEOID, TSRANGEOID, TSTZRANGEOID, DATERANGEOID	empty
TIMEOID	time '00:00:00'
TIMETZOID	timetz '00:00:00'
INTERVALOID	interval '00:00:00'
TINTERVALOID	tinterval(abstime '1970-01-01 00:00:00', abstime '1970-01-01 00:00:00')
SMALLDATETIMEOID	smalldatetime '1970-01-01 00:00:00'
ABSTIMEOID	abstime '1970-01-01 00:00:00'
RELTIMEOID	reltime '00:00:00'
TIMESTAMPOID, TIMESTAMPTZOID	1970-01-01 00:00:00
DATEOID	1970-01-01
YEAROID	0000
POINTOID	(0,0)
PATHOID, POLYGONOID	((0,0))
CIRCLEOID	<(0,0),0>
LSEGOID	[(0,0),(0,0)]
BOXOID	(0,0),(0,0)
JSONOID, JSONBOID, XMLOID	'null'
XMLTYPEOID	'<null/>'
CIDROID	0.0.0.0/32
INETOID	0.0.0.0
MACADDROID	00:00:00:00:00:00

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

OID of Each Data Type	Default Zero Value
BOOLOID	f
CASHOID	$0.00

- **table_name**

  Specifies the name of the target table where data will be inserted.

  Value range: an existing table name

  NOTE

  You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **subquery**

  The inserted object can be a subquery. When a subquery is inserted, the subquery is regarded as a temporary view. The **CHECK OPTION** option can be added to the end of the subquery.

  If a subquery contains only one table, data is inserted into the table. If a subquery contains multiple tables or has nested relationships, check whether a key-preserved table exists to determine whether data can be inserted. For details about key-preserved tables and **WITH CHECK OPTION**, see **CREATE VIEW**.

- **view_name**

  Indicates the target view to be inserted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The restrictions on inserting views and subqueries are as follows:

- The INSERT operation can be performed only on columns that directly reference user columns in the base table.
- A subquery or view must contain at least one updatable column. For details about updatable columns, see **CREATE VIEW**.
- Views and subqueries that contain the DISTINCT, GROUP BY, HAVING, LIMIT or OFFSET clause at the top layer are not supported.
- Views and subqueries that contain set operations (UNION, INTERSECT, EXCEPT, and MINUS) at the top layer are not supported.
- Views and subqueries whose target lists contain aggregate functions, window functions, or return set functions (such as array_agg, json_agg, and generate_series) are not supported.
- Views with BEFORE/AFTER triggers but without INSTEAD OF triggers or INSTEAD rules are not supported.
- The ON DUPLICATE KEY UPDATE function is not supported.
- Table types supported in views and subqueries include ordinary tables, temporary tables, global temporary tables, partitioned tables, level-2 partitioned tables, Ustore tables, and Astore tables.
- For a multi-table join view or subquery, only one base table can be inserted at a time.
- When INSERT joins a view or subquery, explicitly specified columns to be inserted or implicitly specified columns (columns specified during view or subquery creation) cannot reference columns of non-key-preserved tables; if the WITH CHECK OPTION clause is used, INSERT operations cannot be performed on join columns in join views or subqueries. For details about the key-preserved table, see **CREATE VIEW**.
- The INSERT operation cannot be performed on the system view.

- **alias_name**

  Specifies the table alias when the INSERT statement is used without AS alias.

  NOTE

  1. When the INSERT statement is used without AS alias, the table alias cannot be a keyword (such as SELECT and VALUE) or an expression. The alias must comply with the identifier naming rule.
  2. When the INSERT statement is used without AS alias, data cannot be inserted into the specified partition.

- **partition_clause**

  Inserts data to a specified partition.

  For details about the keywords, see **SELECT**.

  If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

- **column_name**

  Specifies the name of a column in a table.

  – The column name can be qualified with a subcolumn name or array index, if needed.

  – Each column not present in the column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting data into only some columns of a composite type leaves the other columns **NULL**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The target column names **column_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
  - The target columns are the first *N* column names, if there are only *N* columns provided by the VALUE clause and QUERY.
  - The values provided by the VALUE clause and QUERY are joined with the corresponding columns from left to right in the table.
  - Data can be inserted in the format of **table alias.column name**.

  Value range: an existing column

- **expression**

  Specifies an expression or a value to assign to the corresponding column.

  - In the INSERT ON DUPLICATE KEY UPDATE statement, expression can be **VALUES(***column_name***)** or **EXCLUDED.***column_name*, indicating that the value of **column_name** corresponding to the conflict row is referenced. **VALUES(***column_name***)** can be nested in a compound expression, for example, **VALUES(***column_name***)+1**, **VALUES(***column_name***) +VALUES(***column_name***)**, and **function_name(VALUES(***column_name***))**.

    NOTE

    - **VALUES(***column_name***)** can be used only in the ON DUPLICATE KEY UPDATE clause.
    - **VALUES(***column_name***)** cannot be used in the IN or NOT IN expressions.
  - If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.
  - If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

- **DEFAULT**

  Specifies the default value of a column. The value is **NULL** if no default value is assigned to it.

- **query**

  Specifies a query statement (SELECT statement) that uses the query result as the inserted data.

- **RETURNING**

  Returns the inserted rows. The syntax of the RETURNING list is identical to that of the output list of SELECT.

- **output_expression**

  Specifies an expression used to calculate the output result of the INSERT statement after each row is inserted.

  Value range: The expression can use any column in the table. You can use the asterisk (*) to return all columns of the inserted row.

- **output_name**

  Specifies a name to use for a returned column.

  Value range: a string that complies with the **Identifier Naming Conventions**.

- **ON DUPLICATE KEY UPDATE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For a table with a UNIQUE constraint (UNIQUE INDEX or PRIMARY KEY), if the inserted data violates the UNIQUE constraint, the UPDATE clause is executed to update the conflicting rows. If **NOTHING** is specified for the UPDATE clause, no operation will be performed. You can use **EXCLUDED.** or **VALUES()** to select the column corresponding to the source data.

For a table without a UNIQUE constraint, only INSERT is performed.

- Row triggers are supported. The execution sequence of triggers is determined by the actual execution process.

  Executing INSERT will trigger the BEFORE INSERT and AFTER INSERT triggers.

  Executing **UPDATE** will trigger the BEFORE INSERT, BEFORE UPDATE, and AFTER UPDATE triggers.

  Executing **UPDATE NOTHING** will trigger the BEFORE INSERT trigger.
- Statement triggers are supported. The triggers are determined by the statement to be executed.

  Executing **UPDATE NOTHING** will trigger the BEFORE INSERT and AFTER INSERT triggers.

  Executing **UPDATE** will trigger the BEFORE INSERT, AFTER INSERT, BEFORE UPDATE, and AFTER UPDATE.
- The UNIQUE constraint or primary key of DEFERRABLE is not supported.
- If a table has multiple UNIQUE constraints and the inserted data violates multiple UNIQUE constraints, only the first row that has a conflict is updated. (The check sequence is closely related to index maintenance. Generally, the conflict check is performed on the index that is created first.)
- Primary keys and unique index columns cannot be updated.
- Foreign tables are not supported.
- The WHERE clause and expression of UPDATE cannot contain sublinks.

- **ON CONFLICT**

  If a UNIQUE constraint or exclusive constraint conflict occurs during an insertion, the insertion is canceled when ON CONFLICT is followed by DO NOTHING, and the update is performed when it is followed by DO UPDATE SET. If no conflict occurs, the common INSERT process is executed.

  - **index_column_name**: Name of the index column.
  - **index_expression**: Similar to **index_column_name**, it is an expression index based on one or more columns of the table and can be used for fast access to a variation of the basic data.
  - **index_predicate**: condition expression that specifies the range of a partially unique index.
  - **expression**: expression or value to be assigned to the corresponding column.
  - **DEFAULT**: The corresponding column will be filled with the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The INSERT... ON CONFLICT syntax has the following restrictions:

1. Only PG compatibility is supported.
2. The [COLLATE collation] [opclass] syntax is not supported.
3. The ON CONSTRAINT constraint_name syntax is not supported.
4. Users must have the UPDATE permission before using DO UPDATE SET.
5. Nesting in the conflict_target, UPDATE SET, or UPDATE SET clause is not supported.
6. Column-format tables, foreign tables, STREAM objects, and CONTVIEW objects are not supported.
7. Distribution keys cannot be updated.
8. In distributed mode, if the execution plan is **stream**, **light proxy**, or **fqs**, multiple data records with the same unique key cannot be inserted into the same statement at a time. If the execution plan is **pgxc**, the preceding operation is allowed.
9. GSIs are not supported.
10. Database links are not supported.
11. Subqueries cannot be inserted.

Examples

- **Insert a data record.**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE test_t1(col1 INT,col2 VARCHAR);

-- Insert data.
gaussdb=# INSERT INTO test_t1 (col1, col2) VALUES (1,'AB');

-- Add values to some columns of the table.
gaussdb=# INSERT INTO test_t1 (col1) VALUES (2);

-- There is no parenthesis on the left of the VALUES keyword. Values must be added to all fields in the parenthesis on the right according to the table structure sequence.
gaussdb=# INSERT INTO test_t1 VALUES (3,'AC');

-- Query the table.
gaussdb=# SELECT * FROM test_t1;
 col1 | col2
------+------
    1 | AB
    2 |
    3 | AC
(3 rows)
-- Drop.
gaussdb=# DROP TABLE test_t1;
```

- **Insert multiple data records.**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE test_t2(col1 INT,col2 VARCHAR);
gaussdb=# CREATE TABLE test_t3(col1 INT,col2 VARCHAR);

-- Insert multiple data records.
gaussdb=# INSERT INTO test_t2 (col1, col2) VALUES (10,'AA'),(20,'BB'),(30,'CC');

-- Query.
gaussdb=# SELECT * FROM test_t2;
 col1 | col2
------+------
   10 | AA
   20 | BB
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  30 | CC
(3 rows)

-- Insert data in test_t2 into test_t3.
gaussdb=# INSERT INTO test_t3 SELECT * FROM test_t2;

-- Query.
gaussdb=# SELECT * FROM test_t3;
 col1 | col2
------+------
   10 | AA
   20 | BB
   30 | CC
(3 rows)

-- Drop.
gaussdb=# DROP TABLE test_t2;
DROP TABLE test_t3;
```

- **ON DUPLICATE KEY UPDATE**

  Example:

```
-- Create a table.
gaussdb=# CREATE TABLE test_t4 (id INT PRIMARY KEY, info VARCHAR(10));
gaussdb=# INSERT INTO test_t4 VALUES (1, 'AA'), (2,'BB'), (3, 'CC');

-- Use the ON DUPLICATE KEY UPDATE keyword.
gaussdb=# INSERT INTO test_t4 VALUES (3, 'DD'), (4, 'EE') ON DUPLICATE KEY UPDATE info =
VALUES(info);

-- Query.
gaussdb=# SELECT * FROM test_t4;
 id | info
----+------
  1 | AA
  2 | BB
  4 | EE
  3 | DD

-- Drop.
gaussdb=# DROP TABLE test_t4;
```

- **ON CONFLICT**

  Example:

```
-- Create a table.
gaussdb=# CREATE DATABASE pg_db dbcompatibility = 'PG';
gaussdb=# \c pg_db
pg_db=# CREATE TABLE insert_onconflict_tb1(id INT, a INT PRIMARY KEY, b INT, c VARCHAR2(20));
pg_db=# INSERT INTO insert_onconflict_tb1 VALUES (1, 1, 2, 'aaa'), (2, 2, 0, 'zzz');
-- Query the table.
pg_db=# SELECT * FROM insert_onconflict_tb1;
 id | a | b |  c
----+---+---+-----
  1 | 1 | 2 | aaa
  2 | 2 | 0 | zzz
(2 rows)
-- Use the ON CONFLICT keyword.
pg_db=# INSERT INTO insert_onconflict_tb1 VALUES (1, 1, 5, 'ddd'), (2, 2, 1, 'yyy') ON CONFLICT (a)
DO UPDATE SET b=excluded.b, c=excluded.c;
pg_db=# INSERT INTO insert_onconflict_tb1 VALUES (1, 1, 5, 'ddd'), (2, 2, 1, 'yyy') ON CONFLICT (a)
DO NOTHING;
-- Query the table.
pg_db=# SELECT * FROM insert_onconflict_tb1;
 id | a | b |  c
----+---+---+-----
  1 | 1 | 5 | ddd
  2 | 2 | 1 | yyy
(2 rows)
-- Drop the table.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
pg_db=# DROP TABLE insert_onconflict_tb1;
pg_db=# \c postgres
-- Drop the PG-compatible library.
gaussdb=# DROP DATABASE pg_db;
```

- **INSERT IGNORE**

  Example 1: Damage to the NOT NULL constraint

```
-- Create a table.
gaussdb=# CREATE TABLE test_t5(f1 INT NOT NULL);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'f1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t5 VALUES(NULL);
WARNING:  null value in column "f1" violates not-null constraint
DETAIL:  Failing row contains (null).
INSERT 0 1

-- Query the table.
gaussdb=# SELECT * FROM test_t5;
 f1
----
  0
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE test_t5;
DROP TABLE
```

  Example 2: UNIQUE KEY conflict

```
-- Create a table.
gaussdb=# CREATE TABLE test_t6(f1 INT PRIMARY KEY);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "test_t6_pkey" for table "test_t6"
CREATE TABLE

-- Insert data.
gaussdb=# INSERT INTO test_t6 VALUES(1);
INSERT 0 1

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t6 VALUES(1);
INSERT 0 0

-- Query the table.
gaussdb=# SELECT * FROM test_t6;
 f1
----
  1
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE test_t6;
DROP TABLE
```

  Example 3: No partition found for the inserted value

```
-- Create a table.
gaussdb=# CREATE TABLE test_t7(f1 INT, f2 INT) PARTITION BY LIST(f1) (PARTITION p0 VALUES(1, 4,
7), PARTITION p1 VALUES (2, 5, 8));
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'f1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t7 VALUES(3, 5);
INSERT 0 0

-- Query the table.
gaussdb=# SELECT * FROM test_t7;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 f1 | f2
----+----
(0 rows)

-- Drop the table.
gaussdb=# DROP TABLE test_t7;
DROP TABLE
```

Example 4: Unmatch between the inserted data and the specified partition

```
-- Create a table.
gaussdb=# CREATE TABLE test_t8(f1 INT NOT NULL, f2 TEXT, f3 INT) PARTITION BY RANGE(f1)
(PARTITION p0 VALUES LESS THAN(5), PARTITION p1 VALUES LESS THAN(10), PARTITION p2
VALUES LESS THAN(15), PARTITION p3 VALUES LESS THAN(MAXVALUE));
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'f1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t8 PARTITION(p2) VALUES(20, 'Jan', 1);
INSERT 0 0

-- Query the table.
gaussdb=# SELECT * FROM test_t8;
 f1 | f2 | f3
----+----+----
(0 rows)

-- Drop the table.
gaussdb=# DROP TABLE test_t8;
DROP TABLE
```

Example 5: Multiple rows returned for a subquery

```
-- Create a table.
gaussdb=# CREATE TABLE test_t9(f1 INT, f2 INT);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'f1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

-- Insert data.
gaussdb=# INSERT INTO test_t9 VALUES(1, 1), (2, 2), (3, 3);
INSERT 0 3

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t9 VALUES((SELECT f1 FROM test_t9), 0);
WARNING:  more than one row returned by a subquery used as an expression
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
gaussdb=# SELECT * FROM test_t9 WHERE f2 = 0;
 f1 | f2
----+----
    |  0
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE test_t9;
DROP TABLE
```

Example 6: Oversized data

```
-- Create a table.
gaussdb=# CREATE TABLE test_t10(f1 VARCHAR(5));
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'f1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t10 VALUES('aaaaaaaaa');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
WARNING:  value too long for type character varying(5)
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
gaussdb=# SELECT * FROM test_t10;
  f1
-------
 aaaaa
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE test_t10;
DROP TABLE
```

Example 7: Time function overflow

```
-- Create a table.
gaussdb=# CREATE TABLE test_t11(f1 DATETIME);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'f1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t11 VALUES(date_sub('2000-01-01', INTERVAL 2001 YEAR));
WARNING:  Datetime function: datetime field overflow
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
gaussdb=# SELECT * FROM test_t11;
 f1
----

(1 row)

-- Drop the table.
gaussdb=# DROP TABLE test_t11;
DROP TABLE
```

Example 8: Division by 0

```
-- Create a table.
gaussdb=# CREATE TABLE test_t12(f1 INT);
CREATE TABLE

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t12 VALUES(1/0);
WARNING:  division by zero
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
gaussdb=# SELECT * FROM test_t12;
 f1
----

(1 row)

-- Drop the table.
gaussdb=# DROP TABLE test_t12;
DROP TABLE
```

Example 9: Incorrect value

```
-- Create a table.
gaussdb=# CREATE TABLE test_t13(f0 INT, f1 FLOAT);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'f0' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

-- Use the IGNORE keyword.
gaussdb=# INSERT IGNORE INTO test_t13 VALUES(1, '1.11aaa');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
WARNING:  invalid input syntax for type real: "1.11aaa"
LINE 1: INSERT IGNORE INTO test_t13 VALUES(1, '1.11aaa');
                                              ^
CONTEXT:  referenced column: f1
INSERT 0 1

-- Query the table.
gaussdb=# SELECT * FROM  test_t13;
 f0 |  f1
----+------
  1 | 1.11
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE test_t13;
DROP TABLE
```

Example 10: Insert a data record using a table alias.

```
-- Create a table.
gaussdb=# create table tb1 (va int , vb int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'va' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

 -- Use a table alias.
gaussdb=# insert into tb1 as tt(tt.va, tt.vb) values (1,2);
INSERT 0 1
gaussdb=# insert into tb1 tt(tt.va, tt.vb) values (3,4);
INSERT 0 1

-- Query the table.
gaussdb=# select * from tb1;
 va | vb
----+----
  1 |  2
  3 |  4
(2 rows)

-- Drop the table.
gaussdb=# DROP TABLE tb1;
DROP TABLE
```

- **WITH [RECURSIVE] with_query [, ...]**

  Example:

```
-- Grade table.
gaussdb=# CREATE TABLE grade (
    sid INT,
    course VARCHAR(20),
    score FLOAT
);
-- Student table.
gaussdb=# CREATE TABLE student(
    sid INT PRIMARY KEY,
    class INT,
    name  VARCHAR(50),
    sex INT CHECK (sex = 0 or sex = 1)
);

-- Insert data.
gaussdb=# WITH student_sid AS ( INSERT INTO student ( sid, CLASS, NAME, sex ) VALUES ( 1, 1,
'scott', 1 ) RETURNING sid )
    INSERT INTO grade ( sid, course, score )
    VALUE ( ( SELECT sid FROM student_sid ), 'match', '96' ),
   ( ( SELECT sid FROM student_sid ), 'chinese', '82' ),
   ( ( SELECT sid FROM student_sid ), 'english', '86' );

-- Query data.
gaussdb=# SELECT * FROM student;
 sid | class | name  | sex
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-----+--------+-------+-----
   1 |      1 | scott |   1
(1 row)

gaussdb=# SELECT * FROM grade;
 sid | course  | score
-----+---------+-------
   1 | match   |    96
   1 | chinese |    82
   1 | english |    86
(3 rows)

-- Drop.
gaussdb=# DROP TABLE student;
gaussdb=# DROP TABLE grade;
```

- **Insert data into a view or subquery.**

  Example 1: Insert a subquery.

```
-- Create a schema.
gaussdb=# CREATE SCHEMA ins_subqry;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = 'ins_subqry';
SET

-- Create tables.
gaussdb=# CREATE TABLE t1 (x1 int, y1 int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'x1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# CREATE TABLE t2 (x2 int PRIMARY KEY, y2 int);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "t2_pkey" for table "t2"
CREATE TABLE

-- Insert data into t1 through a subquery.
gaussdb=# INSERT INTO (SELECT * FROM t1) VALUES (1, 1);
INSERT 0 1
gaussdb=# INSERT INTO (SELECT * FROM t1 WHERE y1 < 3) VALUES (5, 5);
INSERT 0 1

-- Insert a subquery with CHECK OPTION specified.
gaussdb=# INSERT INTO (SELECT * FROM t1 WHERE y1 < 3 WITH CHECK OPTION) VALUES (5, 5);

DROP SCHEMA
```

Suggestions

- VALUES

  When you run the INSERT statement to insert data in batches, you are advised to combine multiple records into one statement to improve data loading performance.

  Example:

  ```
  INSERT INTO sections VALUES (30, 'Administration', 31, 1900),(40, 'Development', 35, 2000), (50, 'Development' , 60 , 2001);
  ```

  If values of an INSERT statement are distributed on a DN, GaussDB can push the statement down to the corresponding DN for execution. Currently, only constants, simple expressions, and pushdown functions (**provolatile** in

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

pg_proc is set to **'i'**) are supported. If a column in the table has a default value, the value must be a constant or a simple expression. Neither a single-value statement nor a multi-value statement can be pushed down to a single DN.

7.12.14.6 INSERT ALL

Description

Inserts one or multiple data records into multiple tables.

Precautions

- You must have the INSERT permission on a table to insert data into it. If a user is granted the INSERT ANY TABLE permission, the user has the USAGE permission on all schemas except system schemas and the INSERT permission on tables in these schemas.
- If you use the query clause to insert rows from a query, you need to have the SELECT permission on any table or column used in the query.
- Data cannot be written directly to a generated column. In the INSERT statement, values cannot be specified for generated columns, but the keyword DEFAULT can be specified.
- This syntax can be executed only in the ORA-compatible mode.

Syntax

```
INSERT [/*+ plan_hint */] [ ALL | FIRST ]
   { [ WHEN condition THEN ]
   { INTO table_name
   [ { [alias_name] [ ( column_name [, ...] ) ] } | { [partition_clause] [ AS alias ]
   [ ( column_name [, ...] ) ] } ]
   [ VALUES {( { expression | DEFAULT } [, ...] ) } ] }[, ...] }[, ...]
   { subquery };
```

Parameters

- **plan_hint** clause

  Follows the INSERT keyword in the **/*+ */** format. Only the syntax format is adapted, and specific functions are not supported.

- **ALL/FIRST**

  The keyword cannot be omitted and can only be **ALL**, if a conditional clause (WHEN condition THEN) is not used. The keyword can be omitted and is **ALL** by default if a conditional clause is used. In this case, the meanings of **ALL** and **FIRST** are as follows:

  - **ALL**: Run through all branches of matching conditions and insert data into the corresponding table as long as the conditions are met.
  - **FIRST**: After finding the first branch that meets the conditions, insert the data into the table corresponding to the branch, and the check for remaining branches stops.

- **WHEN condition THEN**

  Specifies the condition judgment when inserting data into a table. The insertion is performed only when the condition is met. For conditions, refer to the columns in the subquery.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **table_name**

  Specifies the name of the target table where data will be inserted.

  Value range: an existing table name

- **alias_name**

  Specifies the table alias when the INSERT statement is used without AS alias.

  NOTE

  1. When the INTO clause is used without AS alias, the table alias cannot be a keyword (such as SELECT and VALUE) or an expression. The alias must comply with the **Identifier Naming Conventions**.
  2. When the INTO clause is used without AS alias, the table alias cannot be in the INTO table_name alias_name(alias_name.col1, ...,alias_name.coln) VALUES(xxx); format.
  3. When the INTO clause is used without AS alias, data cannot be inserted into the specified partition.

- **partition_clause**

  Inserts data to a specified partition.

  ```
  PARTITION { ( partition_name ) | FOR ( partition_value [, ...] ) } |
  SUBPARTITION { ( subpartition_name ) | FOR ( subpartition_value [, ...] ) }
  ```

  For details about the keywords, see **SELECT**.

  If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

- **column_name**

  Specifies the name of a column in a table.

  - The column name can be qualified with a subcolumn name or array index, if needed.
  - Each column not present in the column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting data into only some columns of a composite type leaves the other columns **NULL**.
  - The target column names **column_name** can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
  - The target columns are the first *N* column names, if there are only *N* columns provided by the VALUE clause and QUERY.
  - The values provided by the VALUE clause and QUERY are joined with the corresponding columns from left to right in the table.

  Value range: an existing column

- **VALUES**

  It cannot be followed by multiple rows.

- **expression**

  Specifies an expression or a value to assign to the corresponding column.

  - If single-quotation marks **(')** are inserted into a column, the single-quotation marks need to be used for escape.
  - If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - Aggregate functions are not supported.
  - Subqueries are not supported.

- **DEFAULT**

  Specifies the default value of a column. The value is **NULL** if no specified default value has been assigned to it.

- **subquery**

  Specifies a query statement (SELECT statement) that uses query results as the inserted data and cannot be omitted. If there are no subqueries, use SELECT * FROM DUAL.

  If a subquery contains a table alias, the alias cannot be referenced in the CONDITION and INTO clauses.

Examples

- **Inserting data to multiple tables without conditions**

  Example:

```
-- Create an ORA-compatible database.
gaussdb=# CREATE DATABASE insertall_test_db DBCOMPATIBILITY 'ORA';

-- Switch to an ORA-compatible database.
gaussdb=# \c insertall_test_db;

-- Create tables.
insertall_test_db=# CREATE TABLE insert_all_test0(c1 INT, c2 VARCHAR2(20));
insertall_test_db=# CREATE TABLE insert_all_test1(c1 INT, c2 VARCHAR2(20));
insertall_test_db=# CREATE TABLE insert_all_test2(c1 INT, c2 VARCHAR2(20));
insertall_test_db=# CREATE TABLE insert_all_test3(c1 INT, c2 VARCHAR2(20));

-- Construct data.
insertall_test_db=# INSERT INTO insert_all_test0 VALUES(1,'a'),(2,'b'),(3,'c'),(4,'d'),(5,'e');

-- Insert data to the tables.
insertall_test_db=# INSERT ALL
insertall_test_db-# INTO insert_all_test1
insertall_test_db-# INTO insert_all_test1 VALUES(1,'a')
insertall_test_db-# INTO insert_all_test1(c1,c2)
insertall_test_db-# INTO insert_all_test1(c1) VALUES(1)
insertall_test_db-# INTO insert_all_test1(c2) VALUES('aaa')
insertall_test_db-# INTO insert_all_test2(c2) VALUES(c2)
insertall_test_db-# INTO insert_all_test2(c2) VALUES(c2||'*')
insertall_test_db-# INTO insert_all_test3(c1,c2) VALUES(1,'a')
insertall_test_db-# INTO insert_all_test3(c1,c2) VALUES(1,c2)
insertall_test_db-# INTO insert_all_test3(c1,c2) VALUES(c1,c2)
insertall_test_db-# INTO insert_all_test3(c2,c1) VALUES('***',666)

gaussdb=# DROP DATABASE insertall_test_db;
```

7.12.15 L

7.12.15.1 LOAD DATA

Description

Imports data from a file to a specified table in the database.

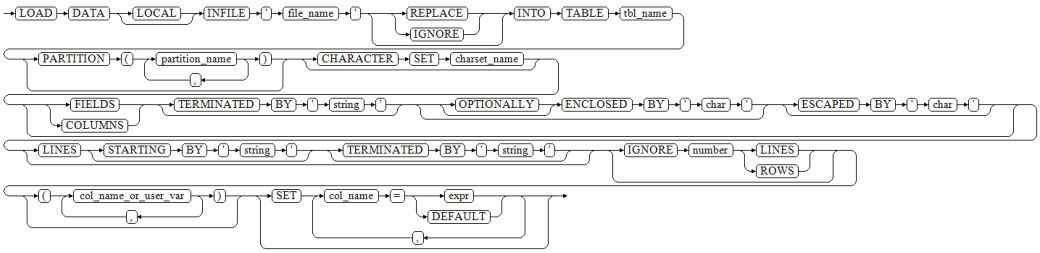
Precautions

- The LOAD DATA syntax is supported only when **sql_compatibility** is set to **'MYSQL'**.
- The LOAD DATA syntax is the same as that of database MYSQL only when **b_format_version** is set to **'5.7'** and **b_format_dev_version** is set to **'s2'**.
- The GUC parameters related to the LOAD DATA syntax are the same as those of the COPY FROM syntax. For details, see **Precautions**.
- The LOAD DATA syntax requires the INSERT and DELETE permissions on tables.
- If the data written to a table by running **LOAD DATA** cannot be converted to the data type of the table, the import fails.
- LOAD DATA applies only to tables but not views.

Syntax

```
LOAD DATA
    [LOCAL]
    INFILE 'file_name'
    [REPLACE | IGNORE]
    INTO TABLE tbl_name
    [PARTITION (partition_name [, partition_name] ...)]
    [CHARACTER SET charset_name]
    [{FIELDS | COLUMNS}
        [TERMINATED BY 'string']
        [[OPTIONALLY] ENCLOSED BY 'char']
        [ESCAPED BY 'char']
    ]
    [LINES
        [STARTING BY 'string']
        [TERMINATED BY 'string']
    ]
    [IGNORE number {LINES | ROWS}]
    [(col_name_or_user_var
        [, col_name_or_user_var] ...)]
    [SET col_name={expr | DEFAULT}
        [, col_name={expr | DEFAULT}] ...]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **LOCAL**

  Specifies the location of the file to be imported.

  If **LOCAL** is not specified and **file_name** is a relative path, data is imported to the data directory by default.

  If the **LOCAL** parameter is specified, **file_name** must be set to an absolute path. If **file_name** is set to a relative path, data is imported to the location of the database binary file by default, that is, *$GAUSSHOME*/**bin/**.

  NOTE

  If the imported data conflicts with the table data or the number of columns in the file is less than the number of columns in the specified table, the function of specifying **LOCAL** is the same as that of specifying **IGNORE**.

- **REPLACE | IGNORE**

  If the data to be imported conflicts with the original data in the table, specifying **REPLACE** replaces the conflicting data, and specifying **IGNORE** skips the conflicting data and continues the import. If data conflicts occur but none of **REPLACE**, **IGNORE**, or **LOCAL** is specified, the import stops and an error is reported.

  NOTE

  If the number of columns in the file is less than that in the specified table, specifying **IGNORE** or **LOCAL** will assign default values to the remaining columns. If **IGNORE** or **LOCAL** is not specified, an error is reported.

- **PARTITION**

  If the table to be imported is a partitioned table, this parameter specifies a partition. If the data is inconsistent with the specified partition range, an error is reported.

- **CHARACTER SET**

  Specifies the encoding format of a data file. The default value is the current client encoding format.

- **FIELDS | COLUMNS**

  - **TERMINATED BY**

    Specifies the delimiter between columns. The default value is **"\t"**.

    NOTE

    The specified newline character cannot be the same as the delimiter.

  - **[OPTIONALLY] ENCLOSED BY**

    Specifies the quotation mark character. The default value is **''**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The **OPTIONALLY** parameter is optional and does not take effect.

The quotation mark can only be a single character and cannot be a character string.

- **ESCAPED BY**

  Specifies the escape character. The default value is **"\"**.

  The escape character can only be a single character and cannot be a character string.

- **LINES**
  - **STARTING BY**

    Specifies the style of the starting field in the data file to be imported.
  - **TERMINATED BY**

    Specifies the newline character style of the imported data file.
- **IGNORE**

  Specifies that the first *number* rows of the data file are skipped during data import.
- **col_name_or_user_var**

  Specifies an optional list of columns to be copied.

  Value range: any columns. All columns will be copied if no column list is specified.

  NOTE

  - The parameter for specifying columns cannot be used to specify a column repeatedly.
  - When columns are specified using the LOAD DATA syntax, **col_name_or_user_var** can only be specified as existing columns but not user variables.
- **SET**

  Specifies the column value, which can be an expression or **DEFAULT**.

  NOTE

  - The expression does not support column names.
  - If no implicit conversion exists between the expression result type and the type of the assigned column, an error is reported.

Examples

```
-- Prepare the environment.
gaussdb=# CREATE DATABASE test_load WITH DBCOMPATIBILITY = 'MYSQL';
gaussdb=# \c test_load
gaussdb=# SET b_format_version='5.7';
gaussdb=# SET b_format_dev_version='s2';

-- Prepare the files to be imported.
gaussdb=# CREATE TABLE load_data_tmp1(a int, b int);
gaussdb=# INSERT INTO load_data_tmp1 VALUES(1,1),(2,2),(3,3);
gaussdb=# \copy load_data_tmp1 to '/home/omm/load1.csv';
gaussdb=# CREATE TABLE load_data_tmp2(a int, b int);
gaussdb=# INSERT INTO load_data_tmp2 VALUES(1,2);
gaussdb=# \copy load_data_tmp2 to '/home/omm/load2.csv';
gaussdb=# CREATE TABLE load_data_tmp3(a int, b int);
gaussdb=# INSERT INTO load_data_tmp3 VALUES(4,4),(5,5);
gaussdb=# \copy load_data_tmp3 to '/home/omm/load3.csv';
gaussdb=# CREATE TABLE load_data_tmp4(a char(50));
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# INSERT INTO load_data_tmp4 VALUES('"load test quote"'), ('\'load test single_quote\'');
gaussdb=# \copy load_data_tmp4 to '/home/omm/load4.csv';

-- Create a table.
gaussdb=# CREATE TABLE load_data_tbl1(load_col1 INT UNIQUE, load_col2 INT, load_col3 CHAR(10));

-- Insert a data record into a table.
gaussdb=#  INSERT INTO load_data_tbl1 VALUES(0,0,'load0');

-- Copy data from the /home/omm/load1.csv file to the load_data_tbl table, specify a column name, and
set the value of the load_col3 column to load.
gaussdb=#  LOAD DATA INFILE '/home/omm/load1.csv' INTO TABLE load_data_tbl1(load_col1, load_col2)
SET load_col3 = 'load';
-- The values imported to the load_col3 column later are all load.
gaussdb=#  SELECT * FROM load_data_tbl1 ORDER BY load_col1;
 load_col1 | load_col2 | load_col3
-----------+-----------+-----------
         0 |         0 | load0
         1 |         1 | load
         2 |         2 | load
         3 |         3 | load
(4 rows)

-- Copy data from the /home/omm/load2.csv file to the load_data_tbl table and specify IGNORE to
ignore conflicts.
gaussdb=# LOAD DATA INFILE '/home/omm/load2.csv' IGNORE INTO TABLE load_data_tbl1;
-- Data in the load_data_tbl1 table remains unchanged, and conflicting data is skipped.
gaussdb=#  SELECT * FROM load_data_tbl1 ORDER BY load_col1;
 load_col1 | load_col2 | load_col3
-----------+-----------+-----------
         0 |         0 | load0
         1 |         1 | load
         2 |         2 | load
         3 |         3 | load
(4 rows)

-- Create a partitioned table.
gaussdb=# CREATE TABLE load_data_tbl2
(
    load_col_col1 INT,
    load_col_col2 INT

```

7.12.15.2 LOCK

Description

LOCK TABLE obtains a table-level lock.

GaussDB always tries to select the lock mode with minimum constraints when automatically requesting a lock for a statement referenced by a table. Use **LOCK** if users need a more strict lock mode. For example, suppose an application runs a transaction at the Read Committed isolation level and needs to ensure that data in a table remains stable in the duration of the transaction. To achieve this, you could obtain **SHARE** lock mode over the table before the query. This prevents data from being concurrently modified, ensuring that subsequent queries can read committed and persistent data. It is because the **SHARE** lock mode conflicts with the **ROW EXCLUSIVE** lock acquired by writers, and your **LOCK TABLE name IN SHARE MODE** statement will wait until any concurrent holders of **ROW EXCLUSIVE** mode locks commit or roll back. Therefore, once you obtain the lock, there are no uncommitted writes outstanding; furthermore none can begin until you release the lock.

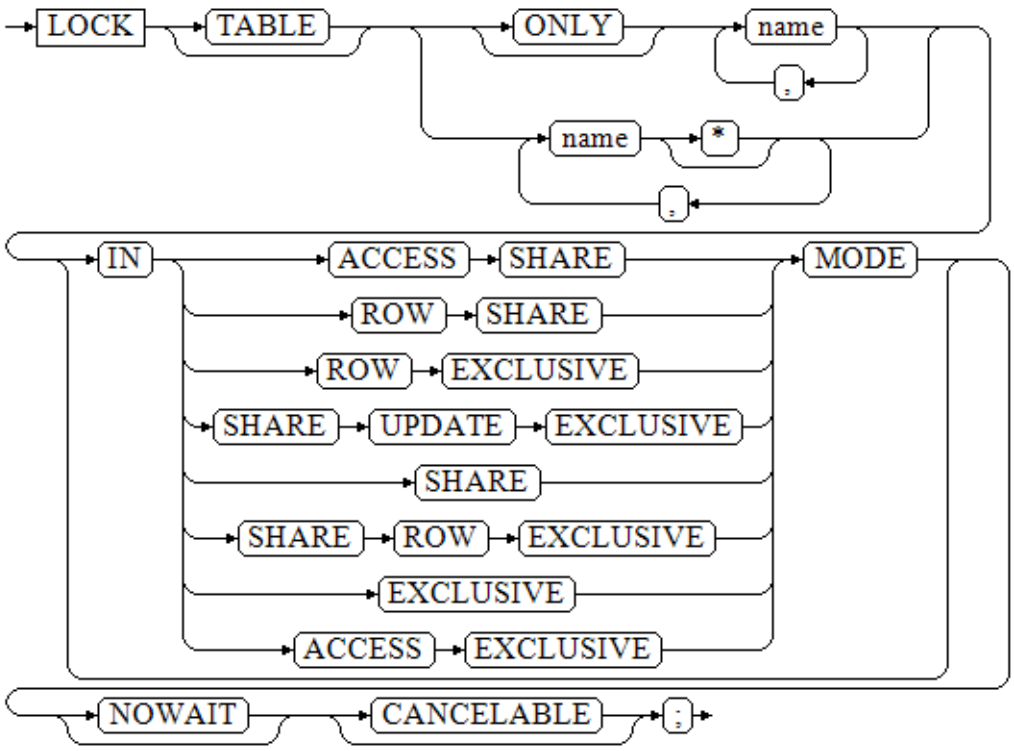
Precautions

- LOCK TABLE is useless outside a transaction block: the lock would remain held only to the completion of the statement. If LOCK TABLE is out of any transaction block, an error is reported.
- If no lock mode is specified, then **ACCESS EXCLUSIVE**, the most restrictive mode, is used.
- LOCK TABLE ... IN ACCESS SHARE MODE requires SELECT privileges on the target table. All other forms of LOCK require table-level UPDATE and/or the DELETE permission.
- There is no UNLOCK TABLE statement. Locks are always released at transaction end.
- LOCK TABLE only deals with table-level locks, and so the mode names involving **ROW** are all misnomers. These mode names should generally be read as indicating the intention of the user to acquire row-level locks within the locked table. Also, **ROW EXCLUSIVE** mode is a shareable table lock. Note that all lock modes have the same semantics as long as LOCK TABLE is involved. The only difference lies in whether locks conflict with each other. For details about the rules, see **Table 7-274**.
- If the xc_maintenance_mode parameter is not enabled, an error is reported when an ACCESS EXCLUSIVE lock is applied for a system catalog.
- Only the redistribution tool can use the automatic CANCEL service API.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
LOCK [ TABLE ] {[ ONLY ] name [, ...]| {name [ * ]} [, ...]}
    [ IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE | SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE ]
    [ NOWAIT ][CANCELABLE];
```



Parameters

Table 7-274 Lock mode conflicts

Requested Lock Mode/ Current Lock Mode	ACCESS SHARE	ROW SHARE	ROW EXCLUSIVE	SHARE UPDATE EXCLUSIVE	SHARE	SHARE ROW EXCLUSIVE	EXCLUSIVE	ACCESS EXCLUSIVE
ACCESS SHARE	-	-	-	-	-	-	-	X
ROW SHARE	-	-	-	-	-	-	X	X
ROW EXCLUSIVE	-	-	-	-	X	X	X	X

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Requested Lock Mode/ Current Lock Mode	ACCESS SHARE	ROW SHARE	ROW EXCLUSIVE	SHARE UPDATE EXCLUSIVE	SHARE	SHARE ROW EXCLUSIVE	EXCLUSIVE	ACCESS EXCLUSIVE
SHARE UPDATE EXCLUSIVE	-	-	-	X	X	X	X	X
SHARE	-	-	X	X	-	X	X	X
SHARE ROW EXCLUSIVE	-	-	X	X	X	X	X	X
EXCLUSIVE	-	X	X	X	X	X	X	X
ACCESS EXCLUSIVE	X	X	X	X	X	X	X	X

LOCK parameters are as follows:

- **name**

  Specifies the name (optionally schema-qualified) of an existing table to lock.

  Tables are locked one-by-one in the order specified in the LOCK TABLE statement.

  Value range: an existing table name

  NOTE

  You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **ONLY**

  If **ONLY** is specified, only that table is locked. If it is not specified, the table and all its sub-tables are locked.

- **ACCESS SHARE**

  Allows only read operations on a table. In general, any SQL statements that only read a table and do not modify it will acquire this lock mode. The SELECT statement acquires an **ACCESS SHARE** lock on referenced tables.

- **ROW SHARE**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Allows concurrent read of a table but does not allow any other operations on the table.

SELECT FOR UPDATE and **SELECT FOR SHARE** automatically acquire the **ROW SHARE** lock on the target table and add the **ACCESS SHARE** lock to other referenced tables except **FOR SHARE** and **FOR UPDATE**.

For a partitioned table, **SELECT FOR SHARE** obtains the **ROW EXCLUSIVE** lock of the partition object on the DN for concurrency control.

- **ROW EXCLUSIVE**

  Allows concurrent read of a table but does not allow modification of data in the table. **ROW EXCLUSIVE** is the same as **ROW SHARE**. **UPDATE**, **DELETE**, and **INSERT** automatically acquire this lock on the target table and add the **ACCESS SHARE** lock to other referenced tables. Generally, all statements that modify table data acquire the **ROW EXCLUSIVE** lock for tables.

- **SHARE UPDATE EXCLUSIVE**

  Protects a table against concurrent schema changes and **VACUUM** runs.

  The VACUUM (without FULL), ANALYZE, and CREATE INDEX CONCURRENTLY statements automatically request this lock.

- **SHARE**

  Allows concurrent queries of a table but does not allow modification of the table.

  The CREATE INDEX (without CONCURRENTLY) statement automatically requests this lock.

- **SHARE ROW EXCLUSIVE**

  Protects a table against concurrent data changes, and is self-exclusive so that only one session can hold it at a time.

  No SQL statements automatically acquire this lock mode.

- **EXCLUSIVE**

  Allows concurrent queries of the target table but does not allow any other operations.

  This mode allows only concurrent ACCESS SHARE locks; that is, only reads from the table can proceed concurrently with a transaction holding this lock mode.

  No SQL statements automatically acquire this lock mode on user tables. However, it will be acquired on some system catalogs in case of some operations.

- **ACCESS EXCLUSIVE**

  Guarantees that the holder is the only transaction accessing the table in any way.

  Acquired by the **ALTER TABLE**, **DROP TABLE**, **TRUNCATE**, **REINDEX**, **CLUSTER**, and **VACUUM FULL** commands.

  This is also the default lock mode for **LOCK TABLE** statements that do not specify a mode explicitly.

- **NOWAIT**

  Specifies that **LOCK TABLE** should not wait for any conflicting locks to be released: if the specified lock(s) cannot be acquired immediately without waiting, the transaction is aborted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If a table-level lock is obtained without specifying **NOWAIT** and other mutex locks exist, the system waits for other locks to be released.

- **CANCELABLE**

  Allows the waiting thread to send CANCEL signals to the holding threads and waiting threads.

  Only the redistribution tool can use this parameter. An error message is displayed when the parameter is used by users.

Examples

- SHARE ROW EXCLUSIVE

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason (
r_reason_sk         INTEGER      NOT NULL,
r_reason_id         CHAR(16)     NOT NULL,
r_reason_desc       INTEGER
);

-- Insert multiple records into the table.
gaussdb=# INSERT INTO tpcds.reason VALUES (1, 'AAAAAAAABAAAAAAA', '18'),(5,
'AAAAAAAACAAAAAAA', '362'),(7, 'AAAAAAAADAAAAAAA', '585');

-- Create a table named reason_t1.
gaussdb=# CREATE TABLE tpcds.reason_t1 AS TABLE tpcds.reason;

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Use the SHARE ROW EXCLUSIVE MODE lock mode to lock a table.
gaussdb=# LOCK TABLE tpcds.reason_t1 IN SHARE ROW EXCLUSIVE MODE;

-- If you perform the DELETE operation on another device, the operation is blocked.
gaussdb=# DELETE FROM tpcds.reason_t1 WHERE r_reason_sk = 7;

-- End the transaction and release the lock.
gaussdb=# COMMIT;
```

- ROW EXCLUSIVE

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- After the UPDATE statement is executed, request a ROW EXCLUSIVE lock on the referenced table.
gaussdb=# UPDATE tpcds.reason_t1 SET r_reason_desc=180 WHERE r_reason_sk=1;

-- When the ALTER TABLE statement is executed on another device, the operation is blocked.
gaussdb=# ALTER TABLE tpcds.reason_t1 ADD r_reason_asc int;

-- End the transaction and release the lock.
gaussdb=# COMMIT;
```

- ACCESS EXCLUSIVE

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- After the TRUNCATE statement is executed, request an ACCESS EXCLUSIVE lock on the referenced table.
gaussdb=# TRUNCATE tpcds.reason_t1;

-- When the SELECT statement is executed on another device, the operation is blocked.
gaussdb=# SELECT * FROM tpcds.reason_t1;

-- End the transaction and release the lock.
gaussdb=# COMMIT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Drop the tpcds.reason_t1 table.
gaussdb=# DROP TABLE tpcds.reason_t1;

-- Drop the tpcds.reason table.
gaussdb=# DROP TABLE tpcds.reason;

-- Drop a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

7.12.15.3 LOCK BUCKETS

Description

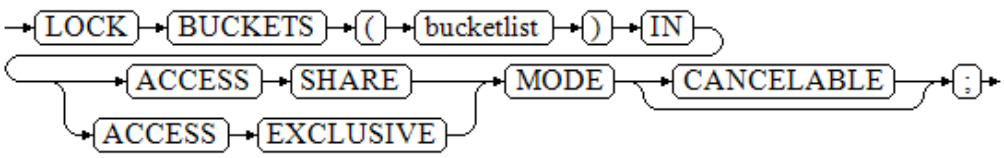
Bucket-based lock.

Precautions

- It can be called only during hash bucket scaling out.
- LOCK BUCKETS is useless outside a transaction block: the lock would remain held only to the completion of the statement. If LOCK BUCKETS is out of any transaction block, an error is reported.

Syntax

```
LOCK BUCKETS (bucketlist) IN {ACCESS SHARE|ACCESS EXCLUSIVE} MODE [CANCELABLE];
```



Parameters

Parameters of LOCK BUCKETS are as follows:

- **bucketlist**

  Specifies the list of buckets to be locked.

  Value range: For each bucket, the value range is [0,1023].
- **ACCESS SHARE**

  Allows only read operations on a bucket.
- **ACCESS EXCLUSIVE**

  Guarantees that the holder is the only transaction accessing the bucket in any way.
- **CANCELABLE**

  Allows the waiting thread to send CANCEL signals to the holding threads and waiting threads.

Examples

```
gaussdb=# START TRANSACTION;

gaussdb=# LOCK BUCKETS (0,1,2,3) IN ACCESS EXCLUSIVE MODE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# COMMIT;
```

7.12.16 M

7.12.16.1 MARK BUCKETS

Description

Used by the scale-out tool to notify the kernel of the buckets that have been migrated.

Precautions

It can be called by administrators only during hash bucket scale-out.

Syntax

```
MARK BUCKETS (bucketlist) FINISH FROM datanode_name TO datanode_name;
```

Parameters

- **bucketlist**

  Specifies the list of buckets that have been migrated.

  Value range: For each bucket, the value range is [0,1023].

- **datanode_name**

  Specifies the name of the node involved in bucket migration.

  Value range: a string. It must comply with the **naming convention**.

Examples

```
gaussdb=# MARK BUCKETS (0,1,2,3) FINISH FROM datanode1 TO datanode3;
```

7.12.16.2 MERGE INTO

Description

MERGE INTO conditionally matches data in a target table with that in a source table. If data matches, UPDATE is executed on the target table; if data does not match, INSERT is executed. You can use this syntax to run UPDATE and INSERT at a time for convenience.

Precautions

- You have the INSERT and UPDATE permissions for the target table and the SELECT permission for the source table.
- MERGE INTO cannot be executed during redistribution.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the source table of the MERGE INTO operation contains data columns that are dynamically anonymized, the result of inserting data to or updating data in the target table is the anonymized value and cannot be restored.

Syntax

```
MERGE [/*+ plan_hint */] INTO table_name [ [ AS ] alias ]
USING { { table_name | view_name } | subquery } [ [ AS ] alias ]
ON ( condition )
[
  WHEN MATCHED THEN
  UPDATE SET { column_name = { expression  | DEFAULT } |
         ( column_name [, ...] ) = ( { expression  | DEFAULT } [, ...] ) } [, ...]
  [ WHERE condition ]
]
[
  WHEN NOT MATCHED THEN
  INSERT { DEFAULT VALUES |
  [ ( column_name [, ...] ) ] VALUES ( { expression  | DEFAULT } [, ...] ) [, ...] [ WHERE condition ] }
];
```

Parameters

- plan_hint clause

  Follows the MERGE keyword in the **/*+ */** format. It is used to optimize the plan of a MERGE statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- INTO clause

  Specifies the target table that is being updated or has data being inserted. If the target table is a replication table, the default value of a column (such as auto-increment column) in the target table cannot be the volatile function. If **enable_stream_operator** is set to **off**, the target table must contain a primary key or UNIQUE and NOT NULL constraints.

  - **table_name**

    Specifies the name of the target table.

  - **alias**

    Specifies the alias of the target table.

    Value range: a string. It must comply with the **naming convention**.

- USING clause

  Specifies the source table, which can be a table, view, or subquery. If the target table is a replication table, the USING clause cannot contain non-replication tables.

- ON clause

  Specifies the condition used to match data between the source and target tables. Columns in the condition cannot be updated.

- WHEN MATCHED clause

  Performs UPDATE if data in the source table matches that in the target table based on the condition.

  Distribution keys cannot be updated. System catalogs and system columns cannot be updated.

- WHEN NOT MATCHED clause

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Performs INSERT if data in the source table does not match that in the target table based on the condition.

An INSERT clause cannot contain multiple VALUES.

The order of WHEN MATCHED and WHEN NOT MATCHED clauses can be reversed. One of them can be used by default, but they cannot be both used at one time. Two WHEN MATCHED or WHEN NOT MATCHED clauses cannot be specified at the same time.

- **DEFAULT**

  Specifies the default value of a column.

  The value is **NULL** if no default value is assigned to it.

- WHERE condition

  Specifies the conditions for the UPDATE and INSERT clauses. The two clauses will be executed only when the conditions are met. The default value can be used. System columns cannot be referenced in WHERE condition. You are advised not to use numeric types such as int as conditions, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

Examples

```
-- Create the target table products and source table newproducts, and insert data to them.
gaussdb=# CREATE TABLE products
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

gaussdb=# INSERT INTO products VALUES (1501, 'vivitar 35mm', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1502, 'olympus is50', 'electrncs');
gaussdb=# INSERT INTO products VALUES (1600, 'play gym', 'toys');
gaussdb=# INSERT INTO products VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO products VALUES (1666, 'harry potter', 'dvd');

gaussdb=# CREATE TABLE newproducts
(
product_id INTEGER,
product_name VARCHAR2(60),
category VARCHAR2(60)
);

gaussdb=# INSERT INTO newproducts VALUES (1502, 'olympus camera', 'electrncs');
gaussdb=# INSERT INTO newproducts VALUES (1601, 'lamaze', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1666, 'harry potter', 'toys');
gaussdb=# INSERT INTO newproducts VALUES (1700, 'wait interface', 'books');

-- Run MERGE INTO.
gaussdb=# MERGE INTO products p
USING newproducts np
ON (p.product_id = np.product_id)
WHEN MATCHED THEN
  UPDATE SET p.product_name = np.product_name, p.category = np.category WHERE p.product_name !=
'play gym'
WHEN NOT MATCHED THEN
  INSERT VALUES (np.product_id, np.product_name, np.category) WHERE np.category = 'books';
MERGE 4

-- Query updates.
gaussdb=# SELECT * FROM products ORDER BY product_id;
 product_id |  product_name  | category
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------+----------------+-----------
      1501 | vivitar 35mm   | electrncs
      1502 | olympus camera | electrncs
      1600 | play gym       | toys
      1601 | lamaze         | toys
      1666 | harry potter   | toys
      1700 | wait interface | books
(6 rows)

-- Delete the table.
gaussdb=# DROP TABLE products;
gaussdb=# DROP TABLE newproducts;
```

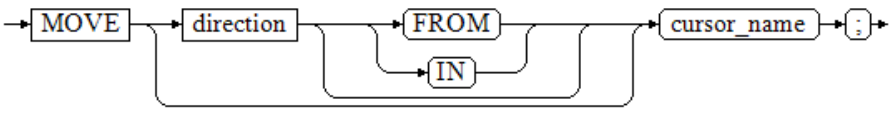
7.12.16.3 MOVE

Description

MOVE repositions a cursor without retrieving any data. MOVE works exactly like the **FETCH** statement, except MOVE only repositions the cursor and does not return rows.

Syntax

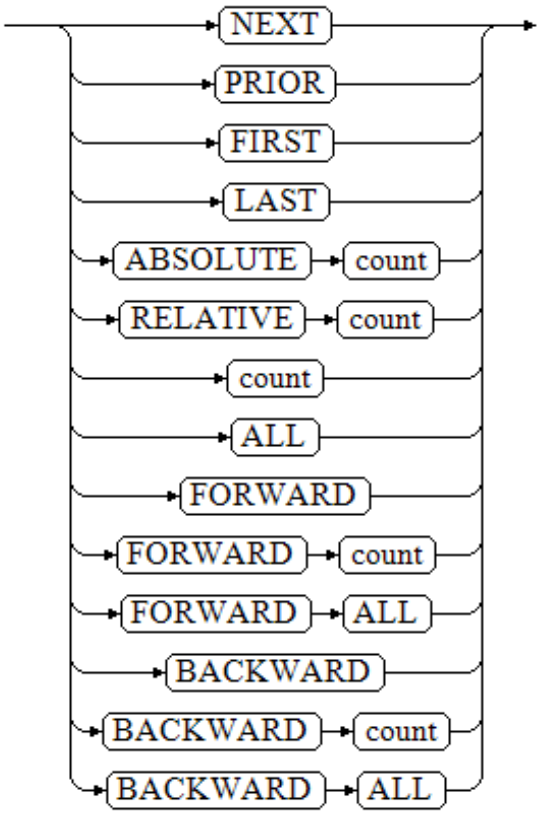
```
MOVE [ direction [ FROM | IN ] ] cursor_name;
```



The direction clause specifies optional parameters.

```
NEXT
  | PRIOR
  | FIRST
  | LAST
  | ABSOLUTE count
  | RELATIVE count
  | count
  | ALL
  | FORWARD
  | FORWARD count
  | FORWARD ALL
  | BACKWARD
  | BACKWARD count
  | BACKWARD ALL
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

The parameters of **MOVE** and **FETCH** are the same. For details, see **Parameters** in **FETCH**.

NOTE

On successful completion, a **MOVE** statement returns a tag of the form **MOVE count**. The **count** is the number of rows that a **FETCH** statement with the same parameters would have returned (possibly zero).

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test(c1 int);
gaussdb=# INSERT INTO tbl_test VALUES (generate_series(1,20));

-- Set up cursor1.
gaussdb=# BEGIN;
gaussdb=# CURSOR cursor1 FOR SELECT * FROM tbl_test ORDER BY 1;

-- Run the MOVE command to move the cursor backwards by five rows. No result is returned.
gaussdb=# MOVE FORWARD 5 FROM cursor1;
MOVE 5

-- Run the FETCH command to retrieve two rows of data.
gaussdb=# FETCH FORWARD 2 FROM cursor1;
 c1
----
  6
  7
(2 rows)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Close the cursor and end the transaction.
gaussdb=# CLOSE cursor1;
gaussdb=# END;

-- Delete.
gaussdb=# DROP TABLE tbl_test;
```

Helpful Links

CLOSE and **FETCH**

7.12.17 P

7.12.17.1 PREDICT BY

Description

Uses a trained model to perform prediction tasks.

Precautions

This syntax is not supported because the current version does not support inference tasks using training models.

7.12.17.2 PREPARE

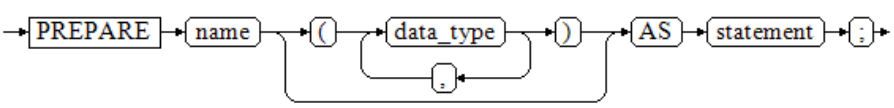
Description

Creates a prepared statement.

A prepared statement is a performance optimizing object on the server. When the **PREPARE** statement is executed, the specified query is parsed, analyzed, and rewritten. When **EXECUTE** is executed, the prepared statement is planned and executed. This avoids repetitive parsing and analysis. After the PREPARE statement is created, it exists throughout the database session. Once it is created (even if in a transaction block), it will not be deleted when a transaction is rolled back. It can only be deleted by explicitly calling **DEALLOCATE** or automatically deleted when the session ends.

Syntax

```
PREPARE name [ ( data_type [, ...] ) ] AS statement;
```



Parameters

- **name**

  Specifies the name of a prepared statement. It must be unique in the session.
- **data_type**

  Specifies the type of an argument.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **statement**

  Specifies a SELECT, INSERT, UPDATE, DELETE, MERGE INTO, or VALUES statement.

Examples

For details, see **Examples**.

Helpful Links

DEALLOCATE and **EXECUTE**

7.12.17.3 PREPARE TRANSACTION

Description

Prepares the current transaction for two-phase commit.

After this statement, the transaction is no longer associated with the current session; instead, its state is fully stored on disk, and there is a high probability that it can be committed successfully, even if a database crash occurs before the commit is requested.

Once prepared, a transaction can later be committed or rolled back with **COMMIT PREPARED** or **ROLLBACK PREPARED**, respectively. Those statements can be issued from any session, not only the one that executed the original transaction.

From the point of view of the issuing session, **PREPARE TRANSACTION** is not unlike a **ROLLBACK** statement: after executing it, there is no active current transaction, and the effects of the prepared transaction are no longer visible. (The effects will become visible again if the transaction is committed.)

If the **PREPARE TRANSACTION** statement fails for any reason, it becomes a **ROLLBACK** and the current transaction is canceled.

Precautions

- The transaction function is maintained automatically by the database, and should be not visible to users.
- Currently, the distributed system does not allow users to call the user-defined PREPARE TRANSACTION operation. This syntax is reserved only for local two-phase cleanup on CNs in maintenance mode and does not ensure the global transaction capability.
- When running the **PREPARE TRANSACTION** statement, increase the value of **max_prepared_transactions** in configuration file **gaussdb.conf**. You are advised to set it to a value not less than that of **max_connections** so that one pending prepared transaction is available for each session.

Syntax

```
PREPARE TRANSACTION transaction_id;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **transaction_id**

  Specifies an arbitrary identifier that later identifies this transaction for **COMMIT PREPARED** or **ROLLBACK PREPARED**. The identifier must be different from those for current prepared transactions.

  Value range: The identifier must be written as a string literal, and must be less than 200 bytes long.

Helpful Links

COMMIT PREPARED and **ROLLBACK PREPARED**

7.12.17.4 PURGE

Description

The **PURGE** statement can be used to:

- Clear tables or indexes from the recycle bin and release all space related to the objects.
- Clear the recycle bin.
- Clear the objects of a specified tablespace in the recycle bin.

Precautions

- The PURGE operation supports tables (**PURGE TABLE**), indexes (**PURGE INDEX**), and recycle bins (**PURGE RECYCLEBIN**).
- The permission requirements for performing the PURGE operation are as follows:
  - **PURGE TABLE**: The user must be the owner of the table and must have the USAGE permission on the schema to which the table belongs. When the separation of duties is disabled, system administrators have this permission by default.
  - **PURGE INDEX**: The user must be the owner of the index and have the USAGE permission on the schema to which the index belongs. When the separation of duties is disabled, system administrators have this permission by default.
  - **PURGE RECYCLEBIN**: Common users can clear only the objects owned by themselves in the recycle bin. In addition, the user must have the USAGE permission of the schema to which the objects belong. When the separation of duties is disabled, system administrators can clear all objects in the recycle bin by default.

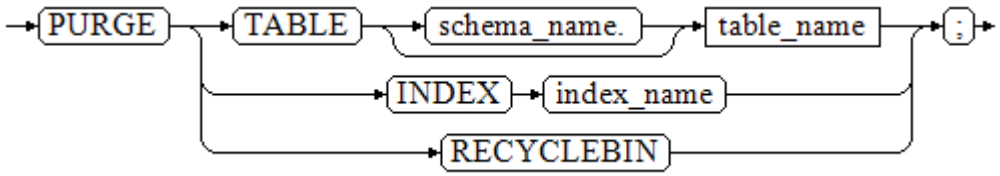
Prerequisites

- The **enable_recyclebin** parameter has been enabled to enable the recycle bin. Contact an administrator for details about how to use the parameter.
- The **recyclebin_retention_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact an administrator for details about how to use the parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

```
PURGE { TABLE [schema_name.]table_name
      | INDEX index_name
      | RECYCLEBIN
    };
```



Parameters

- **schema_name**

  Schema name

- **TABLE [schema_name.] table_name**

  Clears a specified table in the recycle bin. The table can be schema-qualified.

- **INDEX index_name**

  Clears a specified index in the recycle bin.

- **RECYCLEBIN**

  Clears all objects in the recycle bin.

Examples

```
-- Create the reason_t1 table.
gaussdb=# CREATE TABLE reason_t1(
    r_reason_sk     integer,
    r_reason_id     character(16),
    r_reason_desc   character(100)
) WITH(STORAGE_TYPE = ustore);

-- Create the reason_t2 table:
gaussdb=# CREATE TABLE reason_t2(
    r_reason_sk     integer,
    r_reason_id     character(16),
    r_reason_desc   character(100)
) WITH(STORAGE_TYPE = ustore);

-- Add indexes to the reason_t1 and reason_t2 tables.
gaussdb=#  CREATE INDEX idx_t1 on reason_t1(r_reason_id);
gaussdb=#  CREATE INDEX idx_t2 on reason_t2(r_reason_id);
gaussdb=#  DROP TABLE reason_t1;
gaussdb=#  DROP TABLE reason_t2;

-- View the recycle bin.
gaussdb=#  SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
          rcyname           | rcyoriginname | rcytablespace
----------------------------+---------------+---------------
 BIN$31C94EB4207$8001$0==$0 | reason_t1     |             0

(1 row)

-- Purge all objects in the recycle bin.
gaussdb=#  PURGE recyclebin;
gaussdb=#  SELECT rcyname,rcyoriginname,rcytablespace FROM GS_RECYCLEBIN;
        rcyname         | rcyoriginname | rcytablespace
------------------------+---------------+---------------
(0 rows)
```

7.12.18 R

7.12.18.1 REASSIGN OWNED

Description

Changes the owner of the database object.

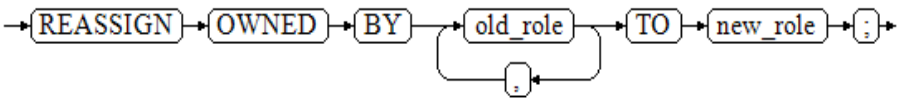
REASSIGN OWNED changes the database object owner of an old role to a new role.

Precautions

- REASSIGN OWNED is often executed before role deletion.
- To run the REASSIGN OWNED statement, you must have the permissions of the original and target roles.

Syntax

```
REASSIGN OWNED BY old_role [, ...] TO new_role;
```



Parameters

- **old_role**

  Specifies the role name of the old owner.

- **new_role**

  Specifies the role name of the new owner. Note: Only the initial user can use the REASSIGN OWNED syntax to change the owner to the initial user.

Examples

```
-- Create the test_jim and test_tom users.
gaussdb=# CREATE USER test_jim PASSWORD '********';
gaussdb=# CREATE USER test_tom PASSWORD '********';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- View the user with the same name as owner of the automatically created schema.
gaussdb=# \dn test*
   List of schemas
   Name   |  Owner
----------+----------
 test_jim | test_jim
 test_tom | test_tom
(2 rows)

-- Change the owner of all database objects owned by test_jim to test_tom.
gaussdb=# REASSIGN OWNED BY test_jim TO test_tom;

-- View the schema information. The owner of the test_jim schema is changed to test_tom.
gaussdb=# \dn test*
   List of schemas
   Name   |  Owner
----------+----------
 test_jim | test_tom
 test_tom | test_tom
(2 rows)

-- Delete the test_jim and test_tom users.
gaussdb=# DROP USER test_jim, test_tom CASCADE;
```

DROP OWNED

7.12.18.2 REFRESH INCREMENTAL MATERIALIZED VIEW

Description

REFRESH INCREMENTAL MATERIALIZED VIEW refreshes a materialized view in incremental mode.

Precautions

- Incremental refresh supports only fast-refresh materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

Syntax

```
REFRESH INCREMENTAL MATERIALIZED VIEW mv_name;
```

Parameters

- **mv_name**

  Name of the materialized view to be refreshed.

Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Fast refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH INCREMENTAL MATERIALIZED VIEW my_imv;

-- View the fast-refresh materialized view.
gaussdb=# SELECT * FROM my_imv;
 c1 | c2
----+----
  1 |  1
  2 |  2
(2 rows)

-- Delete the fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

7.12.18.3 REFRESH MATERIALIZED VIEW

Description

REFRESH MATERIALIZED VIEW refreshes materialized views in complete-refresh mode.

Precautions

- Full refreshing can be performed on both complete- and fast-refresh materialized views.
- To refresh a materialized view, you must have the SELECT permission on the base table.

Syntax

```
REFRESH MATERIALIZED VIEW mv_name;
```

Parameters

- **mv_name**

  Name of the materialized view to be refreshed.

Examples

```
-- Create an ordinary table.
gaussdb=# CREATE TABLE my_table (c1 int, c2 int);

-- Create a complete-refresh materialized view.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE MATERIALIZED VIEW my_mv AS SELECT * FROM my_table;

-- Create a fast-refresh materialized view.
gaussdb=# CREATE INCREMENTAL MATERIALIZED VIEW my_imv AS SELECT * FROM my_table;

-- Write data to the base table.
gaussdb=# INSERT INTO my_table VALUES(1,1),(2,2);

-- Completely refresh the complete-refresh materialized view my_mv.
gaussdb=# REFRESH MATERIALIZED VIEW my_mv;

-- Completely refresh the fast-refresh materialized view my_imv.
gaussdb=# REFRESH MATERIALIZED VIEW my_imv;

-- Delete a fast-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_imv;

-- Delete a complete-refresh materialized view.
gaussdb=# DROP MATERIALIZED VIEW my_mv;

-- Delete the my_table table.
gaussdb=# DROP TABLE my_table;
```

7.12.18.4 REINDEX

Description

Rebuilds an index using the data stored in the index's table, replacing the old copy of the index.

There are several scenarios in which REINDEX can be used:

- An index has become corrupted, and no longer contains valid data.
- An index has become "bloated", that is, it contains many empty or nearly-empty pages.
- You have altered a storage parameter (such as a fill factor) for an index, and wish that the change takes full effect.

Precautions

- REINDEX DATABASE and REINDEX SYSTEM type cannot be performed in transaction blocks.
- Currently, only REINDEX INDEX and REINDEX TABLE are supported for global secondary indexes.
- If the index contains the **lpi_parallel_method** option and the value is **PARTITION**, and the **parallel_workers** value of the index's table is greater than 0, the index cannot be rebuilt in parallel. If the index does not contain the **lpi_parallel_method** option or the value of the option is set to **AUTO**, page-level parallel index is rebuilt by default. For details, see **LPI_PARALLEL_METHOD**.
- When REINDEX CONCURRENTLY is used to rebuild indexes online, the index sequence in the table changes, and the query plan may change.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

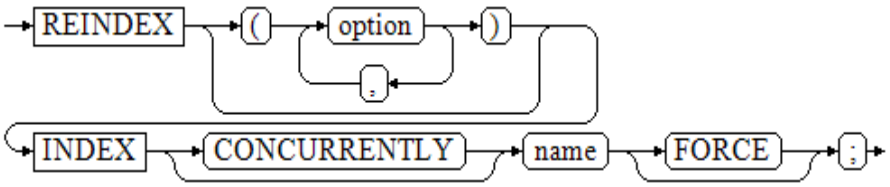
Syntax

- Rebuild an ordinary index.

```
REINDEX { INDEX | [INTERNAL] TABLE | DATABASE | SYSTEM } [ CONCURRENTLY ] name [ FORCE ];
```

- Rebuild the index and convert the type.

```
REINDEX [ ( option [, ...] ) ] { INDEX } [ CONCURRENTLY ] name [ FORCE ];
```



- Rebuild an index partition.

```
REINDEX { INDEX | [INTERNAL] TABLE } name
   PARTITION partition_name [ FORCE ];
```

Parameters

- **INDEX**

  Rebuilds the specified index.

- **TABLE**

  Rebuilds all indexes of a specified table. If a table has a TOAST table, the table will also be reindexed. If an index on the table has been invalidated by running **alter unusable**, the index cannot be rebuilt. Indexes in the TOAST table cannot be rebuilt when specifying the CONCURRENTLY option.

- **DATABASE**

  Rebuilds all indexes within the current database. Indexes in the TOAST table within the current database cannot be rebuilt when specifying the CONCURRENTLY option.

- **SYSTEM**

  Rebuilds all indexes on system catalogs within the current database. Indexes on user tables are not processed.

- **option**

  Currently, only **CROSSBUCKET** is supported, and the value can only be **ON** or **OFF**. This parameter is used to determine whether the index of a hash bucket table is converted to a cross-bucket index (CBI) or local-bucket index (LBI). This conversion supports only the index of the distributed hash bucket table and does not support the GSI index. In the current version, only the session of the scale-out process can use the online index type conversion.

- **CONCURRENTLY**

  Rebuilds an index (with ShareUpdateExclusiveLock) in non-blocking DML mode. When an index is rebuilt, other statements cannot access the table on which the index depends. If this keyword is specified, DML is not blocked during the rebuilding. Indexes in system catalogs cannot be rebuilt online. REINDEX INTERNAL TABLE CONCURRENTLY, REINDEX SYSTEM CONCURRENTLY, and REINDEX INVALID INDEX CONCURRENTLY are not supported. When REINDEX DATABASE CONCURRENTLY is executed, all indexes on user tables in the current database are rebuilt online (indexes on system catalogs are not processed). REINDEX CONCURRENTLY cannot be executed within a transaction. Online index rebuilding supports only B-tree and UB-tree indexes, ordinary indexes, global indexes, and local indexes. PCR

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

UB-tree indexes and level-2 partitions are not supported. GSIs can be rebuilt online using REINDEX INDEX CONCURRENTLY, but expression GSIs and partial GSIs cannot be rebuilt online. During online GSI rebuild, do not execute DDL statements concurrently with other DDL statements. Otherwise, deadlocks and errors may occur. You can reconnect to the client and try again. Online parallel index rebuilding supports only ordinary indexes, global indexes, and local indexes of Astore and Ustore, and GSIs of Ustore. Other online index rebuilding specifications are inherited from the current version. If online index rebuilding fails, the system automatically clears new indexes to prevent resource occupation in scenarios such as manual cancellation, duplicate unique index key values, insufficient resources, thread startup failure, and lock timeout. If the system cannot automatically clear invalid new indexes (for example, the database breaks down, FATAL, or PANIC), you need to manually clear invalid new indexes (using the DROP INDEX statement) and temporary tables (using the DROP TABLE statement) as soon as possible to prevent more resources from being occupied. Generally, the suffix of an invalid index is **_ccnew**. For GSIs, the prefix of an invalid new index is **ccgsi_tmp_index_**. In the distributed system, failed indexes in DNs are automatically cleared and those in CNs need to be manually cleared. If a critical error occurs, the metadata of the failed indexes cannot be found on some nodes in the distributed system. The DROP INDEX statement cannot be used to delete these indexes. You need to use the DROP INDEX IF EXISTS statement to delete them. The execution of REINDEX INDEX CONCURRENTLY adds a four-level session lock to the table and its first several phases are similar to those of CREATE INDEX CONCURRENTLY. Therefore, the execution may be suspended or deadlocked, which is similar to that of CREATE INDEX CONCURRENTLY. For example, if two sessions perform the REINDEX CONCURRENTLY operation on the same index or table at the same time, a deadlock occurs. For details, see **CONCURRENTLY**.

NOTE

This keyword is specified when an index is rebuilt. For Astore, you need to complete two full table scans for building. During the first scan, a new index is created without blocking read and write operations. During the second scan, the changes in the first scan are merged and updated. For Ustore, you need to complete a full table scan. During the scan, data generated by concurrent DML operations is inserted into the temporary table named **index_oid_cctmp**. After the scan is complete, you merge the temporary table to the new index suffixed with **_ccnew{n}** (for GSIs, the prefix is **ccgsi_tmp_index_**), delete the temporary table, exchange the old and new indexes, mark the old index as dead, enable the new index, and rebuild the index.

- **name**

  Specifies the name of the index, table, or database whose index needs to be rebuilt. Tables and indexes can be schema-qualified.

  NOTE

  REINDEX DATABASE and REINDEX SYSTEM can create indexes for only the current database. Therefore, **name** must be the same as the current database name.

- **FORCE**

  Deprecated parameter. It is currently reserved for compatibility with earlier versions.

- **partition_name**

  Specifies the name of the index or table to be reindexed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range:

- The name of an index is specified if REINDEX INDEX is used.
- The name of a table is specified if REINDEX TABLE is used.

NOTICE

- REINDEX DATABASE and REINDEX SYSTEM cannot be performed in transaction blocks.
- REINDEX and REINDEX CONCURRENTLY do not support separate operations on TOAST tables or TOAST indexes.

Examples

```
-- Create the table tbl_test and insert data into the tables.
gaussdb=# CREATE TABLE tbl_test(c1 int,c2 varchar);
gaussdb=# INSERT INTO tbl_test VALUES (1, 'AAAAAAA'),(5, 'AAAAAAB'),(10, 'AAAAAAC');

-- Create an index and check the index size.
gaussdb=# CREATE INDEX idx_test_c1 ON tbl_test(c1);
gaussdb=# SELECT pg_size_pretty(pg_total_relation_size('idx_test_c1')) AS size;
  size
--------
 176 kB
(1 row)

-- Insert 10,000 data records and then delete the data. It is found that the index becomes larger.
gaussdb=# INSERT INTO tbl_test VALUES (generate_series(1,10000),'test');
gaussdb=# DELETE FROM tbl_test WHERE c2 = 'test';
gaussdb=# SELECT pg_size_pretty(pg_total_relation_size('idx_test_c1')) AS size;
  size
--------
 504 kB
(1 row)

-- After an independent index is rebuilt, the index size is restored to the initial size.
gaussdb=# REINDEX INDEX idx_test_c1;
gaussdb=# SELECT pg_size_pretty(pg_total_relation_size('idx_test_c1')) AS size;
  size
--------
 176 kB
(1 row)

-- Rebuild a single index online.
gaussdb=# REINDEX INDEX CONCURRENTLY idx_test_c1;

-- Rebuild all indexes in the table tbl_test.
gaussdb=# REINDEX TABLE tbl_test;

-- Rebuild all indexes in the table tbl_test online.
gaussdb=# REINDEX TABLE CONCURRENTLY tbl_test;

-- Drop the tbl_test table.
gaussdb=# DROP TABLE tbl_test;
```

Suggestions

- INTERNAL TABLE

  This scenario is used for fault recovery. You are advised not to perform concurrent operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DATABASE

  You are advised not to reindex a database in a transaction.
- SYSTEM

  You are advised not to reindex a system catalog in a transaction.

7.12.18.5 RELEASE SAVEPOINT

Description

RELEASE SAVEPOINT destroys a savepoint previously defined in the current transaction.

Destroying a savepoint makes it unavailable as a rollback point, but it has no other user visible behavior. It does not undo the effects of statements executed after the savepoint was established. To do that, use ROLLBACK TO SAVEPOINT. Destroying a savepoint when it is no longer needed allows the system to reclaim some resources earlier than transaction end.

RELEASE SAVEPOINT also destroys all savepoints that were established after the named savepoint was established.

Precautions

- Releasing a savepoint name that was not previously defined will cause an error.
- It is not possible to release a savepoint when the transaction is in an aborted state.
- If multiple savepoints have the same name, only the one that was most recently defined is released.

Syntax

```
RELEASE [ SAVEPOINT ] savepoint_name;
```

Parameters

- **savepoint_name**

  Specifies the name of the savepoint you want to destroy.

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create a table.
gaussdb=# CREATE TABLE tpcds.table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (3);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Establish a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO tpcds.table1 VALUES (4);

-- Delete the savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- Query the table content, which should contain both 3 and 4.
gaussdb=# SELECT * FROM tpcds.table1;
 a
---
 3
 4
(2 rows)

-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the table content again. You can see 3 and 4 at the same time.
gaussdb=# SELECT * FROM tpcds.table1;
 a
---
 3
 4
(2 rows)

-- Delete the table.
gaussdb=# DROP TABLE tpcds.table1;

-- Delete a schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

Helpful Links

SAVEPOINT and **ROLLBACK TO SAVEPOINT**

7.12.18.6 RENAME TABLE

Description

In the same statement, changing the name of a single table or multiple tables does not affect the stored data.

Precautions

- To change the name of a single table, this syntax is equivalent to RENAME in ALTER TABLE.
- Changing the names of multiple tables is equivalent to running RENAME in ALTER TABLE for multiple times. However, changing the names of local and non-local temporary tables at the same time is not supported.

Syntax

Modify the table name.

```
RENAME { TABLE | TABLES } table_name TO new_table_name [, table_name2 TO new_table_name2, ...];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

If you run this command when **sql_compatibility** is set to **'MYSQL'**, **b_format_version** set to **'5.7'**, and **b_format_dev_version** set to **'s2'**, the following situations may occur:

- If the new table name starts with "#mysql50#" and is followed by other characters, "#mysql50#" will be ignored.
- If the old and new table names are the same, no error is reported.

Parameters

- **TABLE | TABLES**

  TABLE and TABLES can be used interchangeably, regardless of the number of tables operated in the statement.

- **table_name TO new_table_name [, table_name2 TO new_table_name2, ...]**

  table_name and **table_name2** indicate the names of the tables to be modified.

  new_table_name and **new_table_name2** indicate the new table names.

  TO is the connection word.

Examples of Modifying Tables

- Rename a single table.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# RENAME TABLE aa TO test_alt1;
gaussdb=# DROP TABLE test_alt1;
```

- Rename multiple tables.

```
gaussdb=# CREATE TABLE aa(c1 int, c2 int);
gaussdb=# CREATE TABLE bb(c1 int, c2 int);
gaussdb=# RENAME TABLE aa TO test_alt1, bb TO test_alt2;
gaussdb=# DROP TABLE test_alt1,test_alt2;
```

ALTER TABLE

7.12.18.7 REPLACE

Description

The REPLACE statement is used to insert data into a table or replace existing data in a table. If the data to be inserted has the primary key or unique key conflicts with the existing data, the REPLACE statement deletes the existing data and then inserts the new data.

You can use REPLACE in the following ways:

- Replace or insert values. That is, VALUES or VALUE is used to construct a row of records and insert the row into the table.
- Replace or insert the query. One or more rows of records are constructed based on the result set returned by SELECT and inserted into a table.
- Set the value of a specified column. Similar to value insertion, the default value is used for columns that are not specified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- To execute this statement, you must have the DELETE and INSERT permissions on the table.
- If the primary key or unique key does not conflict, you can directly insert the data. If the primary key or unique key conflicts, delete the original data and then insert the new data.
- The return format of the REPLACE operation is **REPLACE 0** *X*, where *X* indicates the number of DELETE and INSERT operations.
- In the REPLACE...SELECT syntax, the number of columns in **select_list** must be the same as the number of columns to be inserted.
- In the REPLACE...SET syntax:
  - If **col_name** has a default value, **SET col_name = col_name + 1** is equivalent to **SET col_name =** *Default value of col_name* **+ 1**.
  - If **col_name** has neither default value nor NOT NULL constraint, **SET col_name = col_name + 1** is equivalent to **col_name = NULL**.
  - If **col_name** does not have a default value but has a NOT NULL constraint, the data types that support a default value are timestamp, timestamp with time zone, time, time with time zone, interval, tinterval, smalldatetime, date, uuid, name, point, polygon, circle, lseg, box, json, jsonb, xml, varbit, numeric, cidr, inet, macaddr, numrange, int8range, int4range, tsrange, tstzrange, daterange, hash16, hash32, bool, bytea, char, bigint, int, smallint, tinyint, text, raw, blob, clob, float4, float8, abstime, reltime, bpchar, varchar, nvarchar, money, uint1, uint2, uint4, uint8, and enum. The default values are as follows:

Data Type	Default Value of col_name
int8, int4, int2, int1, float8, float4, numeric, uint1, uint2, uint4, and uint8	**0**. If **numeric** specifies a decimal place, the decimal place is displayed. For example, **NUMERIC (10, 3): 0.000**
text, clob, bpchar, varchar, char, nvarchar2, name, blob, raw, and varbit	Empty string.
numrange, int8range, int4range, tsrange, tstzrange, and daterange	empty
bytea	\x
money	$0.00
json, jsonb, and xml	'null'
macaddr	00:00:00:00:00:00
inet	0.0.0.0
cidr	0.0.0.0/32
point	(0,0)

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Data Type	Default Value of col_name
lseg	[(0,0),(0,0)]
box	(0,0),(0,0)
path	((0,0))
polygon	((0,0))
circle	<(0,0),0>
uuid	00000000-0000-0000-0000-000000000000
hash16	0000000000000000
hash32	00000000000000000000000000000000
bool	f
abstime	abstime '1970-01-01 00:00:00'
reltime	reltime '00:00:00'
interval	interval '00:00:00'
tinterval	tinterval(abstime '1970-01-01 00:00:00', abstime '1970-01-01 00:00:00')
timestamp	timestamp '1970-01-01 00:00:00'
timestamp with time zone	timestamptz '1970-01-01 00:00:00'
date	date '1970-01-01'
time	time '00:00:00'
time with time zone	timetz '00:00:00'
smalldatetime	smalldatetime '1970-01-01 00:00:00'

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The default value of the enumerated type (ENUM) is the first element. If the first element does not exist, NULL is returned.
- In an ORA database (**sql_compatibility = 'ORA'**), an empty string of the text, clob, blob, raw, bytea, varchar, nvarchar2, bpchar, char, name, byteawithoutorderwithqualcol, or byteawithoutordercol type is equivalent to null. If a column has a NOT NULL constraint, an error is reported when a reference column is used to insert data into a table.
- In MySQL-compatible mode (**sql_compatibility = 'MYSQL'**), if **b_format_version** is set to **'5.7'**, **b_format_dev_version** is set to **'s1'**, and **sql_mode** does not contain **strict_tans_tables**, **only_full_group_by**, **no_zero_in_date**, **no_zero_date**, or **error_for_division_by_zero**, then the default values of **timestamp** and **datetime** are **0000-00-00 00:00:00**, and the default value of **DATE** is **0000-00-00** under the NOT NULL constraint.
- The uint1, uint2, uint4, and uint8 data types are supported only in the MySQL-compatible mode (**sql_compatibility = 'MYSQL'**).
- If the default value of the function expression can be calculated during parsing, the default value is the calculated constant. Otherwise, the value is **NULL**.
- In other scenarios, the default value is **NULL**.

- In the REPLACE... SET syntax, the current **col_name** value depends on the previous **col_name** value. If there is no previous **col_name** value, the default value is used. For example, in the **SET f1 = f1 + 1, f2 = f1** scenario, **f1** is equal to the default value of **f1** (assumed to **1**) plus 1, and **f2** is equal to the calculated value of **f1**, that is **2**.
- Triggers are not supported. The INSERT or DELETE trigger of the target table is not fired.
- The UNIQUE constraint or primary key of DEFERRABLE is not supported.
- If a table has multiple UNIQUE constraints and the inserted data violates multiple UNIQUE constraints, all the data that violates the constraints is deleted and new data is inserted. In this scenario, data may be deleted by mistake. Therefore, exercise caution when performing this operation.
- If multiple rows are inserted and these rows have UNIQUE constraint conflicts with data in the same row in the table, the REPLACE operation is performed in sequence.
- In **SET col_name = col_name + 1**, the length of **col_name** cannot exceed 1. For example, in **SET col_name = table_name.col_name + 1**, the length of **table_name.col_name** is 2. Formats such as B.A, C.B.A, and D.C.B.A are not supported.
- Tables containing global secondary indexes do not support the REPLACE syntax.
- When comparing floating-point data, note that precision loss may occur.
- If a row-level security policy is created on a table, REPLACE INTO is not supported.
- Foreign tables are not supported.
- Encrypted tables are not supported.
- Memory tables are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

- Replace or insert values.

```
REPLACE [ INTO ] table_name
    [ PARTITION ( partition_name [, ... ] ) ]
    [ ( col_name [, ... ] ) ]
    { VALUES | VALUE } ( value [, ... ] ) [, ... ];

-- The format of value is as follows:
{ expression | DEFAULT }
```

- Replace or insert the query.

```
REPLACE [ INTO ] table_name
    [ PARTITION ( partition_name [, ... ] ) ]
    [ ( col_name [, ... ] ) ]
    query;
```

- Set the value of a specified column.

```
REPLACE [INTO] table_name
    [ PARTITION ( partition_name [, ... ] ) ]
    SET col_name = value [, ... ];

-- The format of value is as follows:
{ expression | DEFAULT }
```

Parameters

- **table_name**

  Specifies the name of the target table where data will be inserted.

  Value range: an existing table name.

- **col_name**

  Specifies the name of a column in a table.

  - The column name can be qualified with a subcolumn name or array index, if needed.
  - Each column not present in the column list will be filled with a default value, either its declared default value or **NULL** if there is none. Inserting data into only some columns of a composite type leaves the other columns **NULL**.
  - The target column names (specified by **col_name**) can be listed in any order. If no list of column names is given at all, the default is all the columns of the table in their declared order.
  - The target columns are the first *N* column names, if there are only *N* columns provided by the VALUE clause and QUERY.
  - The values provided by the VALUE clause and QUERY are joined with the corresponding columns from left to right in the table.

  Value range: an existing column.

- **PARTITION (partition_name [, ...])**

  Inserts data to a specified partition. **partition_name** indicates the partition name.

  If the value of the VALUE clause is inconsistent with that of the specified partition, an exception is displayed.

- **value**

  Specifies the value to be inserted. The value format is as follows:

  ```
  { expression | DEFAULT }
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

a. **expression** indicates that a valid expression or value is assigned to the corresponding column.

   If single-quotation marks are inserted in a column, the single-quotation marks need to be used for escape.

   If the expression for any column is not of the correct data type, automatic type conversion will be attempted. If the attempt fails, data insertion fails, and the system returns an error message.

b. **DEFAULT** indicates the default value of the corresponding column name. The value is **NULL** if no default value is assigned to it.

- **query**

  Specifies a query statement (SELECT statement) that uses the query result as the inserted data.

Examples

```
-- Create table test.
gaussdb=# CREATE TABLE test(f1 int primary key, f2 int, f3 int);

-- Insert three data records.
gaussdb=# INSERT INTO test VALUES(1, 1, 1), (2, 2, 2), (3, 3, 3);
INSERT 0 3

-- Replace or insert values.
gaussdb=# REPLACE INTO test VALUES(1, 11, 11);
REPLACE 0 2

-- Query the result.
gaussdb=# SELECT * FROM test WHERE f1 = 1;
 f1 | f2 | f3
----+----+----
  1 | 11 | 11
(1 row)

-- Replace or insert the query.
gaussdb=# REPLACE INTO test SELECT 2, 22, 22;
REPLACE 0 2

-- Query the result.
gaussdb=# SELECT * FROM test WHERE f1 = 2;
 f1 | f2 | f3
----+----+----
  2 | 22 | 22
(1 row)

-- Replace or insert the specified column.
gaussdb=# REPLACE INTO test SET f1 = f1 + 3, f2 = f1 * 10 + 3, f3 = f2;
REPLACE 0 2

-- Query the result.
gaussdb=# SELECT * FROM test WHERE f1 = 3;
 f1 | f2 | f3
----+----+----
  3 | 33 | 33
(1 row)

-- Drop table test.
gaussdb=# DROP TABLE test;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.18.8 RESET

Description

Restores GUC parameters to their default values. The default values are parameter default values complied in the **gaussdb.conf** configuration file.

RESET is an alternative spelling for:

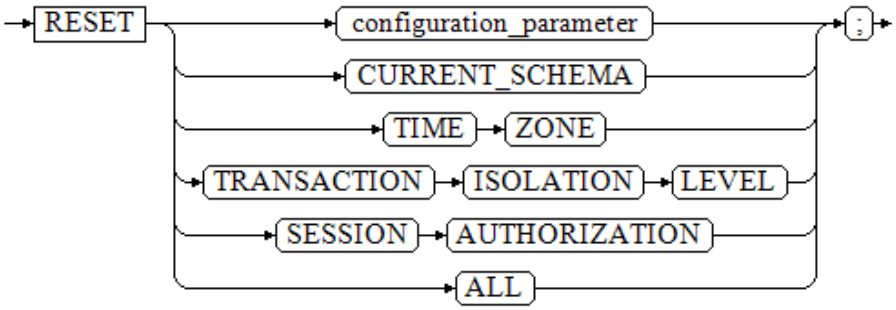
```
SET configuration_parameter TO DEFAULT;
```

Precautions

RESET and SET have the same transaction behavior. Their impact will be rolled back.

Syntax

```
RESET {configuration_parameter | CURRENT_SCHEMA | TIME ZONE | TRANSACTION ISOLATION LEVEL |
SESSION AUTHORIZATION | ALL };
```



Parameters

- **configuration_parameter**

  Specifies the name of a GUC parameter.

  Value range: GUC parameters. You can view them by running the **SHOW ALL** statement.

  NOTE

  Some parameters that viewed by **SHOW ALL** cannot be set by **SET**, for example, **max_datanodes**.

- **CURRENT_SCHEMA**

  Specifies the current schema.

- **TIME ZONE**

  Specifies the time zone.

- **TRANSACTION ISOLATION LEVEL**

  Specifies the transaction isolation level.

- **SESSION AUTHORIZATION**

  Specifies the current user identifier of the current session.

- **ALL**

  Resets all GUC parameters to default values.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Set the time zone to Italy.
gaussdb=# SET timezone TO 'Europe/Rome';
-- View the current time zone.
gaussdb=# SHOW timezone;
  TimeZone
-------------
 Europe/Rome
(1 row)

-- Set the time zone to the default value.
gaussdb=# RESET timezone;
-- View the current time zone.
gaussdb=# SHOW timezone;
 TimeZone
----------
 PRC
(1 row)

-- The preceding SQL statement is equivalent to the following two SQL statements. Set the time zone to the default value.
gaussdb=# SET timezone TO DEFAULT;
gaussdb=# ALTER SESSION SET timezone to DEFAULT;
```

Helpful Links

SET and **SHOW**

7.12.18.9 REVOKE

Description

REVOKE revokes permissions from one or more roles.

Precautions

If a non-owner user of an object attempts to REVOKE permission on the object, the statement is executed based on the following rules:

- If the user has no permissions whatsoever on the object, the statement will fail outright.
- If an authorized user has some permissions, only the permissions with authorization options are revoked.
- If the authorized user does not have the authorization option, the REVOKE ALL PRIVILEGES form will issue an error message. For other forms of statements, if the permission specified in the statement does not have the corresponding authorization option, the statement will issue a warning.

Syntax

- Revoke the permission on a specified table or view.

```
REVOKE [ GRANT OPTION FOR ]
    { { SELECT | INSERT | UPDATE | DELETE | TRUNCATE | REFERENCES | ALTER | DROP | COMMENT | INDEX | VACUUM }[, ...]
    | ALL [ PRIVILEGES ] }
    ON { [ TABLE ] table_name [, ...]
        | ALL TABLES IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Revoke the permission on a specified field in a table.

```
REVOKE [ GRANT OPTION FOR ]
    { {{ SELECT | INSERT | UPDATE | REFERENCES | COMMENT } ( column_name [, ...] )}[, ...]
    | ALL [ PRIVILEGES ] ( column_name [, ...] ) }
    ON [ TABLE ] table_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified sequence.

```
REVOKE [ GRANT OPTION FOR ]
    { { SELECT | UPDATE | ALTER | DROP | COMMENT }[, ...]
    | ALL [ PRIVILEGES ] }
    ON { [ SEQUENCE ] sequence_name [, ...]
       | ALL SEQUENCES IN SCHEMA schema_name [, ...] }
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified database.

```
REVOKE [ GRANT OPTION FOR ]
    { { CREATE | CONNECT | TEMPORARY | TEMP | ALTER | DROP | COMMENT } [, ...]
    | ALL [ PRIVILEGES ] }
    ON DATABASE database_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified domain.

```
REVOKE [ GRANT OPTION FOR ]
    { USAGE | ALL [ PRIVILEGES ] }
    ON DOMAIN domain_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the specified CMK permission.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | DROP } [, ...] | ALL [PRIVILEGES] }
    ON CLIENT_MASTER_KEYS client_master_keys_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the specified CEK permission.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | DROP } [, ...] | ALL [PRIVILEGES]}
    ON COLUMN_ENCRYPTION_KEYS column_encryption_keys_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified directory.

```
REVOKE [ GRANT OPTION FOR ]
    { { READ | WRITE | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
    ON DIRECTORY directory_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external data source.

```
REVOKE [ GRANT OPTION FOR ]
   { USAGE | ALL [ PRIVILEGES ] }
    ON FOREIGN DATA WRAPPER fdw_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified external server.

```
REVOKE [ GRANT OPTION FOR ]
    { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON FOREIGN SERVER server_name [, ...]
    FROM { [ GROUP ] role_name | PUBLIC } [, ...]
    [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified function.

```
REVOKE [ GRANT OPTION FOR ]
    { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
    ON { FUNCTION {function_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
       | ALL FUNCTIONS IN SCHEMA schema_name [, ...] }
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified stored procedure.

```
REVOKE [ GRANT OPTION FOR ]
  { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON { PROCEDURE {proc_name ( [ {[ argmode ] [ arg_name ] arg_type} [, ...] ] )} [, ...]
    | ALL PROCEDURE IN SCHEMA schema_name [, ...] }
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified procedural language.

```
REVOKE [ GRANT OPTION FOR ]
 { USAGE | ALL [ PRIVILEGES ] }
  ON LANGUAGE lang_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified schema.

```
REVOKE [ GRANT OPTION FOR ]
  { { CREATE | USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON SCHEMA schema_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified tablespace.

```
REVOKE [ GRANT OPTION FOR ]
  { { CREATE  | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON TABLESPACE tablespace_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified type.

```
REVOKE [ GRANT OPTION FOR ]
 { { USAGE | ALTER | DROP | COMMENT } [, ...] | ALL [ PRIVILEGES ] }
  ON TYPE type_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the permission on a specified sub-cluster.

```
REVOKE [ GRANT OPTION FOR ]
  { { CREATE | USAGE | COMPUTE  | ALTER | DROP } [, ...] | ALL [ PRIVILEGES ] }
  ON NODE GROUP group_name [, ...]
  FROM { [ GROUP ] role_name | PUBLIC } [, ...]
  [ CASCADE | RESTRICT ];
```

NOTE

When the CREATE permission on a sub-cluster is revoked, the USAGE and COMPUTE permissions are revoked by default.

- Revoke the permission on a package object.

```
REVOKE [ GRANT OPTION FOR ]
 { { EXECUTE | ALTER | DROP | COMMENT } [, ...] | ALL [PRIVILEGES] }
 ON PACKAGE package_name [, ...]
 FROM {[GROUP] role_name | PUBLIC} [, ...]
 [ CASCADE | RESTRICT ];
```

- Revoke permissions from a role.

```
REVOKE [ ADMIN OPTION FOR ]
  role_name [, ...] FROM role_name [, ...]
  [ CASCADE | RESTRICT ];
```

- Revoke the SYSADMIN permission from a role.

```
REVOKE ALL { PRIVILEGES | PRIVILEGE } FROM role_name;
```

- Revoke the ANY permissions.

```
REVOKE [ ADMIN OPTION FOR ]
 { CREATE ANY TABLE | ALTER ANY TABLE | DROP ANY TABLE | SELECT ANY TABLE | INSERT ANY
TABLE | UPDATE ANY TABLE |
 DELETE ANY TABLE | CREATE ANY SEQUENCE | CREATE ANY INDEX | CREATE ANY FUNCTION |
EXECUTE ANY FUNCTION |
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 CREATE ANY PACKAGE | EXECUTE ANY PACKAGE | CREATE ANY TYPE | ALTER ANY TYPE | DROP ANY
TYPE | ALTER ANY SEQUENCE | DROP ANY SEQUENCE |
 SELECT ANY SEQUENCE | ALTER ANY INDEX | DROP ANY INDEX | CREATE ANY SYNONYM | DROP
ANY SYNONYM | CREATE ANY TRIGGER | ALTER ANY TRIGGER |
 DROP ANY TRIGGER
} [, ...]
 FROM [ GROUP ] role_name [, ...];
```

- Revoke the permission on database links.
  ```
  REVOKE { CREATE | ALTER | DROP } [PUBLIC] DATABASE LINK FROM role_name;
  ```

  NOTE

  For details about database links, see **DATABASE LINK**.

- Revoke the permission on PUBLIC synonyms.
  ```
  REVOKE { CREATE | DROP } PUBLIC SYNONYM FROM role_name;
  ```

  Built-in roles (gs_role_public_synonym_create and gs_role_public_synonym_drop) can also be used to revoke the permission on PUBLIC synonyms.

  - Revoke the permission to create PUBLIC synonyms.
    ```
    REVOKE gs_role_public_synonym_create FROM role_name;
    ```
  - Revoke the permission to delete PUBLIC synonyms.
    ```
    REVOKE gs_role_public_synonym_drop FROM role_name;
    ```

Parameters

The keyword PUBLIC indicates an implicitly defined group that has all roles.

For details about permission types and parameters, see **Parameters** in section "GRANT."

Permissions of a role include the permissions directly granted to the role, permissions inherited from the parent role, and permissions granted to PUBLIC. Therefore, revoking the SELECT permission on an object from PUBLIC users does not necessarily mean that the SELECT permission on the object has been revoked from all roles, because the SELECT permission directly granted to roles and inherited from parent roles remains. Similarly, if the SELECT permission is revoked from a user but is not revoked from PUBLIC users, the user can still run the SELECT statement.

If GRANT OPTION FOR is specified, the permission cannot be granted to others, but permission itself is not revoked.

If user A holds the UPDATE permissions on a table and the **WITH GRANT OPTION** option and has granted them to user B, the permissions that user B holds are called dependent permissions. If the permissions or the grant option held by user A is revoked, the dependent permissions still exist. Those dependent permissions are also revoked if CASCADE is specified.

A user can only revoke permissions that were granted directly by that user. For example, if user A has granted permission with grant option (**WITH ADMIN OPTION**) to user B, and user B has in turn granted it to user C, then user A cannot revoke the permission directly from C. However, user A can revoke the grant option held by user B and use CASCADE. In this way, the permission of user C is automatically revoked. For another example, if both user A and user B have granted the same permission to C, A can revoke his own grant but not B's grant, so C will still effectively have the permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If the role executing REVOKE holds permissions indirectly by using more than one role membership path, it is unspecified which containing role will be used to execute the statement. In such cases, you are advised to use SET ROLE to become the specific role, and then execute REVOKE. Failure to do so may lead to deleting permissions not intended to delete, or not deleting any permissions at all.

Examples

- Revoke the permission of role **jerry** from user **joe**.

```
-- Create role jerry.
gaussdb=# CREATE role jerry PASSWORD 'xxxxxxxxxx';

-- Grant the CREATE ANY TABLE permission to jerry and allow the role to grant the permission to others.
gaussdb=# GRANT create any table TO jerry with admin option;

-- Create user joe and grant the permission of role jerry to it.
gaussdb=#  CREATE user joe PASSWORD 'xxxxxxxxxxx';
gaussdb=#  GRANT jerry TO joe;

-- Revoke the permission of role jerry from user joe.
gaussdb=#  REVOKE jerry FROM joe;
```

- Revoke system permissions from user **tom**.

```
-- Create user tom.
gaussdb=# CREATE USER tom PASSWORD 'xxxxxxxxxx';

-- Grant system permissions to user tom.
gaussdb=# GRANT ALL PRIVILEGES TO tom;

-- Revoke system permissions from user tom.
gaussdb=# REVOKE ALL PRIVILEGES FROM tom;
```

- Revoke the SELECT permission on the **reason** table in schema **tpcds** from user **joe**.

```
-- Create schema tpcds.
gaussdb=# CREATE SCHEMA tpcds;

-- Create table reason in schema tpcds.
gaussdb=# CREATE TABLE tpcds.reason (
r_reason_sk         INTEGER      NOT NULL,
r_reason_id         CHAR(16)     NOT NULL,
r_reason_desc       VARCHAR(20)
);

-- Grant the query permission on the table tpcds.reason to joe.
gaussdb=# GRANT select ON tpcds.reason TO joe;

-- Revoke the SELECT permission on the reason table in schema tpcds from user joe.
gaussdb=# REVOKE SELECT ON TABLE tpcds.reason FROM joe;
```

- Revoke the ALTER permission on the fun1() function in schema **tpcds** from user **joe**.

```
-- Create function fun1().
gaussdb=# CREATE or replace FUNCTION tpcds.fun1() RETURN boolean AS
BEGIN
SELECT current_user;
RETURN true;
END;
/
-- Grant the ALTER permission on the fun1() function to user joe.
gaussdb=# GRANT ALTER ON FUNCTION tpcds.fun1() TO joe;

-- Revoke the ALTER permission for the fun1() function in schema tpcds from user joe.
gaussdb=#  REVOKE ALTER ON FUNCTION tpcds.fun1() FROM joe;
```

- Revoke the CONNECT permission on database **testdb** from user **joe**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create database testdb.
gaussdb=# CREATE DATABASE testdb;

-- Grant the CONNECT permission on database testdb to user joe.
gaussdb=# GRANT connect on database testdb TO joe WITH GRANT OPTION;

-- Revoke the CONNECT permission on database testdb from user joe.
gaussdb=# REVOKE CONNECT ON database testdb FROM joe;
```

- Clear data.

```
gaussdb=# DROP TABLE tpcds.reason;
gaussdb=# DROP FUNCTION tpcds.fun1();
gaussdb=# DROP SCHEMA tpcds CASCADE;
gaussdb=# DROP USER joe;
gaussdb=# DROP USER tom;
gaussdb=# REVOKE create any table FROM jerry;
gaussdb=# DROP ROLE jerry;
gaussdb=# DROP DATABASE testdb;
```

Helpful Links

GRANT

7.12.18.10 ROLLBACK

Description

Rolls back the current transaction and backs out all updates in the transaction.

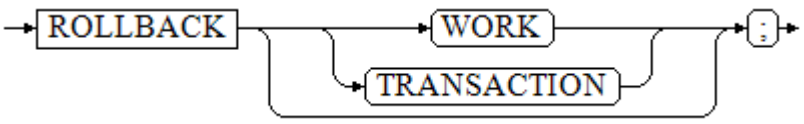
If a fault occurs during the running of a transaction, the transaction cannot be executed. The system cancels all completed operations on the database in the transaction, and the database status returns to the time when the transaction starts.

Precautions

If a ROLLBACK statement is executed out of a transaction, no error occurs, but a notice is displayed.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ];
```



Parameters

WORK | TRANSACTION

Specifies the optional keyword that more clearly illustrates the syntax.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE test (id int, name text);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Alter the table structure.
gaussdb=# ALTER TABLE test ADD COLUMN score int;

-- View the table structure.
gaussdb=# \d test;
     Table "public.test"
 Column |  Type   | Modifiers
--------+---------+-----------
 id     | integer |
 name   | text    |
 score  | integer |

-- Perform rollback.
gaussdb=# ROLLBACK;

-- The table structure is restored to the initial state.
gaussdb=# \d test;
     Table "public.test"
 Column |  Type   | Modifiers
--------+---------+-----------
 id     | integer |
 name   | text    |

-- Drop the test table.
gaussdb=# DROP TABLE test;
```

Helpful Links

COMMIT | END

7.12.18.11 ROLLBACK PREPARED

Description

Cancels a transaction ready for two-phase committing.

Precautions

- The function is only available in maintenance mode (when the GUC parameter **xc_maintenance_mode** is set to **on**). Exercise caution when enabling the mode. It is used by maintenance engineers for troubleshooting. Common users should not use the mode.
- Only the user who initiates a transaction or a system administrator can roll back the transaction.
- The transaction function is maintained automatically by the database, and should be not visible to users.

Syntax

```
ROLLBACK PREPARED transaction_id;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The distributed environment does not support the ROLLBACK PREPARED syntax.

Parameters

transaction_id

Specifies the identifier of the transaction to be committed. The identifier must be different from those for current prepared transactions.

Helpful Links

COMMIT PREPARED and **PREPARE TRANSACTION**

7.12.18.12 ROLLBACK TO SAVEPOINT

Description

ROLLBACK TO SAVEPOINT rolls back to a savepoint. It implicitly destroys all savepoints that were established after the named savepoint.

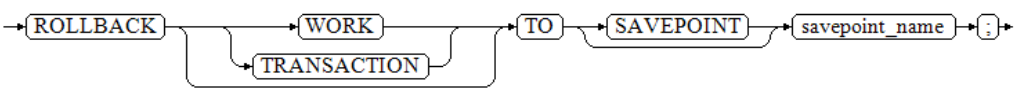
Rolls back all statements that were executed after the savepoint was established. The savepoint remains valid and can be rolled back to again later, if needed.

Precautions

- Specifying a savepoint name that has not been established is an error.
- Cursors have somewhat non-transactional behavior with respect to savepoints. Any cursor that is opened inside a savepoint will be closed when the savepoint is rolled back. If a previously opened cursor is affected by a FETCH statement inside a savepoint that is later rolled back, the cursor remains at the position that FETCH left it pointing to (that is, the cursor motion caused by FETCH is not rolled back). Closing a cursor is not undone by rolling back, either. A cursor whose execution causes a transaction to abort is put in a cannot-execute state, so while the transaction can be restored using ROLLBACK TO SAVEPOINT, the cursor can no longer be used.
- Use ROLLBACK TO SAVEPOINT to roll back to a savepoint. Use RELEASE SAVEPOINT to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.

Syntax

```
ROLLBACK [ WORK | TRANSACTION ] TO [ SAVEPOINT ] savepoint_name;
```



Parameters

- **WORK | TRANSACTION**

  Specifies the optional keyword that more clearly illustrates the syntax.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **savepoint_name**

  Rolls back to a savepoint.

Examples

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Set the savepoint my_savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Roll back to the savepoint my_savepoint.
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Cursor positions are not affected by savepoint rollback.
gaussdb=# DECLARE foo CURSOR FOR SELECT 1 UNION SELECT 2;

-- Set the savepoint foo.
gaussdb=# SAVEPOINT foo;

-- Read a data record, which is the first one.
gaussdb=# FETCH 1 FROM foo;
 ?column?
----------
        1
-- Roll back to the savepoint foo.
gaussdb=# ROLLBACK TO SAVEPOINT foo;

-- Read a data record, which is the second one.
gaussdb=# FETCH 1 FROM foo;
 ?column?
----------
        2
-- Release a savepoint.
gaussdb=# RELEASE SAVEPOINT my_savepoint;

-- End the transaction.
gaussdb=# COMMIT;
```

Helpful Links

SAVEPOINT and **RELEASE SAVEPOINT**

7.12.19 S

7.12.19.1 SAVEPOINT

Description

SAVEPOINT establishes a new savepoint in the current transaction.

A savepoint is a special mark inside a transaction. It allows all statements that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint.

Precautions

- Use ROLLBACK TO SAVEPOINT to roll back to a savepoint. Use RELEASE SAVEPOINT to destroy a savepoint but keep the effects of the statements executed after the savepoint was established.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Savepoints can only be established when inside a transaction block. Multiple savepoints can be defined in a transaction.
- In the case of an unexpected termination of a distributed thread or process caused by a node or connection failure, or of an error caused by the inconsistency between source and destination table structures in a COPY FROM operation, the transaction cannot be rolled back to the established savepoint. Instead, the entire transaction will be rolled back.
- According to the SQL standard, when a savepoint with the same name is created, the previous savepoint with the same name is automatically deleted. In GaussDB, the old savepoint is retained, but only the latest one is used during rollback or release. If the latest savepoint is released, the previous savepoint will again become accessible to ROLLBACK TO SAVEPOINT and RELEASE SAVEPOINT. In addition, SAVEPOINT fully complies with the SQL standard.

Syntax

```
SAVEPOINT savepoint_name;
```

Parameters

savepoint_name

Specifies the name of the new savepoint.

NOTICE

When using SAVEPOINT, you are advised to release SAVEPOINT promptly to avoid too many nested subtransactions. It is recommended that the number of nested subtransactions be less than or equal to 10,000. If the number of nested subtransactions is too large, the current transaction performance may deteriorate.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE table1(a int);

-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (1);

-- Create a savepoint.
gaussdb=# SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (2);

-- Roll back the savepoint.
gaussdb=# ROLLBACK TO SAVEPOINT my_savepoint;

-- Insert data.
gaussdb=# INSERT INTO table1 VALUES (3);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Commit the transaction.
gaussdb=# COMMIT;

-- Query the content of the table. You can see 1 and 3 at the same time, but cannot see 2 because 2 is rolled back.
gaussdb=# SELECT * FROM table1;

-- Delete the table.
gaussdb=# DROP TABLE table1;
```

Helpful Links

RELEASE SAVEPOINT and **ROLLBACK TO SAVEPOINT**

7.12.19.2 SECURITY LABEL ON

Description

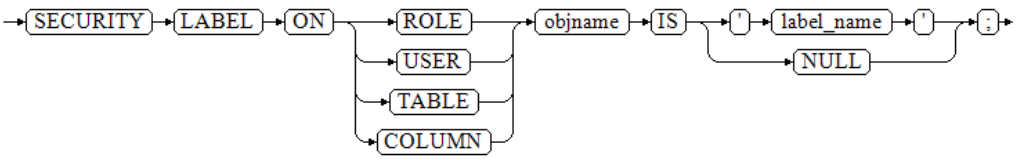
Applies, updates, or cancels a security label.

Precautions

An initial user, a user with the SYSADMIN permission, or a user who inherits the permissions of the built-in role gs_role_seclabel can update or cancel security labels.

Syntax

```
SECURITY LABEL ON { ROLE | USER | TABLE | COLUMN } objname IS {'label_name' | NULL};
```



Parameters

- **objname**
  - For **ROLE** and **USER**, **objname** indicates the user/role name.
  - For **TABLE**, **objname** indicates the table name, which can be prefixed with a schema name.
  - For **COLUMN**, **objname** indicates the name in the format of "table name.column name", which can be prefixed with a schema name.
- **label_name**

  Specifies the security label name.
- **NULL**

  Specifies that the security label is canceled.

Examples

```
-- Create a security label.
gaussdb=# CREATE SECURITY LABEL sec_label 'L1:G4';
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create a table.
gaussdb=# CREATE TABLE tbl(c1 int, c2 int);

-- Create a user.
gaussdb=# CREATE USER bob WITH PASSWORD '********';

-- Apply a security label to the user.
gaussdb=# SECURITY LABEL ON ROLE bob IS 'sec_label';

-- Apply a security label to the table.
gaussdb=# SECURITY LABEL ON TABLE tbl IS 'sec_label';

-- Apply a security label to a column of the table.
gaussdb=# SECURITY LABEL ON COLUMN tbl.c1 IS 'sec_label';

-- Cancel the security label of the user.
gaussdb=# SECURITY LABEL ON ROLE bob IS NULL;
-- Cancel the security label of the table.
gaussdb=# SECURITY LABEL ON TABLE tbl IS NULL;

-- Cancel the security label of the column of the table.
gaussdb=# SECURITY LABEL ON COLUMN tbl.c1 IS NULL;

-- Delete table tb1.
gaussdb=# DROP TABLE tbl;

-- Delete user bob.
gaussdb=# DROP USER bob;

-- Delete the existing security label sec_label.
gaussdb=# DROP SECURITY LABEL sec_label;
```

CREATE SECURITY LABEL and **DROP SECURITY LABEL**

7.12.19.3 SELECT

Description

SELECT retrieves data from a table or view.

Serving as an overlaid filter on database tables, the SELECT statement uses SQL keywords to filter data tables and extract the required data.

Precautions

- The owner of the table, users with the SELECT permission on the table, and users with the SELECT ANY TABLE permission can read data in the table or view. When the separation of duties is disabled, system administrators have this permission by default.
- SELECT can join ordinary tables, but cannot join ordinary and GDS foreign tables. That is, the SELECT statement cannot contain both an ordinary table and a GDS foreign table.
- You must have the SELECT permission on each field used in the SELECT statement.
- Using FOR UPDATE or FOR SHARE requires the UPDATE permission in addition to the SELECT permission.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

Query data.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [/*+ plan_hint */] [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
   { * | {expression [ [ AS ] output_name ]} [, ...] }
   [ FROM from_item [, ...] ]
   [ WHERE condition ]
   [ [ START WITH condition ] CONNECT BY [NOCYCLE]
   condition [ ORDER SIBLINGS BY expression ] ]
   [ GROUP BY grouping_element [, ...] ]
   [ HAVING condition [, ...] ]
   [ WINDOW {window_name AS ( window_definition )} [, ...] ]
   [ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
   [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
   [ LIMIT { [offset,] count | ALL } ]
   [ OFFSET start [ ROW | ROWS ] ]
   [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
   [ {FOR { UPDATE | SHARE } [ OF table_name [, ...] ] [ NOWAIT | WAIT n | SKIP LOCKED ]} [...] ];
```

NOTE

In condition and expression, you can use the aliases of expressions in **targetlist** in compliance with the following rules:

- Reference only within the same level.
- Only reference aliases in **targetlist**.
- Reference a prior expression in a subsequent expression.
- The **volatile** function cannot be used.
- The **Window** function cannot be used.
- Aliases cannot be referenced in the **JOIN ON** condition.
- An error is reported if the target list contains multiple aliases to be referenced.

NOTICE

In the scenario where the SELECT statement plan is cached, the WHERE IN candidate subset cannot be too large. It is recommended that the number of conditions be less than or equal to 100 to prevent high dynamic memory.

- If the WHERE IN candidate subset is too large, the memory usage of the generated plan increases.
- If the WHERE IN subsets constructed by concatenated SQL statements are different, the SQL template of the cache plan cannot be reused. A large number of different plans are generated, and the plans cannot be shared. As a result, a large amount of memory is occupied.

- The subquery **with_query** is as follows:

```
with_query_name [ ( column_name [, ...] ) ]
   AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert | update | delete} )
```

- The specified query source **from_item** is as follows:

```
{[ ONLY ] table_name [ * ] [ slice_clasuse ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
[ TABLESAMPLE sampling_method ( argument [, ...] ) [ REPEATABLE ( seed ) ] ]
[ TIMECAPSULE {TIMESTAMP | CSN} expression ]
|( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
|with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
|function_name ( [ argument [, ...] ] ) [ AS ] alias [ ( column_alias [, ...] | column_definition [, ...] ) ]
|function_name ( [ argument [, ...] ] ) AS ( column_definition [, ...] )
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
|xmltable_clause
|from_item unpivot_clause
|from_item pivot_clause
|from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
```

- The GROUP BY clause is as follows:

```
( )
| expression
| ( expression [, ...] )
| ROLLUP ( { expression | ( expression [, ...] ) } [, ...] )
| CUBE ( { expression | ( expression [, ...] ) } [, ...] )
| GROUPING SETS ( grouping_element [, ...] )
```

- The slice_clause for specifying partitions in **from_item** is as follows:

```
SLICE BY ( slice_name [, ...] )
```

  NOTE

  Specifies that SLICE applies only to the range bucket table.

- The partition_clause for specifying partitions in **from_item** is as follows:

```
PARTITION { ( partition_name [, ...] ) | FOR ( partition_value [, ...] ) }
```

  NOTE

  - The specified partition applies only to partitioned tables.
  - If PARTITION specifies multiple partition names, the partition names can be the same. The union set of the partition ranges is used.

- The sorting order nlssort_expression_clause is as follows:

```
NLSSORT ( column_name, ' NLS_SORT = { SCHINESE_PINYIN_M | generic_m_ci } ' )
```

  The second parameter can be **generic_m_ci**, which supports only the case-insensitive order for English characters.

- Simplified query syntax, equivalent to **select * from table_name**.

```
TABLE { ONLY {(table_name)| table_name} | table_name [ * ]};
```

- For xmltable_clause:

```
XMLTABLE(
xmlnamespaces_clause
row_expression
passing_clause
columns_clause
)
```

  - For xmlnamespaces_clause:

```
[
   XMLNAMESPACES(
   {string AS identifier }
   |
   { DEFAULT string }
   [, { string AS identifier } | { DEFAULT string } ]...
   ),
]
```

  - For passing_clause:

```
PASSING [BY { REF | VALUE }] document_expression [BY { REF | VALUE }]
```

  - For columns_clause:

```
[
   COLUMNS
   name { type [PATH column_expression] [DEFAULT default_expression] [NOT NULL | NULL] |
FOR ORDINALITY }
   [, ...]
]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

  If **RECURSIVE** is specified, it allows a SELECT subquery to reference itself by name.

  The detailed format of **with_query** is as follows: **with_query_name [(column_name [, ...])] AS [[NOT] MATERIALIZED] ({select | values | insert | update | delete})**

  - **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a SELECT, VALUES, INSERT, UPDATE or DELETE statement.
  - RECURSIVE can appear only after WITH. In the case of multiple CTEs, you only need to declare RECURSIVE at the first CTE.
  - You can use **MATERIALIZED** or **NOT MATERIALIZED** to modify the CTE. Currently, only inline execution is supported for stream plans. In this case, this syntax does not take effect.

    - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.
    - If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- plan_hint clause

  Follows the SELECT keyword in the /*+<*Plan hint*> */ format. It is used to optimize the plan of a SELECT statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **ALL**

  Specifies that all rows that meet the conditions are returned. This is the default behavior and can be omitted.

- **DISTINCT [ON (expression [, ...])]**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Removes all duplicate rows from the result set of the SELECT statement so that each row in the result set is unique.

Only the first row in the set of rows that have the same result calculated on the given expression **ON (expression [, ...])** is retained.

NOTICE

DISTINCT ON expression is explained with the same rule of **ORDER BY**. Unless you use ORDER BY to guarantee that the required row appears first, you cannot know what the first row is.

- **SELECT list**

  Specifies the name of a column in the table to be queried. The value can be a part of the column name or all of the column names. The wildcard (*) is used to represent the column name.

  You may use the **AS output_name** clause to give an alias for an output column. The alias is used for the displaying of the output column. The name, value, and type keywords can be used as column aliases.

  Column names can be expressed in the following formats:

  – Manually input column names which are separated by commas (,)

  – Columns computed in the FROM clause.

- FROM clause

  Specifies one or more source tables for SELECT.

  The FROM clause can contain the following elements:

  – table_name

    Specifies the name of a table or view. The schema name can be added before the table name or view name, for example, schema_name.table_name.

    NOTE

    You can use database link to perform operations on remote tables and synonyms. For details, see **DATABASE LINK**.

  – alias

    Gives a temporary alias to a table to facilitate the quotation by other queries.

    An alias is used for brevity or to eliminate ambiguity for self-joins. If an alias is provided, it completely replaces the actual name of the table.

    NOTICE

    If an alias is specified for the *joined_table* table created by JOIN and *joined_table* is wrapped with "()", that is, (*joined_table*), non-reserved keywords UNPIVOT and PIVOT cannot be used as aliases.

  – TABLESAMPLE sampling_method (argument [, ...]) [REPEATABLE (seed)]

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The TABLESAMPLE clause following *table_name* specifies that the specified *sampling_method* should be used to retrieve the subset of rows in the table.

The optional REPEATABLE clause specifies the number of seeds used to generate random numbers in the sampling method. The seed value can be any non-null constant value. If the table was not changed during the query, the two queries having the same seed and *argument* values will select the same sampling in this table. However, different seed values usually generate different samples. If **REPEATABLE** is not specified, a new random sample will be selected for each query based on the seed generated by the system.

- TIMECAPSULE { TIMESTAMP | CSN } expression

  Queries the table data of a specified CSN or at a specified time point.

  Currently, the following tables do not support flashback query: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, views, sequence tables, hash bucket tables, shared tables, and heritance tables.

  - TIMECAPSULE TIMESTAMP

    Searches for the result set of a specified time point based on the date as the flashback query flag. *date* must be a valid past timestamp.

  - TIMECAPSULE CSN

    Searches for the result set of a specified CSN based on the CSN flashback of the table as the flashback query flag. The CSN can be obtained from **snpcsn** recorded in gs_txn_snapshot.

  - expression

    Constants, functions, or SQL expressions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- A flashback query cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. Between the flashback point and the current point, if a statement (TRUNCATE, DDL, DCL, or VACUUM FULL) has been executed to modify the table structure or affect physical storage, the flashback fails. The error message "ERROR: The table definition of %s has been changed." is displayed when flashback is performed on a table where DDL operations have been performed. The error message "ERROR: recycle object %s desired does not exist" is displayed when flashback is performed on a table where DDL operations, such as changing namespaces and table names, have been performed.
- Flashback query supports scanning PCR UB-tree indexes. If no such indexes, flashback query supports only seq scan for full table scan.
- When the flashback point is too old, the source version cannot be obtained because the flashback version is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.
- The flashback point is specified by time. The maximum difference between the flashback point and the actual time is 3 seconds.
- After truncating a table, perform a flashback query or flashback on the table. The error message "Snapshot too old" is displayed when a flashback is performed at a specified time point. Data cannot be found or the error message "Snapshot too old" is reported during the CSN-based flashback.
- In the GTM-free scenario, each node uses the local CSN and does not have a globally unified CSN. Therefore, flashback in CSN mode is not supported.

– column_alias

  Specifies the column alias.

– slice_name

  Specifies the user-defined slice name in the range bucket table.

– PARTITION

  Queries data in the specified partition in a partitioned table.

– partition_name

  Specifies the name of a partition.

– partition_value

  Specifies the value of the specified partition key. If there are many partition keys, use the **PARTITION FOR** clause to specify the value of the only partition key you want to use.

– subquery

  Performs a subquery in the **FROM** clause. A temporary table is created to save subquery results.

– with_query_name

  Specifies that the **WITH** clause can also be used as the source of the **FROM** clause and can be referenced by the name of the **WITH** query.

– function_name

  Function name. Function calls can appear in the **FROM** clause.

– join_type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The options are as follows:

- [INNER] JOIN

  A **JOIN** clause combines two **FROM** items. You can use parentheses to determine the order of nesting. In the absence of parentheses, **JOIN** nests left-to-right.

- LEFT [OUTER] JOIN

  Returns all rows that meet join conditions in the Cartesian product, plus those rows that do not match the right table rows in the left table by join conditions. This left-hand row is extended to the full width of the joined table by inserting **NULL** values for the right-hand columns. Note that only the **JOIN** clause's own condition is considered while the system decides which rows have matches. Outer conditions are applied afterward.

- RIGHT [OUTER] JOIN

  Returns all the joined rows, plus one row for each unmatched right-hand row (extended with **NULL** on the left).

  This is just a notational convenience, since you could convert it to a **LEFT OUTER JOIN** by switching the left and right inputs.

- FULL [OUTER] JOIN

  Returns all the joined rows, pluses one row for each unmatched left-hand row (extended with **NULL** on the right), and pluses one row for each unmatched right-hand row (extended with **NULL** on the left).

- CROSS JOIN

  Is equivalent to **INNER JOIN ON (TRUE)**, which means no rows are removed by qualification. These join types are just a notational convenience, since they do nothing you could not do with plain **FROM** and **WHERE**.

  NOTE

  You must specify a join condition for INNER JOIN and OUTER JOIN, that is, one of the following: **NATURAL ON**, **join_condition**, and **USING (join_column [, ...])**. For **CROSS JOIN**, none of these clauses can appear.

CROSS JOIN and **INNER JOIN** produce a simple Cartesian product, the same result as you get from listing the two items at the top level of **FROM**.

– ON join_condition

  Defines which rows have matches in joins. Example: ON left_table.a = right_table.a You are advised not to use numeric types such as int for **join_condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

– USING(join_column[, ...])

  ON left_table.a = right_table.a AND left_table.b = right_table.b ... abbreviation. Corresponding columns must have the same name.

– NATURAL

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Is a shorthand for a **USING** list that mentions all columns in the two tables that have the same names.

- from item

  Specifies the name of the query source object connected.

- xmltable_clause

  Currently, xmltable_clause can be used only in ORA- or PG-compatible mode. xmltable_clause produces a virtual table based on data of the given XMLTYPE (in ORA-compatible mode) or XML (in PG-compatible mode) type.

  - xmlnamespaces_clause

    The optional xmlnamespaces_clause is a clause that starts with XMLNAMESPACES followed by a comma-separated XML namespace declaration. **string** indicates the full name of the namespace for which single quotation marks are used as boundary characters. **identifier** indicates the namespace alias for which double quotation marks are used as boundary characters. The alias can be used in row_expression and columns_clause. In the current version, DEFAULT cannot be used to declare the default namespace.

  - row_expression

    The required **row_expression** is an XPath 1.0 expression with English single quotation marks as boundary characters. The document_expression in the subsequent passing_clause is used as its context to obtain a group of XML nodes. These nodes are processed by columns_clause to generate each row of the virtual table.

  - passing_clause

    The required passing_clause starts with PASSING, where **document_expression** is the data of the XMLTYPE (in ORA-compatible mode) or XML (in PG-compatible mode) type that is passed to XMLTABLE for processing. Currently, only single-root data is supported. In ORA-compatible mode, an error is reported regardless of whether BY VALUE or BY REF in the first or second place is used. In PG-compatible mode, although BY VALUE or BY REF in the first and second places can be identified and received, no functional processing is performed.

  - columns_clause

    The optional columns_clause is used to specify the information required for the columns to be generated in the virtual table.

    name: indicates the name of a column.

    type: indicates the column type.

    PATH: **column_expression** in the optional **PATH** part is an expression of XPath 1.0. A node in the node set obtained by **row_expression** is used as the context of the node, and the data required by the value of the corresponding column in the row data generated by the node is obtained through processing by the node. There is an implicit conversion when it is converted to a result of the TYPE type. If the **PATH** part is not provided, **name** is regarded as **column_expression**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

DEFAULT: **default_expression** in the optional **DEFAULT** part is an expression. If a NULL value is obtained after **column_expression** processing, the result obtained by calculating **default_expression** is used to generate the value of the column. Note that **default_expression** is calculated only when necessary. If the expression is stable, **default_expression** is calculated only once when necessary.

NOT NULL | **NULL**: In PG-compatible mode, the optional NOT NULL or NULL is used to indicate whether the column value can be **NULL**. If the column value is inconsistent with the specified option, an error is reported.

FOR ORDINALITY: indicates that the column is a row number column. Row numbers starting from 1 are filled for generated rows. Only one column can be marked as **FOR ORDINALITY**.

In ORA-compatible mode, columns_clause can be omitted. After columns_clause is omitted, the default **columns_clause: COLUMNS column_value XMLTYPE PATH '.'** is generated internally for subsequent processing. In PG-compatible mode, columns_clause cannot be omitted.

NOTICE

Currently, xmltable_clause has the following restrictions:

- The involved XPath expressions are XPath 1.0.
- Currently, XPath expressions such as **'..'** cannot be used in **column_expression**.
- When the data obtained through **column_expression** is converted to the data of the TYPE type, in ORA-compatible mode, if the obtained data is too long and exceeds the typmod of the type, the data will be truncated. Currently, long data is truncated only when the typmod of the CHAR, CHARACTER, NCHAR, BPCHAR, VARCHAR, CHARACTER VARYING, VARCHAR2 and NVARCHAR2 data types (including those attached with (n)) is greater than 0. In PG-compatible mode, an error is reported.
- Currently, the maximum size of the input XMLTYPE (in ORA-compatible mode) or XML (in PG-compatible mode) type data is 1 GB.
- For upgrade from a version that does not support XMLTABLE to a version that supports XMLTABLE, the XMLTABLE syntax cannot be used during the upgrade observation period.
- The following expression is supported in XPath only in ORA-compatible mode: *:nodename, where **nodename** indicates the node name. This expression indicates that the namespace of the node specified by **nodename** is ignored when the node is selected.
- The non-reserved keyword XMLTABLE cannot be used as the name of a function of the Functions as Table Sources type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

When non-constructed XMLTYPE (in ORA-compatible mode) data is entered, spaces and carriage return characters that are at the same level as the non-constructed part and are used to control the writing format between nodes are parsed as text nodes. For example, in the following text, the space and carriage return between the end label of **node2** and the start label of **node3** are parsed as text nodes, which is different from that in database ORA.

Input:

```
<root>
<node1>node1</node1>
malform
<node2>node2</node2>
<node3>node3</node3>
</root>
```

Actual situation:

```
<root><node1>node1</node1>
malform
<node2>node2</node2>
<node3>node3</node3>
</root>
```

Currently, the functions implemented by xmltable_clause are different from those implemented by databases ORA and PG. Pay attention to the differences. For details, see **Table 7-275**.

Table 7-275 Comparison between GaussDB and databases ORA and PG

GaussDB	PG	ORA
XPath 1.0 expressions are used at **row_expression** and **PATH** in columns_clause.	Same as that in GaussDB.	XQuery 1.0 expressions are used at **row_expression** and **PATH** in columns_clause.
The default namespace function is not supported.	Same as that in GaussDB.	The default namespace function is supported.
A single data record can be passed through passing_clause, but the alias cannot be used.	Same as that in GaussDB. (Note that the input data is of the XML type.)	Multiple data records can be passed through the corresponding clause and aliases can be used.
The passing_clause cannot be omitted.	Same as that in GaussDB.	The corresponding clause can be omitted.
The RETURNING SEQUENCE BY REF clause cannot be used after passing_clause.	Same as that in GaussDB.	The RETURNING SEQUENCE BY REF clause can be used after the corresponding clause.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

GaussDB	PG	ORA
In columns_clause, you cannot use (SEQUENCE) BY REF to modify the returned data of the XMLType type.	Same as that in GaussDB.	You can use (SEQUENCE) BY REF in the corresponding clause to modify the returned data of the XML type.
If the **PATH** part in columns_clause is omitted and the column name is not enclosed using double quotation marks (""), the node can be correctly found for subsequent operations when the node name in the data passed to XMLTABLE is in lowercase.	Same as that in GaussDB.	If the corresponding part is omitted and the column name is not enclosed using double quotation marks (""), the node can be correctly found for subsequent operations when the node name in the data passed to XMLTABLE is in uppercase.
The declaration of the column type in columns_clause cannot be omitted.	Same as that in GaussDB.	The declaration of the column type in the corresponding clause can be omitted.
In ORA-compatible mode, the columns_clause can be omitted. In PG-compatible mode, the columns_clause cannot be omitted.	The corresponding clause cannot be omitted.	The corresponding clause can be omitted.
In ORA-compatible mode, if the returned data length exceeds the typmod of the type, the data is truncated. In PG-compatible mode, if the returned data length exceeds the typmod of the type, an error is reported.	An error is reported when the length of the returned data exceeds the typmod of the type.	If the length of the returned data exceeds the value of typmod, the data is truncated.

Example:

```
gaussdb=# CREATE DATABASE test DBCOMPATIBILITY = 'ORA';
gaussdb=# \c test
test=# SELECT * FROM XMLTABLE(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
test(# XMLNAMESPACES('nspace1' AS "ns1", 'nspace2' AS "ns2"), -- Declare two XML namespaces 'nspace1' and 'nspace2' and the corresponding aliases "ns1" and "ns2".
test(# '/ns1:root/*:child' -- Select the root node whose namespace is 'nspace1' from the passed data through row_expression, select all child nodes under the root node, and ignore the child namespaces. ns1 is the alias of 'nspace1'.
test(# PASSING xmltype(
test(# '<root xmlns="nspace1">
test'#     <child>
test'#         <name>peter</name>
test'#         <age>11</age>
test'#     </child>
test'#     <child xmlns="nspace1">
test'#         <name>qiqi</name>
test'#         <age>12</age>
test'#     </child>
test'#     <child xmlns="nspace2">
test'#         <name>hacker</name>
test'#         <age>15</age>
test'#     </child>
test'# </root>')
test(# COLUMNS
test(# columns FOR ORDINALITY, -- Row number column
test(# name varchar(10) path 'ns1:name', -- Select the name node whose namespace is 'nspace1' from each child node obtained by row_expression, convert the value in the node to varchar(10), and return the value. ns1 is the alias of nspace1.
test(# age int); -- Select the age node from each child node obtained by row_expression, convert the value in the node to int, and return the value. The first child node does not explicitly specify the namespace. Therefore, the namespace of the parent node root is followed. Therefore, no value in this column is returned.
 column | name  | age
--------+-------+-----
      1 | peter |
      2 | qiqi  |
      3 |       |
(3 rows)

-- Switch to the default database and delete the test database. Change the database name as required.
gaussdb=# \c postgres
gaussdb=# DROP DATABASE test;
```

- unpivot_clause

  Converts a column to a row. The syntax format is as follows:

  ```
  UNPIVOT [ {INCLUDE | EXCLUDE} NULLS ]
    (
       unpivot_col_clause
       unpivot_for_clause
       unpivot_in_clause
    )
  ```

  - {INCLUDE | EXCLUDE} NULLS

    Controls whether the converted result contains NULL rows. **INCLUDE NULLS** indicates that the converted results contain NULL rows. **EXCLUDE NULLS** indicates that the converted results do not contain NULL rows. If this clause is ignored, the unpivot operation removes NULL rows from the converted results by default.

  - unpivot_col_clause

    ```
    unpivot_col_element
    ```

    unpivot_col_element specifies the output column names. These columns store the values to be converted.

  - unpivot_col_element

    ```
    { column | ( column [, column]... ) }
    ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

unpivot_col_element has two forms: column and (column [, column]...).

- unpivot_for_clause
  ```
  FOR { unpivot_col_element }
  ```
  unpivot_col_element contained in the unpivot_for_clause is used to specify the output column names. These columns store the alias and names of the column to be converted.

- unpivot_in_clause
  ```
  IN ( unpivot_in_element [,unpivot_in_element...] )
  ```
  unpivot_in_clause specifies the columns to be converted. The column names and column values are saved in the previously specified output columns.

  unpivot_in_element
  ```
  { unpivot_col_element }[  AS { unpivot_alias_element } ]
  ```
  unpivot_col_element specifies the column to be converted. If (column [, column]...) is used to specify the column to be converted, the *column* names are connected by underscores (_) and saved in the output columns. For example, IN ((col1, col2)) generates the column name **col1_col2** and saves it in the output column specified by unpivot_for_clause. In addition, the AS keyword can be used to specify an alias for the column to be converted. Once an alias is specified, the alias is saved in the output column instead of the name of column to be converted.

- unpivot_alias_element
  ```
  { alias | ( alias [, alias]... )}
  ```
  Similar to **unpivot_col_element**, **unpivot_alias_element** has two forms. **alias** indicates the specified alias.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Currently, unpivot_clause has the following restrictions:

- This parameter can be used only in ORA-compatible mode.
- The unpivot_clause clause cannot be used with hints.
- For unpivot_col_clause, the number of output columns specified by unpivot_col_element must be the same as that of unpivot_col_element contained in unpivot_in_clause.
- For unpivot_for_clause, the number of output columns specified by unpivot_col_element must be the same as the number of aliases specified by unpivot_alias_element contained in unpivot_in_clause.
- For unpivot_in_clause, the alias must be a constant or an expression that can be converted to a constant.
- For unpivot_in_clause, constant expressions support only IMMUTABLE functions.
- For all unpivot_col_element parameters contained in unpivot_in_clause, if the column types in the same position of these unpivot_col_element parameters are different, UNPIVOT attempts to convert the column types in order to convert the values of columns to be converted to a public type. Similarly, for all unpivot_alias_element parameters, if the alias types of these unpivot_alias_element parameters in the same position are different, UNPIVOT attempts to do the similar type conversion.

  For example, assume that there is an unpivot_in_clause in the form of IN (col1, col2), where col1 is of the int type and col2 is of the float type, UNPIVOT attempts to convert the column value of col1 to the public type float during the calculation.

– pivot_clause

  Converts a row into column. The syntax format is as follows:

```
PIVOT [ XML ]
( aggregate_function ( expr ) [[AS] alias ]
    [, aggregate_function ( expr ) [[AS] alias ] ]...
    pivot_for_clause
    pivot_in_clause
)
```

  - aggregate_function (expr) [[AS] alias]

    Aggregates calculation on a given expression. The calculation result is saved in the output column specified by pivot_in_clause. [AS] alias (the AS keyword can be omitted) can be used to specify an alias for aggregate_function. The alias is added to the end of output column name specified by pivot_in_clause in the format of "*_alias*".

  - pivot_for_clause

```
FOR { column
    | ( column [, column]... )
    }
```

    Specifies the row to be converted. The **column** indicates a column of the row to be converted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- pivot_in_clause

```
IN ( { { { expr
         | ( expr [, expr]... )
         } [ [AS] alias]
       }...
     }
 )
```

Specifies the name of the output column. The column name can consist of one or more expressions, for example, (expr1, expr2). When a column name consists of multiple expressions, these expressions are connected by underscores (_) in sequence. That is, the output column name corresponding to (expr1, expr2) is "expr1_expr2". These expressions not only generate output column names, but also determine the time when the aggregate function is triggered. If the values of row to be converted is the same as the value of these expressions, the results calculated by **aggregate_function** are saved in the output column names that consist of these expressions. Assume that expr1 is "1" and expr2 is "2". For row "1 2", **aggregate_function** is used for calculation. For row "1 1", the calculation is not triggered.

NOTICE

Currently, pivot_clause has the following restrictions:

- This parameter can be used only in ORA-compatible mode.
- The pivot_clause clause cannot be used with hints.
- If more than one aggregate_function is specified, at most one aggregate_function is allowed to have no alias, the rest of the aggregate_function functions are required to specify an alias.
- XML supports only syntax but does not support functions.
- The expression in pivot_in_clause can be a constant or an expression that can be converted to a constant. If the expression is not a unary expression, specify an alias for the expression.
- For pivot_in_clause, constant expressions support only IMMUTABLE functions.
- For the expression in pivot_in_clause, when the keyword AS is used to specify an alias for the expression, only the non-reserved keywords can be used as aliases.
- If the length of an output column name exceeds 63 characters, an error is reported.

- WHERE clause

  The WHERE clause forms an expression for row selection to narrow down the query range of SELECT. **condition** indicates any expression that returns a value of Boolean type. Rows that do not meet this condition will not be retrieved. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to bool values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

In the **WHERE** clause, you can use the operator (+) to convert a table join to an outer join. However, this method is not recommended because it is not the standard SQL syntax and may raise syntax compatibility issues during platform migration. There are many restrictions on using the operator (+):

a. It can appear only in the **WHERE** clause.
b. If a table join has been specified in the **FROM** clause, the operator (+) cannot be used in the **WHERE** clause.
c. The operator (+) can work only on columns of tables or views, instead of on expressions.
d. If table A and table B have multiple join conditions, the operator (+) must be specified in all the conditions. Otherwise, the operator (+) will not take effect, and the table join will be converted into an inner join without any prompt information.
e. Tables specified in a join condition where the operator (+) works cannot cross queries or subqueries. If tables where the operator (+) works are not in the **FROM** clause of the current query or subquery, an error will be reported. If a peer table for the operator (+) does not exist, no error will be reported and the table join will be converted into an inner join.
f. Expressions where the operator (+) is used cannot be directly connected through **OR**.
g. If a column where the operator (+) works is compared with a constant, the expression becomes a part of the JOIN condition.
h. A table cannot have multiple foreign tables.
i. The operator (+) can appear only in the following expressions: comparison, NOT, ANY, ALL, IN, NULLIF, IS DISTINCT FROM, and IS OF. It is not allowed in other types of expressions. In addition, these expressions cannot be connected through **AND** or **OR**.
j. The operator (+) can be used to convert a table join only to a left or right outer join, instead of a full join. That is, the operator (+) cannot be specified on both tables of an expression.

NOTICE

- For the WHERE clause, if special character "%", "_", or "\" is queried in LIKE, add the slash "\" before each character.
- If an IN clause is added after a WHERE clause and no parenthesis is added after IN, only one element can be added after IN, and restrictions can be used only in ORA-compatible mode. The element has the following restrictions:
  - Constant: such as character strings, integers, and floating points
  - Column name
  - CASE WHEN clause
  - Function

- **START WITH clause**

  The **START WITH** clause is usually used together with the **CONNECT BY** clause and indicates the initial condition of recursion. Data is traversed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

recursively and hierarchically. If this clause is omitted and the CONNECT BY clause is used alone, all rows in the table are used as the initial set. For details, see **CONNECT BY**.

- CONNECT BY clause

  CONNECT BY indicates a recursive join condition. It is used together with START WITH to implement data traversal and recursion. Example:

```
gaussdb=#  CREATE TABLE test(name varchar, id int, fatherid int);
gaussdb=#  INSERT INTO test VALUES('A', 1, 0), ('B', 2, 1),('C',3,1),('D',4,1),('E',5,2);
gaussdb=#  SELECT * FROM TEST START WITH id = 1 CONNECT BY prior id = fatherid ORDER
SIBLINGS BY id DESC;
 name | id | fatherid
------+----+----------
 A    | 1 |        0
 D    | 4 |        1
 C    | 3 |        1
 B    | 2 |        1
 E    | 5 |        2
(5 rows)
```

  In the CONNECT BY condition, the PRIOR keyword can be specified for a column to indicate that the column is recursive. If NOCYCLE is added before the recursive join condition, recursion stops when a loop record is encountered.

NOTICE

A SELECT statement containing the START WITH .. CONNECT BY clause does not support the FOR SHARE or UPDATE lock.

The process of executing the START WITH statement is as follows:

a. The initial dataset is selected based on the condition in the START WITH clause. In the preceding example, **('A', 1, 0)** is selected first. Then, this initial dataset is set as the working set.

b. If the working set is not empty, the data in the working set is used as the input for the next query. The filter criteria are specified in the CONNECT BY clause. The keyword PRIOR indicates the current record. For example, **prior id = fatherid** in the preceding example indicates that the ID of the current record is **fatherid** of the next record.

c. Set the data set filtered out in **the previous step** as the working set and repeat **the previous step**.

In addition, the database adds the following pseudocolumns to each selected data record so that users can learn about the location of the data in the recursive or tree structure:

- **LEVEL**: level of a node. The level of the root node is **1**.
- **CONNECT_BY_ISLEAF**: specifies whether a node is a leaf node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

connect_by_isleaf: If a node does not have any subnode, the node is a leaf node and **connect_by_isleaf** is set to **1**. Otherwise, **connect_by_isleaf** is set to **0**.

Assume that table **T1** exists and the data in table **T1** is shown in **Figure 7-12**.

Figure 7-12 Data structure

T1	
A	B
1	2
2	3
2	4
3	5

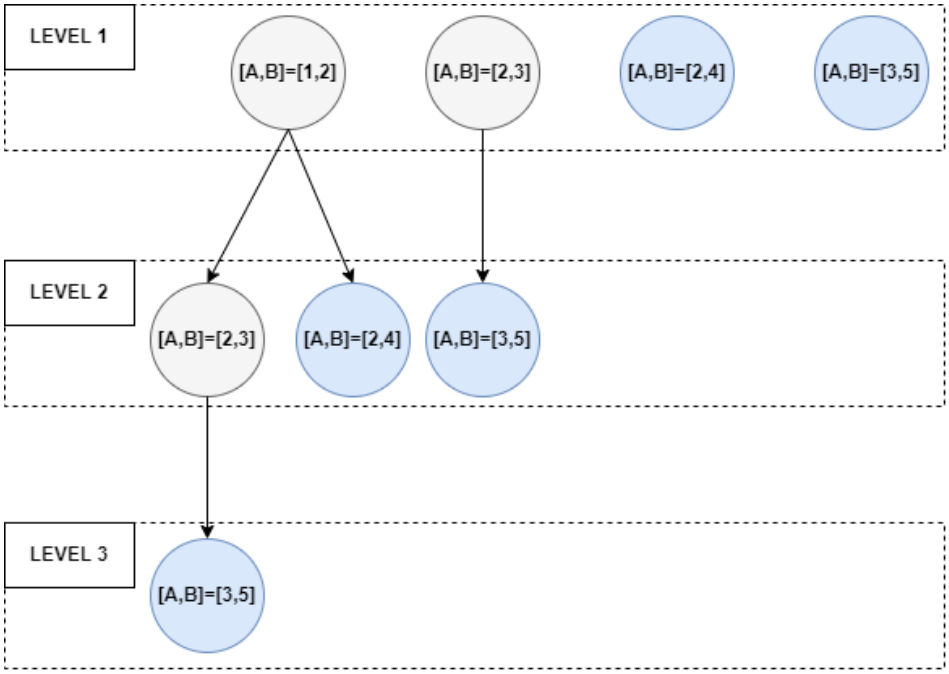
Run the following statement:

```
SELECT * FROM T1 CONNECT BY PRIOR B=A AND LEVEL<=3;
```

The tree structure of the result is shown in **Figure 7-13**, where the blue nodes are leaf nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 7-13 Logical structure of the execution



In addition to pseudocolumns, the following query functions are provided (for details, see **Hierarchical Recursion Query Functions**):

- **sys_connect_by_path(col, separator)**: returns the connection path from the root node to the current row. The **col** parameter indicates the name of the column displayed in the path, and the **separator** parameter indicates the connector.
- **connect_by_root(col)**: displays the top-level node of the node. **col** indicates the name of the output column.

If a loop exists in the dataset, the database provides loop detection. By default, if a loop is detected, an error is reported and no data is returned. In addition, the NOCYCLE keyword is provided. With it, the query can be executed normally and when the first duplicate data record is found, the query exits directly instead of reporting an error.

Besides, in the hierarchical query, the search is performed strictly according to the depth-first order. If **ROWNUM** is used as the filter condition in START WITH or CONNECT, the value of **ROWNUM** is increased by 1 for each record to be returned. Then, the record is verified based on **ROWNUM** conditions. Records that do not satisfy the conditions are discarded and the value of **ROWNUM** is decreased by 1.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- The PRIOR keyword can be used only in the CONNECT BY clause instead of the START WITH clause.
- In addition to **targetlist**, "prior (single column)" is parsed as "prior single column". User-defined functions named **prior** are not perceived.
- The PRIOR keyword can be specified only for columns in the table instead of expressions, pseudocolumns, or type conversion. For example, PRIOR (a + 1) is not allowed.
- In the CONNECT BY clause, the column using the keyword PRIOR cannot be in the same condition with pseudocolumns such as level and rownum, but they can be in different conditions. For example, (PRIOR a = level) is not allowed, but (PRIOR a = b) and (level = 1) is allowed. Different conditions refer to the conditions connected by AND at the top of the CONNECT BY clause. For example, (PRIOR a = 1 or level = 1) is considered as a condition and is not allowed.
- In the START WITH and CONNECT BY clauses, pseudocolumns cannot be used for sublinks, for example, "rownum = (subquery)" or "rownum in (subquery)".
- You are advised not to use ROWNUM in the CONNECT BY clause. If ROWNUM is required, test it thoroughly to avoid unexpected results.
- When START WITH and CONNECT BY are called on the CTE defined by WITH AS, if there are multiple CTEs, ensure that the definition of each CTE does not depend on other CTEs.
- If no loop exists in the data but the error message "runs into cycle" is reported, increase the value of **max_recursive_times**.
- **connect_by_isleaf**, **connect_by_iscycle** and **level** are of the int type.
- In hierarchical queries, **connect_by_isleaf**, **connect_by_iscycle**, and **level** must be parsed as pseudocolumns and will not be parsed as columns whose alias names in projection columns are the same as pseudocolumns.
- You are advised not to reference other views when defining views with hierarchical queries.
- Optimization suggestions for the START WITH clause:
  - Create indexes based on the conditions in the CONNECT BY clause to improve the performance of the START WITH clause.
  - Identify bottlenecks based on the plan collected by running EXPLAIN PERFORMANCE. If the recursive operator (inner plan) of RECURSIVE UNION is the Hash JOIN operator, but the hash table is created for the temporary table **tmp_result** or the hash table in plan is materialized (that is, the batch size is greater than 1), the possible cause is that the value of **work_mem** is too small. As a result, the hash table cannot be created for the outer data table. You can increase the value of **work_mem** to improve performance.

    Note: GaussDB optimizes tables with a small volume of data and caches table results in hash tables to improve performance. In this case, indexes are not required. However, if the data volume exceeds the limit specified by **work_mem**, the optimization becomes invalid. In this case, you can create indexes for optimization.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The keyword PRIOR can be used only in the CONNECT BY clause and cannot be used in the START WITH clause.
- The keyword PRIOR can be specified only for columns in the table instead of the expression and type conversion. For example, prior (a + 1) is not allowed.
- In the CONNECT BY clause, the column using the keyword PRIOR cannot in the same condition with pseudo columns such as level and rownum, but they can be in different conditions. For example, (prior a = level) is not allowed, but (prior a = b) and (level = 1) is allowed. Different conditions refer to the conditions connected by AND at the top of the CONNECT BY clause. For example, (prior a = 1 or level = 1) is considered as a condition and is not allowed.
- You are advised not to use pseudo columns in the START WITH statement. If pseudo columns need to be used, please test the columns to avoid inconsistency between the result and expected result.
- If no value or **NULL** is used in the START WITH statement, the initial recursive condition is empty and an empty result is returned.
- If no value is used in the CONNECT BY statement, the recursive condition is empty and all results that meet the condition of the START WITH clause are returned.
- Columns modified by PRIOR support only the following types: INT8, INT1, INT2, OID, INT4, BOOL, CHAR, NAME, FLOAT4, FLOAT8, ABSTIME, RELTIME, DATE, CASH, TIME, TIMESTAMP, TIMESTAMPTZ, SMALLDATETIME, UUID, INTERVAL, TIMETZ, INT2VECTOR, CLOB, NVARCHAR2, VARCHAR, TEXT, VECTOR, BPCHAR, RAW, BYTEA, NUMERIC, XID, CID, and TID. The whitelist restriction cannot be bypassed by forcibly converting the type to the preceding types, for example, PRIOR col::text (where **col** is not of the type in the whitelist) is not supported.
- In a hierarchical query statement, if the projection column utilizes a window function, the result depends on the order of the intermediate result set. To use a window function, conduct thorough testing to verify that the semantics align with expectations.

The default behavior of START WITH is width-first search. However, depth-first search can be implemented by working with pseudocolumns. Example:

```
gaussdb=# SELECT sys_connect_by_path(name,'-') as path, *, LEVEL FROM test START WITH id = 1
CONNECT BY fatherid=prior id ORDER BY path;
  path  | name | id | fatherid | level
--------+------+----+----------+-------
 -A     | A    |  1 |        0 |     1
 -A-B   | B    |  2 |        1 |     2
 -A-B-E | E    |  5 |        2 |     3
 -A-C   | C    |  3 |        1 |     2
 -A-D   | D    |  4 |        1 |     2
gaussdb=# DROP TABLE test;
```

If a loop exists in the dataset, the database provides loop detection. By default, if a loop is detected, an error is reported and no data is returned. In addition, the NOCYCLE keyword is provided. With it, the query can be executed normally and when the first duplicate data record is found, the query exits directly instead of reporting an error.

- ORDER SIBLINGS BY clause

  The output of the START WITH statement is returned level by level. However, there is no sequence guarantee at each level because the database

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

automatically selects the optimal execution path during each round of query. In the preceding example, A is output first, but the sequence of B, C, and D is not fixed. If you have requirements on the final output sequence, you can use ORDER SIBLINGS BY. The usage of ORDER SIBLINGS BY is the same as that of ORDER BY. ORDER SIBLINGS BY is used for sorting at each level during recursion.

NOTICE

The expression following ORDER SIBLINGS BY only supports sorting by calling non-aggregate and window functions for ordinary columns, column name offsets, and column names. It does not support calling system functions related to START WITH for column names or using pseudocolumns related to START WITH.

- GROUP BY clause

  Condenses query results into a single row all selected rows that share the same values for the grouped expressions.

  - CUBE ({ expression | (expression [, ...]) } [, ...])

    A CUBE grouping is an extension to the **GROUP BY** clause that creates subtotals for all of the possible combinations of the given list of grouping columns (or expressions). In terms of multidimensional analysis, CUBE generates all the subtotals that could be calculated for a data cube with the specified dimensions. For example, given three expressions (n=3) in the CUBE clause, the operation results in $2^n = 2^3 = 8$ groupings. Rows grouped on the values of *n* expressions are called regular rows, and the rest are called superaggregate rows.

  - GROUPING SETS (grouping_element [, ...])

    Another extension to the GROUP BY clause. It allows users to specify multiple GROUP BY options. This improves efficiency by trimming away unnecessary data group. After you specify the required data group, the database does not need to compute a whole ROLLUP or CUBE.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- If **sql_mode** contains the **ONLY_FULL_GROUP_BY** option, the following situations occur:
  - If the non-aggregate function column in the SELECT list is consistent with the column for GROUP BY, no error is reported.
  - If the non-aggregate function column in the SELECT list is inconsistent with the column for GROUP BY, the following situations may occur:
    - If the GROUP BY list contains a primary key or a unique non-null key, the SQL statement does not report an error.
    - Non-aggregate function columns in the SELECT list are also included in the GROUP BY or WHERE list. If included in the WHERE list, the columns in the WHERE clause must be in the form of a constant, and then no error will be reported.
    - If both the JOIN and GROUP BY clauses are contained, the following situations may occur:
      - LEFT JOIN

        In the syntax, when the ON clause is used for equality check between two columns, no error is reported if the GROUP BY clause contains columns from the LEFT JOIN table.

        For example, when LEFT JOIN operations are performed on tables **t1** and **t2**, if the condition in the ON clause is **t1.col1=t2.col2 ...**, the GROUP BY clause only needs to contain **t1.col1**.
      - RIGHT JOIN

        In the syntax, when the ON clause is used for equality check between two columns, no error is reported if the GROUP BY clause contains columns from the RIGHT JOIN table.

        For example, when RIGHT JOIN operations are performed on tables **t1** and **t2**, if the condition in the ON clause is **t1.col1=t2.col2 ...**, the GROUP BY clause only needs to contain **t2.col2**.
      - INNER JOIN/CROSS JOIN/STRAIGHT_JOIN

        In the syntax, when the ON clause is used for equality check between two columns, no error is reported if the GROUP BY clause contains either of the columns.
- If **sql_mode** does not contain the **ONLY_FULL_GROUP_BY** option, no restriction exists and no error is reported in the preceding error scenarios.
  - If SELECT contains both non-aggregate columns and aggregate functions, it must be used together with GROUP BY. Otherwise, an error is reported.
  - If a non-aggregate column beyond the column for GROUP BY contains multiple data records after it is grouped, due to differences in execution plans and DN data distribution, the queried column data is a random data record in the grouped data.

- HAVING clause

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Selects special groups by working with the GROUP BY clause. The HAVING clause compares some attributes of groups with a constant. Only groups that matching the logical expression in the HAVING clause are extracted.

- WINDOW clause

  The general format is **WINDOW window_name AS (window_definition) [, ...]**. **window_name** is a name can be referenced by **window_definition**. **window_definition** can be expressed in the following forms:

  ```
  [ existing_window_name ]
  [ PARTITION BY expression [, ...] ]
  [ ORDER BY expression [ ASC | DESC | USING operator ] [ NULLS { FIRST | LAST } ] [, ...] ]
  [ frame_clause ]
  ```

  frame_clause defines a **window frame** for the window function. The window function (not all window functions) depends on **window frame** and **window frame** is a set of relevant rows of the current query row. frame_clause can be expressed in the following forms:

  ```
  [ RANGE | ROWS ] frame_start
  [ RANGE | ROWS ] BETWEEN frame_start AND frame_end
  ```

  Formats of **frame_start** and **frame_end**:

  ```
  UNBOUNDED PRECEDING
  VALUE PRECEDING
  CURRENT ROW
  VALUE FOLLOWING
  UNBOUNDED FOLLOWING
  ```

  NOTE

  Restrictions on scenarios where VALUE is used:

  - The table columns operated by the aggregate function or window function support only the INT1, INT2, INT4, INT8, FLOAT4, FLOAT8, NUMERIC, INTERVAL, TIME, TIMETZ, TIMESTAMP, TIMESTAMPTZ, and DATE types.
  - The VALUE type supports only the INT1, INT2, INT4, INT8, INT16, FLOAT4, FLOAT8, NUMERIC, INTERVAL, and character string (only character strings that can be implicitly converted to numbers are supported) types.
  - The value of VALUE must be a non-negative number.
  - Currently, **VALUE** only supports constants as the upper and lower boundaries and does not support variables and expressions.

- UNION clause

  Computes the set union of the rows returned by the involved **SELECT** statements.

  The **UNION** clause has the following constraints:

  – By default, the result of **UNION** does not contain any duplicate rows unless the **ALL** clause is declared.

  – The number of columns in multiple SELECT statements must be the same, and the data type and sequence of each column must be the same.

  – Multiple **UNION** operators in the same SELECT statement are evaluated left to right, unless otherwise specified by parentheses.

  – FOR UPDATE cannot be specified either for a UNION result or for any input of a UNION.

  General expression:

  ```
  select_statement UNION [ALL] select_statement
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **select_statement** can be any SELECT statement without an ORDER BY, LIMIT, or FOR UPDATE clause.
  - **ORDER BY** and **LIMIT** can be attached to the subexpression if it is enclosed in parentheses.

NOTICE

- It is recommended that the number of UNION ALL clauses be less than 100. If the number of UNION ALL clauses exceeds 100, ensure that the instance memory is sufficient.
- The following constraints apply when you perform set operations with **NULL**:
  - **NULL** can only be a projection column itself or a projection column in a subquery of the FROM statement.
  - In CTEs and recursive queries, complex subqueries (DISTINCT, GROUP BY, and ORDER BY statements) are not supported.

- **INTERSECT clause**

  Computes the set intersection of rows returned by the involved **SELECT** statements. The result of **INTERSECT** does not contain any duplicate rows.

  The INTERSECT clause has the following constraints:

  - Multiple INTERSECT operators in the same SELECT statement are evaluated left to right, unless otherwise specified by parentheses.
  - Processing INTERSECT preferentially when UNION and INTERSECT operations are executed for results of multiple SELECT statements.

  General format:

  ```
  select_statement INTERSECT select_statement
  ```

  select_statement can be any **SELECT** statement without a **FOR UPDATE** clause.

- **EXCEPT clause**

  Has the following common form:

  ```
  select_statement EXCEPT [ ALL ] select_statement
  ```

  select_statement can be any SELECT statement without a FOR UPDATE clause.

  The **EXCEPT** operator computes the set of rows that are in the result of the left SELECT statement but not in the result of the right one.

  The result of **EXCEPT** does not contain any duplicate rows unless the **ALL** clause is declared. To execute **ALL**, a row that has *m* duplicates in the left table and *n* duplicates in the right table will appear MAX(*m*–*n*, 0) times in the result set.

  Multiple **EXCEPT** operators in the same **SELECT** statement are evaluated left to right, unless parentheses dictate otherwise. **EXCEPT** binds at the same level as **UNION**.

  Currently, FOR UPDATE cannot be specified either for an EXCEPT result or for any input of an EXCEPT.

- **MINUS clause**

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Has the same function and syntax as **EXCEPT** clause.

- **ORDER BY clause**

  Sorts data retrieved by **SELECT** in descending or ascending order. If the **ORDER BY** expression contains multiple columns:

  – If two columns are equal according to the leftmost expression, they are compared according to the next expression and so on.

  – If they are equal according to all specified expressions, they are returned in an implementation-dependent order.

  – When used with the **DISTINCT** keyword, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the SELECT statement.

  – When used with the **GROUP BY** clause, the columns to be sorted in **ORDER BY** must be included in the columns of the result set retrieved by the SELECT statement.

  When the clause is not used with the GROUP BY clause and the columns of the result set retrieved by the SELECT statement contain aggregate functions:

  – The ORDER BY clause is ignored if the columns of the retrieved result set do not contain any set returning functions.

  – Only the sorting of the columns that contain set returning functions is retained if the columns of the retrieved result set contain set returning functions.

  NOTE

  To support Chinese pinyin order, set the encoding format to **UTF-8**, **GB18030**, **GB18030_2022**, **GBK**, or **ZHS16GBK** when initializing the database. The statements are as follows:

  ```
  initdb –E UTF8 –D ../data –locale=zh_CN.UTF-8
  initdb -E GB18030 -D ../data -locale=zh_CN.GB18030
  initdb -E GB18030_2022 -D ../data -locale=zh_CN.GB18030
  initdb –E GBK –D ../data –locale=zh_CN.GBK
  initdb –E ZHS16GBK –D ../data –locale=zh_CN.GBK
  ```

- LIMIT clause

  Consists of two independent sub-clauses:

  LIMIT { count | ALL } limits the number of rows to be returned. **count** specifies the number of rows to be returned. The effect of **LIMIT ALL** is the same as that of omitting the LIMIT clause.

  OFFSET start count specifies the maximum number of rows to return, while **start** specifies the number of rows to skip before starting to return rows. When both are specified, **start** rows are skipped before starting to count the **count** rows to be returned.

  ROWNUM cannot be used as count or offset in the LIMIT clause.

- OFFSET clause

  The SQL: 2008 standard has introduced a different clause:

  OFFSET start { ROW | ROWS }

  start specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY**

  If **count** is omitted in a **FETCH** clause, it defaults to **1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- FOR UPDATE clause

  The FOR UPDATE clause locks the rows retrieved by SELECT. This ensures that the rows cannot be modified or deleted by other transactions until the current transaction ends. That is, other transactions that attempt UPDATE, DELETE, or SELECT FOR UPDATE of these rows will be blocked until the current transaction ends.

  To prevent the operation from waiting for the commit of other transactions, you can use **NOWAIT**. If the selected row cannot be locked immediately, an error is reported immediately when you execute **SELECT FOR UPDATE NOWAIT**. If you use **WAIT n** and the selected row cannot be locked immediately, the operation needs to wait for *n* seconds (the value of *n* is of the int type with a range of $0 \leq n \leq 2147483$). If the lock is obtained within *n* seconds, the operation is performed normally. Otherwise, an error is reported. If you use **SKIP LOCKED**, locked rows are skipped when a table is locked. Only rows that are locked using a row lock can be skipped. In scenarios where locks do not block each other in different transactions, for example, SELECT FOR SHARE - SELECT FOR SHARE SKIP LOCKED, rows that are locked with preceding locks are not skipped though **SKIP LOCKED** is specified.

  FOR SHARE behaves similarly, except that it acquires a shared rather than exclusive lock on each retrieved row. A share lock blocks other transaction from performing UPDATE, DELETE, or SELECT FOR UPDATE on these rows, but it does not prevent them from performing SELECT FOR SHARE.

  If specified tables are named in FOR UPDATE or FOR SHARE, then only rows coming from those tables are locked. Any other tables used in SELECT are simply read as usual. Otherwise, locking all tables in the statement.

  If FOR UPDATE or FOR SHARE is applied to a view or sub-query, it affects all tables used in the view or sub-query.

  Multiple FOR UPDATE and FOR SHARE clauses can be written if it is necessary to specify different locking behaviors for different tables.

  If the same table is mentioned (or implicitly affected) by both FOR UPDATE and FOR SHARE clauses, it is processed as FOR UPDATE. Similarly, a table is processed as **NOWAIT** if that is specified in any of the clauses affecting it.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- For SQL statements containing FOR UPDATE or FOR SHARE, their execution plans will be pushed down to DNs. If the pushdown fails, an error will be reported.
- The query of row number contained in the projected column or WHERE conditions does not support FOR UPDATE/SHARE.
- For the FOR UPDATE/SHARE statements whose subquery is a stream plan, the same locked row cannot be concurrently updated.
- For the ORDER BY FOR UPDATE/SHARE statement, the execution sequence of the SORT and LOCK operators in the stream plan is different from that in other plans. In the stream plan, LOCK is executed before SORT. In other plans, SORT is executed before LOCK. The reason is that if the data in the stream plan is not on the current DN, the data needs to be redistributed and locked on the original DN. After redistribution, data becomes disordered. Therefore, the SORT operator needs to be added. If SORT is performed before LOCK, the original ordered data becomes disordered again. In this case, the SORT operator is meaningless and can be eliminated. The final plan execution sequence is changed from **sort > lock > sort** to **lock > sort**.
- In scenarios where FOR UPDATE/SHARE statements are concurrently executed, ORDER BY is used to sort data to avoid deadlocks. This method is not feasible for distributed systems because the DN lock sequence cannot be ensured by ORDER BY. In addition, adding ORDER BY causes performance overhead. Therefore, you are advised not to add ORDER BY to solve the deadlock problem.
- The DATABASE LINK function does not support the SKIP LOCKED syntax.
- In distributed scenarios, FOR UPDATE/SHARE cannot be performed on multiple tables.

- NLS_SORT

  Specifies that a column is sorted in a special order. Currently, only Chinese Pinyin and case-insensitive sorting are supported. To support this sorting mode, you need to set the encoding format to **UTF8**, **GB18030**, **GB18030_2022**, **GBK**, or **ZHS16GBK** when creating a database. If you set the encoding format to another format, for example, **SQL_ASCII**, an error may be reported or the sorting mode may be invalid.

  Value range:

  – **SCHINESE_PINYIN_M**, sorted by Pinyin order.

  – **generic_m_ci**: sorted in case-insensitive order (optional; only English characters are supported in the case-insensitive order.)

- PARTITION clause

  Queries data in the specified partition in a partitioned table.

7.12.19.3.1 Simple Queries

A simple query retrieves one or more columns of data from one or more tables or views.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The following example demonstrates a typical simple query operation that retrieves both partial and complete information from a specified table:

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE student(
    sid INT PRIMARY KEY,
    class INT,
    name  VARCHAR(50),
    gender INT CHECK(gender = 0 OR gender = 1) -- Gender. 1: male; 0: female
);
gaussdb=# INSERT INTO student (sid, class, name, gender) VALUES (1, 1, 'michael', 0);
gaussdb=# INSERT INTO student (sid, class, name, gender) VALUES (2, 2, 'bob', 1);
gaussdb=# INSERT INTO student (sid, class, name, gender) VALUES (3, 2, 'gary', 0);

-- Query some columns.
gaussdb=# SELECT sid, name FROM student;
 sid |  name
-----+---------
   1 | michael
   2 | bob
   3 | gary
(3 rows)

-- Query all columns.
gaussdb=# SELECT * FROM student;
 sid | class |  name   | gender
-----+-------+---------+-----
   1 |     1 | michael |   0
   2 |     2 | bob     |   1
   3 |     2 | gary    |   0
(3 rows)

-- Specify the column alias.
gaussdb=# SELECT sid student_id, name FROM student;
 student_id |  name
------------+---------
          1 | michael
          2 | bob
          3 | gary
(3 rows)

-- Drop.
gaussdb=# DROP TABLE student;
```

7.12.19.3.2 Conditional Queries

A conditional query retrieves data that meets the conditions.

The following example demonstrates a typical conditional query that displays the query results in a specified table based on specific query conditions:

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test_grade(
    id INT,
    name VARCHAR(20),
    score FLOAT       -- Score
);
gaussdb=# INSERT INTO test_grade VALUES (1,'Scott',90),(2,'Jack',87.5),(3,'Ben',48);

-- Query information about students who fail to pass the test.
gaussdb=# SELECT * FROM test_grade WHERE score < 60;
 id | name | score
----+------+-------
  3 | Ben  |    48
(1 row)

-- Drop.
gaussdb=# DROP TABLE test_grade;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.19.3.3 Group Queries

A group query is usually used together with aggregate functions to query category statistics. Common aggregate functions include count(), sum(), avg(), min(), and max(). GROUP BY is often used in group queries.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE student (id INT,name VARCHAR(20),class INT);
gaussdb=# INSERT INTO student VALUES (1, 'Scott', 1), (2, 'Ben', 1);
gaussdb=# INSERT INTO student VALUES (3, 'Jack', 2),(4, 'Anna', 2),(5, 'Judy', 2);
gaussdb=# INSERT INTO student VALUES (6, 'Sally', 3), (7, 'Jordan', 3);

-- Use the aggregate function COUNT() to count the number of people in each class.
gaussdb=# SELECT class, count(*) AS cnt FROM student GROUP BY class;
 class | cnt
-------+-----
     2 |   3
     1 |   2
     3 |   2
(3 rows)

-- Use the HAVING clause to retrieve data of classes with fewer than three people.
gaussdb=# SELECT class, COUNT(*) AS num FROM student GROUP BY class HAVING COUNT(*) < 3;
 class | num
-------+-----
     1 |   2
     3 |   2
(2 rows)

-- Drop.
gaussdb=# DROP TABLE student;
```

sql_mode contains the **ONLY_FULL_GROUP_BY** option, which is used to verify the GROUP BY list and SELECT list.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test (
          id int  primary key NOT NULL,
          id_2 int unique NOT NULL,
          s1 varchar(10),
          s2 int,
          s3 varchar(12)
        );
gaussdb=# INSERT INTO test value(1,101,'a',1000,'aa');
gaussdb=# INSERT INTO test value(2,102,'b',2000,'aaa');
gaussdb=# INSERT INTO test value(3,103,'c',3000,'aaaa');
gaussdb=# INSERT INTO test value(4,104,'b',4000,'aaa');
gaussdb=# INSERT INTO test value(5,105,'c',5000,'aaaaa');
gaussdb=# CREATE TABLE tb1(a int, b int, c int);
gaussdb=# INSERT INTO tb1 VALUES(1, 4, 11);
gaussdb=# INSERT INTO tb1 VALUES(2, 5, 12);
gaussdb=# INSERT INTO tb1 VALUES(2, 6, 13);
gaussdb=# INSERT INTO tb1 VALUES(2, 2, 13);
gaussdb=# CREATE TABLE tb2(a int, b int);
gaussdb=# INSERT INTO tb2 VALUES(2, 7);
gaussdb=# INSERT INTO tb2 VALUES(2, 8);
gaussdb=# INSERT INTO tb2 VALUES(3, 9);

-- Set <b>sql_mode</b>.
gaussdb=# SET sql_mode =
'ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ZERO_IN_DATE,NO_ZERO_DATE,ERROR_FOR_DIVISION_
BY_ZERO,NO_AUTO_CREATE_USER,NO_ENGINE_SUBSTITUTION';

-- If the non-aggregate function column in the SELECT list is consistent with the column for GROUP BY, no
error is reported.
gaussdb=# SELECT s1, s3 FROM test GROUP BY s1,s3 ORDER BY s1,s3;
 s1 |  s3

-- Drop.
gaussdb=# DROP TABLE test, tb1, tb2;
```

7.12.19.3.4 Pagination Queries

The syntax is as follows:

```
SELECT query_list FROM table_name [ LIMIT { [offset,] count | ALL } ]
```

- **offset**: indicates the number of rows to skip before starting to return rows.
- **count**: indicates the number of data records to be retrieved after the skipped rows.
- **ALL**: indicates that all data after the skipped rows is retrieved.

```
-- Create a table and insert 100 data records into the table.
gaussdb=# CREATE TABLE testl(id int PRIMARY KEY, flag varchar(10));
gaussdb=# INSERT INTO testl (id, flag) VALUES (generate_series(1,100),'flag'||generate_series(1,100));

-- Query the first five data records.
gaussdb=# SELECT * FROM testl ORDER BY 1  LIMIT 5;
 id | flag
----+-------
  1 | flag1
  2 | flag2
  3 | flag3
  4 | flag4
  5 | flag5
(5 rows)

-- Query four data records after the twentieth record.
gaussdb=# SELECT * FROM testl ORDER BY 1 LIMIT 20,4;
 id |  flag
----+--------
 21 | flag21
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 22 | flag22
 23 | flag23
 24 | flag24
(4 rows)

-- Query all data after the ninety-sixth record.
gaussdb=# SELECT * FROM testl ORDER BY 1 LIMIT 96,ALL;
 id  |  flag
-----+---------
  97 | flag97
  98 | flag98
  99 | flag99
 100 | flag100
(4 rows)

-- Delete.
gaussdb=# DROP TABLE testl;
```

7.12.19.3.5 Partition Queries

Queries data in a specified partition.

The following example is a typical partition query, demonstrating how to partition a specified table and query information of a designated partition:

```
-- Create a range partitioned table.
gaussdb=# CREATE TABLE test_range1(
    id INT,
    info VARCHAR(20)
) PARTITION BY RANGE (id) (
    PARTITION p1 VALUES LESS THAN (200),
    PARTITION p2 VALUES LESS THAN (400),
    PARTITION p3 VALUES LESS THAN (600),
    PARTITION p4 VALUES LESS THAN (800),
    PARTITION pmax VALUES LESS THAN (MAXVALUE)
);

-- Insert 1000 data records.
gaussdb=# INSERT INTO test_range1 VALUES(GENERATE_SERIES(1,1000),'abcd');

-- Query the number of data records in the p1 partition.
gaussdb=# SELECT COUNT(*) FROM test_range1 PARTITION (p1);
 count
-------
   199
(1 row)

-- Drop.
gaussdb=# DROP TABLE test_range1;
```

7.12.19.3.6 Join Queries

A join query may also be referred to as a cross-table query, where multiple tables need to be associated.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE emp(
    id int,             -- Employee ID
    name varchar,   -- Employee name
    deptno int      -- Employee department ID
);

gaussdb=# CREATE TABLE dept(
    deptno int,     -- Department ID
    depname varchar -- Department name
);

gaussdb=# INSERT INTO emp VALUES (1, 'Joe', 10), (2, 'Scott', 20), (3, 'Ben', 999);   -- The department of Ben has not been confirmed yet. Therefore, the department ID is 999.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# INSERT INTO dept VALUES (10, 'hr'), (20, 'it'), (30, 'sal');                -- There is no employee in
the sal department.
```

- INNER JOIN

```
gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 JOIN dept t2 ON t1.deptno = t2.deptno;
 id | name  | depname
----+-------+---------
  1 | Joe   | hr
  2 | Scott | it
(2 rows)
```

- LEFT JOIN

```
gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 LEFT JOIN dept t2 ON t1.deptno =
t2.deptno;
 id | name  | depname
----+-------+---------
  1 | Joe   | hr
  2 | Scott | it
  3 | Ben   |
(3 rows)
```

- RIGHT JOIN

```
gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 RIGHT JOIN dept t2 ON t1.deptno =
t2.deptno;
 id | name  | depname
----+-------+---------
  1 | Joe   | hr
  2 | Scott | it
    |       | sal
(3 rows)
```

- FULL JOIN

```
gaussdb=# SELECT t1.id,t1.name,t2.depname FROM emp t1 FULL JOIN dept t2 ON t1.deptno =
t2.deptno;
 id | name  | depname
----+-------+---------
  1 | Joe   | hr
  2 | Scott | it
    |       | sal
  3 | Ben   |
(4 rows)

-- Delete.
gaussdb=# DROP TABLE emp,dept;
```

7.12.19.3.7 Subqueries

A query can be nested in another query, and its result is used as the data source or condition of the other query. Outer queries are also called parent queries, and inner queries are also called subqueries.

- Subqueries can be classified into single-row subqueries and multi-row subqueries based on the number of records returned.
- Subqueries can be classified into correlated subqueries and non-correlated subqueries based on whether a subquery is executed for multiple times.

Single-Row Subqueries

Single-row subquery operators include >=, >, <=, <, and <>.

```
-- Create a student table and insert data into the table.
gaussdb=# CREATE TABLE student(
    sid VARCHAR(5),     -- Student ID
    grade INT,          -- Grade
    name VARCHAR(20),   -- Name
    height INT          -- Height
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# INSERT INTO student VALUES ('00001',1,'Scott',135),('00002',1,'Jack',95),('00003',1,'Ben',100);
gaussdb=# INSERT INTO student VALUES ('00004',2,'Henry',115),('00005',2,'Jordan',130),
('00006',2,'Bob',126);
gaussdb=# INSERT INTO student VALUES ('00007',3,'Bella',128),('00008',3,'Alicia',136);
-- Create a teacher table and insert data into the table.
gaussdb=# CREATE TABLE teacher (
    name VARCHAR(20),    -- Teacher name
    grade INT            -- Class
);
-- Insert data.
gaussdb=# INSERT INTO teacher VALUES ('Bill',1),('Sally',2),('Luke',3);

-- Query the students who are taller than Bella.
gaussdb=# SELECT * FROM student
WHERE height > (SELECT height FROM student WHERE name = 'Bella');
  sid  | grade |  name  | height
-------+-------+--------+--------
 00001 |     1 | Scott  |    135
 00005 |     2 | Jordan |    130
 00008 |     3 | Alicia |    136
(3 rows)
```

Multi-Row Subqueries

Multi-row subquery operators are as follows:

- IN: equal to any value in the list.
- ANY: used together with single-row comparison operators to compare with any value returned by the subquery.
- ALL: used together with single-row comparison operators to compare with all values returned by the subquery.
- SOME: another name for ANY and both operators have the same effect.

Example: Query the students of Sally and Luke.

```
gaussdb=# SELECT * FROM student t1 WHERE t1.grade IN (
    SELECT grade FROM teacher WHERE name = 'Sally' OR name = 'Luke'
);
  sid  | grade |  name  | height
-------+-------+--------+--------
 00004 |     2 | Henry  |    115
 00005 |     2 | Jordan |    130
 00006 |     2 | Bob    |    126
 00007 |     3 | Bella  |    128
 00008 |     3 | Alicia |    136
(5 rows)
```

Example: Query the students in grade 2 who are taller than any students in grade 3.

```
gaussdb=# SELECT * FROM student
WHERE grade = 2 AND
      height > ANY (SELECT height FROM student WHERE grade = 3);
  sid  | grade |  name  | height
-------+-------+--------+--------
 00005 |     2 | Jordan |    130
(1 row)

-- The query result is equivalent to that of the following query:
gaussdb=# SELECT * FROM student
WHERE grade = 2 AND
      height > (SELECT MIN(height) FROM student WHERE grade = 3);
```

Example: Query the students in grade 1 who are taller than all students in grade 2.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT * FROM student
WHERE grade = 1 AND
    height > ALL (SELECT height FROM student WHERE grade = 2);
 sid  | grade | name  | height
-------+-------+-------+--------
 00001 |     1 | Scott |    135
(1 row)

-- The query result is equivalent to that of the following query:
gaussdb=# SELECT * FROM student
WHERE grade = 1 AND
    height > (SELECT MAX(height) FROM student WHERE grade = 2);
```

Correlated Subqueries

Characteristics: Subqueries cannot run independently and are related to parent queries. Execute parent queries and then subqueries. Each time a parent query is executed, its subquery is recalculated.

Example: Query the students whose height is greater than the average height of the students in the class.

```
gaussdb=# SELECT * FROM student out
WHERE height > (SELECT AVG(height) FROM student
              WHERE grade = out.grade);
 sid  | grade |  name  | height
-------+-------+--------+--------
 00001 |     1 | Scott  |    135
 00005 |     2 | Jordan |    130
 00006 |     2 | Bob    |    126
 00008 |     3 | Alicia |    136
(4 rows)
```

Non-Correlated Subqueries

Characteristics: A subquery queries the value and then returns the result to the outer layer for query.

Example: Query the students whose height is greater than the average height of the students in the class.

```
gaussdb=# SELECT t1.*
FROM student t1,
    (SELECT grade, AVG(height) avg_hei FROM student GROUP BY grade) t2
WHERE t1.grade = t2.grade AND
    t1.height > t2.avg_hei;
 sid  | grade |  name  | height
-------+-------+--------+--------
 00001 |     1 | Scott  |    135
 00005 |     2 | Jordan |    130
 00006 |     2 | Bob    |    126
 00008 |     3 | Alicia |    136
(4 rows)
-- Delete.
gaussdb=# DROP TABLE student;
gaussdb=# DROP TABLE teacher;
```

7.12.19.3.8 Hierarchical Queries

Syntax

```
SELECT [level], column FROM table
START WITH condition
CONNECT BY[PRIOR column1 = column2|column1 = prior column2]
[ORDER SIBLINGS BY] [GROUP BY]
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **level**: specifies the pseudocolumn to return the query level.
- **START WITH**: specifies the hierarchy, that is, the root row of the query.
- **CONNECT BY**: specifies the relationship between parent rows and child rows.
- **PRIOR**: specifies the parent level.
- **ORDER SIBLINGS BY**: specifies the sequence in the same level.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE area (id INT,name VARCHAR(25),parent_id INT);
gaussdb=# INSERT INTO area VALUES (1,'China',NULL);
gaussdb=# INSERT INTO area VALUES (2,'Beijing',1);
gaussdb=# INSERT INTO area VALUES(3,'Chaoyang District',2);
gaussdb=# INSERT INTO area VALUES(4,'Shaanxi Province',1);
gaussdb=# INSERT INTO area VALUES(5,'Xi'an',4);
gaussdb=# INSERT INTO area VALUES(6,'Yanta District',5);
gaussdb=# INSERT INTO area VALUES(7,'Weiyang District',5);

-- Query the hierarchy.
gaussdb=# SELECT level, name FROM area
   START WITH (id = 1)
   CONNECT BY PRIOR id = parent_id;
 level |  name
-------+--------
     1 | China
     2 | Shaanxi Province
     3 | Xi'an
     4 | Weiyang District
     4 | Yanta District
     2 | Beijing
     3 | Chaoyang District
(7 rows)
```

- Use WHERE to filter a node (only Beijing).

  ```
  -- Use WHERE to filter a node (only Beijing).
  gaussdb=# SELECT level, name FROM area
     WHERE id <> 2
     START WITH (id = 1)
     CONNECT BY PRIOR id = parent_id;
   level |  name
  -------+--------
       1 | China
       2 | Shaanxi Province
       3 | Xi'an
       4 | Weiyang District
       4 | Yanta District
       3 | Chaoyang District
  (6 rows)
  ```

- Add a condition to the CONNECT BY PRIOR clause to filter a branch (Beijing and its sub-regions).

  ```
  gaussdb=# SELECT level, name FROM area
     START WITH (id = 1)
     CONNECT BY PRIOR id = parent_id AND id <> 2;
   level |  name
  -------+--------
       1 | China
       2 | Shaanxi Province
       3 | Xi'an
       4 | Weiyang District
       4 | Yanta District
  (5 rows)

  -- Drop.
  gaussdb=# DROP TABLE area;
  ```

7.12.19.3.9 Compound Queries

A query that contains a compound operator is a compound query. All compound queries have the same priority. The number of columns and expressions in each query result in a set operation must be the same, and the types must be compatible.

Common set operations include:

- UNION: a union set of the two query result sets where duplicates are removed.
- UNION ALL: a union set of the two queries where the results of the two queries are simply combined.
- INTERSECT: intersection of two queries (only duplicated data is displayed).
- MINUS: difference of two query result sets. Only the data that exists in the first result set but does not exist in the second result set is displayed, and the data is sorted based on the results in the first column.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test1(c11 INT, c12 VARCHAR);
gaussdb=# INSERT INTO test1 VALUES (1,'a'),(2,'b'),(4,'d');

gaussdb=# CREATE TABLE test2(c21 INT, c22 VARCHAR);
gaussdb=# INSERT INTO test2 VALUES (1,'a'),(3,'c');
```

- UNION

```
gaussdb=# SELECT * FROM test1 UNION SELECT * FROM test2;
 c11 | c12
-----+-----
   1 | a
   4 | d
   2 | b
   3 | c
(4 rows)
```

- UNION ALL

```
gaussdb=# SELECT * FROM test1 UNION ALL SELECT * FROM test2;
 c11 | c12
-----+-----
   1 | a
   2 | b
   4 | d
   1 | a
   3 | c
(5 rows)
```

- INTERSECT

```
gaussdb=# SELECT * FROM test1 INTERSECT SELECT * FROM test2;
 c11 | c12
-----+-----
   1 | a
(1 row)
```

- MINUS

```
gaussdb=# SELECT * FROM test1 MINUS SELECT * FROM test2;
 c11 | c12
-----+-----
   4 | d
   2 | b
(2 rows)
-- Delete.
gaussdb=# DROP TABLE test1,test2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.19.3.10 Rows to Columns and Columns to Rows

- Rows to columns

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test_p1(id INT, math INT, english INT);
gaussdb=# INSERT INTO test_p1 VALUES (1,84,78), (2,98,82), (3,68,59);
gaussdb=# SELECT * FROM test_p1;
 id | math | english
----+------+---------
  3 |   68 |      59
  1 |   84 |      78
  2 |   98 |      82
(3 rows)

-- Convert rows to columns.
gaussdb=# SELECT * FROM test_p1 UNPIVOT(score FOR class IN(math, english));
 id |  class  | score
----+---------+-------
  3 | MATH    |    68
  3 | ENGLISH |    59
  1 | MATH    |    84
  1 | ENGLISH |    78
  2 | MATH    |    98
  2 | ENGLISH |    82
(6 rows)

-- Delete.
gaussdb=# DROP TABLE test_p1;
```

- Columns to rows

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE test_p2(id INT, class VARCHAR(20), score INT);
gaussdb=# INSERT INTO test_p2 VALUES (1,'math',64), (1,'english',78);
gaussdb=# INSERT INTO test_p2 VALUES (2,'math',98), (2,'english',82);
gaussdb=# INSERT INTO test_p2 VALUES (3,'math',68), (3,'english',59);
gaussdb=# SELECT * FROM test_p2;
 id |  class  | score
----+---------+-------
  3 | math    |    68
  3 | english |    59
  1 | math    |    64
  1 | english |    78
  2 | math    |    98
  2 | english |    82
(6 rows)

-- Convert columns to rows.
gaussdb=# SELECT * FROM test_p2 PIVOT(MAX(score) FOR class IN('math','english'));
 id | 'math' | 'english'
----+--------+-----------
  3 |     68 |        59
  1 |     64 |        78
  2 |     98 |        82
(3 rows)

-- Delete.
gaussdb=# DROP TABLE test_p2;
```

7.12.19.3.11 Window Function Queries

The window function performs a calculation on the related row set in the data set and returns a result set.

Compared with the calculation performed by the aggregate function, the window function does not aggregate multiple rows into a single output row.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE fruit_sale (
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  "statistical_date" date,
  "product" varchar(255),
  "year" varchar(5),
  "sales_quantity" numeric(8),
  "amount" numeric(8)
);

gaussdb=# INSERT INTO fruit_sale VALUES ('2024-01-01', 'Watermelon', '2024', 1721, 253541);
gaussdb=# INSERT INTO fruit_sale VALUES ('2024-01-01', 'Apple', '2024', 5559, 269419);
gaussdb=# INSERT INTO fruit_sale VALUES ('2024-02-01', 'Watermelon', '2024', 4711, 129644);

-- Collect statistics on the sales volume of all fruits.
gaussdb=# SELECT *,SUM(sales_quantity) OVER (PARTITION by null) total_qty FROM fruit_sale;
 statistical_date | product | year | sales_quantity | amount | total_qty
------------------+---------+------+----------------+--------+-----------
 2024-01-01       | Watermelon    | 2024 |          1721 | 253541 |     11991
 2024-01-01       | Apple    | 2024 |          5559 | 269419 |     11991
 2024-02-01       | Watermelon    | 2024 |          4711 | 129644 |     11991
(3 rows)

-- Drop.
gaussdb=# DROP TABLE fruit_sale;
```

7.12.19.3.12 Simplified Queries

Uses the TABLE syntax to directly specify a particular table for query.

The operation is equivalent to performing a simple query for all table information using the SELECT syntax.

```
-- Create a table.
gaussdb=# CREATE TABLE t1(c1 int, c2 int, c3 int);

-- Insert data.
gaussdb=# INSERT INTO t1 VALUES (1,2,3);
 c1 | c2 | c3
----+----+----
  1 |  2 |  3
(1 row)

-- Query data in the table.
gaussdb=# TABLE t1;
 c1 | c2 | c3
----+----+----
  1 |  2 |  3
(1 row)

-- Drop.
gaussdb=# DROP TABLE t1;
```

7.12.19.3.13 Queries Using Hints

Optimizes the query result based on the specified hint rule.

The following example demonstrates a typical hint query that optimizes the query results based on specific hint rules in a specified table.

```
-- Create a table.
gaussdb=# CREATE TABLE t1(c1 int, c2 int, c3 int);
gaussdb=# CREATE TABLE t2(c1 int, c2 int, c3 int);
gaussdb=# CREATE INDEX it1 ON t1(c1,c2);

-- Specify the scanning mode using a hint.
gaussdb=# EXPLAIN SELECT /*+ indexscan(t1 it1)*/* from t1,t2 WHERE t1.c1=t2.c2;
 id |                operation                 | E-rows | E-width | E-costs
----+------------------------------------------+--------+---------+---------
  1 | ->  Streaming (type: GATHER)             |     30 |      24 | 61.51
  2 |    ->  Hash Join (3,4)                   |     30 |      24 | 60.26
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 3 |       ->  Index Scan using it1 on t1        |     30 |      12 | 44.46
 4 |       ->  Hash                              |     29 |      12 | 15.49
 5 |         ->  Streaming(type: REDISTRIBUTE) |     30 |      12 | 15.49
 6 |           ->  Seq Scan on t2                |     30 |      12 | 14.14
(6 rows)

 Predicate Information (identified by plan id)
-------------------------------------------------
   2 --Hash Join (3,4)
         Hash Cond: (t1.c1 = t2.c2)
(2 rows)

-- Specify the number of rows using a hint.
gaussdb=# EXPLAIN SELECT /*+ rows(t1 t2 #5)*/* FROM t1,t2;
 id |              operation               | E-rows | E-width | E-costs
----+--------------------------------------+--------+---------+---------
  1 | ->  Streaming (type: GATHER)         |      5 |      24 | 37.60
  2 |    ->  Nested Loop (3,5)             |      5 |      24 | 37.35
  3 |       ->  Streaming(type: BROADCAST) |     90 |      12 | 17.93
  4 |         ->  Seq Scan on t1           |     30 |      12 | 14.14
  5 |       ->  Materialize                |     30 |      12 | 14.21
  6 |         ->  Seq Scan on t2           |     30 |      12 | 14.14
(6 rows)

gaussdb=# DROP TABLE t1;
gaussdb=# DROP TABLE t2;
```

7.12.19.4 SELECT INTO

Description

Defines a new table based on a query result and inserts data obtained by query to the new table. Different from common SELECT, SELECT INTO does not return data to the client. The columns of the new table have the same names and data types as the output columns of SELECT.

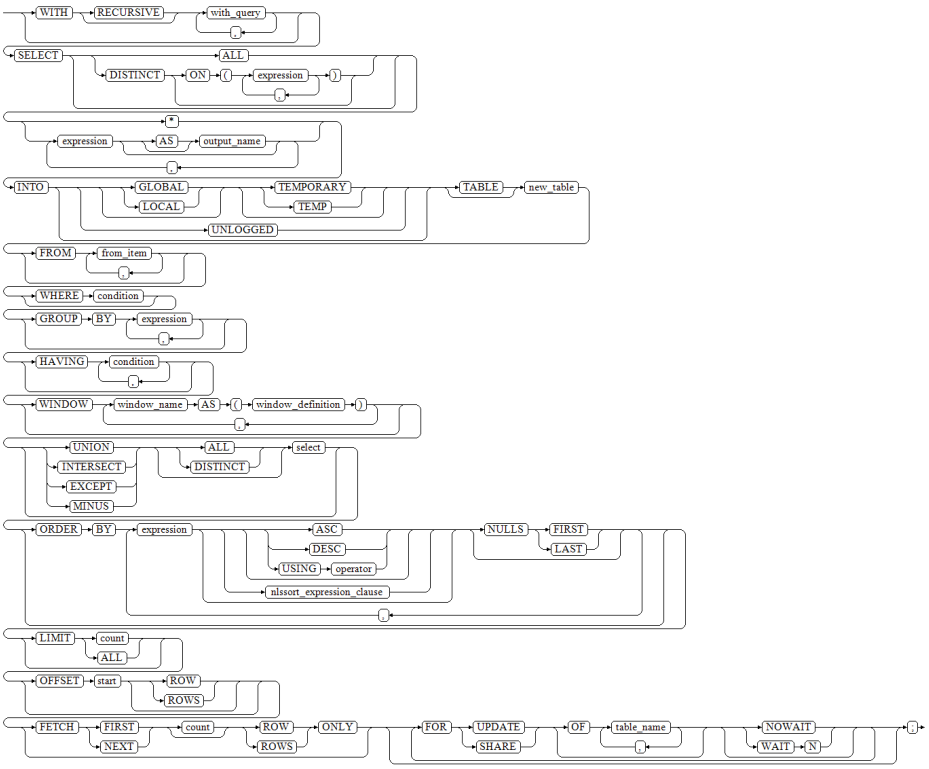
Precautions

CREATE TABLE AS provides functions similar to SELECT INTO in functions and provides a superset of functions provided by SELECT INTO. You are advised to use CREATE TABLE AS, because SELECT INTO cannot be used in a stored procedure.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
    { * | {expression [ [ AS ] output_name ]} [, ...] }
    INTO [ [ GLOBAL | LOCAL ] [ TEMPORARY | TEMP ] | UNLOGGED ] [ TABLE ] new_table
    [ FROM from_item [, ...] ]
    [ WHERE condition ]
    [ GROUP BY expression [, ...] ]
    [ HAVING condition [, ...] ]
    [ WINDOW {window_name AS ( window_definition )} [, ...] ]
    [ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
    [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
    [ LIMIT { count | ALL } ]
    [ OFFSET start [ ROW | ROWS ] ]
    [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
    [ {FOR { UPDATE | SHARE } [ OF table_name [, ...] ] [ NOWAIT | WAIT N]} [...] ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



Parameters

- **new_table**

  Specifies the name of the new table.

- **UNLOGGED**

  Specifies that the table is created as an unlogged table. Data written to unlogged tables is not written to the WALs, which makes them considerably faster than ordinary tables. However, an unlogged table is automatically truncated after a crash or unclean shutdown. The contents of an unlogged table are also not replicated to standby servers. Any indexes created on an unlogged table are automatically unlogged as well.

  – Usage scenario: Unlogged tables do not ensure data security. Users can back up data before using unlogged tables; for example, users should back up the data before a system upgrade.

  – Troubleshooting: If data is missing in the indexes of unlogged tables due to some unexpected operations such as an unclean shutdown, users should rebuild the indexes with errors.

NOTE

For details about other parameters of SELECT INTO, see **Parameters**.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_person (
  id     integer,
  name   varchar(20),
  gender varchar(5) CHECK(gender = 'Male' or gender = 'Female')
);
gaussdb=# INSERT INTO tbl_person VALUES (1, 'Bob', 'Male'),(2, 'Anne', 'Female'),(3, 'Jack', 'Male'),(4,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
'Danny', 'Male'),(5, 'Alice', 'Female'),(6, 'Susan', 'Female');

-- Add information about all persons whose gender is male in the person table to the new table.
gaussdb=# SELECT * INTO tbl_man FROM tbl_person WHERE gender =' Male'

-- Query data in the tbl_man table.
gaussdb=# SELECT * FROM tbl_man;
 id | name  | gender
----+-------+-----
  1 | Bob   | Male
  3 | Jack  | Male
  4 | Danny | Male
(3 rows)

-- Drop the table.
gaussdb=# DROP TABLE tbl_person, tbl_man;
```

Helpful Links

SELECT

7.12.19.5 SET

Description

Modifies a GUC parameter.

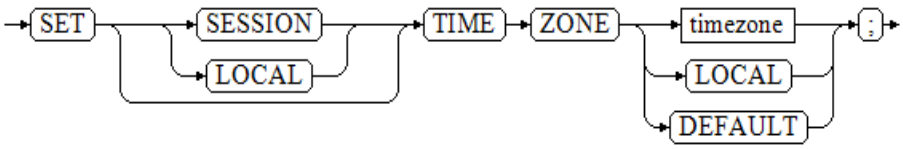
Precautions

Most GUC parameters can be modified by executing **SET**. Some parameters cannot be modified after a server or session starts.

Syntax

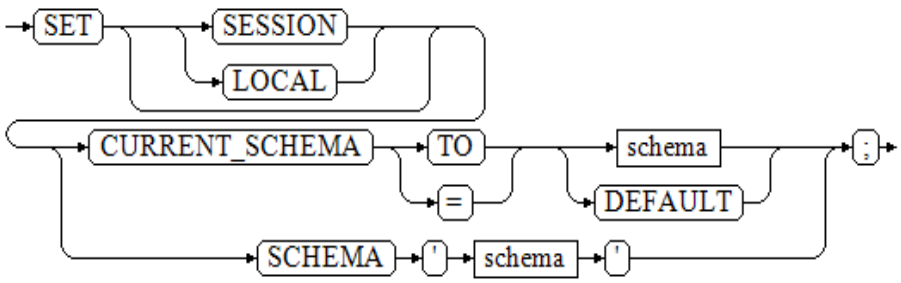
- Set the system time zone.

```
SET [ SESSION | LOCAL ] TIME ZONE { timezone | LOCAL | DEFAULT };
```



- Set the schema of the table.

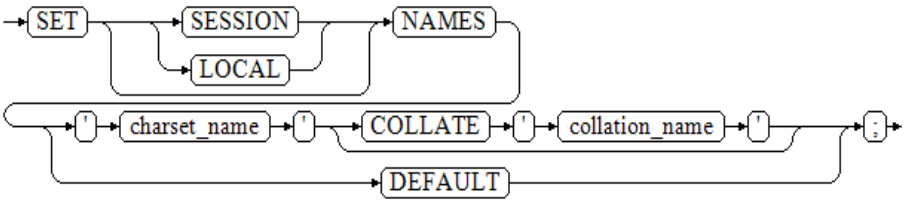
```
SET [ SESSION | LOCAL ]
    {CURRENT_SCHEMA { TO | = } { schema | DEFAULT }
    | SCHEMA 'schema'};
```



- Set client encoding.

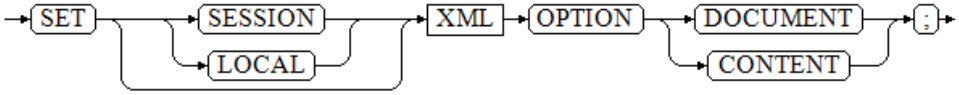
```
SET [ SESSION | LOCAL ] NAMES {'charset_name' [COLLATE 'collation_name'] | DEFAULT};
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.



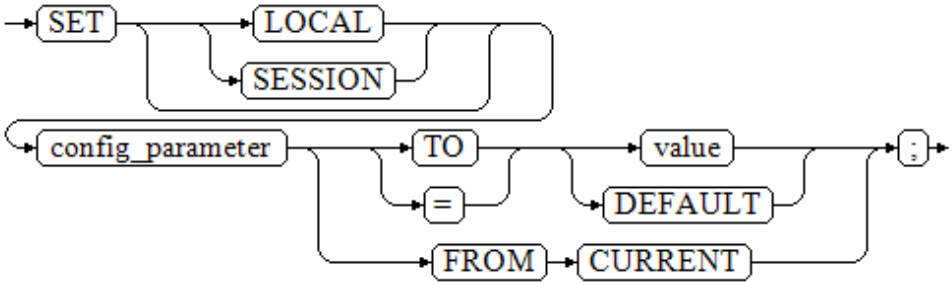
- Set XML parsing mode.

```
SET [ SESSION | LOCAL ] XML OPTION { DOCUMENT | CONTENT };
```



- Set other GUC parameters.

```
SET [ SESSION | LOCAL ]
   {config_parameter { { TO | = } { value | DEFAULT }
                     | FROM CURRENT }};
```



Parameters

- **SESSION**

  Specifies that the specified parameters take effect for the current session. This is the default value if neither **SESSION** nor **LOCAL** appears.

  If this command is executed in a transaction, the effect of the command disappears after the transaction is rolled back. Once the surrounding transaction is committed, the effect will persist until the end of the session, unless the parameters are reset by another SET statement.

- **LOCAL**

  Specifies that the specified parameters take effect for the current transaction. After **COMMIT** or **ROLLBACK**, the session-level setting takes effect again.

  The effects of this command last only till the end of the current transaction, whether committed or not. A special case is **SET** followed by **SET LOCAL** within a single transaction: the **SET LOCAL** value will be seen until the end of the transaction, but afterward (if the transaction is committed) the **SET** value will take effect.

- **TIME ZONE timezone**

  Specifies the local time zone for the current session.

  Value range: a valid local time zone. The corresponding GUC parameter is **TimeZone**. The default value is **PRC**.

- **CURRENT_SCHEMA schema**

  Specifies the current schema.

  Value range: an existing schema name

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **SCHEMA schema**

  Specifies the current schema. Here the schema is a string.

  Example: set schema 'public';

- **NAMES {'charset_name' [COLLATE 'collation_name'] | DEFAULT};**
  - The COLLATE clause can be specified when **sql_compatibility** is set to **'MYSQL'**, **b_format_version** set to **'5.7'**, and **b_format_dev_version** set to **'s2'**.

    Sets the client character encoding, character set of a constant string, collation, and character set of the returned result.

    It is equivalent to:

    ```
    SET client_encoding = charset_name;
    SET character_set_connection = charset_name;
    SET collation_connection = collation_name;
    SET character_set_results = charset_name;
    ```

    Value range: character sets and collations supported in MYSQL-compatible mode. Currently, the database character set must be specified for **charset_name**.
  - The COLLATE clause cannot be specified in other scenarios.

    Specifies the client character encoding.

    It is equivalent to:

    ```
    SET client_encoding TO charset_name;
    ```

    Value range: a valid character encoding name. The default value is **UTF8**.

- **XML OPTION option**

  Specifies the XML parsing mode.

  Value range: **CONTENT** (default), **DOCUMENT**

- **config_parameter**

  Specifies the name of a configurable GUC parameter. You can use **SHOW ALL** to view available GUC parameters.

  NOTE

  Some parameters that viewed by **SHOW ALL** cannot be set by **SET**. For example, **max_datanodes**.

- **value**

  Specifies the new value of **config_parameter**. This parameter can be specified as string constants, identifiers, numbers, or comma-separated lists of these. **DEFAULT** can be written to indicate resetting the parameter to its default value.

Examples

```
-- Set the time zone.
gaussdb=# SET TIME ZONE 'PST8PDT';

-- Set the search path of a schema.
gaussdb=# SET search_path TO tpcds, public;

-- Set client encoding.
gaussdb=# SET client_encoding TO utf8;

-- Set XML parsing mode.
gaussdb=# SET XML OPTION DOCUMENT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Set the date style to the traditional POSTGRES style (date placed before month):
gaussdb=# SET datestyle TO postgres;
```

RESET and **SHOW**

7.12.19.6 SET CONSTRAINTS

Description

SET CONSTRAINTS sets the behavior of constraint checking within the current transaction.

IMMEDIATE constraints are checked at the end of each statement. DEFERRED constraints are not checked until transaction commit. Each constraint has its own mode.

Upon creation, a constraint is given one of three characteristics **DEFERRABLE INITIALLY DEFERRED**, **DEFERRABLE INITIALLY IMMEDIATE**, or **NOT DEFERRABLE**. The third class is always **IMMEDIATE** and is not affected by the **SET CONSTRAINTS** statement. The first two classes start every transaction in specified modes, but its behaviors can be changed within a transaction by SET CONSTRAINTS.

SET CONSTRAINTS with a list of constraint names changes the mode of just those constraints (which must all be deferrable). If multiple constraints match a name, the name is affected by all of these constraints. **SET CONSTRAINTS ALL** changes the modes of all deferrable constraints.

When **SET CONSTRAINTS** changes the mode of a constraint from **DEFERRED** to **IMMEDIATE**, any data that is modified at the end of the transaction is checked during the execution of the **SET CONSTRAINTS** statement. If any such constraint is violated, the **SET CONSTRAINTS** fails (and does not change the constraint mode). Therefore, **SET CONSTRAINTS** can be used to force checking of constraints to occur at a specific point in a transaction. Check and unique constraints are always checked immediately when a row is inserted or modified.

Precautions

SET CONSTRAINTS sets the behavior of constraint checking only within the current transaction. Therefore, if you execute this statement outside of a transaction block (START TRANSACTION/COMMIT pair), it will not appear to have any effect.

Syntax

```
SET CONSTRAINTS { ALL | { name  } [, ...] } { DEFERRED | IMMEDIATE };
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **name**

  Specifies the constraint name.

  Value range: an existing table name, which can be found in the system catalog **pg_constraint**.

- **ALL**

  Specifies all constraints.

- **DEFERRED**

  Specifies that constraints are not checked until transaction commit.

- **IMMEDIATE**

  Specifies that constraints are checked at the end of each statement.

Examples

```
-- Set that constraints are checked when a transaction is committed.
gaussdb=# SET CONSTRAINTS ALL DEFERRED;

-- Set that constraints are checked at the end of each statement.
gaussdb=# SET CONSTRAINTS ALL IMMEDIATE;
```

7.12.19.7 SET ROLE

Description

Sets the current user identifier of the current session.

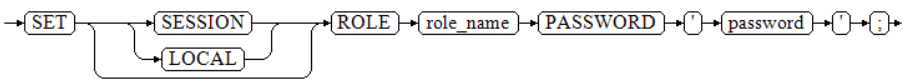
Precautions

- Users of the current session must be members of specified **rolename**, but the system administrator can choose any roles when separation of duties is disabled.
- Executing this statement may add or restrict permissions of a user. If the role of a session user has the **INHERITS** attribute, it automatically has all permissions of roles that SET ROLE enables the role to be. In this case, SET ROLE physically deletes all permissions directly granted to session users and permissions of its belonging roles and only leaves permissions of the specified roles. If the role of the session user has the **NOINHERITS** attribute, SET ROLE deletes permissions directly granted to the session user and obtains permissions of the specified role.

Syntax

- Set the current user identifier of the current session.

  ```
  SET [ SESSION | LOCAL ] ROLE role_name PASSWORD 'password';
  ```

- Reset the current user identifier to that of the current session.

  ```
  RESET ROLE;
  ```

  
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **SESSION**

  Specifies that the statement takes effect only for the current session. This parameter is used by default.

- **LOCAL**

  Specifies that the specified statement takes effect only for the current transaction.

- **role_name**

  Specifies the role name.

  Value range: a string. It must be an existing username in the database.

- **password**

  Specifies the password of a role. It must comply with the password convention.

  NOTE

  - The restrictions on using a ciphertext password are as follows:
    - An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.
  - Ciphertext passwords are usually used in gs_dump and gs_dumpall export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.

- **RESET ROLE**

  Resets the current user identifier.

Examples

```
-- Query the current session user and the current user.
gaussdb=# SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | omm
(1 row)

-- Create a role paul.
gaussdb=# CREATE ROLE paul PASSWORD '********';

-- Set the current user to paul.
gaussdb=# SET ROLE paul PASSWORD '********';

-- View the current session user and the current user.
gaussdb=> SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | paul
(1 row)

-- Reset the current user.
gaussdb=> RESET ROLE;

-- Drop the user.
gaussdb=# DROP USER paul;
```

Helpful Links

SET SESSION AUTHORIZATION

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.19.8 SET SESSION AUTHORIZATION

Description

Sets the session user identifier and the current user identifier of the current session to a specified user.

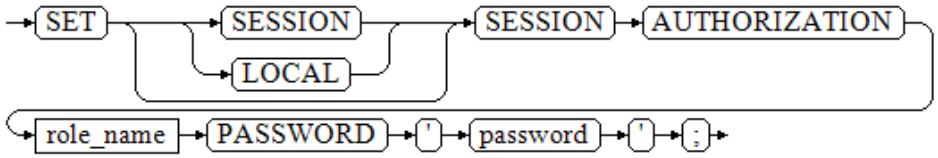
Precautions

The session identifier can be changed only when the initial session user has the system administrator permissions. Otherwise, the system supports the statement only when the authenticated username is specified.

Syntax

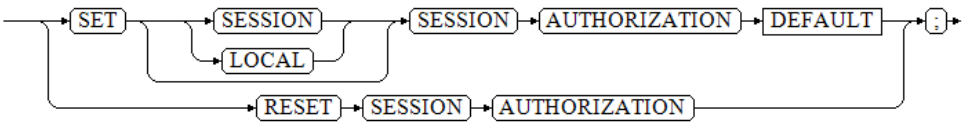
- Set the session user identifier and current user identifier for the current session.

```
SET [ SESSION | LOCAL ] SESSION AUTHORIZATION role_name PASSWORD 'password';
```



- Reset the identifiers of the session and current users to the initially authenticated usernames.

```
{SET [ SESSION | LOCAL ] SESSION AUTHORIZATION DEFAULT
   | RESET SESSION AUTHORIZATION};
```



Parameters

- **SESSION**

  Specifies that the specified parameters take effect for the current session.

- **LOCAL**

  Specifies that the specified statement takes effect only for the current transaction.

- **role_name**

  Specifies the username.

  Value range: a string. It must be an existing username in the database.

- **password**

  Specifies the password of a role. It must comply with the password convention.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The restrictions on using a ciphertext password are as follows:

- An administrator cannot use a ciphertext password to switch to another administrator but to a user with lower permissions.

Ciphertext passwords are usually used in gs_dump and gs_dumpall export scenarios. In other scenarios, you are advised not to use ciphertext passwords directly.

- **DEFAULT**

  Resets the identifiers of the session and current users to the initially authenticated usernames.

Examples

```
-- Query the session user and the current user.
gaussdb=# SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | omm
(1 row)

-- Create a role paul.
gaussdb=# CREATE ROLE paul PASSWORD '********';

-- Set the current user and session user to paul, and query the session user and current user.
gaussdb=# SET SESSION AUTHORIZATION paul PASSWORD '********';
gaussdb=> SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 paul         | paul
(1 row)

-- Reset the session user and the current user.
gaussdb=> RESET SESSION AUTHORIZATION;
gaussdb=# SELECT SESSION_USER, CURRENT_USER;
 session_user | current_user
--------------+--------------
 omm          | omm
(1 row)

-- Delete the user.
gaussdb=# DROP USER paul;
```

Helpful Links

SET ROLE

7.12.19.9 SET TRANSACTION

Description

Sets characteristics of a transaction. Available transaction characteristics include the transaction isolation level and transaction access mode (read/write or read only). You can set the current transaction characteristics using LOCAL or the default transaction characteristics of a session using SESSION.

Precautions

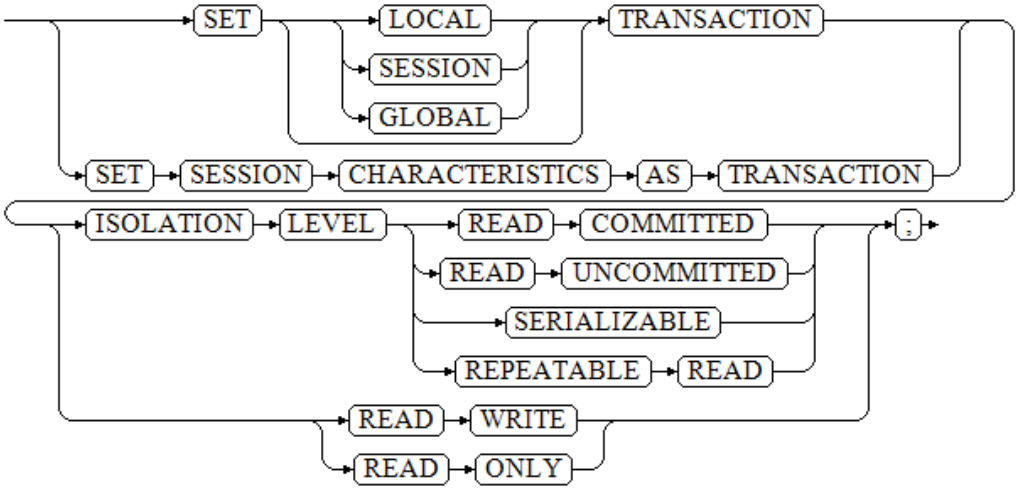
The current transaction characteristics must be set in a transaction, that is, **START TRANSACTION** or **BEGIN** must be executed before **SET TRANSACTION** is executed. Otherwise, the setting does not take effect.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

Set the isolation level and access mode of the transaction.

```
{ SET [ LOCAL | SESSION ] TRANSACTION | SET SESSION CHARACTERISTICS AS TRANSACTION }
  { ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
  | { READ WRITE | READ ONLY }
  };
```



Parameters

- **LOCAL**

  Specifies that the specified statement takes effect only for the current transaction.

- **SESSION**

  Specifies that the specified parameters take effect for the current session.

- **ISOLATION LEVEL**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  NOTE

  - The isolation level cannot be changed after data is modified using INSERT, DELETE, UPDATE, FETCH, or COPY in the current transaction.

  Value range:

  - **READ COMMITTED**: Only committed data is read. This is the default value.
  - **READ UNCOMMITTED**: After this isolation level is set, its behavior is the same as that of **READ COMMITTED**.
  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, this isolation level is not supported in GaussDB. It is equivalent to **REPEATABLE READ**.

- **READ WRITE | READ ONLY**

  Specifies the transaction access mode (read/write or read only).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> The access mode of the default transaction feature of the session can be set only when the database is started or by sending the HUP signal.

Examples

```
-- Start a transaction.
gaussdb=# START TRANSACTION;

-- Set the isolation level of the transaction to READ COMMITTED and the access mode to READ ONLY.
gaussdb=# SET LOCAL TRANSACTION ISOLATION LEVEL READ COMMITTED READ ONLY;

-- Query the current transaction isolation level.
gaussdb=# SHOW transaction_isolation;
 transaction_isolation
-----------------------
 read committed
(1 row)

-- Commit the transaction.

gaussdb=# COMMIT;
```

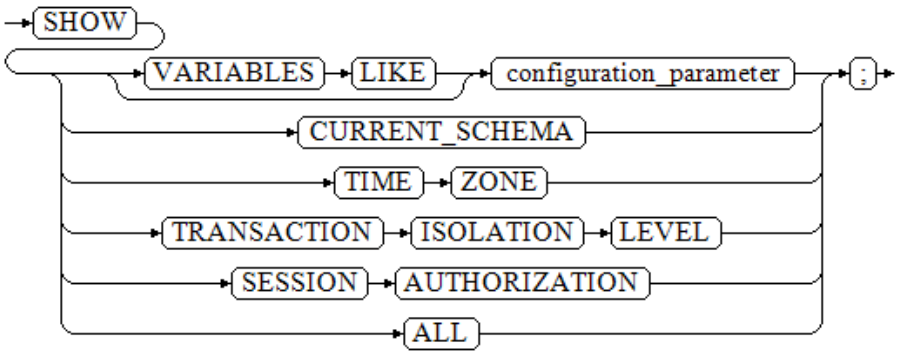
7.12.19.10 SHOW

Description

SHOW shows the current value of a GUC parameter.

Syntax

```
SHOW
 {
   [VARIABLES LIKE] configuration_parameter |
   CURRENT_SCHEMA |
   TIME ZONE |
   TRANSACTION ISOLATION LEVEL |
   SESSION AUTHORIZATION |
   ALL
 };
```



Parameters

- **configuration_parameter**

  Specifies the name of a GUC parameter.

  Value range: GUC parameters. You can view them by running the **SHOW ALL** command.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **NOTE**
>
> Some parameters viewed by running **SHOW ALL** cannot be set by running **SET**, for example, **max_datanodes**.

- **CURRENT_SCHEMA**

  Specifies the current schema.
- **TIME ZONE**

  Specifies the time zone.
- **TRANSACTION ISOLATION LEVEL**

  Specifies the transaction isolation level.
- **SESSION AUTHORIZATION**

  Specifies the session authorization.
- **ALL**

  Specifies all GUC parameters.

Examples

```
-- Show the value of timezone.
gaussdb=# SHOW timezone;
TimeZone
----------
 PRC
(1 row)

-- Show the current schema.
gaussdb=# SHOW CURRENT_SCHEMA;
 current_schema
----------------
 "$user",public
(1 row)

-- Show the isolation level of a transaction.
gaussdb=# SHOW TRANSACTION ISOLATION LEVEL;
 transaction_isolation
-----------------------
 read committed
(1 row)

-- Show the user identifier of the current session.
gaussdb=# SHOW SESSION AUTHORIZATION;
 session_authorization
-----------------------
 omm1
(1 row)

-- Show all parameters.
gaussdb=# SHOW ALL;

-- Show all parameters whose names contain var.
gaussdb=# SHOW VARIABLES LIKE var;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.12.19.11 SHUTDOWN

Description

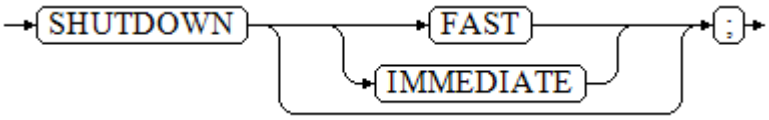
SHUTDOWN shuts down the currently connected database node.

Precautions

- Only an administrator can run this command.
- The distributed database does not support the **SHUTDOWN** command.

Syntax

```
SHUTDOWN [FAST | IMMEDIATE];
```



Parameters

- **FAST | IMMEDIATE**

  FAST: Rolls back all active transactions, forcibly disconnects the client, and shuts down the database node without waiting for the client to disconnect.

  IMMEDIATE: Shuts down the server forcibly. Fault recovery will occur on the next startup.

  If the shutdown mode is not specified, the default value **FAST** is used.

Examples

```
-- Shut down the current database node.
gaussdb=# SHUTDOWN;

-- Shut down the current database node in fast mode.
gaussdb=# SHUTDOWN FAST;
```

7.12.19.12 START TRANSACTION

Description

Starts a transaction. If the isolation level or read/write mode is specified, a new transaction will have those characteristics. You can also specify them using **SET TRANSACTION**.

Precautions

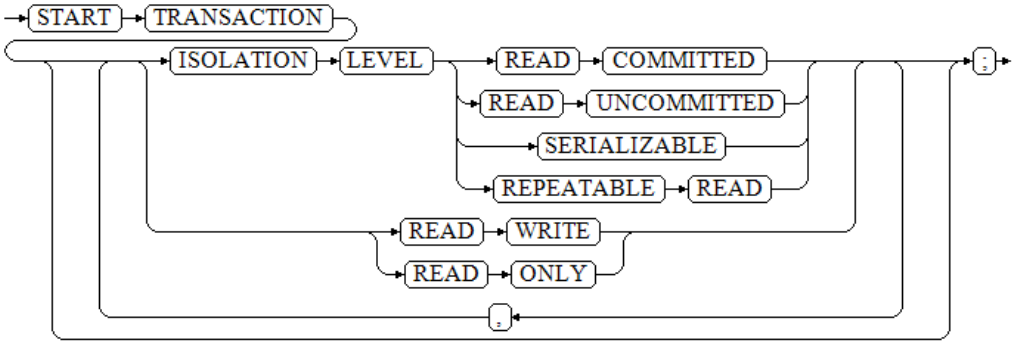
When START TRANSACTION is used, **autocommit** remains disabled and is not restored to the initial state until you run COMMIT or ROLLBACK to end a transaction.

Syntax

Format 1: START TRANSACTION

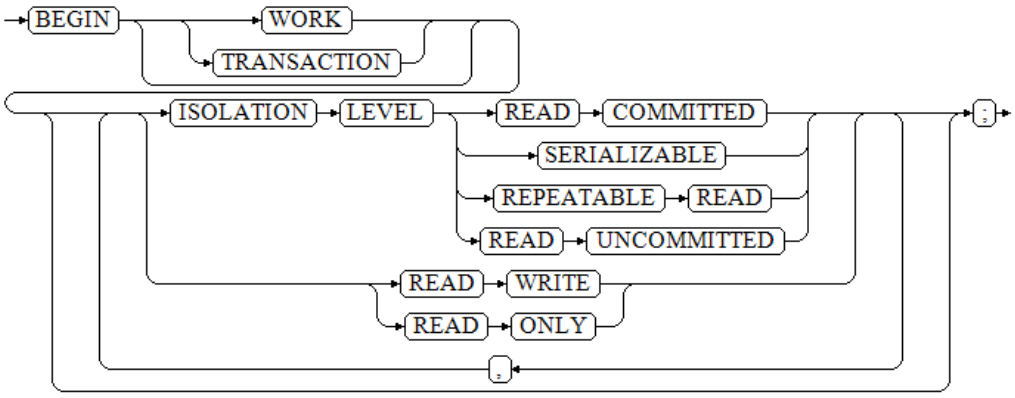
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
START TRANSACTION
 [
  {
    ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
    | { READ WRITE | READ ONLY }
  } [, ...]
 ];
```



Format 2: BEGIN

```
BEGIN [ WORK | TRANSACTION ]
 [
  {
    ISOLATION LEVEL { READ COMMITTED | READ UNCOMMITTED | SERIALIZABLE | REPEATABLE READ }
    | { READ WRITE | READ ONLY }
  } [, ...]
 ];
```



Parameters

- **WORK | TRANSACTION**

  Specifies the optional keyword in BEGIN format without functions.

- **ISOLATION LEVEL**

  Specifies the transaction isolation level that determines the data that a transaction can view if other concurrent transactions exist.

  > NOTE
  >
  > The isolation level of a transaction cannot be reset after the first clause (INSERT, DELETE, UPDATE, FETCH, COPY) for modifying data is executed in the transaction.

  Value range:

  – **READ COMMITTED**: Only committed data is read. This is the default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - **READ UNCOMMITTED**: After this isolation level is set, its behavior is the same as that of **READ COMMITTED**.
  - **REPEATABLE READ**: Only the data committed before transaction start is read. Uncommitted data or data committed in other concurrent transactions cannot be read.
  - **SERIALIZABLE**: Currently, GaussDB does not support this isolation level. Setting this isolation level is equivalent to **REPEATABLE READ**.
- **READ WRITE | READ ONLY**

  Specifies the transaction access mode (read/write or read only).

Examples

```
-- Create a schema.
gaussdb=# CREATE SCHEMA tpcds;

-- Create the tpcds.reason table.
gaussdb=# CREATE TABLE tpcds.reason (c1 int, c2 int);

-- Start a transaction in default mode.
gaussdb=# START TRANSACTION;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction in default mode.
gaussdb=# BEGIN;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# END;

-- Start a transaction with the isolation level being READ COMMITTED and the access mode being READ WRITE:
gaussdb=# START TRANSACTION ISOLATION LEVEL READ COMMITTED READ WRITE;
gaussdb=# SELECT * FROM tpcds.reason;
gaussdb=# COMMIT;

-- Delete the table.
gaussdb=# DROP TABLE tpcds.reason;

-- Delete the schema.
gaussdb=# DROP SCHEMA tpcds CASCADE;
```

COMMIT | END, **ROLLBACK**, and **SET TRANSACTION**

7.12.20 T

7.12.20.1 TIMECAPSULE TABLE

Description

The TIMECAPSULE TABLE statement restores a table to an earlier state in the event of human or application errors.

The table can flash back to a past point in time, depending on the source version of the data stored in the system. In addition, GaussDB cannot restore a table to an earlier state through DDL operations that has changed the structure of the table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- The TIMECAPSULE TABLE statement can be used to flash back the data of the source version or the data from the recycle bin.
  - TO TIMECAPSULE and TO CSN can flash a table back to an earlier version. Currently, only the Ustore is supported.
  - The recycle bin records the objects dropped or truncated by running DROP and TRUNCATE. TO BEFORE DROP and TO BEFORE TRUNCATE can flash data back from the recycle bin. Currently, the Ustore and Astore are supported.
- The following object types do not support flashback: system catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, hash bucket tables, and encrypted tables.
- Flashback is not supported for tables that contain user-defined types.
- After flashback is enabled, tables in the recycle bin can be backed up but cannot be restored.
- If a statement (DDL, DCL, or VACUUM FULL) that modifies the table structure or affects physical storage is executed between the flashback point and the current point, the flashback fails.
- To run DROP, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the owner of the junk object.

  To run TRUNCATE, you must have the CREATE or USAGE permission on the schema to which the junk object belongs, and you must be the owner of the schema or the junk object. In addition, you must have the TRUNCATE permission on the junk object.
- Scenarios or tables that do not support DROP or TRUNCATE:
  - Scenario where the recycle bin is disabled (**enable_recyclebin** is set to **off**)
  - Scenario where the system is in the maintenance state (**xc_maintenance_mode** is set to **on**) or is upgraded from an unsupported baseline version to a supported version
  - Scenario where multiple objects are deleted (The **DROP** or **TRUNCATE TABLE** command is executed to delete multiple objects at the same time.)
  - System catalogs, DFS tables, global temporary tables, local temporary tables, unlogged tables, sequence tables, encrypted tables, and hash bucket tables
  - Objects in the recycle bin are cleared and do not support DROP or TRUNCATE FLASHBACK. The **recyclebin_retention_time** parameter specifies the retention period of objects in the recycle bin.
  - Scaling is not supported. During scale-out and redistribution, data in the recycle bin is forcibly dropped. During scale-out, dropped objects are not moved to the recycle bin.
  - The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations.
  - If a statement (such as DDL, DCL, VACUUM FULL, and partition adding/deleting/splitting/merging) that modifies the table structure or affects

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

physical files are executed between the TRUNCATE TABLE and TRUNCATE flashback operations, the flashback fails.

- When a table is entirely deleted or truncated, partitions are moved to the recycle bin along with the entire table. A single deleted partition cannot be moved to the recycle bin. This avoids data consistency damage.
- If there are residual online indexes (a node that is not created exists and the index cannot be found on the node), an error is reported when a table is dropped. You need to clear the residual data to successfully drop the table and place the object in the recycle bin.
- If the object on which the table depends is an external object (for example, a composite object or a user-defined object), the table is physically deleted and is not moved to the recycle bin.

- DROP FLASHBACK constraints

  You can specify either the original user-defined name of the table or the system-generated name assigned to the object when it was dropped.

  - System-generated recycle bin object names are unique. Therefore, if you specify the system-generated name, the database retrieves that specified object. To see the content in your recycle bin, run **SELECT * FROM gs_recyclebin;**.
  - If you specify a user-specified name and the recycle bin contains more than one object of that name, the database retrieves the object that was moved to the recycle bin most recently. To retrieve a table of an earlier version, perform the following steps:

    - Specify the system-generated recycle bin name of the table you want to retrieve.
    - Run the **TIMECAPSULE TABLE ... TO BEFORE DROP** statement until you retrieve the table you want.
  - During table restoration, the dropped table along with its original base table name is restored. The subobject names of the table remain the same as those in the recycle bin. You can run the DDL command to manually change the names of subobjects as required.
  - If a table has default values that reference sequences and user-defined functions, flashing back the dropped table will succeed, but the default values will not be restored.
  - Similarly, if a table is referenced by views, dropping the table will cascadingly delete the views. Therefore, flashing back the dropped table will succeed, but the views will not be restored.
  - The recycle bin does not support write operations such as DML, DCL, and DDL, and does not support DQL query operations (supported in later versions).
  - The **recyclebin_retention_time** parameter specifies the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires.

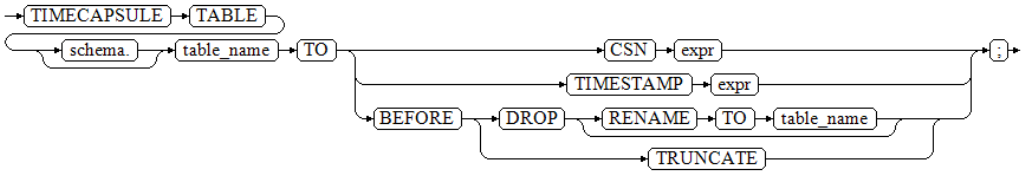
- TRUNCATE FLASHBACK constraints
  - After TRUNCATE FLASHBACK is performed, the statistics remain unchanged and are still displayed as **0**. You can modify the statistics by manual ANALYZE during off-peak hours (to reduce the impact on performance).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- RENAME TO supports only the DROP FLASHBACK operation to specify a new name for the retrieval table, but does not support TRUNCATE FLASHBACK.
- TRUNCATE FLASHBACK cannot span statements that affect the table structure or physical storage. Otherwise, an error is reported. If a statement (such as DDL, DCL, VACUUM FULL, and partition adding/deleting/splitting/merging) that modifies the table structure or affects physical storages are executed between the flashback point and current point, the flashback fails. The error message "ERROR: The table definition of %s has been changed." is displayed when flashback is performed on a table where DDL operations have been performed. The error message "ERROR: recycle object %s desired does not exist" is displayed when flashback is performed on a table where DDL operations, such as changing namespaces and table names, have been performed.

Syntax

```
TIMECAPSULE TABLE
   [schema.]table_name TO { CSN expr | TIMESTAMP expr | BEFORE { DROP [RENAME TO table_name] |
TRUNCATE } };
```



Parameters

- **schema**

  Specifies a schema containing the table to be flashed back. If this parameter is not specified, the current schema is used.

- **table_name**

  Specifies a table name.

- **TO CSN**

  Specifies the CSN corresponding to the time point when the table is to be flashed back. *expr* must be a number representing a valid CSN.

  Note: In the GTM-free scenario, each node uses the local CSN and does not have a globally unified CSN. Therefore, flashback in TO CSN mode is not supported.

- **TO TIMESTAMP**

  Specifies a timestamp value corresponding to the point in time to which you want to flash back the table. The result of *expr* must be a valid past timestamp (convert a string to a time type using the **TO_TIMESTAMP** function). The table will be flashed back to a time within approximately 3 seconds of the specified timestamp.

  Note: When the flashback point is too old, the source version cannot be obtained because it is recycled. As a result, the flashback fails and the error message "Restore point too old" is displayed.

- **TO BEFORE DROP**

  Retrieves dropped tables and their subobjects from the recycle bin.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **RENAME TO**

  Specifies a new name for the table retrieved from the recycle bin.

- **TO BEFORE TRUNCATE**

  Flashes back to the point in time before the TRUNCATE operation.

Examples

- **Flashing data back to a specified time**

  You need to set the **undo_retention_time** parameter to set the retention period of old undo logs.

  Contact an administrator for information about how to use parameters.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test(c1 int, c2 int) with(storage_type = ustore) DISTRIBUTE BY
REPLICATION;
gaussdb=# INSERT INTO tbl_test VALUES (1,1),(2,2),(3,3);

-- Query the current time and next_csn on all global nodes.
gaussdb=# SELECT now();
              now
-------------------------------
 2023-11-27 17:06:34.840698+08
(1 row)

gaussdb=# SELECT int8in(xidout(next_csn)) FROM gs_get_next_xid_csn();
 int8in
--------
  25391
  25391
  25391
  25391
  25391
  25391
(6 row)

-- Modify data.
gaussdb=# UPDATE tbl_test SET c1=111, c2=222 WHERE c1=1;

-- Query data and flash the data back to the state before UPDATE.
gaussdb=# SELECT * FROM tbl_test;
 c1  | c2
-----+-----
 111 | 222
   2 |   2
   3 |   3
(3 rows)
gaussdb=# TIMECAPSULE table tbl_test TO TIMESTAMP to_timestamp('2023-11-27
17:06:34.840698','YYYY-MM-DD HH24:MI:SS.FF');

-- You can also use the following SQL statements:
gaussdb=# TIMECAPSULE table tbl_test TO CSN 25391;

gaussdb=# SELECT * FROM tbl_test;
 c1 | c2
----+----
  2 |  2
  3 |  3
  1 |  1
(3 rows)

-- Delete.
gaussdb=# DROP TABLE tbl_test PURGE;
```

- **Flashing back data from the recycle bin**

  Prerequisites:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - The **enable_recyclebin** parameter has been enabled to enable the recycle bin. Contact an administrator for details about how to use the parameter.
  - The **recyclebin_retention_time** parameter has been set for specifying the retention period of objects in the recycle bin. The objects will be automatically deleted after the retention period expires. Contact an administrator for details about how to use the parameter.

```
-- Create a table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test1(c1 int, c2 varchar(10))with(storage_type = ustore);
gaussdb=# INSERT INTO tbl_test1 VALUES (1,'AAA'),(2,'BBB');

-- Drop the table.
gaussdb=# DROP TABLE tbl_test1;

-- Flash back to the time before the table is deleted.
gaussdb=# TIMECAPSULE TABLE tbl_test1 TO BEFORE DROP;

-- Query data.
gaussdb=# SELECT * FROM tbl_test1;
 c1 | c2
----+-----
  1 | AAA
  2 | BBB
(2 rows)

-- Delete a table. (The PURGE parameter is added to delete the table data from the recycle bin.)
gaussdb=# DROP TABLE tbl_test1 PURGE;
```

7.12.20.2 TRUNCATE

Description

TRUNCATE quickly removes all rows from a database table.

It has the same effect as an unqualified DELETE on each table, but TRUNCATE is faster because it does not actually scan the tables. This is most useful on large tables.

Precautions

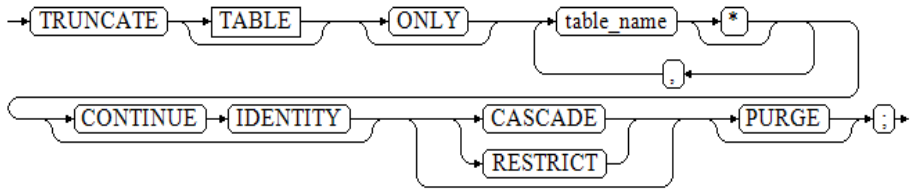
- TRUNCATE TABLE has the same function as a DELETE statement with no WHERE clause, emptying a table.
- TRUNCATE TABLE uses less system and transaction log resources as compared with DELETE.
  - DELETE deletes a row each time, and records the deletion of each row in the transaction log.
  - TRUNCATE TABLE deletes all rows in a table by releasing the data page storing the table data, and records the releasing of the data page only in the transaction log.
- The differences between TRUNCATE, DELETE, and DROP are as follows:
  - TRUNCATE TABLE deletes content, releases space, but does not delete definitions.
  - DELETE TABLE deletes content, but does not delete definitions nor release space.
  - DROP TABLE deletes content and definitions, and releases space.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

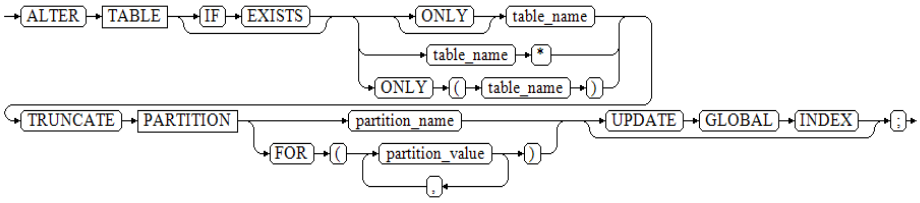
- Truncate the data in a table.

```
TRUNCATE [ TABLE ] [ ONLY ] {table_name [ * ]} [, ... ]
    [ CONTINUE IDENTITY ] [ CASCADE | RESTRICT ] [ PURGE ];
```



- Truncate the data in a partition.

```
ALTER TABLE [ IF EXISTS  ] { [ ONLY  ] table_name
                        | table_name *
                        | ONLY ( table_name )  }
    TRUNCATE PARTITION { partition_name
                    | FOR (  partition_value  [, ...] )  } [ UPDATE GLOBAL INDEX ];
```



Parameters

- **ONLY**

  If **ONLY** is specified, only the specified table is cleared. If **ONLY** is not specified, the table and all its subtables (if any) are cleared.

- **table_name**

  Specifies the name (optionally schema-qualified) of the target table.

  Value range: an existing table name

- **CONTINUE IDENTITY**

  Does not change the values of sequences. This is the default action.

- **CASCADE | RESTRICT**
  - **CASCADE**: cascadingly truncates all tables added to a group due to CASCADE.
  - **RESTRICT** (default): refuses to truncate if any of the tables have foreign-key references from tables that are not listed in the statement (not supported in distributed scenarios).

- **PURGE**

  Purges table data in the recycle bin by default.

- **partition_name**

  Specifies the partition in the target partitioned table.

  Value range: an existing partition name

- **partition_value**

  Specifies the value of the specified partition key.

  The value specified by **PARTITION FOR** can uniquely identify a partition.

  Value range: value range of the partition key for the partition to be renamed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When the PARTITION FOR clause is used, the entire partition where **partition_value** is located is cleared.

- **UPDATE GLOBAL INDEX**

  Updates all global indexes in the partitioned table to ensure that correct data can be queried using global indexes.

  If this parameter is not used, all global indexes in the partitioned table will become invalid.

Examples

- Clear table data.

```
-- Create the reason table.
gaussdb=# CREATE TABLE reason (r_reason_sk int,r_reason_id varchar(16),r_reason_desc
varchar(100));

-- Insert multiple records into the table.
gaussdb=# INSERT INTO reason values(1,'AAAAAAAABAAAAAAA','reason 1'),
(5,'AAAAAAAABAAAAAAA','reason 2'),
                                  (15,'AAAAAAAABAAAAAAA','reason 3'), (25,'AAAAAAAABAAAAAAA','reason
4'),
                                  (35,'AAAAAAAABAAAAAAA','reason 5'), (45,'AAAAAAAACAAAAAAA','reason
6');

-- Check the table information. The table size is about 16 KB.
gaussdb=# \d+
                                 List of relations
 Schema |  Name  | Type  | Owner | Size  |             Storage              | Description
--------+--------+-------+-------+-------+----------------------------------+-------------
 public | reason | table | omm   | 16 kB | {orientation=row,compression=no} |
(1 row)

-- Run the DELETE statement without the WHERE condition to clear data in the table and check the
table size.
gaussdb=# DELETE FROM reason;
gaussdb=# \d+
                                 List of relations
 Schema |  Name  | Type  | Owner | Size  |             Storage              | Description
--------+--------+-------+-------+-------+----------------------------------+-------------
 public | reason | table | omm   | 16 kB | {orientation=row,compression=no} |
(1 row)

-- Run the TRUNCATE statement to clear the reason table and check the table size.
gaussdb=# TRUNCATE TABLE reason;
gaussdb=# \d+
                                 List of relations
 Schema |  Name  | Type  | Owner |  Size   |             Storage              | Description
--------+--------+-------+-------+---------+----------------------------------+-------------
 public | reason | table | omm   | 0 bytes | {orientation=row,compression=no} |
(1 row)

-- Drop the table.
gaussdb=# DROP TABLE reason;
```

- Clear data of a partitioned table.

```
-- Create a partitioned table.
gaussdb=# CREATE TABLE reason_p(
    r_reason_sk integer,
    r_reason_id character(16),
    r_reason_desc character(100)
)PARTITION BY RANGE (r_reason_sk)(
    partition p_05_before values less than (05),
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    partition p_15 values less than (15),
    partition p_25 values less than (25),
    partition p_35 values less than (35),
    partition p_45_after values less than (MAXVALUE)
);

-- Insert data.
gaussdb=# INSERT INTO reason_p values(1,'AAAAAAAABAAAAAAA','reason 1'),
(5,'AAAAAAAABAAAAAAA','reason 2'),
                                (15,'AAAAAAAABAAAAAAA','reason 3'), (25,'AAAAAAAABAAAAAAA','reason
4'),
                                (35,'AAAAAAAABAAAAAAA','reason 5'), (45,'AAAAAAAACAAAAAAA','reason
6');

-- Clear the p_05_before partition.
gaussdb=# ALTER TABLE reason_p TRUNCATE PARTITION p_05_before UPDATE GLOBAL INDEX;

-- Clear the partitioned table.
gaussdb=# TRUNCATE TABLE reason_p;

-- Delete the reason_p table.
gaussdb=# DROP TABLE reason_p;
```

7.12.21 U

7.12.21.1 UPDATE

Description

Updates specified columns in all rows that meet the specified conditions. You can use WHERE to declare conditions. All columns specified by the SET clause will be updated. Other columns retain their original values.

Precautions

- The owner of a table, users with the UPDATE permission on the table, or users with the UPDATE ANY TABLE permission can update data in the table. When the separation of duties is disabled, system administrators have this permission by default.
- UPDATE..... LIMIT row_count supports only some scenarios of execution plan pushdown. (Table replication is not supported.) The prerequisites are that the filter criteria must contain the equivalent distribution key and the filter criteria should be relatively simple. Do not use forcible type conversion. If the command fails to be executed, simplify the filter criteria.
- You must have the SELECT permission on all tables involved in the expressions or conditions.
- Distribution keys can be updated only when **enable_update_distkey** is set to **on** or K-means distribution is used, and constraints are met. Otherwise, distribution keys do not support the UPDATE operation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The constraints on updating distribution keys are as follows:

- Distribution keys can be updated only when **enable_update_distkey** is set to **on** or K-means distribution is used.
- The UPDATE statement cannot be pushed down to DNs for execution. The PGXC plan is directly generated and is not changed based on the values before and after the distribution key is updated.
- Tables with row-level UPDATE TRIGGER are not supported. Otherwise, the execution fails and an error message is displayed. The row-level INSERT/DELETE TRIGGER does not take effect, and the update-statement-level TRIGGER is executed normally.
- Concurrent update of the same row is not supported. You need to obtain a lock first. The result (returning **0** or reporting an error) of obtaining a lock on DNs depends on the setting of the GUC parameter **concurrent_dml_mode**. An error will be reported in the following cases: (1) The error message "update distribute column conflict" is displayed. (2) When the time spent for obtaining a lock exceeds the threshold, an error message is displayed, indicating that the lock times out.
- Tables with global secondary indexes (GSIs) are not supported. Otherwise, an error is reported.
- Only Hash or K-means distribution is supported. LIST/RANGE distributed tables are not supported. Otherwise, an error is reported.
- MERGE INTO and UPSERT cannot be used to update distribution keys. Otherwise, an error is reported.
- GTM_FREE is not supported. Otherwise, an error is reported.
- UPDATE RETURNING is not supported. Otherwise, an error is reported.
- Statements with joined tables are not supported. Otherwise, an error is reported.
- UPDATE+LIMIT is not supported. Otherwise, an error is reported.
- In ORA-compatible and MySQL-compatible modes, multiple partitions cannot be deleted at a time. Therefore, when the DELETE statements are reversely parsed during distribution key update, multiple partitions are not involved. Data consistency is ensured by the condition **tableoid**.

- For row-store replication tables, UPDATE can be performed only in the following two scenarios:
  - Scenarios with PRIMARY KEY constraints.
  - Scenarios where the execution plan can be pushed down.
- For the UPDATE statement whose subquery is a stream plan, the same row cannot be concurrently updated.
- You cannot modify the database character encoding by updating a system catalog. Such operation will cause exceptions in existing data or other operations. If you need to change the character encoding of a database, follow the database switching process to migrate data.

Syntax

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
UPDATE [/*+ plan_hint */] [ ONLY ] {table_name [ partition_clause ] | subquery | view_name} [ * ] [ [ AS ] alias ]
SET {column_name = { expression | DEFAULT }
   |( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
   [ FROM from_list] [ WHERE condition | WHERE CURRENT OF cursor_name ]
   [ ORDER BY {expression [ [ ASC | DESC | USING operator ]
[ LIMIT { count } ]
   [ RETURNING {*
            | {output_expression [ [ AS ] output_name ]} [, ...] }];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
where sub_query can be:
SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
{ * | {expression [ [ AS ] output_name ]} [, ...] }
[ FROM from_item [, ...] ]
[ WHERE condition  ]
[ GROUP BY grouping_element [, ...] ]
[ HAVING condition [, ...] ]
[ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS { FIRST |
LAST } ]} [, ...] ]
[ LIMIT { [offset,] count | ALL } ]
```

- The subquery **with_query** is as follows:

  ```
  with_query_name [ ( column_name [, ...] ) ] AS [ [ NOT ] MATERIALIZED ] ( {select | values | insert |
  update | delete} )
  ```

- For subquery:

  ```
  [ WITH [ RECURSIVE ] with_query [, ...] ]
  SELECT [/*+ plan_hint */] [ ALL ]
  { * | {expression [ [ AS ] output_name ]} [, ...] }
  [ into_option ]
  [ FROM from_item [, ...] ]
  [ WHERE condition ]
  [ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
  [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
  { FIRST | LAST } ]} [, ...] ]
  [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ]
  [ into_option ];
  ```

- The specified subquery source **from_item** is as follows:

  ```
  {[ ONLY ] {table_name | view_name} [ * ] [ partition_clause ] [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
  |with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]}
  ```

- For partition_clause:

  ```
  PARTITION { ( partition_name [, ...] ) | FOR ( partition_value [, ...] ) }
  ```

Parameters

- **WITH [RECURSIVE] with_query [, ...]**

  Specifies one or more subqueries that can be referenced by name in the main query, which is equivalent to a temporary table. This subquery statement structure is called the common table expression (CTE) structure. When this structure is used, the execution plan contains the CTE SCAN content.

  If RECURSIVE is specified, it allows a SELECT subquery to reference itself by name.

  with_query:

  - **with_query_name** specifies the name of the result set generated by a subquery. Such names can be used to access the result sets of subqueries in a query.
  - **column_name** specifies the column name displayed in the subquery result set.
  - Each subquery can be a SELECT, VALUES, INSERT, UPDATE or DELETE statement.
  - You can use MATERIALIZED or NOT MATERIALIZED to modify the CTE.
    - If **MATERIALIZED** is specified, the WITH query will be materialized, and a copy of the subquery result set is generated. The copy is directly queried at the reference point. Therefore, the WITH subquery cannot be jointly optimized with the SELECT statement trunk (for

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

example, predicate pushdown and equivalence class transfer). In this scenario, you can use **NOT MATERIALIZED** for modification. If the WITH query can be executed as a subquery inline, the preceding optimization can be performed.

- If the user does not explicitly declare the materialized attribute, comply with the following rules: If the CTE is referenced only once in the SELECT statement trunk to which it belongs and semantically supports inline execution, it will be rewritten as subquery inline execution. Otherwise, the materialized execution will be performed in CTE Scan mode.

- **plan_hint**

  Follows the UPDATE keyword in the **/*+ */** format. It is used to optimize the plan of an UPDATE statement block. For details, see **Hint-based Optimization**. In each statement, only the first **/*+** *plan_hint* ***/** comment block takes effect as a hint. Multiple hints can be written.

- **table_name**

  Specifies the name (optionally schema-qualified) of the table to be updated. If ONLY is specified before the table name, only matched rows in the table are updated. If it is not specified, any matching rows inherited from the table are also updated.

  Value range: an existing table name

  NOTE

  You can use database links to perform operations on remote tables. For details, see **DATABASE LINK**.

- **subquery**

  Specifies the subquery to be updated. When a subquery is updated, the subquery is regarded as a temporary view. The **CHECK OPTION** option can be added to the end of the subquery.

  If a subquery contains only one table, data is updated into the table. If a subquery contains multiple tables or has nested relationships, check whether a key-preserved table exists to determine whether data can be updated. For details about key-preserved tables and **WITH CHECK OPTION**, see **CREATE VIEW**.

- **view_name**

  Specifies the target view to be updated.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The restrictions on updating views and subqueries are as follows:

- The UPDATE operation can be performed only on columns that directly reference user columns in the base table.
- A subquery or view must contain at least one updatable column. For details about updatable columns, see **CREATE VIEW**.
- Views and subqueries that contain the DISTINCT, GROUP BY, HAVING, LIMIT, or OFFSET clause at the top layer are not supported.
- Views and subqueries that contain set operations (UNION, INTERSECT, EXCEPT, and MINUS) at the top layer are not supported.
- Views and subqueries whose target lists contain aggregate functions, window functions, or return set functions (such as array_agg, json_agg, and generate_series) are not supported.
- Views with BEFORE or AFTER triggers but without INSTEAD OF triggers or INSTEAD rules are not supported.
- Table types supported in views and subqueries include ordinary tables, temporary tables, global temporary tables, partitioned tables, level-2 partitioned tables, Ustore tables, and Astore tables.
- Only one base table can be updated at a time in a multi-table join view or join subquery.
- Join views or subqueries can update only key-preserved tables. If **CHECK OPTION** is specified, join columns cannot be updated. For details about the key-preserved table, see **CREATE VIEW**.
- System views cannot be updated.

- **partition_clause**

  Updates a specified partition.

  NOTE

  If PARTITION specifies multiple partition names, the partition names can be the same. The union set of the partition ranges is used.

- **alias**

  Specifies a substitute name for the target table.

  Value range: a string. It must comply with the **naming convention**.

- **column_name**

  Specifies the name of the column to be modified.

  You can refer to this column by specifying the target table alias and the column name. Example: **UPDATE foo AS f SET f.col_name = 'namecol'**

  Value range: an existing column

- **expression**

  Specifies a value assigned to a column or an expression that assigns the value.

- **DEFAULT**

  Specifies the default value of a column.

  The value is **NULL** if no specified default value has been assigned to it.

- **sub_query**

  Specifies a subquery.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This statement can be executed to update a table with information for other tables in the same database. For details about clauses in the SELECT statement, see **SELECT**.

When a single column is updated, the ORDER BY and LIMIT clauses can be used. When multiple columns are updated, the ORDER BY and LIMIT clauses cannot be used.

NOTICE

If the WHERE clause of a subquery in the SET clause uses the "(+)" operator, the configuration item **enable_ora_joinop_in_updatestmt** must be added to the compatibility parameter **behavior_compat_options** for the setting to take effect.

- **from_list**

  Specifies a list of table expressions, allowing columns from other tables to appear in the WHERE condition and the update expressions. This is similar to the list of tables that can be specified in the FROM clause of a SELECT statement.

  NOTICE

  Note that the target table cannot appear in the **from_list**, unless you intend a self-join (in which case it must appear with an alias in the **from_list**).

- **condition**

  Specifies an expression that returns a value of the Boolean type. Only rows for which this expression returns **true** are updated. You are advised not to use numeric types such as int for **condition**, because such types can be implicitly converted to Boolean values (non-zero values are implicitly converted to **true** and **0** is implicitly converted to **false**), which may cause unexpected results.

- **WHERE CURRENT OF cursor_name**

  When the cursor points to a row in a table, you can use this syntax to update the row.

  cursor_name: specifies the name of a cursor.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- This syntax is not supported by the database in the MySQL-compatible mode.
- This syntax supports only ordinary tables instead of partitioned tables or hash bucket tables.
- This syntax can be used only in stored procedures.
- This syntax cannot be used together with other WHERE conditions.
- This syntax cannot be used together with WITH, USING, ORDER BY, or FROM.
- The SELECT statement corresponding to the CURSOR must be declared as FOR UPDATE.
- The SELECT statement corresponding to the CURSOR supports only a single table. It does not support LIMIT/OFFSET, subqueries, or sublinks.
- The CURSOR declared as FOR UPDATE in a stored procedure cannot be used after being committed or rolled back.
- If the row to which the CURSOR points does not exist, an error is reported (only when UPDATE is used instead of DELETE) in the ORA-compatible mode, indicating that the specified row does not exist. In other compatibility modes, no error is reported.
- When this syntax is used in a replication table, pushdown is not supported. A primary key is required.

- **ORDER BY**

  For details about the keywords, see **SELECT**.

- **LIMIT**

  For details about the keywords, see **SELECT**.

- **RETURNING output_expression**

  Specifies an expression to be computed and returned by the UPDATE statement after each row is updated.

  Value range: The expression can use any column names of the table named by **table_name** or tables listed in **FROM**. Write * to return all columns.

- **output_name**

  Specifies a name to use for a returned column.

Examples

- Modify all data in the table.

```
-- Create the tbl_test1 table and insert data into the table.
gaussdb=# CREATE TABLE tbl_test1(id int, info varchar(10));
gaussdb=# INSERT INTO tbl_test1 VALUES (1, 'A'), (2, 'B');

-- Query.
gaussdb=# SELECT * FROM tbl_test1;
 id | info
----+------
  1 | A
  2 | B
(2 rows)

-- Modify the info column of all data in the tbl_test1 table.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# UPDATE tbl_test1 SET info = 'aa';

-- Query the tbl_test1 table.
gaussdb=# SELECT * FROM tbl_test1;
 id | info
----+------
  1 | aa
  2 | aa
(2 rows)
```

- Modify some data in the table.

```
-- Modify the data whose ID is 2 in the tbl_test1 table.
gaussdb=# UPDATE tbl_test1 SET info = 'bb' WHERE id = 2;

-- Query the tbl_test1 table.
gaussdb=# SELECT * FROM tbl_test1;
 id | info
----+------
  1 | aa
  2 | bb
(2 rows)
```

- Modify the data and return the modified data.

```
-- Modify the data whose ID is 1 in the tbl_test1 table and specify the info column to be returned.
gaussdb=# UPDATE tbl_test1 SET info = 'ABC' WHERE id = 1 RETURNING info;
 info
------
 ABC
(1 row)

UPDATE 1

-- Drop the tbl_test1 table.
gaussdb=# DROP TABLE tbl_test1;
```

- Use a subquery to insert new data based on the existing data when modifying data.

```
-- Create a table.
gaussdb=# CREATE TABLE test_grade (
    sid int,                -- Student ID
    name varchar(50),       -- Name
    score char,             -- Score
    examtime date,          -- Exam time
    last_exam boolean       -- The last exam or not
);

-- Insert data.
gaussdb=# INSERT INTO test_grade VALUES (1,'Scott','A','2008-07-08',1),(2,'Ben','D','2008-07-08',1),
(3,'Jack','D','2008-07-08',1);

-- Query.
gaussdb=# SELECT * FROM test_grade;
 sid | name  | score |  examtime  | last_exam
-----+-------+-------+------------+-----------
   3 | Jack  | D     | 2008-07-08 | t
   1 | Scott | A     | 2008-07-08 | t
   2 | Ben   | D     | 2008-07-08 | t
(3 rows)

-- On August 25, 2008, Ben took a make-up exam and the score is B. You need to change the value of last_exam to No, and then insert the score of August 25, 2008.
gaussdb=# WITH old_exa AS ( UPDATE test_grade SET last_exam = 0 WHERE sid = 2 AND examtime
= '2008-07-08' RETURNING sid, name )
        INSERT INTO test_grade VALUES ( ( SELECT sid FROM old_exa ), (SELECT name FROM old_exa),
'B', '2008-08-25', 1 );

-- Query.
gaussdb=# SELECT * FROM test_grade;
 sid | name  | score |  examtime  | last_exam
-----+-------+-------+------------+-----------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  3 | Jack  | D    | 2008-07-08 | t
  1 | Scott | A    | 2008-07-08 | t
  2 | Ben   | D    | 2008-07-08 | f
  2 | Ben   | B    | 2008-08-25 | t
(4 rows)

-- Drop.
gaussdb=# DROP TABLE test_grade;
```

- **Updating a view or subquery**

  Example 1: Update a subquery.

```
-- Create a schema.
gaussdb=# CREATE SCHEMA upd_subqry;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = 'upd_subqry';
SET

-- Create tables and insert data into the tables.
gaussdb=# CREATE TABLE t1 (x1 int, y1 int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'x1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# CREATE TABLE t2 (x2 int PRIMARY KEY, y2 int);
NOTICE:  CREATE TABLE / PRIMARY KEY will create implicit index "t2_pkey" for table "t2"
CREATE TABLE
gaussdb=# INSERT INTO t1 VALUES (1, 1), (2, 2), (3, 3), (5, 5);
INSERT 0 4
gaussdb=# INSERT INTO t2 VALUES (1, 1), (2, 2), (3, 3), (5, 5);
INSERT 0 4

-- Update t1 through a subquery.
gaussdb=# UPDATE (SELECT * FROM t1) SET y1 = 13 where y1 = 3;
UPDATE 1
gaussdb=# UPDATE (SELECT * FROM t1 WHERE y1 < 2) SET y1 = 12 WHERE y1 = 2;
UPDATE 0

-- Insert a subquery with READ ONLY specified.
gaussdb=# UPDATE (SELECT * FROM t1 WITH READ ONLY) SET y1 = 1 WHERE y1 = 11;
ERROR:  cannot perform a DML operation on a read-only subquery.

-- Insert a multi-table join subquery.
gaussdb=# UPDATE (SELECT * FROM t1, t2 WHERE x1 = x2) SET y1 = 11 WHERE y2 = 1;
UPDATE 1

-- Insert a multi-table join subquery with CHECK OPTION specified. The join columns x1 and x2
cannot be updated.
gaussdb=# UPDATE (SELECT * FROM t1, t2 WHERE x1 = x2 WITH CHECK OPTION) SET y1 = 1 WHERE
y2 = 1;
UPDATE 1
gaussdb=# UPDATE (SELECT * FROM t1, t2 WHERE x1 = x2 WITH CHECK OPTION) SET x1 = 6 WHERE
y2 = 5;
ERROR:  virtual column not allowed here

-- Drop a schema.
gaussdb=# RESET CURRENT_SCHEMA;
RESET
gaussdb=# DROP SCHEMA upd_subqry CASCADE;
NOTICE:  drop cascades to 2 other objects
DETAIL:  drop cascades to table upd_subqry.t1
drop cascades to table upd_subqry.t2
DROP SCHEMA
```

  Example 2: Update a view.

```
-- Create a schema.
gaussdb=# CREATE SCHEMA upd_view;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = 'upd_view';
SET
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Create tables and insert data into the tables.
gaussdb=# CREATE TABLE t1 (x1 int, y1 int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'x1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.

7.12.22 V

7.12.22.1 VACUUM

Description

VACUUM recycles storage space occupied by tables or B-Tree indexes. In normal database operation, rows that have been deleted are not physically removed from their table; they remain present until a VACUUM is done. Therefore, it is necessary to do VACUUM periodically, especially on frequently-updated tables.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Precautions

- If no table is specified, VACUUM processes the tables on which the user has the corresponding permission in the current database. With a parameter, VACUUM processes only that table.
- To perform VACUUM operation on a table, you must be a table owner or a user granted the VACUUM permission on the table. When separation of duties is disabled, system administrators have this permission by default. However, database owners are allowed to VACUUM all tables in their databases, except shared catalogs. (The restriction for shared catalogs means that a true database-wide VACUUM can only be executed by a system administrator). VACUUM skips over any tables that the calling user does not have the permission to vacuum.
- VACUUM cannot be executed inside a transaction block.
- It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. After adding or deleting a large number of rows, it might be a good idea to run **VACUUM ANALYZE** for the affected table. This will update the system catalogs with the results of all recent changes, and allow the query planner to make better choices in planning queries.
- FULL is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table. VACUUM FULL usually shrinks a table more than VACUUM does. If the physical space usage does not decrease after you run the statement, check whether there are other active transactions (that have started before you delete data transactions and not ended before you run **VACUUM FULL**). If there are such transactions, run this statement again when the transactions quit.
- VACUUM FULL returns the free space in the table to the tablespace by rebuilding the table. During the rebuilding, extra storage space equivalent to the valid data size in the table is required. For a non-segment-page table, after VACUUM FULL is executed, the physical files occupied by the original table are deleted, and the physical file space occupied by the original table is returned to the OS. For a segment-page table, after VACUUM FULL is executed, the physical space occupied by the original table is returned to the segment-page data file instead of the OS.
- VACUUM causes a substantial increase in I/O traffic, which might cause poor performance for other active sessions. Therefore, it is sometimes advisable to use the cost-based VACUUM delay feature.
- When **VERBOSE** is specified, VACUUM prints progress messages to indicate which table is currently being processed. Various statistics about the tables are printed as well.
- When the option list is surrounded by parentheses, the options can be written in any order. If there are no brackets, the options must be given in the order displayed in the syntax.
- VACUUM and VACUUM FULL clear deleted tuples after the delay specified by **vacuum_defer_cleanup_age**.
- VACUUM ANALYZE executes a VACUUM operation and then an ANALYZE operation for each selected table. This is a handy combination form for routine maintenance scripts.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Plain VACUUM (without FULL) simply recycles space and makes it available for reuse. This form of statement can operate concurrently with normal reading and writing of the table, as an exclusive lock is not obtained. VACUUM FULL executes wider processing, including moving rows across blocks to compress tables so they occupy the minimum number of disk blocks. This form is much slower and requires an exclusive lock on each table while it is being processed.
- If the **xc_maintenance_mode** parameter is not enabled, VACUUM FULL skips all system catalogs.
- If you run **VACUUM FULL** immediately after running **DELETE**, the space will not be recycled. After running **DELETE**, execute 1000 non-SELECT transactions, or wait for 1s and then execute one transaction. Then, run **VACUUM FULL** to the space.
- During VACUUM FULL, an exclusive lock is added to the table. Therefore, you are advised not to run **VACUUM FULL** during peak hours. Otherwise, the lock waiting time is too long or a deadlock occurs.
- To ensure performance and statistics accuracy, do not run ANALYZE-related commands, such as VACUUM ANALYZE, AUTOANALYZE, and manual ANALYZE, at the same time or frequently.
- For Ustore, the behavior of manual VACUUM is the same as that in Astore. Locks are obtained to clear heap tables and indexes. In Ustore, AUTOVACUUM only clears GPIs of partitioned tables, updates FSMs of heap tables, and recycles index pages.
- When **VACUUM FULL** is executed, partitions are traversed for clearance and GPIs are rebuilt after partition clearance. Therefore, if there are a large number of partitions, you are advised to delete GPIs first and rebuild indexes after **VACUUM FULL** is executed. In this way, the execution time of **VACUUM FULL** is reduced.
- You cannot perform VACUUM FULL online for database-level, index-level, partitioned table, secondary partitioned table, segment-page table, hash/range bucket table, temporary table, and unlogged table objects. If an object involves the preceding unsupported types, the ONLINE keyword does not take effect. By default, VACUUM FULL is executed offline, and a message is displayed indicating that the VACUUM FULL statement cannot be executed online.
- When performing online VACUUM FULL operations, reserve sufficient disk space, at least equal to the total size of the tables to be operated and the accessories such as indexes on the tables.
- If the online VACUUM FULL execution is canceled, the residual data clearance process starts first. If the execution is also canceled again, the clearance process ends and residual data remains.
- Resource contention exists between online VACUUM FULL operations and user services. Therefore, online VACUUM FULL operations are not suitable for heavy-traffic scenarios. In scenarios where resources are limited, fine-grained resource control is recommended. Parallel acceleration is not recommended.
- Online VACUUM FULL operations are not supported in M-compatible mode.
- Online VACUUM FULL execution does not support the FREEZE keyword. If both FREEZE and ONLINE keywords are specified, VACUUM FULL is executed offline by default, and a message is displayed indicating that the VACUUM FULL statement cannot be executed online.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Online VACUUM FULL operations cannot be performed in a transaction or a stored procedure.
- If online VACUUM FULL fails, significant table space bloat may occur. The bloat degree is proportional to the online VACUUM FULL execution duration and the number of concurrent write operations. Long transactions may block online VACUUM FULL. You are advised not to perform online VACUUM FULL when long transactions exist.
- After VACUUM FULL is executed online, DQL operations are blocked and an error is reported for concurrent DML operations.
- During online VACUUM FULL execution, do not execute DDL statements concurrently with other DDL statements. Otherwise, deadlocks or errors may occur. In this case, reconnect to the client and try again.
- A schema named **online$$ddl$$[hash value]** is generated during online VACUUM FULL execution.
  - By default, the owner of the schema is the initial user. You are advised not to perform the operations on the schema during online VACUUM FULL execution. Otherwise, the online VACUUM FULL execution may be terminated and an unknown error may occur. You are advised not to query tables in this schema. By default, gs_dump will not export this schema.
  - You cannot create a schema whose prefix is **online$$**. Otherwise, an error notice is displayed. If schemas with the same name conflict with each other, online VACUUM FULL execution does not take effect. By default, VACUUM FULL is executed offline, and a message is displayed indicating that the VACUUM FULL statement cannot be executed online due to the schema name conflict. -
- If a GSI exists in the object table, the ONLINE keyword does not take effect. By default, VACUUM FULL is executed offline, and a message is displayed indicating that VACUUM FULL cannot be executed online. -

Syntax

- Recycle space and update statistics information, without requirements for keyword orders.

```
VACUUM [ ( { FULL | FREEZE | VERBOSE | { ANALYZE | ANALYSE } } [, ... ] ) ]
    [ table_name [ (column_name [, ...] ) ] [ PARTITION ( partition_name ) ] ]
    [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ];
```

- Recycle space, without updating statistics information.

```
VACUUM [ FULL ] [ FREEZE ] [ VERBOSE ] [ table_name [ PARTITION ( partition_name ) ] ]
    [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ];
```

- Recycle space and update statistics information, and require keywords in order.

```
VACUUM [ FULL ] [ FREEZE ] [ VERBOSE ] { ANALYZE | ANALYSE } [ VERBOSE ]
    [ table_name [ ( column_name [, ...] ) ] ] [ PARTITION ( partition_name ) ]
    [ OFFLINE | [ ONLINE [ WITH ( { online_parameter = value } [, ... ] ) ] ] ];
```

- Recycle the space of a specified bucket and update the **bucketxid** column in the pg_hashbucket system catalog. Statistics are not updated. It can be called by administrators only during scale-out.

```
VACUUM FREEZE BUCKETS (bucketid [, ...]);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameters

- **FULL**

  Selects "FULL" vacuum, which can recycle more space, but takes much longer and exclusively locks the table.

  NOTE

  Using FULL will cause statistics information missing. To collect statistics information, add the keyword ANALYZE to the VACUUM FULL statement.

- **FREEZE**

  Is equivalent to running **VACUUM** with the **vacuum_freeze_min_age** parameter set to **0**.

- **VERBOSE**

  Prints a detailed VACUUM activity report for each table.

- **ANALYZE | ANALYSE**

  Updates statistics used by the planner to determine the most efficient way to execute a query.

- **table_name**

  Specifies the name (optionally schema-qualified) of a specific table to vacuum.

  Value range: name of a specific table to vacuum. The default value indicates all tables in the current database.

- **column_name**

  Specifies the name of the column to be analyzed. This parameter must be used together with ANALYZE.

  Value range: name of a specific column to analyze. The default value indicates all columns.

  NOTE

  The mechanism of the VACUUM ANALYZE statement is to execute VACUUM and ANALYZE in sequence. Therefore, if **column_name** is incorrect, VACUUM may be successfully executed but ANALYZE may fail to be executed. For a partitioned table, ANALYZE may fail to be executed after VACUUM is successfully executed on a partition.

- **partition_name**

  Specifies the partition name of the table to be cleared. The default value indicates all partitions.

- **ONLINE | OFFLINE**

  Executes VACUUM online or offline. This parameter is used to execute VACUUM FULL online and therefore the read and write services are not blocked for a long time during VACUUM FULL.

  The keywords ONLINE and OFFLINE are used.

  – ONLINE: executes online. If the VACUUM FULL statement contains scenarios (such as the FREEZE keyword) that are not supported by the current feature, the statement is executed offline and a NOTICE is displayed, indicating that the ONLINE keyword is ignored.

  – OFFLINE: executes offline.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Value range: **OFFLINE** or **ONLINE**, which indicates offline execution and online execution respectively. The value is **OFFLINE** by default.

NOTE

If VACUUM FULL fails to be executed online due to user instruction termination commands, lock timeout, or database faults, the system automatically clears residual objects. Automatic cleanup may fail due to reasons such as lock timeout. In this case, manual cleanup is required. For severe faults, such as FATAL, PANIC, and database faults, residual temporary schema objects may exist, affecting subsequent online VACUUM FULL and online DDL execution. In this case, you need to use the **online_ddl_cleanup()** function to manually clear the objects. If no residual data exists, you are advised not to use the online_ddl_cleanup() function. Otherwise, online VACUUM FULL may be terminated and an unknown error may occur.

- **online_parameter**

  Specifies the online VACUUM FULL option when the ONLINE keyword is specified. This parameter does not take effect if the ONLINE keyword is not specified or conditions for online VACUUM FULL execution are not met.

  Value range:

  - **parallel_threads**: controls multi-thread parallel operations to achieve higher performance when resources are sufficient. Value range: an integer ranging from 1 to 32. The default value is **1**.

    - When a user enables resource control, for example, I/O resource control (for example, **io_limits** > **0** or **io_priority** = **high**/**medium**/**low**), **parallel_threads** ignores resource control under the user or session. In addition, a message is displayed, indicating that the current resource control is invalid and multi-thread acceleration is enabled. The online VACUUM FULL multi-thread execution complies with the resource control of the initial user.

    - This parameter can take effect together with the index parallel parameter **parallel_workers**. **parallel_workers** controls the degree of parallelism for index building during VACUUM FULL, and **parallel_threads** controls the degree of parallelism for catchups during VACUUM FULL.

  - **max_catchup_times**: controls the maximum number of catchups. This parameter is used to prevent the execution of VACUUM FULL from taking a long time. Value range: an integer ranging from 1 to 50. The default value is **50**.

    Online VACUUM FULL execution records the IUD incremental data generated during data reconstruction to a temporary table and reconstructs the incremental data in multiple rounds of catchups. To prevent VACUUM FULL catchup failures due to a large amount of concurrent IUD data, you can set this parameter to limit the number of catchups.

Examples

- VACUUM

```
-- Create the table tbl_test and insert data into the tables.
gaussdb=# CREATE TABLE tbl_test(c1 int);
gaussdb=# INSERT INTO tbl_test VALUES (1);

-- View the data and the CTID of the data.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# SELECT ctid,* FROM tbl_test;
 ctid  | c1
-------+----
 (0,1) |  1
(1 row)

-- Delete the data record.
gaussdb=# DELETE FROM tbl_test;

-- Insert a data record again. It is found that a new ctid is used.
gaussdb=# INSERT INTO tbl_test VALUES (2);
gaussdb=# SELECT ctid,* FROM tbl_test;
 ctid  | c1
-------+----
 (0,2) |  2
(1 row)

-- After the VACUUM statement is executed, the old space is reused when data is inserted.
gaussdb=# VACUUM ANALYZE tbl_test;
gaussdb=# INSERT INTO tbl_test VALUES (3);
gaussdb=# SELECT ctid,* FROM tbl_test;
 ctid  | c1
-------+----
 (0,1) |  3
 (0,2) |  2
(2 rows)

-- Drop the table.
gaussdb=# DROP TABLE tbl_test;
```

- VACUUM FULL

```
-- Create a table.
gaussdb=# CREATE TABLE tbl_test2(c1 int);

-- Insert 100,000 data records and check the table size.
gaussdb=# INSERT INTO tbl_test2 VALUES (generate_series(1,100000));
gaussdb=# SELECT 'tbl_test2' AS tablename, pg_size_pretty(pg_relation_size('tbl_test2')) AS size;
 tablename |  size
-----------+---------
 tbl_test2 | 3048 kB
(1 row)

-- Delete data and check the table size.
gaussdb=# DELETE FROM tbl_test2;
gaussdb=# SELECT 'tbl_test2' AS tablename, pg_size_pretty(pg_relation_size('tbl_test2')) AS size;
 tablename |  size
-----------+---------
 tbl_test2 | 3048 kB
(1 row)

-- Use VACUUM FULL to reclaim space and check the table size.
gaussdb=# VACUUM FULL ANALYZE tbl_test2;
gaussdb=# SELECT 'tbl_test2' AS tablename, pg_size_pretty(pg_relation_size('tbl_test2')) AS size;
 tablename |  size
-----------+---------
 tbl_test2 | 0 bytes
(1 row)

-- Use VACUUM FULL to recycle spaces online.
gaussdb=# VACUUM FULL ANALYZE tbl_test2 ONLINE;

-- Drop.
gaussdb=# DROP TABLE tbl_test2;
```

Suggestions

- vacuum
  - VACUUM cannot be executed inside a transaction block.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

  - It is recommended that active production databases be vacuumed frequently (at least nightly), in order to remove dead rows. It is strongly recommended that you run **VACUUM ANALYZE** after adding or deleting a large number of records.
  - **FULL** is recommended only in special scenarios. For example, you wish to physically narrow the table to decrease the occupied disk space after deleting most rows of a table.

7.12.22.2 VALUES

Description

Computes a row or a set of rows based on given values. It is most commonly used to generate a constant table within a large statement.

Precautions

- VALUES lists with large numbers of rows should be avoided, as you might encounter out-of-memory failures or poor performance. VALUES appearing within INSERT is a special case, because the desired column types are known from the INSERT's target table, and need not be inferred by scanning the VALUES list. In this case, a large number of result rows can be processed.
- If more than one row is specified, all the rows must have the same number of elements.

Syntax

```
VALUES {( expression [, ...] )} [, ...]
    [ ORDER BY { sort_expression [ ASC | DESC | USING operator ] } [, ...] ]
    [ LIMIT { count | ALL } ]
    [ OFFSET start [ ROW | ROWS ] ]
    [ FETCH { FIRST | NEXT } [ count ] { ROW | ROWS } ONLY ];
```

Parameters

- **expression**

  Specifies a constant or expression to compute and insert at the indicated place in the resulting table or set of rows.

  In a VALUES list appearing at the top level of an INSERT, an expression can be replaced by DEFAULT to indicate that the destination column's default value should be inserted. DEFAULT cannot be used when VALUES appears in other contexts.

- **sort_expression**

  Specifies an expression or integer constant indicating how to sort the result rows.

- **ASC**

  Specifies an ascending sort order.

- **DESC**

  Specifies a descending sort order.

- **operator**

  Specifies a sorting operator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **count**

  Specifies the maximum number of rows to return.

- **OFFSET start [ROW | ROWS]**

  Specifies the maximum number of returned rows, whereas **start** specifies the number of rows to skip before starting to return rows.

- **FETCH { FIRST | NEXT } [count] { ROW | ROWS } ONLY**

  The FETCH clause restricts the total number of rows starting from the first row of the return query result, and the default value of **count** is **1**.

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE test_t2(col1 INT,col2 VARCHAR);
gaussdb=# CREATE TABLE test_t3(col1 INT,col2 VARCHAR);

-- Insert multiple data records.
gaussdb=# INSERT INTO test_t2 (col1, col2) VALUES (10,'AA'),(20,'BB'),(30,'CC');

-- Perform a pagination query and return to the first page. Display one row of data on each page.
gaussdb=# SELECT * FROM test_t2 ORDER BY col1 ASC LIMIT 1 OFFSET 0;
col1 | col2
------+------
   10 | AA
(1 row)

-- Insert data in test_t2 into test_t3.
gaussdb=# INSERT INTO test_t3 SELECT * FROM test_t2;

-- Perform a query using FETCH and return to the first page. Display one row of data on each page.
gaussdb=# SELECT * FROM test_t3 ORDER BY col1 ASC OFFSET 0 FETCH FIRST 1 ROWS ONLY;
 col1 | col2
------+------
   10 | AA
(1 row)

-- Delete tables test_t2 and test_t3.
gaussdb=# DROP TABLE test_t2;
gaussdb=# DROP TABLE test_t3;
```

7.13 Appendix

7.13.1 Extended Functions

The following table lists the extended functions supported by GaussDB and they are for reference only.

Type	Name	Description
Trigger function	pg_get_triggerdef(trigger_oid)	Gets **CREATE** [**CONSTRAINT**] **TRIGGER** command for triggers.
	pg_get_triggerdef(trigger_oid, pretty_bool)	Gets **CREATE** [**CONSTRAINT**] **TRIGGER** command for triggers.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

7.13.2 Dollar-Quoted String Constants

If a string sequence contains a single quotation mark ('), double the single quotation mark (') to two single quotation marks (''). Otherwise, the SQL statement may fail to be executed.

If a string contains many single quotation marks (') or backslashes (\), the string may be difficult to understand and error-prone because all the single quotation marks (') are doubled.

To make the query more readable in such situations, dollar quoting is provided to write string constants. A dollar-quoted string constant consists of a dollar sign ($), a "tag" of zero or more characters, another dollar sign, an arbitrary sequence of characters that make up the string content, a dollar sign, another tag the same as the previous one, and a dollar sign.

```
gaussdb=# SELECT $$it's an example$$;
   ?column?
-----------------
 it's an example
(1 row)
```

7.13.3 DATABASE LINK

Description

In the local database, a database link is used to connect to and access the remote database.

A database link can be public or private. A private database link can be accessed only by the creator, while a public database link can be accessed by all users.

All created database link information is stored in the system view gs_db_links of the local database.

Precautions

- The database link feature can be used only in ORA-compatible versions.
- The remote database connected to database link supports only 503.1.0 and later versions.
- Ensure that the values of the compatibility parameter **DBCOMPATIBILITY** and GUC parameters **behavior_compat_options**, **a_format_dev_version**, and **a_format_version** of the local and remote databases are the same.
- When a session is enabled for a database link connection, the following GUC parameters are set:

  ```
  set search_path=pg_catalog, '$user', 'public';
  set datestyle=ISO;
  set intervalstyle=postgres;
  set extra_float_digits=3;
  ```

  Other parameters are set at the remote end. If the remote parameters are different from the local parameters, the data display formats may be different. Therefore, ensure that the remote parameters are the same as the local parameters.
- Preparations: Use gs_guc to add a whitelist to the **gs_hba.conf** file to allow client connections.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
Example: gs_guc reload -I all -N all -Z coordinator -Z datanode -h "host all all 192.168.11.11/32 sha256"
```

For details about the parameters, see the description of gs_guc client authentication policy settings.

In some cases, the IP address of the DN also needs to be added to the cluster whitelist.

- The permission to create a database link needs to be granted using the GRANT syntax. By default, a new user does not have the permission, but a system administrator has the permission. For details, see GRANT description.
- When a database link is used to perform operations on a remote table, a schema corresponding to the remote table is created locally. If the metadata of the table does not exist locally, the metadata is written to the local system catalog. In this case, a level-7 lock is used to ensure write consistency until the transaction ends. When a database link is deleted, the corresponding metadata is also deleted.
- When DATABASE LINK is used, locally created tables are used only to store metadata of remote tables. The table structure cannot be queried using the \d or pg_get_tabledef function.
- If a long transaction uses the database link to operate a remote object for the first time, the lock is held until the transaction ends. Other transactions that use the dblink for the first time are blocked. To avoid this problem, run a quick statement, for example, "select * from t1@dblink where 1=2;", to query the remote object to be used and flush its metadata to disks. In addition, similar problem also occurs when the structure of the remote table changes and the stored metadata is updated locally.
- When a schema corresponding to the remote end is created locally, "USERNAME (available only for private database link) #remote schema@DBLINK" is used as the schema name. The maximum length of the schema name is 63 characters.
- If the local and remote character sets are different, an error indicating that the conversion fails may be reported. The error information is that the remote end returns an error. If the character encoding of the local database is GB18030_2022, the character encoding sent to the remote database is converted to GB18030. Therefore, if the character set of the local database is GB18030_2022, the character set of the remote database can only be GB18030 or GB18030_2022.
- If a key file is regenerated after a database link is created, an error is reported when the database link is used. This is because the key file used for creating the database link is different from that used for decryption.
- When a database link is used to perform operations on a remote table, a single-node node group is created and randomly bound to a DN.

NOTICE

When the permission to create a database link is granted to a user, the user can remotely access a database by using the IP address of the remote database. Exercise caution when granting this permission to users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Syntax

- Create a database link.

```
CREATE [ PUBLIC ] DATABASE LINK dblink
 [ CONNECT TO { CURRENT_USER | user IDENTIFIED BY password } ] [ USING ( option 'value' [...]) ];
```

- Modify the database link information.

```
ALTER [ PUBLIC ] DATABASE LINK dblink
 { CONNECT TO user IDENTIFIED BY password };
```

- Delete a specified database link.

```
DROP [ PUBLIC ] DATABASE LINK dblink;
```

  NOTE

  - **PUBLIC**: creates a public database link visible to all users. If this clause is omitted, the database link is private and available only to the current user. The data that can be accessed on the remote database depends on the identity used by the database link during connection.
  - If **CONNECT TO user IDENTIFIED BY password** is specified, the database link makes a connection as a user with specified password.
  - If **CONNECT TO CURRENT_USER** is specified, the database link uses the initial username and empty password of the current database to connect to the remote database.
  - If the preceding two clauses are omitted, the database link connects to the remote database as a local initial user.
  - **dblink**: indicates the name of the database link to be created.
  - **user**: indicates the username used by the created database link.
  - **password**: indicates the password of the username.
  - **USING (option 'value' [, ...])**

    Specifies parameters such as the IP address, port number, and remote database name of the database to be connected. The supported options are as follows:

    - **host**: specifies the IP address for connection. Multiple IP addresses can be specified using character strings separated by commas (,). Currently, encrypted databases, SSL settings, and certificate authentication are not supported. If no IP address is specified, this parameter is left empty by default.
    - **port**: specifies the port number for connection. If this parameter is not specified, the default value **5432** is used.
    - **dbname**: specifies the name of the database to be connected. If this parameter is not specified, the username used for connecting to the remote end is used by default.
    - **fetch_size**: specifies the amount of data obtained from the remote end each time. The value of **fetch_size** ranges from 0 to 2147483647. The default value is **100**.

    Notes:

    - You can write only part of the preceding options in the brackets after USING.
    - If the keyword USING is not written, the content in the brackets is not written as well.
    - When a database link is created, the system does not check whether the connection is successful. If related keywords are missing, an error may be reported.

  Perform the SELECT operation through a database link.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The syntax for accessing a remote database object by using a created database link is basically the same as that for accessing a local object. The difference is that **@dblink** is added to the end of the remote object descriptor. For details about restrictions on SQL statements, see **Table 7-276**.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
 SELECT [/*+ plan_hint */] [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
 { * | {expression [ [ AS ] output_name ]} [, ...] }
 [ FROM from_item [, ...] ]
 [ WHERE condition ]
 [ [ START WITH condition ] CONNECT BY [NOCYCLE] condition [ ORDER SIBLINGS BY expression ] ]
 [ GROUP BY grouping_element [, ...] ]
 [ HAVING condition [, ...] ]
 [ { UNION | INTERSECT | EXCEPT | MINUS } [ ALL | DISTINCT ] select ]
 [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } ]} [, ...] ]
 [ LIMIT { [offset,] count | ALL } ]
 [ OFFSET start [ ROW | ROWS ] ]
 [ {FOR { UPDATE | SHARE  } [ OF table_name [, ...] ] } [...] ];
 {[ ONLY ] table_name [ * ] @ dblink [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  |( select ) [ AS ] alias [ ( column_alias [, ...] ) ]
  |with_query_name [ [ AS ] alias [ ( column_alias [, ...] ) ] ]
  | [function_name] ( [ argument [, ...] ] ) [ AS ] alias [ ( column_alias [, ...] | column_definition [, ...] ) ]
  | [function_name] ( [ argument [, ...] ] ) AS ( column_definition [, ...] )
  |from_item [ NATURAL ] join_type from_item [ ON join_condition | USING ( join_column [, ...] ) ]};
```

- Perform the INSERT operation through a database link.

```
[ WITH [ RECURSIVE ] with_query [, ...] ]
 INSERT [/*+ plan_hint */] INTO table_name @ dblink [ ( column_name [, ...] ) ]
    { DEFAULT VALUES
    | VALUES {( { expression | DEFAULT } [, ...] ) }[, ...]
    | query }
    [ RETURNING { {output_expression [ [ AS ] output_name ] }[, ...]} ];
```

- Perform the UPDATE operation through a database link.

```
UPDATE [/*+ plan_hint */] [ ONLY ] table_name @ dblink [ [ AS ] alias ]
 SET {column_name = { expression | DEFAULT }
   |( column_name [, ...] ) = {( { expression | DEFAULT } [, ...] ) |sub_query }}[, ...]
    [ FROM from_list] [ WHERE condition ]
    [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } ]} [, ...] ]
    [ LIMIT { [offset,] count | ALL } ]
    [ RETURNING { {output_expression [ [ AS ] output_name ]} [, ...] }];

 where sub_query can be:
 SELECT [ ALL | DISTINCT [ ON ( expression [, ...] ) ] ]
 { * | {expression [ [ AS ] output_name ]} [, ...] }
 [ FROM from_item [, ...] ]
 [ WHERE condition ]
 [ GEOUP BY grouping_element [, ...] ]
 [ HAVING condition [, ...] ];
```

- Perform the DELETE operation through a database link.

```
 [ WITH [ RECURSIVE ] with_query [, ...] ]
 DELETE [/*+ plan_hint */] FROM [ ONLY ] table_name @ dblink [ [ AS ] alias ]
    [ USING using_list ]
    [ WHERE condition]
    [ ORDER BY {expression [ [ ASC | DESC | USING operator ] | nlssort_expression_clause ] [ NULLS
{ FIRST | LAST } ]} [, ...] ]
    [ LIMIT { [offset,] count | ALL } ]
    [ RETURNING { { output_expr [ [ AS ] output_name ] } [, ...] } ];
```

- Perform the LOCK TABLE operation through a database link.

```
 LOCK [ TABLE ] {[ ONLY ] name @ dblink [, ...]}
    [ IN {ACCESS SHARE | ROW SHARE | ROW EXCLUSIVE | SHARE UPDATE EXCLUSIVE | SHARE |
SHARE ROW EXCLUSIVE | EXCLUSIVE | ACCESS EXCLUSIVE} MODE ]
    [ NOWAIT ];
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Call a stored procedure or function of the remote database.

```
CALL | SELECT [ schema. ] { func_name@dblink | procedure_name@dblink } ( param_expr );
```

CAUTION

- When a database link calls a remote function or stored procedure, the user-defined types, **out** output parameters, aggregate functions, window functions, and return set functions are not supported. **SELECT * FROM func@dblink()** cannot be used to call the function or stored procedure.
- When a database link calls a remote function or stored procedure, functions under PUBLIC are called by default if no schema is specified.
- When the database link calls a remote function or stored procedure, **param_expr** does not support the use of ":=" or "=>" to separate parameter names and parameter values.

NOTE

- The meanings of the parameters irrelevant to database link in the preceding SQL statements are the same as those in the original SQL statements.
- When specifying a column name, you can add "@dblink" to the end of the column name to specify the column of the table to which the corresponding database link points.
- When a database link is used to execute an UPDATE or DELETE statement with LIMIT, the statement can be executed regardless of whether the WHERE condition is a distribution key.

Restrictions

- **Transaction**

  When a database link is used, the relationship between local and remote transactions is as follows:

  a. A local transaction synchronously controls the commit/rollback status of a remote transaction.

  b. The relationship between isolation levels is as follows.

Local Isolation Level	Remote Isolation Level
Read Uncommitted	Repeatable Read
Read Committed	Repeatable Read
Repeatable Read	Repeatable Read
Serializable	Serializable

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

If you commit a local transaction, a transaction commit request is sent to the remote end. If the local transaction fails to be committed due to an exception (such as a connection exception or a local cluster instance exception) after the remote transaction is successfully committed, the committed remote transaction cannot be withdrawn. As a result, the local transaction may be inconsistent with the remote transaction.

- **Permissions of local users to use database links**

  a. If the keyword public is used, the link is a public database link and can be used by all users or schemas.

  b. If the keyword public is not used, the link is a private database link and can be used only by the current user or schema. (Users with the SYSADMIN permission cannot use database links across schemas.)

- **Permission to access remote database objects through database links**

  The permissions to access remote database objects are the same as those of the remote connection user bound to the database link.

- **Supported SQL statements**

  – For details about the statements supported by database links, see **Table 7-276**.

  – For details about the table types supported by database links, see **Table 7-277**.

- **Function call using a database link**

  – When a database link calls a remote function, the user-defined types, OUT/INOUT parameters, PACKAGE inner functions, aggregate functions, window functions, and return set functions are not supported.

  – When a database link calls a stored procedure or function of a remote database in the PLSQL_BODY, the user-defined types, OUT/INOUT parameters, PACKAGE inner functions, overloaded functions, aggregate functions, window functions, and return set functions are not supported.

NOTICE

- You can use the following syntax to call stored procedures or functions of a remote database in the PLSQL_BODY: [CALL | SELECT] [schema.] { func_name@dblink | procedure_name@dblink } (param_expr).
- You can use the following syntax to call parameterless stored procedures or functions of a remote database in the PLSQL_BODY: [CALL | SELECT] [schema.] { func_name@dblink | procedure_name@dblink } ( ).

- **Synonyms**

  – The database link name cannot be created as a synonym.

  – Synonyms that point to a database link object in a remote database cannot be called through database link. Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

    - Step 1: Create table **TABLE1** on **DB1**.
    - Step 2: Create **DBLINK1** on **DB2** for connecting to **DB1**. Create the synonym "CREATE SYNONYM T1 FOR TABLE1@DBLINK1".
    - Step 3: Create **DBLINK2** on **DB3** for connecting to **DB2**. Call the synonym T1 "SELECT * FROM T1@DBLINK2" on **DB2** through **DBLINK2**.

- **Table type constraints**
  - HASHBUCKET: The query or DML operation cannot be performed on the remote hash bucket table through database link.
  - SLICE: The query or DML operation cannot be performed on the remote slice table through database link.
  - Replication table: The query or DML operation cannot be performed on the remote replication table through database link.
  - TEMPORARY: The query or DML operation cannot be performed on the remote temporary table through database link.
- **Views**
  - Currently, you can create a view for a remote table of a database link. However, when the structure of the remote table changes, an exception may occur when you use the view. Example:
    - Step 1: Create table **TABLE1** on **DB1**.
    - Step 2: Create **DBLINK** on **DB2** for connecting to **DB1**. Create the view "CREATE VIEW V1 AS SELECT * FROM TABLE1@DBLINK".
    - Step 3: Delete a column from **TABLE1** on **DB1**. An error is reported when you query the view on **DB2**.
- **Other scenarios**
  - The database link table does not support triggers, including the scenarios where a database link is used in the function called by a trigger, the function called by a trigger is a database link function, and the trigger is defined on a database link.
  - The UPSERT and MERGE syntaxes are not supported.
  - The CURRENT CURSOR syntax is not supported.
  - Hidden columns in a table cannot be queried.
- **Dump and backup**
  - Dump operations cannot be performed on database link-related database objects. A standby node does not support calling or connection through a database link.
  - Database objects such as database links cannot be restored from the backup of their clusters. This is because the key files of different clusters are different and the corresponding cluster key file is required for decryption when the database link is used.
- **Predicate pushdown constraints**

  Only the data types, operators, and functions used in the WHERE clause are built-in, and the used functions are of the IMMUTABLE type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **Aggregate function pushdown constraints**

  Only single tables that do not contain GROUP, ORDER BY, HAVING, and LIMIT clauses in the SELECT statement are supported. Window functions are not supported.

- **Hint pushdown**

  Only hints in scan mode can be pushed down based on the hint conditions of database link table objects. The syntax format is as follows:

  ```
  [no] tablescan|indexscan|indexonlyscan(table [index])
  ```

  The table name or table alias in a query block must be unique.

Table 7-276 Supported SQL statements

SQL Type	Operation Object	Supported Option	Execution Context
Creating a database link	DATABASE LINK	N/A	Common transaction block
Modifying a database link	DATABASE LINK	Only the username and password can be changed.	Common transaction block
Deleting a database link	DATABASE LINK	N/A	Common transaction block
SELECT statement	Ordinary table, ordinary view, and complete-refresh materialized view	• WHERE clause • JOIN clause used between a database link table and an inner table • JOIN clause used between database link tables • Aggregate function • LIMIT clause • ORDER BY clause • GROUP BY and HAVING clauses • UNION clause • WITH clause • START WITH and CONNECT BY clauses • FOR UPDATE clause • ROWNUM	Common transaction block, stored procedure, function, advanced package, and logical view

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

SQL Type	Operation Object	Supported Option	Execution Context
INSERT statement	Ordinary table	• Inserting multiple values	Common transaction block, stored procedure, function, and advanced package
UPDATE statement	Ordinary table	• LIMIT clause • ORDER BY clause • WHERE clause	Common transaction block, stored procedure, function, and advanced package
DELETE statement	Ordinary table	• LIMIT clause • ORDER BY clause • WHERE clause	Common transaction block, stored procedure, function, and advanced package
LOCK TABLE statement	Ordinary table	• LOCKMODE clause • NOWAIT clause	Common transaction block

Table 7-277 Supported table types

Dimension	GaussDB Table Type		Database Link Support
TEMP option	Temporary table		Not supported
	Global temporary table		Not supported
UNLOGGED option	Unlogged table		Supported
Storage features	Row store	Astore	Supported
		Ustore	Not supported
	Partitioned table		Not supported
	Level-2 partitioned table		Not supported
Views	Remote view accessed by a database link		DQL statements are supported, but DML statements are not supported.
	Remote table associated with a local view through a database link		DQL statements are supported, but DML statements are not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8 Best Practices

8.1 Best Practices of SQL Queries

Based on the SQL execution mechanism and a large number of practices, SQL statements can be optimized by following certain rules to enable the database to execute SQL statements more quickly and obtain correct results.

- Replace UNION with UNION ALL.

  UNION eliminates duplicate rows while merging two result sets but UNION ALL merges the two result sets without deduplication. Deduplication takes a long time. Therefore, use UNION ALL instead of UNION if you are sure that the two result sets do not contain duplicate rows based on the service logic.

- Add NOT NULL to the **JOIN** columns.

  If there are many **NULL** values in the **JOIN** columns, you can add the filter criterion IS NOT NULL to filter data in advance to improve the JOIN efficiency.

- Convert NOT IN to NOT EXISTS.

  The NOT IN statement needs to be implemented using NESTLOOP ANTI JOIN, and the NOT EXISTS statement can be implemented using HASH ANTI JOIN. If no **NULL** value exists in the **JOIN** columns, NOT IN is equivalent to NOT EXISTS. Therefore, if you are sure that no **NULL** value exists, you can convert NOT IN to NOT EXISTS to generate HASH JOIN and to improve the query performance.

  The statements for creating a foreign table are as follows:

  ```
  DROP SCHEMA IF EXISTS no_in_to_no_exists_test CASCADE;
  CREATE SCHEMA no_in_to_no_exists_test;
  SET CURRENT_SCHEMA=no_in_to_no_exists_test;
  CREATE TABLE t1(c1 int, c2 int, c3 int);
  CREATE TABLE t2(d1 int, d2 int NOT NULL, d3 int);
  ```

  The statement for implementing the query using NOT IN is as follows:

  ```
  SELECT * FROM t1 WHERE  c1 NOT IN (SELECT d2 FROM t2);
  ```

  The plan is as follows:

  ```
  gaussdb=# EXPLAIN SELECT * FROM t1 WHERE  c1 NOT IN (SELECT d2 FROM t2);
                                QUERY PLAN
  ------------------------------------------------------------------------------
   Streaming (type: GATHER)  (cost=0.06..38.57 rows=3 width=12)
     Node/s: All datanodes
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  ->  Nested Loop Anti Join  (cost=0.00..38.44 rows=3 width=12)
        Join Filter: ((t1.c1 = t2.d2) OR (t1.c1 IS NULL))
        ->  Seq Scan on t1  (cost=0.00..14.14 rows=30 width=12)
        ->  Materialize  (cost=0.00..18.08 rows=90 width=4)
              ->  Streaming(type: BROADCAST)  (cost=0.00..17.93 rows=90 width=4)
                    Spawn on: All datanodes
                    ->  Seq Scan on t2  (cost=0.00..14.14 rows=30 width=4)
(9 rows)
```

Because there is no null value in the **t2.d2** column (the **t2.d2** column is **NOT NULL** in the table definition), the query can be equivalently modified as follows:

```
SELECT * FROM t1 WHERE  NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
```

The generated plan is as follows:

```
gaussdb=# EXPLAIN SELECT * FROM t1 WHERE  NOT EXISTS (SELECT * FROM t2 WHERE t1.c1=t2.d2);
                              QUERY PLAN
-------------------------------------------------------------------------------
 Streaming (type: GATHER)  (cost=14.38..29.99 rows=3 width=12)
   Node/s: All datanodes
   ->  Hash Right Anti Join  (cost=14.32..29.86 rows=3 width=12)
         Hash Cond: (t2.d2 = t1.c1)
         ->  Streaming(type: REDISTRIBUTE)  (cost=0.00..15.49 rows=30 width=4)
               Spawn on: All datanodes
               ->  Seq Scan on t2  (cost=0.00..14.14 rows=30 width=4)
         ->  Hash  (cost=14.14..14.14 rows=29 width=12)
               ->  Seq Scan on t1  (cost=0.00..14.14 rows=30 width=12)
(9 rows)
```

- Use hashagg.

  If the GROUP BY condition exists in the query statement, the generated plan may contain sorting operations, that is, the plan contains the GroupAgg+Sort operator. As a result, the performance is poor. You can set the GUC parameter **work_mem** to increase the available memory and generate a plan with HashAgg to avoid sorting operations and improve performance. For details about how to set **work_mem**, contact the administrator.

- Replace functions with CASE statements.

  The GaussDB performance greatly deteriorates if a large number of functions are called. In this case, you can modify the pushdown functions to CASE statements.

- Do not use functions or expressions for indexes.

  Using functions or expressions for indexes will stop indexing and enable scanning on the full table.

- Do not use operator (!=, <, or >), NULL, OR, or implicit parameter conversion in WHERE clauses.

- For tables with frequent data changes, add hints to related SQL statements to fix an execution plan.

  For a table with frequent data changes, the statistics may not be the latest before the automatic ANALYZE is triggered. As a result, the execution plan may not be optimal. You are advised to add hints to related SQL statements to fix the execution plan.

- Split complex SQL statements.

  You can split an SQL statement into several ones and save the execution result to a temporary table if the SQL statement is too complex to be tuned using the solutions above, including but not limited to the following scenarios:

  – The same subquery is involved in multiple SQL statements of a job and the subquery contains a large amount of data.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Incorrect plan cost causes a small hash bucket of subquery. For example, the actual number of rows is 10 million, but only 1000 rows are in hash bucket.
- Functions such as substr and to_number cause incorrect measures for subqueries containing a large amount of data.
- BROADCAST subqueries are performed on large tables in multi-DN environment.

For details about optimization, see **Typical SQL Optimization Methods**.

8.2 Best Practices for Permission Configuration

Context

A database may be used by many users, and users are grouped into a database role for easy management. A database role can be regarded as one or a group of database users.

For databases, users and roles are basically the same. The difference is that when CREATE ROLE is used to create a role, no schema with the same name is created and the user does not have the LOGIN permission by default. When CREATE USER is used to create a user, a schema with the same name is automatically created. By default, the user has the LOGIN permission. That is, a role with the LOGIN permission can be considered to be a user. In service design, you are advised to use a role to manage permissions rather than accessing databases.

Overview

Improper permission configuration may cause permission exploitation. This section describes the functions of each permission role.

Solution

1. **Database user**

   Database users are used to connect databases, access database objects, and run SQL statements. Only an existing database user can be used to connect databases. Therefore, a database administrator must plan a database user for each user who wants to connect to a database.

   Specify at least an account and the corresponding password for a database user.

   By default, database users can be classified into two types, as listed in **Table 8-1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-1 User types

Type	Description
Initial User	Has the highest-level database rights, that is, has all system and object permissions. The initial user is not affected by the settings of the object permissions. This is comparable to the permissions of **root** in a Unix system. For security purposes, you are advised not to operate as an initial user unless necessary. When installing or initializing a database, you can specify the initial username and password. If you do not specify the username, an initial user with the same name as the OS user who installs the database is automatically generated. If no password is specified, the initial user password is empty after the installation. You need to set the initial user password on the gsql client before performing other operations. Note: For security purposes, remote login to GaussDB Kernel in trust mode is prohibited for all users, and remote login in any mode is prohibited for the initial user.
Common User	By default, a user can access the default database system catalogs (excluding pg_authid, pg_largeobject, pg_user_status, and pg_auth_history) and views and connect to the default database **postgres**, as well as the objects in the public schema, including tables, views, and functions. • You can run CREATE USER and ALTER USER to specify system permissions, or run GRANT ALL PRIVILEGE to grant the SYSADMIN permission. • You can run the GRANT statement to assign object permissions to a common user. • The user can run the GRANT statement to assign other user permissions to a common user.

2. **Database permission types**

   Permissions and roles work together to specify accessible data and executable SQL statements. For details, see **Table 8-2**.

   System permissions are specified by using the CREATE USER/ALTER USER and CREATE ROLE/ALTER ROLE statements and cannot be inherited from roles. The SYSADMIN permission can be granted or revoked by using the GRANT/REVOKE ALL PRIVILEGES statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 8-2 Permission types

Type	Description
System permission	System permissions are also regarded as user attributes, which can be specified when a user is being created or modified. System permissions include SYSADMIN, MONADMIN, OPRADMIN, POLADMIN, CREATEDB, CREATEROLE, AUDITADMIN, and LOGIN. They can be specified only by the CREATE USER or ALTER USER statement. System permissions except SYSADMIN cannot be granted or revoked by the GRANT or REVOKE statement. In addition, system permissions cannot be inherited from roles.
Object permission	Object permissions are operation permissions for tables, views, indexes, sequences, and functions. These permissions include SELECT, INSERT, UPDATE, and DELETE. Only an object owner or SYSADMIN can use the GRANT/REVOKE statement to grant or revoke object permissions.
Role	A role is a group of permissions. If a role consists of system permissions, these permissions cannot be granted to other users or roles. If a role consists of object permissions, these permissions can be granted to other users or roles.

3. **Database permission model**
   a. **System permission model**
      - **Default permission mechanism**

        Figure 8-1 Permission architecture

        
        Figure 8-1 shows the permission architecture. In the default permission mechanism, the SYSADMIN has most permissions.

        - **Initial installation user**: an account automatically generated during cluster installation. This account has the highest permissions in the system and can perform all operations.
        - **SYSADMIN**: system administrator permissions, which are only inferior to those of the initial installation user. By default, the system administrator has the same permissions as the object owner, excluding the permissions of the monitor administrator and O&M administrator.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- **MONADMIN**: monitor administrator permissions, including the permissions to access and grant views and functions in the monitor schema DBE_PERF.
- **OPRADMIN**: O&M administrator permissions, including the permission to use Roach to perform backup and restoration.
- **CREATEROLE**: security administrator permissions, including the permissions to create, modify, and delete users and roles.
- **AUDITADMIN**: audit administrator permissions, including the permissions to view and maintain database audit logs.
- **CREATEDB**: permission to create databases.
- **POLADMIN**: security policy administrator permissions, including the permissions to create resource labels, dynamic data masking policies, and unified audit policies.

- **Separation of duties**

  Figure 8-2 Separation of duties

  
  - **SYSADMIN**: system administrator permission. The user with this attribute no longer has the permissions to create, modify, delete users or roles, or view or maintain database audit logs.
  - **CREATEROLE**: security administrator permissions, including the permissions to create, modify, and delete users and roles.
  - **AUDITADMIN**: audit administrator permissions, including the permissions to view and maintain database audit logs.
  - A user or role can only have the system permissions of either SYSADMIN, CREATEROLE, o AUDITADMIN.

b. **Object permission model**

- Object permissions refer to the permissions to perform operations for database objects (such as databases, schemas, and tables), including SELECT, INSERT, UPDATE, DELETE, and CONNECT.
- The permissions vary by object. Object permissions can be granted to users or roles.
- You can use GRANT or REVOKE to grant permissions to a user or revoke them from the user. Object permissions can be inherited by a role.

c. **Role permission model**

GaussDB Kernel provides a group of default roles whose names start with **gs_role_**. These roles are provided to access to specific, typically high-

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

privileged operations. You can grant these roles to other users or roles within the database so that they can use specific functions. These roles should be given with great care to ensure that they are used where they are needed. **Table 8-3** describes the permissions of built-in roles.

Table 8-3 Permissions of built-in roles

Role	Permission
gs_role_copy_files	Permission to run the **copy... to/from filename** command. However, the GUC parameter **enable_copy_server_files** must be set first to enable the function of copying server files.
gs_role_signal_backend	Permission to call the pg_cancel_backend(), pg_terminate_backend(), and pg_terminate_session() functions to cancel or terminate other sessions. However, this role cannot perform operations on sessions of the initial user or users with the PERSISTENCE attribute.
gs_role_tablespace	Permission to create a tablespace.
gs_role_replication	Permission to call logical replication functions, such as kill_snapshot(), pg_create_logical_replication_slot(), pg_create_physical_replication_slot(), pg_drop_replication_slot(), pg_replication_slot_advance(), pg_create_physical_replication_slot_extern(), pg_logical_slot_get_changes(), pg_logical_slot_peek_changes(), pg_logical_slot_get_binary_changes(), and pg_logical_slot_peek_binary_changes().
gs_role_account_lock	Permission to lock and unlock users. However, this role cannot lock or unlock the initial user or users with the PERSISTENCE attribute.
gs_role_pldebugger	Permission to debug functions in dbe_pldebugger.
gs_role_directory_create	Permission to create directory objects. However, this role needs to enable the GUC parameter **enable_access_server_directory** first.
gs_role_directory_drop	Permission to drop directory objects. However, this role needs to enable the GUC parameter **enable_access_server_directory** first.

4. System permission configuration
   - **Configuring the default permission mechanism**
     - **Initial user**

       The account automatically generated during database installation is called an initial user. The initial user is also the SYSADMIN, MONADMIN, OPRADMIN, and POLADMIN. It has the highest

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

permissions in the system and can perform all operations. If the initial username is not specified during installation, the username is the same as the name of the OS user who installs the database. If the password of the initial user is not specified during the installation, the password is empty after the installation. In this case, you need to change the password of the initial user on the gsql client before performing other operations. If the initial user password is empty, you cannot perform other SQL operations, such as upgrade, capacity expansion, and node replacement, except changing the password.

An initial user bypasses all permission checks. You are advised to use the initial user as a database administrator only for database management other than service running.

- **SYSADMIN**

```
gaussdb=#CREATE USER u_sysadmin WITH SYSADMIN password '********';
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_sysadmin01 SYSADMIN;
```

- **MONADMIN**

```
gaussdb=#CREATE USER u_monadmin WITH MONADMIN password '********';
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_monadmin01 MONADMIN;
```

- **OPRADMIN**

```
gaussdb=#CREATE USER u_opradmin WITH OPRADMIN password "xxxxxxxxx";
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_opradmin01 OPRADMIN;
```

- **POLADMIN**

```
gaussdb=#CREATE USER u_poladmin WITH POLADMIN password "xxxxxxxxx";
-- Alternatively, run the following SQL statement when the user already exists:
gaussdb=#ALTER USER u_poladmin01 POLADMIN;
```

– **Configuring the separation of duties**

To configure this mode, you need to set the GUC parameter **enableSeparationOfDuty** to **on**. This is a POSTMASTER parameter. After this parameter is modified, you need to restart the database.

```
gs_guc set -Z coordinator -Z datanode -N all -I all -c "enableSeparationOfDuty=on"
gs_om -t stop
gs_om -t start
```

The syntax for creating and configuring user permissions is the same as that for default permissions.

5. Role permission configuration

```
-- Create the database test.
gaussdb=#CREATE DATABASE test;
-- Create role1 and user1.
gaussdb=#CREATE ROLE role1 PASSWORD '********';
gaussdb=#CREATE USER user1 PASSWORD '********';
-- Grant the CREATE ANY TABLE permission to role1.
gaussdb=#GRANT CREATE ON DATABASE test TO role1;

-- If role1 is assigned to user1, user1 belongs to group role1 and inherits the permissions of role1 to create schemas in the database test.
gaussdb=#GRANT role1 TO user1;

-- Query user and role information.
gaussdb=#\du role1|user1;
          List of roles
 Role name |  Attributes  | Member of
-----------+--------------+-----------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
role1     | Cannot login | {}
user1     |              | {role1}
```

Practice Effect

None.

8.3 Best Practices for Data Skew Query

8.3.1 Quickly Locating Tables That Cause Data Skew

Currently, the **table_distribution(schemaname text, tablename text)** and **table_distribution()** functions as well as the **PGXC_GET_TABLE_SKEWNESS** view are provided to query for data skew. You can choose any of them as needed.

Scenario 1: Data Skew Caused by a Full Disk

First, use the **pg_stat_get_last_data_changed_time(oid)** function to query for the tables whose data is changed recently. The last change time of a table is recorded only on the CN where INSERT, UPDATE, and DELETE operations are performed. Therefore, you need to query for tables that are changed within the last day (the period can be changed in the function).

```
CREATE OR REPLACE FUNCTION get_last_changed_table(OUT schemaname text, OUT relname text)
RETURNS setof record
AS $$
DECLARE
   row_data record;
   row_name record;
   query_str text;
   query_str_nodes text;
   BEGIN
      query_str_nodes := 'SELECT node_name FROM pgxc_node where node_type = ''C''';
      FOR row_name IN EXECUTE(query_str_nodes) LOOP
         query_str := 'EXECUTE DIRECT ON (' || row_name.node_name || ') ''SELECT b.nspname,a.relname
FROM pg_class a INNER JOIN pg_namespace b on a.relnamespace = b.oid where
pg_stat_get_last_data_changed_time(a.oid) BETWEEN current_timestamp - 1 AND current_timestamp;''';
         FOR row_data IN EXECUTE(query_str) LOOP
            schemaname = row_data.nspname;
            relname = row_data.relname;
            return next;
         END LOOP;
      END LOOP;
      return;
   END; $$
LANGUAGE 'plpgsql';
```

Then, execute the **table_distribution(schemaname text, tablename text)** function to query for the storage space occupied the tables on each DN.

```
SELECT table_distribution(schemaname,relname) FROM get_last_changed_table();
```

Scenario 2: Routine Data Skew Inspection

- If the number of tables in the database is less than 10,000, use the skew view to query data skew of all tables in the database.
  ```
  SELECT * FROM pgxc_get_table_skewness ORDER BY totalsize DESC;
  ```
- If the number of tables in the database is no less than 10,000, you are advised to use the table_distribution() function instead of the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

PGXC_GET_TABLE_SKEWNESS view because the view takes a longer time (hours) due to the query of the entire database for skew columns. When you use the table_distribution() function, you can define the output based on **PGXC_GET_TABLE_SKEWNESS**, optimizing the calculation and reducing the output columns. For example:

```
SELECT schemaname,tablename,max(dnsize) AS maxsize, min(dnsize) AS minsize
FROM pg_catalog.pg_class c
INNER JOIN pg_catalog.pg_namespace n ON n.oid = c.relnamespace
INNER JOIN pg_catalog.table_distribution() s ON s.schemaname = n.nspname AND s.tablename = c.relname
INNER JOIN pg_catalog.pgxc_class x ON c.oid = x.pcrelid AND x.pclocatortype = 'H'
GROUP BY schemaname,tablename;
```

8.4 Best Practices for VACUUM

8.4.1 VACUUM Parameters

Table 8-4 VACUUM parameters

Name	Description	Default Value
track_counts	Specifies whether to enable the statistics collection function.	on
AutoVacuum	Specifies whether to enable the automatic cleanup function.	on
AutoVacuum_mode	Specifies whether Autoanalyze or AutoVacuum is enabled. This parameter is valid only when **AutoVacuum** is set to **on**.	mix
autovacuum_max_workers	Specifies the maximum number of working processes that can be automatically cleared.	3
autovacuum_naptime	Specifies the interval between two automatic vacuum operations.	10min
autovacuum_vacuum_cost_limit	Specifies the upper limit of the cost used in AutoVacuum.	1000
autovacuum_vacuum_cost_delay	Specifies the sleep time required if the cost exceeds the upper limit.	20ms
vacuum_freeze_min_age	Specifies the upper limit of tuple age. The tuple needs to be frozen if this upper limit is exceeded.	2000000000
autovacuum_freeze_max_age	Specifies the upper limit of table age. AutoVacuum needs to be forcibly started if this upper limit is exceeded.	4000000000

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Description	Default Value
vacuum_freeze_table_age	Specifies the upper limit of table age. The emergency mode needs to be executed if this upper limit is exceeded.	4000000000
autovacuum_vacuum_threshold	Specifies the threshold for AutoVacuum to perform VACUUM.	50
autovacuum_vacuum_scale_factor	Specifies the AutoVacuum factor, which is the scale factor for AutoVacuum to perform VACUUM.	0.2
autovacuum_analyze_threshold	Specifies the threshold for AutoVacuum to perform ANALYZE.	50
autovacuum_analyze_scale_factor	Specifies the autoanalyze factor, which is the scale factor for AutoVacuum to perform ANALYZE.	0.1

8.4.2 FAQ

8.4.2.1 Possible Causes of Data Table Bloat

To ensure the service performance of the database, the delete operation does not immediately release the space of historical version rows. Instead, the rows are marked as deleted. The space is then asynchronously reclaimed. If the recycling operation is blocked or a logic defect occurs, the deleted space cannot be reused, and the newly inserted rows continuously expand the file, leading to tablespace bloat. Space bloat may occur in database indexes, heap tables, and log files. In this section, the principle of heap tablespace bloat is discussed.

For Astore, the multi-version mechanism stores historical versions in the heap table to form a version chain. When a tuple is deleted or updated, the original tuple becomes a dead tuple. Recycling can be triggered only when the transaction ID of the operation transaction is less than **oldestxmin**. Therefore, Astore is prone to have space bloat issues.

Ustore uses the multi-version management mechanism to store historical versions in undo logs. The historical versions can be cleared after transactions are submitted. In addition, Ustore uses in-place update instead of the append update mode of Astore. The update operation does not cause heap tablespace bloat. Therefore, in frequent update scenarios, the space stability of Ustore is much better than that of Astore. However, this does not mean that Ustore is not subject to space bloat. Based on the backtracking and summary of historical problems, the main causes of heap tablespace bloat are classified into the following types:

1. A long transaction exists. As a result, **oldestxmin** is not properly updated. After a transaction is deleted and submitted, the space cannot be reused.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

2. The AUTOVACUUM cleanup is inefficient and cannot keep up with the rate at which dead tuples are generated.
3. FSM is incorrect or inaccurate.

8.4.2.1.1 oldestxmin Is Stuck Due to Long Transactions

Symptom

VACUUM of Astore can only clean up dead tuples that have been committed and whose transaction IDs are smaller than **oldestxmin**. If a long transaction is not committed for a long time, **oldestxmin** cannot be updated. As a result, AUTOVACUUM cannot reclaim dead tuples, causing Astore space bloat.

Fault Locating

To solve this problem, use the gs_txid_oldestxmin() view to query **oldestxmin** and use the txid_current() view to query the latest XID. Then, you can determine whether **oldestxmin** is stuck based on the difference between the two views.

```
select txid_current() as xid, gs_txid_oldestxmin() as oldestxmin, xid - oldestxmin as diff;
```

Example:

```
gaussdb=# select txid_current() as xid, gs_txid_oldestxmin() as oldestxmin, xid - oldestxmin as diff;
  xid   | oldestxmin | diff
--------+------------+------
 220790 |     220789 |    1
(1 row)
```

Generally, a difference of less than 10,000 between the two is considered normal. If the difference is too large, for example, several hundred thousand or even millions, long transactions exist in the system. You can use pg_stat_activity to obtain information about blocked transactions.

```
select 'elp:'|| now() - xact_start diff, query, datname, pid, usename, xact_start, enqueue, state, query_id,
query from pg_stat_activity where query not like 'WLM%' order by diff desc;
select * from pg_running_xacts;
```

Example:

```
gaussdb=# select 'elp:'|| now() - xact_start diff, query, datname, pid, usename, xact_start, enqueue, state,
query_id, query from pg_stat_activity where query not like 'WLM%' and state='active' order by diff desc;
    diff     |                                                
```

```
    0 |
 elp:         |
                                                | postgres | 140124852582144 | postgres |
|         | active |
    0 |
 elp:         |
                                                | postgres | 140124747724544 | postgres |
|         | active |
    0 |
 elp:         |
                                                | postgres | 140124232349440 | postgres |
|         | active |
    0 |
(6 rows)

gaussdb=# select * from pg_running_xacts where pid=140125682005760;
 handle |  gxid  | state |  node  | xmin | vacuum | timeline | prepare_xid |       pid       | next_xid | dbid
--------+--------+-------+--------+------+--------+----------+-------------+-----------------+----------+-------
     -1 | 220796 | 0     | sgnode |    0 | f      |       11 |           0 | 140125682005760 |        0 | 12912
(1 row)
```

In addition, logical replication slots may also block the update of **oldestxmin**. You can check the replication slot information as follows:

```
select * from pg_get_replication_slots();
```

Example:

```
gaussdb=# select * from pg_get_replication_slots();
 slot_name | plugin | slot_type | datoid | active | xmin | catalog_xmin | restart_lsn | dummy_standby |
confirmed_flush | confirmed_csn | dictionary_csn_min | slo
t_dictionary_type
-----------+--------+-----------+--------+--------+------+--------------+-------------+---------------+-----------------
+---------------+--------------------+----
------------------
 dn_6003   |        | physical  |      0 | t      |      |              | 0/15E52890  | f             |               |
|                 |
 dn_6002   |        | physical  |      0 | t      |      |              | 0/15E52890  | f             |               |
|                 |
(2 rows)
```

Workarounds

After identifying the active thread that blocks the update of **oldestxmin**, terminate the corresponding thread.

8.4.2.1.2 AUTOVACUUM Cleanup Efficiency Is Low

Symptom

AUTOVACUUM requires a large number of I/O operations during cleanup. AUTOVACUUM has its own I/O control mechanism. It reduces the impact of AUTOVACUUM threads on services by controlling the number of page accesses per unit of time. This I/O control mechanism greatly affects the efficiency of VACUUM in large table and large-capacity scenarios.

Fault Locating

For details about how to estimate the cleanup efficiency, see **How Do I Estimate the VACUUM Cleanup Rate or How Long It Will Take?**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Workarounds

If AUTOVACUUM cleanup is slow and cannot keep up with the generation of dead rows, dead rows are stacked continuously. In this case, perform the following operations:

1. Modify the AUTOVACUUM parameter: When the system I/O resources are sufficient, you can reduce the value of **autovacuum_vacuum_cost_delay** to speed up the VACUUM cleanup. The default value of this parameter is **20ms**. That is, a forced sleep is triggered when about 20 to 50 pages are scanned, and the duration of each sleep is 20 ms. You are advised to set this parameter to **1ms** to improve the cleanup efficiency of background threads.
2. Perform VACUUM manually: If dead rows cannot be reclaimed immediately after the parameter is modified, you can use the view to identify tables with a large number of dead rows and manually perform VACUUM on those tables. Manual execution of VACUUM is not subject to I/O control. Therefore, dead rows can be cleaned up efficiently.

8.4.2.1.3 FSM Is Damaged

Symptom

FSM is a mechanism used to maintain free space of data pages. Each FSM entry uses 8 bits to describe the free space of a page. The allocation of all data pages and space management depend on the accuracy of this mechanism. If FSM is inaccurate, free pages may fail to be obtained, triggering the page extension logic.

Fault Locating

In GaussDB 505.2, the spatial accuracy analysis view is introduced. Such problems can be quickly analyzed and located.

Workarounds

Perform VACUUM manually to rebuild FSM of the target table and quickly restore the FSM accuracy.

8.4.2.2 How Do I Estimate the Current Table or Database Space Bloat Ratio?

- Method 1: If possible, use INSERT INTO SELECT to fully import data from the old table to the new table. Estimate the space bloat ratio based on the sizes of the old and new tables. For example:

```
gaussdb=# create table t4(like t3);
CREATE TABLE
gaussdb=# insert into t4 select * from t3;
INSERT 0 85376
gaussdb=# select pg_table_size('t3'::regclass) / pg_table_size('t4'::regclass);
    ?column?
------------------
 7.87027797576622
(1 row)
```

- Method 2: Run the **\d** command to view the table structure, estimate the average length of tuples, and multiply the average length by the number of active tuples to estimate the space occupied by the tables. Bloat ratio ≈ Table size/(Number of active rows × Average length of a single row) Average length

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

of a single row ≈ Sum of lengths of all columns + Row pointer length (4 bytes) + tuple header length (24 bytes) You can use COUNT(*) or the pg_stat_get_live_tuples function to obtain the number of active rows.

For example:

```
gaussdb=# select pg_table_size('t3'::regclass);
 pg_table_size
---------------
      90456064
(1 row)
gaussdb=# \d t3;
          Table "public.t3"
 Column |      Type      | Modifiers
--------+----------------+-----------
 a      | integer        |
 b      | character(100) |

gaussdb=# select count(1) from t3;
 count
-------
 85376
(1 row)
```

In the preceding example, the total length of all columns is 104 bytes (100 bytes + 4 bytes), the number of valid rows is 85,376, and the valid space is approximately 85376 × (104 + 4 + 24) = 11269632. Bloat ratio ≈ 90456064/11269632 = 8, that is, the space has bloated by nine times, which is approximately equal to the result of method 1.

8.4.2.3 How Do I Evaluate Whether the Current Table or Database Requires VACUUM?

GaussDB provides the system function pg_autovac_status to query whether a table has reached the VACUUM threshold. Combined with the pg_class system catalog, you can query the top *N* tables with the highest dead row rates. For example, the following SQL statement queries the top 10 tables with the highest dead row rates:

```
SELECT
C.oid AS relid,
N.nspname AS schemaname,
C.relname AS relname,
C.reltuples AS n_rel_tup,
pg_catalog.pg_stat_get_dead_tuples(C.oid) AS n_dead_tup,
pg_catalog.pg_autovac_status(C.oid).doVacuum as need_Vacuum,
CAST(n_dead_tup / C.reltuples AS decimal(10, 2)) AS dead_radio
FROM pg_class C LEFT JOIN
pg_index I ON C.oid = I.indrelid
LEFT JOIN pg_namespace N ON (N.oid = C.relnamespace)
WHERE C.relkind IN ('r') and C.reltuples > 0
GROUP BY C.oid, N.nspname, C.relname, C.reltuples, need_Vacuum
order by dead_radio desc limit 10;
```

The command output is as follows:

```
 relid | schemaname |          relname          | n_rel_tup | n_dead_tup | need_vacuum | dead_radio
-------+------------+---------------------------+-----------+------------+-------------+------------
  2604 | pg_catalog | pg_attrdef                |         1 |         14 |             |      14.00
  2606 | pg_catalog | pg_constraint             |        12 |         15 |             |       1.25
  3118 | pg_catalog | pg_foreign_table          |         2 |          2 |             |       1.00
  3079 | pg_catalog | pg_extension              |        24 |         15 |             |        .63
  2601 | pg_catalog | pg_am                     |        11 |          4 |             |        .36
  1417 | pg_catalog | pg_foreign_server         |         4 |          1 |             |        .25
  2610 | pg_catalog | pg_index                  |       421 |         82 |             |        .19
  2328 | pg_catalog | pg_foreign_data_wrapper   |         6 |          1 |             |        .17
```

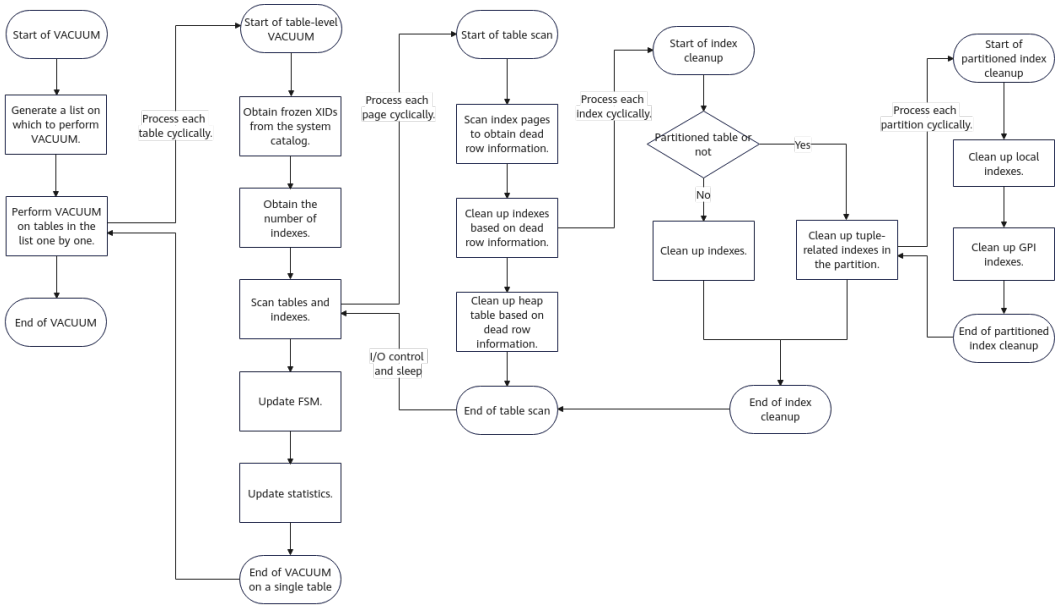
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 2619 | pg_catalog | pg_statistic           |      1231 |       187 |           |       .15
 2609 | pg_catalog | pg_description         |      4748 |        25 |           |       .01
(10 rows)
```

8.4.2.4 How Do I Estimate the VACUUM Cleanup Rate or How Long It Will Take?

The execution of AUTOVACUUM is divided into several steps. The execution duration of each step is different. The following figure shows the simplified process.

Figure 8-3 VACUUM process



As shown in the preceding figure, the time required to perform VACUUM on a single table is related to the number of table pages, number of index pages, number of global indexes, number of partitions, and I/O control time.

The formula for estimating the speed of VACUUM on a single table is as follows:

- Non-partitioned tables

  Number of pages = Number of data pages + Number of index pages

  Cleanup time = Number of pages × Cleanup duration + Number of pages/Evaluation cost × Sleep time

  Cleanup speed = Total number of dead rows/Cleanup time

- Partitioned Table

  Number of pages = Number of data pages + Number of ordinary index pages + (Total number of global index pages) × Number of partitions

  Cleanup time = Number of pages × Cleanup duration + Number of pages/Evaluation cost × Sleep time

  Cleanup speed = Total number of dead rows/Cleanup time

You can run the following SQL statement to evaluate the speed of VACUUM on a single table:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Non-partitioned table

```
select
((heap_pages * prune_time) + (index_pages * prune_time) * nindexs + ((heap_pages+index_pages) *
hit_percent * Vacuum_cost_page_hit + (heap_pages+index_pages) * miss_percent *
Vacuum_cost_page_miss + (heap_pages+index_pages) * dirty_percent * Vacuum_cost_page_dirty) *
Vacuum_cost_delay / Vacuum_cost_limit) as totaltime, deadtuples/totaltime as speed
from
(select relpages as heap_pages,  b.n_dead_tup as deadtuples, b.n_dead_tup/(reltuples+b.n_dead_tup
+1) as dirty_percent from pg_class a, pg_stat_all_tables b where a.relname = 't1' and b.relname =
a.relname) as abc , (select sum(relpages) as index_pages, count(*) as nindexs from pg_class where
relname in (select indexname from pg_indexes where tablename = 't1') and relkind = 'i') as bcd ,
(select 0.07 as prune_time, 0.05 as miss_percent , 0.95 as hit_percent , 1 as Vacuum_cost_page_hit,10
as Vacuum_cost_page_miss , 200 as Vacuum_cost_limit ,20 as Vacuum_cost_delay , 20 as
Vacuum_cost_page_dirty);
```

- Partitioned table

```
select
((heap_pages * prune_time) + (local_index_pages * prune_time) * nlocalindexs + (gpi_index_pages *
prune_time) * npartitions * ngpiindexs + ((heap_pages + local_index_pages + gpi_index_pages) *
hit_percent * Vacuum_cost_page_hit + (heap_pages + local_index_pages + gpi_index_pages) *
miss_percent * Vacuum_cost_page_miss + (heap_pages + local_index_pages + gpi_index_pages) *
dirty_percent * Vacuum_cost_page_dirty) * Vacuum_cost_delay / Vacuum_cost_limit) as total_time,
 dead_tuples/total_time as speed
 from
 (select relpages as heap_pages, b.n_dead_tup as dead_tuples, b.n_dead_tup/(reltuples+b.n_dead_tup
+1) as dirty_percent from pg_class a, pg_stat_all_tables b where a.relname = 't1' and b.relname =
a.relname) as abc ,
 (select sum(relpages) as local_index_pages,
 count(*) as nlocalindexs
 from
 pg_class where oid in (select indexrelid from pg_index where indrelid=(select oid from pg_class where
relname = 't1')) and relkind='i') as bcd , (select sum(relpages) as gpi_index_pages, count(*) as
ngpiindexs  from pg_class where oid in (select indexrelid from pg_index where indrelid=(select oid
from pg_class where relname = 't1')) and relkind='I') as fenqu , (select count(*) as npartitions from
pg_partition where parentid in (select oid from pg_class where relname = 't1'))as qqq ,(select 0.07 as
prune_time, 0.05 as miss_percent , 0.95 as hit_percent , 1 as Vacuum_cost_page_hit,10 as
Vacuum_cost_page_miss , 200 as Vacuum_cost_limit ,20 as Vacuum_cost_delay , 20 as
Vacuum_cost_page_dirty) as yyy;
```

NOTE

1. In the formula, **prune_time** indicates the time required for cleaning up a tuple. The value is related to the hardware I/O capability. For SSDs, the value is around 0.07 ms. For NVMe SSDs with higher I/O capabilities, set this parameter to a smaller value. For HDDs with lower I/O capabilities, set this parameter to a larger value.
2. **miss_percent** and **hit_percent** indicate the cache hit and miss rates. In scenarios right after data import, the cache hit rate is relatively low. After the system becomes stable, the miss rate is around 0.5 and the hit rate is around 0.95.
3. The value of **vacuum_cost_delay** is the same as the value of the GUC parameter **autovacuum_vacuum_cost_delay**.

In addition, the following progress analysis view is introduced in the current version to obtain the AUTOVACUUM progress and efficiency.

```
gaussdb=# select * from gs_stat_progress_vacuum(140123447490304);
       pid       | dataname | relid | relname |      phase      |
         detail
-----------------+----------+-------+---------+---------------
+-----------------------------------------------------------------------------------------------
-----------------------------------------------------------------------------------------------------------------------
 140123447490304 | postgres | 24602 | t1      | scanning heap | vacuum db "postgres" starts at 2025-02-09
14:10:17.863838-05, vacuumed 12/242 relations, current r
elation "t1"; heap: scanned 55298/73216 blocks, skipped 0 blocks; info: found 0 dead tuples, already run
610s, delay 608s.
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.4.2.5 How Do I Locate Inaccurate Statistics Such as Number of Dead Rows in the Database?

You can use ANALYZE to update the statistics. If there is a significant difference in dead row data before and after the execution of ANALYZE, it indicates that the statistics are inaccurate. Note that ANALYZE is performed based on sampling. Therefore, there is a certain error. When a large number of empty pages exist in the table, the accuracy of statistics by sampling may be affected. In this case, you can use the gs_parse_page_bypath tool mentioned in the preceding to increase the sampling ratio to parse the pages more accurately and calculate the number of dead rows.

8.5 Best Practices for Import and Export Using COPY

The **COPY** syntax is a useful tool for exporting data from GaussDB to data files in CSV, BINARY, FIXED, or TEXT format. It can also import data from the four types of files to a specified table.

8.5.1 Typical Scenarios

Preparations

During import or export using COPY, the database requires file read/write permissions on the server. To grant these permissions, enable the GUC parameter **enable_copy_server_files**.

```
gs_guc reload -I all -N all -Z datanode -Z coordinator -c "enable_copy_server_files=on"
```

NOTICE

- Parameters in the COPY command must match the actual data in files, including the format, delimiter, newline character, and character set.
- If the specified client-side encoding matches the server-side encoding, the COPY command preserves the binary form of data during import and export, preventing any structural damage that may result from transcoding. This mechanism guarantees the integrity and originality of data migration, making it suitable for scenarios that demand absolute fidelity.

8.5.1.1 Using the Recommended CSV Format

In **CSV format**, each file is divided into multiple records using newline characters. Each record is further split into multiple fields using **delimiters**, which are commas (',') by default. Each field can be enclosed within a pair of **quote characters**, which are double quotation marks ('"') by default. This eliminates the need to escape special characters such as EOL characters and delimiters within the field content. Furthermore, CSV is a widely recognized standard with exceptional cross-platform compatibility and cross-industry universality, solidifying its position as the top recommended format.

Export command:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
COPY {data_source} TO '/path/export.csv' delimiter ',' quote '"' escape '"' ENCODING {server_encoding} CSV;
```

Import command:

```
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during file export.
COPY {data_destination} FROM '/path/export.csv' delimiter ',' quote '"' escape '"' ENCODING {file_encoding}
CSV;
```

NOTICE

To import a manually created CSV data file into the database, ensure that the file complies with CSV standards. Additionally, specify the correct parameters, including delimiters, quote characters, and EOL characters, in the COPY command.

Examples

Step 1 Prepare data.

```
gaussdb=# CREATE DATABASE db1 ENCODING='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' DBCOMPATIBILITY = 'ORA';
CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# CREATE TABLE test_copy(id int, name text);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'id' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
db1=# INSERT INTO test_copy VALUES(1, 'aaa');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(2, e'bb\nb');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(3, e'cc\tc');
INSERT 0 1
db1=# INSERT INTO test_copy(name) VALUES('ddd');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(5, e'ee\\e');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(6, ',');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(7, '"');
INSERT 0 1

db1=#  SELECT * FROM test_copy;
 id |   name
----+-----------
  1 | aaa
  2 | bb       +
    | b
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(7 rows)
```

Step 2 Export data from the entire table.

```
db1=# COPY test_copy TO '/home/xy/test.csv'
   DELIMITER ','
   QUOTE '"'
   ESCAPE '"'
   ENCODING 'UTF-8'
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    CSV;
COPY 7
```

The content of the exported CSV file is as follows:

```
1,aaa
2,"bb
b"
3,cc    c
,ddd
5,ee\e
6,","
7,""""""
```

Step 3 Import data.

```
db1=# TRUNCATE test_copy;
TRUNCATE TABLE

db1=# COPY test_copy FROM '/home/xy/test.csv'
    DELIMITER ','
    QUOTE '"'
    ESCAPE '"'
    ENCODING 'UTF-8'
    CSV;
COPY 7
```

Step 4 (Custom data set export) Export the **name** column for all rows in **test_copy**, excluding those with an empty ID.

```
db1=# COPY (SELECT name FROM test_copy WHERE id IS NOT NULL)
    TO '/home/xy/test.csv'
    DELIMITER ','
    QUOTE '"'
    ESCAPE '"'
    ENCODING 'UTF-8'
    CSV;
COPY 6
```

The content of the exported CSV file is as follows:

```
aaa
"bb
b"
cc    c
ee\e
","
""""""
```

----End

8.5.1.2 Importing and Exporting Data with Extreme Performance

When there are strict demands for data import and export performance, and the import and export occur between clusters of the same version, you can use the **BINARY** format to read and store data as binary numbers other than regular text. Although this format provides performance advantages over others, it comes with the following limitations:

1. The BINARY format is specific to GaussDB, making it non-portable. It is advisable to use this format only for importing and exporting data between databases of the same version.
2. The BINARY format is tightly coupled with specific data types. For example, while the TEXT format allows exporting data from a smallint field and importing it into an integer column, this is not possible with the BINARY format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

3. Certain data types cannot be imported or exported using the BINARY format. For details, see **BINARY limitations**.

Export command:

```
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
SET client_encoding = '{server_encoding}';
COPY {data_source} TO '/path/export.bin' binary;
```

Import command:

```
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
SET client_encoding = '{file_encoding}';
COPY {data_destination} FROM '/path/export.bin' binary;
```

NOTICE

Before choosing the BINARY format, carefully review its limitations. Use it to enhance import and export performance only when you are completely certain that these limitations will not impact the data to be exported.

Examples

Step 1 Prepare data.

```
gaussdb=# REATE DATABASE db1 ENCODING='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' DBCOMPATIBILITY = 'ORA';CREATE DATABASE
gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".

db1=# CREATE TABLE test_copy(id int, name text);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'id' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

db1=# INSERT INTO test_copy VALUES(1, 'aaa');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(3, e'cc\tc');
INSERT 0 1
db1=# INSERT INTO test_copy(name) VALUES('ddd');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(5, e'ee\\e');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(6, ',');
INSERT 0 1
db1=# INSERT into TEST_COPY VALUES(7, '"');
INSERT 0 1

db1=# SELECT * FROM test_copy;
 id |   name
----+-----------
  1 | aaa
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(6 rows)
```

Step 2 Export data.

```
db1=# SET client_encoding = 'UTF-8';
SET
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
db1=# COPY test_copy TO '/home/xy/test.bin' BINARY;
COPY 6
```

Step 3 Import data.

```
db1=# TRUNCATE test_copy;
TRUNCATE TABLE

db1=# SET client_encoding = 'UTF-8';
SET
db1=# COPY test_copy FROM '/home/xy/test.bin' BINARY;
COPY 6
```

----End

8.5.1.3 Exporting Files for Manual Parsing

The FIXED format maintains a fixed data structure to simplify file parsing: Each row represents a record, and within each row, the starting offset and length of each field value are fixed. Therefore, it is advisable to utilize the FIXED format when you need to manually parse a data file exported from the database. Despite this, the FIXED format has its limitations, as detailed in **FIXED description**.

Export command:

```
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
-- col1_name(col1_offset, col1_length) indicates that the data named col1_name in each row of the data file starts at the position with an offset of col1_offset and extends for a length of col1_length.
COPY {data_source} FROM '/path/export.fixed' encoding {server_encoding} FIXED
FORMATTER(col1_name(col1_offset, col1_length), col2_name(col2_offset, col2_length));
```

Import command:

```
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during file export.
-- col1_name(col1_offset, col1_length) indicates that the data named col1_name in each row of the data file starts at the position with an offset of col1_offset and extends for a length of col1_length.
COPY {data_destination} FROM '/path/export.fixed' ENCODING {file_encoding} FIXED
FORMATTER(col1_name(col1_offset, col1_length), col2_name(col2_offset, col2_length));
```

NOTICE

The fixed column width format has limitations: It requires maintaining a relatively uniform width for each column in the table, allowing for the selection of an appropriate fixed **col_length** to prevent data truncation and eliminate unnecessary spaces in all columns. In cases where column widths vary significantly or change dynamically, it is advisable to prioritize flexible formats such as TEXT or CSV to ensure data integrity and efficient use of storage space.

Examples

Step 1 Prepare data.

```
gaussdb=# CREATE DATABASE db1 ENCODING='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' DBCOMPATIBILITY = 'ORA';
CREATE DATABASE

gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".
db1=# CREATE TABLE test_copy(id int, name text);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'id' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

db1=# INSERT INTO test_copy VALUES(1, 'aaa');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(2, 'bb"b');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(3, 'cc  c');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES('', e'dd\td');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES('5', e'ee\e');
INSERT 0 1

db1=# SELECT * FROM test_copy;
 id |   name
----+-----------
  1 | aaa
  2 | bb"b
  3 | cc  c
    | dd      d
  5 | eee
(5 rows)
```

Step 2 Export data.

```
db1=# COPY test_copy TO '/home/xy/test.fixed' encoding 'UTF-8' FIXED FORMATTER(id(0,1), name(1,5));
COPY 5
```

The content of the exported data file is as follows:

```
1  aaa
2 bb"b
3cc  c
  dd    d
5  eee
```

Step 3 Import data.

```
db1=# TRUNCATE test_copy;
TRUNCATE TABLE
db1=# COPY test_copy FROM '/home/xy/test.fixed' ENCODING 'UTF-8' FIXED FORMATTER(id(0,1),
name(1,5));
COPY 5
```

----End

8.5.1.4 Importing and Exporting Data When Only the TEXT Format Is Available

In TEXT format, each file is divided into multiple records using **EOL characters**. Each record is further split into multiple fields using **delimiters**, which are tab characters ('\t') by default.

Using the TEXT format in GaussDB necessitates special logic, for example:

- The backspace (0x08), form-feed (0x0C), newline (0x0A), carriage return (0x0D), horizontal tab (0x09), and vertical tab (0x0B) characters are escaped as **'\b'**, **'\f'**, **'\n'**, **'\r'**, **'\t'**, and **'\v'**, respectively.
- By default, the EOL character is configured as the first identified **'\n'**, **'\r'**, or **'\r\n'** during import, and as **'\n'** during export.
- A single backslash is escaped as double backslashes.
- NULL values are escaped as **'\N'**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Exporting Data from and Importing Data into GaussDB

Recommended export command:

```
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
COPY {data_source} TO '/path/export.txt' eol e'\n' delimiter e'\t' ENCODING '{server_encoding}';
```

Corresponding import command:

```
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
COPY {data_destination} FROM '/path/export.txt' eol e'\n' delimiter e'\t' ENCODING '{file_encoding}';
```

Example:

Step 1 Prepare data.

```
gaussdb=# CREATE DATABASE db1 ENCODING='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE
='en_US.UTF-8' DBCOMPATIBILITY = 'ORA';
CREATE DATABASE

gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".

db1=# create table test_copy(id int, name text);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'id' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

db1=# INSERT INTO test_copy VALUES(1, 'aaa');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(3, e'cc\tc');
INSERT 0 1
db1=# INSERT INTO test_copy(name) VALUES('ddd');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(5, e'ee\\e');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(6, e',');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(7, e'"');
INSERT 0 1

db1=# SELECT * FROM test_copy;
 id |   name
----+-----------
  1 | aaa
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(6 rows)
```

Step 2 Export data.

```
db1=# COPY test_copy TO '/home/xy/test.txt' EOL e'\n' DELIMITER e'\t' ENCODING 'UTF-8';
COPY 6
```

Step 3 Import data.

```
db1=# TRUNCATE test_copy;
TRUNCATE TABLE
db1=# COPY test_copy FROM '/home/xy/test.txt' EOL e'\n' DELIMITER e'\t' ENCODING 'UTF-8';
COPY 6
```

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Exporting Data Files from GaussDB for Manual Parsing

In this scenario, you will not want the exported TEXT files to exhibit any escape behavior specific to GaussDB. Follow these steps:

- Check for EOL characters or delimiters in the field data.
- If they exist, modify the **EOL** or **delimiter** parameter to use other characters that do not appear in the field data. It is advisable to select from invisible characters (0x01 to 0x1F) for this purpose.
- You can use the **NULL** option to specify how NULL values should be represented during export.
- Finally, include the **without escaping** parameter to prevent escaping in the output.

Export command:

```
-- data_source can be a table name or a SELECT statement.
-- server_encoding can be obtained using SHOW server_encoding.
COPY {data_source} TO '/path/export.txt' WITHOUT escaping COL e'\x1E' DELIMITER e'\x1F' NULL '\N'
ENCODING '{server_encoding}';
```

NOTICE

The primary function of the escaping mechanism is to prevent special characters (such as delimiters and newline characters) in fields from damaging the file structure. When choosing to disable the escaping mechanism, be sure to isolate special characters by carefully choosing delimiters and newline characters for non-escaping scenarios and ensuring that these characters are absent in the data content. This is essential for non-escaped file parsing, as any character conflicts can lead to data parsing failure or structural disorder.

Example:

Step 1 Prepare data.

```
gaussdb=# CREATE DATABASE db1 encoding='UTF-8' LC_COLLATE='en_US.UTF-8' LC_CTYPE ='en_US.UTF-8'
dbcompatibility = 'ORA';
CREATE DATABASE

gaussdb=# \c db1
Non-SSL connection (SSL connection is recommended when requiring high-security)
You are now connected to database "db1" as user "omm".

db1=# CREATE TABLE test_copy(id int, name text);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'id' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

db1=# INSERT INTO test_copy VALUES(1, 'aaa');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(3, e'cc\tc');
INSERT 0 1
db1=# INSERT INTO test_copy(name) VALUES('ddd');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(5, e'ee\\e');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(6, e',');
INSERT 0 1
db1=# INSERT INTO test_copy VALUES(7, e'"');
INSERT 0 1
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
db1=# SELECT * FROM test_copy;
 id |   name
----+-----------
  1 | aaa
  3 | cc      c
    | ddd
  5 | ee\e
  6 | ,
  7 | "
(6 rows)
```

Step 2 Export data.

```
db1=# COPY test_copy TO '/home/xy/test.txt' WITHOUT ESCAPING EOL e'\x1E' DELIMITER e'\x1F' NULL '\N' ENCODING 'UTF-8';
COPY 6
```

Step 3 Read data. In this step, data is first split into rows based on the selected EOL character (0x1E). Then each row of data stream is further divided based on the delimiter (0x1F) to extract the field values within each row.

----End

Importing User-Created Data Files into GaussDB

If you only have raw field data without a complete data file, you can create a data file manually. To minimize the need for extensive modifications—such as escaping or other special character processing—it is advisable to use the TEXT format. When creating a data file in TEXT format, you can select custom delimiters and EOL characters to ensure accurate data import.

Step 1 Select an EOL character. If the field data contains 0x0A, do not use 0x0A as the EOL character. Otherwise, newlines within the field data will be misinterpreted as EOL characters, resulting in a single line of data being split into two. To prevent this issue, ensure that the selected EOL character is not present in the field data. For instance, consider using 0x1E as the EOL character since it is not found in the field data. It is advisable to select from invisible characters (0x01 to 0x1F) for this purpose.

Step 2 Select a delimiter. If the field data contains tab characters, do not use them as delimiters. Otherwise, tabs within the field data will be misinterpreted as delimiters, resulting in a single field being split into two. To prevent this issue, ensure that the selected delimiter is not present in the field data. For instance, consider using 0x1F as the delimiter since it is not found in the field data. It is advisable to select from invisible characters (0x01 to 0x1F) for this purpose.

Step 3 Build data. Create a data file using the EOL character and delimiter selected in steps 1 and 2. Check the character set of the server. You need to generate a data file that matches the server's character set.

Step 4 Import data. In this example, the character set of the data file is UTF-8.

```
db1=# COPY test_copy TO '/home/xy/test.txt' WITHOUT ESCAPING EOL e'\x1E' DELIMITER e'\x1F' NULL '\N' ENCODING 'UTF-8';
COPY 6
```

----End

8.5.1.5 Importing and Exporting Data Files on a GSQL Client

When you execute the COPY command to export data on a GSQL client, the generated data files are saved on the database server by default. This can make it

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

difficult for users to access the files. To offer easier file access, the \COPY command directly generates data files on the local client.

Differences Between COPY and \COPY

1. File location: The files generated and read during COPY import are located on the server. Conversely, in \COPY import, both the generated and read files are located on the client.
2. Performance: To complete \COPY import, the client must read file streams and transmit them to the server. This results in decreased performance in comparison to COPY.
3. Function: Compared to COPY, \COPY offers an additional capability—parallel import on clients. For detailed specifications, consult "Database Connection Tools > gsql for Connecting to a Database > Meta-Command Reference" in *Tool Reference*.

Example \COPY Commands

The difference between the export commands of \COPY and COPY is that **COPY** is replaced by **\COPY**. Below is a simple example of converting CSV export commands from **COPY** to their **\COPY** equivalents:

```
-- COPY commands
COPY {data_source} to '/path/export.csv' encoding {server_encoding} csv;
COPY {data_source} from '/path/export.csv' encoding {server_encoding} csv;

-- Corresponding \COPY commands
\COPY {data_source} to '/path/export.csv' encoding {server_encoding} csv;
\COPY {data_source} from '/path/export.csv' encoding {server_encoding} csv;
```

Example Commands for Parallel Import

```
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
-- parallel_num indicates the number of clients for data import. When there are sufficient cluster resources, it is advisable to set it to 8.

-- Command for import in CSV format
\COPY {data_destination} FROM '/path/export.txt' ENCODING {file_encoding} PARALLEL {parallel_num} CSV;

-- Command for import in FIXED format
\COPY {data_destination} FROM '/path/export.txt' ENCODING {file_encoding} PARALLEL {parallel_num} FIXED;

-- Command for import in TEXT format
\COPY {data_destination} FROM '/path/export.txt' ENCODING {file_encoding} PARALLEL {parallel_num};
```

8.5.1.6 Importing and Exporting Data Through the JDBC Driver

In the presence of the JDBC driver, you can call its CopyManager APIs to implement data import and export. CopyManager can import data into tables and export data from databases in batches.

8.5.1.7 Importing Erroneous Data Through Error Tolerance

Both the COPY and \COPY commands will halt the data import process upon detecting any data exceptions. To overcome this limitation, GaussDB provides two error tolerance modes: intelligent correction mode and strict verification mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The strict verification mode (Level 1 error tolerance) is preferred because it can skip abnormal records, maintaining data integrity and minimizing the impact on import performance. For details, see **Guide to Importing Erroneous Data**.

Below are import commands executed in strict verification mode (Level1 error tolerance):

```
-- CSV format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding
{file_encoding} CSV;
-- BINARY format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding
{file_encoding} BINARY;
-- FIXED format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding
{file_encoding} FIXED;
-- TEXT format
\COPY {data_destination} from '/path/export.txt' log errors reject limit '{limit_num}' encoding
{file_encoding};
-- data_destination can only be a table name.
-- file_encoding indicates the encoding format used during binary file export.
-- limit_num specifies the maximum number of erroneous rows that the COPY FROM statement can
tolerate during data import. If this limit is exceeded, errors will be reported as usual according to the
original mechanism.
```

NOTICE

To use the error tolerance feature, regular users require permissions on the two system catalogs of the feature. Execute the following SQL statements to grant them these permissions:

```
GRANT INSERT,SELECT,DELETE ON Pgxc_copy_error_log TO {user_name};
GRANT INSERT,SELECT,DELETE ON gs_copy_summary TO {user_name};
```

8.5.2 Guide to Exporting Erroneous Data

Data errors during export typically occur when character strings or binary data that does not match the server-side encoding is inserted into the database. To address this, you are advised to keep the client-side encoding consistent with the server-side encoding, eliminating the need for validity checks against the server-side encoding and data transcoding.

Encoding Consistency Principle During Export

1. When the client-side encoding is consistent with the server-side encoding:
   - Native data is exported.
   - Data integrity and originality are guaranteed.
   - Character set conversion is not required.
2. When the client-side encoding is inconsistent with the server-side encoding:
   - The client-side encoding is employed as the target encoding standard for the exported files.
   - The kernel first checks existing data against the server-side encoding. Upon detecting any data encoded in an illegal format, it will report an error.
   - The kernel then proceeds to transcode the data. If it encounters any characters that cannot be transcoded (due to code bits present in the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

source character set but not in the target character set), it will report an error.

Solutions to Illegal Encoding

If your database contains any data encoded in an illegal format and you wish to export the data without triggering an error, consider the following methods:

Preferred method: Keep the client-side encoding consistent with the server-side encoding. Then export data using the server-side encoding without performing any transcoding.

Step 1 Query the database server-side encoding.

```
gaussdb=# SHOW server_encoding;
```

Step 2 Query the database client-side encoding.

```
gaussdb=# SHOW client_encoding;
```

Step 3 Keep the client-side encoding consistent with the server-side encoding.

```
gaussdb=# SET client_encoding = '{server_encoding}';
```

Step 4 Execute COPY to export data to a file in standard CSV format.

```
gaussdb=# COPY test_copy TO '/data/test_copy.csv' CSV;
```

----End

Alternative solution: Use placeholders ('?') to replace any bytes encoded in an illegal format. This solution depends on the transcoding capability of the database kernel and will alter the content of the exported data.

Step 1 Query the database server-side encoding.

```
gaussdb=# SHOW server_encoding;
```

Step 2 Set the database client-side encoding as the target encoding.

```
gaussdb=# SET client_encoding = {target_encoding};
```

Step 3 Leverage the kernel's transcoding capability to replace any bytes encoded in an illegal format while exporting data.

```
gaussdb=# COPY test_copy TO '/data/test_copy.csv' CSV COMPATIBLE_ILLEGAL_CHARS;
```

----End

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- Consider enabling the **COMPATIBLE_ILLEGAL_CHARS** parameter to correct any exported data encoded in an illegal format during export, while keeping the data in the database unchanged. Kindly use this parameter as necessary.
- When enabled, the **COMPATIBLE_ILLEGAL_CHARS** parameter:
  - Replaces illegal characters with the ones specified in the **convert_illegal_char_mode** parameter. The default replacement character is **'?'** (U+003F).
  - Replaces zero characters (U+0000) with spaces (U+0020). If you do not need this replacement, configure the zero-character function in different compatible modes.
- For detailed constraints on the **COMPATIBLE_ILLEGAL_CHAR....** parameter, refer to the COPY syntax section.

8.5.3 Guide to Importing Erroneous Data

The error tolerance mechanism during data import provides two modes.

Intelligent Correction Mode (Adaptive Import)

- Principle: Prioritize data integrity and leverage intelligent correction to ensure that the highest possible volume of accurate data is imported.
- Scenario: Apply this mode when the imported data contains column count exceptions (extra columns) or character exceptions.
- Procedure:
  a. Rectify the column count exceptions by truncating extra columns.
  b. Transcode the character sets and clean illegal characters.
  c. Write all data into the target database.
- Output: corrected data set, along with logs recorded by GaussDB for character exceptions

Strict Verification Mode (Precise Import)

- Principle: Prioritize data accuracy and enforce strict compliance when importing data into the database.
- Scenario: Apply this mode in fields that demand strict data accuracy, particularly for sensitive data like medical records and financial transactions. This mode helps alleviate concerns about intelligent correction potentially compromising data accuracy.
- Procedure:
  a. Conduct a series of verifications at multiple levels (column count exceptions, character exceptions, data type conversion exceptions, and constraint conflicts).
  b. Generate an error diagnosis report (which includes row numbers, error types, and error data).
  c. Create an erroneous data isolation area.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

d. Only import the original data that successfully passes these verifications into the database.

- Output: pure data set and error details report (further details available in gs_copy_error_log and gs_copy_summary)
- Error tolerance level: applies to all the exceptions processed by the intelligent correction mode, including extra, missing, or deprecated columns, data type conversion errors, overlong columns, and transcoding exceptions. The process is as follows:

```
-- When the number of data type errors during data import does not exceed 100, no error will be reported, and GaussDB will proceed to the next row. However, if the number exceeds 100, an error will be reported. The details and row number of the erroneous data will be recorded in the gs_copy_error_log table.
gaussdb=# COPY test_copy FROM '/home/omm/temp/test.csv' log errors reject LIMIT '100' CSV;
-- In comparison to the previous statement, the next one includes an additional action: recording all data from the erroneous row in gs_copy_error_log. This action is recommended when there is no risk to data security. Note that SYSADMIN permissions are required.
gaussdb=# copy test_copy from '/home/omm/temp/test.csv' log errors data reject limit '100' csv;
```

Conclusion

To optimize data import processes, you can combine the intelligent correction mode with the strict verification mode, with the intelligent correction mode taking priority. When intelligent correction is enabled during a COPY import and it corrects a data item, strict verification will not be triggered for that specific row. Consequently, the error table will not record relevant data, nor will it update **reject limit**. Before importing data, carefully evaluate whether to automatically correct column and character exceptions or discard them, depending on specific requirements.

8.6 Best Practices for Import and Export Using Tools

8.6.1 Instance-level Import and Export

gs_dumpall can be used to logically back up database instances and export data of all databases in an instance, including data in the default database, data in user-defined databases, and definitions of global objects shared by all databases.

For details about how to use the gs_dumpall tool, see "Data Import and Export Tools > gs_dumpall for Exporting All Database Information" in *Tool Reference*.

NOTICE

- gs_dumpall does not back up parameters for running databases.
- gs_dumpall supports only plain-text format export. Therefore, only gsql can be used to restore a file exported using gs_dumpall.
- After restoration, you are advised to run **ANALYZE** on each database to provide useful statistics for the optimizer.

During backup, you are advised to run the following commands as the initial user or a user with SYSADMIN permissions:

```
nohup gs_dumpall -U root -W ******** -f /data/backup/bkp2.sql -p 8000 > /data/backup/dumpall_backup.log &
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

During restoration, you are advised to run the following commands as the initial user:

```
nohup gsql -d postgres -p 8000 -U root -W ******** -f /data/backup/bkp2.sql -a > /data/backup/
dumpall_restore.log &
```

8.6.2 Database-level Import and Export

gs_dump can be used to back up a single database and supports four archive formats. The application scenarios of these archive formats are described in **Table 8-5**. You can choose a proper archive format as required.

For details about how to use the gs_dump tool, see "Data Import and Export Tools > gs_dump for Exporting Database Information" in *Tool Reference*.

Table 8-5 Formats of exported files

Format	Value of -F	Description	Suggestion	Import Tool
Plain-text	p	A plain-text script file containing SQL statements and commands. The commands can be executed on gsql, a command line terminal, to rebuild database objects and load table data.	For a small-sized database or the exported SQL file needs to be modified, the plain-text format is recommended.	Before using gsql to restore database objects, you can use a text editor to edit the plain-text export file as needed. For details about how to use the gsql tool, see "Database Connection Tools > gsql for Connecting to a Database > gsql Usage Guide" in *Tool Reference*.
Custom	c	A binary file that allows the restoration of all or selected database objects from an exported file.	For medium- or large-sized databases, the backup result needs to be exported to a single file. You are advised to customize the archive format.	You can use gs_restore to import database objects from a custom-, directory-, or tar-format archive. For details about how to use the gs_restore tool, see "Data Import and Export Tools > gs_restore for Importing Data" in *Tool Reference*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Format	Value of -F	Description	Suggestion	Import Tool
Directory	d	A directory containing directory files of database objects and the data files of tables and BLOBs.	For medium- or large-sized databases, database objects and data files need to be stored and exported in different directories. Therefore, the directory format is recommended.	
.tar archive	t	A tar-format archive that allows the restoration of all or selected database objects from an exported file. The tar file cannot be further compressed and has an 8-GB limitation on the size of each single file.	For a small-sized database, you need to export the archive result and pack it. The tar format is recommended.	

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- gs_dump does not back up all global objects (roles, tablespaces, and corresponding permissions) of the database. Therefore, ensure that global objects have been created on the target database or new instance before the restoration. The **-g** command of gs_dumpall can be used to export global objects and use gsql to import global objects at the target end. For details about how to use the gs_dumpall tool, see "Data Import and Export Tools > gs_dumpall for Exporting All Database Information" in *Tool Reference*.
- gs_dump and gs_restore do not support import and export across database compatibility modes. Ensure that the database compatibility mode and compatibility configuration parameters of the source and target databases are the same. For details about how to query and create a database of a specified compatibility mode, see **CREATE DATABASE**.
- Do not modify the files and contents exported using the **-F c/d/t** formats. Otherwise, the restoration may fail. If you need to modify or replace the file exported using the **-F p** format, edit them with caution.
- After restoration, you are advised to run **ANALYZE** on the database to provide useful statistics for the optimizer.

You are advised to run the following command as the initial user or a user with the SYSADMIN permission to back up data. The source database is **my_database**, and the exported data contains data and object definitions.

```
-- Plain-text
nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_database_backup.sql > /data/backup/my_database_backup.log &
-- Custom
nohup gs_dump my_database -U root -W ******** -p 8000 -F c -f /data/backup/my_database_backup.dmp > /data/backup/my_database_backup.log &
-- Directory
nohup gs_dump my_database -U root -W ******** -p 8000 -F d -f /data/backup/my_database_backup > /data/backup/my_database_backup.log &
-- .tar archive
nohup gs_dump my_database -U root -W ******** -p 8000 -F t -f /data/backup/my_database_backup.tar > /data/backup/my_database_backup.log &
```

Before restoration, you need to create a target database that has the same attributes as the source database and does not contain any data.

```
-- Run the following gsql meta-command to view the database attribute information:
\l+
-- Create a target database based on the queried attribute information.
create database my_database2 encoding='xxxxx' LC_COLLATE='xxxxx' LC_CTYPE ='xxxxx' TEMPLATE=xxx DBCOMPATIBILITY 'xxx';
```

Run the following command as the initial user or a user with the SYSADMIN permissions to restore the database:

```
-- Plain-text
nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_database_backup.sql -a > /data/backup/my_database_restore.log &
-- Custom
nohup gs_restore /data/backup/my_database_backup.dmp -d my_database2 -p 8000 -U root -W ******** -F c -v > /data/backup/my_database_restore.log &
-- Directory
nohup gs_restore /data/backup/my_database_backup -d my_database2 -p 8000 -U root -W ******** -F d -v > /data/backup/my_database_restore.log &
-- .tar archive
nohup gs_restore /data/backup/my_database_backup.tar -d my_database2 -p 8000 -U root -W ******** -F t -v > /data/backup/my_database_restore.log &
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

8.6.3 Schema-level Import and Export

The gs_dump tool can be used to back up a single schema and you are advised to use the gs_dump tool and the **-n** parameter to do so. Multiple **-n** parameters can be used to back up multiple schemas.

For details about how to use the gs_dump tool, see "Data Import and Export Tools > gs_dump for Exporting Database Information" in *Tool Reference*.

NOTICE

If the exported schema depends on objects that are not exported, an error message may be displayed indicating that the dependent objects are missing when the schema is imported. Therefore, ensure that the dependent objects have been created before importing the schema.

You are advised to run the following command as the initial user or a user with SYSADMIN permissions to back up data. The source database is **my_database**, and the exported data contains data and object definitions.

```
-- Plain-text
nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_schema_backup.sql -n
my_schema > /data/backup/my_schema_backup.log &
-- Custom
nohup gs_dump my_database -U root -W ******** -p 8000 -F c -f /data/backup/my_schema_backup.dmp -n
my_schema > /data/backup/my_schema_backup.log &
-- Directory
nohup gs_dump my_database -U root -W ******** -p 8000 -F d -f /data/backup/my_schema_backup -n
my_schema > /data/backup/my_schema_backup.log &
-- .tar archive
nohup gs_dump my_database -U root -W ******** -p 8000 -F t -f /data/backup/my_schema_backup.tar -n
my_schema > /data/backup/my_schema_backup.log &
```

Before restoration, you need to create a target database that has the same attributes as the source database and does not contain the target schema.

```
-- Run the following gsql meta-command to view the database attribute information:
\l+
-- Create a target database based on the queried attribute information.
create database my_database2 encoding='xxxxx' LC_COLLATE='xxxxx' LC_CTYPE ='xxxxx' TEMPLATE=xxx
DBCOMPATIBILITY 'xxx';
```

Run the following command as the initial user or a user with SYSADMIN permissions to restore the database:

```
-- Plain-text
nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_schema_backup.sql -a > /data/
backup/my_schema_restore.log &
-- Custom
nohup gs_restore /data/backup/my_database_backup.dmp -d my_database2 -p 8000 -U root -W ******** -F c
-v -n my_schema > /data/backup/my_schema_restore.log &
-- Directory
nohup gs_restore /data/backup/my_database_backup -d my_database2 -p 8000 -U root -W ******** -F d -v -
n my_schema > /data/backup/my_schema_restore.log &
-- .tar archive
nohup gs_restore /data/backup/my_database_backup.tar -d my_database2 -p 8000 -U root -W ******** -F t -
v -n my_schema > /data/backup/my_schema_restore.log &
```

8.6.4 Table-level Import and Export

Many tools are available for table-level import and export. You can select a proper tool based on the following scenarios:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

1. If you need to export the definition and data of a single table to the same file, you are advised to use the plain-text archive of the gs_dump tool and the **-t** parameter. You can use multiple **-t** parameters to back up multiple tables. For details about how to use the gs_dump tool, see "Data Import and Export Tools > gs_dump for Exporting Database Information" in *Tool Reference*.

   NOTICE

   If the exported table depends on objects that are not exported, an error message may be displayed indicating that the dependent objects are missing when the table is imported. Therefore, ensure that the dependent objects have been created before importing the table.

   You are advised to run the following command as the initial user or a user with the SYSADMIN permission to back up data. The source database is **my_database**, and the target table is **my_table** in **my_schema**.

   ```
   nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_table_backup.sql -t my_schema.my_table > /data/backup/my_table_backup.log &
   ```

   Before restoration, create a target database with the same attributes as the source database, and ensure that the target schema exists in the database and no target table exists. Then, run the following command as the initial user or a user with SYSADMIN permissions to restore the database:

   ```
   nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_table_backup.sql -a > /data/backup/my_table_restore.log &
   ```

2. Only the definition of a single table needs to be exported and no data in the table is required.

   NOTICE

   If the exported table depends on objects that are not exported, an error message may be displayed indicating that the dependent objects are missing when the table is imported. Therefore, ensure that the dependent objects have been created before importing the table.

   You are advised to use the plain-text archive of the gs_dump tool together with the **-s** parameter. The command is as follows:

   ```
   nohup gs_dump my_database -U root -W ******** -p 8000 -F p -f /data/backup/my_table_backup.sql -t my_schema.my_table -s > /data/backup/my_table_backup.log &
   ```

   Before restoration, create a target database with the same attributes as the source database, and ensure that the target schema exists in the database and no target table exists. Then, run the following command as the initial user or a user with SYSADMIN permissions to restore the database:

   ```
   nohup gsql -d my_database2 -p 8000 -U root -W ******** -f /data/backup/my_table_backup.sql -a > /data/backup/my_table_restore.log &
   ```

9 User-defined Functions

When the cluster is started, the UDF master process is started in addition to CNs and DNs. To execute a UDF in fenced mode, the UDF master process forks itself to UDF worker processes, and UDF worker processes execute the UDF in fenced mode.

9.1 PL/SQL Functions

PL/SQL is a loadable procedural language.

Functions created using PL/SQL can be used in any place where you can use built-in functions. For example, you can use calculation functions, definition operators, and index expressions to create complex conditions.

SQL is used by most databases as a query language. It is portable and easy to learn. Each SQL statement must be executed independently by a database server.

This means that the client application performs the following processes for each query: send a query to the database server, wait for the query to be received, receive and process the result, perform related calculation, and then send more queries to the server. If the client and the database server are not on the same machine, this process also causes inter-process communication and network load.

PL/SQL enables a whole computing part and a series of queries to be grouped inside a database server. This makes procedural language available and SQL easier to use. In addition, the client/server communication cost is reduced.

- Extra round-trip communication between clients and servers is eliminated.
- Intermediate results that are not required by clients do not need to be sorted or transmitted between the clients and servers.
- Parsing can be skipped in multiple rounds of queries.

PL/SQL can use all data types, operators, and functions in the SQL statements. The syntax for creating functions using PL/SQL is **CREATE FUNCTION**.

PL/SQL is a loadable procedural language. Its application method is similar to that of **Stored Procedures**. The difference is that **Stored Procedures** has no return value, and PL/SQL functions have return values.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

XML data can be used as the input parameter, output parameter, user-defined variable, and return value of a user-defined function.

10 Stored Procedures

10.1 Overview

In GaussDB, business rules and logics are saved as stored procedures.

A stored procedure is a combination of SQL, PL/SQL, and Java statements. Stored procedures can move the code that executes business rules from applications to databases. Therefore, the code storage can be used by multiple programs at a time.

For details about how to create and call a stored procedure, see **CREATE PROCEDURE**.

The application methods for PL/SQL functions mentioned in **PL/SQL Functions** are the same as those for stored procedures. Unless otherwise specified, the following sections apply to stored procedures and PL/SQL functions.

10.2 Data Types

A data type refers to a value set and an operation set defined on the value set. GaussDB consists of tables, each of which is defined by its own columns. Each column corresponds to a data type. GaussDB uses corresponding functions to perform operations on data based on data types. For example, GaussDB can perform operations such as addition, subtraction, multiplication, and division on numeric data.

XML data can be used as input parameters, output parameters, user-defined variables, and return values of stored procedures, as well as stored procedures that support autonomous transactions.

10.3 Data Type Conversion

Certain data types in the database support implicit data type conversions, such as assignments and parameters called by functions. For other data types (such as INT and composite types), you can use the type conversion functions provided by GaussDB, such as the **cast(x as y [DEFAULT z ON CONVERSION ERROR][,fmt])** function, to forcibly convert them.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-1 lists common implicit data type conversions in GaussDB.

NOTICE

The valid value range of **DATE** supported by GaussDB is from 4713 B.C. to 294276 A.D.

Table 10-1 Implicit data type conversions

Raw Data Type	Target Data Type	Remarks
CHAR	VARCHAR2	-
CHAR	NUMBER	Raw data must consist of digits.
CHAR	DATE	Raw data cannot exceed the valid date range.
CHAR	RAW	-
CHAR	CLOB	-
VARCHAR2	CHAR	-
VARCHAR2	NUMBER	Raw data must consist of digits.
VARCHAR2	DATE	Raw data cannot exceed the valid date range.
VARCHAR2	CLOB	-
NUMBER	CHAR	-
NUMBER	VARCHAR2	-
DATE	CHAR	-
DATE	VARCHAR2	-
RAW	CHAR	-
RAW	VARCHAR2	-
CLOB	CHAR	-
CLOB	VARCHAR2	-
CLOB	NUMBER	Raw data must consist of digits.
INT4	CHAR	-

10.4 Arrays, Collections, and Records

10.4.1 Arrays

Use of Array Types

Before the use of arrays, an array type needs to be defined:

Define an array type immediately after the **AS** keyword in a stored procedure. Run the following statement:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array_type**: indicates the name of the array type to be defined.
- **VARRAY**: indicates the array type to be defined.
- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data_type**: indicates the types of members in the array type to be created.

NOTE

- In GaussDB, an array automatically increases. If an access violation occurs, a **NULL** value will be returned, and no error message will be reported.
- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- The **size** supports only the syntax and does not support the function.
- **data_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported) or set type, but cannot be the array or cursor type defined in the stored procedure.
- When **data_type** is collection, multi-dimensional arrays are not supported.
- NOT NULL syntax is not supported.
- The constructors of the array type can be used only in ORA-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, if a varray array is created in a package and invoked outside the package, the restrictions for the length or precision become invalid.

GaussDB supports the access of content in an array by using parentheses, and the **extend**, **count**, **first**, **last prior**, **next**, **exists**, **trim**, and **delete** functions.

NOTE

If the stored procedure contains DML statements (**SELECT**, **UPDATE**, **INSERT**, or **DELETE**), DML statements can access array elements only using brackets. In this way, it may be separated from the function expression area.

Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;--Define the array type.
    ARRINT ARRAY_INTEGER: = ARRAY_INTEGER();  --Declare the variable of the array type.
BEGIN
    ARRINT.EXTEND(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();
    IF ARRINT.EXISTS(10) THEN
       DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
       DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/

-- Call the stored procedure.
gaussdb=# CALL array_proc();

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE array_proc;
```

10.4.1.1 Use of Array Types

Before the use of arrays, an array type needs to be defined:

Syntax

Define an array type immediately after the AS keyword in a stored procedure. Run the following statement:

```
TYPE array_type IS VARRAY(size) OF data_type;
```

Related parameters are as follows:

- **array_type**: indicates the name of the array type to be defined.
- **size**: indicates the maximum number of members in the array type to be defined. The value is a positive integer.
- **data_type**: indicates the types of members in the array type to be created.

Precautions

- GaussDB supports access to array elements using index syntax (enclosed by parentheses ()) and provides various dedicated functions (such as EXTEND, COUNT, FIRST, LAST, PRIOR, EXISTS, TRIM, NEXT, and DELETE) for flexible array operations and management.
- In GaussDB, an array automatically increases. If an access violation occurs, a **NULL** value will be returned, and no error message will be reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- The scope of an array type defined in a stored procedure takes effect only in this storage process.
- **size** is used only for syntax compatibility and has no actual meaning.
- **data_type** can also be the record type defined in a stored procedure (anonymous blocks are not supported) or collection type, but cannot be the array or cursor type defined in the stored procedure.
- When **data_type** is collection, multi-dimensional arrays are not supported.
- The constructors of the array type can be used only in ORA-compatible mode.
- The constructor of the array type cannot be used as the default value of a function or stored procedure parameter.
- If the elements of an array are of the collection type and **data_type** of the array is set to **VARCHAR** or **NUMERIC** that can define the length and precision, you need to enable the **tableof_elem_constraints** option for GUC parameter **behavior_compat_options** to verify the element length of the array or convert the element to the corresponding precision.
- After **enable_recordtype_check_strict** is set to **on**, if the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.
- If the stored procedure contains DML statements (SELECT, UPDATE, INSERT, or DELETE), DML statements can access array elements only using brackets. In this way, it may be separated from the function expression area.
- Elements of varray variables cannot be accessed in DML statements.
- NOT NULL syntax is not supported.

Examples

```
-- Perform array operations in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE array_proc AS
DECLARE
    TYPE ARRAY_INTEGER IS VARRAY(1024) OF INTEGER;-- Define the array type.
    ARRINT ARRAY_INTEGER: = ARRAY_INTEGER();  -- Declare the variable of the array type.
BEGIN
    ARRINT.EXTEND(10);
    FOR I IN 1..10 LOOP
        ARRINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(1));
    DBE_OUTPUT.PRINT_LINE(ARRINT(10));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.NEXT(ARRINT.FIRST)));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.PRIOR(ARRINT.LAST)));
    ARRINT.TRIM();
    IF ARRINT.EXISTS(10) THEN
       DBE_OUTPUT.PRINT_LINE('Exist 10th element');
    ELSE
       DBE_OUTPUT.PRINT_LINE('Not exist 10th element');
    END IF;
    DBE_OUTPUT.PRINT_LINE(ARRINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.FIRST));
    DBE_OUTPUT.PRINT_LINE(ARRINT(ARRINT.LAST));
    ARRINT.DELETE();
END;
/

-- Call the stored procedure.

(1 row)

-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE array_proc;
```

10.4.1.2 Functions Supported by Arrays

NOTE

- The following cases are used in ORA-compatible mode. In the function definition description, the content in [] is optional. For example, count[()] can be written as count or count().
- Currently, the following errors are not supported: array uninitialized error (Reference to uninitialized collection), array index out-of-bounds error (Subscript beyond count), and array index out-of-limit error (Subscript outside of limit).
- In an inner expression, functions of the array type cannot be called in nesting mode.

- extend[(count)]

  Parameter: *count* is of the int4 type.

  Return value: No value is returned.

  Description: Extends one or *count* elements at the end of a varray variable. The default value is **NULL**.

  Example 1: The extend is used to extend one element. The default value is **NULL**.

  ```
  gaussdb=# declare
  gaussdb-#     type array_integer is varray(10) of integer;
  gaussdb-#     arrint array_integer := array_integer();
  gaussdb-# begin
  gaussdb$#     dbe_output.print_line(arrint.count);
  gaussdb$#     arrint.extend;
  gaussdb$#     dbe_output.print_line(arrint.count);
  gaussdb$# end;
  gaussdb$# /
  0
  1
  ANONYMOUS BLOCK EXECUTE
  ```

  Example 2: The extend(count) is used to extend the *count* elements. The default value is **NULL**.

  ```
  gaussdb=# declare
  gaussdb-#     type array_integer is varray(10) of integer;
  gaussdb-#     arrint array_integer := array_integer();
  gaussdb-# begin
  gaussdb$#     dbe_output.print_line(arrint.count);
  gaussdb$#     arrint.extend(3);
  gaussdb$#     dbe_output.print_line(arrint.count);
  gaussdb$# end;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb$# /
0
3
ANONYMOUS BLOCK EXECUTE
```

- extend(count, idx)

  Parameters: *idx* and *count* are of the INT4 type.

  Return value: No value is returned.

  Description: Extends *count* elements at the end of a varray variable, and the value of the extended element is equal to the value of the given *idx* index element.

  Example: The extend(count, idx) is used to extend the element at the *idx* position.

```
gaussdb=# set a_format_version='10c';
SET
gaussdb=# set a_format_dev_version='s1';
SET
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1,2);
gaussdb-# begin
gaussdb$#     arrint.extend(2, 1);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     for i in 1..arrint.count loop
gaussdb$#         dbe_output.print_line(arrint(i));
gaussdb$#     end loop;
gaussdb$# end;
gaussdb$# /
4
1
2
1
1
ANONYMOUS BLOCK EXECUTE
```

- count[()]

  Parameter: none.

  Return value: INT4 type.

  Description: Returns the number of elements in an array.

  Example: View the number of initialized array elements.

```
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer;
gaussdb-#     len int;
gaussdb-# begin
gaussdb$#     arrint := array_integer(1, 2, 3);
gaussdb$#     len := arrint.count();
gaussdb$#     dbe_output.print_line(len);
gaussdb$# end;
gaussdb$# /
3
ANONYMOUS BLOCK EXECUTE
```

- trim[(n)]

  Parameter: *n* is of the INT4 type.

  Return value: No value is returned.

  Description: Deletes an element at the end of the array if there is no parameter. Alternatively, deletes a specified number of elements at the end of the array if the input parameter *n* is specified.

  Example: Delete *n* elements from an array.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1,2,3);
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.trim(1);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$# end;

2
ANONYMOUS BLOCK EXECUTE
-- If n is greater than the number of array elements, clear all array elements.
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1,2,3);
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.trim(4);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$# end;
gaussdb$# /
3
0
ANONYMOUS BLOCK EXECUTE
```

- delete[()]

  Parameter: none

  Return value: No value is returned.

  Description: Clears elements in an array.

  Example: Clear elements in an array.

```
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1,2,3);
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     arrint.delete();
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$# end;
gaussdb$# /

gaussdb-# begin
gaussdb$#     arrint.delete();
gaussdb$# end;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- delete(idx)

  Parameter: INT4 type.

  Return value: No value is returned.

  Description: If the specified index *idx* is within the array range, the element with the specified index *idx* is deleted from the array.

  Example 1: The given index *idx* is within the array range.

```
gaussdb=# declare
gaussdb-#     type array_integer is varray(10) of integer;
gaussdb-#     arrint array_integer := array_integer(1, 2, 3);
gaussdb-# begin
gaussdb$#     dbe_output.print_line(arrint.count);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb$#     arrint.delete(2);
gaussdb$#     dbe_output.print_line(arrint.count);
gaussdb$#     for i in 1..arrint.count loop
gaussdb$#         dbe_output.print_line(arrint(i));

INFO:  {1,2,3}
ANONYMOUS BLOCK EXECUTE
```

- first[()]

  Parameter: none.

  Return value: INT4 type.

  Description: Returns the index of the first element in an array. If there is no first element, **NULL** is returned.

  Example:

```
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc');
gaussdb-# begin
gaussdb$#     raise info 'first is %',v.first();

ANONYMOUS BLOCK EXECUTE
```

- last[()]

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter: none.

Return value: INT4 type.

Description: Returns the index of the last element in an array. If there is no last element, **NULL** is returned.

Example:

```
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc');
gaussdb-# begin
gaussdb$#     raise info 'last is %',v.last();
gaussdb$# end;
gaussdb$# /
INFO:  last is 2
ANONYMOUS BLOCK EXECUTE
-- If the array is not initialized, NULL is returned.
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr;
gaussdb-# begin
gaussdb$#     raise info 'last is %',v.last;
gaussdb$# end;
gaussdb$# /
INFO:  last is <NULL>
ANONYMOUS BLOCK EXECUTE
```

- prior(idx)

  Parameter: int4 type.

  Return value: INT4 type.

  Description: Returns the index of the element before the specified index in an array. If the index of the element cannot be found, **NULL** is returned.

  Example:

```
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc');
gaussdb-# begin
gaussdb$#     raise info 'prior is %',v.prior(2);
gaussdb$# end;
gaussdb$# /
INFO:  prior is 1
ANONYMOUS BLOCK EXECUTE
-- If the array is not initialized, NULL is returned.
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr;
gaussdb-# begin
gaussdb$#     raise info 'prior is %',v.prior(2);
gaussdb$# end;
gaussdb$# /
INFO:  prior is <NULL>
ANONYMOUS BLOCK EXECUTE
-- The index is out of range and is greater than the array range.
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc','qwe');
gaussdb-# begin
gaussdb$#     raise info 'prior is %',v.prior(10);
gaussdb$# end;
gaussdb$# /
INFO:  prior is 3
ANONYMOUS BLOCK EXECUTE
```

- next(idx)

  Parameter: int4 type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return value: INT4 type.

Description: Returns the index of the element following the specified index in an array. If the index of an element cannot be found, **NULL** is returned.

Example:

```
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc');
gaussdb-# begin
gaussdb$#     raise info 'next is %',v.next(1);
gaussdb$# end;
gaussdb$# /
INFO:  next is 2
ANONYMOUS BLOCK EXECUTE
-- If the array is not initialized, NULL is returned.
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr;
gaussdb-# begin
gaussdb$#     raise info 'next  is %',v.next(1);
gaussdb$# end;
gaussdb$# /
INFO:  next  is <NULL>
ANONYMOUS BLOCK EXECUTE
-- The index is out of range and is greater than the array range.
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc','qwe');
gaussdb-# begin
gaussdb$#     raise info 'next  is %',v.next(10);
gaussdb$# end;
gaussdb$# /
INFO:  next  is <NULL>
ANONYMOUS BLOCK EXECUTE
```

- exists(idx)

  Parameter: int4 type.

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Function: Checks whether an element exists in a specified position.

  Example:

```
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr := varr('asd','zxc');
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := v.exists(1);
gaussdb$#     raise info '%',flag;
gaussdb$#     flag := v.exists(3);
gaussdb$#     raise info '%',flag;
gaussdb$#     flag := v.exists(7);
gaussdb$#     raise info '%',flag;
gaussdb$# end;
gaussdb$# /
INFO:  t
INFO:  f
INFO:  f
ANONYMOUS BLOCK EXECUTE
-- If the array is not initialized, false is returned.
gaussdb=# declare
gaussdb-#     type varr is varray(10) of varchar(3);
gaussdb-#     v varr;
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := v.exists(1);
gaussdb$#     raise info '%',flag;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb$#     flag := v.exists(3);
gaussdb$#     raise info '%',flag;
gaussdb$#     flag := v.exists(7);
gaussdb$#     raise info '%',flag;
gaussdb$# end;
gaussdb$# /
INFO:  f
INFO:  f

ANONYMOUS BLOCK EXECUTE
```

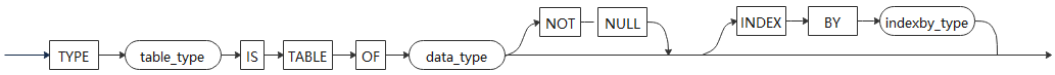
10.4.2 Collections

10.4.2.1 Use of Collection Types

Before the use of collections, a collection type must be defined.

Define a collection type immediately after the AS keyword in a stored procedure. For details about the definition method, see **Figure 10-1**.

Figure 10-1 Defining a collection type



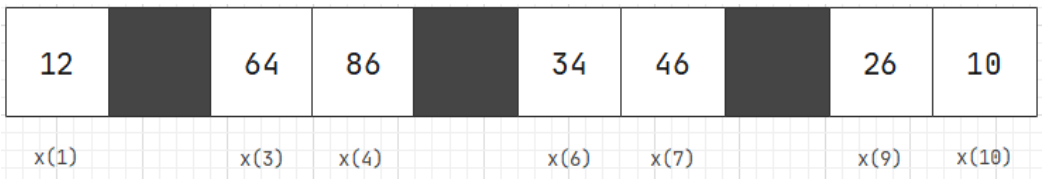
In the preceding information:

- **table_type**: indicates the name of the collection type to be defined.
- **data_type**: indicates the type of members in the collection to be created.
- **indexby_type**: indicates the type of the index set to be created.

Nest-Table Collection Type

Members of a specified data type are stored in a variable-length array. You can use the extend function to expand the storage space and use the trim function to release the storage space. For example, if a collection variable *x* has 10 storage units and the member type is int, members are stored as shown in **Figure 10-2**.

Figure 10-2 Storage model



Members x(2), x(5), and x(8) are invalid, but their storage space is still reserved. You can assign values to them later without re-allocating space.

When a nest-table collection is used as the return value of a function or an input parameter of an autonomous transaction, invalid members will be deleted from the storage space, and the index sets of all members change accordingly.

After a collection type is defined, use table_type as the type name to declare the variable.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
var_name table_type [:= table_type([v1[,...]])];
```

You can use a type constructor to initialize the variable during or after declaration. If the variable is not initialized, the value of *var_name* is **NULL**.

After the variable is declared and initialized, you can access collection members through an index set or assign values to members. The index set range is [1,*upper*]. The value of *upper* is the size of the current space. If you attempt to access a deleted member, the error message "no data found" will be returned.

Constraints

- GaussDB supports access to collection elements by using parentheses, and it also supports the extend, count, first, last, prior, next, and delete functions. The collection functions support multiset union, intersect, except all, and distinct.
- Collection types can be created only in ORA-compatible mode (**sql_compatibility** is set to **ORA**).
- In GaussDB, a nest-table collection does not automatically increase, and an error is reported when you attempt to access the index set out of the specified range.
- Collections can be defined in schemas, anonymous blocks, stored procedures, packages, and user-defined functions, among which the scopes of the collection types vary.
- **NOT NULL** has no function but only takes effect in the syntax.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof_elem_constraints** parameter (**behavior_compat_options** must be set to **tableof_elem_constraints**) to verify the length of elements in the collection or convert elements to the corresponding precision.
- If **data_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof_elem_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The value of **data_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- Variables of a collection type cannot be assigned a value of another collection type, even if their member types are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE** *t1* **IS TABLE OF** *int* and **TYPE** *t2* **IS TABLE OF** *int*, respectively. A value of the collection type defined by **TYPE** *t1* **IS TABLE OF** *int* cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- Only the equal (=) and non-equal operations (<> or !=) between collections are supported. Other relational and arithmetic operations are not supported.
- Use IS [NOT] NULL to compare a collection type with **NULL**. The result of comparison with **NULL** using the equal operator (=) is inaccurate.
- Variables of the collection type can be used as parameters and return values of functions. In this case, the type of the parameters or return values must have been defined in a schema.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When a nest-table collection is used as the input parameter of a function, an array with elements of the same type can be specified as the input parameter. Multi-dimensional arrays are not supported, and the array index set must start from 1. (This function is outdated and not recommended.) You can run the **set behavior_compat_options = 'disable_rewrite_nesttable';** command to disable the function.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.
- If the GUC parameter **enable_recordtype_check_strict** is set to **on** and the member is of the record type and a column of the record type has the NOT NULL or DEFAULT attribute, an error is reported during stored procedure or package compilation.
- DML statements cannot be used to access elements of the collection type that are not defined in schemas.

Index-By Table Collection Type

This collection type stores the index set and corresponding member values in a hash table as key-value pairs. All operations on variables of this type are actually operations on the hash table. Users do not need to expand or release storage space, but only need to assign values or delete members. The operations related to the collection type are described as follows:

1. Type definition

   When defining the index-by table collection type, specify both the member type **data_type** and index set type **indexby_type**. The index set type can only be INTEGER or VARCHAR.

2. Variable declaration and initialization

   After the index-by table collection type is declared, it can be initialized. There are three initialization scenarios: uninitialized, initialized to null, and initialized to specified index set and member values. The effect of uninitialized variables is the same as that of initializing variables to null. If a variable is not initialized or is initialized to null, the variable is not **NULL**. You can assign a value to the variable later. Initializing a variable to specified index set and member values will save the specified index set and member values to the variable as key-value pairs.

3. Variable assignment

   Assignment to variables of the index-by table collection type is classified into member assignment and group assignment. Member assignment allows you to assign a value to a member by specifying the index set. If the member does not have a value, the assigned value is used directly. If the member has a value, the member value is updated. Group assignment will clear the original members in the variable and save the new member values. In the group assignment scenario, **NULL** cannot be assigned to variables. Otherwise, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

4. Variable value

   You can specify an index set to obtain the member value of the corresponding index in the variable. If the member cannot be found based on the index set, the error message "no data found" is returned.

Constraints

- Index-by table collection types can be created only in ORA-compatible mode (**sql_compatibility** is set to **ORA**).
- Index-by table collection types can be defined in anonymous blocks, stored procedures, user-defined functions, and packages, among which the scopes of the collection types vary. Index-by table collection types cannot be defined in schemas.
- **NOT NULL** has no function but only takes effect in the syntax.
- When **data_type** is set to a type that can define the length and precision, such as varchar and numeric, you need to enable the **tableof_elem_constraints** parameter (**behavior_compat_options** must be set to **tableof_elem_constraints**) to verify the length of elements in the collection or convert elements to the corresponding precision.
- If **data_type** is of the array type, the element length verification or precision conversion of the array type is also affected by whether the **tableof_elem_constraints** parameter is enabled.
- The value of the collection type converted from the array type does not support element length verification or precision conversion.
- The value of **data_type** can be a base data type or a record type, collection type, or array type defined in a stored procedure. The ref cursor type is not supported.
- The value of **indexby_type** can only be **INTEGER** or **VARCHAR**.
- When **indexby_type** is set to **VARCHAR** and **tableof_elem_constraints** is enabled, the length of the index value is verified when a value is assigned to an index-by table collection type. The verification behavior is not affected by whether **char_coerce_compat** is enabled. If the index length is greater than the defined length, an error is reported. If the **tableof_elem_constraints** parameter is disabled, the index value length is not verified.
- An uninitialized variable of the index-by table collection type is not **NULL**.
- **NULL** cannot be assigned to a variable of the index-by table collection type. Otherwise, an error is reported.
- **NULL** and '' (single quotation marks) cannot be assigned to a variable of the index-by table collection type.
- Variables of the index-by table collection type cannot be assigned values of another index-by table collection type, even if their member type and index set type are the same. For example, *t1* and *t2* are of different collection types defined by **TYPE** *t1* **IS TABLE OF** *int* **index by** *int* and **TYPE** *t2* **IS TABLE OF** *int* **index by** *int*, respectively. A value of the collection type defined by **TYPE** *t1* **IS TABLE OF** *int* **index by** *int* cannot be assigned to *t2*, and vice versa. (This restriction may not take effect when the variables are of the member types because the value assignment logic of variables is affected by the parent type.)
- An index-by table collection type does not support relational and arithmetic operations.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- When a variable of the index-by table collection type is assigned by running **SELECT ... bulk collect INTO**, the index set must be of the integer type. The index set type cannot be varchar.
- Variables of the index-by table collection type can be used as the parameters and return values of functions. In this case, the type of the parameters or return values must be a collection type defined in the package.
- When an index-by table collection is used as the input parameter of a function, an array with elements of the same type can be specified as the input parameter. Multi-dimensional arrays are not supported, and the index type cannot be VARCHAR. (This function is outdated and not recommended.) You can run the **set behavior_compat_options = 'disable_rewrite_nesttable';** command to disable the function.
- Currently, the type constructor supports only the collection type and the maximum number of parameters is the same as that of user-defined function parameters. For the index-by table collection type, the index value can only be a constant when the constructor is used.
- Operations on XML data are not supported.
- When creating a table, do not use the collection type or any type containing a collection as a column in the table.
- Constructors of the collection type do not support floating point numbers and expressions as indexes.
- For a collection type defined in an anonymous block, after ROLLBACK is executed or EXCEPTION occurs in an anonymous block, the collection type cannot be used.
- After the GUC parameter **enable_recordtype_check_strict** is set to **on**, if the member is of the record type and a column of the record type has the not null or default attribute, an error is reported during stored procedure or package compilation.
- DML statements cannot be used to access elements of the collection type that are not defined in schemas.

Examples

Example 1: nest-table collection type

```
-- Perform operations on a collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TABLEINT TABLE_INTEGER := TABLE_INTEGER();  -- Declare the variable of the collection type.
BEGIN
    TABLEINT.extend(10);
    FOR I IN 1..10 LOOP
        TABLEINT(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(TABLEINT.COUNT);
    DBE_OUTPUT.PRINT_LINE(TABLEINT(1));
    DBE_OUTPUT.PRINT_LINE(TABLEINT(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL table_proc();
10
1
10
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 table_proc
------------

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE table_proc;
DROP PROCEDURE
-- Perform operations on a nest-table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE nest_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER;-- Define a collection type.
    TYPE NEST_TABLE_INTEGER IS TABLE OF TABLE_INTEGER;-- Define a collection type.
    NEST_TABLE_VAR NEST_TABLE_INTEGER := NEST_TABLE_INTEGER(); -- Declare a variable of the nest-
table collection type.
BEGIN
    NEST_TABLE_VAR.extend(10);
    FOR I IN 1..10 LOOP
        NEST_TABLE_VAR(I) := TABLE_INTEGER();
        NEST_TABLE_VAR(I).extend(10);
        NEST_TABLE_VAR(I)(I) := I;
    END LOOP;
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR.COUNT);
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(1)(1));
    DBE_OUTPUT.PRINT_LINE(NEST_TABLE_VAR(10)(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL nest_table_proc();
10
1
10

Example 2: index-by table collection type

```
-- Perform operations on an index-by table collection in the stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE index_table_proc AS
DECLARE
    TYPE TABLE_INTEGER IS TABLE OF INTEGER INDEX BY INTEGER; -- Define a collection type.
    TYPE TABLE_VARCHAR IS TABLE OF INTEGER INDEX BY VARCHAR; -- Define a collection type.
    TABLEINT_01 TABLE_INTEGER;                          -- Declare a variable of the collection type, which is
not initialized.
    TABLEINT_02 TABLE_INTEGER := TABLE_INTEGER();       -- Declare a variable of the collection type.
The initial value is null.
    TABLEINT_03 TABLE_INTEGER := TABLE_INTEGER(2=>3,3=>4);   -- Declare a variable of the collection
type and initialize it to the specified value.
    RES INTEGER;
BEGIN
    FOR I IN 1..10 LOOP
        TABLEINT_01(I) := I;     -- Assign values to members.
        TABLEINT_02(I) := I + 1; -- Assign values to members.
    END LOOP;
    TABLEINT_01 := TABLEINT_02;  -- Group assignment
    RES := TABLEINT_03(2);       -- Return the collection values.
    DBE_OUTPUT.PRINT_LINE(RES);
    DBE_OUTPUT.PRINT_LINE(TABLEINT_01(1));
    DBE_OUTPUT.PRINT_LINE(TABLEINT_01(10));
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
```

```

10.4.2.2 Collection Functions

Collection Operators

- =

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are equal.

  Example:

  ```
  gaussdb=# declare
  gaussdb-#     type nest is table of int;
  gaussdb-#     a nest := nest(1,2);
  gaussdb-#     b nest := nest(1,2);
  gaussdb-#     flag bool;
  gaussdb-# begin
  gaussdb$#     flag := a = b;
  gaussdb$#     raise info '%', flag;
  gaussdb$# end;
  gaussdb$# /
  INFO:  t
  ANONYMOUS BLOCK EXECUTE
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- <>

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are not equal.

  Example:

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2);
gaussdb-#     b nest := nest(1,2);
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := a <> b;
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- IS [NOT] NULL

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Determines whether a collection is **NULL**.

  Example:

```
gaussdb=# declare
gaussdb=#     type nest is table of int;
gaussdb=#     a nest;
gaussdb=#     b nest := NULL;
gaussdb=#     c nest := nest(1,2);
gaussdb=#     flag bool;
gaussdb=# begin
gaussdb=#     flag := a IS NULL;
gaussdb=#     raise info '%', flag;
gaussdb=#     flag := b IS NULL;
gaussdb=#     raise info '%', flag;
gaussdb=#     flag := c IS NULL;
gaussdb=#     raise info '%', flag;
gaussdb=# end;
gaussdb=# /
INFO:  t
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- ^=

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether two collections are not equal.

  Example:

```
gaussdb=# declare
gaussdb=#     type nest is table of int;
gaussdb=#     a nest := nest(1,2);
gaussdb=#     b nest := nest(1,2);
gaussdb=#     flag bool;
gaussdb=# begin
gaussdb=#     flag := a ^= b;
gaussdb=#     raise info '%', flag;
gaussdb=# end;
gaussdb=# /
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- [NOT] IN

  Parameter: nesttable

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Determines whether a collection is in the collection list.

  Example:

```
gaussdb=# declare
gaussdb=#     type tab is table of varchar(10);
gaussdb=#     tmp1 tab := tab('a', 'b');
gaussdb=#     tmp2 tab := tab('a', 'b');
gaussdb=#     flag bool;
gaussdb=# begin
gaussdb=#     flag := tmp2 in (tmp1);
gaussdb=#     raise info '%', flag;
gaussdb=# end;
gaussdb=# /
INFO:  t
ANONYMOUS BLOCK EXECUTE
```

MULTISET

- MULTISET UNION [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Union of two collection variables. **ALL** indicates that duplicate elements are not removed, and **DISTINCT** indicates that duplicate elements are removed.

  Example 1: Calculate the union of two collection variables and do not remove duplicate elements. That is, MULTISET UNION ALL.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET UNION ALL b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,2,3}
ANONYMOUS BLOCK EXECUTE
```

  Example 2: Calculate the union of two collection variables and remove duplicate elements. That is, MULTISET UNION DISTINCT.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET UNION DISTINCT b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3}
ANONYMOUS BLOCK EXECUTE
```

- MULTISET EXCEPT [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Difference of two collection variables. Take A MULTISET EXCEPT B as an example. **ALL** indicates that elements that both A and B have in A are

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

removed and returned. The number of elements to be removed is calculated. For a specific element, if A appears *m* times and B appears *n* times (m > n), the number of elements removed from A is *m* minus *n*. If m ≤ n, *m* elements are removed from A. **DISTINCT** indicates that elements that both A and B have in A are removed and returned. The number of elements to be removed is not calculated. If specific elements appear in A and B, all such elements in A are removed. **ALL** is the default value.

Example 1: Calculate a difference set of two collection variables, remove elements that both A and B have in A, and return result. The number of elements to be removed is calculated. That is, MULTISET EXCEPT ALL.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET EXCEPT ALL b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2}
ANONYMOUS BLOCK EXECUTE
```

Example 2: Calculate a difference set of two collection variables, remove elements that both A and B have in A, and return result. The number of elements to be removed is not calculated. That is, MULTISET EXCEPT DISTINCT.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET EXCEPT DISTINCT b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1}
ANONYMOUS BLOCK EXECUTE
```

- MULTISET INTERSECT [ALL | DISTINCT]

  Parameter: nesttable

  Return value: nesttable

  Description: Intersection of two collection variables. For example, A MULTISET INTERSECT B: ALL indicates that all duplicate elements (including elements that are repeated for multiple times) are retained. DISTINCT indicates that the intersection of unique values is returned and duplicate elements are removed. **ALL** is the default value.

  Example 1: Calculate the intersection of two collection variables and do not remove duplicate elements. That is, MULTISET INTERSECT ALL.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET INTERSECT ALL b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /

```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example 2: Calculate the intersection of two collection variables and remove duplicate elements. That is, MULTISET INTERSECT DISTINCT.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,2);
gaussdb-#     b nest := nest(2,2,3);
gaussdb-# begin
gaussdb$#     a := a MULTISET INTERSECT DISTINCT b;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {2}
ANONYMOUS BLOCK EXECUTE
```

Functions of the Collection Type

NOTE

- In the following function definition description, the content in [] is optional. For example, count[()] can be written as count or count().
- In an inner expression, functions of the collection type cannot be called in nesting mode.

- exists(idx)

  Parameter: *idx* is of the INT4 or VARCHAR type.

  Return value: **TRUE** or **FALSE**, of the Boolean type.

  Description: Checks whether a valid element exists in a specified position.

  Example:

```
gaussdb=# declare
gaussdb-#     type nest is table of varchar2;
gaussdb-#     a nest := nest('happy','?');
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     flag := a.exists(1);
gaussdb$#     raise info '%', flag;
gaussdb$#     flag := a.exists(10);
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE

gaussdb=# declare
gaussdb-#     type nest is table of varchar2 index by varchar2;
gaussdb-#     a nest;
gaussdb-#     flag bool;
gaussdb-# begin
gaussdb$#     a('1') := 'Be';
gaussdb$#     a('2') := 'happy';
gaussdb$#     a('3') := '.';
gaussdb$#     flag := a.exists('1');
gaussdb$#     raise info '%', flag;
gaussdb$#     flag := a.exists('ddd');
gaussdb$#     raise info '%', flag;
gaussdb$# end;
gaussdb$# /
INFO:  t
INFO:  f
ANONYMOUS BLOCK EXECUTE
```

- extend[(count[, idx])]

  Parameters: *idx* and *count* are of the INT4 type.

  Return value: No value is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Description: Supports only variables of the nest-table type. One or *count* elements are extended at the end of the nest-table variable. If index set element *idx* exists, *count* index elements are copied to the end of the variable.

Example 1: A nest-table variable extends 1 element and the extended element value is **NULL**.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.extend;
gaussdb$#     raise info '%', a;
gaussdb$#     a.extend;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1}
INFO:  {1,NULL}
INFO:  {1,NULL,NULL}
ANONYMOUS BLOCK EXECUTE
```

Example 2: A nest-table variable extends *n* elements and the extended element value is **NULL**.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.extend(2);
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1}
INFO:  {1,NULL,NULL}
ANONYMOUS BLOCK EXECUTE
```

Example 3: A nest-table variable extends *n* elements and the extended element value is the value of the specified index element.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(9);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.extend(2,1);
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {9}
INFO:  {9,9,9}
ANONYMOUS BLOCK EXECUTE
```

- delete[(idx1[, idx2])]

  Parameter: *idx1* and *idx2* are of the INT4 or VARCHAR2 type.

  Return value: No value is returned.

  Description: Deletes all elements and releases corresponding storage space in a nest-table collection (to use this collection, extend must be executed again), or deletes all elements (including index set elements) in an index-by table collection but does not release corresponding storage space.

  Restriction: For the nest-table collection type, if an element is deleted but it is not removed from the storage space, the space is invalid and can be assigned a value. Note: When a collection is used as the return value of a function or an input parameter of an autonomous transaction, invalid members will be

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

deleted from the storage space, and the index sets of all members change accordingly.

Example 1: Delete all elements and spaces of the collection type from the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.delete();
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3,4,5}
INFO:  {}
ANONYMOUS BLOCK EXECUTE
```

Example 2: Delete an element at a specified position from the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.delete(3);
gaussdb$#     raise info '%', a;
gaussdb$#     a(3) := 3;
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3,4,5}
INFO:  {1,2,4,5}
INFO:  {1,2,3,4,5}
ANONYMOUS BLOCK EXECUTE
```

Example 3: Delete elements in a specified interval from the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     a nest := nest(1,2,3,4,5);
gaussdb-# begin
gaussdb$#     raise info '%', a;
gaussdb$#     a.delete(2,4);
gaussdb$#     raise info '%', a(1);
gaussdb$#     raise info '%', a(5);
gaussdb$#     raise info '%', a;
gaussdb$# end;
gaussdb$# /
INFO:  {1,2,3,4,5}
INFO:  1
INFO:  5
INFO:  {1,5}
ANONYMOUS BLOCK EXECUTE
```

Example 4: Delete all elements and spaces of the collection type from the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-#     type t1 is table of int index by varchar;
gaussdb-#     v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
gaussdb-# begin
gaussdb$#     v.delete();
gaussdb$#     raise info '%', v.count();
gaussdb$# end;
gaussdb$# /
INFO:  0
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example 5: Delete an element at a specified position from the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-#     type t1 is table of int index by varchar;
gaussdb-#     v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
gaussdb-# begin
gaussdb$#     raise info '%', v('a');
gaussdb$#     v.delete('a');
gaussdb$#     raise info '%', v('a');
gaussdb$# end;
gaussdb$# /
INFO:  1
ERROR:  no data found
CONTEXT:  PL/pgSQL function inline_code_block line 6 at RAISE
```

Example 6: Delete elements in a specified interval from the variable of the index-by table collection type.

```
gaussdb=# declare
gaussdb-#     type t1 is table of int index by varchar;
gaussdb-#     v t1 := t1('a' => 1, 'b' => 2, 'c' => 3, 'd' => 4);
gaussdb-# begin
gaussdb$#     raise info '%', v('b');
gaussdb$#     v.delete('a', 'c');
gaussdb$#     raise info '%', v('b');
gaussdb$# end;
gaussdb$# /
INFO:  2
ERROR:  no data found
CONTEXT:  PL/pgSQL function inline_code_block line 6 at RAISE
```

- trim[(n)]

  Parameter: *n* is of the INT4 type.

  Return value: No value is returned.

  Description: Supports only variables of the nest-table type. Only the nest-table collection type is supported.

  Example:

```
gaussdb=# declare
gaussdb-#     type nest is table of int;
gaussdb-#     aa nest := nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim;  -- No parameter
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim();  -- No parameter
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim(2);  -- Valid parameter
gaussdb$#     raise info 'aa:%' ,aa;
gaussdb$#     aa.trim(2);  -- The collection element space is less than 2. An error is reported when the
parameter is invalid.
gaussdb$# end;

```

- count[()]

  Parameter: none

  Return value: INT type

  Description: Returns the number of valid elements in a collection.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example 1: Use the count function for the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'count:%' ,aa.count;
gaussdb$# aa.delete(3);  -- Delete an element. The element whose index is 3 is invalid.
gaussdb$# raise info 'count:%' ,aa.count();
gaussdb$# end;
gaussdb$# /

- first[()]

  Parameter: none

  Return value: INT or VARCHAR

  Description: Returns the index of the first valid element in a collection.

  Example 1: Use the first function for the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'first:%' ,aa.first();
gaussdb$# aa.delete(1);
gaussdb$# raise info 'first:%' ,aa.first;  -- The element whose index is 1 is invalid. The index of the first valid element is 2.
gaussdb$# end;

- last[()]

  Parameter: none

  Return value: INT or VARCHAR

  Description: Returns the index of the last valid element in a collection.

  Example 1: Use the last function for the variable of the nest-table collection type.

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'last:%' ,aa.last;
gaussdb$# aa.delete(5);
gaussdb$# raise info 'last:%' ,aa.last();  -- The element whose index is 5 is invalid. The index of the last valid element is 4.
gaussdb$# end;

- prior(idx)

  Parameter: *idx* is of the int or varchar type.

  Return value: int or varchar type

  Description: Returns the index of a valid element before the current index in a collection.

  Example 1: Use the prior function for the variable of the nest-table collection type.

  ```
  gaussdb=# declare
  gaussdb-# type nest is table of int;
  gaussdb-# aa nest:=nest(11,22,33,44,55);
  gaussdb-# begin
  gaussdb$# raise info 'prior:%' ,aa.prior(3);
  gaussdb$# end;
  gaussdb$# /
  INFO:  prior:2

  Example 2: Use the prior function for the variable of the index-by table collection type.

  ```
  gaussdb=# declare
  gaussdb-# type t1 is table of int index by varchar;
  gaussdb-# aa t1;
  gaussdb-# begin
  gaussdb$# aa('ccc') := 111;
  gaussdb$# aa('bbb') := 222;
  gaussdb$# aa('aaa') := 333;
  gaussdb$# raise info 'prior:%' ,aa.prior('bbb');
  gaussdb$# raise info 'prior:%' ,aa.prior('ddd');
  gaussdb$# end;
  gaussdb$# /
  INFO:  prior:aaa
  INFO:  prior:ccc
  ANONYMOUS BLOCK EXECUTE
  ```

- next(idx)

  Parameter: *idx* is of the INT or VARCHAR type.

  Return value: INT or VARCHAR

  Description: Returns the index of a valid element following the given index in a collection.

  Example 1: Use the next function for the variable of the nest-table collection type.

  ```
  gaussdb=# declare
  gaussdb-# type nest is table of int;
  gaussdb-# aa nest:=nest(11,22,33,44,55);
  gaussdb-# begin
  gaussdb$# raise info 'next:%' ,aa.next(3);
  gaussdb$# end;
  gaussdb$# /
  INFO:  next:4
  ANONYMOUS BLOCK EXECUTE
  ```

  Example 2: Use the next function for the variable of the index-by table collection type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# declare
gaussdb-# type t1 is table of int index by int;
gaussdb-# aa t1;
gaussdb-# begin
gaussdb$# aa(3) := 111;
gaussdb$# aa(2) := 222;
gaussdb$# aa(1) := 333;
gaussdb$# raise info 'next:%' ,aa.next(2);
gaussdb$# raise info 'next:%' ,aa.next(-999);
gaussdb$# end;
gaussdb$# /
INFO:  next:3
INFO:  next:1
ANONYMOUS BLOCK EXECUTE
```

- limit

  Parameter: none

  Return value: **NULL**.

  Description: Returns the maximum number of elements that can be stored in a nest-table collection. This function applies only to the array type. The return value is **NULL**.

  Example:

```
gaussdb=# declare
gaussdb-# type nest is table of int;
gaussdb-# aa nest:=nest(11,22,33,44,55);
gaussdb-# begin
gaussdb$# raise info 'limit:%' ,aa.limit;
gaussdb$# end;
gaussdb$# /
INFO:  limit:<NULL>
ANONYMOUS BLOCK EXECUTE
```

Collection-related Functions

- unnest_table (anynesttable) or unnest (anynesttable)

  Parameter: any nest-table collection type.

  Description: Returns the result set of all valid elements in a given nest-table. Multiple rows of data are returned.

  Return type: setof anyelement.

  Example:

```
-- If the element type of the collection is record and any element is NULL, the element is not returned. Instead, a non-null record value is returned. All columns of the record are NULL.
gaussdb=# create or replace procedure p1()
gaussdb-# as
gaussdb$#     type t1 is table of int;
gaussdb$#     v2 t1 := t1(null, 2, 3, 4, null);

10.4.3 Records

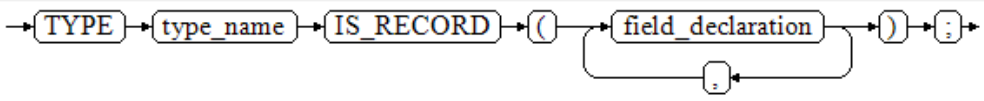
Record Variables

Define a record type and use this type to declare a variable, which is a record variable.

Syntax

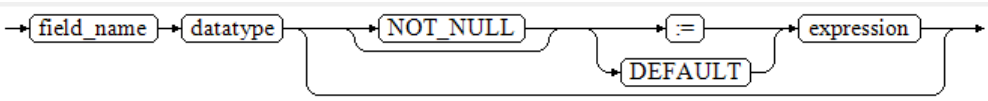
The syntax for defining the record type is as follows:

```
TYPE type_name IS_RECORD (field_declaration [,...] );
```



field_declaration is as follows:

```
field_name datatype [ [NOT_NULL] { := | DEFAULT } expression]
```



The syntax is described as follows:

- *type_name*: specifies the record type.
- *field_name*: specifies member variables of this type.
- *datatype*: specifies data types for the member variables.
- *expression*: specifies the expression for setting a default value.

Constraints

In GaussDB:

- When assigning values to record variables, you can:
  - Declare a record type and define member variables of this type when you declare a function or stored procedure.
  - Assign the value of a record variable to another record variable.
  - Use SELECT INTO or FETCH to assign values to a record type.
  - Assign the **NULL** value to a record variable.
- The record type constructor can use => to assign values. The restrictions are as follows:
  - The => function is used when the record type constructor assigns values. This function is supported only when the ORA-compatible database is used (**sql_compatibility** is set to **'ORA'**).
  - The record type can be defined in a package.
  - The record type constructor uses the => function to assign values. This function is supported only when => is consecutively used to assign values to input parameters, for example, **record_name(elename1 => val1, elename2 => val2, elename3 => val3)** or **record_name(val1, elename2 => val2, elename3 => val3)**. Discontinuous use of => or => is not supported. For example, **record_name(elename1 => val1, elename2 => val2, val3)** or **record_name(val1, elename2 => val2, val3)**, where the last input parameter is not assigned a value.
- The INSERT and UPDATE statements cannot use a record variable to insert or update data.
- The constructor of the record type cannot be used as the default value of a function or stored procedure parameter.
- Just like a variable, a record column of the compound type does not have a default value in the declaration.
- If a member has a record type, the default value of the inner record type cannot be not passed to the outer record type.
- If the GUC parameter **enable_recordtype_check_strict** is set to **on** and the member is of the record type and a column of the record type has the NOT NULL or DEFAULT attribute, an error is reported during stored procedure or package compilation.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- If the GUC parameter **enable_recordtype_check_strict** is set to **on**, a package contains the record type, and a column of the record type has the NOT NULL or DEFAULT attribute, an error is reported during creation or compilation.
- If the GUC parameter **enable_recordtype_check_strict** is set to **on**, the NOT NULL function of the record type in the stored procedure takes effect.
- After the **proc_outparam_override** option is enabled for the GUC parameter **behavior_compat_options**:
  - Functions that contain the **out** output parameter and returns data of the record type can be called using SELECT and CALL in external SQL statements, and can be called using PERFORM and expressions in stored procedures.
  - If the function returns data of the undefined record type, at least one **out** parameter is required. If the function returns data of the defined record type, the **out** parameter is optional. For details, see **Examples**.
  - Functions that contain the **out** output parameter and return data of the composite or record type, ensure that the expected return type of the function is the same as the actual return type.

Examples

```
-- Create a table and insert data into the table.
gaussdb=# create table emp_rec(
gaussdb(#     empno numeric(4,0) not null,
gaussdb(#     ename varchar(10)
gaussdb(# );
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'empno' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# insert into emp_rec values(111, 'aaa'), (222, 'bbb'), (333, 'ccc');
INSERT 0 3
-- The table is defined as follows:
gaussdb=# \d emp_rec
          Table "public.emp_rec"
 Column |         Type          | Modifiers
--------+-----------------------+-----------
 empno  | numeric(4,0)          | not null
 ename  | character varying(10) |

-- Perform record operations in the function.
gaussdb=# CREATE OR REPLACE FUNCTION regress_record(p_w VARCHAR2) RETURNS VARCHAR2 AS $$

10.5 DECLARE Syntax

10.5.1 Basic Structure

Structure

A PL/SQL block can contain a sub-block which can be placed in any section. The following describes the architecture of a PL/SQL block:

- Declaration section: declares variables, types, cursors, and regional stored procedures and functions used in the PL/SQL block.
  ```
  DECLARE
  ```

  NOTE

  This section is optional if no variables need to be declared.

  - An anonymous block may omit the DECLARE keyword if no variable needs to be declared.
  - For a stored procedure, AS is used, which is equivalent to DECLARE. The AS keyword must be reserved even if there is no variable declaration section.
- Execution section: specifies procedure and SQL statements. It is the main section of a program and is required.
  ```
  BEGIN
  ```
- Exception-handling section: processes errors. It is optional.
  ```
  EXCEPTION
  ```
- End: Required.
  ```
  END;
  /
  ```

NOTICE

You are not allowed to use consecutive tabs in the PL/SQL block because they may result in an exception when the gsql tool is executed with the **-r** parameter specified.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Types

PL/SQL blocks are classified into the following types:

- Anonymous block: a dynamic block that can be executed only for once. For details about the syntax, see **Figure 10-3**.
- Subprogram: a stored procedure, function, operator, or advanced package stored in a database. A subprogram created in a database can be called by other programs.

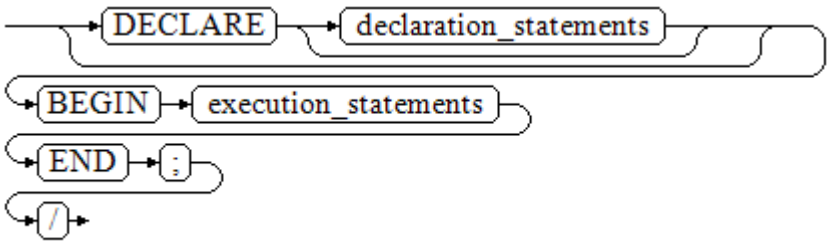
10.5.2 Anonymous Blocks

An anonymous block applies to a script infrequently executed or a one-off activity. An anonymous block is executed in a session and is not stored.

Syntax

Figure 10-3 shows the syntax of an anonymous block.

Figure 10-3 anonymous_block::=



- The execute part of an anonymous block starts with a **BEGIN** statement, has a break with an **END** statement, and ends with a semicolon (;). Type a slash (/) and press **Enter** to execute the statement.

  NOTICE

  The terminator "/" must be written in an independent row.

- The declaration section includes the variable definition, type, and cursor definition.
- A simplest anonymous block does not execute any commands. However, at least one statement, even a **NULL** statement, must be presented in any implementation blocks.

Examples

The following lists basic anonymous block programs:

```
-- Null statement block
gaussdb=# BEGIN
    NULL;
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Display information on the console.
gaussdb=# BEGIN
    dbe_output.print_line('hello world!');
END;
/
hello world!
ANONYMOUS BLOCK EXECUTE
-- Display variable content on the console.
gaussdb=# DECLARE
    my_var VARCHAR2(30);
BEGIN
    my_var :='world';
    dbe_output.print_line('hello'||my_var);
END;
/
helloworld
ANONYMOUS BLOCK EXECUTE
```

10.5.3 Subprograms

A subprogram stores stored procedures, functions, operators, and advanced packages. A subprogram created in a database can be called by other programs.

10.5.3.1 Standalone Subprograms

Subprograms created in a schema include stored procedures, functions, and packages created in a schema.

For details, see:

- **CREATE PACKAGE**
- **CREATE FUNCTION**
- **CREATE PROCEDURE**

10.5.3.2 Package Subprograms

Subprograms created in a package include stored procedures and functions created and declared in a package.

For details, see **CREATE PACKAGE**.

10.5.3.3 Nested Subprograms

Subprograms created in a PL/SQL block include sub-stored-procedures or subfunctions declared and created in anonymous blocks, stored procedures, functions, and stored procedures and functions in packages.

Precautions

- This is used in the ORA compatibility database.
- The maximum number of nesting layers is specified by the **max_subpro_nested_layers** parameter. The default value is **3**, and the value range is 0 to 100. If a nested subprogram contains an anonymous block, the layer of anonymous block is not counted, but the nested subprograms in the anonymous block are counted in the total number of layers.
- Nested subprograms do not support overloading or SETOF.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Nested subprograms cannot be defined as autonomous transactions. They can call stored procedures or functions that contain autonomous transactions.
- Subfunctions (FUNCTION) cannot be directly called and must have return values. Sub-stored-procedures (PROCEDURE) cannot be called in expressions.
- Nested subprograms cannot be called by PERFORM. Dynamic statements cannot contain nested subprograms.
- Currently, only the following modifiers are supported for nested subprograms:
  ```
  {IMMUTABLE  | STABLE  | VOLATILE }
  {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }
  ```
- Only one qualifier can reference a nested subprogram or a variable of a nested subprogram.
- When the return value type of a subfunction (FUNCTION) is the record type customized by the function, subfunc().col cannot be used to access the column attribute of the return value of the subfunction. As a result, an error is reported during execution.
- The declaration of a nested subprogram must be at the end of the declaration part (declare the nested subprogram after the declaration of variables, cursors, and types is complete).
- Nested subprograms can be called only inside declared functions or stored procedures and cannot be used externally.
- The debugger breakpoint is not supported when nested subprograms are used. Step-by-step debugging is supported.
- Other precautions are the same as those for stored procedures and functions.

Syntax

- Syntax format for creating a sub-stored-procedure:
  ```
  PROCEDURE procedure_name [ (parameters) ]
      [{IMMUTABLE  | STABLE  | VOLATILE }
       | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }]
      { IS | AS }
      [ declarations ]
  BEGIN
      plsql_body
  END;
  ```
- Syntax for creating a subfunction:
  ```
  FUNCTION function_name  [ (parameters) ] RETURN rettype
      [{IMMUTABLE  | STABLE  | VOLATILE }
       | {CALLED ON NULL INPUT | RETURNS NULL ON NULL INPUT | STRICT }]
      { IS | AS }
      [ declarations ]
  BEGIN
      plsql_body
  END;
  ```

  In the **declarations** part, you can define the nested subprograms of the lower layer.
- Example:
  ```
  -- Create a stored procedure.
  CREATE OR REPLACE PROCEDURE proc_test() AS
      -- Declare and define a sub-stored-procedure.
      PROCEDURE proc_sub() IS
      BEGIN
          dbe_output.put_line('this is subpragram');
      END;
  BEGIN
      dbe_output.put_line('this is a procedure');
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    -- Call a sub-stored-procedure in an execution block.
    proc_sub();
END;
/
    -- Call a stored procedure externally.
BEGIN
    proc_test;
END;
/
-- Output the result.
this is a procedure
this is subpragram
ANONYMOUS BLOCK EXECUTE
```

Declaration and Definition Rules of Nested Subprograms

- Nested subprograms cannot be declared or defined repeatedly. Overloading is not supported.
- The identifier of a nested subprogram cannot be the same as the variable name or keyword.
- Declaration before definition is supported. The definition of subprogram declared first must be found in the subsequent declaration block.

Calling Rules of Nested Subprograms

- Nested subprograms can call themselves to achieve recursive calling effects.
- Nested subprograms can call upper-layer subprograms.
- Nested subprograms can call locally declared lower-layer subprograms, but cannot call nested subprograms in lower-layer subprograms.
- Nested subprograms can call subprograms declared earlier than themselves at the same layer.

Example:

```
-- Call itself.
CREATE OR REPLACE PROCEDURE proc_test(var1 int) AS
    PROCEDURE proc_sub(var2 int) IS
    BEGIN
        dbe_output.put_line('var = ' || var2);
        IF var2 > 1 THEN
            proc_sub(var2 - 1);
        END IF;
    END;
BEGIN
    proc_sub(var1);
END;
/
BEGIN
    proc_test(3);
END;
/
-- Output the result.
var = 3
var = 2
var = 1

-- Call the upper-layer subprogram.
CREATE OR REPLACE PROCEDURE proc_test(var1 int) AS
    PROCEDURE procsub_1(var2 int) IS
    BEGIN
    proc_test(var2 - 1);
    END;
BEGIN
    dbe_output.put_line('proc_test var1 = ' || var1);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    IF var1 > 1 THEN
        procsub_1(var1);
    END IF;
END;
/
BEGIN
    proc_test(3);
END;
/
-- Output the result.
proc_test var1 = 3
proc_test var1 = 2
proc_test var1 = 1

-- Call the lower-layer subprogram declared locally.
CREATE OR REPLACE PROCEDURE proc_test() AS
    PROCEDURE proc_sub1 IS
        procedure proc_sub2 IS
        BEGIN
            dbe_output.put_line('--this is subpragram2 begin');
            dbe_output.put_line('--this is subpragram2 end');
        END;
    BEGIN
    dbe_output.put_line('this is subpragram1 begin');
    proc_sub2();
    dbe_output.put_line('this is subpragram1 end');
    END;
BEGIN
    dbe_output.put_line('this is a procedure begin');
    proc_sub1();
    dbe_output.put_line('this is a procedure end');
END;
/
BEGIN
    proc_test;
END;
/
-- Output the result.
this is a procedure begin
this is subpragram1 begin
--this is subpragram2 begin
--this is subpragram2 end
this is subpragram1 end
this is a procedure end
```

Variables of Nested Subprograms

Variable types include basic types, record types, TABLE OF types, cursor types, and varray types supported by PL/SQL.

- Accessible variables:
  - Variable declared by itself.
  - Variable declared by the upper-layer subprogram.
- Variable access rules:
  - If a variable does not contain a qualifier, the variable is first searched in the program. If the variable name does not exist, the variable is searched at the upper layer, and so on.
  - If a variable has a qualifier, it is searched in the area of the qualifier. Currently, only one qualifier can be called.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.6 Basic Statements

During PL/SQL programming, you may define some variables, assign values to variables, and call other stored procedures. This chapter describes basic PL/SQL statements, including variable definition statements, value assignment statements, call statements, and return statements.

NOTE

You are advised not to call the SQL statements containing passwords in the stored procedures because authorized users may view the stored procedure file in the database and password information is leaked. If a stored procedure contains other sensitive information, permission to access this procedure must be configured, preventing information leakage.

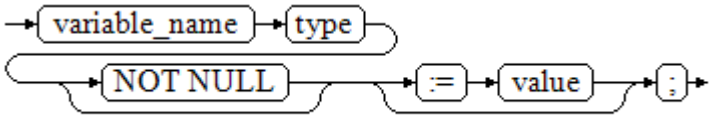
10.6.1 Variable Definition Statements

This section describes the declaration of variables in the PL/SQL and the scope of this variable in codes.

Variable Declaration

Figure 10-4 shows the variable declaration syntax.

Figure 10-4 declare_variable::=



The syntax is described as follows:

- *variable_name* specifies the name of a variable.
- **type** indicates the type of a variable.
- **value** indicates the initial value of the variable. (If the initial value is not given, NULL is taken as the initial value.) **value** can also be an expression.

Example

```
gaussdb=# DECLARE
    emp_id  INTEGER := 7788; -- Define a variable and assign a value to it.
BEGIN
    emp_id := 5*7784; -- Assign a value to the variable.
END;
/
```

In addition to the declaration of basic variable types, **%TYPE** and **%ROWTYPE** can be used to declare variables related to table columns or table structures.

%TYPE Attribute

%TYPE declares a variable to be of the same data type as a previously declared variable (for example, a column in a table). For example, if you want to define the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

my_name variable whose data type is the same as the data type of **firstname** in **employee**, you can define the variable as follows:

```
my_name employee.firstname%TYPE
-- Example
DROP TABLE IF EXISTS employee;
CREATE TABLE employee(firstname varchar,secondname varchar);
DECLARE
    my_name employee.firstname%TYPE;
BEGIN
    my_name = 'abc';
    DBE_OUTPUT.PRINT_LINE(my_name);
END;
/
```

In this way, you do not need to know the data type of **firstname** in **employee**. Even if the data type of **firstname** changes, you do not need to change the data type of *my_name*.

%ROWTYPE Attribute

%ROWTYPE declares data types of a set of data. It stores a row of table data or results fetched from a cursor. For example, if you want to define a set of data with the same column names and column data types as the **employee** table, you can define the data as follows:

```
my_employee employee%ROWTYPE
DROP TABLE IF EXISTS employee;
CREATE TABLE employee(firstname varchar,secondname varchar);
DECLARE
    my_employee employee%ROWTYPE;
BEGIN
    my_employee.firstname := 'ab1';
    my_employee.secondname := 'ab2';
    DBE_OUTPUT.PRINT_LINE(my_employee.firstname);
    DBE_OUTPUT.PRINT_LINE(my_employee.secondname);
END;
/
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- In the environment with multiple CNs, the **%ROWTYPE** and **%TYPE** attributes of the temporary table cannot be declared in a stored procedure. The temporary table is valid only in the current session. During compilation, other CNs cannot view the temporary table of the current CN. Therefore, if there are multiple CNs, the system displays a message indicating that the temporary table does not exist.
- **%TYPE** cannot reference the variables of the record types that are not across packages or the cursor variables of a column type.
- **%ROWTYPE** cannot reference the type of a composite variable or a record variable.
- The non-PACKAGE *record%TYPE* cannot be used as the variable type or input/output parameter type.
- *View%ROWTYPE* or **SCHEMA.***view%ROWTYPE* cannot be used as the input/output parameter type.
- The **PACKAGE.***record%TYPE* or **SCHEMA.PACKAGE.***record%TYPE* cannot be used as the input/output parameter type.
- *Table/View*.**column.***column%TYPE* or **SCHEMA.***Table/View*.**column.***column%TYPE* cannot be nested with one or more layers as variable types or input/output parameter type.
- *Record*.**column.***column%TYPE* and **PACKAGE.***record*.**column.***column%TYPE* cannot be nested with a column type of records at one or more layers as the variable type or input/output parameter type.
- The cursor variable of more levels, such as **PACKAGE.***cursor%ROWTYPE* and **SCHEMA.PACKAGE.***cursor%ROWTYPE*, cannot be used as the parameter type or input/output parameter type.
- When **%TYPE** is used to obtain the type from *record*.**column** and such type is defined by **%TYPE**, the constraint of the original type (such as NUMBER(3) and VARCHAR2(10)) are not retained.

Scope of a Variable

The scope of a variable indicates the accessibility and availability of the variable in code block. In other words, a variable takes effect only within its scope.

- To define a function scope, a variable must declare and create a **BEGIN-END** block in the declaration section. The necessity of such declaration is also determined by block structure, which requires that a variable has different scopes and lifetime during a process.
- A variable can be defined multiple times in different scopes, and inner definition can cover outer one.
- A variable defined in an outer block can also be used in a nested block. However, the outer block cannot access variables in the nested block.

Example

```
gaussdb=# DECLARE
    emp_id  INTEGER :=7788; -- Define a variable and assign a value to it.
    outer_var  INTEGER :=6688; -- Define a variable and assign a value to it.
BEGIN
    DECLARE
        emp_id INTEGER :=7799; -- Define a variable and assign a value to it.
        inner_var  INTEGER :=6688; -- Define a variable and assign a value to it.
    BEGIN
        dbe_output.print_line('inner emp_id ='||emp_id); -- Display the value 7799.
        dbe_output.print_line('outer_var ='||outer_var); -- Reference a variable of an outer block.
    END;
    dbe_output.print_line('outer emp_id ='||emp_id); -- Display the value 7788.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
/
```

10.6.2 Assignment Statements

Variable Syntax

Figure 10-5 shows the syntax for assigning a value to a variable.

Figure 10-5 assignment_value::=

The syntax is described as follows:

- *variable_name* specifies the name of a variable.
- **value** can be a value or an expression. The type of **value** must be compatible with the type of *variable_name*.

Variable Value Assignment Example

```
DECLARE
    emp_id  INTEGER := 7788; -- Assign a value.
BEGIN
    emp_id := 5; -- Assign a value.
    DBE_OUTPUT.PRINT_LINE(emp_id);
    emp_id := 5*7784;
    DBE_OUTPUT.PRINT_LINE(emp_id);
END;
/
-- The result is as follows:
5
38920
ANONYMOUS BLOCK EXECUTE
```

INTO/BULK COLLECT INTO

Values returned by statements in a stored procedure are stored in variables. BULK COLLECT INTO allows some or all returned values to be temporarily stored in an array.

Syntax

```
SELECT select_expressions INTO [STRICT] target FROM ...
SELECT INTO [STRICT] target [FROM ..]
EXECUTE [IMMEDIATE] select_expressions BULK COLLECT INTO target ...
```

The syntax is described as follows:

- **select_expressions**: SQL statement for query. You can use basic SQL commands and INTO clauses to assign the result of a single row or multiple columns to a variable (such as record, row, or scalar variable list).
- **target**: target variable, which can be a record variable, a row variable, or a comma-separated list of simple variables and record/row fields.
- **STRICT** (Optional): If the GUC parameter **behavior_compat_options** is set to **'select_into_return_null'** (disabled by default) and the **STRICT** option is specified, the query must return a non-empty result set. Otherwise, an error is

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

reported: "NO_DATA_FOUND", "TOO_MANY_ROWS" or "QUERY_RETURNED_NO_ROWS". If the option is not specified, the empty result set can be returned.

NOTE

- BULK COLLECT INTO can assign values to arrays or collection in batches. Use the **LIMIT** column properly to prevent performance deterioration caused by excessive data operations.
- INTO and BULK COLLECT INTO support only direct nesting of record type value with less than four layers.
- To return an empty result set, you need to enable PG-compatible mode during database initialization. Set the GUC parameter **behavior_compat_options** to **'select_into_return_null'**, the compatibility mode is enabled. If the GUC parameter **behavior_compat_options** is not set, the compatibility mode is disabled.
- For array variables, elements in parentheses () are preferentially identified as index sets. Therefore, expressions with parentheses cannot be written after array variables. For example, **SELECT (1+3) INTO va(5)** cannot be written as **SELECT INTO va(5) (1+3)** or **SELECT INTO va[5] (1+3)**.
- BULK COLLECT INTO can be used only in the ORA-compatible database.
- The IMMEDIATE keyword is used only for syntax compatibility and has no actual meaning.

Examples

```
gaussdb=# DROP TABLE IF EXISTS customers;
gaussdb=# CREATE TABLE customers(id int,name varchar);
gaussdb=# INSERT INTO customers VALUES(1,'ab');
gaussdb=# DECLARE
    my_id integer;
BEGIN
    select id into my_id from customers limit 1; -- Assign a value.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=# DECLARE
    type id_list is varray(6) of customers.id%type;
    id_arr id_list;
BEGIN
    select id bulk collect into id_arr from customers order by id DESC limit 20; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
gaussdb=#  DECLARE
    TYPE id_list IS varray(6) OF customers.id%type;
    id_arr id_list;
    sql_qry varchar2(150);
BEGIN
    sql_qry := 'SELECT id FROM customers ORDER BY id DESC LIMIT 20';
    EXECUTE IMMEDIATE sql_qry BULK COLLECT INTO id_arr; -- Assign values in batches.
END;
/
ANONYMOUS BLOCK EXECUTE
```

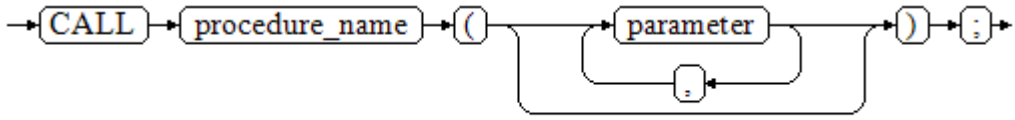
10.6.3 Call Statements

Syntax

Figure 10-6 shows the syntax diagram for calling a clause.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-6 call_clause::=



The above syntax diagram is explained as follows:

- *procedure_name*: specifies the name of a stored procedure.
- *parameter*: specifies the parameters for the stored procedure. You can set no parameter or multiple parameters.

Examples

```
-- Create a table.
gaussdb=# CREATE SCHEMA hr;
gaussdb=# SET CURRENT_SCHEMA = hr;
gaussdb=# CREATE TABLE staffs
(
  section_id INTEGER,
  salary INTEGER
);
gaussdb=# INSERT INTO staffs VALUES (30, 10);
gaussdb=# INSERT INTO staffs VALUES (30, 20);

-- Create the stored procedure proc_staffs.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_staffs
(vIM
section     NUMBER(6),
salary_sum out NUMBER(8,2),
staffs_count out INTEGER
)
IS
BEGIN
SELECT sum(salary), count(*) INTO salary_sum, staffs_count FROM hr.staffs where section_id = section;
END;
/
CREATE PROCEDURE
-- Create the stored procedure proc_return.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_return
AS
v_num NUMBER(8,2);
v_sum INTEGER;
BEGIN
proc_staffs(30, v_sum, v_num);  --Call a statement.
dbe_output.print_line(v_sum||'#'||v_num);
RETURN;  --Return a statement.
END;
/
CREATE PROCEDURE
-- Invoke the stored procedure proc_return.
gaussdb=# CALL proc_return();
30#2.00
 proc_return
-------------

(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_staffs;
gaussdb=# DROP PROCEDURE proc_return;

--Create the function func_return.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE OR REPLACE FUNCTION func_return returns void
language plpgsql
AS $$
DECLARE
v_num INTEGER := 1;
BEGIN
dbe_output.print_line(v_num);
RETURN;  --Return a statement.
END $$;
CREATE FUNCTION

-- Call the function func_return.
gaussdb=# CALL func_return();
1
 func_return
-------------

(1 row)

-- Drop the function.
gaussdb=# DROP FUNCTION func_return;

-- Clear the current database mode.
gaussdb=# DROP SCHEMA hr CASCADE;
```

10.7 Dynamic Statements

10.7.1 Executing Dynamic Query Statements

This section describes how to execute dynamic query statements. GaussDB provides two methods for dynamic query: EXECUTE IMMEDIATE and OPEN FOR. The former dynamically executes SELECT statements while the latter combines the use of cursors. If you need to store query results in a dataset, use OPEN FOR.

EXECUTE IMMEDIATE

Figure 10-7 shows the syntax diagram.

Figure 10-7 EXECUTE IMMEDIATE dynamic_select_clause::=

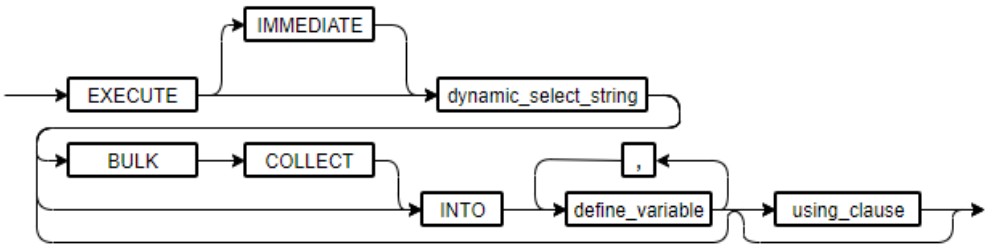


Figure 10-8 shows the syntax diagram for **using_clause**.

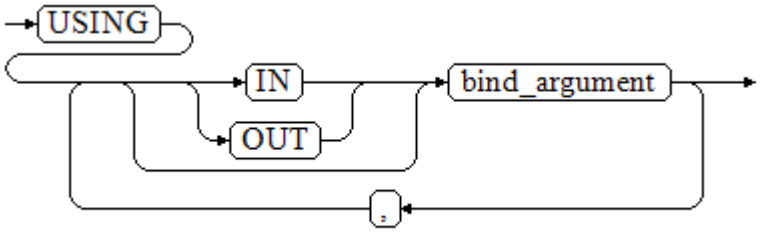
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-8 using_clause::=



The syntax is described as follows:

- **define_variable**: specifies a variable to store query results.
- **USING IN** *bind_argument*: specifies the variable whose value is passed to the dynamic SQL statement. The variable is used when a dynamic placeholder exists in *dynamic_select_string*.
- **USING OUT** *bind_argument*: specifies the variable that stores a value returned by the dynamic SQL statement.

NOTICE

- In query statements, INTO and OUT cannot coexist.
- A placeholder name starts with a colon (:) and can be followed by digits, characters, or character strings (quoted digits, characters, or character strings cannot be used). A placeholder name corresponds to *bind_argument* in the USING clause.
- *bind_argument* can only be a value, variable, or expression. It cannot be a database object such as a table name, column name, and data type. That is, *bind_argument* cannot be used to transfer schema objects for dynamic SQL statements. If a stored procedure needs to transfer database objects by declaring the parameter to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object.
- A dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument* in the USING clause. When the GUC parameter **behavior_compat_options** is set to **dynamic_sql_compat**, the bind arguments in the USING clause are matched in sequence based on the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder.
- The IMMEDIATE keyword is used only for syntax compatibility and has no actual meaning.

Example:

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
gaussdb=# CREATE SCHEMA hr;
gaussdb=# SET CURRENT_SCHEMA = hr;
gaussdb=# CREATE TABLE staffs
(
  staff_id NUMBER,
  first_name VARCHAR2,
  salary NUMBER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
);
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);
gaussdb=# INSERT INTO staffs VALUES (201, 'lily', 3000);
gaussdb=# INSERT INTO staffs VALUES (202, 'john', 4400);

-- Retrieve values from dynamic statements (INTO clause).
gaussdb=# DECLARE
   staff_count  VARCHAR2(20);
BEGIN
   EXECUTE IMMEDIATE 'select count(*) from hr.staffs'
      INTO staff_count;
   dbe_output.print_line(staff_count);
END;
/
3
ANONYMOUS BLOCK EXECUTE
-- Pass and retrieve values (the INTO clause is used before the USING clause).
gaussdb=# CREATE OR REPLACE PROCEDURE dynamic_proc
AS
   staff_id     NUMBER(6) := 200;
   first_name   VARCHAR2(20);
   salary       NUMBER(8,2);
BEGIN
   EXECUTE IMMEDIATE 'select first_name, salary from hr.staffs where staff_id = :1'
      INTO first_name, salary
      USING IN staff_id;
   dbe_output.print_line(first_name || ' ' || salary);
END;
/
CREATE PROCEDURE
-- Call the stored procedure.
gaussdb=# CALL dynamic_proc();
mike 5800.00
 dynamic_proc
--------------

(1 row)

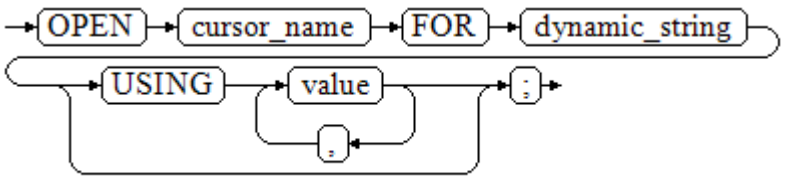
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE dynamic_proc;
```

OPEN FOR

Dynamic query statements can be executed by using OPEN FOR to open dynamic cursors.

Figure 10-9 shows the syntax diagram.

Figure 10-9 open_for::=



Parameter description:

- *cursor_name*: specifies the name of the cursor to be opened.
- *dynamic_string*: specifies the dynamic query statement.
- **USING** *value*: applies when a placeholder exists in *dynamic_string*.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

For details about use of cursors, see **Cursors**.

Example:

```
gaussdb=# CREATE SCHEMA hr;
gaussdb=# SET CURRENT_SCHEMA = hr;
gaussdb=# DROP TABLE IF EXISTS staffs;
gaussdb=# CREATE TABLE staffs
(
  section_id NUMBER,
  first_name VARCHAR2,
  phone_number VARCHAR2,
  salary NUMBER
  );
gaussdb=# INSERT INTO staffs VALUES (30, 'mike', '13567829252', 5800);
gaussdb=# INSERT INTO staffs VALUES (40, 'john', '17896354637', 4000);

gaussdb=# DECLARE
    name          VARCHAR2(20);
    phone_number  VARCHAR2(20);
    salary        NUMBER(8,2);
    sqlstr        VARCHAR2(1024);

    TYPE app_ref_cur_type IS REF CURSOR; -- Define the cursor type.
    my_cur app_ref_cur_type; -- Define the cursor variable.

BEGIN
    sqlstr := 'select first_name,phone_number,salary from hr.staffs
        where section_id = :1';
    OPEN my_cur FOR sqlstr USING '30'; -- Open the cursor. USING is optional.
    FETCH my_cur INTO name, phone_number, salary; -- Retrieve the data.
    WHILE my_cur%FOUND LOOP
         dbe_output.print_line(name||'#'||phone_number||'#'||salary);
         FETCH my_cur INTO name, phone_number, salary;
    END LOOP;
    CLOSE my_cur; -- Close the cursor.
END;
/
mike#13567829252#5800.00
ANONYMOUS BLOCK EXECUTE
gaussdb=# DROP TABLE staffs;
```

10.7.2 Executing Dynamic Non-Query Statements

Syntax

Figure 10-10 shows the syntax diagram.

Figure 10-10 noselect::=

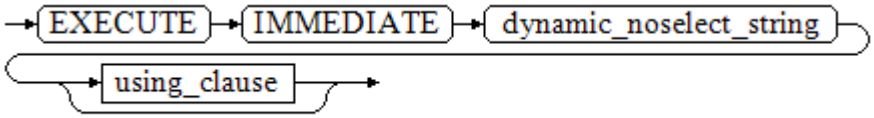


Figure 10-11 shows the syntax diagram for **using_clause**.

Figure 10-11 using_clause::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The above syntax diagram is explained as follows:

USING IN *bind_argument* is used to specify the variable whose value is passed to the dynamic SQL statement. The variable is used when a placeholder exists in *dynamic_noselect_string*. That is, a placeholder is replaced by the corresponding *bind_argument* when a dynamic SQL statement is executed. Note that *bind_argument* can only be a value, variable, or expression, and cannot be a database object such as a table name, column name, and data type. If a stored procedure needs to transfer database objects by declaring the parameter to construct dynamic SQL statements (generally, DDL statements), you are advised to use double vertical bars (||) to concatenate *dynamic_select_clause* with a database object. In addition, a dynamic PL/SQL block allows duplicate placeholders. That is, a placeholder can correspond to only one *bind_argument*. When the GUC parameter **behavior_compat_options** is set to **dynamic_sql_compat**, the *bind_argument* in the USING clause is matched in the placeholder sequence. Duplicate placeholders will not be identified as the same placeholder (placeholder names cannot contain quoted digits, characters, or strings).

Examples

```
-- Create a table.
gaussdb=# CREATE TABLE sections_t1
(
  section       NUMBER(4) ,
  section_name  VARCHAR2(30),
  manager_id    NUMBER(6),
  place_id      NUMBER(4)
)
DISTRIBUTE BY hash(manager_id);

-- Declare a variable.
gaussdb=# DECLARE
  section       NUMBER(4) := 280;
  section_name  VARCHAR2(30) := 'Info support';
  manager_id    NUMBER(6) := 103;
  place_id      NUMBER(4) := 1400;
  new_colname   VARCHAR2(10) := 'sec_name';
BEGIN
-- Execute the query.
    EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :4)'
       USING section, section_name, manager_id,place_id;
-- Execute the query (duplicate placeholders).
    EXECUTE IMMEDIATE 'insert into sections_t1 values(:1, :2, :3, :1)'
       USING section, section_name, manager_id;
-- Run the ALTER statement. You are advised to use double vertical bars (||) to concatenate the dynamic
DDL statement with a database object.
    EXECUTE IMMEDIATE 'alter table sections_t1 rename section_name to ' || new_colname;
END;
/
ANONYMOUS BLOCK EXECUTE
-- Query data.
gaussdb=# SELECT * FROM sections_t1;
 section |   sec_name   | manager_id | place_id
---------+--------------+------------+----------
     280 | Info support |        103 |     1400
     280 | Info support |        103 |      280
(2 rows)

-- Delete the table.
gaussdb=# DROP TABLE sections_t1;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.7.3 Dynamically Calling Stored Procedures

This section describes how to dynamically call store procedures. You must use anonymous statement blocks to package stored procedures or statement blocks and append IN and OUT behind the EXECUTE IMMEDIATE...USING statement to input and output parameters.

Syntax

Figure 10-12 shows the syntax diagram.

Figure 10-12 call_procedure::=

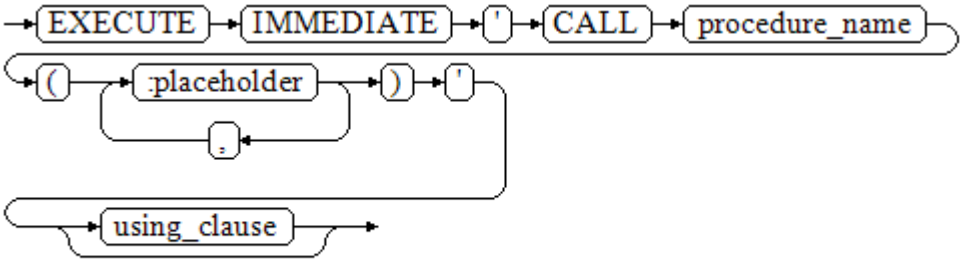

Figure 10-13 shows the syntax diagram for **using_clause**.

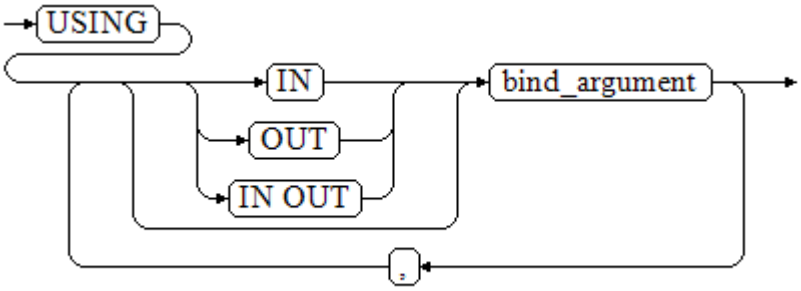
Figure 10-13 using_clause::=



The above syntax diagram is explained as follows:

- **CALL** *procedure_name*: calls the stored procedure.
- **[:placeholder1,:placeholder2, ...]**: indicates the list of placeholders for stored procedure parameters. Placeholder names cannot contain quoted digits, characters, or character strings. The numbers of the placeholders and parameters are the same.
- **USING [IN|OUT|IN OUT]** *bind_argument*: specifies the variable whose value is passed to the stored procedure parameter. The modifiers in front of *bind_argument* and of the corresponding parameter are the same.
- When a stored procedure is called, => cannot be used to skip parameters.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Create the stored procedure proc_add.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_add
(
    param1    in   INTEGER,
    param2    out  INTEGER,
    param3    in   INTEGER
)
AS
BEGIN
   param2:= param1 + param3;
END;
/

gaussdb=# DECLARE
    input1 INTEGER:=1;
    input2 INTEGER:=2;
    statement  VARCHAR2(200);
    param2     INTEGER;
BEGIN
   -- Declare the call statement.
    statement := 'call proc_add(:col_1, :col_2, :col_3)';
   -- Execute the statement.
    EXECUTE IMMEDIATE statement
        USING IN input1, OUT param2, IN input2;
    dbe_output.print_line('result is: '||to_char(param2));
END;
/
result is: 3
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_add;
```

10.7.4 Dynamically Calling Anonymous Blocks

This section describes how to execute anonymous blocks in dynamic statements. Append IN and OUT behind the EXECUTE IMMEDIATE...USING statement to input and output parameters.

Syntax

Figure 10-14 shows the syntax for dynamically calling an anonymous block.

Figure 10-14 call_anonymous_block::=

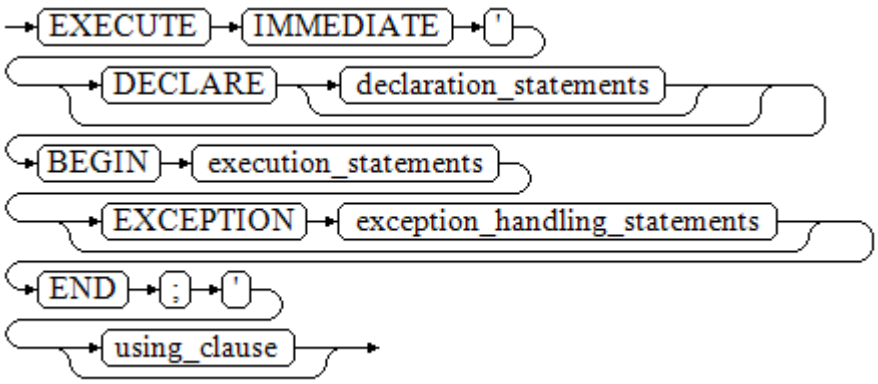


Figure 10-15 shows the syntax diagram for using_clause.

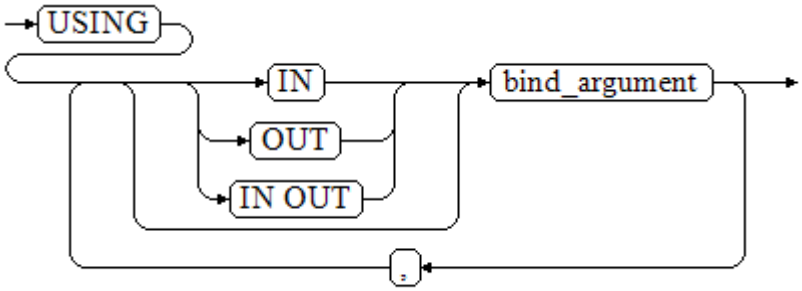
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-15 using_clause::=



The syntax is described as follows:

- The execution section of an anonymous block starts with a BEGIN statement, has a break with an END statement, and ends with a semicolon (;).
- **USING [IN|OUT|IN OUT]** *bind_argument*: specifies the variable whose value is passed to the stored procedure parameter. The modifiers in front of *bind_argument* and of the corresponding parameter are the same.
- The input and output parameters in the middle of an anonymous block are designated by placeholders. The numbers of the placeholders and parameters are the same. The sequences of the parameters corresponding to the placeholders and the USING parameters are the same.

NOTICE

- Parameters can be bound only when SQL statements and stored procedures are called in anonymous blocks. For example, expressions and cursors are used in anonymous blocks, and dynamic statements are called in nested mode in anonymous blocks.
- Output parameters cannot be bound when the SELECT INTO statement in an anonymous block calls FUNCTION/PROCEDURE that contains output parameters.
- Variables declared in an anonymous block and binding parameters cannot be used in the same statement at the same time.
- The PERFORM keyword cannot be used to call a stored procedure when parameters are bound.
- When a stored procedure is called, only bound parameters can be used as input and output parameters. Expressions (for example, 1+:va) cannot be used as input and output parameters. In addition, placeholder names cannot contain quoted digits, characters, or character strings.
- The IMMEDIATE keyword is used only for syntax compatibility and has no actual meaning.
- When the bound input parameter type is refcursor, the modification in the stored procedure is isolated from the input parameter.
- When the **dynamic_sql_check** parameter is enabled and the number of placeholders is the same as the number of parameters, an error is reported if placeholders with the same name are used as anonymous block parameters. In this case, you need to rename the placeholders. For details, see **Examples**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
gaussdb=# DROP SCHEMA IF EXISTS hr CASCADE;
gaussdb=# CREATE SCHEMA hr;
CREATE SCHEMA
gaussdb=# SET CURRENT_SCHEMA = hr;
SET
gaussdb=# CREATE TABLE staffs
(
  staff_id NUMBER,
  first_name VARCHAR2,
  salary NUMBER
);
CREATE TABLE
gaussdb=# INSERT INTO staffs VALUES (200, 'mike', 5800);

10.8 Control Statements

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

10.8.1 RETURN Statements

In GaussDB, data can be returned in either of the following ways: **RETURN**, **RETURN NEXT**, or **RETURN QUERY**. **RETURN NEXT** and **RETURN QUERY** are used only for functions and cannot be used for stored procedures.

10.8.1.1 RETURN

Syntax

Figure 10-16 shows the syntax diagram for a return statement.

Figure 10-16 return_clause::=

The above syntax diagram is explained as follows:

Assign the result returned by a stored procedure or function to the caller.

Examples

See **Examples** for call statement examples.

10.8.1.2 RETURN NEXT and RETURN QUERY

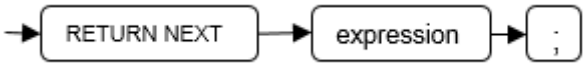
Syntax

When creating a function, specify **SETOF** *datatype* for the return values.

- return_next_clause::=

  Figure 10-17 shows the return_next_clause::= statement.

  Figure 10-17 return_next_clause::=

- return_query_clause::=

  Figure 10-18 shows the return_query_clause::= statement.

  Figure 10-18 return_query_clause::=

If a function needs to return a result set, use RETURN NEXT or RETURN QUERY to add results to the result set, and then continue to execute the next statement of the function. As the RETURN NEXT or RETURN QUERY statement is executed repeatedly, more and more results will be added to the result set. After the function is executed, all results are returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

RETURN NEXT can be used for scalar and compound data types.

RETURN QUERY has a variant RETURN QUERY EXECUTE. You can add dynamic queries and add parameters to the queries by USING.

Examples

```
gaussdb=# DROP TABLE t1;
gaussdb=# CREATE TABLE t1(a int);
gaussdb=# INSERT INTO t1 VALUES(1),(10);

--RETURN NEXT
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_next() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  FOR r IN select * from t1
  LOOP
    RETURN NEXT r;
  END LOOP;
  RETURN;
END;
$$ LANGUAGE plpgsql;
gaussdb=# call fun_for_return_next();
 a
---
 1
 10
(2 rows)

-- RETURN QUERY
gaussdb=# CREATE OR REPLACE FUNCTION fun_for_return_query() RETURNS SETOF t1 AS $$
DECLARE
  r t1%ROWTYPE;
BEGIN
  RETURN QUERY select * from t1;
END;
$$
language plpgsql;
gaussdb=# call fun_for_return_query();
 a
---
 1
 10
(2 rows)
```

10.8.2 Conditional Statements

Conditional statements are used to decide whether given conditions are met. Operations are executed based on the decisions made.

GaussDB supports five usages of IF:

- IF_THEN

  Figure 10-19 shows the IF_THEN::= statement.

  Figure 10-19 IF_THEN::=

  
 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

IF_THEN is the simplest form of IF. If the condition is true, statements are executed. If it is false, they are skipped.

Example:

```
gaussdb=# DECLARE
    v_user_id integer default 1;
BEGIN
IF v_user_id <> 0 THEN
    raise info 'v_user_id is NOT 0';
END IF;
END;
/
INFO:  v_user_id is NOT 0
```

- IF_THEN_ELSE

  Figure 10-20 shows the IF_THEN_ELSE::= statement.

  Figure 10-20 IF_THEN_ELSE::=

  
  IF_THEN_ELSE has an ELSE branch and can be executed if the condition is false.

  Example:

```
gaussdb=# DECLARE
    v_user_id integer default 0;
BEGIN
    IF v_user_id <> 0 THEN
        raise info 'v_user_id is NOT 0';
    ELSE
        raise info 'v_user_id is 0';
    END IF;
END;
/
INFO:  v_user_id is 0
```

- IF_THEN_ELSE IF

  IF statements can be nested in the following way:

```
gaussdb=# DECLARE
    v_user_id integer default 1;
BEGIN
    IF v_user_id = 0 THEN
        raise info 'v_user_id is  0';
    ELSE
        IF v_user_id > 0 THEN
            raise info 'v_user_id > 0';
        END IF;
    END IF;
END;
/
INFO:  v_user_id > 0
```

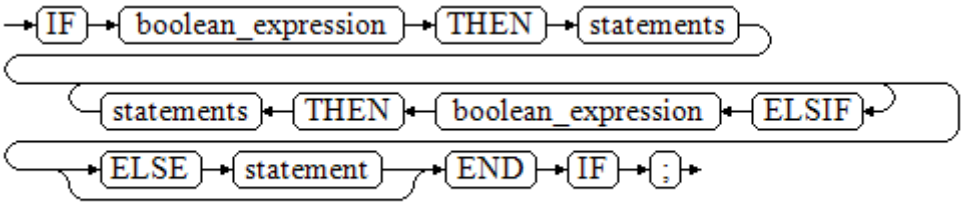
  Actually, this is a way of an IF statement nesting in the ELSE part of another IF statement. Therefore, an END IF statement is required for each nesting IF statement and another END IF statement is required to end the parent IF-ELSE statement. To set multiple options, use the following form:

- IF_THEN_ELSIF_ELSE

  Figure 10-21 shows the IF_THEN_ELSIF_ELSE::= statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-21 IF_THEN_ELSIF_ELSE::=



Example:

```
gaussdb=# DECLARE
    v_user_id integer default NULL;
BEGIN
    IF v_user_id = 0 THEN
        raise info 'v_user_id is  0';
    ELSIF v_user_id > 0 THEN
        raise info 'v_user_id > 0';
    ELSIF v_user_id < 0 THEN
        raise info 'v_user_id < 0';
    ELSE
        raise info 'v_user_id is NULL';
    END IF;
END;
/
INFO:  v_user_id is NULL
```

- IF_THEN_ELSEIF_ELSE

  ELSEIF is an alias of ELSIF.

  Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_control_structure(i in integer)
AS
    BEGIN
        IF i > 0 THEN
            raise info 'i:% is greater than 0. ',i;
        ELSIF i < 0 THEN
            raise info 'i:% is smaller than 0. ',i;
        ELSE

10.8.3 Loop Statements

Simple LOOP Statements

Syntax diagram

Figure 10-22 shows the loop::= statement.

Figure 10-22 loop::=

Figure 10-23 shows the label declaration ::= statement.

Figure 10-23 label declaration ::=

Example

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_loop(i in integer, count out integer)
AS
    BEGIN
        count:=0;
        LOOP
        IF count > i THEN
            raise info 'count is %. ', count;
            EXIT;
        ELSE
            count:=count+1;
        END IF;
        END LOOP;
    END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_loop(10,5);
INFO:  count is 11.
 count
-------
    11
(1 row)
```

NOTICE

The loop must be exploited together with EXIT; otherwise, a dead loop occurs.

WHILE_LOOP Statements

Syntax diagram

Figure 10-24 shows the while_loop::= statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-24 while_loop::=

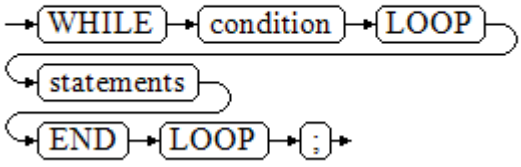

Figure 10-25 shows the label declaration ::= statement.

Figure 10-25 label declaration ::=

If the conditional expression is true, a series of statements in the WHILE statement are repeatedly executed and the condition is decided each time the loop body is executed.

Example

```
gaussdb=# CREATE TABLE integertable(c1 integer) DISTRIBUTE BY hash(c1);
CREATE TABLE
gaussdb=# CREATE OR REPLACE PROCEDURE proc_while_loop(maxval in integer)
AS
    DECLARE
    i int :=1;
    BEGIN
        WHILE i < maxval LOOP
            INSERT INTO integertable VALUES(i);
            i:=i+1;
        END LOOP;
    END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_while_loop(10);
 proc_while_loop
-----------------

(1 row)

-- Drop the stored procedure and table.
gaussdb=# DROP PROCEDURE proc_while_loop;
DROP PROCEDURE

gaussdb=# DROP TABLE integertable;
DROP TABLE
```

FOR_LOOP (integer Variable) Statements

Syntax diagram

Figure 10-26 shows the for_loop::= statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-26 for_loop::=

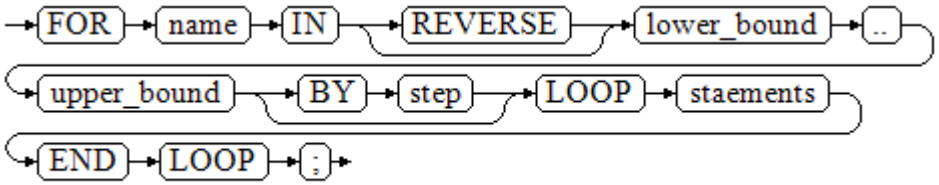

Figure 10-27 shows the label declaration ::= statement.

Figure 10-27 label declaration ::=

NOTE

- The variable *name* is automatically defined as the integer type and exists only in this loop. The value of *name* ranges from **lower_bound** to **upper_bound**.
- When the keyword REVERSE is used, the lower bound must be greater than or equal to the upper bound; otherwise, the loop body is not executed.

Example

```
-- Loop from 0 to 5.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_for_loop()
AS
    BEGIN
    FOR I IN 0..5 LOOP
        DBE_OUTPUT.PRINT_LINE('It is '||to_char(I) || ' time;') ;
    END LOOP;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_for_loop();
It is 0 time;
It is 1 time;
It is 2 time;
It is 3 time;
It is 4 time;
It is 5 time;
 proc_for_loop
---------------

(1 row)

-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE proc_for_loop;
DROP PROCEDURE
```

FOR_LOOP Query Statements

Syntax diagram

Figure 10-28 shows the for_loop_query::= statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-28 for_loop_query::=

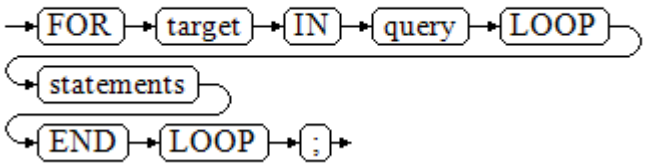

Figure 10-29 shows the label declaration ::= statement.

Figure 10-29 label declaration ::=

NOTE

- The variable *target* is automatically defined, its type is the same as that in the query result, and it is valid only in this loop. The value of *target* is the query result.
- You can use EXECUTE to add a dynamic query and use USING to insert parameters to the query. For details, see the dynamic query content in **Example**.

Example

```
-- Display the query result from the loop.
gaussdb=# CREATE OR REPLACE PROCEDURE proc_for_loop_query()
AS
    record VARCHAR2(50);
BEGIN
    FOR record IN SELECT spcname FROM pg_tablespace LOOP
    dbe_output.print_line(record);
    END LOOP;
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_for_loop_query();
pg_default
pg_global
 proc_for_loop_query
---------------------

(1 row)

-- Drop the stored procedure.
gaussdb=# DROP PROCEDURE proc_for_loop_query;
DROP PROCEDURE

-- Dynamic query.
gaussdb=# CREATE TABLE t1(id int);
gaussdb=# INSERT INTO t1 VALUES(1);
gaussdb=#
DECLARE
a int := 1;
item t1%rowtype;
BEGIN
    FOR item IN EXECUTE 'SELECT * FROM t1 WHERE id = :1' USING a LOOP
        RAISE INFO '%', item;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
   END LOOP;
END;
/
INFO:  (1)
ANONYMOUS BLOCK EXECUTE
gaussdb=# DROP TABLE t1;
```

FORALL Batch Query Statements

Syntax diagram

Figure 10-30 shows the forall::= statement.

Figure 10-30 forall::=

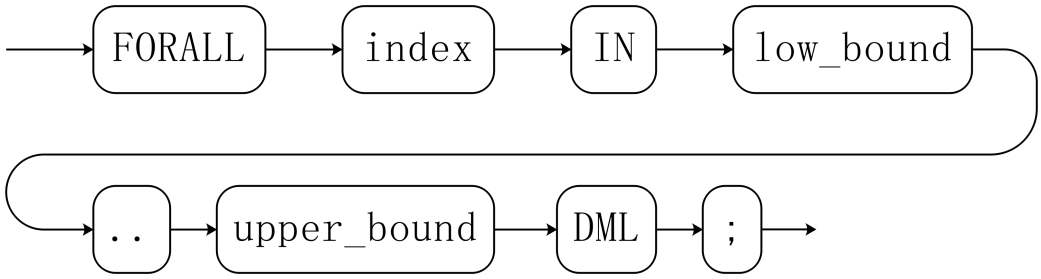

Figure 10-31 shows the label declaration:: statement.

Figure 10-31 label declaration ::=

NOTE

- The variable *index* is automatically defined as the integer type and exists only in this loop. The value of *index* ranges from **low_bound** to **upper_bound**.
- When FORALL is used together with BULK COLLECT INTO, the INTO variable returns only the execution result of a single DML statement.

Example

```
gaussdb=# CREATE TABLE TEST_t1 (
  title NUMBER(6),
  did VARCHAR2(20),
  data_period VARCHAR2(25),
  kind VARCHAR2(25),
  interval VARCHAR2(20),
  time DATE,
  isModified VARCHAR2(10)
)
DISTRIBUTE BY hash(did);
CREATE TABLE

gaussdb=# INSERT INTO TEST_t1 VALUES( 8, 'Donald', 'OConnell', 'DOCONNEL', '650.507.9833',
to_date('21-06-1999', 'dd-mm-yyyy'), 'SH_CLERK' );
INSERT 0 1
gaussdb=# CREATE OR REPLACE PROCEDURE proc_forall()
AS
BEGIN
   FORALL i IN 100..120
      update TEST_t1 set title = title + 100*i;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
gaussdb=# CALL proc_forall();
 proc_forall
-------------

(1 row)

-- Query the calling result of the stored procedure.
gaussdb=# SELECT * FROM TEST_t1;
 title  |  did   | data_period |   kind   |   interval   |        time         | ismodified
--------+--------+-------------+----------+--------------+---------------------+------------
 231008 | Donald | OConnell    | DOCONNEL | 650.507.9833 | 1999-06-21 00:00:00 | SH_CLERK
(1 row)

-- Drop the stored procedure and table.
gaussdb=# DROP PROCEDURE proc_forall;
DROP PROCEDURE

gaussdb=# DROP TABLE TEST_t1;
DROP TABLE
```

10.8.4 Branch Statements

Syntax

Figure 10-32 shows the syntax diagram for a return statement.

Figure 10-32 case_when::=

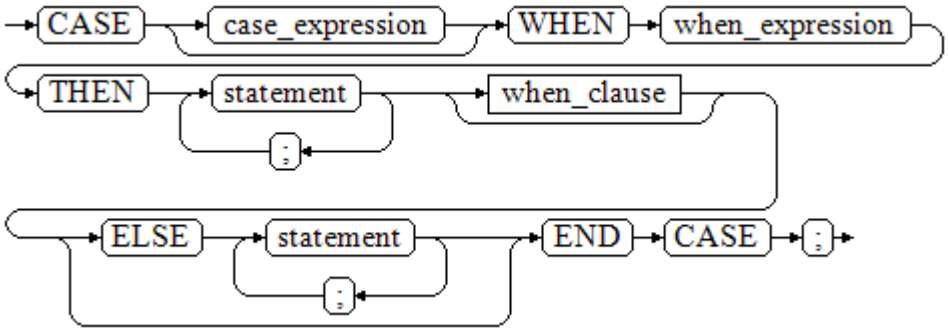

Figure 10-33 shows the syntax diagram for when_clause.

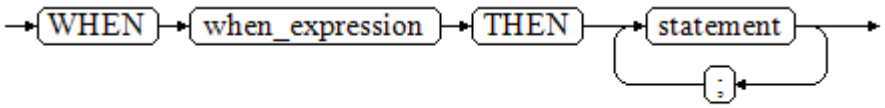
Figure 10-33 when_clause::=



Parameter description:

- *case_expression*: specifies the variable or expression.
- *when_expression*: specifies the constant or conditional expression.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- *statement*: specifies the statement to be executed.

Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE proc_case_branch(pi_result in integer, pi_return out integer)
AS
   BEGIN
      CASE pi_result
         WHEN 1 THEN
            pi_return := 111;
         WHEN 2 THEN
            pi_return := 222;
         WHEN 3 THEN
            pi_return := 333;
         WHEN 6 THEN
            pi_return := 444;
         WHEN 7 THEN
            pi_return := 555;
         WHEN 8 THEN
            pi_return := 666;
         WHEN 9 THEN
            pi_return := 777;
         WHEN 10 THEN
            pi_return := 888;
         ELSE
            pi_return := 999;
      END CASE;
      raise info 'pi_return : %',pi_return ;
END;
/
CREATE PROCEDURE

gaussdb=# CALL proc_case_branch(3,0);
INFO:  pi_return : 333
 pi_return
-----------
       333
(1 row)

-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_case_branch;
DROP PROCEDURE
```

10.8.5 NULL Statements

In PL/SQL programs, NULL statements are used to indicate "nothing should be done", equal to placeholders. They grant meanings to some statements and improve program readability.

Syntax

The following shows example use of NULL statements:

```
DECLARE
   ...
BEGIN
   ...
   IF v_num IS NULL THEN
      NULL; -- No data needs to be processed.
   END IF;
END;
/
```

Parameter description:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- *v_num*: specifies the variable or expression.

Example

```
gaussdb=# DECLARE
    v_num integer default NULL;
BEGIN
    IF v_num IS NOT NULL THEN
        raise info 'v_num is NULL';
    ELSE
        NULL; -- No data needs to be processed.
    END IF;
END;
/
ANONYMOUS BLOCK EXECUTE
```

10.8.6 Error Trapping Statements

By default, any error occurring in a PL/SQL function aborts execution of the function, and indeed of the surrounding transaction as well. You can trap errors and restore from them by using a **BEGIN** block with an **EXCEPTION** clause. The syntax is an extension of the normal syntax for a **BEGIN** block:

```
[<<label>>]
[DECLARE
    declarations]
BEGIN
    statements
EXCEPTION
    WHEN condition [OR condition ...] THEN
        handler_statements
    [WHEN condition [OR condition ...] THEN
        handler_statements
    ...]
END;
```

If no error occurs, this form of block simply executes all the statements, and then control passes to the next statement after **END**. But if an error occurs within the statements, further processing of the statements is abandoned, and control passes to the **EXCEPTION** list. The list is searched for the first condition matching the error that occurred. If a match is found, the corresponding **handler_statements** are executed, and then control passes to the next statement after **END**. If no match is found, the error propagates out as though the **EXCEPTION** clause were not there at all: Error codes can be used to catch other error codes of the same type.

The error can be caught by an enclosing block with **EXCEPTION**, or if there is none it aborts processing of the function.

The condition names can be any of those shown in *Error Code Reference*. The special condition name **OTHERS** matches every error type except **QUERY_CANCELED**.

If a new error occurs within the selected **handler_statements**, it cannot be caught by this **EXCEPTION** clause, but is propagated out. A surrounding **EXCEPTION** clause could catch it.

When an error is caught by an **EXCEPTION** clause, the local variables of the PL/SQL function remain as they were when the error occurred, but all changes to persistent database state within the block are rolled back.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE mytab(id INT,firstname VARCHAR(20),lastname VARCHAR(20)) DISTRIBUTE BY
hash(id);
CREATE TABLE

gaussdb=# INSERT INTO mytab(firstname, lastname) VALUES('Tom', 'Jones');
INSERT 0 1

gaussdb=# CREATE FUNCTION fun_exp() RETURNS INT
AS $$
DECLARE
    x INT :=0;
    y INT;
BEGIN
    UPDATE mytab SET firstname = 'Joe' WHERE lastname = 'Jones';
    x := x + 1;
    y := x / 0;
EXCEPTION
    WHEN division_by_zero THEN
        RAISE NOTICE 'caught division_by_zero';
        RETURN x;
END;$$
LANGUAGE plpgsql;
CREATE FUNCTION

gaussdb=# call fun_exp();
NOTICE:  caught division_by_zero
 fun_exp
---------
       1
(1 row)

gaussdb=# select * from mytab;
 id | firstname | lastname
----+-----------+----------
    | Tom       | Jones
(1 row)

gaussdb=# DROP FUNCTION fun_exp();
DROP FUNCTION

gaussdb=# DROP TABLE mytab;
DROP TABLE
```

When control reaches the assignment to **y**, it will fail with a **division_by_zero** error. This will be caught by the **EXCEPTION** clause. The value returned in the **RETURN** statement will be the incremented value of **x**.

NOTE

- A block containing an **EXCEPTION** clause is more expensive to enter and exit than a block without one. Therefore, do not use **EXCEPTION** without need.
- In the following scenarios, the processing exception cannot be captured and the entire stored procedure is rolled back: 1. The node is faulty. 2. The thread of the node involved in the stored procedure exits due to a network fault. In addition, the structure of the source data is inconsistent with that of the target table in the COPY FROM operation. 3. Exceptions occur when EXCEPTION clears subtransactions. (For a stored procedure that contains the EXCEPTION statement, an implicit subtransaction is started when the statement is executed. After the statement is executed, the subtransaction is automatically cleared. During the clearing, exceptions may occur due to memory control.)

Example: Exceptions with **UPDATE**/**INSERT**

This example uses exception handling to perform either **UPDATE** or **INSERT**, as appropriate:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CREATE TABLE db (a INT, b TEXT);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# CREATE FUNCTION merge_db(key INT, data TEXT) RETURNS VOID AS
$$
BEGIN
    LOOP

-- First try to update the key
        UPDATE db SET b = data WHERE a = key;
        IF found THEN
            RETURN;
        END IF;
-- The key does not exist. Therefore, try to insert one. If someone else inserts the same key concurrently, the
unique key may fail to be obtained.
        BEGIN
            INSERT INTO db(a,b) VALUES (key, data);
            RETURN;
        EXCEPTION WHEN unique_violation THEN
        -- Do nothing, and loop to try the UPDATE again.
        END;
     END LOOP;
END;
$$
LANGUAGE plpgsql;
CREATE FUNCTION

gaussdb=# SELECT merge_db(1, 'david');
 merge_db
----------

(1 row)

gaussdb=# SELECT merge_db(1, 'dennis');
 merge_db
----------

(1 row)

--Delete FUNCTION and TABLE:
gaussdb=# DROP FUNCTION merge_db;
DROP FUNCTION

gaussdb=# DROP TABLE db ;
DROP TABLE
```

10.8.7 GOTO Statements

A GOTO statement unconditionally transfers the control from the current statement to a labeled statement. The GOTO statement changes the execution logic. Therefore, use this statement only when necessary. Alternatively, you can use the EXCEPTION statement to handle issues in special scenarios. To execute a GOTO statement, the labeled statement must be unique.

Syntax

Figure 10-34 shows the label declaration ::= statement.

Figure 10-34 label declaration ::

Figure 10-35 shows the goto statement ::= statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-35 goto statement ::

Examples

```
gaussdb=# CREATE OR REPLACE PROCEDURE GOTO_test()
AS
DECLARE
   v1  int;
BEGIN
   v1  := 0;
      LOOP
      EXIT WHEN v1 > 100;
            v1 := v1 + 2;
            if v1 > 25 THEN
                  GOTO pos1;
            END IF;
      END LOOP;
<<pos1>>
v1 := v1 + 10;
raise info 'v1 is %. ', v1;
END;
/
CREATE PROCEDURE
gaussdb=# call GOTO_test();
INFO:  v1 is 36.
 goto_test
-----------

(1 row)
```

Constraints

Using GOTO statements has the following constraints:

- Does not allow multiple labeled GOTO statements even if the statements are in different blocks.

  ```
  BEGIN
    GOTO pos1;
    <<pos1>>
    SELECT * FROM ...
    <<pos1>>
    UPDATE t1 SET ...
  END;
  ```

- A GOTO statement cannot transfer control to the IF, CASE, or LOOP statement.

  ```
  BEGIN
     GOTO pos1;
     IF valid THEN
       <<pos1>>
       SELECT * FROM ...
     END IF;
  END;
  ```

- A GOTO statement cannot transfer control from one IF clause to another, or from one WHEN clause in the CASE statement to another.

  ```
  BEGIN
     IF valid THEN
       GOTO pos1;
       SELECT * FROM ...
     ELSE
       <<pos1>>
       UPDATE t1 SET ...
     END IF;
  END;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- Transferring control from an outer block to an inner BEGIN-END block is not supported.

```
BEGIN
  GOTO pos1;
  BEGIN
    <<pos1>>
    UPDATE t1 SET ...
  END;
END;
```

- Cannot transfer control from an exception handler to the current BEGIN-END block, but can transfer control to the upper-layer BEGIN-END block.

```
BEGIN
  <<pos1>>
  UPDATE t1 SET ...
  EXCEPTION
    WHEN condition THEN
      GOTO pos1;
END;
```

- To branch to a position that does not have an executable statement, you need to add the NULL statement.

```
DECLARE
  done  BOOLEAN;
BEGIN
  FOR i IN 1..50 LOOP
    IF done THEN
      GOTO end_loop;
    END IF;
    <<end_loop>>  -- You cannot run the GOTO statement to go here unless there is an executable
statement following it.
    NULL; -- The statement added here is used to avoid errors.
  END LOOP;  -- If the previous sentence NULL does not exist, an error is reported.
END;
/
```

10.9 Transaction Statements

A stored procedure itself is automatically in a transaction. A transaction is automatically started when the most peripheral stored procedure is called. In addition, the transaction is automatically committed when the calling ends, or is rolled back when an exception occurs during calling. In addition to automatic transaction control, you can also use COMMIT or ROLLBACK to control transactions in stored procedures. Running the COMMIT or ROLLBACK command in a stored procedure will commit or roll back the current transaction and automatically starts a new transaction. All subsequent operations will be performed in the new transaction.

A savepoint is a special mark inside a transaction. It allows all commands that are executed after it was established to be rolled back, restoring the transaction state to what it was at the time of the savepoint. In a stored procedure, you can use savepoints to manage transactions. Currently, you can create, roll back, and release savepoints. If a savepoint for rollback is used in a stored procedure, only the modification of the current transaction is rolled back. The execution process of the stored procedure is not changed, and the values of local variables in the stored procedure are not rolled back.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

The applicable contexts are as follows:

1. COMMIT, ROLLBACK, and SAVEPOINT can be used in PL/SQL stored procedures/functions.
2. COMMIT, ROLLBACK, and SAVEPOINT can be used in stored procedures and functions that contain EXCEPTION.
3. COMMIT, ROLLBACK, and SAVEPOINT can be used in EXCEPTION statements of stored procedures.
4. A stored procedure that contains COMMIT, ROLLBACK, or SAVEPOINT (which means the stored procedure is controlled by BEGIN, START, or END) can be called in a transaction block.
5. A stored procedure that contains savepoints can be called in a subtransaction and an externally defined savepoint is used to roll back the transaction to the savepoint defined outside the stored procedure.
6. A savepoint defined in the stored procedure can be viewed outside the stored procedure. That is, the modification of the transaction can be rolled back to the savepoint defined in the stored procedure.
7. COMMIT, ROLLBACK, and SAVEPOINT, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

The following content can be committed or rolled back:

1. DDL statements after COMMIT or ROLLBACK can be committed or rolled back.
2. DML statements after COMMIT or ROLLBACK can be committed.
3. GUC parameters in stored procedures can be committed or rolled back.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

CAUTION

- The following contexts are not applicable:
  1. COMMIT, ROLLBACK, and SAVEPOINT cannot be called in stored procedures other than PL/SQL, such as PL/Python.
  2. After SAVEPOINT is called in a transaction block, stored procedures that contain COMMIT or ROLLBACK cannot be called.
  3. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in TRIGGER.
  4. COMMIT, ROLLBACK, and SAVEPOINT cannot be called in EXECUTE statements.
  5. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in CURSOR statements.
  6. Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT, ROLLBACK, SAVEPOINT or another stored procedure that contain COMMIT, ROLLBACK, or SAVEPOINT.
  7. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in SQL statements other than SELECT PROC and CALL PROC.
  8. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in a stored procedure whose header contains GUC parameters.
  9. COMMIT, ROLLBACK, or SAVEPOINT cannot be called in expressions or CURSOR and EXECUTE statements.
  10. Stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT cannot be called in the return values and expression calculation of stored procedures.
  11. Savepoints defined outside a stored procedure cannot be released in the stored procedure.
  12. A stored procedure transaction and its autonomous transaction are two independent transactions and cannot use savepoints defined in each other's transaction.
  13. Advanced packages cannot call stored procedures that contain COMMIT, ROLLBACK, or SAVEPOINT statements through DBE_SQL.
- The following content cannot be committed or rolled back:
  1. Variables declared or imported in stored procedures cannot be committed or rolled back.
  2. In stored procedures, GUC parameters that take effect only after a restart cannot be submitted or rolled back.

Syntax

```
Define a savepoint.
    SAVEPOINT savepoint_name;
Roll back a savepoint.
    ROLLBACK TO [SAVEPOINT] savepoint_name;
Release a savepoint.
    RELEASE [SAVEPOINT] savepoint_name;
```

COMMIT and ROLLBACK, as well as IF, FOR, CURSOR LOOP, and WHILE, can be called in most PL/SQL contexts and statements.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TEST_COMMIT2()
IS
BEGIN
    DROP TABLE IF EXISTS TEST_COMMIT;
    CREATE TABLE TEST_COMMIT(A INT);
    FOR I IN REVERSE 3..0 LOOP
 INSERT INTO TEST_COMMIT SELECT I;
 COMMIT;
    END LOOP;
    FOR I IN REVERSE 2..4 LOOP
 UPDATE TEST_COMMIT SET A=I;
 COMMIT;
    END LOOP;
EXCEPTION
WHEN OTHERS THEN
 INSERT INTO TEST_COMMIT SELECT 4;
    COMMIT;
END;
/
gaussdb=# call TEST_COMMIT2();
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CONTEXT:  SQL statement "CREATE TABLE TEST_COMMIT(A INT)"

                29
(1 row)
```

Constraints

Constraints on the use of COMMIT and ROLLBACK in a stored procedure are as follows:

NOTE

A TRIGGER stored procedure cannot contain COMMIT or ROLLBACK or called another stored procedure that contains COMMIT or ROLLBACK.

```
gaussdb=# DROP TABLE IF EXISTS EXAMPLE1;
gaussdb=# CREATE TABLE EXAMPLE1(COL1 INT);
gaussdb=# INSERT INTO EXAMPLE1(col1) VALUES (1);
gaussdb=# CREATE OR REPLACE FUNCTION FUNCTION_TRI_EXAMPLE2() RETURN TRIGGER
AS
EXP INT;
BEGIN
   FOR i IN 0..20 LOOP
      INSERT INTO EXAMPLE1(col1) VALUES (i);
      IF i % 2 = 0 THEN
         COMMIT;
      ELSE
         ROLLBACK;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    END IF;
  END LOOP;
  SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
END;
/

gaussdb=# CREATE TRIGGER TRIGGER_EXAMPLE AFTER DELETE ON EXAMPLE1
FOR EACH ROW EXECUTE PROCEDURE FUNCTION_TRI_EXAMPLE2();
CREATE TRIGGER
gaussdb=# DELETE FROM EXAMPLE1;
ERROR:  Can not commit/rollback if it's atomic is true: can not use commit rollback in Complex SQL
CONTEXT:  PL/pgSQL function function_tri_example2() line 7 at COMMIT
```

NOTE

Stored procedures that contain IMMUTABLE or SHIPPABLE cannot call COMMIT or ROLLBACK or another stored procedure that contains COMMIT or ROLLBACK.

```
gaussdb=# DROP TABLE IF EXISTS EXAMPLE1;
gaussdb=# CREATE TABLE EXAMPLE1(COL1 INT);
gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE1()
IMMUTABLE
AS
EXP INT;
BEGIN
  FOR i IN 0..20 LOOP
    SELECT COUNT(*) FROM EXAMPLE1 INTO EXP;
    IF i % 2 = 0 THEN
      COMMIT;
    ELSE
      ROLLBACK;
    END IF;
  END LOOP;
END;
/
gaussdb=# CALL TRANSACTION_EXAMPLE1();
ERROR:  Can not commit/rollback if it's atomic is true: commit/rollback/savepoint is not allowed in a non-volatile function
CONTEXT:  PL/pgSQL function transaction_example1() line 7 at COMMIT
```

NOTE

Variables declared or imported in stored procedures cannot be committed or rolled back.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE2(EXP_OUT OUT INT)
AS
EXP INT;
BEGIN
  EXP_OUT := 0;
  COMMIT;
  DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
  EXP_OUT := 1;
  ROLLBACK;
  DBE_OUTPUT.PRINT_LINE('EXP IS:'||EXP);
END;
/
gaussdb=# CALL TRANSACTION_EXAMPLE2(100);
EXP IS:
EXP IS:
 exp_out
---------
       1
(1 row)
```

NOTE

Calling in SQL statements (other than Select Procedure) is not supported.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE3()
AS
BEGIN
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1 (col1) VALUES (i);
        IF i % 2 = 0 THEN
            EXECUTE IMMEDIATE 'COMMIT';
        ELSE
            EXECUTE IMMEDIATE 'ROLLBACK';
        END IF;
    END LOOP;
END;
/
gaussdb=# CALL TRANSACTION_EXAMPLE3();
ERROR:  cannot call transaction statements in EXECUTE IMMEDIATE statement.
CONTEXT:  PL/pgSQL function transaction_example3() line 6 at EXECUTE statement
```

NOTE

COMMIT or ROLLBACK cannot be called in a stored procedure whose header contains GUC parameters.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE4()
SET ARRAY_NULLS TO "ON"
AS
BEGIN
    FOR i IN 0..20 LOOP
        INSERT INTO EXAMPLE1 (col1) VALUES (i);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
    END LOOP;
END;
/
gaussdb=# CALL TRANSACTION_EXAMPLE4();
ERROR:  Can not commit/rollback if it's atomic is true: transaction statement in store procedure with GUC setting in option clause is not supported
CONTEXT:  PL/pgSQL function transaction_example4() line 6 at COMMIT
```

NOTE

A stored procedure object whose cursor is open cannot contain COMMIT or ROLLBACK.

```
gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE5(INTIN IN INT, INTOUT OUT INT)
AS
BEGIN
INTOUT := INTIN + 1;
COMMIT;
END;
/

gaussdb=# CREATE OR REPLACE PROCEDURE TRANSACTION_EXAMPLE6()
AS
CURSOR CURSOR1(EXPIN INT)
IS SELECT TRANSACTION_EXAMPLE5(EXPIN);
INTEXP INT;
BEGIN
    FOR i IN 0..20 LOOP
        OPEN CURSOR1(i);
        FETCH CURSOR1 INTO INTEXP;
        INSERT INTO EXAMPLE1(COL1) VALUES (INTEXP);
        IF i % 2 = 0 THEN
            COMMIT;
        ELSE
            ROLLBACK;
        END IF;
        CLOSE CURSOR1;
    END LOOP;
END;
/
gaussdb=# CALL TRANSACTION_EXAMPLE6();
ERROR:  Can not commit/rollback if it's atomic is true: transaction statement in store procedure used as
```

CALL STP_SAVEPOINT_EXAMPLE3();
COMMIT;
ERROR:  cannot release outer savepoint
CONTEXT:  PL/pgSQL function stp_savepoint_example3() line 4 at RELEASE SAVEPOINT
```

10.10 Other Statements

10.10.1 Lock Operations

GaussDB provides multiple lock modes to control concurrent accesses to table data. These modes are used when Multi-Version Concurrency Control (MVCC) cannot give expected behaviors. Alike, most GaussDB commands automatically apply appropriate locks to ensure that called tables are not deleted or modified in an incompatible manner during command execution. For example, when concurrent operations exist, ALTER TABLE cannot be executed on the same table.

For the complete lock operations, see **LOCK**.

10.10.2 Cursor Operations

GaussDB provides cursors as a data buffer for users to store execution results of SQL statements. Each cursor region has a name. Users can use SQL statements to obtain records one by one from cursors and grant the records to master variables, then being processed further by host languages.

Cursor operations include cursor definition, open, fetch, and close operations.

For the complete example of cursor operations, see **Explicit Cursor**.

10.11 Cursors

10.11.1 Overview

To process SQL statements, the stored procedure process assigns a memory segment to store context association. Cursors are handles or pointers pointing to context regions. With cursors, stored procedures can control alterations in context regions.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- When a stored procedure uses returns to return a cursor, if JDBC is used to call the stored procedure, the returned cursor is unavailable. Using **out** to output parameters is not affected.
- In distributed mode, if the parameter of the stored procedure called in the SQL statement is of the refcursor type or the return value is of the refcursor type, pushdown is not supported.
- When a stored procedure contains COMMIT/ROLLBACK, an explicit cursor caches all data of the cursor to ensure that the cursor is still available after COMMIT/ROLLBACK. If the cursor data volume is large, this process may take a long time.

Cursors are classified into explicit cursors and implicit cursors. **Table 10-2** shows the usage conditions of explicit and implicit cursors for different SQL statements.

Table 10-2 Cursor usage conditions

SQL Statement	Cursor
Non-query statements	Implicit
Query statements with single-line results	Implicit or explicit
Query statements with multi-line results	Explicit

10.11.2 Explicit Cursor

An explicit cursor is used to process query statements, particularly when query results are multiple records.

Procedure

An explicit cursor performs the following six PL/SQL steps to process query statements:

Step 1 Define a static cursor: Define a cursor name and its corresponding SELECT statement.

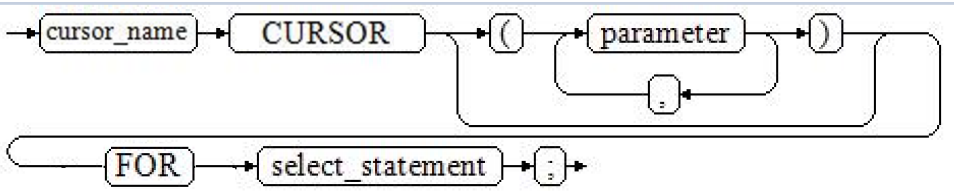
Figure 10-36 shows the syntax diagram for defining a static cursor.

Figure 10-36 static_cursor_define::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

or

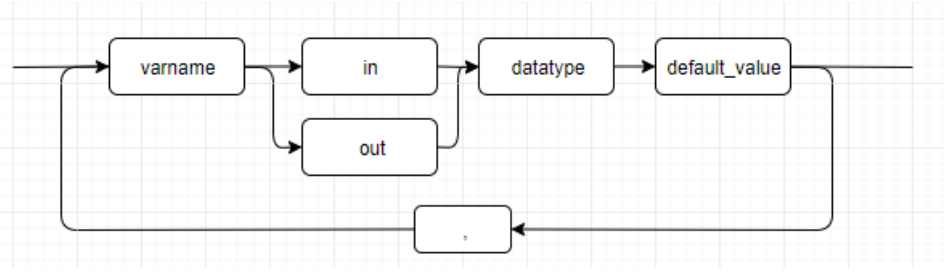
Figure 10-37 static_cursor_define::=



Parameters:

- **cursor_name**: defines a cursor name.
- **parameter**: cursor parameter, which can only be an input parameter. The default value can be defined by **:=**, **=**, or **default**. For details about the format, see **Figure 10-38**.

  Figure 10-38 Reference diagram for using the parameter format

- *select_statement*: specifies a query statement.

NOTE

- The system automatically determines whether the cursor can be used for backward fetching based on the execution plan.
- In syntax, **parameter** can be an output parameter, but its behavior is the same as that of an input parameter.
- It is automatically disabled in the exception.

Define a dynamic cursor: Define a **ref** cursor, which means that the cursor can be opened dynamically by a set of static SQL statements. Define the type of the **ref** cursor first, and then the cursor variable of this cursor type. Dynamically bind a SELECT statement through OPEN FOR when the cursor is opened.

Figure 10-39 and **Figure 10-40** show the syntax diagrams for defining a dynamic cursor.

Figure 10-39 cursor_typename::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

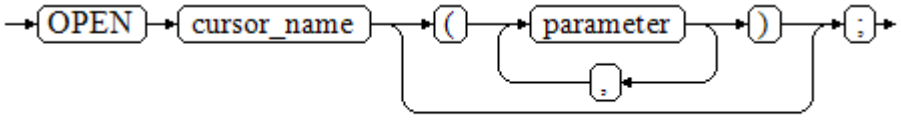
GaussDB supports the dynamic cursor type **sys_refcursor**. A function or stored procedure can use the **sys_refcursor** parameter to pass on or pass out the cursor result set. A function can return **sys_refcursor** to return the cursor result set.

Figure 10-40 dynamic_cursor_define::=

Step 2 Open the static cursor: Execute the SELECT statement corresponding to the cursor. The query result is placed in the workspace and the pointer directs to the head of the workspace to identify the cursor result set. If the cursor query statement carries the **FOR UPDATE** option, the OPEN statement locks the data rows corresponding to the cursor result set in the database table.

Figure 10-41 shows the syntax diagram for opening a static cursor.

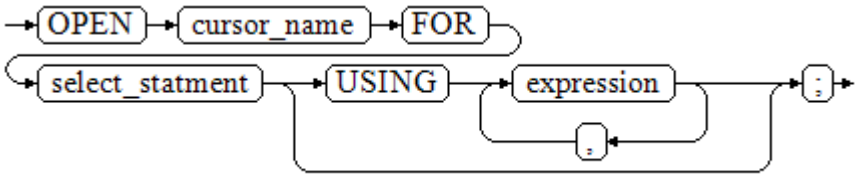
Figure 10-41 open_static_cursor::=



Open the dynamic cursor: Use the OPEN FOR statement to open the dynamic cursor and the SQL statement is dynamically bound.

Figure 10-42 shows the syntax diagram for opening a dynamic cursor.

Figure 10-42 open_dynamic_cursor::=



A PL/SQL program cannot use the OPEN statement to repeatedly open a cursor.

Step 3 Fetch cursor data: Retrieve data rows in the result set and place them in specified output variables.

Figure 10-43 shows the syntax diagram for fetching cursor data.

Figure 10-43 fetch_cursor::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Step 4 Process the record.

Step 5 Continue to process until the active set has no record.

Step 6 Close the cursor: After you fetch and process the data in the cursor result set, close the cursor in time to release system resources used by the cursor and invalidate the workspace of the cursor so that the FETCH statement cannot be used to fetch data anymore. A closed cursor can be reopened by an OPEN statement.

Figure 10-44 shows the syntax diagram for closing a cursor.

Figure 10-44 close_cursor::=

----End

Attributes

Cursor attributes are used to control program procedures or learn about program status. When a DML statement is executed, the PL/SQL opens a built-in cursor and processes its result. A cursor is a memory segment for maintaining query results. It is opened when a DML statement is executed and closed when the execution is finished. An explicit cursor has the following attributes:

- **%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **%ISOPEN**: Boolean attribute, which returns **TRUE** if the cursor has been opened.
- **%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.

Examples

DDL and DML statements are prepared. Subsequent examples in this section depend on this case.

```
gaussdb=# drop schema if exists hr cascade;
gaussdb=# create schema hr;
gaussdb=# set current_schema = hr;
gaussdb=# drop table if exists sections;
gaussdb=# drop table if exists staffs;
gaussdb=# drop table if exists department;
-- Create a department table.
gaussdb=# create table sections(
    section_name varchar(100),
    place_id     int,
    section_id   int
);
gaussdb=# insert into sections values ('hr',1,1);

-- Create an employee table.
gaussdb=# create table staffs(
    staff_id number(6),
    salary number(8,2),
    section_id int,
```

  EXIT WHEN C1%NOTFOUND;
END LOOP;
END;
/
1
1
ANONYMOUS BLOCK EXECUTE
-- Delete the stored procedure.
gaussdb=# DROP PROCEDURE proc_sys_ref;
```

10.11.3 Implicit Cursor

Implicit cursors are automatically set by the system for non-query statements such as modify or delete operations, along with their workspace. Implicit cursors are named **SQL**, which is defined by the system.

Overview

Implicit cursor operations, such as definition, open, value-grant, and close operations, are automatically performed by the system and do not need users to process. Users can use only attributes related to implicit cursors to complete operations. In workspace of implicit cursors, the data of the latest SQL statement is stored and is not related to explicit cursors defined by users.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Format call: **SQL%**

NOTE

- INSERT, UPDATE, DELETE, and SELECT statements do not need defined cursors.
- Implicit cursor attributes are not affected by the commit or rollback operation.

Attributes

An implicit cursor has the following attributes:

- **SQL%FOUND**: Boolean attribute, which returns **TRUE** if the last fetch returns a row.
- **SQL%NOTFOUND**: Boolean attribute, which returns **TRUE** if the last fetch fails to return a row.
- **SQL%ROWCOUNT**: numeric attribute, which returns the number of records fetched from the cursor.
- **SQL%ISOPEN**: Boolean attribute, whose value is always **FALSE**. Close implicit cursors immediately after an SQL statement is run.

Examples

```
-- Delete all employees in a department from the hr.staffs table. If the department has no employees, delete the department from the hr.department table.

gaussdb=# CREATE OR REPLACE PROCEDURE proc_cursor3()
AS
    DECLARE
    V_DEPTNO NUMBER(4) := 100;
    BEGIN
        DELETE FROM hr.staffs WHERE section_id = V_DEPTNO;
        -- Proceed based on cursor status.
        IF SQL%NOTFOUND THEN
        DELETE FROM hr.department WHERE section_id = V_DEPTNO;
        END IF;
    END;
/

gaussdb=# CALL proc_cursor3();
 proc_cursor3
--------------

(1 row)

-- Drop the stored procedure and the temporary table.
gaussdb=# DROP PROCEDURE proc_cursor3;
```

10.11.4 Cursor Loop

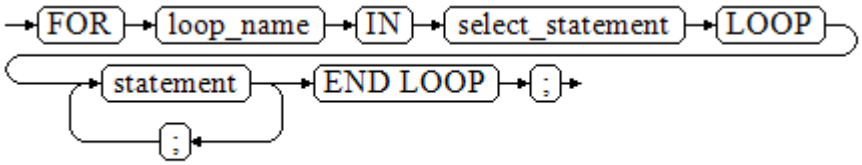
Use of cursors in WHILE and LOOP statements is called a cursor loop. Generally, OPEN, FETCH, and CLOSE statements are called in this kind of loop. The following describes a loop that simplifies a cursor loop without the need for these operations. This mode is applicable to a static cursor loop, without executing four steps about a static cursor.

Syntax

Figure 10-45 shows the syntax diagram of a FOR AS loop.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-45 FOR_AS_loop::=



Precautions

- The UPDATE operation for the queried table is not allowed in the loop statement.
- The variable *loop_name* is automatically defined and is valid only in this loop. Its type is the same as that in the query result of *select_statement*. The value of *loop_name* is the query result of *select_statement*.
- The specific type of the **loop_name** variable is not parsed during compilation. If the specific type needs to be parsed (for example, **loop_name** is used as the input and output parameters of an overloaded function or stored procedure), a compilation error is reported.
- The **%FOUND**, **%NOTFOUND**, and **%ROWCOUNT** attributes access the same internal variable in GaussDB. Transactions and the anonymous block do not support multiple cursor accesses at the same time.

Examples

```
gaussdb=# BEGIN
FOR ROW_TRANS IN
        SELECT first_name FROM hr.staffs
    LOOP
        DBE_OUTPUT.PRINT_LINE (ROW_TRANS.first_name );
    END LOOP;
END;
/
-- Execution result:
gaussdb=# Tom
ANONYMOUS BLOCK EXECUTE

10.12 Advanced Packages

Advanced packages have two sets of interfaces. The first set is basic interfaces, and the second set is secondary encapsulation interfaces that are used improve usability. The second set is recommended.

10.12.1 Basic Interfaces

10.12.1.1 PKG_SERVICE

Table 10-3 lists all APIs supported by PKG_SERVICE.

Table 10-3 PKG_SERVICE

API	Description
PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE	Checks whether a context is registered.
PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS	Deregisters all registered contexts.
PKG_SERVICE.SQL_REGISTER_CONTEXT	Registers a context.
PKG_SERVICE.SQL_UNREGISTER_CONTEXT	Deregisters a context.
PKG_SERVICE.SQL_SET_SQL	Sets an SQL statement for a context. Currently, only the SELECT statement is supported.
PKG_SERVICE.SQL_RUN	Executes the configured SQL statement on a context.
PKG_SERVICE.SQL_NEXT_ROW	Reads the next row of data in a context.
PKG_SERVICE.SQL_GET_VALUE	Reads a dynamically defined column value in a context.
PKG_SERVICE.SQL_SET_RESULT_TYPE	Dynamically defines a column of a context based on the type OID.
PKG_SERVICE.JOB_CANCEL	Removes a scheduled task by task ID.
PKG_SERVICE.JOB_FINISH	Disables or enables scheduled task execution.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_SERVICE.JOB_SUBMIT	Commits a scheduled job. Job ID can be automatically generated by the system or specified manually.
PKG_SERVICE.JOB_UPDATE	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
PKG_SERVICE.SUBMIT_ON_NODES	Commits a job to all nodes. The job ID is automatically generated by the system.
PKG_SERVICE.ISUBMIT_ON_NODES	Commits a job to all nodes. The job ID is specified by the user.
PKG_SERVICE.SQL_GET_ARRAY_RESULT	Obtains the array value returned in the context.
PKG_SERVICE.SQL_GET_VARIABLE_RESULT	Obtains the column value returned in the context.

- PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE

  This function checks whether a context is registered. This function transfers the ID of the context to be queried. If the context exists, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE function is as follows:

  ```
  PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE(
   context_id      IN INTEGER
  )
  RETURN BOOLEAN;
  ```

  Table 10-4 PKG_SERVICE.SQL_IS_CONTEXT_ACTIVE parameters

Parameter	Description
context_id	ID of the context to be queried.

- PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS

  This function cancels all contexts.

  The prototype of the PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS function is as follows:

  ```
  PKG_SERVICE.SQL_CLEAN_ALL_CONTEXTS(
  )
  RETURN VOID;
  ```

- PKG_SERVICE.SQL_REGISTER_CONTEXT

  This function opens a context, which is the prerequisite for the subsequent operations in the context. This function does not transfer any parameter. It

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

automatically generates context IDs in an ascending order and returns values to INTEGER variables.

The prototype of the PKG_SERVICE.SQL_REGISTER_CONTEXT function is as follows:

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- PKG_SERVICE.SQL_UNREGISTER_CONTEXT

  This function closes a context, which is the end of each operation in the context. If this function is not called when the stored procedure ends, the memory is still occupied by the context. Therefore, remember to close a context when you do not need to use it. If an exception occurs, the stored procedure exits but the context is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

  The prototype of the PKG_SERVICE.SQL_UNREGISTER_CONTEXT function is as follows:

  ```
  PKG_SERVICE.SQL_UNREGISTER_CONTEXT(
   context_id      IN INTEGER
  )
  RETURN INTEGER;
  ```

  Table 10-5 PKG_SERVICE.SQL_UNREGISTER_CONTEXT parameters

Parameter	Description
context_id	ID of the context to be closed.

- PKG_SERVICE.SQL_SET_SQL

  This function parses the query statement of a given context. The input query statement is executed immediately. Currently, only the SELECT query statement can be parsed. The statement parameters can be transferred only through the TEXT type. The length cannot exceed 1 GB.

  The prototype of the PKG_SERVICE.SQL_SET_SQL function is as follows:

  ```
  PKG_SERVICE.SQL_SET_SQL(
  context_id      IN INTEGER,
  query_string    IN TEXT,
  language_flag   IN INTEGER
  )
  RETURN BOOLEAN;
  ```

  Table 10-6 PKG_SERVICE.SQL_SET_SQL parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.
query_string	Query statement to be parsed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
language_flag	Version language number, which specifies the behavior of different versions. • **1**: incompatible version. • **2**: version in ORA-compatible mode.

- PKG_SERVICE.SQL_RUN

  This function executes a given context. It receives a context ID first, and the data obtained after execution is used for subsequent operations. Currently, only the SELECT query statement can be executed.

  The prototype of the PKG_SERVICE.SQL_RUN function is as follows:

```
PKG_SERVICE.SQL_RUN(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

  Table 10-7 PKG_SERVICE.SQL_RUN parameters

Parameter	Description
context_id	ID of the context whose query statement is to be parsed.

- PKG_SERVICE.SQL_NEXT_ROW

  This function returns the number of data rows returned after the SQL statement is executed. Each time the API is executed, the system obtains a set of new rows until all data is read.

  The prototype of the **PKG_SERVICE.SQL_NEXT_ROW** function is as follows:

```
PKG_SERVICE.SQL_NEXT_ROW(
context_id     IN INTEGER,
)
RETURN INTEGER;
```

  Table 10-8 PKG_SERVICE.SQL_NEXT_ROW parameters

Parameter	Description
context_id	ID of the context to be executed.

- PKG_SERVICE.SQL_GET_VALUE

  This function returns the context element value in a specified position of a context and accesses the data obtained by **PKG_SERVICE.SQL_NEXT_ROW**.

  The prototype of the **PKG_SERVICE.SQL_GET_VALUE** function is as follows:

```
PKG_SERVICE.SQL_GET_VALUE(
context_id          IN    INTEGER,
pos                 IN    INTEGER,
col_type            IN    ANYELEMENT
)
RETURN ANYELEMENT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-9 PKG_SERVICE.SQL_GET_VALUE parameters

Parameter	Description
context_id	ID of the context to be executed.
pos	Position of a dynamically defined column in the query.
col_type	Variable of any type, which defines the return value type of columns.

- PKG_SERVICE.SQL_SET_RESULT_TYPE

  This function defines columns returned from a given context and can be used only for contexts defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The prototype of **PKG_SERVICE.SQL_SET_RESULT_TYPE** is as follows:

```
PKG_SERVICE.SQL_SET_RESULT_TYPE(
context_id     IN INTEGER,
pos            IN INTEGER,
coltype_oid    IN ANYELEMENT,
maxsize        IN INTEGER
)
RETURN INTEGER;
```

Table 10-10 PKG_SERVICE.SQL_SET_RESULT_TYPE parameters

Parameter	Description
context_id	ID of the context to be executed.
pos	Position of a dynamically defined column in the query.
coltype_oid	Variable of any type. The OID of the corresponding type can be obtained based on the variable type.
maxsize	Length of a defined column.

- PKG_SERVICE.JOB_CANCEL

  The stored procedure **CANCEL** deletes a specified task.

  The prototype of the **PKG_SERVICE.JOB_CANCEL** function is as follows:

```
PKG_SERVICE.JOB_CANCEL(
id  IN  INTEGER);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-11 PKG_SERVICE.JOB_CANCEL parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	INTEGER	IN	No	Specifies the job ID.

- PKG_SERVICE.JOB_FINISH

  The stored procedure **FINISH** disables or enables a scheduled task.

  The prototype of the **PKG_SERVICE.JOB_FINISH** function is as follows:

```
PKG_SERVICE.JOB_FINISH(
id          IN   INTEGER,
broken      IN   BOOLEAN,
next_time   IN   TIMESTAMP  DEFAULT  sysdate);
```

Table 10-12 PKG_SERVICE.JOB_FINISH parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	INTEGER	IN	No	Specifies the job ID.
broken	BOOLEAN	IN	No	Specifies the status flag, **TRUE** for broken and **FALSE** for not broken. The current job is updated based on the parameter value **TRUE** or **FALSE**. If the parameter is left empty, the job status remains unchanged.
next_time	TIMESTAMP	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **TRUE**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **FALSE** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

- PKG_SERVICE.JOB_SUBMIT

  The stored procedure JOB_SUBMIT commits a scheduled task provided by the system.

  The prototype of the PKG_SERVICE.JOB_SUBMIT function is as follows:

```
PKG_SERVICE.JOB_SUBMIT(
id          IN   BIGINT,
content     IN   TEXT,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
next_time     IN   TIMESTAMP DEFAULT sysdate,
interval_time IN   TEXT  DEFAULT 'null',
job           OUT  INTEGER);
```

NOTE

When a scheduled task (using **JOB**) is created, the system binds the current database and the username to the task by default. This function can be called by using **call** or **select**. If you call this function by using **select**, there is no need to specify output parameters. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx** before the SQL statement.

Table 10-13 PKG_SERVICE.JOB_SUBMIT parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
id	BIGINT	IN	No	Specifies the job ID. If the input ID is **NULL**, a job ID is generated internally.
content	TEXT	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
next_time	TIMESTAMP	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
interval_time	TEXT	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a NUMERIC value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	INTEGER	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **pkg_service.job_submit** is called using **select**, this parameter can be omitted.

- PKG_SERVICE.JOB_UPDATE

  The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the **PKG_SERVICE.JOB_UPDATE** function is as follows:

```
PKG_SERVICE.JOB_UPDATE(
id             IN   BIGINT,
next_time      IN   TIMESTAMP,
interval_time  IN   TEXT,
content        IN   TEXT);
```

Table 10-14 PKG_SERVICE.JOB_UPDATE parameters

Parameter	Type	Input/ Output Parameter	Empty or Not	Description
id	INTEGER	IN	No	Specifies the job ID.
next_time	TIMESTAMP	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	TEXT	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
content	TEXT	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.

Example:

```
CREATE TABLE test_table(a int);
CREATE TABLE

CREATE OR REPLACE PROCEDURE test_job(a in int) IS
BEGIN
INSERT INTO test_table VALUES(a);
COMMIT;
END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```

(1 row)

DROP TABLE test_table;
DROP TABLE
```

- PKG_SERVICE.SUBMIT_ON_NODES

  The stored procedure **SUBMIT_ON_NODES** creates a scheduled task on all CNs and DNs. Only users **sysadmin** and **monitor admin** have this permission.

  The prototype of the **PKG_SERVICE.SUBMIT_ON_NODES** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
PKG_SERVICE.SUBMIT_ON_NODES(
node_name    IN   NAME,
database     IN   NAME,
what         IN   TEXT,
next_date    IN   TIMESTAMP WITHOUT TIME ZONE,
job_interval IN   TEXT,
job          OUT  INTEGER);
```

Table 10-15 PKG_SERVICE.SUBMIT_ON_NODES parameters

Parameter	Type	Input/Output Parameter	Empty or Not	Description
node_name	TEXT	IN	No	Specifies the job execution node. Currently, the value can only be **ALL_NODE** (indicating that the job is executed on all nodes) or **CCN** (indicating that the job is executed on the central coordinator node).
database	TEXT	IN	No	Database used by a cluster job. When the node type is **ALL_NODE**, the value can only be **postgres**.
what	TEXT	IN	No	Specifies the SQL statement to be executed. One or multiple DMLs, anonymous blocks, and statements for calling stored procedures, or all three combined are supported.
nextdate	TIMESTAMP	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
job_interval	TEXT	IN	No	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a NUMERIC value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
job	INTEGER	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **dbms.submit_on_nodes** is called using **select**, this parameter can be omitted.

Example:

```
SELECT pkg_service.submit_on_nodes('ALL_NODE', 'postgres', 'select
capture_view_to_json(''dbe_perf.statement'', 0);', sysdate, 'interval ''60 second''');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 submit_on_nodes
-----------------
           12068
(1 row)

SELECT pkg_service.submit_on_nodes('CCN', 'postgres', 'select
capture_view_to_json(''dbe_perf.statement'', 0);', sysdate, 'interval ''60 second''');
 submit_on_nodes
-----------------
            9027
(1 row)
```

- PKG_SERVICE.ISUBMIT_ON_NODES

  ISUBMIT_ON_NODES has the same syntax function as **SUBMIT_ON_NODES**, but the first parameter of **ISUBMIT_ON_NODES** is an input parameter, that is, a specified task ID. In contrast, that last parameter of **ISUBMIT_ON_NODES** is an output parameter, indicating the task ID automatically generated by the system. Only users **sysadmin** and **monitor admin** have this permission.

- PKG_SERVICE.SQL_GET_ARRAY_RESULT

  This function is used to return the value of the bound OUT parameter of the array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **PKG_SERVICE.SQL_GET_ARRAY_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_ARRAY_RESULT(
    context_id in int,
    pos in VARCHAR2,
    column_value inout anyarray,
    result_type in anyelement
);
```

Table 10-16 PKG_SERVICE.SQL_GET_ARRAY_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried.
pos	Name of the bound parameter.
column_value	Return value.
result_type	Return type.

- PKG_SERVICE.SQL_GET_VARIABLE_RESULT

  This function is used to return the value of the bound OUT parameter of the non-array type and obtain the OUT parameter in a stored procedure.

  The prototype of the **PKG_SERVICE.SQL_GET_VARIABLE_RESULT** function is as follows:

```
PKG_SERVICE.SQL_GET_VARIABLE_RESULT(
    context_id in int,
    pos in VARCHAR2,
    result_type in anyelement
)
RETURNS anyelement;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-17 PKG_SERVICE.SQL_GET_VARIABLE_RESULT parameters

Parameter	Description
context_id	ID of the context to be queried.
pos	Name of the bound parameter.
result_type	Return type.

10.12.1.2 PKG_UTIL

Table 10-18 lists all APIs supported by PKG_UTIL.

Table 10-18 PKG_UTIL

API	Description
PKG_UTIL.LOB_GET_LENGTH	Obtains the length of a LOB.
PKG_UTIL.LOB_READ	Reads a part of a LOB.
PKG_UTIL.LOB_WRITE	Writes the source object to the target object in the specified format.
PKG_UTIL.LOB_APPEND	Appends the source LOB to the target LOB.
PKG_UTIL.LOB_COMPARE	Compares two LOBs based on the specified length.
PKG_UTIL.LOB_MATCH	Returns the position of the Nth occurrence of a character string in a LOB.
PKG_UTIL.LOB_RESET	Resets the character in specified position of a LOB to a specified character.
PKG_UTIL.LOB_GET_LENGTH	Obtains and returns the specified length of a LOB.
PKG_UTIL.LOB_READ_HUGE	Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.
PKG_UTIL.LOB_WRITEAPPEND_HUGE	Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.LOB_APPEND_HUGE	Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.
PKG_UTIL.READ_BFILE_TO_BLOB	Loads the source BFILE file to the target BLOB and returns the target object.
PKG_UTIL.LOB_COPY_HUGE	Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.
PKG_UTIL.BLOB_RESET	Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.
PKG_UTIL.CLOB_RESET	Sets a segment of data in a CLOB to spaces and returns the processed CLOB and the actually processed length.
PKG_UTIL.LOADBLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOADCLOBFROMFILE	Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.LOB_CONVERTTOCLOB_HUGE	Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.
PKG_UTIL.BFILE_GET_LENGTH	Obtains and returns the specified length of a BFILE file.
PKG_UTIL.BFILE_OPEN	Opens a BFILE file and returns its file descriptor.
PKG_UTIL.BFILE_CLOSE	Closes a BFILE file.
PKG_UTIL.LOB_WRITE_HUGE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
PKG_UTIL.IO_PRINT	Displays character strings.
PKG_UTIL.RAW_GET_LENGTH	Obtains the length of RAW data.
PKG_UTIL.RAW_CAST_FROM_VARCHAR2	Converts VARCHAR2 data to RAW data.
PKG_UTIL.RAW_CAST_FROM_....	Converts binary integers to RAW data.
PKG_UTIL.RAW_CAST_TO_BI....	Converts RAW data to binary integers.
PKG_UTIL.RANDOM_SET_SEED	Sets a random seed.
PKG_UTIL.RANDOM_GET_VALUE	Returns a random value.
PKG_UTIL.FILE_SET_DIRNAME	Sets the directory to be operated.
PKG_UTIL.FILE_OPEN	Opens a file based on the specified file name and directory.
PKG_UTIL.FILE_SET_MAX_LINE_SIZE	Sets the maximum length of a line to be written to a file.
PKG_UTIL.FILE_IS_CLOSE	Checks whether a file handle is closed.
PKG_UTIL.FILE_READ	Reads data of a specified length from an open file handle.
PKG_UTIL.FILE_READLINE	Reads a line of data from an open file handle.
PKG_UTIL.FILE_WRITE	Writes the data specified in the buffer to a file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.FILE_WRITELINE	Writes the buffer to a file and adds newline characters.
PKG_UTIL.FILE_NEWLINE	Adds a line.
PKG_UTIL.FILE_READ_RAW	Reads binary data of a specified length from an open file handle.
PKG_UTIL.FILE_WRITE_RAW	Writes binary data to a file.
PKG_UTIL.FILE_FLUSH	Writes data from a file handle to a physical file.
PKG_UTIL.FILE_CLOSE	Closes an open file handle.
PKG_UTIL.FILE_REMOVE	Deletes a physical file. To do so, you must have the corresponding permission.
PKG_UTIL.FILE_RENAME	Renames a file on the disk, similar to **mv** in Unix.
PKG_UTIL.FILE_SIZE	Returns the size of a file.
PKG_UTIL.FILE_BLOCK_SIZE	Returns the number of blocks contained in a file.
PKG_UTIL.FILE_EXISTS	Checks whether a file exists.
PKG_UTIL.FILE_GETPOS	Specifies the offset of a returned file, in bytes.
PKG_UTIL.FILE_SEEK	Sets the offset for file position.
PKG_UTIL.FILE_CLOSE_ALL	Closes all file handles opened in a session.
PKG_UTIL.EXCEPTION_REPORT_ERROR	Throws an exception.
PKG_UTIL.LOB_RAWTOTEXT	Converts the RAW type to the TEXT type.
PKG_UTIL.UTILITY_COMPILE_SCHEMA	Recompiles specified schemas, packages, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the PL/SQL object is returned and the recompilation stops. This package has been deprecated. pkg_util.gs_compile_schema is recommended.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
PKG_UTIL.GS_COMPILE_SCHEMA	Recompiles specified schemas, packages, functions, and stored procedures. If an error is reported when compiling a PL/SQL object, the exception is captured and the recompilation continues to compile other objects until all objects are compiled or the number of recompilation attempts reaches the upper limit. When the advanced package is executed through JDBC, the SQLSTATE 00000 is displayed, which indicates that the operation is successful. For details about the error code description, see "Standard SQL Error Codes" in *Error Code Reference*.
PKG_UTIL.APP_SET_MODULE	Sets the value of a module.
PKG_UTIL.APP_READ_MODULE	Reads the value of a module.
PKG_UTIL.APP_SET_ACTION	Sets the value of an action.
PKG_UTIL.APP_READ_ACTION	Reads the value of an action.
PKG_UTIL.MODIFY_PACKAGE_STATE	Modifies the PL/SQL status of the current session.

- PKG_UTIL.LOB_GET_LENGTH

  Obtains the length of the input data.

  The prototype of the PKG_UTIL.LOB_GET_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
lob       IN   CLOB
)
RETURN INTEGER;

PKG_UTIL.LOB_GET_LENGTH(
lob       IN   BLOB
)
RETURN INTEGER;
```

  Table 10-19 PKG_UTIL.LOB_GET_LENGTH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB/BLOB	IN	No	Specifies the object whose length is to be obtained.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.LOB_READ

  Reads an object and returns the specified part.

  The prototype of the PKG_UTIL.LOB_READ function is as follows:

```
PKG_UTIL.LOB_READ(
lob       IN   ANYELEMENT,
len       IN   INT,
start     IN   INT,
mode      IN   INT
)
RETURN ANYELEMENT
```

  Table 10-20 PKG_UTIL.LOB_READ API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB / BLOB	IN	No	Specifies CLOB or BLOB data.
len	INT	IN	No	Specifies the length of the returned result.
start	INT	IN	No	Specifies the offset to the first character.
mode	INT	IN	No	Specifies the type of the read operation. **0** indicates **READ**, **1** indicates **TRIM**, and **2** indicates **SUBSTR**.

- PKG_UTIL.LOB_WRITE

  Writes the source object to the target object based on the specified parameters and returns the target object.

  The prototype of the PKG_UTIL.LOB_WRITE function is as follows:

```
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   BLOB,
src_lob     IN      RAW
len         IN      INT,
start_pos   IN      BIGINT
)
RETURN BLOB;
PKG_UTIL.LOB_WRITE(
dest_lob    INOUT   CLOB,
src_lob     IN      VARCHAR2
len         IN      INT,
start_pos   IN      BIGINT
)
RETURN CLOB;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-21 PKG_UTIL.LOB_WRITE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB/BLOB	INOUT	No	Specifies the target object that data will be written to.
src_lob	CLOB/BLOB	IN	No	Specifies the source object to be written.
len	INT	IN	No	Specifies the write length of the source object.
start_pos	BIGINT	IN	No	Specifies the write start position of the target object.

- PKG_UTIL.LOB_APPEND

  Appends the source object to the target BLOB/CLOB and returns the target BLOB/CLOB.

  The prototype of the PKG_UTIL.LOB_APPEND function is as follows:

```
PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   BLOB,
src_lob     IN      BLOB,
len         IN      INT DEFAULT NULL
)
RETURN BLOB;

PKG_UTIL.LOB_APPEND(
dest_lob    INOUT   CLOB,
src_lob     IN      CLOB,
len         IN      INT DEFAULT NULL
)
RETURN CLOB;
```

Table 10-22 PKG_UTIL.LOB_APPEND API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB/CLOB	IN	No	BLOB/CLOB from which data is to be written.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	INT	IN	Yes	Length read from *src* and appended to *dest*. The default value is **NULL**, indicating that all content of *src* is read and appended to *dest*.

- PKG_UTIL.LOB_COMPARE

  Checks whether objects are the same based on the specified start position and size. If **lob1** is larger, **1** is returned. If **lob2** is larger, **–1** is returned. If **lob1** is equal to **lob2**, **0** is returned.

  The prototype of the PKG_UTIL.LOB_COMPARE function is as follows:

```
PKG_UTIL.LOB_COMPARE(
lob1        IN   ANYELEMENT,
lob2        IN   ANYELEMENT,
len         IN   INT DEFAULT 1073741771,
start_pos1      IN   INT DEFAULT 1,
start_pos2      IN   INT DEFAULT 1
)
RETURN INTEGER;
```

  Table 10-23 PKG_UTIL.LOB_COMPARE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob1	CLOB/BLOB	IN	No	Indicates the character string for comparison.
lob2	CLOB/BLOB	IN	No	Indicates the character string for comparison.
len	INT	IN	No	Indicates the length to be compared.
start_pos1	INT	IN	No	Specifies the start offset of **lob1**.
start_pos2	INT	IN	No	Specifies the start offset of **lob2**.

- PKG_UTIL.LOB_MATCH

  Returns the position where a pattern is displayed in a LOB for the *match_n*th time.

  The prototype of the PKG_UTIL.LOB_MATCH function is as follows:

```
PKG_UTIL.LOB_MATCH(
lob         IN   ANYELEMENT,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
pattern      IN   ANYELEMENT,
start        IN   INT,
match_nth    IN   INT DEFAULT 1
)
RETURN INTEGER;
```

Table 10-24 PKG_UTIL.LOB_MATCH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB/BLOB	IN	No	Indicates the character string for comparison.
pattern	CLOB/BLOB	IN	No	Specifies the pattern to be matched.
start	INT	IN	No	Specifies the start position for LOB comparison.
match_nth	INT	IN	No	Specifies the matching times.

- PKG_UTIL.LOB_RESET

  Clears a character string and resets the string to the value of **value**.

  The prototype of the PKG_UTIL.LOB_RESET function is as follows:

```
PKG_UTIL.LOB_RESET(
lob          IN   BLOB,
len          IN   INT,
start        IN   INT,
value         IN    INT DEFAULT 0
)
RETURN RECORD;
```

Table 10-25 PKG_UTIL.LOB_RESET API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	IN	No	Specifies the character string for reset.
len	INT	IN	No	Specifies the length of the string to be reset.
start	INT	IN	No	Specifies the start position for reset.
value	INT	IN	Yes	Sets characters. Default value: **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.LOB_GET_LENGTH

  Obtains and returns the specified length of a LOB.

  The prototype of the PKG_UTIL.LOB_GET_LENGTH function is as follows:

```
PKG_UTIL.LOB_GET_LENGTH(
   lob IN BLOB)
RETURN BIGINT;

PKG_UTIL.LOB_GET_LENGTH(
   lob IN CLOB)
RETURN BIGINT;
```

  Table 10-26 PKG_UTIL.LOB_GET_LENGTH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB/CLOB	IN	No	LOB type.

- PKG_UTIL.LOB_READ_HUGE

  Reads a part of the LOB content based on the specified length and initial position offset, and returns the read LOB and length.

  The prototype of the PKG_UTIL.LOB_READ_HUGE function is as follows:

```
PKG_UTIL.LOB_READ_HUGE(
   lob       IN CLOB,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
   lob       IN BLOB,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;

PKG_UTIL.LOB_READ_HUGE(
   fd        IN INTEGER,
   len       IN BIGINT,
   start_pos IN BIGINT,
   mode      IN INTEGER)
RETURN RECORD;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-27 PKG_UTIL.LOB_READ_HUGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob/fd	BLOB/CLOB/INTEGER	IN	No	File descriptor of the specified LOB or BFILE file.
len	BIGINT	IN	No	Length to read.
start_pos	BIGINT	IN	No	Offset position from which read starts.
mode	INTEGER	IN	No	Read mode (**0**: read, **1**: trim, **2**: substr).

- PKG_UTIL.LOB_WRITEAPPEND_HUGE

  Reads the content of a specified length from the source BLOB or CLOB, appends the content to the target BLOB or CLOB, and returns the target object.

  The prototype of the PKG_UTIL.LOB_WRITEAPPEND_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITEAPPEND_HUGE(
   dest_lob INOUT CLOB,
   len      IN    INTEGER,
   src_lob  IN    VARCHAR2
)RETURN CLOB;

PKG_UTIL.LOB_WRITEAPPEND_HUGE(
   dest_lob INOUT BLOB,
   len      IN    INTEGER,
   src_lob  IN    RAW
)RETURN BLOB;
```

Table 10-28 PKG_UTIL.LOB_WRITEAPPEND_HUGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
len	INTEGER	IN	Yes	Length of the source object to be written. If the value is **NULL**, the entire source object is written by default.
src_lob	VARCHAR2/RAW	IN	No	BLOB/CLOB from which data is to be written.

- PKG_UTIL.LOB_APPEND_HUGE

  Appends the source BLOB or CLOB to the target BLOB/CLOB and returns the target object.

  The prototype of the PKG_UTIL.LOB_APPEND_HUGE function is as follows:

```
PKG_UTIL.LOB_APPEND_HUGE(
   dest_lob INOUT BLOB,
   src_lob  IN    BLOB)
RETURN BLOB;
PKG_UTIL.LOB_APPEND_HUGE(
   dest_lob INOUT CLOB,
   src_lob  IN    CLOB)
RETURN CLOB;
```

  Table 10-29 PKG_UTIL.LOB_APPEND_HUGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target BLOB/CLOB to which data is written.
src_lob	BLOB/CLOB	IN	No	BLOB/CLOB from which data is to be written.

- PKG_UTIL.READ_BFILE_TO_BLOB

  Loads the source BFILE file to the target BLOB and returns the target object.

  The prototype of the PKG_UTIL.READ_BFILE_TO_BLOB function is as follows:

```
PKG_UTIL.READ_BFILE_TO_BLOB(
   fd IN INTEGER
)RETURN BLOB;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-30 PKG_UTIL.READ_BFILE_TO_BLOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	Source BFILE file to be read.

- PKG_UTIL.LOB_COPY_HUGE

  Reads the content of a specified length from the specified offset position of the source BLOB or CLOB, writes the content to the specified offset position of the target BLOB or CLOB, and returns the target object.

  The prototype of the PKG_UTIL.LOB_COPY_HUGE function is as follows:

```
PKG_UTIL.LOB_COPY_HUGE(
   lob_obj    INOUT BLOB,
   source_obj  IN    BLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1
)RETURN BLOB;

PKG_UTIL.LOB_COPY_HUGE(
   lob_obj    INOUT CLOB,
   source_obj  IN    CLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1
)RETURN CLOB;
```

Table 10-31 PKG_UTIL.LOB_COPY_HUGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob_obj	BLOB/CLOB	INOUT	No	Target BLOB/CLOB.
source_obj	BLOB/CLOB	IN	No	Source BLOB/CLOB.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	IN	No	Offset position of the target LOB to which the data is loaded.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_offset	BIGINT	IN	No	Offset position of the source LOB from which the data is read.

- PKG_UTIL.BLOB_RESET

  Sets a segment of data in a BLOB to the specified value and returns the processed BLOB and the actually processed length.

  The prototype of the PKG_UTIL.BLOB_RESET function is as follows:

```
PKG_UTIL.BLOB_RESET(
   lob       INOUT BLOB,
   len       INOUT BIGINT,
   start_pos IN    BIGINT DEFAULT 1,
   value     IN    INTEGER DEFAULT 0
)RETURN RECORD;
```

  Table 10-32 PKG_UTIL.BLOB_RESET API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	BLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in bytes.
start	INTEGER	IN	No	Specifies the start position for reset.
value	INTEGER	IN	Yes	Sets characters. Default value: **0**.

- PKG_UTIL.CLOB_RESET

  Sets a piece of data to spaces.

  The prototype of the PKG_UTIL.CLOB_RESET function is as follows:

```
PKG_UTIL.CLOB_RESET(
   lob       INOUT CLOB,
   len       INOUT BIGINT,
   start_pos IN    BIGINT DEFAULT 1
)RETURN RECORD;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-33 PKG_UTIL.CLOB_RESET API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
lob	CLOB	INOUT	No	LOB to be reset.
len	INTEGER	INOUT	No	Length to reset, in characters.
start	INTEGER	IN	No	Reset start position. The default value is **1**.

- PKG_UTIL.LOADBLOBFROMFILE

  Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target BLOB, and returns the target object, read position, and write position.

  The prototype of the PKG_UTIL.LOADBLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADBLOBFROMFILE(
   dest_lob     INOUT  BLOB,
   fd           IN     INTEGER,
   amount       IN     BIGINT,
   dest_offset  INOUT  BIGINT,
   file_offset  INOUT  BIGINT
)RETURN RECORD;
```

Table 10-34 PKG_UTIL.LOADBLOBFROMFILE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target BLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length of the data to be copied (in bytes for BLOBs or in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG_UTIL.LOADCLOBFROMFILE

  Reads the content of a specified length from the specified offset position of the source BFILE object, writes the content to the specified offset position of the target CLOB, and returns the target object, read position, and write position.

  The prototype of the PKG_UTIL.LOADCLOBFROMFILE function is as follows:

```
PKG_UTIL.LOADCLOBFROMFILE(
   dest_lob     INOUT  CLOB,
   fd           IN     INTEGER,
   amount       IN     BIGINT,
   dest_offset  INOUT  BIGINT,
   file_offset  INOUT  BIGINT
)RETURN RECORD;
```

  Table 10-35 PKG_UTIL.LOADCLOBFROMFILE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target CLOB as the INOUT parameter.
fd	INTEGER	IN	No	File descriptor of the source BFILE object.
amount	BIGINT	IN	No	Length to copy (in characters for CLOBs).
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source BFILE file from which the data is read as the INOUT parameter.

- PKG_UTIL.LOB_CONVERTTOBLOB_HUGE

  Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a BLOB, and writes the BLOB to the specified position of target LOB. *amount* indicates the length to be converted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the PKG_UTIL.LOB_CONVERTTOBLOB_HUGE function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB_HUGE(
   dest_lob    INOUT  BLOB,
   src_clob    IN     CLOB,
   amount      IN     BIGINT,
   dest_offset INOUT  BIGINT,
   src_offset  INOUT  BIGINT)
)RETURN RECORD;
```

Table 10-36 PKG_UTIL.LOB_CONVERTTOBLOB_HUGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB	INOUT	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in characters.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG_UTIL.LOB_CONVERTTOCLOB_HUGE

  Reads the content of a specified length from the specified offset position of the source CLOB, converts the content into a CLOB, and writes the CLOB to the specified position of target LOB. *amount* indicates the length to be converted.

  The prototype of the PKG_UTIL.LOB_CONVERTTOCLOB_HUGE function is as follows:

  ```
  PKG_UTIL.LOB_CONVERTTOCLOB_HUGE(
     dest_lob    INOUT  CLOB,
     src_blob    IN     BLOB,
     amount      IN     BIGINT,
     dest_offset INOUT  BIGINT,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  src_offset  INOUT  BIGINT)
)RETURN RECORD;
```

Table 10-37 PKG_UTIL.LOB_CONVERTTOCLOB_HUGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	CLOB	INOUT	No	Target LOB.
src_blob	BLOB	IN	No	BLOB to be converted.
amount	BIGINT	IN	No	Length to convert, in bytes.
dest_offset	BIGINT	INOUT	No	Offset position of the target LOB to which the data is written as the INOUT parameter.
src_offset	BIGINT	INOUT	No	Offset position of the source CLOB from which the data is read as the INOUT parameter.

- PKG_UTIL.BFILE_GET_LENGTH

  Obtains and returns the specified length of a BFILE file.

  The prototype of the PKG_UTIL.BFILE_GET_LENGTH function is as follows:

  ```
  PKG_UTIL.BFILE_GET_LENGTH(
    fd INTEGER
  )RETURN BIGINT;
  ```

  Table 10-38 PKG_UTIL.LOB_GET_LENGTH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- PKG_UTIL.BFILE_OPEN

  Opens a BFILE file and returns its file descriptor.

  The prototype of the PKG_UTIL.BFILE_OPEN function is as follows:

```
PKG_UTIL.BFILE_OPEN(
    file_name TEXT,
    open_mode TEXT)
RETURN INTEGER;
```

  Table 10-39 PKG_UTIL.BFILE_OPEN API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	Name of the specified BFILE file.
open_mode	TEXT	IN	No	Open mode, which can only be set to **r**, that is, the read mode.

- PKG_UTIL.BFILE_CLOSE

  Closes a BFILE file.

  The prototype of the PKG_UTIL.BFILE_CLOSE function is as follows:

```
PKG_UTIL.BFILE_CLOSE(
    fd INTEGER)
RETURN BOOL;
```

  Table 10-40 PKG_UTIL.BFILE_CLOSE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
fd	INTEGER	IN	No	File descriptor of the specified BFILE file.

- PKG_UTIL.LOB_WRITE_HUGE

  Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

  The prototype of the PKG_UTIL.LOB_WRITE_HUGE function is as follows:

```
PKG_UTIL.LOB_WRITE_HUGE(
    dest_lob  INOUT BLOB,
    len       IN INTEGER,
    start_pos IN BIGINT,
    src_lob   IN RAW
)RETURN BLOB;

PKG_UTIL.LOB_WRITE_HUGE(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  dest_lob  INOUT CLOB,
  len       IN INTEGER,
  start_pos IN BIGINT,
  src_lob   IN VARCHAR2
)RETURN CLOB;
```

Table 10-41 PKG_UTIL.LOB_WRITE_HUGE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dest_lob	BLOB/CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
len	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs).
start_pos	bigint	IN	No	Offset position for writing data to *dest_lob*.
src_lob	RAW/VARCHAR2	IN	No	Source LOB.

- PKG_UTIL.IO_PRINT

  Outputs a string.

  The prototype of the PKG_UTIL.IO_PRINT function is as follows:

```
PKG_UTIL.IO_PRINT(
format       IN   TEXT,
is_one_line  IN   BOOLEAN
)
RETURN VOID;
```

Table 10-42 PKG_UTIL.IO_PRINT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
format	TEXT	IN	No	Specifies the character string to be output.
is_one_line	BOOLEAN	IN	No	Specifies whether to output the string as a line.

- PKG_UTIL.RAW_GET_LENGTH

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Obtains the length of RAW data.

The prototype of the PKG_UTIL.RAW_GET_LENGTH function is as follows:

```
PKG_UTIL.RAW_GET_LENGTH(
value      IN   RAW
)
RETURN INTEGER;
```

Table 10-43 PKG_UTIL.RAW_GET_LENGTH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
raw	RAW	IN	No	Specifies the object whose length is to be obtained.

- PKG_UTIL.RAW_CAST_FROM_VARCHAR2

  Converts VARCHAR2 data to RAW data.

  The prototype of the PKG_UTIL.RAW_CAST_FROM_VARCHAR2 function is as follows:

  ```
  PKG_UTIL.RAW_CAST_FROM_VARCHAR2(
  str      IN   VARCHAR2
  )
  RETURN RAW;
  ```

  Table 10-44 PKG_UTIL.RAW_CAST_FROM_VARCHAR2 API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	VARCHAR2	IN	No	Specifies the source data to be converted.

- PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER

  Converts BIGINT data to RAW data.

  The prototype of the PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER function is as follows:

  ```
  PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER(
  value      IN   BIGINT,
  endianess  IN   INTEGER
  )
  RETURN RAW;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-45 PKG_UTIL.RAW_CAST_FROM_BINARY_INTEGER API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	BIGINT	IN	No	Specifies the source data to be converted.
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN).

- PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER

  Converts RAW data into BINARY_INTEGER.

  The prototype of the PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER function is as follows:

```
PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER(
value       IN   RAW,
endianess   IN   INTEGER
)
RETURN INTEGER;
```

Table 10-46 PKG_UTIL.RAW_CAST_TO_BINARY_INTEGER API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
value	RAW	IN	No	Specifies the source data to be converted.
endianess	INTEGER	IN	No	The value is an integer in lexicographic order. Currently, the value can be **1** (BIG_ENDIAN), **2** (LITTLE_ENDIAN), or **3** (MACHINE_ENDIAN).

- PKG_UTIL.RANDOM_SET_SEED

  Sets a random seed.

  The prototype of the PKG_UTIL.RANDOM_SET_SEED function is as follows:

```
PKG_UTIL.RANDOM_SET_SEED(
seed        IN   INT
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-47 PKG_UTIL.RANDOM_SET_SEED API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
seed	INT	IN	No	Sets a random seed.

- PKG_UTIL.RANDOM_GET_VALUE

  Returns a 15-digit random number ranging from 0 to 1.

  The prototype of the PKG_UTIL.RANDOM_GET_VALUE function is as follows:

```
PKG_UTIL.RANDOM_GET_VALUE(
)
RETURN NUMERIC;
```

- PKG_UTIL.FILE_SET_DIRNAME

  Sets the directory to be operated. It must be called to set directory for each operation involving a single directory.

  The prototype of the PKG_UTIL.FILE_SET_DIRNAME function is as follows:

```
PKG_UTIL.FILE_SET_DIRNAME(
dir  IN  TEXT
)
RETURN BOOL
```

Table 10-48 PKG_UTIL.FILE_SET_DIRNAME API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** File directories need to be added to the system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. Functions that involve **location** as parameters also comply with this rule.

- PKG_UTIL.FILE_OPEN

  Opens a file. A maximum of 50 files can be opened at a time. This function returns a handle of the INTEGER type.

  The prototype of the PKG_UTIL.FILE_OPEN function is as follows:

```
PKG_UTIL.FILE_OPEN(
file_name    IN  TEXT,
open_mode    IN  INTEGER)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-49 PKG_UTIL.FILE_OPEN API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the OPEN function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	INTEGER	IN	No	File opening mode, including **r** (read), **w** (write), and **a** (append). **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_SET_MAX_LINE_SIZE

  Sets the maximum length of a line to be written to a file.

  The prototype of the PKG_UTIL.FILE_SET_MAX_LINE_SIZE function is as follows:

  ```
  PKG_UTIL.FILE_SET_MAX_LINE_SIZE(
  max_line_size IN INTEGER)
  RETURN BOOL
  ```

  Table 10-50 PKG_UTIL.FILE_SET_MAX_LINE_SIZE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
max_line_size	INTEGER	IN	Yes	Maximum number of characters in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- PKG_UTIL.FILE_IS_CLOSE

  Checks whether a file handle is closed.

  The prototype of the PKG_UTIL.FILE_IS_CLOSE function is as follows:

  ```
  PKG_UTIL.FILE_IS_CLOSE(
  file IN INTEGER
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURN BOOL
```

Table 10-51 PKG_UTIL.FILE_IS_CLOSE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- PKG_UTIL.FILE_READ

  Reads a line of data from an open file handle based on the specified length.

  The prototype of the PKG_UTIL.FILE_READ function is as follows:

```
PKG_UTIL.FILE_READ(
file     IN   INTEGER,
buffer   OUT  TEXT,
len      IN   BIGINT DEFAULT 1024)
```

Table 10-52 PKG_UTIL.FILE_READ API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	TEXT	OUT	No	Buffer used to receive data.
len	BIGINT	IN	No	Number of bytes read from a file.

- PKG_UTIL.FILE_READLINE

  Reads a line of data from an open file handle based on the specified length.

  The prototype of the PKG_UTIL.FILE_READLINE function is as follows:

```
PKG_UTIL.FILE_READLINE(
file    IN  INTEGER,
buffer  OUT TEXT,
len     IN  INTEGER DEFAULT NULL)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-53 PKG_UTIL.FILE_READLINE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened by calling the OPEN function. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	TEXT	OUT	No	Buffer used to receive data.
len	INTEGER	IN	Yes	Number of bytes read from a file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

- PKG_UTIL.FILE_WRITE

  Writes the data specified in the buffer to a file.

  The prototype of the PKG_UTIL.FILE_WRITE function is as follows:

```
PKG_UTIL.FILE_WRITE(
file IN INTEGER,
buffer IN TEXT
)
RETURN BOOL
```

Table 10-54 PKG_UTIL.FILE_WRITE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	IN	No	Text data to be written to a file. The maximum buffer size is 32767 bytes. If no value is specified, the default value is 1024 bytes. Before the writing is performed, the buffer occupied by PUT operations cannot exceed 32767 bytes. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_NEWLINE

  Writes a line terminator to an open file. The line terminator is related to the platform.

  The prototype of the PKG_UTIL.FILE_NEWLINE function is as follows:

  ```
  PKG_UTIL.FILE_NEWLINE(
  file IN INTEGER
  )
  RETURN BOOL
  ```

  Table 10-55 PKG_UTIL.FILE_NEWLINE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- PKG_UTIL.FILE_WRITELINE

  Writes a line to a file.

  The prototype of the PKG_UTIL.FILE_WRITELINE function is as follows:

  ```
  PKG_UTIL.FILE_WRITELINE(
  file IN INTEGER,
  buffer IN TEXT
  )
  RETURN BOOL
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-56 PKG_UTIL.FILE_WRITELINE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
buffer	TEXT	IN	No	Content to be written.

- PKG_UTIL.FILE_READ_RAW

  Reads binary data of a specified length from an open file handle and returns the read binary data. The return type is RAW.

  The prototype of the PKG_UTIL.FILE_READ_RAW function is as follows:

```
PKG_UTIL.FILE_READ_RAW(
file      IN INTEGER,
length    IN INTEGER DEFAULT NULL
)
RETURN RAW
```

Table 10-57 PKG_UTIL.FILE_READ_RAW API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
length	INTEGER	IN	Yes	Length of the data to be read. The default value is **NULL**. By default, all data in the file is read. The maximum size is 1 GB.

- PKG_UTIL.FILE_WRITE_RAW

  Writes the input binary object of the RAW type to an open file. If the insertion is successful, **true** is returned.

  The prototype of the PKG_UTIL.FILE_WRITE_RAW function is as follows:

```
PKG_UTIL.FILE_WRITE_RAW(
file IN INTEGER,
r    IN RAW
)
RETURN BOOL
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-58 PKG_UTIL.FILE_WRITE_RAW API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
r	RAW	IN	No	Data to be written to the file. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- PKG_UTIL.FILE_FLUSH

  Data in a file handle must be written into a physical file. Data in the buffer must have a line terminator. Refresh is important if a file must be read when it is opened. For example, debugging information can be refreshed to a file so that it can be read immediately.

  The prototype of the PKG_UTIL.FILE_FLUSH function is as follows:

  ```
  PKG_UTIL.FILE_FLUSH (
  file IN INTEGER
  )
  RETURN VOID
  ```

  Table 10-59 PKG_UTIL.FILE_FLUSH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- PKG_UTIL.FILE_CLOSE

  Closes an open file handle.

  The prototype of the PKG_UTIL.FILE_CLOSE function is as follows:

  ```
  PKG_UTIL.FILE_CLOSE (
  file IN INTEGER
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURN BOOL
```

Table 10-60 PKG_UTIL.FILE_CLOSE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- PKG_UTIL.FILE_REMOVE

  Deletes a disk file. To perform this operation, you must have required permissions.

  The prototype of the PKG_UTIL.FILE_REMOVE function is as follows:

  ```
  PKG_UTIL.FILE_REMOVE(
  file_name IN TEXT
  )
  RETURN VOID
  ```

  Table 10-61 PKG_UTIL.FILE_REMOVE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
filen_ame	TEXT	IN	No	Name of the file to be deleted

- PKG_UTIL.FILE_RENAME

  Renames a file on the disk, similar to **mv** in Unix.

  The prototype of the PKG_UTIL.FILE_RENAME function is as follows:

  ```
  PKG_UTIL.FILE_RENAME(
  src_dir IN TEXT,
  src_file_name IN TEXT,
  dest_dir IN TEXT,
  dest_file_name IN TEXT,
  overwrite BOOLEAN DEFAULT false)
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-62 PKG_UTIL.FILE_RENAME API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Source file directory (case-sensitive). **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	No	Source file name.
dest_dir	TEXT	IN	No	Target file directory (case-sensitive). **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	TEXT	IN	No	Target file name.
overwrite	BOOLEAN	IN	Yes	The default value is **false**. If a file with the same name exists in the destination directory, the file will not be rewritten.

- PKG_UTIL.FILE_SIZE

  Returns the size of a specified file.

  The prototype of the PKG_UTIL.FILE_SIZE function is as follows:

```
bigint PKG_UTIL.FILE_SIZE(
file_name IN TEXT
)return BIGINT
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-63 PKG_UTIL.FILE_SIZE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name.

- PKG_UTIL.FILE_BLOCK_SIZE

  Returns the number of blocks contained in a specified file.

  The prototype of the PKG_UTIL.FILE_BLOCK_SIZE function is as follows:

  ```
  bigint PKG_UTIL.FILE_BLOCK_SIZE(
  file_name IN TEXT
  )return BIGINT
  ```

  Table 10-64 PKG_UTIL.FILE_BLOCK_SIZE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name.

- PKG_UTIL.FILE_EXISTS

  Checks whether a file exists.

  The prototype of the PKG_UTIL.FILE_EXISTS function is as follows:

  ```
  PKG_UTIL.FILE_EXISTS(
  file_name IN TEXT
  )
  RETURN BOOL
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-65 PKG_UTIL.FILE_EXISTS API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file_name	TEXT	IN	No	File name.

- PKG_UTIL.FILE_GETPOS

  Specifies the offset of a returned file, in bytes.

  The prototype of the PKG_UTIL.FILE_GETPOS function is as follows:

```
PKG_UTIL.FILE_GETPOS(
file IN INTEGER
)
RETURN BIGINT
```

Table 10-66 PKG_UTIL.FILE_GETPOS API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.

- PKG_UTIL.FILE_SEEK

  Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the PKG_UTIL.FILE_SEEK function is as follows:

```
void PKG_UTIL.FILE_SEEK(
file IN INTEGER,
start IN BIGINT
)
RETURN VOID
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-67 PKG_UTIL.FILE_SEEK API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	Opened file handle.
start	BIGINT	IN	No	File offset, in bytes.

- PKG_UTIL.FILE_CLOSE_ALL

  Closes all file handles opened in a session.

  The prototype of the PKG_UTIL.FILE_CLOSE_ALL function is as follows:

```
PKG_UTIL.FILE_CLOSE_ALL(
)
RETURN VOID
```

Table 10-68 PKG_UTIL.FILE_CLOSE_ALL API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
None	None	None	None	None.

- PKG_UTIL.EXCEPTION_REPORT_ERROR

  Throws an exception.

  The prototype of the PKG_UTIL.EXCEPTION_REPORT_ERROR function is as follows:

```
PKG_UTIL.EXCEPTION_REPORT_ERROR(
code INTEGER,
log TEXT,
flag BOOLEAN DEFAULT FALSE
)
RETURN INTEGER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-69 PKG_UTIL.EXCEPTION_REPORT_ERROR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
code	Integer	IN	No	Error code displayed when a running exception occurs.
log	TEXT	IN	No	Logs displayed when a running exception occurs.
flag	BOOLEAN	IN	Yes	Reserved. The default value is **FALSE**.

- PKG_UTIL.APP_READ_CLIENT_INFO

  Reads the client information.

  The prototype of the PKG_UTIL.APP_READ_CLIENT_INFO function is as follows:

  ```
  PKG_UTIL.APP_READ_CLIENT_INFO(
  OUT buffer TEXT
  )return TEXT
  ```

  Table 10-70 PKG_UTIL.APP_READ_CLIENT_INFO API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	OUT	No	Client information returned.

- PKG_UTIL.APP_SET_CLIENT_INFO

  Sets the client information.

  The prototype of the PKG_UTIL.APP_SET_CLIENT_INFO function is as follows:

  ```
  PKG_UTIL.APP_SET_CLIENT_INFO(
  str TEXT
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-71 PKG_UTIL.APP_SET_CLIENT_INFO API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
str	TEXT	IN	No	Client information to be set.

- PKG_UTIL.LOB_CONVERTTOBLOB

  Converts a CLOB to a BLOB. *amount* indicates the conversion length.

  The prototype of the PKG_UTIL.LOB_CONVERTTOBLOB function is as follows:

```
PKG_UTIL.LOB_CONVERTTOBLOB(
dest_lob BLOB,
src_clob CLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)return RAW
```

Table 10-72 PKG_UTIL.LOB_CONVERTTOBLOB API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
dest_lob	BLOB	IN	No	Target LOB.
src_clob	CLOB	IN	No	CLOB to be converted.
amount	INTEGER	IN	No	Conversion length.
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG_UTIL.lLOB_CONVERTTOCLOB

  Converts a BLOB to a CLOB. *amount* indicates the conversion length.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the PKG_UTIL.LOB_CONVERTTOCLOB function is as follows:

```
PKG_UTIL.LOB_CONVERTTOCLOB(
dest_lob CLOB,
src_blob BLOB,
amount INTEGER,
dest_offset INTEGER,
src_offset INTEGER
)return TEXT
```

Table 10-73 PKG_UTIL.LOB_CONVERTTOCLOB API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
dest_lob	CLOB	IN	No	Target LOB.
src_blob	BLOB	IN	No	BLOB to be converted.
amount	INTEGER	IN	No	Conversion length.
dest_offset	INTEGER	IN	No	Start position of the target LOB.
src_offset	INTEGER	IN	No	Start position of the source CLOB.

- PKG_UTIL.LOB_TEXTTORAW

  Converts the text type to the raw type.

  The prototype of the PKG_UTIL.LOB_TEXTTORAW function is as follows:

  ```
  PKG_UTIL.LOB_TEXTTORAW(
  src_lob CLOB
  )
  RETURN RAW
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-74 PKG_UTIL.LOB_TEXTTORAW API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_lob	CLOB	IN	No	LOB to be converted.

- PKG_UTIL.LOB_RAWTOTEXT

  Converts RAW data to TEXT data.

  The prototype of the PKG_UTIL.LOB_RAWTOTEXT function is as follows:

```
PKG_UTIL.LOB_RAWTOTEXT(
src_lob IN BLOB
)
RETURN TEXT
```

Table 10-75 PKG_UTIL.LOB_RAWTOTEXT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_lob	BLOB	IN	No	LOB to be converted.

- PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY

  Calculates the difference between two character strings.

  The prototype of the PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY function is as follows:

```
PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY(
str1 TEXT,
str2 TEXT
)
RETURN INTEGER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-76 PKG_UTIL.MATCH_EDIT_DISTANCE_SIMILARITY API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str1	TEXT	IN	No	First character string.
str2	TEXT	IN	No	Second character string.

- PKG_UTIL.RAW_CAST_TO_VARCHAR2

  Converts the raw type to the varchar2 type.

  The prototype of the PKG_UTIL.RAW_CAST_TO_VARCHAR2 function is as follows:

```
PKG_UTIL.RAW_CAST_TO_VARCHAR2(
str RAW
)
RETURN VARCHAR2
```

Table 10-77 PKG_UTIL.RAW_CAST_TO_VARCHAR2 API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
str	RAW	IN	No	Hexadecimal string.

- PKG_UTIL.SESSION_CLEAR_CONTEXT

  Clears the session context.

  The prototype of the PKG_UTIL.SESSION_CLEAR_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_CLEAR_CONTEXT(
namespace TEXT,
client_identifier TEXT,
attribute TEXT
)
RETURN INTEGER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-78 PKG_UTIL.SESSION_CLEAR_CONTEXT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
client_identifier	TEXT	IN	Yes	Usually same as the value of **namespace**. If this parameter is set to **null**, all namespaces are modified by default.
attribute	TEXT	IN	No	Attribute value to be cleared.

- PKG_UTIL.SESSION_SEARCH_CONTEXT

  Searches for an attribute value.

  The prototype of the PKG_UTIL.SESSION_SEARCH_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SEARCH_CONTEXT(
namespace TEXT,
attribute TEXT
)
RETURN INTEGER
```

Table 10-79 PKG_UTIL.SESSION_SEARCH_CONTEXT API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute value to be searched for.

- PKG_UTIL.SESSION_SET_CONTEXT

  Sets an attribute value.

  The prototype of the PKG_UTIL.SESSION_SET_CONTEXT function is as follows:

```
PKG_UTIL.SESSION_SET_CONTEXT(
namespace TEXT,
attribute TEXT,
value TEXT
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURN INTEGER
```

Table 10-80 PKG_UTIL.SESSION_SET_CONTEXT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Namespace of an attribute.
attribute	TEXT	IN	No	Attribute to be set.
value	TEXT	IN	No	Attribute value.

- PKG_UTIL.UTILITY_GET_TIME

  Prints the Unix timestamp.

  The prototype of the PKG_UTIL.UTILITY_GET_TIME function is as follows:

  ```
  PKG_UTIL.UTILITY_GET_TIME()
  RETURN BIGINT
  ```

- PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE

  Displays the error stack of a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_ERROR_BACKTRACE()
  RETURN TEXT
  ```

- PKG_UTIL.UTILITY_FORMAT_ERROR_STACK

  Displays the error information about a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_ERROR_STACK function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_ERROR_STACK()
  RETURN TEXT
  ```

- PKG_UTIL.UTILITY_FORMAT_CALL_STACK

  Displays the call stack of a stored procedure.

  The prototype of the PKG_UTIL.UTILITY_FORMAT_CALL_STACK function is as follows:

  ```
  PKG_UTIL.UTILITY_FORMAT_CALL_STACK()
  RETURN TEXT
  ```

- PKG_UTIL.UTILITY_COMPILE_SCHEMA

  Recompiles packages, functions and stored procedures under the specified schema.

  The prototype of the PKG_UTIL.UTILITY_COMPILE_SCHEMA function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
PKG_UTIL.UTILITY_COMPILE_SCHEMA (
schema IN VARCHAR2,
compile_all IN BOOLEAN DEFAULT TRUE,
reuse_settings IN BOOLEAN DEFAULT FALSE
)
RETURNS VOID
```

- PKG_UTIL.GS_COMPILE_SCHEMA

  Recompiles packages, functions and stored procedures under the specified schema.

  The prototype of the PKG_UTIL.GS_COMPILE_SCHEMA stored procedure is as follows:

```
pkg_util.GS_COMPILE_SCHEMA (
schema_name IN VARCHAR2 DEFAULT NULL,
compile_all IN BOOLEAN DEFAULT FALSE,
retry_times IN INT DEFAULT 10
)
```

Table 10-81 PKG_UTIL.GS_COMPILE_SCHEMA API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schema_name	VARCHAR2	IN	Yes	Specifies the name of the namespace.
compile_all	Boolean	IN	Yes	Specifies to compile all objects. • **false**: Compile the packages, functions, and stored procedures whose status is false in the pg_object table. • **true**: Compile all packages, functions, and stored procedures in the pg_object table. • **retry_times**: number of retry times.

- PKG_UTIL.APP_SET_MODULE

  Sets the value of a module.

  The prototype of the PKG_UTIL.APP_SET_MODULE stored procedure is as follows:

```
PKG_UTIL.APP_SET_MODULE (
   str TEXT)
returns VOID
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-82 PKG_UTIL.APP_SET_MODULE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
text	Text	IN	No	Specifies the value of a module to be set.

Example:

```
CALL PKG_UTIL.APP_SET_MODULE('set module');
 app_set_module
----------------

(1 row)
```

- PKG_UTIL.APP_READ_MODULE

  Reads the value of a module.

  The prototype of the PKG_UTIL.APP_READ_MODULE stored procedure is as follows:

  ```
  PKG_UTIL.APP_READ_MODULE(
  OUT buffer TEXT
  )
  ```

  Table 10-83 PKG_UTIL.APP_READ_MODULE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	OUT	No	Specifies the value of a module to be returned.

  Example:

  ```
  DECLARE
      module VARCHAR2(64);
  BEGINPKG_UTIL.APP_READ_MODULE(module);
      dbe_output.print_line(module);
  END;
  /
  set module
  ANONYMOUS BLOCK EXECUTE
  ```

- PKG_UTIL.APP_SET_ACTION

  Sets the value of an action.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the PKG_UTIL.APP_SET_ACTION stored procedure is as follows:

```
PKG_UTIL.APP_SET_ACTION (
    str TEXT)
returns VOID
```

Table 10-84 PKG_UTIL.APP_SET_ACTION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
text	Text	IN	No	Specifies the value of an action to be set.

Example:

```
CALL PKG_UTIL.APP_SET_ACTION('set action');
 app_set_action
----------------

(1 row)
```

- PKG_UTIL.APP_READ_ACTION

  Reads the value of an action.

  The prototype of the PKG_UTIL.APP_READ_ACTION stored procedure is as follows:

  ```
  PKG_UTIL.APP_READ_ACTION(
  OUT buffer TEXT
  )
  ```

  Table 10-85 PKG_UTIL.APP_READ_ACTION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	OUT	No	Specifies the value of an action to be returned.

  Example:

  ```
  DECLARE
        action VARCHAR2(64);
  BEGINPKG_UTIL.APP_READ_ACTION(action);
      dbe_output.print_line(action);
  END;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
/
set action
ANONYMOUS BLOCK EXECUTE
```

- PKG_UTIL.MODIFY_PACKAGE_STATE

  Modifies the PL/SQL status of the current session.

  The prototype of the PKG_UTIL.MODIFY_PACKAGE_STATE stored procedure is as follows:

```
PKG_UTIL.MODIFY_PACKAGE_STATE (
    flags INT)
returns VOID
```

Table 10-86 PKG_UTIL.MODIFY_PACKAGE_STATE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
flags	INT	IN	No	Bit flag of the operation performed on the PL/SQL. When **flags** is set to **1**, the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally. Other bit flags are not supported.

Example:

```
CALL PKG_UTIL.MODIFY_PACKAGE_STATE(1);
 modify_package_state
----------------------

(1 row)
```

10.12.1.3 DBE_DESCRIBE

For details about the basic interfaces supported by DBE_DESCRIBE, see **Table 1 DBE_DESCRIBE basic interfaces**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-87 DBE_DESCRIBE basic interfaces

Interface	Description
DBE_DESCRIBE.GET_PROCEDURE_NAME	This is an internal function and is not recommended. The name of a stored procedure or function is extracted from the original input of a user.
DBE_DESCRIBE.IS_NUMBER_TYPE	This is an internal function and is not recommended. It is used to determine whether the data type is numeric.

- DBE_DESCRIBE.GET_PROCEDURE_NAME

  This is an internal function and is not recommended. It is used to extract the name of a stored procedure or function from the original input of a user.

  The prototype of the DBE_DESCRIBE.GET_PROCEDURE_NAME function is as follows:

  ```
  DBE_DESCRIBE.GET_PROCEDURE_NAME(
  name IN VARCHAR2)
  RETURNS VARCHAR2;
  ```

  Table 10-88 DBE_DESCRIBE.GET_PROCEDURE_NAME interface parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Entity name.

- DBE_DESCRIBE.IS_NUMBER_TYPE

  This is an internal function and is not recommended. It is used to check whether the type is numeric.

  The prototype of the DBE_DESCRIBE.IS_NUMBER_TYPE function is as follows:

  ```
  DBE_DESCRIBE.IS_NUMBER_TYPE(
  type_oid IN INTEGER)
  RETURNS BOOLEAN;
  ```

  Table 10-89 DBE_DESCRIBE.IS_NUMBER_TYPE interface parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
type_oid	INTEGER	IN	Yes	OID of the type.

10.12.1.4 DBE_XML

Table 10-90 lists all APIs supported by DBE_XML.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-90 DBE_XML parameters

API	Description
DBE_XML.XML_FREE_PARSER	Frees a parser.
DBE_XML.XML_PARSER_GET_DOC	Obtains the parsed document node.
DBE_XML.XML_GET_VALIDATION_MODE	Obtains the validation attribute.
DBE_XML.XML_NEW_PARSER	Creates a parser instance.
DBE_XML.XML_PARSE_BUFFER	Parses the VARCHAR string.
DBE_XML.XML_PARSE_CLOB	Parses the CLOB string.
DBE_XML.XML_SET_VALIDATION_MODE	Sets the validation attribute.
DBE_XML.XML_DOM_APPEND_CHILD	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
DBE_XML.XML_DOM_CREATE_ELEMENT	Returns the DOMElement object with the specified name.
DBE_XML.XML_DOM_CREATE_ELEMENT_NS	Returns the DOMElement object with the specified name and namespace.
DBE_XML.XML_DOM_CREATE_TEXT_NODE	Creates and returns a DOMText object.
DBE_XML.XML_DOM_FREE_DOCUMENT	Frees a specified XML DOM object.
DBE_XML.XML_DOM_FREE_ELEMENT	Frees a specified XML DOM object.
DBE_XML.XML_DOM_FREE_NODE	Frees a DOMNode node.
DBE_XML.XML_DOM_FREE_NODELIST	Frees a DOMNodeList node.
DBE_XML.XML_DOM_GET_ATTRIBUTE	Obtains the attributes of a specified XML DOM object.
DBE_XML.XML_DOM_GET_ATTRIBUTES	Returns the attribute values of a DOMNode node as a map.
DBE_XML.XML_DOM_GET_CHILD_NODES	Converts several subnodes under a node into a node list.
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME	Obtains the list of specified subnodes of a specified XML DOM object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS	Obtains the list of subnodes in the specified namespace of a specified XML DOM object.
DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT	Returns the first subnode of the specified document.
DBE_XML.XML_DOM_GET_FIRST_CHILD	Returns the first subnode of a node.
DBE_XML.XML_DOM_GET_LAST_CHILD	Returns the last subnode of a node.
DBE_XML.XML_DOM_GET_LENGTH	Returns the number of nodes based on the content in the node of the specified type.
DBE_XML.XML_DOM_GET_LOCALNAME	Returns the local name of the given object.
DBE_XML.XML_DOM_GET_NAMED_ITEM	Returns the node specified by name.
DBE_XML.XML_DOM_GET_NAMED_ITEM_NS	Returns the node specified by name and namespace.
DBE_XML.XML_DOM_GET_NEXT_SIBLING	Returns the next node of the specified node.
DBE_XML.XML_DOM_GET_NODE_NAME	Returns the name of a node.
DBE_XML.XML_DOM_GET_NODE_TYPE	Returns the type of a node.
DBE_XML.XML_DOM_GET_NODE_VALUE	Returns the value of a node.
DBE_XML.XML_DOM_GET_PARENT_NODE	Returns the parent node of the given node.
DBE_XML.XML_DOM_GET_TAGNAME	Obtains the tag name of a specified XML DOM object.
DBE_XML.XML_DOM_HAS_CHILD_NODES	Checks whether the DOMNode object has any subnode.
DBE_XML.XML_DOM_IMPORT_NODE	Copies a node to another node and mounts the copied node to a specified document.
DBE_XML.XML_DOM_IS_NULL	Checks whether the given object is null.
DBE_XML.XML_DOM_ITEM	Returns the element corresponding to the index in a list or map based on the index.
DBE_XML.XML_DOM_MAKE_ELEMENT	Returns the DOMElement object after conversion.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XML.XML_DOM_MAKENODE	Converts the given object to the DOMNode type.
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY	Returns a new DOMDocument object.
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_CLOB	Returns a new DOMDocument instance object created from the specified CLOB type.
DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE	Returns a new DOMDocument instance object created from the specified XMLType type.
DBE_XML.XML_DOM_SET_ATTRIBUTE	Sets the attributes of a specified XML DOM object.
DBE_XML.XML_DOM_SET_CHARSET	Sets the character set for a DOMDocument object.
DBE_XML.XML_DOM_SET_DOCTYPE	Sets the external DTD of a DOMDocument object.
DBE_XML.XML_DOM_SET_NODE_VALUE	Sets the value of a node in the DOMNode object.
DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC	Writes the given DOMDocument object to the buffer.
DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE	Writes the given DOMNode object to the buffer.
DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC	Writes the given DOMDocument object to a CLOB.
DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE	Writes the given DOMNode object to a CLOB.
DBE_XML.XML_DOM_WRITE_TO_FILE_DOC	Writes an XML node to a specified file using the database character set.
DBE_XML.XML_DOM_WRITE_TO_FILE_NODE	Writes an XML node to a specified file using the database character set.
DBE_XML.XML_DOM_GET_SESSION_TREE_NUM	Displays the number of DOM trees of all types in the current session.
DBE_XML.XML_DOM_GET_DOC_TREES_INFO	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO	Displays the number of nodes of each type for a specific document variable.

- DBE_XML.XML_FREE_PARSER

  Frees a given parser object.

  The stored procedure prototype of DBE_XML.XML_FREE_PARSER is as follows:

```
DBE_XML.XML_FREE_PARSER(
id IN RAW(13))
returns VOID;
```

  Table 10-91 DBE_XML.XML_FREE_PARSER parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.

- DBE_XML.XML_PARSER_GET_DOC

  Returns the root node of the DOM tree document constructed by the parser.

  The prototype of the DBE_XML.XML_PARSER_GET_DOC function is as follows:

```
DBE_XML.XML_PARSER_GET_DOC(
id IN RAW(13))
returns RAW(13);
```

  Table 10-92 DBE_XML.XML_PARSER_GET_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.

  NOTE

  - If the DBE_XML.XML_PARSER_GET_DOC function is empty, **NULL** is returned.
  - If the parser input by the DBE_XML.XML_PARSER_GET_DOC function has not parsed any document, **NULL** is returned.

- DBE_XML.XML_GET_VALIDATION_MODE

  Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the DBE_XML.XML_GET_VALIDATION_MODE function is as follows:

```
DBE_XML.XML_GET_VALIDATION_MODE(
id RAW(13))
returns BOOL;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-93 DBE_XML.XML_GET_VALIDATION_MODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.

- DBE_XML.XML_NEW_PARSER

  Creates a parser object and returns a new parser instance.

  The prototype of the DBE_XML.XML_NEW_PARSER function is as follows:

  ```
  DBE_XML.XML_NEW_PARSER()
  RETURNS RAW(13);
  ```

- DBE_XML.XML_PARSE_BUFFER

  Parses XML documents stored in strings.

  The stored procedure prototype of DBE_XML.XML_PARSE_BUFFER is as follows:

  ```
  DBE_XML.XML_PARSE_BUFFER(
  id RAW(13),
  xmlstr VARCHAR2)
  RETURNS VOID;
  ```

Table 10-94 DBE_XML.XML_PARSE_BUFFER parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.
xmlstr	VARCHAR2	IN	No	A string that stores XML documents.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The maximum length of a character string that can be parsed by the xml_parse_buffer function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and escaped to ' and ". However, predefined entities in database ORA are not escaped to characters.

- DBE_XML.XML_PARSE_CLOB

  Parses XML documents stored in XML_PARSE_CLOB.

  The stored procedure prototype of DBE_XML.XML_PARSE_CLOB is as follows:

```
DBE_XML.XML_PARSE_CLOB(
id IN RAW(13),
doc IN CLOB)
returns VOID;
```

Table 10-95 DBE_XML.XML_PARSE_CLOB parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.
doc	CLOB	IN	No	A string that stores XML documents.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- xml_parse_clob cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and escaped to ' and ". However, predefined entities in database ORA are not escaped to characters.

- DBE_XML.XML_SET_VALIDATION_MODE

  Sets the parsing validation mode of a specified parser.

  The stored procedure prototype of DBE_XML.XML_SET_VALIDATION_MODE is as follows:

```
DBE_XML.XML_SET_VALIDATION_MODE(
id RAW(13),
validate BOOLEAN)
returns VOID;
```

Table 10-96 DBE_XML.XML_SET_VALIDATION_MODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	Parser object.
validate	BOOLEAN	IN	Yes	Mode to be set: • **TRUE**: DTD validation is enabled. • **FALSE**: DTD validation is disabled.

NOTE

- If the input parameter **validate** of the DBE_XML.XML_SET_VALIDATION_MODE function is null, the parsing validation mode of the parser is not changed.
- By default, the DTD validation is enabled during parser initialization.

- DBE_XML.XML_DOM_APPEND_CHILD

  Adds the newchild node to the end of the parent(n) node and returns the newly added node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The stored procedure prototype of DBE_XML.XML_DOM_APPEND_CHILD is as follows:

```
DBE_XML.XML_DOM_APPEND_CHILD(
   parentId IN RAW(13),
   childId IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-97 DBE_XML.XML_DOM_APPEND_CHILD parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
parentId	RAW(13)	IN	No	XML DOM object.
childId	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_CREATE_ELEMENT

  Returns the DOMElement object with the specified name.

  The prototype of the DBE_XML.XML_DOM_CREATE_ELEMENT function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT(
   id IN RAW(13),
   tagname IN VARCHAR2
)
RETURNS RAW(13);
```

Table 10-98 DBE_XML.XML_DOM_CREATE_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
tagname	VARCHAR2	IN	No	Name of the new DOMElement object.

- DBE_XML.XML_DOM_CREATE_ELEMENT_NS

  Returns the DOMElement object with the specified name and namespace.

  The prototype of the DBE_XML.XML_DOM_CREATE_ELEMENT_NS function is as follows:

```
DBE_XML.XML_DOM_CREATE_ELEMENT_NS(
   id IN RAW(13),
   tagname IN VARCHAR2,
   ns IN VARCHAR2
)
RETURNS RAW(13);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-99 DBE_XML.XML_DOM_CREATE_ELEMENT_NS parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
tagname	VARCHAR2	IN	No	Name of the new DOMElement object.
ns	VARCHAR2	IN	No	Namespace.

- DBE_XML.XML_DOM_CREATE_TEXT_NODE

  Creates and returns a DOMText object.

  The prototype of the DBE_XML.XML_DOM_CREATE_TEXT_NODE function is as follows:

```
DBE_XML.XML_DOM_CREATE_TEXT_NODE(
   id IN RAW(13),
   data IN VARCHAR2
)
RETURNS RAW(13);
```

  Table 10-100 DBE_XML.XML_DOM_CREATE_TEXT_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
data	VARCHAR2	IN	No	Content of the new DOMText node.

- DBE_XML.XML_DOM_FREE_DOCUMENT

  Frees a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_DOCUMENT is as follows:

```
DBE_XML.XML_DOM_FREE_DOCUMENT(
   id RAW(13)
)
RETURNS VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-101 DBE_XML.XML_DOM_FREE_DOCUMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_FREE_ELEMENT

  Frees a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_ELEMENT is as follows:

```
DBE_XML.XML_DOM_FREE_ELEMENT (
    id RAW(13)
)
RETURNS VOID;
```

Table 10-102 DBE_XML.XML_DOM_FREE_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_FREE_NODE

  Frees a DOMNode node.

  The prototype of the DBE_XML.XML_DOM_FREE_NODE function is as follows:

```
DBE_XML.XML_DOM_FREE_NODE (
    id RAW(13)
)
RETURNS VOID;
```

Table 10-103 DBE_XML.XML_DOM_FREE_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_FREE_NODELIST

  Frees a DOMNodeList node.

  The stored procedure prototype of DBE_XML.XML_DOM_FREE_NODELIST is as follows:

```
DBE_XML.XML_DOM_FREE_NODELIST(
    id IN RAW(13)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
)
RETURNS VOID
```

Table 10-104 DBE_XML.XML_DOM_FREE_NODELIST parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_ATTRIBUTE

  Obtains the attributes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_GET_ATTRIBUTE (
   docid   IN  RAW(13),
   name    IN  VARCHAR2
)
RETURNS VARCHAR2;
```

Table 10-105 DBE_XML.XML_DOM_GET_ATTRIBUTE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.

- DBE_XML.XML_DOM_GET_ATTRIBUTES

  Returns the attribute values of a DOMNode node as a map.

  The prototype of the DBE_XML.XML_DOM_GET_ATTRIBUTES function is as follows:

```
DBE_XML.XML_DOM_GET_ATTRIBUTES (
   id RAW(13)
)
RETURNS RAW(13);
```

Table 10-106 DBE_XML.XML_DOM_GET_ATTRIBUTES parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_CHILD_NODES

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Converts several subnodes under a node into a node list.

The prototype of the DBE_XML.XML_DOM_GET_CHILD_NODES function is as follows:

```
DBE_XML.XML_DOM_GET_CHILD_NODES(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-107 DBE_XML.XML_DOM_GET_CHILD_NODES parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME

  Obtains the list of specified subnodes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME (
   docid   IN  RAW(13),
   name    IN  VARCHAR2
)
RETURNS RAW(13);
```

  Table 10-108 DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.

- DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS

  Obtains the list of subnodes in the specified namespace of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS is as follows:

```
DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS (
   docid   IN  RAW(13),
   name    IN  VARCHAR2,
   ns      IN  VARCHAR2
)
RETURNS RAW(13);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-109 DBE_XML.XML_DOM_GET_CHILDREN_BY_TAGNAME_NS parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.
ns	VARCHAR2	IN	Yes	String.

- DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT

  Returns the first subnode of the specified document.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT is as follows:

```
DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT(
   id  RAW(13)
)
RETURNS RAW(13);
```

Table 10-110 DBE_XML.XML_DOM_GET_DOCUMENT_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_FIRST_CHILD

  Returns the first subnode of a node.

  The prototype of the DBE_XML.XML_DOM_GET_FIRST_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_FIRST_CHILD(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-111 DBE_XML.XML_DOM_GET_FIRST_CHILD parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_LAST_CHILD

  Returns the last subnode of a node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_XML.XML_DOM_GET_LAST_CHILD function is as follows:

```
DBE_XML.XML_DOM_GET_LAST_CHILD(
    id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-112 DBE_XML.XML_DOM_GET_LAST_CHILD parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_LENGTH

  Returns the number of nodes based on the content in the node of the specified type.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_LENGTH is as follows:

  ```
  DBE_XML.XML_DOM_GET_LENGTH(
      id RAW(13)
  )
  RETURNS VOID;
  ```

  Table 10-113 DBE_XML.XML_DOM_GET_LENGTH parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_GET_LOCALNAME

  Returns the local name of the given object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_LOCALNAME is as follows:

  ```
  DBE_XML.XML_DOM_GET_LOCALNAME (
      id  RAW(13)
  )
  RETURNS VARCHAR2;
  ```

  Table 10-114 DBE_XML.XML_DOM_GET_LOCALNAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_XML.XML_DOM_GET_NAMED_ITEM

  Returns the node specified by name.

  The prototype of the DBE_XML.XML_DOM_GET_NAMED_ITEM function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM(
    id IN RAW(13),
    nodeName IN VARCHAR2
)
RETURNS RAW(13);
```

  Table 10-115 DBE_XML.XML_DOM_GET_NAMED_ITEM parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved.

- DBE_XML.XML_DOM_GET_NAMED_ITEM_NS

  Returns the node specified by name and namespace.

  The prototype of the DBE_XML.XML_DOM_GET_NAMED_ITEM_NS function is as follows:

```
DBE_XML.XML_DOM_GET_NAMED_ITEM_NS(
    id  RAW(13),
    nodeName IN VARCHAR2,
    ns IN VARCHAR2
)
RETURNS RAW(13);
```

  Table 10-116 DBE_XML.XML_DOM_GET_NAMED_ITEM_NS parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
nodeName	VARCHAR2	IN	No	Name of the element to be retrieved.
ns	VARCHAR2	IN	Yes	Namespace.

- DBE_XML.XML_DOM_GET_NEXT_SIBLING

  Returns the next node of the specified node.

  The prototype of the DBE_XML.XML_DOM_GET_NEXT_SIBLING function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XML.XML_DOM_GET_NEXT_SIBLING(
   id IN RAW(13)
)
RETURNS RAW(13);
```

Table 10-117 DBE_XML.XML_DOM_GET_NEXT_SIBLING parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_NODE_NAME

  Returns the name of a node.

  The prototype of the DBE_XML.XML_DOM_GET_NODE_NAME function is as follows:

```
DBE_XML.XML_DOM_GET_NODE_NAME(
   id IN RAW(13)
)
RETURNS VARCHAR2;
```

Table 10-118 DBE_XML.XML_DOM_GET_NODE_NAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_NODE_TYPE

  Returns the type of a node.

  The prototype of the DBE_XML.XML_DOM_GET_NODE_TYPE function is as follows:

```
DBE_XML.XML_DOM_GET_NODE_TYPE(
   id IN RAW(13)
)
RETURNS INTEGER;
```

Table 10-119 DBE_XML.XML_DOM_GET_NODE_TYPE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_GET_NODE_VALUE

  Returns the value of a node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The stored procedure prototype of DBE_XML.XML_DOM_GET_NODE_VALUE is as follows:

```
DBE_XML.XML_DOM_GET_NODE_VALUE(
id IN RAW(13))
RETURNS VARCHAR2;
```

Table 10-120 DBE_XML.XML_DOM_GET_NODE_VALUE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_GET_PARENT_NODE

  Returns the parent node of the given node.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_PARENT_NODE is as follows:

  ```
  DBE_XML.XML_DOM_GET_PARENT_NODE(
  id IN RAW(13))
  RETURNS RAW(13);
  ```

  Table 10-121 DBE_XML.XML_DOM_GET_PARENT_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_GET_TAGNAME

  Obtains the tag name of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_GET_TAGNAME is as follows:

  ```
  DBE_XML.XML_DOM_GET_TAGNAME (
     docid RAW(13)
  )
  RETURNS VARCHAR2;
  ```

  Table 10-122 DBE_XML.XML_DOM_GET_TAGNAME parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
docid	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_HAS_CHILD_NODES

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Checks whether the DOMNode object has any subnode.

The stored procedure prototype of DBE_XML.XML_DOM_HAS_CHILD_NODES is as follows:

```
DBE_XML.XML_DOM_HAS_CHILD_NODES(
id IN RAW(13))
RETURNS BOOLEAN
```

Table 10-123 DBE_XML.XML_DOM_HAS_CHILD_NODES parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_IMPORT_NODE

  Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown.

  The prototype of the DBE_XML.XML_DOM_IMPORT_NODE function is as follows:

```
DBE_XML.XML_DOM_IMPORT_NODE(
    doc_id IN RAW(13),
    node_id IN RAW(13),
    deep IN BOOLEAN
)
RETURNS RAW(13);
```

Table 10-124 DBE_XML.XML_DOM_IMPORT_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
doc_id	RAW(13)	IN	No	Document to which the node is mounted.
node_id	RAW(13)	IN	No	Node to be imported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
deep	BOOLEAN	IN	No	Specifies whether to perform recursive import. • If the value is **TRUE**, the node and all its subnodes are imported. • If the value is **FALSE**, the node itself is imported.

- DBE_XML.XML_DOM_IS_NULL

  Checks whether the given object is null. If it is null, **TRUE** is returned. Otherwise, **FALSE** is returned.

  The prototype of the DBE_XML.XML_DOM_IS_NULL function is as follows:

```
DBE_XML.XML_DOM_IS_NULL (
    id  RAW(13)
)
RETURNS BOOLEAN;
```

  Table 10-125 DBE_XML.XML_DOM_IS_NULL parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_ITEM

  Returns the element corresponding to the index in a list or map based on the index.

  The prototype of the DBE_XML.XML_DOM_ITEM function is as follows:

```
DBE_XML.XML_DOM_ITEM (
    id IN RAW(13),
    index IN INTEGER
)
RETURNS RAW(13);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-126 DBE_XML.XML_DOM_ITEM parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
index	INTEGER	IN	No	Index of the element to be retrieved.

- DBE_XML.XML_DOM_MAKE_ELEMENT

  Returns the DOMElement object after conversion.

  The stored procedure prototype of DBE_XML.XML_DOM_MAKE_ELEMENT is as follows:

```
DBE_XML.XML_DOM_MAKE_ELEMENT(
id IN RAW(13))
RETURNS RAW(13)
```

Table 10-127 DBE_XML.XML_DOM_MAKE_ELEMENT parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

- DBE_XML.XML_DOM_MAKENODE

  Converts the given object to the DOMNode type.

  The stored procedure prototype of DBE_XML.XML_DOM_MAKENODE is as follows:

```
DBE_XML.XML_DOM_MAKENODE(
  id    RAW(13)
)
RETURNS DOMNODE;
```

Table 10-128 DBE_XML.XML_DOM_MAKENODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY

  Returns a new DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_EMPTY()
RETURNS RAW(13);
```

- DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_CLOB

  Returns a new DOMDocument instance object created from the specified CLOB type.

  The prototype of the DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_CLOB function is:

```
DBE_XML.XML_DOM_NEW_DOM_DOCUMENT_CLOB(
   content IN  CLOB
)
RETURNS RAW(13);
```

  Table 10-129 xml_dom_new_dom_document_clob parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type.

- DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE

  Returns a new DOMDocument instance object created from the specified XMLType type.

  The prototype of the DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE function is as follows:

```
DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE(
   content IN  CLOB
)
RETURNS RAW(13);
```

  Table 10-130 DBE_XML.XML_DOM_NEW_DOCUMENT_XMLTYPE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
content	CLOB	IN	No	Specified CLOB type.

- DBE_XML.XML_DOM_SET_ATTRIBUTE

  Sets the attributes of a specified XML DOM object.

  The stored procedure prototype of DBE_XML.XML_DOM_SET_ATTRIBUTE is as follows:

```
DBE_XML.XML_DOM_SET_ATTRIBUTE(
   docid   IN  RAW(13),
   name    IN  VARCHAR2,
   value   IN  VARCHAR2
)
RETURNS void;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-131 DBE_XML.XML_DOM_SET_ATTRIBUTE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
name	VARCHAR2	IN	No	String.
value	VARCHAR2	IN	No	String.

- DBE_XML.XML_DOM_SET_CHARSET

  Sets the character set for a DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_SET_CHARSET function is as follows:

```
DBE_XML.XML_DOM_SET_CHARSET(
   id      IN RAW(13),
   charset IN VARCHAR2
)
RETURNS void;
```

Table 10-132 DBE_XML.XML_DOM_SET_CHARSET parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
charset	VARCHAR2	IN	No	Character set.

- DBE_XML.XML_DOM_SET_DOCTYPE

  Sets the external DTD of a DOMDocument object.

  The prototype of the DBE_XML.XML_DOM_SET_DOCTYPE function is as follows:

```
DBE_XML.XML_DOM_SET_DOCTYPE(
   id          IN  RAW(13),
   dtd_name    IN  VARCHAR2,
   system_id   IN  VARCHAR2,
   public_id   IN  VARCHAR2
)
RETURNS void;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-133 DBE_XML.XML_DOM_SET_DOCTYPE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
dtd_name	VARCHAR2	IN	No	Name of the DOCType to be initialized.
system_id	VARCHAR2	IN	No	ID of the system whose DOCType needs to be initialized.
public_id	VARCHAR2	IN	No	Public ID of the DOCType to be initialized.

- DBE_XML.XML_DOM_SET_NODE_VALUE

  Sets the value of a node in the DOMNode object.

  The stored procedure prototype of DBE_XML.XML_DOM_SET_NODE_VALUE is as follows:

```
DBE_XML.XML_DOM_SET_NODE_VALUE(
id IN RAW(13),
node_value IN VARCHAR2)
RETURNS VOID
```

Table 10-134 DBE_XML.XML_DOM_SET_NODE_VALUE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.
node_value	VARCHAR2	IN	No	String to be set in the DOMNode object.

- DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC

  Writes the given DOMDocument object to the buffer.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC(
id IN RAW(13))
RETURNS VARCHAR2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-135 DBE_XML.XML_DOM_WRITE_TO_BUFFER_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE

  Writes the given DOMNode object to the buffer.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE(
id IN RAW(13))
RETURNS VARCHAR2;
```

Table 10-136 DBE_XML.XML_DOM_WRITE_TO_BUFFER_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC

  Writes the given DOMDocument object to a CLOB.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC(
    id IN RAW(13)
)
RETURNS VARCHAR2;
```

Table 10-137 DBE_XML.XML_DOM_WRITE_TO_CLOB_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE

  Writes the given DOMNode object to a CLOB.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE(
    id          IN  RAW(13)
)
RETURNS CLOB;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-138 DBE_XML.XML_DOM_WRITE_TO_CLOB_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.

- DBE_XML.XML_DOM_WRITE_TO_FILE_DOC

  Writes an XML node to a specified file using the database character set.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_FILE_DOC is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN  RAW(13),
file_dir IN  VARCHAR2)
RETURNS VOID

DBE_XML.XML_DOM_WRITE_TO_FILE_DOC(
id IN  RAW(13),
file_dir IN  VARCHAR2,
charset  IN  VARCHAR2)
RETURNS VOID PACKAGE
```

Table 10-139 DBE_XML.XML_DOM_WRITE_TO_FILE_DOC parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	Yes	XML DOM object.
file_dir	VARCHAR2	IN	No	File to be written.
charset	VARCHAR2	IN	No	Specified character set.

- DBE_XML.XML_DOM_WRITE_TO_FILE_NODE

  Writes an XML node to a specified file using the database character set.

  The stored procedure prototype of DBE_XML.XML_DOM_WRITE_TO_FILE_NODE is as follows:

```
DBE_XML.XML_DOM_WRITE_TO_FILE_NODE(
id IN  RAW(13),
filename IN  VARCHAR2)
RETURNS VOID
```

Table 10-140 DBE_XML.XML_DOM_WRITE_TO_FILE_NODE parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
filename	VARCHAR2	IN	No	Specified file address.

- DBE_XML.XML_DOM_GET_SESSION_TREE_NUM

  Queries the number of DOM trees of all types in the current session.

  The prototype of the DBE_XML.XML_DOM_GET_SESSION_TREE_NUM function is as follows:

  ```
  DBE_XML.XML_DOM_GET_SESSION_TREE_NUM()
  RETURNS INTEGER
  ```

- DBE_XML.XML_DOM_GET_DOC_TREES_INFO

  Queries the DOM tree information of the document type in the current session, such as the memory usage.

  The prototype of the DBE_XML.XML_DOM_GET_DOC_TREES_INFO function is as follows:

  ```
  DBE_XML.XML_DOM_GET_DOC_TREES_INFO()
  RETURNS VARCHAR2
  ```

- DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO

  Queries the number of subnodes of each type in the specified document.

  The prototype of the DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO function is as follows:

  ```
  dbe_xml.xml_dom_get_detail_doc_tree_info(
  id IN  RAW(13))
  RETURNS VARCHAR2
  ```

  Table 10-141 DBE_XML.XML_DOM_GET_DETAIL_DOC_TREE_INFO parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	RAW(13)	IN	No	XML DOM object.

10.12.2 Secondary Encapsulation APIs (Recommended)

10.12.2.1 DBE_APPLICATION_INFO

Interface Description

Table 10-142 provides all interfaces supported by the **DBE_APPLICATION_INFO** package. **DBE_APPLICATION_INFO** applies to the current session.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-142 DBE_APPLICATION_INFO

Interface	Description
DBE_APPLICATION_INFO.SET_CLIENT_INFO	Writes client information.
DBE_APPLICATION_INFO.READ_CLIENT_INFO	Reads client information.
DBE_APPLICATION_INFO.SET_MODULE	Sets the name of the currently running module to the new module. You can set the module and action.
DBE_APPLICATION_INFO.READ_MODULE	Reads the values of the module and action columns of the current session.
DBE_APPLICATION_INFO.SET_ACTION	Sets the name of the current action in the current module.

- DBE_APPLICATION_INFO.SET_CLIENT_INFO

  Writes client information. The DBE_APPLICATION_INFO.SET_CLIENT_INFO function prototype is as follows:

  ```
  DBE_APPLICATION_INFO.SET_CLIENT_INFO(
      str text
  )returns void;
  ```

  Table 10-143 DBE_APPLICATION_INFO.SET_CLIENT_INFO interface parameters

Parameter	Description
str	Client information to be written. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

- DBE_APPLICATION_INFO.READ_CLIENT_INFO

  The DBE_APPLICATION_INFO.READ_CLIENT_INFO function prototype is as follows:

  ```
  DBE_APPLICATION_INFO.READ_CLIENT_INFO(
   OUT client_info text);
  ```

  Table 10-144 DBE_APPLICATION_INFO.READ_CLIENT_INFO interface parameters

Parameter	Description
client_info	Client information

- DBE_APPLICATION_INFO.SET_MODULE

  Sets the name of the currently running module to the new module. The prototype of the DBE_APPLICATION_INFO.SET_MODULE function is:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_APPLICATION_INFO.SET_MODULE(
   IN module_name text,
   IN action_name text
);
```

Table 10-145 DBE_APPLICATION_INFO.SET_MODULE parameters

Parameter	Description
module_name	Name of the running module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

Example:

```
CALL dbe_application_info.set_module('module_name','action_name');
 set_module
------------

(1 row)
```

- DBE_APPLICATION_INFO.READ_MODULE

  Reads the values of the module and action columns of the current session. The prototype of the DBE_APPLICATION_INFO.READ_MODULE function is:

```
DBE_APPLICATION_INFO.READ_MODULE(
   OUT module_name text,
   OUT action_name text
);
```

Table 10-146 DBE_APPLICATION_INFO.READ_MODULE parameters

Parameter	Description
module_name	Name of the running module.
action_name	Name of the current action in the current module.

Example:

```
DECLARE
 module varchar2(64);
 action varchar2(64);
BEGIN
 dbe_application_info.read_module(module,action);
 dbe_output.print_line(module);
 dbe_output.print_line(action);
END;
/
module_name
action_name
ANONYMOUS BLOCK EXECUTE
```

- DBE_APPLICATION_INFO.SET_ACTION

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Sets the name of the current action in the current module. The prototype of the DBE_APPLICATION_INFO.SET_ACTION function is:

```
DBE_APPLICATION_INFO.SET_ACTION(
    IN action_name text
);
```

Table 10-147 DBE_APPLICATION_INFO.SET_ACTION parameters

Parameter	Description
action_name	Name of the current action in the current module. The maximum length is 64 bytes. If the length exceeds 64 bytes, it will be truncated.

Examples

```
CALL dbe_application_info.set_action('action_name');
 set_action
------------

(1 row)
```

10.12.2.2 DBE_COMPRESSION

API Description

Evaluates the sampling compression rate of a specified data object or obtains the compression type of a specified row of data based on the input parameters.

Table 10-148 DBE_COMPRESSION

API	Description
GET_COMPRESSION_RATIO	Evaluates the sampling compression rate of a specified data object based on input parameters.
GET_COMPRESSION_TYPE	Obtains the compression type of data in a specified row based on input parameters.

CAUTION

The GET_COMPRESSION_TYPE API supports only DNs in the distributed database.

- DBE_COMPRESSION.GET_COMPRESSION_RATIO

  Evaluates the sampling compression rate of a specified data object based on input parameters. The prototype is as follows:

  ```
  DBE_COMPRESSION.GET_COMPRESSION_RATIO(
  SCRATCHTBSNAME IN VARCHAR2,
  OWNNAME        IN VARCHAR2,
  OBJNAME        IN VARCHAR2,
  SUBOBJNAME     IN VARCHAR2,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
COMPTYPE       IN NUMBER,
BLKCNT_CMP     OUT INTEGER,
BLKCNT_UNCMP   OUT INTEGER,
ROW_CMP        OUT INTEGER,
ROW_UNCMP      OUT INTEGER,
CMP_RATIO      OUT NUMBER,
COMPTYPE_STR   OUT VARCHAR2,
SAMPLE_RATIO   IN NUMBER DEFAULT 20,
OBJTYPE        IN INTEGER DEFAULT 1);
```

Table 10-149 DBE_COMPRESSION.GET_COMPRESSION_RATIO API parameters

Parameter	Description
SCRATCHTBSNAME	Tablespace to which a data object belongs.
OWNNAME	Data object owner (schema to which the data object belongs).
OBJNAME	Data object name.
SUBOBJNAME	Name of a data subobject.
COMPTYPE	Compression type. The options are as follows: ● **1**: uncompressed. ● **2**: advanced compression.
BLKCNT_CMP	Number of blocks occupied by compressed samples.
BLKCNT_UNCMP	Number of blocks occupied by uncompressed samples.
ROW_CMP	Number of rows that can be contained in a single block after samples are compressed.
ROW_UNCMP	Number of rows that can be contained in a single block when samples are not compressed.
CMP_RATIO	Compression ratio, that is, **blkcnt_uncmp** divided by **blkcnt_cmp**.
COMPTYPE_STR	Character string that describes the compression type.
SAMPLE_RATIO	Sampling ratio. The value is an integer or floating-point number ranging from 0 to 100, corresponding to the sampling ratio of *N* percent. The default value is **20**, indicating that 20% of the rows are sampled.
OBJTYPE	Object type. The options are as follows: ● **1**: table object.

- DBE_COMPRESSION.GET_COMPRESSION_TYPE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

This API is used to obtain the compression type of a specified row based on input parameters. This API is an O&M API and does not check the visibility. That is, if the input CTID is a deleted row, this API still returns the latest status of the current row on the page. The prototype is as follows:

```
DBE_COMPRESSION.GET_COMPRESSION_TYPE(
OWNNAME    IN VARCHAR2,
TABNAME    IN VARCHAR2,
CTID       IN TEXT,
SUBOBJNAME IN VARCHAR2 DEFAULT NULL,
BUCKETID   IN pg_catalog.int2 DEFAULT NULL)
```

Table 10-150 DBE_COMPRESSION.GET_COMPRESSION_TYPE API parameters

Parameter	Description
OWNNAME	Data object owner (schema to which the data object belongs).
TABNAME	Data object name.
CTID	CTID of the target row.
SUBOBJNAME	Name of a data subobject.
BUCKETID	Table bucket ID of the target row, which is used only for bucket tables. The default value is **NULL**.

10.12.2.3 DBE_FILE

The DBE_FILE package provides the capabilities of reading and writing operating system text files for stored procedures.

Precautions

- DBE_FILE requires that files opened using DBE_FILE.FOPEN be encoded using the database character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE_FILE.READ_LINE is used to read files. DBE_FILE requires that files opened using DBE_FILE.FOPEN_NCHAR be encoded using the UTF-8 character set. If the opened files are not encoded using the expected character set, an encoding verification error occurs when DBE_FILE.READ_LINE_NCHAR is used to read files.
- When DBE_OUTPUT.PUT_LINE is used to print the result obtained by the DBE_FILE.READ_LINE_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE_OUTPUT.PRINT_LINE does not support this function.
- DBE_FILE requires that the character set encoding of the client be the same as that of the database.
- Assume that the database character set encoding is ASCII, the client character set encoding supports Chinese, and the client calls DBE_FILE.WRITE_NCHAR or DBE_FILE.WRITE_LINE_NCHAR to write Chinese content. If the entered content is in UTF-8 encoding format, the written content may not be encoded

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

in UTF-8 format. An error may be reported when the DBE_FILE.READ_LINE_NCHAR is used.

Data Types

- DBE_FILE.FILE_TYPE

  Defines the representation of files in the DBE_FILE package. The fields in DBE_FILE.FILE_TYPE are private fields of the DBE_FILE package. Do not change the field value of the type defined in DBE_FILE.FILE_TYPE.

```
CREATE TYPE DBE_FILE.FILE_TYPE AS(
    id INTEGER,
    datatype INTEGER,
    byte_mode BOOLEAN
);
```

Table 10-151 DBE_FILE.FILE_TYPE columns

Parameter	Description
id	File handle.
datatype	File data type (CHAR, NCHAR, or binary). Currently, only CHAR and NCHAR files are supported. For a CHAR file, **1** is returned. For an NCHAR file, **2** is returned.
byte_mode	Indicates that the file is opened in binary mode (**TRUE**) or text mode (**FALSE**).

API Description

Table 10-152 lists all APIs supported by the **DBE_FILE** package.

Table 10-152 DBE_FILE

API	Description
DBE_FILE.OPEN	Opens a file based on the specified directory and file name. The corresponding file handle or the DBE_FILE.FILE_TYPE type object encapsulated with the file handle is returned.
DBE_FILE.IS_CLOSE	Checks whether a file is closed.
DBE_FILE.IS_OPEN	Checks whether a file is opened.
DBE_FILE.READ_LINE	Reads a line of a specified length from an open file handle.
DBE_FILE.WRITE	Writes data to an open file.
DBE_FILE.NEW_LINE	Writes one or more line terminators to an open file.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_FILE.WRITE_LINE	Writes data to an open file and automatically appends a line terminator.
DBE_FILE.FORMAT_WRITE	Writes data in a specified format to the buffer of an open file.
DBE_FILE.GET_RAW	Reads RAW data from an open file.
DBE_FILE.PUT_RAW	Writes RAW data to an open file.
DBE_FILE.FLUSH	Writes cached data to a physical file.
DBE_FILE.CLOSE	Closes an open file.
DBE_FILE.CLOSE_ALL	Closes all files opened in a session.
DBE_FILE.REMOVE	Deletes a disk file. To perform this operation, you must have required permissions.
DBE_FILE.RENAME	Renames a disk file, which is similar to the mv command of Unix.
DBE_FILE.COPY	Copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.
DBE_FILE.GET_ATTR	Reads and returns the attributes of a disk file.
DBE_FILE.SEEK	Adjusts the position of a file pointer forward or backward based on the specified number of bytes.
DBE_FILE.GET_POS	Returns the current offset of a file, in bytes.
DBE_FILE.FOPEN_NCHAR	Opens a file of the NCHAR type based on the specified directory and file name.
DBE_FILE.WRITE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type.
DBE_FILE.WRITE_LINE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type and automatically appends a line terminator.
DBE_FILE.FORMAT_WRITE_NCHAR	Writes data of the NVARCHAR2 type to the buffer of an open file of the NCHAR type in a specified format. It is a DBE_FILE.WRITE_NCHAR API that allows formatting.
DBE_FILE.READ_LINE_NCHAR	Reads a line of a specified length from an open file of the NCHAR type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_FILE.OPEN/DBE_FILE.FOPEN

  Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a file handle of the INTEGER type. The function of DBE_FILE.FOPEN is similar to that of DBE_FILE.OPEN. It returns an object of the type defined in DBE_FILE.FILE_TYPE.

  The prototypes of the DBE_FILE.OPEN and DBE_FILE.FOPEN functions are:

```
DBE_FILE.OPEN (
dir             IN    TEXT,
file_name       IN    TEXT,
open_mode       IN    TEXT,
max_line_size   IN    INTEGER DEFAULT 1024)
RETURN INTEGER;

DBE_FILE.FOPEN(
   dir          IN TEXT,
   file_name    IN TEXT,
   open_mode    IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

Table 10-153 DBE_FILE.OPEN API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the **OPEN** function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
open_mode	TEXT	IN	No	Open mode of a specified file, including: • **r**: read text. • **w**: write text. • **a**: append text. • **rb**: read byte. • **wb**: write byte. • **ab**: append byte. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	INTEGER	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

- DBE_FILE.IS_CLOSE

  Checks whether a file handle is closed. A Boolean value is returned. If an invalid file handle is detected, the **INVALID_FILEHANDLE** exception is thrown.

  The prototype of the DBE_FILE.IS_CLOSE function is as follows:

```
DBE_FILE.IS_CLOSE (
   file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_CLOSE(
   file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-154 DBE_FILE.IS_CLOSE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_CLOSE API returns empty.

- DBE_FILE.IS_OPEN

  Checks whether a file handle is opened. A Boolean value is returned. If an invalid file handle is detected, the **INVALID_FILEHANDLE** exception is thrown.

  The prototype of the DBE_FILE.IS_OPEN function is as follows:

```
DBE_FILE.IS_OPEN(
   file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.IS_OPEN(
   file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

Table 10-155 DBE_FILE.IS_OPEN API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	Yes	File handle or DBE_FILE.FILE_TYPE object to be checked. If the value is empty, the DBE_FILE.IS_OPEN API returns **FALSE**.

- DBE_FILE.READ_LINE

  Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

read cannot exceed the value of **max_line_size** specified when the file is opened.

The prototype of the DBE_FILE.READ_LINE function is as follows:

```
DBE_FILE.READ_LINE(
   file   IN  INTEGER,
   buffer OUT TEXT,
   len    IN  INTEGER DEFAULT NULL)
RETURN TEXT;

DBE_FILE.READ_LINE(
   file   IN  DBE_FILE.FILE_TYPE,
   buffer OUT TEXT,
   len    IN  INTEGER DEFAULT NULL)
RETURN TEXT;
```

Table 10-156 DBE_FILE.READ_LINE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.
buffer	TEXT	OUT	No	Buffer for receiving data.
len	INTEGE	IN	Yes	Number of bytes read from a file. The default value is **NULL**. If the default value **NULL** is used, **max_linesize** is used to specify the line size.

- DBE_FILE.WRITE

  Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation does not write a line terminator.

  The prototype of the DBE_FILE.WRITE function is as follows:

```
DBE_FILE.WRITE(
   file   IN INTEGER,
   buffer IN TEXT)
RETURN BOOLEAN;

DBE_FILE.WRITE(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN TEXT)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-157 DBE_FILE.WRITE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in write mode. This operation does not write line terminators.
buffer	TEXT	IN	Yes	Text data to be written to a file. The accumulated write length of each line cannot be greater than or equal to the value of **max_line_size** specified when OPEN or FOPEN is used. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.NEW_LINE

  Writes one or more line terminators to the buffer corresponding to a file. The line terminators are related to the platform used.

  The prototype of the DBE_FILE.NEW_LINE function is as follows:

```
DBE_FILE.NEW_LINE(
   file      IN INTEGER,
   line_nums IN INTEGER DEFAULT 1)
RETURN BOOLEAN;

DBE_FILE.NEW_LINE(
   file      IN DBE_FILE.FILE_TYPE,
   line_nums IN INTEGER DEFAULT 1)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-158 DBE_FILE.NEW_LINE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN. The file must be opened in write mode. This operation does not write line terminators.
line_nums	INTEGER	IN	Yes	Number of line terminators written to a file. The default value is **1**. If this parameter is left blank, line terminators are not written.

- DBE_FILE.WRITE_LINE

  Writes buffer data to the buffer corresponding to a file. The file must be opened in write mode. This operation automatically adds a line terminator.

  The prototype of the DBE_FILE.WRITE_LINE function is as follows:

```
DBE_FILE.WRITE_LINE(
   file   IN INTEGER,
   buffer IN TEXT,
   flush  IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.WRITE_LINE(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN TEXT,
   flush  IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

Table 10-159 DBE_FILE.WRITE_LINE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	TEXT	IN	Yes	Text data to be written to a file. The length of each line (including the newline character) cannot be greater than the value of **max_line_size** specified when OPEN or FOPEN is executed or the default value. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	BOOLEAN	IN	Yes	Specifies whether to flush data to disks after WRITE_LINE. The default value is **FALSE**.

- DBE_FILE.FORMAT_WRITE

  Writes formatted data to the buffer corresponding to an open file. It is a DBE_FILE.WRITE API that allows formatting.

  The prototype of the DBE_FILE.FORMAT_WRITE function is as follows:

```
DBE_FILE.FORMAT_WRITE(
   file   IN INTEGER,
   format IN TEXT,
   arg1   IN TEXT DEFAULT NULL,
   . . .
   arg6   IN TEXT DEFAULT NULL)
RETURN BOOLEAN;

DBE_FILE.FORMAT_WRITE(
   file   IN DBE_FILE.FILE_TYPE,
   format IN TEXT,
   arg1   IN TEXT DEFAULT NULL,
   . . .
   arg6   IN TEXT DEFAULT NULL)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-160 DBE_FILE.FORMAT_WRITE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
format	TEXT	IN	Yes	Formatted string, containing the text and format characters \n and %s. If this parameter is left blank, no data is written.
[arg1. . .arg6]	TEXT	IN	Yes	Six optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE_FILE.GET_RAW

  Reads RAW data from an open file, stores the read result in the buffer, and returns the result from *r*.

  The prototype of the DBE_FILE.GET_RAW function is as follows:

```
DBE_FILE.GET_RAW(
   file   IN  INTEGER,
   r      OUT RAW,
   length IN  INTEGER DEFAULT NULL)
RETURN RAW;

DBE_FILE.GET_RAW(
   file   IN  DBE_FILE.FILE_TYPE,
   r      OUT RAW,
   length IN  INTEGER DEFAULT NULL)
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-161 DBE_FILE.GET_RAW API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
r	RAW	OUT	No	Buffer for receiving RAW data.
length	INTEGER	IN	Yes	Number of bytes read from the file. The default value is **NULL**. If the value is **NULL**, the maximum length of the RAW type is used to specify the size.

- DBE_FILE.PUT_RAW

  Writes raw data to the buffer corresponding to a file.

  The prototype of the DBE_FILE.PUT_RAW function is as follows:

```
DBE_FILE.PUT_RAW (
   file  IN INTEGER,
   r     IN RAW,
   flush IN BOOLEAN DEFAULT FALSE)
RETURN BOOLEAN;

DBE_FILE.PUT_RAW (
   file  IN DBE_FILE.FILE_TYPE,
   r     IN RAW,
   flush IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

Table 10-162 DBE_FILE.PUT_RAW API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
r	RAW	IN	No	RAW data to be written to a file. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
flush	BOOLEAN	IN	Yes	Specifies whether to flush data to disks after PUT_RAW. The default value is **FALSE**.

- DBE_FILE.FLUSH

  Writes data in the buffer to a physical file. The buffer data must have a line terminator. This function can write the data in the buffer to the corresponding physical file in time.

  The prototype of the DBE_FILE.FLUSH function is as follows:

```
DBE_FILE.FLUSH(
   file IN INTEGER)
RETURN VOID;

DBE_FILE.FLUSH(
   file IN DBE_FILE.FILE_TYPE)
RETURN VOID;
```

  Table 10-163 DBE_FILE.FLUSH API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.CLOSE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Closes an open file. When this function is called, if there is cached data to be written, exception information may be received and the return value is always **TRUE**.

The prototype of the DBE_FILE.CLOSE function is as follows:

```
DBE_FILE.CLOSE(
   file IN INTEGER)
RETURN BOOLEAN;

DBE_FILE.CLOSE(
   file IN DBE_FILE.FILE_TYPE)
RETURN BOOLEAN;
```

Table 10-164 DBE_FILE.CLOSE API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.CLOSE_ALL

  Closes all file handles opened in a session. This function can be used for emergency cleanup.

  The prototype of the DBE_FILE.CLOSE_ALL function is as follows:

  ```
  DBE_FILE.CLOSE_ALL()
  RETRUN VOID;
  ```

- DBE_FILE.REMOVE

  Deletes a disk file. To use this function, you must have the required permission.

  The prototype of the DBE_FILE.REMOVE function is as follows:

  ```
  DBE_FILE.REMOVE(
     dir       IN TEXT,
     file_name IN TEXT)
  RETURN VOID;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-165 DBE_FILE.REMOVE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
dir	TEXT	IN	No	File directory. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
file_name	TEXT	IN	No	File name.

- DBE_FILE.RENAME

  Renames a disk file. This function is similar to the mv command of Unix.

  The prototype of the DBE_FILE.RENAME function is as follows:

```
DBE_FILE.RENAME(
   src_dir        IN TEXT,
   src_file_name  IN TEXT,
   dest_dir       IN TEXT,
   dest_file_name IN TEXT,
   overwrite      IN BOOLEAN DEFAULT FALSE)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-166 DBE_FILE.RENAME API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
src_dir	TEXT	IN	No	Directory of the source file (case-sensitive). **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	No	Source file to be renamed.
dest_dir	TEXT	IN	No	Target directory (case-sensitive). **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	TEXT	IN	No	New file name.
overwrite	BOOLEAN	IN	Yes	Specifies whether to overwrite the file. If the parameter is left empty or not specified, the parameter is not overwritten. If a file with the same name exists in the target directory, the file will not be overwritten.

- DBE_FILE.COPY

  Copies data in a continuous area to a new file. If **start_line** and **end_line** are omitted, the entire file is copied.

  The prototype of the DBE_FILE.COPY function is as follows:

```
DBE_FILE.COPY (
src_dir          IN     TEXT,
src_file_name    IN     TEXT,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
dest_dir          IN     TEXT,
dest_file_name    IN     TEXT,
start_line        IN     INTEGER DEFAULT 1,
end_line          IN     INTEGER DEFAULT NULL)
RETURN VOID;
```

Table 10-167 DBE_FILE.COPY API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
src_dir	TEXT	IN	No	Directory of the source file. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
src_file_name	TEXT	IN	No	Name of the source file to be copied.
dest_dir	TEXT	IN	No	Directory of the destination file. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.
dest_file_name	TEXT	IN	No	Target file. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
start_line	TEXT	IN	No	Number of the line where the copy starts. The default value is **1**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
end_line	TEXT	IN	Yes	Number of the line where the copy ends. The default value is **NULL**, indicating the end of the file.

- DBE_FILE.GET_ATTR

  Reads and returns the attributes of a disk file.

  The prototype of the DBE_FILE.GET_ATTR function is as follows:

```
DBE_FILE.GET_ATTR(
   location    IN  TEXT,
   filename    IN  TEXT,
   fexists     OUT BOOLEAN,
   file_length OUT BIGINT,
   block_size  OUT INTEGER)
RETURN RECORD;
```

Table 10-168 DBE_FILE.GET_ATTR API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
location	TEXT	IN	No	File directory. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to operate files in the file path specified by **safe_data_path**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
filename	TEXT	IN	No	File name.
fexists	BOOLEAN	OUT	No	Specifies whether the file exists.
file_length	BIGINT	OUT	No	File length (unit: byte). If the file does not exist, **NULL** is returned.
block_size	INTEGER	OUT	No	Block size of the file system (unit: byte). If the file does not exist, **NULL** is returned.

- DBE_FILE.SEEK

  Adjusts the position of a file pointer forward or backward based on the specified number of bytes.

  The prototype of the DBE_FILE.SEEK function is as follows:

```
DBE_FILE.SEEK(
   file          IN INTEGER,
   absolute_start IN BIGINT DEFAULT NULL,
   relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;

DBE_FILE.SEEK(
   file          IN DBE_FILE.FILE_TYPE,
   absolute_start IN BIGINT DEFAULT NULL,
   relative_start IN BIGINT DEFAULT NULL)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-169 DBE_FILE.SEEK API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.
absolute_start	BIGINT	IN	Yes	Absolute offset of a file. The default value is **NULL**.
relative_start	BIGINT	IN	Yes	Relative offset of a file. A positive number indicates forward offset and a negative number indicates backward offset. The default value is **NULL**. If both **absolute_start** and this parameter are specified, the **absolute_start** parameter is used.

- DBE_FILE.GET_POS

  Returns the current offset of a file, in bytes.

  The prototype of the DBE_FILE.FGETPOS function is as follows:

```
DBE_FILE.GET_POS(
   file IN INTEGER)
RETURN BIGINT;

DBE_FILE.GET_POS(
   file IN DBE_FILE.FILE_TYPE)
RETURN BIGINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-170 DBE_FILE.GET_POS API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
file	INTEGER or DBE_FILE.FILE_TYPE	IN	No	File handle opened using OPEN or object of the DBE_FILE.FILE_TYPE type opened using FOPEN.

- DBE_FILE.FOPEN_NCHAR

  Opens a file. You can specify the maximum line size. A maximum of 50 files can be opened in a session. This function returns a DBE_FILE.FILE_TYPE type object that encapsulates a file handle. This function opens a file in national character set mode for input or output.

  The prototype of the DBE_FILE.FOPEN_NCHAR function is as follows:

```
DBE_FILE.FOPEN_NCHAR(
   dir           IN TEXT,
   file_name     IN TEXT,
   open_mode     IN TEXT,
   max_line_size IN INTEGER DEFAULT 1024)
RETURN DBE_FILE.FILE_TYPE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-171 DBE_FILE.FOPEN_NCHAR API parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
dir	TEXT	IN	No	Directory of a file. It is a string, indicating an object name. **NOTE** • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**.
file_name	TEXT	IN	No	File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the FOPEN_NCHAR function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	TEXT	IN	No	Open mode of a specified file, including: • **r**: read text. • **w**: write text. • **a**: append text. • **rb**: read byte. • **wb**: write byte. • **ab**: append byte. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.
max_line_size	INTEGER	IN	Yes	Maximum number of bytes in each line, including newline characters. The minimum value is **1** and the maximum is **32767**. If this parameter is not specified, the default value **1024** is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_FILE.WRITE_NCHAR

  Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation does not write a line terminator. The text string is written in the UTF-8 character set format.

  The prototype of the DBE_FILE.WRITE_NCHAR function is as follows:

```
DBE_FILE.WRITE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN NVARCHAR2)
RETURN VOID;
```

  Table 10-172 DBE_FILE.WRITE_NCHAR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in write mode. This operation does not write line terminators.
buffer	VARCHAR2	IN	Yes	Text data to be written to the file. The accumulated write length of each line cannot be greater than or equal to the value of **max_line_size** specified by **FOPEN_NCHAR**. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.WRITE_LINE_NCHAR

  Writes buffer data to the buffer of a file. The file must be opened in national character set or write mode. This operation automatically adds a line terminator. The text string is written in the UTF-8 character set format.

  The prototype of the DBE_FILE.WRITE_LINE_NCHAR function is as follows:

```
DBE_FILE.WRITE_LINE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   buffer IN NVARCHAR2)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-173 DBE_FILE.WRITE_LINE_NCHAR API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
buffer	VARCHAR2	IN	Yes	Text data to be written to a file. The length of each line (including the newline character) cannot be greater than the value of **max_line_size** specified by FOPEN_NCHAR or the default value. Otherwise, an error is reported when the file is refreshed. **NOTE** For the write operation, the system checks the file type. If the ELF file is written, an error is reported and the system exits.

- DBE_FILE.FORMAT_WRITE_NCHAR

  Writes formatted data to the buffer of an open file. It is a DBE_FILE.WRITE_NCHAR API that allows formatting.

  The prototype of the DBE_FILE.FORMAT_WRITE_NCHAR function is as follows:

```
DBE_FILE.FORMAT_WRITE_NCHAR(
   file   IN DBE_FILE.FILE_TYPE,
   format IN NVARCHAR2,
   arg1   IN NVARCHAR2 DEFAULT NULL,
   . . .
   arg5   IN NVARCHAR2 DEFAULT NULL)
RETURN VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-174 DBE_FILE.FORMAT_WRITE_NCHAR API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR.
format	VARCHAR2	IN	Yes	Formatted string, containing the text and format characters \n and %s.
[arg1 . . .arg5]	VARCHAR2	IN	Yes	Five optional parameters. The parameters and the positions of characters to be formatted are in one-to-one correspondence. If the parameter corresponding to a character to be formatted is not provided, an empty string is used to replace %s.

- DBE_FILE.READ_LINE_NCHAR

  Reads data from an open file and stores the read result to the buffer. It reads data to the end of each line excluding the line terminator, to the end of the file, or to the size specified by the **len** parameter. The length of the data to be read cannot exceed the value of **max_line_size** specified by FOPEN_NCHAR.

  The prototype of the DBE_FILE.READ_LINE_NCHAR stored procedure is as follows:

```
DBE_FILE.READ_LINE_NCHAR(
   file   IN  DBE_FILE.FILE_TYPE,
   buffer OUT NVARCHAR2,
   len    IN  INTEGER DEFAULT NULL)
RETURN NVARCHAR2;
```

Table 10-175 DBE_FILE.READ_LINE_NCHAR API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
file	DBE_FILE.FILE_TYPE	IN	No	Object of the DBE_FILE.FILE_TYPE type opened using FOPEN_NCHAR. The file must be opened in read mode. Otherwise, the INVALID_OPERATION exception is thrown.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
buffer	VARCHAR2	OUT	No	Buffer for receiving data.
len	INTEGER	IN	Yes	Number of bytes read from a file. The default value is **NULL**. If the default value **NULL** is used, **max_line_size** is used to specify the line size.

Examples

```
-- Add the /tmp/ directory to the PG_DIRECTORY system catalog as a SYSADMIN.
CREATE OR REPLACE DIRECTORY dir AS '/tmp/';
-- Execution result:
CREATE DIRECTORY
-- Use the DBE_FILE advanced package.
DECLARE
    f INTEGER;
    buffer VARCHAR2;
    raw_buffer RAW;

    f1 DBE_FILE.FILE_TYPE;
    f2 DBE_FILE.FILE_TYPE;

    fexists BOOLEAN;
    file_length BIGINT;
    block_size INTEGER;
    pos BIGINT;

    nvarchar_buffer nvarchar2;
    f_nchar DBE_FILE.FILE_TYPE;
BEGIN
    -- Open a file.
    f := DBE_FILE.OPEN('dir', 'sample.txt', 'w');

    IF DBE_FILE.IS_OPEN(f) = true THEN
        DBE_OUTPUT.PRINT_LINE('file opened');
    END IF;

    -- Close the file.
    DBE_FILE.CLOSE(f);

    IF DBE_FILE.IS_CLOSE(f) = true THEN
        DBE_OUTPUT.PRINT_LINE('file closed');
    END IF;

    f := DBE_FILE.OPEN('dir', 'sample.txt', 'w');

-- Write a file.
    DBE_FILE.WRITE(f, 'A');
    DBE_FILE.NEW_LINE(f);
    DBE_FILE.WRITE(f, 'B');
    DBE_FILE.WRITE(f, 'C');
    DBE_FILE.NEW_LINE(f, 2);
    DBE_FILE.WRITE_LINE(f, 'ABC');
    DBE_FILE.FORMAT_WRITE(f, '[1 -> %s, 2 -> %s]\n', 'GaussDB', 'DBE_FILE');

10.12.2.4 DBE_HEAT_MAP

API Description

Returns information such as the last modification time of a row in the target data block based on the input parameters. The information is used to browse the basis for determining cold and hot rows. This API is an O&M API and has no visibility check. That is, if the input CTID is a deleted row, this API still returns the latest status of the current row on the page.

Table 10-176 DBE_HEAT_MAP

API	Description
ROW_HEAT_MAP	Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_HEAT_MAP.ROW_HEAT_MAP

  Obtains information such as the last modification time of a row based on the schema to which the object belongs, data object name, data object partition name, and CTID. The prototype is as follows:

```
BE_HEAT_MAP.ROW_HEAT_MAP(
OWNER          IN VARCHAR2,
SEGMENT_NAME   IN VARCHAR2,
PARTITION_NAME IN VARCHAR2     DEFAULT NULL,
CTID           IN TEXT,
V_DEBUG        IN BOOL         DEFAULT FALSE,
BUCKETID       IN pg_catalog.int2 DEFAULT NULL)
```

Table 10-177 DBE_HEAT_MAP.ROW_HEAT_MAP API parameters

Parameter	Description
OWNER	Schema to which a data object belongs.
SEGMENT_NAME	Data object name.
PARTITION_NAME	Data object partition name. This parameter is optional. The default value is **NULL**.
CTID	**ctid** of the target row, that is, **block_id** or **row_id**.
V_DEBUG	Debugging. Debug logs are recorded.
BUCKETID	Table bucket ID of the target row, which is used only for bucket tables. The default value is **NULL**.

Table 10-178 Output parameters of DBE_HEAT_MAP.ROW_HEAT_MAP

Parameter	Description
OWNER	Owner of a data object.
SEGMENT_NAME	Data object name.
PARTITION_NAME	Name of a data object partition. This parameter is optional.
TABLESPACE_NAME	Name of the tablespace to which data belongs.
FILE_ID	ID of the absolute file to which a row belongs.
RELATIVE_FNO	ID of the relative file to which a row belongs. (GaussDB does not have this logic. Therefore, the value is the same as the preceding value.)
CTID	**ctid** of a row, that is, **block_id** or **row_id**.
WRITETIME	Last modification time of a row.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

> **CAUTION**
>
> The DBE_HEAT_MAP.ROW_HEAT_MAP API supports only DNs in the distributed database.

Examples

```
gaussdb=# ALTER DATABASE set ilm = on;
gaussdb=# CREATE Schema HEAT_MAP_DATA;
gaussdb=# SET current_schema=HEAT_MAP_DATA;

gaussdb=# CREATE TABLESPACE example1 RELATIVE LOCATION 'tablespace1';
gaussdb=# CREATE TABLE HEAT_MAP_DATA.heat_map_table(id INT, value TEXT) TABLESPACE example1;
gaussdb=# INSERT INTO HEAT_MAP_DATA.heat_map_table VALUES (1, 'test_data_row_1');

gaussdb=# SELECT * from DBE_HEAT_MAP.ROW_HEAT_MAP(
    owner          =>  'heat_map_data',
    segment_name   =>  'heat_map_table',
    partition_name  => NULL,
    ctid           =>  '(0,1)');
     owner     |  segment_name  | partition_name | tablespace_name | file_id | relative_fno | ctid  | writetime
---------------+----------------+----------------+-----------------+---------+--------------+-------+-----------
 heat_map_data | heat_map_table |                | example1        |   17291 |        17291 | (0,1) |
(1 row)
```

10.12.2.5 DBE_ILM

API Description

Implements ILM policies and APIs for manually triggering and stopping ADO tasks.

Table 10-179 DBE_ILM

API	Description
EXECUTE_ILM	Evaluates the specified data and ILM policy based on parameters. If the evaluation is passed, the corresponding compression job is generated.
STOP_ILM	Stops a compression job that is being executed based on parameters.

- DBE_ILM.EXECUTE_ILM

  Evaluates the specified data and ILM policy based on parameters. If the evaluation is passed, the corresponding compression job is generated. The prototype is as follows:

  ```
  DBE_ILM.EXECUTE_ILM(
  OWNER          IN VARCHAR2,
  OBJECT_NAME    IN VARCHAR2,
  TASK_ID        IN OUT NUMBER,
  SUBOBJECT_NAME IN VARCHAR2 DEFAULT NULL,
  POLICY_NAME    IN VARCHAR2 DEFAULT 'ALL POLICIES',
  EXECUTION_MODE IN NUMBER DEFAULT 2)
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-180 DBE_ILM.EXECUTE_ILM parameters

Parameter	Description
OWNER	Schema to which an object belongs.
OBJECT_NAME	Object name.
TASK_ID	Descriptor ID of the generated ADO task.
SUBOBJECT_NAME	Name of a subobject.
POLICY_NAME	Policy name. You can query the GS_ADM_ILMOBJECTS view to obtain the policy name. The default value **DBE_ILM.ILM_ALL_POLICIES** indicates all policies on the object. The default value of **DBE_ILM.ILM_ALL_POLICIES** is **'ALL POLICIES'**. Lowercase letters are not supported.
EXECUTION_MOD	Execution mode. This parameter is not supported in the current version and is reserved.

- DBE_ILM.STOP_ILM

  Stops an ILM policy that is being executed based on parameters. The prototype is as follows:

```
DBE_ILM.STOP_ILM (
TASK_ID                 IN NUMBER DEFAULT -1,
P_DROP_RUNNING_JOBS     IN BOOLEAN DEFAULT FALSE,
P_JOBNAME               IN VARCHAR2 DEFAULT NULL);
```

Table 10-181 DBE_ILM.STOP_ILM parameters

Parameter	Description
TASK_ID	Specifies the descriptor ID of the ADO task to be stopped.
P_DROP_RUNNING_JOBS	Determines whether to stop a task that is being executed. The value **TRUE** indicates that the task is forcibly stopped, and the value **FALSE** indicates that the task is not stopped.
P_JOBNAME	Specifies the name of the job to be stopped, which can be queried in the GS_MY_ILMEVALUATIONDETAILS view.

NOTE

When there are a large number of concurrent requests and you run DBE_ILM.STOP_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

10.12.2.6 DBE_ILM_ADMIN

API Description

Implements ILM policies, and controls ADO background scheduling and concurrency control parameters.

Table 10-182 DBE_ILM_ADMIN

API	Description
CUSTOMIZE_ILM	Customizes ILM policy attributes based on input parameters.
DISABLE_ILM	Disables background scheduling.
ENABLE_ILM	Enables background scheduling.

NOTE

When there are a large number of concurrent requests and you run DBE_ILM_ADMIN.DISABLE_ILM or DBE_ILM_ADMIN.ENABLE_ILM, the system may display the message "Resources are busy, please try again later." In this case, try again later.

- DBE_ILM_ADMIN.CUSTOMIZE_ILM

  Customizes ILM policy attributes based on input parameters. The prototype is as follows:

```
DBE_ILM_ADMIN.CUSTOMIZE_ILM(
PARAM    IN    NUMBER,
VAL      IN    NUMBER);
```

Table 10-183 DBE_ILM_ADMIN.CUSTOMIZE_ILM parameters

Parameter	Description
PARAM	Sequence number of a parameter.
VAL	Parameter value.

NOTE

In MySQL- or M-compatible mode, if the input **VAL** is a non-numeric character when **DBE_ILM_ADMIN.CUSTOMIZE_ILM()** is called, for example, **DBE_ILM_ADMIN.CUSTOMIZE_ILM(13, '*')**, the input **VAL** is set to **0** by default.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-184 DBE_ILM_ADMIN.CUSTOMIZE_ILM parameters

Parameter ID	Parameter Value	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is **15**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is **30**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
7	ENABLE	Status of background scheduling. This parameter cannot be modified using DBE_ILM_ADMIN.CUSTOMIZE_ILM. Use DBE_ILM_ADMIN.DISABLE_ILM or DBE_ILM_ADMIN.ENABLE_ILM to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. Possible values are: ● **0**: ILM_POLICY_IN_DAYS (default value) ● **1**: ILM_POLICY_IN_SECONDS
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer greater than or equal to 0 and less than 1440 (24 hours).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter Value	Description
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression rate. The default value is **40**. The value ranges from 0 to 10000, in block/ms, indicating the maximum number of blocks that can be compressed per millisecond. **0** indicates that the rate is not limited.
16	ENABLE_META_COMPRESSION	Specifies whether to enable header compression. The default value is **0**. The value can be **0** (disabled) or **1** (enabled). **NOTE** If this parameter is set to **1**, the compression ratio is improved for tables with short rows (less data in a single row), but the performance of accessing compressed rows greatly deteriorates. If most tables in the database have long rows, you are advised not to enable this parameter.
17	SAMPLE_MIN	Minimum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
18	SAMPLE_MAX	Maximum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
19	CONST_PRIO	Constant encoding priority. The default value is **40**. The value range is [0,100]. The value **100** indicates that constant encoding is disabled. Decimals can be entered and will be automatically rounded down.
20	CONST_THRESHOLD	Constant encoding threshold. The default value is **90**. The value range is [1,100], indicating that constant encoding is performed when the proportion of constant values in a column exceeds the threshold. Decimals can be entered and will be automatically rounded down.
21	EQVALUE_PRIO	Equivalent encoding priority. The default value is **60**. The value range is [0,100]. The value **100** indicates that equivalent encoding is disabled. Decimals can be entered and will be automatically rounded down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter Value	Description
22	EQVALUE_THRESHOLD	Equivalent encoding threshold. The default value is **80**. The value range is [1,100], indicating that equivalent encoding is performed when the ratio of equal values in two columns exceeds the threshold. Decimals can be entered and will be automatically rounded down.
23	ENABLE_DELTA_ENCODE_SWITCH	Specifies whether to enable difference encoding. The default value is **1**. The value **0** indicates that difference encoding is disabled, and the value **1** indicates that difference encoding is enabled. Decimals can be entered and will be automatically rounded down.
24	LZ4_COMPRESSION_LEVEL	LZ4 compression level. The default value is **0**. The value range is [0,16]. Decimals can be entered and will be automatically rounded down.
25	ENABLE_LZ4_PARTIAL_DECOMPRESSION	Specifies whether to enable partial decompression. The default value is **1**. The value **0** indicates that partial decompression is disabled, and the value **1** indicates that partial decompression is enabled. Decimals can be entered and will be automatically rounded down.

- DBE_ILM_ADMIN.DISABLE_ILM

  Disables background scheduling. The prototype is as follows:

  ```
  gaussdb=# DBE_ILM_ADMIN.DISABLE_ILM();
  ```

- DBE_ILM_ADMIN.ENABLE_ILM

  Enables background scheduling. The prototype is as follows:

  ```
  gaussdb=# DBE_ILM_ADMIN.ENABLE_ILM();
  ```

  Note: To make background scheduling take effect, you need to enable the GUC parameter **enable_ilm** on the database O&M platform.

Examples

```
gaussdb=# CALL DBE_ILM_ADMIN.CUSTOMIZE_ILM(1, 15);
 customize_ilm
---------------

```

10.12.2.7 DBE_LOB

API Description

Table 10-185 lists all APIs supported by the DBE_LOB package.

NOTE

- In database ORA, the byte content of the space is 00. However, in GaussDB, the byte content corresponding to the space is ASCII code 32.
- In a distributed environment, the maximum size of a CLOB, BLOB, and BFILE is 1 GB.
- LOBMAXSIZE supports a maximum of 1073741771 bytes.

Table 10-185 DBE_LOB

API	Description
DBE_LOB.GET_LENGTH	Obtains and returns the length of a specified LOB. The object cannot be greater than 2 GB.
DBE_LOB.LOB_GET_LENGTH	Obtains and returns the length of a specified LOB or BFILE object.
DBE_LOB.OPEN	Opens a LOB and returns a LOB descriptor.
DBE_LOB.READ	Loads a part of LOB content to the buffer based on the specified length and initial position offset.
DBE_LOB.LOB_READ	Reads a part of LOB (including BFILE) content to the buffer based on the specified length and initial position offset.
DBE_LOB.WRITE	Copies content in the buffer to a LOB based on the specified length and initial position offset.
DBE_LOB.WRITE_APPEND	Copies content in the buffer to the end part of a LOB based on the specified length.
DBE_LOB.LOB_WRITE_APPEND	Copies content in the buffer to the end part of a LOB based on the specified length.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_LOB.COPY	Copies content in a LOB to another LOB based on the specified length and initial position offset.
DBE_LOB.LOB_COPY	Copies content in a LOB to another LOB based on the specified length and initial position offset.
DBE_LOB.ERASE	Deletes content in a LOB (less than or equal to 1 GB) based on the specified length and initial position offset.
DBE_LOB.LOB_ERASE	Deletes content in a LOB based on the specified length and initial position offset.
DBE_LOB.CLOSE	Closes a LOB descriptor.
DBE_LOB.MATCH	Returns the position of the *N*th occurrence of a character string in a LOB.
DBE_LOB.COMPARE	Compares two LOBs (including BFILE objects) or a certain part of two LOBs.
DBE_LOB.SUBSTR	Reads a LOB substring and returns the read substring.
DBE_LOB.LOB_SUBSTR	Reads a LOB or BFILE substring and returns the read substring.
DBE_LOB.STRIP	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the **newlen** parameter.
DBE_LOB.LOB_STRIP	Truncates the LOB of a specified length. After the execution is complete, the length of the LOB is set to the length specified by the **newlen** parameter.
DBE_LOB.CREATE_TEMPORARY	Creates a temporary BLOB or CLOB.
DBE_LOB.APPEND	Adds the content of a LOB to another LOB.
DBE_LOB.LOB_APPEND	Adds the content of a LOB to another LOB.
DBE_LOB.FREETEMPORARY	Deletes a temporary BLOB or CLOB.
DBE_LOB.FILEOPEN	Opens a database BFILE file and returns its file descriptor.
DBE_LOB.FILECLOSE	Closes a BFILE file that is opened by **FILEOPEN**.
DBE_LOB.BFILEOPEN	Opens a database BFILE file.
DBE_LOB.BFILECLOSE	Closes a BFILE file that is opened by **BFILEOPEN**.
DBE_LOB.LOADFROMFILE	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_LOB.LOADFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the LOB in the specified location.
DBE_LOB.LOADBLOBFROMFILE	Loads an external database file of the specified length in the specified location to a BLOB (less than or equal to 1 GB) in a specified location.
DBE_LOB.LOADBLOBFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the BLOB in the specified location.
DBE_LOB.LOADCLOBFROMFILE	Loads an external database file of the specified length in the specified location to a CLOB (less than or equal to 1 GB) in a specified location.
DBE_LOB.LOADCLOBFROMBFILE	Loads the database BFILE file of the specified length in the specified location to the CLOB in the specified location.
DBE_LOB.CONVERTTOBLOB	Converts a CLOB file to a BLOB file (less than or equal to 1 GB).
DBE_LOB.CONVERTTOCLOB	Converts a BLOB file to a CLOB file (less than or equal to 1 GB).
DBE_LOB.LOB_CONVERTTOBLOB	Converts a CLOB file to a BLOB file.
DBE_LOB.LOB_CONVERTTOCLOB	Converts a BLOB file to a CLOB file.
DBE_LOB.GETCHUNKSIZE	Obtains the maximum size of LOB data that can be stored in the chunk structure in the database.
DBE_LOB.LOB_WRITE	Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.
DBE_LOB.BFILENAME	Constructs and returns the DBE_LOB.BFILE object based on the directory and file name.

- DBE_LOB.GET_LENGTH

  Obtains and returns the size of a specified LOB. The maximum size of the object is 2 GB.

  The prototype of the DBE_LOB.GET_LENGTH function is as follows:

```
DBE_LOB.GET_LENGTH (
    blob_obj IN BLOB)
RETURN INTEGER;

DBE_LOB.GET_LENGTH (
    clob_obj IN CLOB)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-186 DBE_LOB.GET_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB whose length is to be obtained

- DBE_LOB.LOB_GET_LENGTH

  Obtains and returns the length of a specified LOB or BFILE file. The maximum size of the object is 32 TB.

  The prototype of the DBE_LOB.LOB_GET_LENGTH function is as follows:

```
DBE_LOB.LOB_GET_LENGTH (
   blob_obj IN BLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
   clob_obj IN CLOB)
RETURN BIGINT;

DBE_LOB.LOB_GET_LENGTH (
   bfile IN DBE_LOB.BFILE)
RETURN BIGINT;
```

Table 10-187 DBE_LOB.LOB_GET_LENGTH parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE whose length is to be obtained

- DBE_LOB.OPEN

  Opens a LOB and returns a LOB descriptor. This procedure is meaningless and is used only for compatibility.

  The prototype of the DBE_LOB.OPEN function is as follows:

```
DBE_LOB.OPEN (
   lob INOUT BLOB);

DBE_LOB.OPEN (
   lob INOUT CLOB);

DBE_LOB.OPEN (
   bfile     INOUT DBE_LOB.BFILE,
   open_mode IN    TEXT DEFAULT 'null');
```

Table 10-188 DBE_LOB.OPEN parameters

Parameter	Description
lob/bfile	Opened BLOB, CLOB or BFILE.
open_mode	Operation mode. Currently, the range is [R,W,A,RB,WB,AB].

- DBE_LOB.READ

  Reads a part of LOB content to the output buffer based on the specified length and initial position offset.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_LOB.READ function is as follows:

```
DBE_LOB.READ (
   blob_obj IN  BLOB,
   amount   IN  INTEGER,
   off_set  IN  INTEGER,
   out_put  OUT RAW);

DBE_LOB.READ (
   clob_obj IN  CLOB,
   amount   IN  INTEGER,
   off_set  IN  INTEGER,
   out_put  OUT VARCHAR2);
```

Table 10-189 DBE_LOB.READ parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to be read
amount	Length of read content **NOTE** If the length to read is less than 1 or greater than 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE_LOB.LOB_READ

  Reads a part of LOB/BFILE content to the output buffer based on the specified length and initial position offset.

  The prototype of the DBE_LOB.LOB_READ function is as follows:

```
DBE_LOB.LOB_READ(
   blob_obj IN    BLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT,
   out_put  OUT   RAW);

DBE_LOB.LOB_READ(
   clob_obj IN    CLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT,
   out_put  OUT   VARCHAR2);

DBE_LOB.LOB_READ(
   bfile   IN    DBE_LOB.BFILE,
   amount  INOUT BIGINT,
   off_set IN    BIGINT,
   out_put OUT   RAW);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-190 DBE_LOB.LOB_READ parameters

Parameter	Description
blob_obj/ clob_obj/bfile	BLOB/CLOB/BFILE object (can be greater than 1 GB) to be read
amount	Length to read as the IN parameter, or actual read length as the OUT parameter. **NOTE** If the length to read is less than 1 or greater than 32767, an error is reported.
off_set	Start position for reading the LOB content, that is, the offset bytes to initial position of the LOB content. If the offset is less than 1 or greater than the LOB length, an error is reported. The initial position is 1.
out_put	Target buffer for storing the read LOB content

- DBE_LOB.WRITE

  Writes content in the source to a LOB based on the specified length and initial position.

  The prototype of the DBE_LOB.WRITE function is as follows:

```
DBE_LOB.WRITE (
   blob_obj INOUT BLOB,
   amount   IN    INTEGER,
   off_set  IN    INTEGER,
   source   IN    RAW);

DBE_LOB.WRITE (
   clob_obj INOUT CLOB,
   amount   IN    INTEGER,
   off_set  IN    INTEGER,
   source   IN    VARCHAR2);
```

Table 10-191 DBE_LOB.WRITE parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
off_set	Start position for writing content to the target LOB, that is, the offset bytes to the initial position of LOB content. **NOTE** If the offset is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported. The initial position is 1, and the maximum value is the maximum length of the LOB type.
source	Content to be written

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_LOB.WRITE_APPEND

  Writes content in the source object to the end part of a LOB based on the specified length.

  The prototype of the DBE_LOB.WRITE_APPEND function is as follows:

```
DBE_LOB.WRITE_APPEND (
   blob_obj   INOUT BLOB,
   amount     IN    INTEGER,
   source_obj IN    RAW);

DBE_LOB.WRITE_APPEND (
   clob_obj   INOUT CLOB,
   amount     IN    INTEGER,
   source_obj IN    VARCHAR2);
```

  Table 10-192 DBE_LOB.WRITE_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

- DBE_LOB.LOB_WRITE_APPEND

  Writes content in the source object to the end part of a LOB based on the specified length.

  The prototype of the DBE_LOB.LOB_WRITE_APPEND function is as follows:

```
DBE_LOB.LOB_WRITE_APPEND(
   blob_obj    INOUT BLOB,
   amount      IN    INTEGER,
   source_obj  IN    RAW);

DBE_LOB.LOB_WRITE_APPEND (
   clob_obj    INOUT CLOB,
   amount      IN    INTEGER,
   source_obj  IN    VARCHAR2);
```

  Table 10-193 DBE_LOB.LOB_WRITE_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is written
amount	Length to write, up to 32767 characters. **NOTE** If the length to write is less than 1 or greater than the length of the content to be written, an error is reported.
source_obj	Content to be written

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_LOB.COPY

  Copies content in a LOB to another LOB based on the specified length and initial position offset.

  The prototype of the DBE_LOB.COPY function is as follows:

```
DBE_LOB.COPY (
   dest_lob   INOUT BLOB,
   src_lob    IN    BLOB,
   len        IN    INTEGER,
   dest_start IN    INTEGER DEFAULT 1,
   src_start  IN    INTEGER DEFAULT 1);
```

  Table 10-194 DBE_LOB.COPY parameters

Parameter	Description
dest_lob	LOB to which the buffer content is to be pasted
src_lob	LOB from which the buffer content is to be copied
len	Length of the copied data.
dest_start	Start position for pasting the buffer content to the target LOB (**dest_lob**), that is, the offset bytes to the initial position of LOB content.
src_start	Start position for copying the buffer content from the source LOB (**src_lob**), that is, the offset bytes to the initial position of LOB content.

- DBE_LOB.LOB_COPY

  Copies content in a LOB to another LOB based on the specified length and initial position offset.

  The prototype of the DBE_LOB.LOB_COPY function is as follows:

```
DBE_LOB.LOB_COPY(
   blob_obj    INOUT BLOB,
   source_obj  IN    BLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1);

DBE_LOB.LOB_COPY(
   clob_obj    INOUT CLOB,
   source_obj  IN    CLOB,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1);
```

  Table 10-195 DBE_LOB.LOB_COPY parameters

Parameter	Description
blob_obj/ clob_obj	LOB to which the buffer content is to be pasted
source_obj	LOB from which the buffer content is to be copied

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
amount	Length of the copied data. **NOTE** If the length to copy is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported.
dest_offset	Start position for pasting the buffer content to the target LOB, that is, the offset bytes/characters to the initial position of LOB content. The unit is byte for BLOB and character for CLOB. **NOTE** If the offset is less than 1 or greater than the value of **LOBMAXSIZE**, an error is reported.
src_offset	Start position for copying the content from the source object, that is, the offset bytes to the initial position of LOB content. The unit is byte for BLOB and character for CLOB. **NOTE** If the offset is less than 1, an error is reported.

- DBE_LOB.ERASE

  Deletes the content in a BLOB (not greater than 1 GB) based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0.

  The prototype of the DBE_LOB.ERASE function is as follows:

```
DBE_LOB.ERASE (
   blob_obj INOUT BLOB,
   amount   INOUT INTEGER,
   off_set  IN    INTEGER DEFAULT 1);
```

Table 10-196 DBE_LOB.ERASE parameters

Parameter	Description
blob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (in bytes for BLOBs) to delete as the IN parameter, or actual length deleted as the OUT parameter. **NOTE** If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which LOB content is to be deleted, that is, the number of offset bytes to the initial position of LOB content. The value cannot be greater than 1 GB. **NOTE** If the offset is less than 1 or this parameter is left empty, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_LOB.LOB_ERASE

  Deletes the content in the LOB based on the specified length and initial position offset. The bytes of the deleted part in the BLOB are filled with 0, and the characters of the deleted part in the CLOB are filled with spaces. The LOB can be greater than 1 GB and the maximum size is 32 TB.

  The prototype of the DBE_LOB.LOB_ERASE function is as follows:

```
DBE_LOB.LOB_ERASE (
   blob_obj INOUT BLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT DEFAULT 1);

DBE_LOB.LOB_ERASE (
   clob_obj INOUT CLOB,
   amount   INOUT BIGINT,
   off_set  IN    BIGINT DEFAULT 1);
```

  Table 10-197 DBE_LOB.LOB_ERASE parameters

Parameter	Description
blob_obj/ clob_obj	LOB whose content is to be deleted as the IN parameter, or LOB with specified content deleted as the OUT parameter. If this parameter is left empty, an error is reported.
amount	Length (BLOB in bytes and CLOB in characters) to delete as the IN parameter, or actual length deleted as the OUT parameter. **NOTE** If the length to delete is less than 1 or this parameter is left empty, an error is reported.
off_set	Start position from which the LOB content is to be deleted, that is, the number of bytes relative to the start position of the BLOB content or the number of characters relative to the start position of the CLOB content. **NOTE** If the offset is less than 1 or this parameter is left empty, an error is reported.

- DBE_LOB.CLOSE

  Closes the LOB descriptor that has been opened.

  The prototype of the DBE_LOB.CLOSE function is as follows:

```
DBE_LOB.CLOSE(
   lob IN BLOB);

DBE_LOB.CLOSE (
   lob IN CLOB);

DBE_LOB.CLOSE (
   file IN INTEGER);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-198 DBE_LOB.CLOSE parameters

Parameter	Description
lob/file	BLOB/CLOB/File object whose LOB descriptor is to be closed

- DBE_LOB.MATCH

  Returns the *M*th occurrence position of a string in a LOB or BFILE file. **NULL** is returned for an invalid input. The LOB or BFILE file can be greater than 1 GB, up to 32 TB.

  The prototype of the DBE_LOB.MATCH function is as follows:

```
DBE_LOB.MATCH(
   blob_obj    IN BLOB,
   blob_obj2   IN RAW,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
   clob_obj    IN CLOB,
   clob_obj2   IN VARCHAR2,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;

DBE_LOB.MATCH(
   bfile       IN DBE_LOB.BFILE,
   blob_obj2     IN RAW,
   beg_index   IN BIGINT DEFAULT 1,
   occur_index IN BIGINT DEFAULT 1)
RETURN BIGINT;
```

Table 10-199 DBE_LOB.MATCH parameters

Parameter	Description
blob_obj/ clob_obj/ bfile	BLOB/CLOB descriptor to be searched for, or BFILE (which must be opened using **DBE_LOB.BFILEOPEN** first). If this parameter is left blank, **NULL** is returned.
blob_obj 2/ clob_obj2	Pattern to match. It is RAW for BLOB/BFILE objects and VARCHAR2 for CLOBs. If this parameter is left empty, **NULL** is returned.
beg_inde x	Absolute offset (in bytes) for BLOB/BFILE objects, or offset (in characters) for CLOBs. The start position for matching is 1. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If a value out of the range is input, **NULL** is returned.
occur_ind ex	Number of pattern matching times. The minimum value is 1. **NOTE** If the value is greater than the maximum number of times that the pattern string can be matched in the LOB, **0** is returned. If the value is out of the range from 1 to *LOBMAXSIZE*, **NULL** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_LOB.COMPARE

  Compares LOBs or BFILE objects.

  - If the compared objects are equal, **0** is returned. Otherwise, a non-zero value is returned.
  - If the first LOB is smaller than the second, **–1** is returned. If the first LOB is larger than the second, **1** is returned.
  - If any of the *len*, *start1*, and *start2* parameters is invalid, **NULL** is returned. The valid offset range is 1 to *LOBMAXSIZE*.
  - If both the values of **start_pos1** and **start_pos2** exceed the LOB/BFILE length, **0** is returned.

  The prototype of the DBE_LOB.COMPARE function is as follows:

```
DBE_LOB.COMPARE (
   lob1       IN BLOB,
   lob2       IN BLOB,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
   lob1       IN CLOB,
   lob2       IN CLOB,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;

DBE_LOB.COMPARE (
   file1      IN DBE_LOB.BFILE,
   file2      IN DBE_LOB.BFILE,
   len        IN BIGINT DEFAULT 1073741312,
   start_pos1 IN BIGINT DEFAULT 1,
   start_pos2 IN BIGINT DEFAULT 1)
RETURN INTEGER;
```

  Table 10-200 DBE_LOB.COMPARE parameters

Parameter	Description
lob1/file1	First BLOB/CLOB/BFILE to be compared (which must be opened using **DBE_LOB.BFILEOPEN** first).
lob2/file2	Second BLOB/CLOB/BFILE to be compared (which must be opened using **DBE_LOB.BFILEOPEN** first).
len	Number of characters or bytes to be compared. The default value is **1073741312**.
start_pos1	Offset of the first LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.
start_pos2	Offset of the second LOB descriptor. The initial position is 1, and the maximum value is the maximum length of the LOB content.

- DBE_LOB.SUBSTR

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Reads a LOB substring and returns the read substring.

The prototype of the DBE_LOB.SUBSTR function is as follows:

```
DBE_LOB.SUBSTR(
   lob_loc IN BLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN INTEGER  DEFAULT 1)
RETURN RAW;

DBE_LOB.SUBSTR(
   lob_loc IN CLOB,
   amount  IN INTEGER DEFAULT 32767,
   off_set IN INTEGER  DEFAULT 1)
RETURN VARCHAR2;
```

Table 10-201 DBE_LOB.SUBSTR parameters

Parameter	Description
lob_loc	LOB descriptor whose substring is to be read. For BLOBs, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. **NOTE** The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If the value exceeds the range, null is returned.

- DBE_LOB.LOB_SUBSTR

  Reads a LOB or BFILE substring and returns the read substring. The LOB or BFILE can be up to 32 TB.

  The prototype of the DBE_LOB.LOB_SUBSTR function is as follows:

  ```
  DBE_LOB.LOB_SUBSTR(
     lob_loc IN BLOB,
     amount  IN INTEGER DEFAULT 32767,
     off_set IN BIGINT  DEFAULT 1)
  RETURN RAW;

  DBE_LOB.LOB_SUBSTR(
     lob_loc IN CLOB,
     amount  IN INTEGER DEFAULT 32767,
     off_set IN BIGINT  DEFAULT 1)
  RETURN VARCHAR2;

  DBE_LOB.LOB_SUBSTR(
     bfile   IN DBE_LOB.BFILE,
     amount  IN INTEGER DEFAULT 32767,
     off_set IN BIGINT  DEFAULT 1)
  RETURN RAW;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-202 DBE_LOB.LOB_SUBSTR parameters

Parameter	Description
lob_loc/ bfile	LOB descriptor or BFILE file whose substring is to be read. The file must be opened by DBE_LOB.BFILEOPEN first. For BLOBs/ BFILE files, the return value is of the RAW type. For CLOBs, the return value is of the VARCHAR2 type.
amount	Number of bytes or characters to be read. **NOTE** The value ranges from 1 to 32767. If the value exceeds the range, null is returned.
off_set	Number of characters or bytes offset from the start position. **NOTE** The value ranges from 1 to *LOBMAXSIZE*. If the value exceeds the range, null is returned.

- DBE_LOB.STRIP

  Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter.

  The prototype of the DBE_LOB.STRIP function is as follows:

```
DBE_LOB.STRIP(
   lob_loc INOUT BLOB,
   newlen  IN INTEGER);

DBE_LOB.STRIP(
   lob_loc INOUT CLOB,
   newlen  IN INTEGER);
```

Table 10-203 DBE_LOB.STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs.

- DBE_LOB.LOB_STRIP

  Truncates a LOB based on a specified length. After this stored procedure is executed, the length of the LOB is set to the length specified by the **newlen** parameter. The LOB can be greater than 1 GB, up to 32 TB.

  The prototype of the DBE_LOB.LOB_STRIP function is as follows:

```
DBE_LOB.LOB_STRIP(
   lob_loc INOUT BLOB,
   newlen  IN    BIGINT);

DBE_LOB.LOB_STRIP(
   lob_loc INOUT CLOB,
   newlen  IN    BIGINT);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-204 DBE_LOB.LOB_STRIP parameters

Parameter	Description
lob_loc	LOB to read as the IN parameter, or truncated object as the OUT parameter. If this parameter is left empty, an error is reported.
newlen	New length after truncation, in bytes for BLOBs or in characters for CLOBs. **NOTE** If the value is less than 1, null is returned. If the value is greater than the LOB length, an error is reported.

- DBE_LOB.CREATE_TEMPORARY

  Creates a temporary BLOB or CLOB. This API is used only for syntax compatibility.

  The prototype of the DBE_LOB.CREATE_TEMPORARY function is as follows:

```
DBE_LOB.CREATE_TEMPORARY (
   lob_loc INOUT BLOB,
   cache   IN    BOOLEAN,
   dur     IN    INTEGER DEFAULT 10);

DBE_LOB.CREATE_TEMPORARY (
   lob_loc INOUT CLOB,
   cache   IN    BOOLEAN,
   dur     IN    INTEGER DEFAULT 10);
```

Table 10-205 DBE_LOB.CREATE_TEMPORARY parameters

Parameter	Description
lob_loc	LOB descriptor
cache	Used only for syntax compatibility.
dur	Used only for syntax compatibility.

- DBE_LOB.APPEND

  Appends *source_obj* to the end of the target LOB.

  The prototype of the DBE_LOB.APPEND function is as follows:

```
DBE_LOB.APPEND (
   blob_obj INOUT BLOB,
   source_obj  IN    BLOB);

DBE_LOB.APPEND (
   clob_obj INOUT CLOB,
   source_obj  IN    CLOB);
```

Table 10-206 DBE_LOB.APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE_LOB.LOB_APPEND

  Appends *source_obj* to the end of the target LOB.

  The prototype of the DBE_LOB.LOB_APPEND function is as follows:

```
DBE_LOB.LOB_APPEND(
   blob_obj   INOUT BLOB,
   source_obj IN    BLOB);

DBE_LOB.LOB_APPEND(
   clob_obj   INOUT CLOB,
   source_obj IN    CLOB);
```

  Table 10-207 DBE_LOB.LOB_APPEND parameters

Parameter	Description
blob_obj/ clob_obj	BLOB/CLOB to which the buffer content is to be written
source_obj	BLOB/CLOB from which the buffer content is to be read

- DBE_LOB.FREETEMPORARY

  Frees LOB files created by CREATE_TEMPORARY.

  The prototype of the DBE_LOB.FREETEMPORARY function is as follows:

```
DBE_LOB.FREETEMPORARY (
   blob INOUT BLOB);

DBE_LOB.FREETEMPORARY (
   clob INOUT CLOB);
```

  Table 10-208 DBE_LOB.FREETEMPORARY parameters

Parameter	Description
blob/clob	BLOB/CLOB to be freed.

- DBE_LOB.FILEOPEN

  Opens an external database BFILE file and returns its file descriptor. A maximum of 10 BFILE files can be opened in a session.

  The BFILE type is defined as follows:

```
DBE_LOB.BFILE (
   directory TEXT,
   filename  TEXT,
   fd        INTEGER);
```

  The prototype of the DBE_LOB.FILEOPEN function is as follows:

```
DBE_LOB.FILEOPEN (
   bfile     IN DBE_LOB.BFILE,
   open_mode IN TEXT)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-209 DBE_LOB.FILEOPEN parameters

Parameter	Description
bfile	External database file to be opened. For a BFILE file, this parameter specifies the file path , file name, and file descriptor. **NOTE** The *file* variable contains the location of the file directory *directory* and the file name *filename*. • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the **OPEN** function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	File open mode, which can only be **r** (that is, read). An error is reported in other modes.

- DBE_LOB.FILECLOSE

  Closes an external BFILE file.

  The prototype of the DBE_LOB.FILECLOSE function is as follows:

```
DBE_LOB.FILECLOSE (
   file IN INTEGER);
```

Table 10-210 DBE_LOB.FILECLOSE parameters

Parameter	Description
file	External database file to be closed (that is opened by FILEOPEN).

- DBE_LOB.BFILEOPEN

  Opens an external database BFILE file. A maximum of 10 BFILE files can be opened in a session.

  The prototype of DBE_LOB.BFILEOPEN is as follows:

```
DBE_LOB.BFILEOPEN (
   bfile     INOUT DBE_LOB.BFILE,
   open_mode IN    TEXT DEFAULT 'R');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-211 DBE_LOB.BFILEOPEN parameters

Parameter	Description
bfile	Opened database BFILE file as the INOUT parameter. **NOTE** The *bfile* variable contains the location of the file directory *directory* and the file name *filename*. • Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. A path contained in a file name is ignored in the **OPEN** function. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
open_mode	File open mode, which can only be **r** (that is, read). An error is reported in other modes.

Examples

```
-- Obtain the substring of the BFILE (the file content is ABCD).
DECLARE
bfile dbe_lob.bfile;
BEGIN
bfile = DBE_LOB.BFILENAME(dir_name, file_name); -- Obtain the corresponding BFILE.
DBE_LOB.bfileopen(bfile, 'r'); -- Open the BFILE.
RAISE NOTICE 'res:%', DBE_LOB.lob_substr(bfile, 10, 1); -- Obtain and print the substring.
DBE_LOB.bfileclose(bfile);-- Close the BFILE.
END;
/
NOTICE:  res:41
ANONYMOUS BLOCK EXECUTE
```

- DBE_LOB.BFILECLOSE

  Closes an external database BFILE file.

  The prototype of DBE_LOB.BFILECLOSE is as follows:

```
DBE_LOB.BFILECLOSE (
    bfile INOUT DBE_LOB.BFILE);
```

Table 10-212 DBE_LOB.BFILECLOSE parameters

Parameter	Description
bfile	Closed database BFILE file as the INOUT parameter.

- DBE_LOB.LOADFROMFILE

  Loads an external BFILE file to a BLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADFROMFILE function is as follows:

```
DBE_LOB.LOADFROMFILE (
    dest_lob     IN BLOB,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  src_file    IN INTEGER,
  amount      IN INTEGER,
  dest_offset IN INTEGER,
  src_offset  IN INTEGER)
RETURN RAW;
```

Table 10-213 DBE_LOB.LOADFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB. The BFILE file will be loaded to the specified offset position of the BLOB.
src_bfile	Source BFILE file to be read.
amount	Length of the content to be read from the BFILE file. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADFROMBFILE

  Loads an external BFILE file to a LOB.

  The prototype of the DBE_LOB.LOADFROMBFILE function is as follows:

```
DBE_LOB.LOADFROMBFILE (
   dest_lob    INOUT BLOB,
   src_file    IN    DBE_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1)
RETURN BLOB;

DBE_LOB.LOADFROMBFILE (
   dest_lob    INOUT CLOB,
   src_file    IN    DBE_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset IN    BIGINT DEFAULT 1,
   src_offset  IN    BIGINT DEFAULT 1)
RETURN CLOB;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-214 DBE_LOB.LOADFROMBFILE parameters

Parameter	Description
dest_lob	Target LOB as the INOUT parameter, to which the BFILE file will be loaded. The file must be opened by **DBE_LOB.BFILEOPEN** first. The LOB can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the content to be read from the BFILE file and to be written to the LOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the LOB **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADBLOBFROMFILE

  Loads an external BFILE file to a BLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADBLOBFROMFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
   dest_lob     IN BLOB,
   src_file     IN INTEGER,
   amount       IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

Table 10-215 DBE_LOB.LOADBLOBFROMFILE parameters

Parameter	Description
dest_lob	Target BLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADBLOBFROMBFILE

  Loads an external BFILE file to a BLOB.

  The prototype of the DBE_LOB.LOADBLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADBLOBFROMFILE (
   dest_lob     INOUT BLOB,
   src_file     IN     DEB_LOB.BFILE,
   amount       IN     BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

Table 10-216 DBE_LOB.LOADBLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target BLOB as the INOUT parameter, to which the BFILE file (which must be opened using **DBE_LOB.BFILEOPEN** first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the BLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADCLOBFROMFILE

  Loads an external BFILE file to a CLOB and returns the object of the RAW type.

  The prototype of the DBE_LOB.LOADCLOBFROMFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMFILE (
   dest_lob    IN CLOB,
   src_file    IN INTEGER,
   amount      IN INTEGER,
   dest_offset IN INTEGER,
   src_offset  IN INTEGER)
RETURN RAW;
```

  Table 10-217 DBE_LOB.LOADCLOBFROMFILE parameters

Parameter	Description
dest_lob	Target CLOB, to which the BFILE file will be loaded.
src_file	Source BFILE file to be read.
amount	Length of the CLOB. **NOTE** If the length is less than 1 or greater than 32767, an error is reported.
dest_offset	Offset length of the CLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.LOADCLOBFROMBFILE

  Loads an external BFILE file to a CLOB.

  The prototype of the DBE_LOB.LOADCLOBFROMBFILE function is as follows:

```
DBE_LOB.LOADCLOBFROMBFILE (
   dest_lob    INOUT CLOB,
   src_file    IN    DEB_LOB.BFILE,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

  Table 10-218 DBE_LOB.LOADCLOBFROMBFILE parameters

Parameter	Description
dest_lob	Target CLOB as the INOUT parameter, to which the BFILE file (which must be opened using **DBE_LOB.BFILEOPEN** first) is loaded. The BFILE file can be greater than 1 GB, up to 32 TB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
src_file	Source BFILE file to be read. The BFILE file can be greater than 1 GB, up to 32 TB.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB. **NOTE** If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the CLOB. **NOTE** If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BFILE file. **NOTE** • If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported. • If the sum of *amount* and *src_offset* is greater than the length of *src_bfile* plus 1, an error is reported.

- DBE_LOB.CONVERTTOBLOB

  Converts a CLOB to a BLOB. The CLOB cannot be greater than 1 GB.

  The prototype of the DBE_LOB.CONVERTTOBLOB function is as follows:

```
DBE_LOB.CONVERTTOBLOB(
   dest_blob   IN BLOB,
   src_clob    IN CLOB,
   amount      IN INTEGER DEFAULT 32767,
   dest_offset IN INTEGER DEFAULT 1,
   src_offset  IN INTEGER DEFAULT 1)
RETURN RAW;
```

Table 10-219 DBE_LOB.CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the BLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the CLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_LOB.LOB_CONVERTTOBLOB

  Converts a CLOB to a BLOB. The LOB can be greater than 1 GB.

  The prototype of the DBE_LOB.LOB_CONVERTTOBLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOBLOB(
   dest_blob   INOUT BLOB,
   src_clob    IN    CLOB,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

  Table 10-220 DBE_LOB.LOB_CONVERTTOBLOB parameters

Parameter	Description
dest_blob	Target BLOB, which is converted from a CLOB.
src_clob	Source CLOB to be read.
amount	Length of the target CLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB. If the length is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
dest_offset	Offset length of the BLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the CLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

- DBE_LOB.CONVERTTOCLOB

  Converts a BLOB to a CLOB. The BLOB cannot be greater than 1 GB.

  The prototype of the DBE_LOB.CONVERTTOCLOB function is as follows:

```
DBE_LOB.CONVERTTOCLOB(
   dest_clob   IN CLOB,
   src_blob    IN BLOB,
   amount      IN INTEGER DEFAULT 32767,
   dest_offset IN INTEGER DEFAULT 1,
   src_offset  IN INTEGER DEFAULT 1)
RETURN text;
```

  Table 10-221 DBE_LOB.CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the BLOB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
dest_offset	Offset length of the CLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy.
src_offset	Offset length of the BLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy.

- DBE_LOB.LOB_CONVERTTOCLOB

  Converts a BLOB to a CLOB. The LOB can be greater than 1 GB.

  The prototype of the DBE_LOB.LOB_CONVERTTOCLOB function is as follows:

```
DBE_LOB.LOB_CONVERTTOCLOB(
   dest_clob    INOUT CLOB,
   src_blob    IN    BLOB,
   amount      IN    BIGINT,
   dest_offset INOUT BIGINT,
   src_offset  INOUT BIGINT)
```

  Table 10-222 DBE_LOB.LOB_CONVERTTOCLOB parameters

Parameter	Description
dest_clob	Target CLOB, which is converted from a BLOB.
src_blob	Source BLOB to be read.
amount	Length of the target BLOB. If the length of a file exceeds this threshold, the file will not be saved to the CLOB.
dest_offset	Offset length of the CLOB. If **dest_offset** is set to **1**, data is loaded from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.
src_offset	Offset length of the BLOB. If **src_offset** is set to **1**, data is read from the start position of the file. The rest may be deduced by analogy. If the offset is less than 1 or greater than the value of *LOBMAXSIZE*, an error is reported.

- DBE_LOB.GETCHUNKSIZE

  Returns *TOAST_MAX_CHUNK_SIZE*. When LOB data is stored in the database, TOAST is used internally.

  The prototype of the DBE_LOB.GETCHUNKSIZE function is as follows:

```
DBE_LOB.GETCHUNKSIZE(
   lob_loc IN CLOB
)RETURN INTEGER

DBE_LOB.GETCHUNKSIZE(
   lob_loc IN BLOB
)RETURN INTEGER
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-223 DBE_LOB.GETCHUNKSIZE parameters

Parameter	Description
lob_loc	Target CLOB/BLOB.

- DBE_LOB.LOB_WRITE

  Reads the specified length of the source object from the start position, writes the content to the specified offset position of the target LOB, overrides the original content, and returns the target LOB.

  The prototype of the DBE_LOB.LOB_WRITE function is as follows:

```
DBE_LOB.LOB_WRITE(
   clob_obj INOUT CLOB,
   amount   IN    INTEGER,
   off_set  IN    BIGINT,
   source   IN    VARCHAR2
)
RETURN CLOB;

DBE_LOB.LOB_WRITE(
   blob_obj INOUT BLOB,
   amount   IN    INTEGER,
   off_set  IN    BIGINT,
   source   IN    RAW
)
RETURN BLOB;
```

Table 10-224 DBE_LOB.LOB_WRITE parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
blob_obj / clob_obj	BLOB/ CLOB	INOUT	No	Target LOB as the INOUT parameter, to which the content is to be written.
amount	INTEGER	IN	No	Length of the data to be written (in bytes for BLOBs or in characters for CLOBs)
off_set	BIGINT	IN	No	Offset position for writing data to *blob_obj/clob_obj*
source	RAW/ VARCHAR2	IN	No	Source object

- DBE_LOB.BFILENAME

  Constructs a BFILE based on the directory and file name.

  The prototype of DBE_LOB.BFILENAME is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_LOB.BFILENAME(
    directory IN TEXT,
    filename  IN TEXT)
RETURN DBE_LOB.BFILE;
```

Table 10-225 DBE_LOB.BFILENAME parameters

Parameter	Description
directory	File path **NOTE** Location of the file directory, which needs to be added to system catalog **PG_DIRECTORY**. If the input path does not match the path in **PG_DIRECTORY**, an error indicating that the path does not exist is reported. • When the GUC parameter **safe_data_path** is enabled, you can only use an advanced package to read and write files in the file path specified by **safe_data_path**. • File name with an extension (file type), excluding the path name. The path contained in the file name will be ignored by OPEN. In Unix, the file name cannot end with the combination of a slash and a dot (/.).
filename	File name

Examples

```
-- Obtain the length of a string.
SELECT DBE_LOB.GET_LENGTH('12345678');
 get_length
------------
          8
(1 row)

-- DBE_LOB.READ API

10.12.2.8 DBE_MATCH

API Description

Table 10-226 provides all APIs supported by the DBE_MATCH package.

Table 10-226 DBE_MATCH

API	Description
DBE_MATCH.EDIT_DISTANCE_SIMILARITY	Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are different.

- DBE_MATCH.EDIT_DISTANCE_SIMILARITY

Compares the difference between two character strings (minimum steps of deletion, addition, and conversion) and normalizes the difference to a value ranging from 0 to 100. The value **100** indicates that the two character strings are the same, and the value **0** indicates that the two character strings are completely different. The DBE_MATCH.EDIT_DISTANCE_SIMILARITY function prototype is as follows:

```
DBE_MATCH.EDIT_DISTANCE_SIMILARITY(
   str1 IN text,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  str2 IN text
)returns integer ;
```

Table 10-227 DBE_MATCH.EDIT_DISTANCE_SIMILARITY parameters

Parameter	Description
str1	First character string. If the value is **null**, **0** is returned.
str2	Second character string. If the value is **null**, **0** is returned.

10.12.2.9 DBE_OUTPUT

NOTE

When DBE_OUTPUT.PUT_LINE is used to print the result obtained by the DBE_FILE.READ_LINE_NCHAR API, ensure that the UTF-8 character set encoding can be converted to the current database character set encoding. If the preceding conditions are met, the result can be properly output. DBE_OUTPUT.PRINT_LINE does not support this function.

API Description

Table DBE_OUTPUT provides all APIs supported by the **DBE_OUTPUT** package.

Table 10-228 DBE_OUTPUT

API	Description
DBE_OUTPUT.PRINT_LINE	Outputs the specified text with newline characters.
DBE_OUTPUT.PRINT	Outputs the specified text without newline characters.
DBE_OUTPUT.SET_BUFFER_SIZE	Sets the size of the output buffer. If the size is not specified, the buffer can contain a maximum of 20000 bytes. If the size is set to a value less than or equal to 2000 bytes, the buffer can contain a maximum of 2000 bytes.
DBE_OUTPUT.DISABLE	Disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and clears the output buffer.
DBE_OUTPUT.ENABLE	Enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_OUTPUT.GET_LINE	Obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client.
DBE_OUTPUT.GET_LINES	Obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client.
DBE_OUTPUT.NEW_LINE	Places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty.
DBE_OUTPUT.PUT	Places an input string in the buffer without a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.
DBE_OUTPUT.PUT_LINE	Places an input string in the buffer with a newline character at the end. When the stored procedure ends, the line ending with the newline character is displayed.

- DBE_OUTPUT.PRINT_LINE

  The stored procedure **PRINT_LINE** writes a line of text carrying a line end symbol in the buffer. The function prototype of **DBE_OUTPUT.PRINT_LINE** is as follows:

  ```
  DBE_OUTPUT.PRINT_LINE (
  format IN VARCHAR2);
  ```

  Table 10-229 Parameters for DBE_OUTPUT.PRINT_LINE

Parameter	Description
format	Output text.

- DBE_OUTPUT.PRINT

  The stored procedure **PRINT** outputs the specified text to the front of the specified text without adding a newline character. The prototype of the DBE_OUTPUT.PRINT function is as follows:

  ```
  DBE_OUTPUT.PRINT (
  format IN VARCHAR2);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-230 Parameters for DBE_OUTPUT.PRINT

Parameter	Description
format	Output text.

- DBE_OUTPUT.SET_BUFFER_SIZE

  The stored procedure **SET_BUFFER_SIZE** sets the output buffer size. If the size is not specified, it contains a maximum of 20000 bytes. The function prototype of DBE_OUTPUT.SET_BUFFER_SIZE is as follows:

```
DBE_OUTPUT.SET_BUFFER_SIZE (
size IN INTEGER default 20000);
```

Table 10-231 Parameters for DBE_OUTPUT.SET_BUFFER_SIZE

Parameter	Description
size	Sets the output buffer size.

- DBE_OUTPUT.DISABLE

  The stored procedure **DISABLE** disables the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE and GET_LINES, and clears the output buffer. The prototype of the DBE_OUTPUT.DISABLE function is as follows:

```
DBE_OUTPUT.DISABLE;
```

- DBE_OUTPUT.ENABLE

  The stored procedure **ENABLE** enables the buffer, allows the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and sets the buffer size. If the buffer size is not specified, 20,000 bytes are allowed by default. The prototype of the DBE_OUTPUT.ENABLE function is as follows:

```
DBE_OUTPUT.ENABLE (
    buffer_size IN INTEGER DEFAULT 20000
);
```

Table 10-232 DBE_OUTPUT.ENABLE parameters

Parameter	Description
buffer_size	Upper limit of the buffer size, in bytes. If **buffer_size** is set to **NULL**, the default value (20000 bytes) is used.

- DBE_OUTPUT.GET_LINE

  The stored procedure **GET_LINE** obtains a line of data from the buffer with a newline character as the boundary. The obtained data is not output to the client. The prototype of the DBE_OUTPUT.GET_LINE function is as follows:

```
DBE_OUTPUT.GET_LINE (
    line   OUT VARCHAR2,
    status OUT INTEGER
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-233 DBE_OUTPUT.GET_LINE parameters

Parameter	Description
line	Obtained character string.
status	Specifies whether the calling is normal. If a character string is obtained, the value is **0**. Otherwise, the value is **1**.

- DBE_OUTPUT.GET_LINES

  The stored procedure **GET_LINES** obtains the character string of a specified number of lines in the buffer as a VARCHAR array. The obtained content is cleared from the buffer and is not output to the client. The prototype of the DBE_OUTPUT.GET_LINES function is as follows:

```
DBE_OUTPUT.GET_LINES (
   lines    OUT   VARCHAR[],
   numlines IN OUT INTEGER
);
```

Table 10-234 DBE_OUTPUT.GET_LINES parameters

Parameter	Description
lines	Outputs an array of multi-line strings read from the buffer.
numlines	Inputs the number of lines to be retrieved from the buffer. The output value is the number of rows actually retrieved. If the output value is less than the input value, it indicates that the number of rows in the buffer is less than the input value.

- DBE_OUTPUT.NEW_LINE

  The stored procedure **NEW_LINE** places a line at the end of the buffer, places an end-of-line marker, and leaves a new line empty. The prototype of the DBE_OUTPUT.NEW_LINE function is as follows:

```
DBE_OUTPUT.NEW_LINE;
```

- DBE_OUTPUT.PUT

  The stored procedure **PUT** places an input string in the buffer without a newline character at the end. After the anonymous block is executed, the line ending with the newline character is displayed. The prototype of the DBE_OUTPUT.PUT function is as follows:

```
DBE_OUTPUT.PUT (
   item IN VARCHAR2);
```

Table 10-235 DBE_OUTPUT.PUT parameters

Parameter	Description
item	Character or string item to be placed in the buffer.

- DBE_OUTPUT.PUT_LINE

  The stored procedure **PUT_LINE** places an input string in the buffer with a newline character at the end. After the anonymous block is executed, the line

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

ending with the newline character is displayed. The prototype of the DBE_OUTPUT.PUT_LINE function is as follows:

```
DBE_OUTPUT.PUT_LINE (
   item IN VARCHAR2);
```

Table 10-236 DBE_OUTPUT.PUT_LINE parameters

Parameter	Description
item	Character or string item to be placed in the buffer.

Examples

```
BEGIN
    DBE_OUTPUT.SET_BUFFER_SIZE(50);
    DBE_OUTPUT.PRINT('hello, ');
    DBE_OUTPUT.PRINT_LINE('database!');-- Output "hello, database!"
END;
/
-- The expected result is as follows:
hello, database!
ANONYMOUS BLOCK EXECUTE

-- Test DISABLE: Disable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The PUT_LINE has no output.
BEGIN
 dbe_output.disable();
       dbe_output.put_line('1');
END;
/
-- The expected result is as follows:
ANONYMOUS BLOCK EXECUTE

-- Test ENABLE: Enable the calling of PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES. The output of PUT_LINE is 1.
BEGIN
 dbe_output.enable();
       dbe_output.put_line('1');
END;
/
-- The expected result is as follows:
1
ANONYMOUS BLOCK EXECUTE

-- Test PUT: Place the input character string a in the buffer without adding a newline character at the end. a has no output.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
END;
/
-- The expected result is as follows:
ANONYMOUS BLOCK EXECUTE

-- Test NEW_LINE. Add a new line. The output is a.
BEGIN
 dbe_output.enable();
 dbe_output.put('a');
       dbe_output.new_line;
END;
/
-- The expected result is as follows:
a
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
-- Test GET_LINE: Obtain buffer data and save the data to variables and use PUT_LINE to output the data.
DECLARE
 line VARCHAR(32672);
 status INTEGER := 0;
BEGIN
 dbe_output.put_line('hello');
 dbe_output.get_line(line, status);
 dbe_output.put_line('-----------');
 dbe_output.put_line(line);
 dbe_output.put_line(status);
END;
/
-- The expected result is as follows:
-----------
hello
0
ANONYMOUS BLOCK EXECUTE

-- Test get_lines: Obtain multiple lines of content in the buffer and use PUT_LINE to output the content.
DECLARE
    lines varchar[];
    linenum integer;
BEGIN
    dbe_output.put_line('line 1');
    dbe_output.put_line('line 2');
    dbe_output.put_line('line 3');
    linenum := 100;
    dbe_output.get_lines(lines, linenum);
    dbe_output.put_line('num: ' || linenum);
    FOR i IN 1 .. linenum LOOP
        dbe_output.put_line(lines[i]);
    END LOOP;
END;
/
-- The expected result is as follows:
num: 3
line 1
line 2
line 3
ANONYMOUS BLOCK EXECUTE
```

NOTE

When the character encoding type server_encoding of the server is not UTF-8, if the character encoding in the data is valid UTF-8 encoding, when processing the character encoding, the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions convert the character encoding into the server_encoding encoding format based on the UTF8 encoding logic before performing subsequent operations, as a result, the return values of the functions may not meet the expectation or an error may be reported. After the GUC parameter **enable_convert_illegal_char** is enabled, the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions process such codes in the same way as when the parameter is disabled. Special characters are not output as placeholders, therefore, you are advised not to use the DBE_OUTPUT.PUTLINE and DBE_OUTPUT.PUT functions for data containing special characters.

10.12.2.10 DBE_RANDOM

Interface Description

Table 10-237 lists all interfaces supported by the **DBE_RANDOM** package.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-237 DBE_RANDOM interface parameters

Interface	Description
DBE_RANDOM.SET_SEED	Sets a seed for a random number.
DBE_RANDOM.GET_VALUE	Generates a random number between a specified **low** and a specified **high**.

- DBE_RANDOM.SET_SEED

  The stored procedure **SEED** is used to set a seed for a random number. The function prototype of **DBE_RANDOM.SET_SEED** is as follows:

  ```
  DBE_RANDOM.SET_SEED (seed  IN  INTEGER);
  ```

  Table 10-238 DBE_RANDOM.SET_SEED interface parameters

Parameter	Description
seed	Generates a seed for a random number.

- DBE_RANDOM.GET_VALUE

  The GET_VALUE function generates a random number between a specified **low** and a specified **high**. The prototype of the **DBE_RANDOM.GET_VALUE** function is as follows:

  ```
  DBE_RANDOM.GET_VALUE(
  min  IN  NUMBER default 0,
  max  IN  NUMBER default 1)
  RETURN NUMBER;
  ```

  Table 10-239 DBE_RANDOM.GET_VALUE interface parameters

Parameter	Description
min	Sets the low bound for a random number. The generated random number is greater than or equal to **min**.
max	Sets the high bound for a random number. The generated random number is less than **max**.

  NOTE

  - The only requirement is that the parameter type is **NUMERIC** regardless of the right and left bound values.
  - **DBE_RANDOM** implements pseudo-random numbers. Therefore, if the initial value (seed) remains unchanged, the sequence of the pseudo-random numbers also remains unchanged.
  - The generated random number contains 15 valid digits.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

```
-- Generate a random number between 0 and 1.
SELECT DBE_RANDOM.GET_VALUE(0,1);
    get_value
------------------
 .917468812743886
(1 row)

-- For integers within a specified range, add the arguments min and max, and truncate the decimals from the result (the maximum value is not included as a possible value). Therefore, for integers from 0 to 99, you can use the following code:
SELECT TRUNC(DBE_RANDOM.GET_VALUE(0,100));
 trunc
-------
    26
(1 row)
```

10.12.2.11 DBE_RAW

Interface Description

Table 10-240 provides all interfaces supported by the **DBE_RAW** package.

Table 10-240 DBE_RAW

Interface	Description
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW	Converts a value of the INTEGER type to a binary representation (RAW type).
DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER	Converts a binary representation (RAW type) to a value of the INTEGER type.
DBE_RAW.GET_LENGTH	Obtains the length of a RAW object.
DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW	Converts a value of the VARCHAR2 type to a binary representation (RAW type).
DBE_RAW.CAST_TO_VARCHAR2	Converts a value of the RAW type to a value of the VARCHAR2 type.
DBE_RAW.SUBSTR	Returns the substring of the RAW type.
DBE_RAW.BIT_OR	Performs the bitwise OR operation on RAW data.
DBE_RAW.BIT_AND	Returns a RAW value after bitwise AND calculation.
DBE_RAW.BIT_COMPLEMENT	Returns a RAW value after bitwise complement calculation.
DBE_RAW.BIT_XOR	Returns a RAW value after bitwise XOR calculation.
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW	Converts a BINARY_DOUBLE value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE	Converts a RAW value to a BINARY_DOUBLE value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT	Converts a RAW value to a FLOAT4 value.
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW	Converts a FLOAT4 value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_NUMBER	Converts a RAW value to a NUMERIC value.
DBE_RAW.CAST_FROM_NUMBER_TO_RAW	Converts a NUMERIC value to a RAW value.
DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2	Converts a RAW value to an NVARCHAR2 value.
DBE_RAW.COMPARE	Returns the first different position of two RAW values.
DBE_RAW.CONCAT	Concatenates a maximum of 12 RAW values into a new RAW value and returns the value.
DBE_RAW.CONVERT	Converts a RAW value from the source encoding mode **from_charset** to the target encoding mode **to_charset**.
DBE_RAW.COPIES	Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result.
DBE_RAW.OVERLAY	Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.
DBE_RAW.REVERSE	Reverses RAW data by byte.
DBE_RAW.TRANSLATE	Converts or discards a specified byte of a RAW value.
DBE_RAW.TRANSLITERATE	Converts a specified byte of a RAW value.
DBE_RAW.XRANGE	Returns a value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

NOTICE

RAW data is represented as hexadecimal characters externally, and stored as binary characters internally. For example, the representation of RAW data 11001011 is 'CB', that is, the input for type conversion is 'CB'.

- DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The stored procedure **CAST_FROM_BINARY_INTEGER_TO_RAW** converts a value of the INTEGER type to a binary representation (RAW type).

The prototype of the DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW (
value          IN  INTEGER,
endianess      IN  INTEGER DEFAULT 1)
RETURN RAW;
```

Table 10-241 DBE_RAW.CAST_FROM_BINARY_INTEGER_TO_RAW parameters

Parameter	Description
value	Specifies the INTEGER value to be converted to the RAW value.
endianess	Specifies the INTEGER value **1** or **2** for the byte sequence. (**1** indicates **BIG_ENDIAN** and **2** indicates **LITTLE-ENDIAN**.)

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER

  The stored procedure **CAST_FROM_RAW_TO_BINARY_INTEGER** converts a binary representation (RAW type) to a value of the INTEGER type.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER function is as follows:

  ```
  DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER (
  value          IN  RAW,
  endianess      IN  INTEGER DEFAULT 1)
  RETURN INTEGER;
  ```

  Table 10-242 DBE_RAW.CAST_FROM_RAW_TO_BINARY_INTEGER parameters

Parameter	Description
value	Specifies an INTEGER value in a binary representation (RAW type).
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.GET_LENGTH

  The stored procedure **GET_LENGTH** returns the length of a RAW object.

  The prototype of the DBE_RAW.GET_LENGTH function is as follows:

  ```
  DBE_RAW.GET_LENGTH(
  value    IN    RAW)
  RETURN INTEGER;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-243 DBE_RAW.GET_LENGTH parameters

Parameter	Description
value	Specifies a RAW object.

- DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW

  The stored procedure **CAST_FROM_VARCHAR2_TO_RAW** converts a VARCHAR2 object to a RAW object.

  The prototype of the DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW function is as follows:

```
DBE_RAW.CAST_TO_RAW(
str     IN    VARCHAR2)
RETURN RAW;
```

Table 10-244 DBE_RAW.CAST_FROM_VARCHAR2_TO_RAW parameters

Parameter	Description
str	VARCHAR2 value to be converted.

- DBE_RAW.CAST_TO_VARCHAR2

  The stored procedure **CAST_TO_VARCHAR2** converts a RAW object to a VARCHAR2 object.

  The prototype of the DBE_RAW.CAST_TO_VARCHAR2 function is as follows:

```
DBE_RAW.CAST_TO_VARCHAR2(
str     IN    RAW)
RETURN VARCHAR2;
```

Table 10-245 DBE_RAW.CAST_TO_VARCHAR2 parameters

Parameter	Description
str	VARCHAR2 value to be converted.

- DBE_RAW.BIT_OR

  The stored procedure **BIT_OR** calculates the bitwise OR result of two RAW data records.

  The prototype of the DBE_RAW.BIT_OR function is as follows:

```
DBE_RAW.BIT_OR(
   str1 IN TEXT,
   str2 IN TEXT)
RETURN TEXT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-246 DBE_RAW.BIT_OR parameters

Parameter	Description
str1	First character string of the bitwise OR calculation. **NOTE** Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.
str2	Second character string of the bitwise OR calculation. **NOTE** Due to legacy reasons, this parameter is defined as the TEXT type. However, the DBE_RAW.BIT_OR interface expects to process RAW values. Defining this parameter as the TEXT type does not affect the processing of RAW values.

- DBE_RAW.SUBSTR

  The stored procedure **SUBSTR** truncates an object of the RAW type based on the start bit and length.

  The prototype of the DBE_RAW.SUBSTR function is as follows:

```
DBE_RAW.SUBSTR(
   IN lob_loc BLOB,
   IN off_set INTEGER DEFAULT 1,
   IN amount INTEGER DEFAULT 32767)
RETURN RAW;
```

Table 10-247 DBE_RAW.SUBSTR parameters

Parameter	Description
lob_loc	Source RAW value. **NOTE** Due to legacy reasons, this parameter is defined as the BLOB type. However, the DBE_RAW.SUBSTR interface expects to process RAW values. Defining this parameter as the BLOB type does not affect the processing of RAW values.
off_set	Start position of the substring. The default value is **1**.
amount	Substring length. The default value is **32767**.

- DBE_RAW.BIT_AND

  Obtains the bitwise AND result of two RAW values.

  The prototype of the DBE_RAW.BIT_AND function is as follows:

```
DBE_RAW.BIT_AND(
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-248 DBE_RAW.BIT_AND parameters

Parameter	Description
r1	The RAW value for the bitwise AND operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise AND operation with r1. The maximum length is 32767.

- DBE_RAW.BIT_COMPLEMENT

  Obtains the bitwise complement result of a RAW value.

  The prototype of the DBE_RAW.BIT_COMPLEMENT function is as follows:

```
DBE_RAW.BIT_COMPLEMENT(
   r IN RAW)
RETURN RAW;
```

Table 10-249 DBE_RAW.BIT_COMPLEMENT parameters

Parameter	Description
r	The RAW value for the bitwise complement operation. The maximum length is 32767.

- DBE_RAW.BIT_XOR

  Obtains the bitwise XOR result of two RAW values.

  The prototype of the DBE_RAW.BIT_XOR function is as follows:

```
DBE_RAW.BIT_XOR(
   r1 IN RAW,
   r2 IN RAW)
RETURN RAW;
```

Table 10-250 DBE_RAW.BIT_XOR parameters

Parameter	Description
r1	The RAW value for the bitwise XOR operation with r2. The maximum length is 32767.
r2	The RAW value for the bitwise XOR operation with r1. The maximum length is 32767.

- DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW

  Converts the BINARY_DOUBLE type to an INTEGER value in a binary representation (RAW type).

  The prototype of the DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW (
   n         IN BINARY_DOUBLE,
   endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-251 DBE_RAW.CAST_FROM_BINARY_DOUBLE_TO_RAW parameters

Parameter	Description
n	BINARY_DOUBLE value to be converted.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE

  Converts an INTEGER value in a binary representation (RAW type) to a BINARY_DOUBLE type.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE(
   r         IN RAW,
   endianess IN INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Table 10-252 DBE_RAW.CAST_FROM_RAW_TO_BINARY_DOUBLE parameters

Parameter	Description
r	The RAW value to be converted. The value contains 8 to 32767 characters.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT

  Converts a RAW value to a FLOAT4 value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT(
   r         IN RAW,
   endianess IN INTEGER DEFAULT 1)
RETURN FLOAT4;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-253 DBE_RAW.CAST_FROM_RAW_TO_BINARY_FLOAT parameters

Parameter	Description
r	The RAW value to be converted. The value contains 4 to 32767 characters.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW

  Converts a FLOAT4 value to a RAW value.

  The prototype of the DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW function is as follows:

```
DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW(
   n         IN FLOAT4,
   endianess IN INTEGER DEFAULT 1)
RETURN RAW;
```

Table 10-254 DBE_RAW.CAST_FROM_BINARY_FLOAT_TO_RAW parameters

Parameter	Description
n	FLOAT4 value to be converted.
endianess	Endianness. The value can be **1**, **2**, or **3**. The value **1** indicates BIG_ENDIAN, **2** indicates LITTLE_ENDIAN, and **3** indicates MACHINE_ENDIAN. The default value is **1**. If BIG_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using BIG_ENDIAN. If LITTLE_ENDIAN is used on the host where the function is executed, the function execution result using MACHINE_ENDIAN is the same as that using LITTLE_ENDIAN.

- DBE_RAW.CAST_FROM_RAW_TO_NUMBER

  Converts a RAW value to a NUMERIC value.

  NOTE

  The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the RAW data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot obtain the same number-type data from GaussDB based on the RAW data corresponding to the number-type data in database ORA. For details about the number-type data in GaussDB, see the example.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_RAW.CAST_FROM_RAW_TO_NUMBER function is as follows:

```
DBE_RAW.CAST_FROM_RAW_TO_NUMBER(
    r IN RAW)
RETURN NUMERIC;
```

Table 10-255 DBE_RAW.CAST_FROM_RAW_TO_NUMBER parameters

Parameter	Description
r	The RAW value to be converted. The value contains 6 to 32767 characters.

- DBE_RAW.CAST_FROM_NUMBER_TO_RAW

  Converts a NUMERIC value to a RAW value.

  NOTE

  The bottom-layer implementation of the number data type in database ORA is different from that in GaussDB, and the RAW data type is the hexadecimal representation of the binary stream implemented at the bottom layer. Therefore, the function in database ORA is different from that in GaussDB. You cannot restore the RAW data corresponding to the number-type data in database ORA to the original number type in database ORA in the GaussDB database. For details about the performance of this function in GaussDB, see the example.

  The prototype of the DBE_RAW.CAST_FROM_NUMBER_TO_RAW function is as follows:

  ```
  DBE_RAW.CAST_FROM_NUMBER_TO_RAW(
      n IN NUMERIC)
  RETURN RAW;
  ```

  Table 10-256 DBE_RAW.CAST_FROM_NUMBER_TO_RAW parameters

Parameter	Description
n	NUMERIC value to be converted.

- DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2

  Converts a RAW value to an NVARCHAR2 value.

  The prototype of the DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2 function is as follows:

  ```
  DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2(
      r IN RAW)
  RETURN NVARCHAR2;
  ```

  Table 10-257 DBE_RAW.CAST_FROM_RAW_TO_NVARCHAR2 parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.

- DBE_RAW.COMPARE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Returns the first different position of two RAW values.

The prototype of the DBE_RAW.COMPARE function is as follows:

```
DBE_RAW.COMPARE(
   r1  IN RAW,
   r2  IN RAW,
   pad IN RAW DEFAULT NULL)
RETURN INTEGER;
```

Table 10-258 DBE_RAW.COMPARE parameters

Parameter	Description
r1	First data to be compared. The value can be **NULL** or the length is 0. The maximum length is 32767.
r2	Second data to be compared. The value can be **NULL** or the length is 0. The maximum length is 32767.
pad	The first byte of **pad** is used to extend the shorter one of **r1** or **r2**. The maximum length is 32767. If this parameter is set to **NULL**, the length is 0, or the default value is used, the extended value is **0x00**.

- DBE_RAW.CONCAT

  Concatenates a maximum of 12 RAW values into a new RAW value and returns the value. If the length after concatenation exceeds 32767, an error is reported.

  The prototype of the DBE_RAW.CONCAT function is as follows:

  ```
  DBE_RAW.CONCAT(
     r1  IN RAW DEFAULT NULL,
     r2  IN RAW DEFAULT NULL,
     r3  IN RAW DEFAULT NULL,
     r4  IN RAW DEFAULT NULL,
     r5  IN RAW DEFAULT NULL,
     r6  IN RAW DEFAULT NULL,
     r7  IN RAW DEFAULT NULL,
     r8  IN RAW DEFAULT NULL,
     r9  IN RAW DEFAULT NULL,
     r10 IN RAW DEFAULT NULL,
     r11 IN RAW DEFAULT NULL,
     r12 IN RAW DEFAULT NULL)
  RETURN RAW;
  ```

  Table 10-259 DBE_RAW.CONCAT parameters

Parameter	Description
r1...r12	The RAW values to be concatenated.

- DBE_RAW.CONVERT

  Converts a RAW value from the source encoding mode **from_charset** to the target encoding mode **to_charset**.

  If the rule for converting between source and target encoding (for example, GBK and LATIN1) does not exist, the parameter **r** is returned without conversion. See the **pg_conversion** system catalog for details.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_RAW.CONVERT function is as follows:

```
DBE_RAW.CONVERT(
   r           IN RAW,
   to_charset   IN VARCHAR2,
   from_charset IN VARCHAR2)
RETURN RAW;
```

Table 10-260 DBE_RAW.CONVERT parameters

Parameter	Description
r	The RAW value to be converted. The maximum length is 32767.
to_charset	Name of the target encoding character set.
from_charset	Name of the source encoding character set. In this encoding, **r** must be valid.

- DBE_RAW.COPIES

  Copies a RAW value for *n* times, concatenates the values, and returns the concatenated result. If the length after copying exceeds 32767, an error is reported.

  The prototype of the DBE_RAW.COPIES function is as follows:

  ```
  DBE_RAW.COPIES(
     r IN RAW,
     n IN NUMERIC)
  RETURN RAW;
  ```

  Table 10-261 DBE_RAW.COPIES parameters

Parameter	Description
r	The RAW values to be copied.
n	Number of replication times. The value must be a positive number. If the value is a decimal, the value is rounded off.

- DBE_RAW.OVERLAY

  Overlays one RAW data with another RAW data by specifying the start position and length to be overlaid.

  The prototype of the DBE_RAW.OVERLAY function is as follows:

  ```
  DBE_RAW.OVERLAY(
     overlay_str IN RAW,
     target      IN RAW,
     pos         IN BINARY_INTEGER DEFAULT 1,
     len         IN BINARY_INTEGER DEFAULT NULL,
     pad         IN RAW            DEFAULT NULL)
  RETURN RAW;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-262 DBE_RAW.OVERLAY parameters

Parameter	Description
overlay_str	Byte used for overwriting. The value cannot be NULL.
target	Source byte string to be overlaid. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
pos	Indicates the byte from which the overlay starts. The position of the first byte is 1. The value of **pos** must be greater than or equal to 1 and the value of **len+pos** must be less than or equal to 32767. The default value is **1**.
len	Length to be overlaid. The value of **len** must be greater than or equal to 0 and the value of **len+pos** must be less than or equal to 32767. The default value is the length of **overlay_str**.
pad	Padding byte. Only the first byte is valid. The default value is **NULL**. If the value is **NULL**, it is regarded as **0x00** by default.

- DBE_RAW.REVERSE

  Reverses RAW data by byte.

  The prototype of the DBE_RAW.REVERSE function is as follows:

```
DBE_RAW.REVERSE(
    r IN RAW
)
RETURN RAW;
```

Table 10-263 DBE_RAW.REVERSE parameters

Parameter	Description
r	The RAW value to be reversed. The maximum length is 32767. If the value is **NULL**, **NULL** is returned.

- DBE_RAW.TRANSLATE

  Converts or discards a specified byte of a RAW value.

  The prototype of the DBE_RAW.TRANSLATE function is as follows:

```
DBE_RAW.TRANSLATE(
    r        IN RAW,
    from_set IN RAW,
    to_set   IN RAW)
RETURN RAW;
```

Table 10-264 DBE_RAW.TRANSLATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
from_set	Bytecode to be converted in the source byte string. The value is of the RAW type. The value cannot be NULL. The bytes in **from_set** in the source byte string are replaced with the bytes in the corresponding positions in **to_set**. If **from_set** contains multiple identical bytes, only the first byte corresponding to the byte is replaced. For example, if **r[x]=from_set[n]**, **r[x]** is replaced with **to_set[n]**. If **to_set[n]** corresponding to **from_set[n]** does not exist (that is, the number of bytes of **to_set** does not exceed **n**), **r[x]** will be discarded.
to_set	Byte code converted from the **from_set** byte. The value is of the RAW type. The value cannot be NULL.

- DBE_RAW.TRANSLITERATE

  Converts a RAW value to a NUMERIC value.

  The prototype of the DBE_RAW.TRANSLITERATE function is as follows:

```
DBE_RAW.TRANSLITERATE(
   r        IN RAW,
   from_set IN RAW DEFAULT NULL,
   to_set   IN RAW DEFAULT NULL,
   pad      IN RAW DEFAULT NULL)
RETURN RAW;
```

  Table 10-265 DBE_RAW.TRANSLITERATE parameters

Parameter	Description
r	Source byte string to be converted. The value is of the RAW type and contains a maximum of 32767 bytes. The value cannot be NULL.
to_set	Byte code converted from the **from_set** byte. The value is of the RAW type. The default value is **NULL**. If the value is **NULL**, all bytes in **r** that exist in **from_set** are converted to **pad**.
from_set	Bytecode to be converted in the source byte string **r**. The value is of the RAW type. The default value is **NULL**. If **from_set** is **NULL**, all bytes in the source byte string **r** are converted into equal-length data filled by **pad**. Otherwise, the bytes in **from_set** in the source byte string **r** are replaced with the bytes in the corresponding position in **to_set**. For example, if **r[x]=from_set[n]**, **r[x]** is converted to **to_set[n]**. If **to_set[n]** does not exist, **r[x]** will be converted to **pad**.
pad	Padding byte. Only the first byte is valid. The default value is **NULL**. If the value is **NULL**, it is regarded as **0x00** by default.

- DBE_RAW.XRANGE

  Returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-code.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_RAW.XRANGE function is as follows:

```
DBE_RAW.XRANGE(
   start_byte IN RAW,
   end_byte   IN RAW)
RETURN RAW;
```

Table 10-266 DBE_RAW.XRANGE parameters

Parameter	Description
start_byte	Start byte. Only the first byte is valid. If the value is **NULL**, it is regarded as **0x00** by default.
end_byte	End byte. Only the first byte is valid. If the value is **NULL**, it is regarded as **0xFF** by default. If **end_byte** is less than **start_byte**, **end_byte** is concatenated to **0xFF**, and then **0x00** is concatenated to **start_byte**.

Examples

```
-- Perform operations on RAW data in a stored procedure.
CREATE OR REPLACE PROCEDURE proc_raw
AS
str varchar2(100) := 'abcdef';
source raw(100);
amount integer;
BEGIN
source := dbe_raw.cast_from_varchar2_to_raw(str);-- Convert the type.
 amount := dbe_raw.get_length(source);-- Obtain the length.
dbe_output.print_line(amount);
END;
/
CREATE PROCEDURE

-- Call the stored procedure.
CALL proc_raw();
6
 proc_raw
----------

(1 row)
-- Delete the stored procedure.
DROP PROCEDURE proc_raw;
DROP PROCEDURE

DECLARE

SELECT DBE_RAW.TRANSLITERATE('1122112233', '55','1133','FFEE') INTO v_raw; -- 55225522FF
-- All bytes between two bytes of the RAW type.
SELECT DBE_RAW.XRANGE('00','03') INTO v_raw; -- 00010203
END;
/
ANONYMOUS BLOCK EXECUTE
```

10.12.2.12 DBE_SCHEDULER

API Description

The advanced package **DBE_SCHEDULER** supports more flexible creation of scheduled jobs through scheduling and programing. For details about all the supported APIs, see **Table 10-267**.

NOTICE

DBE_SCHEDULER supports scheduled jobs for synchronizing data between CNs. Jobs with the same name cannot be created between different CNs.

The synchronization function is not implemented in versions earlier than 505.0.0. Therefore, all synchronization APIs synchronize data only in 505.0.0 and later versions.

Before the upgrade, the system checks whether jobs with the same name exist on CNs of the source version. If jobs with the same name exist on CNs of the source version and they are created on different nodes, an error message is displayed, prompting you to delete the jobs and perform the upgrade again.

Table 10-267 DBE_SCHEDULER

API	Description
DBE_SCHEDULER.CREATE_JOB	Creates a scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SCHEDULER.DROP_JOB	Deletes scheduled jobs.
DBE_SCHEDULER.DROP_SINGLE_JOB	Deletes a single scheduled job.
DBE_SCHEDULER.SET_ATTRIBUTE	Sets object attributes.
DBE_SCHEDULER.RUN_JOB	Runs a scheduled job.
DBE_SCHEDULER.RUN_BACKEND_JOB	Runs a scheduled job in the backend.
DBE_SCHEDULER.RUN_FOREGROUND_JOB	Runs a scheduled job in the frontend.
DBE_SCHEDULER.STOP_JOB	Stops scheduled jobs.
DBE_SCHEDULER.STOP_SINGLE_JOB	Stops a single scheduled job.
DBE_SCHEDULER.GENERATE_JOB_NAME	Generates a scheduled job name.
DBE_SCHEDULER.CREATE_PROGRAM	Creates a program.
DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT	Defines program parameters.
DBE_SCHEDULER.DROP_PROGRAM	Deletes a program.
DBE_SCHEDULER.DROP_SINGLE_PROGRAM	Deletes a single program.
DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE	Sets scheduled job parameters.
DBE_SCHEDULER.CREATE_SCHEDULE	Creates a schedule.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SCHEDULER.DROP_SCHEDULE	Deletes schedules.
DBE_SCHEDULER.DROP_SINGLE_SCHEDULE	Deletes a single schedule.
DBE_SCHEDULER.CREATE_JOB_CLASS	Creates a scheduled job class.
DBE_SCHEDULER.DROP_JOB_CLASS	Deletes scheduled job classes.
DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS	Deletes a single scheduled job class.
DBE_SCHEDULER.GRANT_USER_AUTHORIZATION	Grants special permissions to a user.
DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION	Revokes special permissions from a user.
DBE_SCHEDULER.CREATE_CREDENTIAL	Creates a certificate.
DBE_SCHEDULER.DROP_CREDENTIAL	Destroys a certificate.
DBE_SCHEDULER.ENABLE	Enables an object.
DBE_SCHEDULER.ENABLE_SINGLE	Enables a single object.
DBE_SCHEDULER.DISABLE	Disables objects.
DBE_SCHEDULER.DISABLE_SINGLE	Disables a single object.
DBE_SCHEDULER.EVAL_CALENDAR_STRING	Analyzes the scheduled job period.
DBE_SCHEDULER.EVALUATE_CALENDAR_STRING	Analyzes the scheduled job period.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SCHEDULER.CREATE_JOB

  Creates a scheduled job and synchronize it to all CNs.

  The prototypes of the DBE_SCHEDULER.CREATE_JOB function are as follows:

```
-- Scheduled jobs of an inline schedule and a program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER             DEFAULT 0,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                    DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created scheduled jobs of the schedule and the program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
program_name TEXT,
schedule_name TEXT,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
job_style TEXT                         DEFAULT 'REGULAR',
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created program and the scheduled job of the inline schedule.
DBE_SCHEDULER.CREATE_JOB(
job_name text,
program_name TEXT,
start_date TIMESTAMP WITH TIME ZONE     DEFAULT NULL,
repeat_interval TEXT                    DEFAULT NULL,
end_date TIMESTAMP WITH TIME ZONE       DEFAULT NULL,
job_class TEXT            DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
job_style TEXT                         DEFAULT 'REGULAR',
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)

-- Reference the created schedule and the scheduled job of the inline program.
DBE_SCHEDULER.CREATE_JOB(
job_name TEXT,
schedule_name TEXT,
job_type TEXT,
job_action TEXT,
number_of_arguments INTEGER             DEFAULT 0,
job_class TEXT             DEFAULT 'DEFAULT_JOB_CLASS',
enabled BOOLEAN                         DEFAULT FALSE,
auto_drop BOOLEAN                       DEFAULT TRUE,
comments TEXT                           DEFAULT NULL,
credential_name TEXT                    DEFAULT NULL,
destination_name TEXT                   DEFAULT NULL
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

The scheduled job created through **DBE_SCHEDULER** does not conflict with the scheduled job in **DBE_TASK**.

The scheduled job created by **DBE_SCHEDULER** generates the corresponding **job_id**. However, the **job_id** is meaningless.

For the create API, the validity of input parameter types is not verified. Successful creation does not mean successful execution. You can query the execution status of the current job in the pg_job system catalog.

Table 10-268 DBE_SCHEDULER.CREATE_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name of a scheduled job. In non-ILM scheduling scenarios, jobs prefixed with "ilmadowind$_" and "ilmjob$_" cannot be created.
job_type	TEXT	IN	No	Inline program type of a scheduled job. The options are as follows: • **'PLSQL_BLOCK'**: fast anonymous stored procedure. • **'STORED_PROCEDURE'**: stored procedure that is saved. • **'EXTERNAL_SCRIPT'**: external script.
job_action	TEXT	IN	No	Content executed by an inline program of a scheduled job.
number_of_arguments	INTEGER	IN	No	Number of inline program parameters of a scheduled job.
program_name	TEXT	IN	No	Name of the program referenced by a scheduled job.
start_date	TIMESTAMP WITH TIME ZONE	IN	Yes	Inline scheduling start time of a scheduled job.
repeat_interval	TEXT	IN	Yes	Inline scheduling period of a scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
end_date	TIMESTAMP WITH TIME ZONE	IN	Yes	Inline scheduling expiration time of a scheduled job.
schedule_name	TEXT	IN	No	Name of the schedule referenced by a scheduled job.
job_class	TEXT	IN	No	Name of a scheduled job class.
enabled	BOOLEAN	IN	No	Status of a scheduled job.
auto_drop	BOOLEAN	IN	No	Automatic deletion of a scheduled job.
comments	TEXT	IN	Yes	Comments.
job_style	TEXT	IN	No	Behavior pattern of a scheduled job. Only **'REGULAR'** is supported.
credential_name	TEXT	IN	Yes	Certificate name of a scheduled job.
destination_name	TEXT	IN	Yes	Target name of a scheduled job. Currently, only **'CCN'** (case-insensitive) is supported. Jobs whose **destination_name** is set to **CCN** can be executed only on the central coordinator. Otherwise, the original processing logic is used.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
 create_schedule
-----------------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_schedule
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

NOTICE

To create a scheduled job of the EXTERNAL_SCRIPT type, the administrator must assign related permissions and certificates and the user who starts the database must have the read permission on the external script.

- DBE_SCHEDULER.DROP_JOB

  Deletes scheduled jobs. The operation is performed only when the job is synchronized.

  The prototype of the DBE_SCHEDULER.DROP_JOB function is as follows:

```
DBE_SCHEDULER.drop_job(
job_name text,
force boolean                   default false,
defer boolean                   default false,
commit_semantics text      default 'STOP_ON_FIRST_ERROR'
)
```

  NOTE

  DBE_SCHEDULER.DROP_JOB can specify one or more jobs, or specify a job class to delete a scheduled job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-269 DBE_SCHEDULER.DROP_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	One or more scheduled job names or classes. If you specify multiple scheduled jobs, separate them with commas (,).
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled job. ● **TRUE**: The current scheduled job is stopped and then deleted. ● **FALSE**: The scheduled job fails to be deleted if it is running.
defer	BOOLEAN	IN	No	Specifies whether to delete a scheduled job. ● **TRUE**: A scheduled job can be deleted after it is complete. ● **FALSE**: The scheduled job cannot be executed and is deleted.
commit_semantics	TEXT	IN	No	Commit rules: ● **'STOP_ON_FIRST_ERROR'**: The deletion operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The deletion operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the deletion operation that is performed successfully.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', NULL, 'sysdate', NULL, 'test');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job(job_name=>'job1', program_name=>'program1',
schedule_name=>'schedule1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_schedule
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

NOTICE

The **TRANSACTIONAL** option in **commit_semantic** takes effect only when **force** is set to **false**.

- DBE_SCHEDULER.DROP_SINGLE_JOB

  Deletes a scheduled job. The operation is performed only when the job is synchronized.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_JOB function is as follows:

```
DBE_SCHEDULER.drop_single_job(
job_name text,
force boolean                   default false,
defer boolean                   default false
)
```

Table 10-270 DBE_SCHEDULER.DROP_SINGLE_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Specifies the name of a scheduled job or scheduled job class.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled job. ● **TRUE**: The current scheduled job is stopped and then deleted. ● **FALSE**: The scheduled job fails to be deleted if it is running.
defer	BOOLEAN	IN	No	Specifies whether to delete a scheduled job. ● **TRUE**: A scheduled job can be deleted after it is complete. ● **FALSE**: The scheduled job cannot be executed and is deleted.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 0, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_job('job1', 'program1', '2021-07-20', 'interval ''3 minute''',
'2121-07-20', 'DEFAULT_JOB_CLASS', false, false,'test', 'style', NULL, NULL);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job('job1', false, false);
 drop_single_job
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.SET_ATTRIBUTE

  Modifies the attributes of a scheduled job. The operation is performed only when the job is synchronized.

  The prototypes of the DBE_SCHEDULER.SET_ATTRIBUTE function are as follows:

```
DBE_SCHEDULER.set_attribute(
name                text,
attribute           text,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
value                boolean
)

DBE_SCHEDULER.set_attribute(
name                 text,
attribute            text,
value                text
)

DBE_SCHEDULER.set_attribute(
name                 text,
attribute            text,
value                timestamp
)

DBE_SCHEDULER.set_attribute(
name                 text,
attribute            text,
value                timestamp with time zone
)

DBE_SCHEDULER.set_attribute(
name text,
attribute text,
value text,
value2 text                      default NULL
)
```

NOTE

name specifies any object in **DBE_SCHEDULER**.

Table 10-271 DBE_SCHEDULER.SET_ATTRIBUTE API parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.
attribute	TEXT	IN	No	Attribute name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
value	BOOLEAN/ DATE/ TIMESTAMP / TIMESTAMP WITH TIME ZONE /TEXT	IN	No	Attribute value. The options are as follows: ● Scheduled-job-related: job_type, job_action, number_of_arguments, start_date, repeat_interval, end_date, ob_class, enabled, auto_drop, comments, credential_name, destination_name, program_name, schedule_name, and job_style. ● Program-related: program_action, program_type, number_of_arguments, and comments. ● Scheduling-related: start_date, repeat_interval, end_date, and comments.
value2	TEXT	IN	Yes	Additional attribute value. Reserved parameter bit. Currently, the target attribute with extra attribute values is not supported.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'number_of_arguments', 0);
 set_attribute
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_attribute('program1', 'program_type', 'STORED_PROCEDURE');
 set_attribute
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

Do not use DBE_SCHEDULER.SET_ATTRIBUTE to leave the parameters empty.
The object name cannot be changed using DBE_SCHEDULER.SET_ATTRIBUTE.
Inline objects cannot be changed by DBE_SCHEDULER.SET_ATTRIBUTE.

- DBE_SCHEDULER.RUN_JOB

  Runs a scheduled job.

  The prototype of the DBE_SCHEDULER.RUN_JOB function is as follows:

```
DBE_SCHEDULER.run_job(
job_name text,
use_current_session boolean             default true
)
```

  NOTE

  DBE_SCHEDULER.RUN_JOB is used to run scheduled jobs immediately. It is independent of the scheduling of scheduled jobs and can even run at the same time.

Table 10-272 DBE_SCHEDULER.RUN_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	One or more scheduled job names. If you specify multiple scheduled jobs, separate them with commas (,).
use_current_session	BOOLEAN	IN	No	Specifies whether to run a scheduled job. • **TRUE**: Use the current session to check whether the scheduled job can run properly. • **FALSE**: Start the scheduled job in the backend. The execution result is recorded in logs.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.run_job('job1', false);
 run_job
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

NOTICE

Currently, **use_current_session** applies only to scheduled jobs whose **job_type** is set to **EXTERNAL_SCRIPT**.

- DBE_SCHEDULER.RUN_BACKEND_JOB

  Runs a scheduled job in the backend.

  The prototype of the DBE_SCHEDULER.RUN_BACKEND_JOB function is as follows:

  ```
  DBE_SCHEDULER.run_backend_job(
  job_name text
  )
  ```

  Table 10-273 DBE_SCHEDULER.RUN_BACKEND_JOB API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job_name	text	IN	No	Name of a scheduled job.

  Example:

  ```
  gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
  end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
   create_job
  ------------

  (1 row)

  gaussdb=# CALL DBE_SCHEDULER.run_backend_job('job1');
   run_backend_job
  -----------------

  (1 row)

  gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
   drop_job
  ----------

  (1 row)
  ```

- DBE_SCHEDULER.RUN_FOREGROUND_JOB

  Runs a scheduled job in the current session.

  Only external jobs can be executed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Return value: text

The prototype of the DBE_SCHEDULER.RUN_FOREGROUND_JOB function is as follows:

```
DBE_SCHEDULER.run_foreground_job(
job_name text
)return text
```

Table 10-274 DBE_SCHEDULER.RUN_FOREGROUND_JOB API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name of a scheduled job.

Example:

```
gaussdb=# create user test1 identified by '*********';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# select DBE_SCHEDULER.create_credential('cre_1', 'test1', '*********');
 create_credential
-------------------

(1 row)

gaussdb=# select DBE_SCHEDULER.create_job(job_name=>'job1', job_type=>'EXTERNAL_SCRIPT',
job_action=>'/usr/bin/pwd', enabled=>true, auto_drop=>false, credential_name => 'cre_1');
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.run_foreground_job('job1');
  run_foreground_job
---------------------------------
 Host key verification failed.\r+

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)

gaussdb=# drop user test1;
DROP ROLE
```

- DBE_SCHEDULER.STOP_JOB

  Stops scheduled jobs.

  The prototype of the DBE_SCHEDULER.STOP_JOB function is as follows:

  ```
  DBE_SCHEDULER.stop_job(
  job_name text,
  force boolean                    default false,
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
commit_semantics text                default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-275 DBE_SCHEDULER.STOP_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	One or more scheduled job names or classes. If you specify multiple scheduled jobs, separate them with commas (,).
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled job. ● **TRUE**: The scheduler sends a termination signal to end the job thread immediately. ● **FALSE**: The scheduler attempts to use the interrupt signal to terminate the scheduled job thread.
commit_semantics	TEXT	IN	No	Commit rules: ● **'STOP_ON_FIRST_ERROR'**: The interrupt operation performed before the first error is reported is committed. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the interrupt operation that is performed successfully.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.stop_job('job1', true, 'STOP_ON_FIRST_ERROR');
 stop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
----------

(1 row)
```

- DBE_SCHEDULER.STOP_SINGLE_JOB

  Stops a single scheduled job.

  The prototype of the DBE_SCHEDULER.STOP_SINGLE_JOB function is as follows:

```
DBE_SCHEDULER.stop_single_job(
job_name text,
force boolean                   default false
)
```

Table 10-276 DBE_SCHEDULER.STOP_SINGLE_JOB API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Specifies the name of a scheduled job or scheduled job class.
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled job. ● **TRUE**: The scheduler sends a termination signal to end the job thread immediately. ● **FALSE**: The scheduler attempts to use the interrupt signal to terminate the scheduled job thread.

Example:

```
gaussdb=# SELECT dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.stop_single_job('job1', true);
 stop_single_job
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SCHEDULER.GENERATE_JOB_NAME

  Generates the name of a scheduled job.

  The prototype of the DBE_SCHEDULER.GENERATE_JOB_NAME function is as follows:

```
DBE_SCHEDULER.generate_job_name(
prefix text                    default 'JOB$_'
)return text
```

Table 10-277 DBE_SCHEDULER.GENERATE_JOB_NAME API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
prefix	TEXT	IN	No	Prefix of the generated name. The default value is **'JOB$_'**. Scheduled jobs that are repeatedly executed are named as follows: job$_1, job$_2, job$_3 ...

Example:

```
gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
 generate_job_name
-------------------
 JOB$_1
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name();
 generate_job_name
-------------------
 JOB$_2
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
 generate_job_name
-------------------
 job3
(1 row)

gaussdb=# CALL DBE_SCHEDULER.generate_job_name('job');
 generate_job_name
-------------------
 job4
(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

When DBE_SCHEDULER.GENERATE_JOB_NAME is executed for the first time, a temporary sequence is created in **public** to store the sequence number of the current name. A common user does not have the create permission in **public**. Therefore, if a common user calls the function for the first time in the current database, the function fails to be called. In this case, you need to grant the create permission in **public** to the common user or call the API as a user with the create permission to create a temporary sequence.

- DBE_SCHEDULER.CREATE_PROGRAM

  Creates a program and synchronizes it to all CNs.

  The prototype of the DBE_SCHEDULER.CREATE_PROGRAM function is as follows:

```
DBE_SCHEDULER.create_program(
program_name text,
program_type text,
program_action text,
number_of_arguments integer          default 0,
enabled boolean                    default false,
comments text                      default NULL
)
```

Table 10-278 DBE_SCHEDULER.CREATE_PROGRAM API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Program name.
program_type	TEXT	IN	No	Program type. The options are as follows: • **'PLSQL_BLOCK'**: fast anonymous stored procedure. • **'STORED_PROCEDURE'**: stored procedure that is saved. • **'EXTERNAL_SCRIPT'**: external script.
program_action	TEXT	IN	No	Program operation.
number_of_arguments	INTEGER	IN	No	Number of parameters used by the program.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
enabled	BOOLEAN	IN	No	Specifies whether the program is enabled.
comments	TEXT	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 3, false, 'test');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT

  Defines program parameters. The operation is performed only when the program is synchronized.

  An API with the default value **default_value** will not convert characters to lowercase letters by default. In this version, characters are case-sensitive.

  The prototype of the DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT function is as follows:

```
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text                  default NULL,
argument_type text,
out_argument boolean                 default false
)

-- With a default value --
DBE_SCHEDULER.define_program_argument(
program_name text,
argument_position integer,
argument_name text                  default NULL,
argument_type text,
default_value text,
out_argument boolean                 default false
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-279 DBE_SCHEDULER.DEFINE_PROGRAM_ARGUMENT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Program name.
argument_position	INTEGER	IN	No	Parameter location.
argument_name	TEXT	IN	No	Parameter name.
argument_type	TEXT	IN	No	Parameter type.
default_value	TEXT	IN	No	Default value.
out_argument	BOOLEAN	IN	No	Reserved parameter.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', false);
 define_program_argument
-------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.define_program_argument('program1', 1, 'pa1', 'type1', 'value1',
false);
 define_program_argument
-------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DROP_PROGRAM

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Deletes a program. The operation is performed only when the program is synchronized.

The prototype of the DBE_SCHEDULER.DROP_PROGRAM function is as follows:

```
DBE_SCHEDULER.drop_program(
program_name text,
force boolean                   default false
)
```

Table 10-280 DBE_SCHEDULER.DROP_PROGRAM API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Program name.
force	BOOLEAN	IN	No	Specifies whether to delete a program. ● **TRUE**: Before a program is deleted, all jobs that use the program are disabled. ● **FALSE**: The program cannot be referenced by any job. Otherwise, an error is sent.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_PROGRAM

  Deletes a single program. The operation is performed only when the program is synchronized.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_PROGRAM function is as follows:

  ```
  DBE_SCHEDULER.drop_single_program(
  program_name text,
  force boolean                   default false
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-281 DBE_SCHEDULER.DROP_SINGLE_PROGRAM API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
program_name	TEXT	IN	No	Program name.
force	BOOLEAN	IN	No	Specifies whether to delete a program. • **TRUE**: Before a program is deleted, all jobs that use the program are disabled. • **FALSE**: The program cannot be referenced by any job. Otherwise, an error is sent.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'STORED_PROCEDURE', 'select
pg_sleep(1);', 2, false, 'test');
create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_program('program1', false);
 drop_single_program
---------------------

(1 row)
```

- DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE

  Sets scheduled job parameters. The **argument_value** can be left empty. The operation is performed only when the job is synchronized.

  The prototype of the DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE function is as follows:

```
DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_position integer,
argument_value text
)

DBE_SCHEDULER.set_job_argument_value(
job_name text,
argument_name text,
argument_value text
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-282 DBE_SCHEDULER.SET_JOB_ARGUMENT_VALUE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job_name	TEXT	IN	No	Name of a scheduled job.
argument_position	INTEGER	IN	No	Parameter location.
argument_name	TEXT	IN	Yes	Parameter name.
argument_value	TEXT	IN	Yes	Parameter value.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','EXTERNAL_SCRIPT','begin insert into test1
values(12); end;',2,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.set_job_argument_value('job1', 1, 'value1');
 set_job_argument_value
------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.CREATE_SCHEDULE

  Creates a schedule and synchronizes it to all CNs.

  The prototype of the DBE_SCHEDULER.CREATE_SCHEDULE function is as follows:

```
DBE_SCHEDULER.create_schedule(
schedule_name text,
start_date timestamp with time zone      default NULL,
repeat_interval text,
end_date timestamp with time zone        default NULL,
comments text                            default NULL
)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-283 DBE_SCHEDULER.CREATE_SCHEDULE API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
schedule_name	TEXT	IN	No	Name of a schedule.
start_date	TIMESTAMP WITH TIME ZONE	IN	Yes	Start time of a schedule.
repeat_interval	TEXT	IN	No	Repetition frequency of a schedule.
end_date	TIMESTAMP WITH TIME ZONE	IN	Yes	End time of a schedule.
comments	TEXT	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.DROP_SCHEDULE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Deletes schedules. The operation is performed only when the schedule is synchronized.

The prototype of the DBE_SCHEDULER.DROP_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_schedule(
schedule_name text,
force boolean                    default false
)
```

Table 10-284 DBE_SCHEDULER.DROP_SCHEDULE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	TEXT	IN	No	Name of a schedule.
force	BOOLEAN	IN	No	Specifies whether to delete a schedule. • **true**: Any jobs or windows that use this schedule are disabled before the schedule is deleted. • **false**: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule1');
 drop_single_schedule
----------------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_SCHEDULE

  Deletes a single schedule. The operation is performed only when the schedule is synchronized.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_SCHEDULE function is as follows:

```
DBE_SCHEDULER.drop_single_schedule(
schedule_name text,
force boolean                   default false
)
```

Table 10-285 DBE_SCHEDULER.DROP_SINGLE_SCHEDULE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
schedule_name	TEXT	IN	No	Name of a schedule.
force	BOOLEAN	IN	No	Specifies whether to delete a schedule. • **TRUE**: Any jobs or windows that use this schedule are disabled before the schedule is deleted. • **FALSE**: The schedule cannot be referenced by any job or window. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule1', sysdate, 'sysdate + 3 / (24 * 60 * 60)',
null, 'test1');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule2', sysdate, 'FREQ=DAILY; BYHOUR=6;',
null, 'test1');
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_schedule('schedule3', sysdate, 'FREQ=DAILY; BYHOUR=6;');
 create_schedule
-----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule1');
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule2', false);
 drop_single_schedule
----------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_schedule('schedule3', true);
 drop_single_schedule
----------------------

(1 row)
```

- DBE_SCHEDULER.CREATE_JOB_CLASS

  Creates a scheduled job class and synchronizes it to all CNs.

  The prototype of the DBE_SCHEDULER.CREATE_JOB_CLASS function is as follows:

```
DBE_SCHEDULER.create_job_class(
job_class_name text,
resource_consumer_group text           default NULL,
service text                        default NULL,
logging_level integer                  default 0,
log_history integer                   default NULL,
comments text                          default NULL
)
```

Table 10-286 DBE_SCHEDULER.CREATE_JOB_CLASS API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job_class_name	TEXT	IN	No	Name of a scheduled job class.
resource_consumer_group	TEXT	IN	Yes	Inline resource consumer group of a scheduled job class.
service	TEXT	IN	Yes	Inline database service of a scheduled job class.
logging_level	INTEGER	IN	No	Number of scheduled job records.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
log_history	INTEGER	IN	Yes	Number of days for storing scheduled job records.
comments	TEXT	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.DROP_JOB_CLASS

  Deletes scheduled job classes. The operation is performed only when the scheduled job class is synchronized.

  The prototype of the DBE_SCHEDULER.DROP_JOB_CLASS function is as follows:

  ```
  DBE_SCHEDULER.drop_job_class(
  job_class_name text,
  force boolean                    default false
  )
  ```

  Table 10-287 DBE_SCHEDULER.DROP_JOB_CLASS API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job_class_name	TEXT	IN	No	Name of a scheduled job class.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled job class. ● **TRUE**: Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted. ● **FALSE**: The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job_class('jc1', false);
 drop_job_class
----------------

(1 row)
```

- DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS

  Deletes a single scheduled job class. The operation is performed only when the scheduled job class is synchronized.

  The prototype of the DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS function is as follows:

  ```
  DBE_SCHEDULER.drop_single_job_class(
  job_class_name text,
  force boolean                    default false
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-288 DBE_SCHEDULER.DROP_SINGLE_JOB_CLASS API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job_class_name	TEXT	IN	No	Name of a scheduled job class.
force	BOOLEAN	IN	No	Specifies whether to delete a scheduled job class. • **TRUE**: Jobs of this class will be disabled, and another class will be set as the default class. Only when such setting is successful, this class will be deleted. • **FALSE**: The class to be deleted cannot be referenced by any job. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_job_class(job_class_name => 'jc1', resource_consumer_group
=> '123');
 create_job_class
------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_single_job_class('jc1', false);
 drop_single_job_class
-----------------------

(1 row)
```

- DBE_SCHEDULER.GRANT_USER_AUTHORIZATION

  Grants the scheduled job permissions to the database user. The user who calls this function must have the SYSADMIN permission. Then, it is synchronized to all CNs.

  The prototype of the DBE_SCHEDULER.GRANT_USER_AUTHORIZATION function is as follows:

  ```
  DBE_SCHEDULER.grant_user_authorization(
  username              text,
  privilege             text
  )
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-289 DBE_SCHEDULER.GRANT_USER_AUTHORIZATION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	TEXT	IN	No	Database username.
privilege	TEXT	IN	No	Scheduled job permission.

Example:

```
gaussdb=# create user user1 password '1*s*****';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
 grant_user_authorization
--------------------------

(1 row)
gaussdb=# drop user user1;
DROP ROLE
```

- DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION

  Revokes the scheduled job permissions from the database user. The user who calls this function must have the SYSADMIN permission. The operation is performed only when the permission granting is synchronized.

  The prototype of the DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION function is as follows:

```
DBE_SCHEDULER.revoke_user_authorization(
username              text,
privilege             text
)
```

Table 10-290 DBE_SCHEDULER.REVOKE_USER_AUTHORIZATION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
username	TEXT	IN	No	Database username.
privilege	TEXT	IN	No	Scheduled job permission.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# create user user1 password '1*s*****';
NOTICE:  The encrypted password contains MD5 ciphertext, which is not secure.
CREATE ROLE
gaussdb=# CALL DBE_SCHEDULER.grant_user_authorization('user1', 'create job');
 grant_user_authorization
--------------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.revoke_user_authorization('user1', 'create job');
 revoke_user_authorization
---------------------------

(1 row)
gaussdb=# drop user user1;
DROP ROLE
```

- DBE_SCHEDULER.CREATE_CREDENTIAL

  Creates an authorization certificate. The user who calls this function must have the SYSADMIN permission. Then, it is synchronized to all CNs.

  The prototype of the DBE_SCHEDULER.CREATE_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.create_credential(
credential_name         text,
username                text,
password                text            default NULL,
database_role           text            default NULL,
windows_domain          text            default NULL,
comments                text            default NULL
)
```

Table 10-291 DBE_SCHEDULER.CREATE_CREDENTIAL API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
credential_name	TEXT	IN	No	Name of the authorization certificate.
username	TEXT	IN	No	Database username.
password	TEXT	IN	Yes	User password.
database_role	TEXT	IN	Yes	Database system permission.
windows_domain	TEXT	IN	Yes	Domain to which a Windows user belongs.
comments	TEXT	IN	Yes	Comments.

Example:

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
 create_credential
-------------------
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)
```

NOTICE

The **password** parameter of DBE_SCHEDULER.CREATE_CREDENTIAL must be set to **NULL** or **'******'**. This parameter is used only for compatibility and does not indicate any actual meaning. Do not use the OS username corresponding to the installation user to create a certificate.

- DBE_SCHEDULER.DROP_CREDENTIAL

  Destroys an authorization certificate. The user who calls this function must have the SYSADMIN permission. The operation is performed only when the certificate is synchronized.

  The prototype of the DBE_SCHEDULER.DROP_CREDENTIAL function is as follows:

```
DBE_SCHEDULER.drop_credential(
credential_name         text,
force boolean default false
)
```

Table 10-292 DBE_SCHEDULER.DROP_CREDENTIAL API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
credential_name	TEXT	IN	No	Name of the authorization certificate.
force	BOOLEAN	IN	No	Specifies whether to delete the authorization certificate. • **TRUE**: The certificate will be deleted no matter whether it is referenced by any job. • **FALSE**: No job can reference the certificate. Otherwise, an error occurs.

Example:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.create_credential('cre_1', 'user1', '');
 create_credential
-------------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_credential('cre_1', false);
 drop_credential
-----------------

(1 row)
```

- DBE_SCHEDULER.ENABLE

  Enables objects and synchronizes them to all CNs.

  The prototype of the DBE_SCHEDULER.ENABLE function is as follows:

```
DBE_SCHEDULER.enable(
name text,
commit_semantics text                default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-293 DBE_SCHEDULER.ENABLE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name. You can specify one or more objects. If you specify multiple objects, separate them with commas (,).
commit_semantics	TEXT	IN	No	Commit rules. The following types are supported: ● **'STOP_ON_FIRST_ERROR'**: The enabling operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The enabling operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the enabling operation that is performed successfully.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('job1');
 enable
--------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable('program1', 'STOP_ON_FIRST_ERROR');
 enable
--------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.ENABLE_SINGLE

  Enables a single object and synchronizes it to all CNs.

  The prototype of the DBE_SCHEDULER.ENABLE_SINGLE function is as follows:

  ```
  DBE_SCHEDULER.enable_single(
  name text
  )
  ```

  Table 10-294 DBE_SCHEDULER.ENABLE_SINGLE API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.

  Example:

  ```
  gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
  end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
   create_job
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.enable_single('job1');
 enable_single
---------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

- DBE_SCHEDULER.DISABLE

  Disables multiple objects. The value of name is a character string separated by commas (,). Each character string separated by commas (,) is an object. Operations are synchronized only when operation synchronization is enabled.

  The prototype of the DBE_SCHEDULER.DISABLE function is as follows:

```
DBE_SCHEDULER.disable(
name text,
force boolean                   default false,
commit_semantics text               default 'STOP_ON_FIRST_ERROR'
)
```

Table 10-295 DBE_SCHEDULER.DISABLE API parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.
force	BOOLEAN	IN	No	Specifies whether to disable an object. • **TRUE**: The object is disabled regardless of whether other objects depend on it. • **FALSE**: No object can depend on the object. Otherwise, an error occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
commit_semantics	TEXT	IN	No	Commit rules. The following types are supported: ● **'STOP_ON_FIRST_ERROR'**: The disabling operation performed before the first error is reported is committed. ● **'TRANSACTIONAL'**: Transaction-level commit. The disabling operation performed before an error is reported will be rolled back. ● **'ABSORB_ERRORS'**: The system attempts to bypass an error and commit the disabling operation that is performed successfully.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.create_program('program1', 'stored_procedure', 'insert into
tb_job_test(key) values(null);', 0, false, '');
 create_program
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('job1');
 disable
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable('program1', false, 'STOP_ON_FIRST_ERROR');
 disable
---------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb=# CALL DBE_SCHEDULER.drop_program('program1', false);
 drop_program
--------------

(1 row)
```

- DBE_SCHEDULER.DISABLE_SINGLE

  Disables a single object. Operations are synchronized only when operation synchronization is enabled.

  The prototype of the DBE_SCHEDULER.DISABLE_SINGLE function is as follows:

```
DBE_SCHEDULER.disable_single(
name text,
force boolean                    default false
)
```

Table 10-296 DBE_SCHEDULER.DISABLE_SINGLE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	TEXT	IN	No	Object name.
force	BOOLEAN	IN	No	Specifies whether to disable an object. • **TRUE**: The object is disabled regardless of whether other objects depend on it. • **FALSE**: No object can depend on the object. Otherwise, an error occurs.

Example:

```
gaussdb=# CALL dbe_scheduler.create_job('job1','PLSQL_BLOCK','begin insert into test1 values(12);
end;',0,null,null,null,'DEFAULT_JOB_CLASS',false,false,null,null,null);
 create_job
------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.disable_single('job1', false);
 disable_single
----------------

(1 row)

gaussdb=# CALL DBE_SCHEDULER.drop_job('job1', true, false, 'STOP_ON_FIRST_ERROR');
 drop_job
----------

(1 row)
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SCHEDULER.EVAL_CALENDAR_STRING

  Analyzes the scheduled job period.

  Return type: timestamp with time zone

  The prototype of the DBE_SCHEDULER.EVAL_CALENDAR_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone
)return timestamp with time zone
```

  Table 10-297 DBE_SCHEDULER.EVAL_CALENDAR_STRING API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
calendar_string	TEXT	IN	No	Date string of a scheduled job.
start_date	TIMESTAMP WITH TIME ZONE	IN	No	Start time of a scheduled job.
return_date_after	TIMESTAMP WITH TIME ZONE	IN	No	Date when a scheduled job is returned.

  Example:

```
gaussdb=# CALL DBE_SCHEDULER.eval_calendar_string('FREQ=DAILY; BYHOUR=6;', sysdate, sysdate);
  eval_calendar_string
-----------------------
 2023-09-15 06:47:24+08
(1 row)
```

- DBE_SCHEDULER.EVALUATE_CALENDAR_STRING

  Analyzes the scheduled job period.

  Return type: timestamp with time zone

  The prototype of the DBE_SCHEDULER.EVALUATE_CALENDAR_STRING function is as follows:

```
DBE_SCHEDULER.evaluate_calendar_string(
IN calendar_string text,
IN start_date timestamp with time zone,
IN return_date_after timestamp with time zone,
OUT next_run_date timestamp with time zone
)return timestamp with time zone
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-298 DBE_SCHEDULER.EVALUATE_CALENDAR_STRING API parameters

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
calendar_string	TEXT	IN	No	Date string of a scheduled job.
start_date	TIMESTAMP WITH TIME ZONE	IN	No	Start time of a scheduled job.
return_date_after	TIMESTAMP WITH TIME ZONE	IN	No	Date when a scheduled job is returned.
next_run_date	TIMESTAMP WITH TIME ZONE	OUT	No	The next date when a scheduled job is returned.

Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE pr1(calendar_str text) as
DECLARE
    start_date        timestamp with time zone;
    return_date_after timestamp with time zone;
    next_run_date     timestamp with time zone;
BEGIN
    start_date := '2003-2-1 10:30:00.111111+8'::timestamp with time zone;
    return_date_after := start_date;
    DBE_SCHEDULER.evaluate_calendar_string(
        calendar_str,
        start_date, return_date_after, next_run_date);
    DBE_OUTPUT.PRINT_LINE('next_run_date: ' || next_run_date);
    return_date_after := next_run_date;
END;
/
CREATE PROCEDURE

gaussdb=# CALL pr1('FREQ=hourly;INTERVAL=2;BYHOUR=6,10;BYMINUTE=0;BYSECOND=0');
next_run_date: 2003-02-02 06:00:00+08
 pr1
-----

(1 row)
```

10.12.2.13 DBE_SESSION

API Description

Table 10-299 provides all APIs supported by the **DBE_SESSION** package. DBE_SESSION takes effect at the session level.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-299 DBE_SESSION

API	Description
DBE_SESSION.SET_CONTEXT	Sets the value of an attribute in a specified context.
DBE_SESSION.CLEAR_CONTEXT	Clears the value of an attribute in a specified context.
DBE_SESSION.SEARCH_CONTEXT	Queries the value of an attribute in a specified context.
DBE_SESSION.MODIFY_PACKAGE_STATE	Changes the PL/SQL status of the current session.

- DBE_SESSION.SET_CONTEXT

  Sets the value of an attribute in a specified namespace (context). The prototype of the DBE_SESSION.SET_CONTEXT function is as follows:

```
DBE_SESSION.SET_CONTEXT(
    namespace text,
    attribute text,
    value text
)returns void;
```

  Table 10-300 Parameters for DBE_SESSION.SET_CONTEXT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Name of the context to be set. If the context does not exist, create a context. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute name. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.
value	TEXT	IN	No	Name of the value to be set. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

- DBE_SESSION.CLEAR_CONTEXT

  Clears the value of an attribute in a specified namespace (context). The prototype of the DBE_SESSION.CLEAR_CONTEXT function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_SESSION.CLEAR_CONTEXT (
    namespace text,
    client_identifier text default null,
    attribute text default null
)returns void ;
```

Table 10-301 Parameters for DBE_SESSION.CLEAR_CONTEXT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
client_identifier	TEXT	IN	Yes	Client authentication. The default value is **null**. Generally, you do not need to manually set this parameter.
attribute	TEXT	IN	Yes	Attribute to be cleared. The default value is **null**, indicating that all attributes of the specified context are cleared. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated. Note: To ensure forward compatibility, if the parameter value is **'null'**, all attributes of the specified context are cleared.

- DBE_SESSION.SEARCH_CONTEXT

  Queries the value of an attribute in a specified namespace (context). The prototype of the DBE_SESSION.SEARCH_CONTEXT function is as follows:

```
DBE_SESSION.SEARCH_CONTEXT (
    namespace text,
    attribute text
)returns text;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-302 Parameters for DBE_SESSION.SEARCH_CONTEXT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
namespace	TEXT	IN	No	Context specified by the user. The value contains a maximum of 128 bytes. If the value exceeds 128 bytes, it will be truncated.
attribute	TEXT	IN	No	Attribute to be searched for. The value contains a maximum of 1024 bytes. If the value exceeds 1024 bytes, it will be truncated.

Example:

```
DECLARE
    a text;
BEGIN
    DBE_SESSION.set_context('test', 'gaussdb', 'one');   --Set the gaussdb attribute in the test context
to one.
    a := DBE_SESSION.search_context('test', 'gaussdb');
    DBE_OUTPUT.PRINT_LINE(a);
    DBE_SESSION.clear_context('test', 'test','gaussdb');
END;
/
-- Expected result:
one
ANONYMOUS BLOCK EXECUTE
```

- DBE_SESSION.MODIFY_PACKAGE_STATE

  Changes the PL/SQL status of the current session. The prototype of the DBE_SESSION.MODIFY_PACKAGE_STATE function is as follows:

  ```
  DBE_SESSION.MODIFY_PACKAGE_STATE (
      flags int);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-303 Parameters for DBE_SESSION.MODIFY_PACKAGE_STATE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
flags	INT	IN	No	Bit flag of the operation performed on the PL/SQL. When **flags** is set to **1**, the session cache of the PL/SQL that is currently running in the session is released after the top-level PL/SQL is executed. The current value of any package is cleared globally and the cached cursor is closed. On subsequent use, PL/SQL re-instantiates and re-initializes the package globally. Other bit flags are not supported.

Example:

```
CALL dbe_session.modify_package_state(1);
 modify_package_state
----------------------

(1 row)
```

10.12.2.14 DBE_SQL

Data Types

- DBE_SQL.DESC_REC

  This type is a composite type and is used to store the description of the SQL_DESCRIBE_COLUMNS API.

  The prototype of the DBE_SQL.DESC_REC type is as follows:

```
CREATE TYPE DBE_SQL.DESC_REC AS (
    col_type            int,
    col_max_len         int,
    col_name            VARCHAR2(32),
    col_name_len        int,
    col_schema_name     VARCHAR2(32),
    col_schema_name_len int,
    col_precision       int,
    col_scale           int,
    col_charsetid       int,
    col_charsetform     int,
    col_null_ok         BOOLEAN
);
```

- DBE_SQL.DESC_TAB

  This type is the TABLE type of DESC_REC and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.DESC_TAB type is as follows:

```
CREATE TYPE DBE_SQL.DESC_TAB AS TABLE OF DBE_SQL.DESC_REC INDEX BY INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.DATE_TABLE

  This type is the TABLE type of DATE and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.DATE_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.DATE_TABLE AS TABLE OF DATE INDEX BY INTEGER;
  ```

- DBE_SQL.NUMBER_TABLE

  This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.NUMBER_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.NUMBER_TABLE AS TABLE OF NUMBER INDEX BY INTEGER;
  ```

- DBE_SQL.VARCHAR2_TABLE

  This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.VARCHAR2_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.VARCHAR2_TABLE AS TABLE OF VARCHAR2(32767) INDEX BY INTEGER;
  ```

- DBE_SQL.BLOB_TABLE

  This type is the TABLE type of BLOB and is implemented through the TABLE OF syntax.

  The prototype of the DBE_SQL.BLOB_TABLE type is as follows:

  ```
  CREATE TYPE DBE_SQL.BLOB_TABLE AS TABLE OF BLOB INDEX BY INTEGER;
  ```

API Description

Table 10-304 lists APIs supported by the **DBE_SQL** package.

Table 10-304 DBE_SQL

API	Description
DBE_SQL.REGISTER_CONTEXT	Opens a cursor.
DBE_SQL.SQL_UNREGISTER_CONTEXT	Closes an open cursor.
DBE_SQL.SQL_SET_SQL	Passes a set of SQL statements or anonymous blocks to a cursor.
DBE_SQL.SQL_RUN	Executes SQL statements or anonymous blocks in a given cursor.
DBE_SQL.NEXT_ROW	Reads a row of cursor data.
DBE_SQL.SET_RESULT_TYPE	Dynamically defines a column.
DBE_SQL.SET_RESULT_TYPE_CHAR	Dynamically defines a column of the CHAR type.
DBE_SQL.SET_RESULT_TYPE_INT	Dynamically defines a column of the INT type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SQL.SET_RESULT_TYPE_LONG	Dynamically defines a column of the LONG type.
DBE_SQL.SET_RESULT_TYPE_RAW	Dynamically defines a column of the RAW type.
DBE_SQL.SET_RESULT_TYPE_TEXT	Dynamically defines a column of the TEXT type.
DBE_SQL.SET_RESULT_TYPE_UNKNOWN	Dynamically defines a column of an unknown type.
DBE_SQL.GET_RESULT	Reads a dynamically defined column value.
DBE_SQL.GET_RESULT_CHAR	Reads a dynamically defined column value of the CHAR type.
DBE_SQL.GET_RESULT_INT	Reads a dynamically defined column value of the INT type.
DBE_SQL.GET_RESULT_LONG	Reads a dynamically defined column value of the LONG type.
DBE_SQL.GET_RESULT_RAW	Reads a dynamically defined column value of the RAW type.
DBE_SQL.GET_RESULT_TEXT	Reads a dynamically defined column value of the TEXT type.
DBE_SQL.GET_RESULT_UNKNOWN	Reads a dynamically defined column value of an unknown type.
DBE_SQL.DBE_SQL_GET_RESULT_CHAR	Reads a dynamically defined column value of the CHAR type.
DBE_SQL.DBE_SQL_GET_RESULT_LONG	Reads a dynamically defined column value of the LONG type.
DBE_SQL.DBE_SQL_GET_RESULT_RAW	Reads a dynamically defined column value of the RAW type.
DBE_SQL.IS_ACTIVE	Checks whether a cursor is opened.
DBE_SQL.LAST_ROW_COUNT	Returns the cumulative count of obtained rows.
DBE_SQL.RUN_AND_NEXT	Reads data of a cursor after a set of dynamically defined operations are performed on the cursor.
DBE_SQL.SQL_BIND_VARIABLE	Binds a value to a variable in a statement.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SQL.SQL_BIND_ARRAY	Binds a group of values to a variable in a statement.
DBE_SQL.SET_RESULT_TYPE_INTS	Dynamically defines a column of the INT array type.
DBE_SQL.SET_RESULT_TYPE_TEXTS	Dynamically defines a column of the TEXT array type.
DBE_SQL.SET_RESULT_TYPE_RAWS	Dynamically defines a column of the RAW array type.
DBE_SQL.SET_RESULT_TYPE_BYTEAS	Dynamically defines a column of the BYTEA array type.
DBE_SQL.SET_RESULT_TYPE_CHARS	Dynamically defines a column of the CHAR array type.
DBE_SQL.SET_RESULTS_TYPE	Dynamically defines a column of the array type.
DBE_SQL.GET_RESULTS_INT	Reads a dynamically defined column value of the INT array type.
DBE_SQL.GET_RESULTS_TEXT	Reads a dynamically defined column value of the TEXT array type.
DBE_SQL.GET_RESULTS_RAW	Reads a dynamically defined column value of the RAW array type.
DBE_SQL.GET_RESULTS_BYTEA	Reads a dynamically defined column value of the BYTEA array type.
DBE_SQL.GET_RESULTS_CHAR	Reads a dynamically defined column value of the CHAR array type.
DBE_SQL.GET_RESULTS	Reads a dynamically defined column value.
DBE_SQL.DESCRIBE_COLUMNS	Describes the column information read by the cursor.
DBE_SQL.SQL_DESCRIBE_COLUMNS	Describes the column information read by the cursor.
DBE_SQL.BIND_VARIABLE	Binds parameters.
DBE_SQL.SQL_SET_RESULTS_TYPE_C	Dynamically defines a column of the array type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_SQL.SQL_GET_VALUES_C	Reads a dynamically defined column value.
DBE_SQL.GET_VARIABLE_RESULT	Reads the return value of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_CHAR	Reads the return value (of the char type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_RAW	Reads the return value (of the raw type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_TEXT	Reads the return value (of the text type) of an SQL statement.
DBE_SQL.GET_VARIABLE_RESULT_INT	Reads the return value (of the int type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_TEXT	Reads the return value (of the text array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_RAW	Reads the return value (of the raw array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_CHAR	Reads the return value (of the char array type) of an SQL statement.
DBE_SQL.GET_ARRAY_RESULT_INT	Reads the return value (of the int array type) of an SQL statement.

NOTE

- You are advised to use **dbe_sql.set_result_type** and **dbe_sql.get_result** to define columns.
- If the size of the result set is greater than the value of **work_mem**, the result set will be spilled to a disk temporarily. The value of **work_mem** must be no greater than 512 MB.

- DBE_SQL.REGISTER_CONTEXT

  This function opens a cursor, which is the prerequisite for the subsequent **dbe_sql** operations. This function does not transfer any parameter. It automatically generates cursor IDs in an ascending order and returns values to integer variables.

  CAUTION

  Cursors opened by DBE_SQL are session-level variables. Cross-session calling of opened cursors (such as autonomous transactions) is not supported. If a cross-session cursor is called, the behavior is unpredictable.

  The prototype of the **DBE_SQL.REGISTER_CONTEXT** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_SQL.REGISTER_CONTEXT(
)
RETURN INTEGER;
```

- DBE_SQL.SQL_UNREGISTER_CONTEXT

  This function closes a cursor, which is the end of each **dbe_sql** operation. If this function is not called when the stored procedure ends, the memory is still occupied by the cursor. Therefore, remember to close a cursor when you do not need to use it. If an exception occurs, the stored procedure exits but the cursor is not closed. Therefore, you are advised to include this API in the exception handling of the stored procedure.

  The prototype of the DBE_SQL.SQL_UNREGISTER_CONTEXT function is as follows:

```
DBE_SQL.SQL_UNREGISTER_CONTEXT(
    context_id    IN INT
)
RETURN INTEGER;
```

Table 10-305 DBE_SQL.SQL_UNREGISTER_CONTEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be closed

- DBE_SQL.SQL_SET_SQL

  Parses SQL statements or anonymous blocks in a given cursor. The statement parameters can be transferred only through the TEXT type. The length cannot exceed 1 GB.

  The prototype of the **DBE_SQL.SQL_SET_SQL** function is as follows:

```
DBE_SQL.SQL_SET_SQL(
   context_id    IN INT,
   query_string  IN TEXT,
   language_flag IN INT
)
RETURN BOOLEAN;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-306 DBE_SQL.SQL_SET_SQL parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor whose query statement is to be parsed
query_string	TEXT	IN	No	Query statement to be parsed
language_flag	INT	IN	No	Version language. The value **1** indicates an incompatible version, and the value **2** indicates an ORA-compatible version.

- DBE_SQL.SQL_RUN

  This function executes a given cursor. This function receives a cursor ID and executes SQL statements or anonymous blocks in a given cursor.

  The prototype of the **DBE_SQL.SQL_RUN** function is as follows:

```
DBE_SQL.SQL_RUN(
    context_id     IN INT,
)
RETURN INTEGER;
```

Table 10-307 DBE_SQL.SQL_RUN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor whose query statement is to be parsed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.NEXT_ROW

  This function returns the number of data rows that meet query conditions. Each time the API is executed, the system obtains a set of new rows until all data is read.

  The prototype of the DBE_SQL.NEXT_ROW function is as follows:

```
DBE_SQL.NEXT_ROW(
    context_id     IN INT,
)
RETURN INTEGER;
```

  Table 10-308 DBE_SQL.NEXT_ROW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed

- DBE_SQL.SET_RESULT_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE(
    context_id IN INT,
    pos        IN INT,
    column_ref IN ANYELEMENT,
    maxsize    IN INT default 1024
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-309 DBE_SQL.SET_RESULT_TYPE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.
column_ref	ANYELEMENT	IN	No	Variable of any type. You can select an appropriate API to dynamically define columns based on variable types.
maxsize	INT	IN	Yes	Length of the defined column return type.

- DBE_SQL.SET_RESULT_TYPE_CHAR

  This function defines columns of the CHAR type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHAR** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHAR(
    context_id  IN INT,
    pos         IN INT,
    column_ref  IN TEXT,
    column_size IN INT
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-310 DBE_SQL.SET_RESULT_TYPE_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	TEXT	IN	No	Parameter to be defined
column_size	INT	IN	No	Length of a dynamically defined column

- DBE_SQL.SET_RESULT_TYPE_INT

  This function defines columns of the INT type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INT** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INT(
   context_id IN INT,
   pos        IN INT
)
RETURN INTEGER;
```

Table 10-311 DBE_SQL.SET_RESULT_TYPE_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
pos	INT	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.SET_RESULT_TYPE_LONG

  This function defines columns of a long column type (not LONG) returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type. The maximum size of a long column is 1 GB.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_LONG** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_LONG(
    context_id IN INT,
    pos        IN INT
)
RETURN INTEGER;
```

  Table 10-312 DBE_SQL.SET_RESULT_TYPE_LONG parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.SET_RESULT_TYPE_RAW

  This function defines columns of the RAW type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

The prototype of the **DBE_SQL.SET_RESULT_TYPE_RAW** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_RAW(
    context_id  IN INT,
    pos         IN INT,
    column_ref  IN BYTEA,
    column_size IN INT
)
RETURN INTEGER;
```

Table 10-313 DBE_SQL.SET_RESULT_TYPE_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	BYTEA	IN	No	RAW variable
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_TEXT

  This function defines columns of the TEXT type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_TEXT** function is as follows:

  ```
  DBE_SQL.DEFINE_COLUMN_CHAR(
      context_id IN INT,
      pos        IN INT,
      maxsize    IN INT
  )
  RETURN INTEGER;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-314 DBE_SQL.SET_RESULT_TYPE_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	IN	IN	No	ID of the cursor to be executed
pos	IN	IN	No	Position of a dynamically defined column in the query
maxsize	IN	IN	No	Maximum length of the defined TEXT type

- DBE_SQL.SET_RESULT_TYPE_UNKNOWN

  This function processes columns of unknown data types returned from a given cursor. It is used only for the system to report an error and exist when the type cannot be identified.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_UNKNOWN** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_UNKNOWN(
   context_id IN INT,
   pos        IN INT,
   col_type   IN TEXT
)
RETURN INTEGER;
```

Table 10-315 DBE_SQL.SET_RESULT_TYPE_UNKNOWN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
col_type	TEXT	IN	No	Dynamically defined parameter

- DBE_SQL.GET_RESULT

  This stored procedure returns the cursor element value in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT stored procedure is as follows:

```
DBE_SQL.GET_RESULT(
   context_id   IN INT,
   pos          IN INT,
   column_value INOUT ANYELEMENT
);
```

  Table 10-316 DBE_SQL.GET_RESULT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Relative position of the queried columns in the returned result. The value starts from 1.
column_value	ANYELEMENT	INOUT	No	Return value of a defined column

- DBE_SQL.GET_RESULT_CHAR

  This stored procedure returns the value of the **CHAR** type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_SQL.GET_RESULT_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULT_CHAR(
   context_id    IN    INT,
   pos           IN    INT,
   tr            INOUT CHAR,
   err           INOUT NUMERIC DEFAULT 0,
   actual_length INOUT INT DEFAULT 1024
);
```

Table 10-317 DBE_SQL.GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query
tr	CHAR	INOUT	No	Return value
err	NUMERIC	INOUT	Yes	Error No. It is an output parameter. The input parameter must be a variable. The default value is **0**. Currently, the output value is **–1** regardless of the input parameter.
actual_length	INT	INOUT	Yes	Length of a return value. The default value is **1024**.

- DBE_SQL.GET_RESULT_INT

  This function returns the value of the INT type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. The prototype of the **DBE_SQL.GET_RESULT_INT** function is as follows:

```
DBE_SQL.GET_RESULT_INT(
   context_id IN    INT,
   pos        IN    INT
)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-318 DBE_SQL.GET_RESULT_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.GET_RESULT_LONG

  This stored procedure returns the value of a long column type (not LONG or BIGINT) in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT_LONG stored procedure is as follows:

```
DBE_SQL.GET_RESULT_LONG(
   context_id IN    INT,
   pos        IN    INT,
   lgth       IN    INT,
   off_set    IN    INT,
   vl         INOUT TEXT,
   vl_length  INOUT INT
);
```

Table 10-319 DBE_SQL.GET_RESULT_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
lgth	INT	IN	No	Length of a return value
off_set	INT	IN	No	Start position of a return value
vl	TEXT	INOUT	No	Return value
vl_length	INT	INOUT	No	Length of a return value

- DBE_SQL.GET_RESULT_RAW

  This stored procedure returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULT_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULT_RAW(
    context_id     IN     INT,
    pos            IN     INT,
    tr             INOUT BYTEA,
    err            INOUT NUMERIC DEFAULT 0,
    actual_length INOUT INT DEFAULT 1024
);
```

Table 10-320 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.
tr	BYTEA	INOUT	No	Returned column value.
err	NUMERIC	INOUT	No	Error number. It is an output parameter. The input parameter must be a variable. The default value is **0**. Currently, the output value is **–1** regardless of the input parameter.
actual_length	INT	INOUT	No	Length of a return value. The value longer than this length will be truncated. The default value is **1024**.

- DBE_SQL.GET_RESULT_TEXT

  This function returns the value of the TEXT type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  The prototype of the **DBE_SQL.GET_RESULT_TEXT** function is as follows:

```
DBE_SQL.GET_RESULT_TEXT(
   context_id IN INT,
   pos        IN INT
)
RETURN TEXT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-321 DBE_SQL.GET_RESULT_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed.
pos	INT	IN	No	Position of a dynamically defined column in the query.

- DBE_SQL.GET_RESULT_UNKNOWN

  This function returns the value of an unknown type in a specified position of a cursor. It serves as an error handling API when the type is not unknown.

  The prototype of the DBE_SQL.GET_RESULT_UNKNOWN function is as follows:

```
DBE_SQL.GET_RESULT_UNKNOWN(
    context_id IN INT,
    pos        IN INT,
    col_type   IN TEXT
)
RETURN INTEGER;
```

Table 10-322 DBE_SQL.GET_RESULT_UNKNOWN parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query
col_type	TEXT	IN	No	Returned parameter type

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.DBE_SQL_GET_RESULT_CHAR

  This function returns the value of the CHAR type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**. Different from **DBE_SQL.GET_RESULT_CHAR**, the length of the return value is not set and the entire string is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_CHAR** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_CHAR(
   context_id    IN INT,
   pos           IN INT
)
RETURN CHARACTER;
```

  Table 10-323 DBE_SQL.DBE_SQL_GET_RESULT_CHAR parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.DBE_SQL_GET_RESULT_LONG

  This function returns the value of a long column type (not LONG or BIGINT) in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  Different from **DBE_SQL.GET_RESULT_LONG**, the length of the return value is not set and the entire BIGINT value is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_LONG** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_LONG(
   context_id    IN INT,
   pos           IN INT
)
RETURN BIGINT;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-324 DBE_SQL.DBE_SQL_GET_RESULT_LONG parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query

- DBE_SQL.DBE_SQL_GET_RESULT_RAW

  This function returns the value of the RAW type in a specified position of a cursor and accesses the data obtained by **DBE_SQL.NEXT_ROW**.

  Different from **DBE_SQL.GET_RESULT_RAW**, the length of the return value is not set and the entire string is returned.

  The prototype of the **DBE_SQL.DBE_SQL_GET_RESULT_RAW** function is as follows:

```
DBE_SQL.DBE_SQL_GET_RESULT_RAW(
   context_id    IN    INT,
   pos           IN    INT
)
RETURN RAW;
```

Table 10-325 DBE_SQL.GET_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be executed
pos	INT	IN	No	Position of a dynamically defined column in the query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.IS_ACTIVE

  This function returns the status of a cursor. When a cursor is opened, parsed, executed, or defined, the value is **TRUE**. When a cursor is closed, the value is **FALSE**. If the status is unknown, an error is reported. In other cases, the cursor is closed by default.

  The prototype of the **DBE_SQL.IS_ACTIVE** function is as follows:

  ```
  DBE_SQL.IS_ACTIVE(
     context_id    IN    INT
  )
  RETURN BOOLEAN;
  ```

  Table 10-326 DBE_SQL.IS_ACTIVE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried

- DBE_SQL.LAST_ROW_COUNT

  Returns the accumulated count of data rows obtained after the latest NEXT_ROW execution.

  The prototype of the DBE_SQL.LAST_ROW_COUNT function is as follows:

  ```
  DBE_SQL.LAST_ROW_COUNT(
  )
  RETURN INTEGER;
  ```

- DBE_SQL.RUN_AND_NEXT

  Equivalent to calling SQL_RUN and NEXT_ROW in sequence.

  The prototype of the DBE_SQL.RUN_AND_NEXT function is as follows:

  ```
  DBE_SQL.RUN_AND_NEXT(
     context_id IN INT
  )
  RETURNS INTEGER;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-327 DBE_SQL.RUN_AND_NEXT parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor whose query statement is to be parsed

- DBE_SQL.SQL_BIND_VARIABLE

  This function is used to bind a parameter to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound value.

  The prototype of the **DBE_SQL.SQL_BIND_VARIABLE** function is as follows:

```
DBE_SQL.SQL_BIND_VARIABLE(
    context_id     IN int,
    query_string   IN text,
    language_flag  IN anyelement,
    out_value_size IN int default null
)
RETURNS void;
```

Table 10-328 DBE_SQL.SQL_BIND_VARIABLE parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
query_string	TEXT	IN	No	Name of the bound variable

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
language_flag	ANYELEMENT	IN	No	Bound value
out_value_size	INT	IN	Yes	Size of the return value. Default value: **NULL**.

- DBE_SQL.SQL_BIND_ARRAY

  This function is used to bind a set of parameters to an SQL statement. When an SQL statement is executed, the SQL statement is executed based on the bound array.

  The prototype of the **DBE_SQL.SQL_BIND_ARRAY** function is as follows:

```
DBE_SQL.SQL_BIND_ARRAY(
    context_id    IN int,
    query_string IN text,
    value         IN anyarray
)
RETURNS void;
DBE_SQL.SQL_BIND_ARRAY(
    context_id    IN int,
    query_string IN text,
    value         IN anyarray,
    lower_index  IN int,
    higher_index IN int
)
RETURNS void;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-329 DBE_SQL.SQL_BIND_ARRAY parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
query_string	TEXT	IN	No	Name of the bound variable.
value	ANYARRAY	IN	No	Bound array.
lower_index	INT	IN	No	Minimum index of the bound array.
higher_index	INT	IN	No	Maximum index of the bound array.

- DBE_SQL.SET_RESULT_TYPE_INTS

  This function defines columns of the INT array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_INTS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_INTS(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int
)
RETURNS integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-330 DBE_SQL.SET_RESULT_TYPE_INTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.

- DBE_SQL.SET_RESULT_TYPE_TEXTS

  This function defines columns of the TEXT array type returned from a given cursor and can be used only for the cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the DBE_SQL.SET_RESULT_TYPE_TEXTS function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_TEXTS(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int
)
RETURNS VOID;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-331 DBE_SQL.SET_RESULT_TYPE_TEXTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried.
pos	INT	IN	No	Position of a dynamically defined column in the query.
column_ref	ANY ARRAY	IN	No	Type of the returned array.
cnt	INT	IN	No	Number of values obtained at a time.
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	No	Maximum length of the defined TEXT type.

- DBE_SQL.SET_RESULT_TYPE_RAWS

  This function defines columns of the RAW array type returned from a given cursor and can be used only for the cursors defined by SELECT. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the DBE_SQL.SET_RESULT_TYPE_RAWS function is as follows:

```
DBE_SQL.set_result_type_raws(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
    column_size IN int
)
RETURNS integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-332 DBE_SQL.SET_RESULT_TYPE_RAWS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANY ARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_BYTEAS

  This function defines columns of the BYTEA array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_BYTEAS** function is as follows:

```
DBE_SQL.set_result_type_byteas(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
    column_size IN int
)
RETURNS integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-333 DBE_SQL.SET_RESULT_TYPE_BYTEAS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULT_TYPE_CHARS

  This function defines columns of the CHAR array type returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULT_TYPE_CHARS** function is as follows:

```
DBE_SQL.SET_RESULT_TYPE_CHARS(
    context_id  IN int,
    pos         IN int,
    column_ref  IN anyarray,
    cnt         IN int,
    lower_bnd   IN int,
    column_size IN int
)
RETURNS integer;
```

Table 10-334 DBE_SQL.SET_RESULT_TYPE_CHARS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANY ARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
column_size	INT	IN	No	Column length

- DBE_SQL.SET_RESULTS_TYPE

  This function defines columns returned from a given cursor and can be used only for the cursors defined by **SELECT**. The defined columns are identified by the relative positions in the query list. The data type of an input variable determines the corresponding column type.

  The prototype of the **DBE_SQL.SET_RESULTS_TYPE** function is as follows:

```
DBE_SQL.SET_RESULTS_TYPE(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    maxsize    IN int DEFAULT 1024
) returns void;
```

Table 10-335 DBE_SQL.SET_RESULTS_TYPE parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANYARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
maxsize	INT	IN	Yes	Maximum length of the defined type

- DBE_SQL.GET_RESULTS_INT

  This stored procedure returns the value of the INT array type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULTS_INT stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_INT(
    context_id   IN    int,
    pos          IN    int,
    column_value INOUT anyarray
);
```

Table 10-336 DBE_SQL.GET_RESULTS_INT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_TEXT

  This stored procedure returns the value of the TEXT array type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULTS_TEXT stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_TEXT(
    context_id   IN    int,
    pos          IN    int,
    column_value INOUT anyarray
);
```

Table 10-337 DBE_SQL.GET_RESULTS_TEXT parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_RAW

  This stored procedure returns the value of the RAW array type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULTS_RAW stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_RAW(
    context_id   IN    int,
    pos          IN    int,
    column_value INOUT anyarray
);
```

  Table 10-338 DBE_SQL.GET_RESULTS_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_BYTEA

  This stored procedure returns the value of the BYTEA array type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULTS_BYTEA stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_BYTEA(
    context_id   IN    int,
    pos          IN    int,
    column_value INOUT anyarray
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-339 DBE_SQL.GET_RESULTS_BYTEA parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_value	ANYARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS_CHAR

  This stored procedure returns the value of the CHAR array type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  The prototype of the DBE_SQL.GET_RESULTS_CHAR stored procedure is as follows:

```
DBE_SQL.GET_RESULTS_CHAR(
    context_id   IN    int,
    pos          IN    int,
    column_value INOUT anyarray
);
```

Table 10-340 DBE_SQL.GET_RESULTS_CHAR parameters

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_value	ANY ARRAY	INOUT	No	Return value

- DBE_SQL.GET_RESULTS

  This stored procedure returns the value of the array type in a specified position of a cursor and accesses the data obtained by DBE_SQL.NEXT_ROW.

  NOTE

  The bottom-layer mechanism of DBE_SQL.GET_RESULTS is implemented through arrays. When different arrays are used to obtain the return value of the same column, NULL values are filled in the array due to discontinuous internal indexes to ensure the continuity of array indexes. As a result, the length of the returned result array is different from that of Oracle Database.

  The prototype of the DBE_SQL.GET_RESULTS stored procedure is as follows:

```
DBE_SQL.GET_RESULTS(
   context_id   IN    int,
   pos          IN    int,
   column_value INOUT anyarray
);
```

Table 10-341 DBE_SQL.GET_RESULTS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
column_value	ANY ARRAY	INOUT	No	Return value

- DBE_SQL.SQL_DESCRIBE_COLUMNS

  This function is used to describe column information and can be used only for cursors defined by **SELECT**.

  The prototype of the **DBE_SQL.SQL_DESCRIBE_COLUMNS** function is as follows:

```
DBE_SQL.SQL_DESCRIBE_COLUMNS(
    context_id IN    int,
    col_cnt    INOUT int,
    desc_t     INOUT dbe_sql.desc_tab
)RETURNS record;
```

Table 10-342 DBE_SQL.SQL_DESCRIBE_COLUMNS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
col_cnt	INT	INOUT	No	Number of columns returned
desc_t	DBE_SQL.DESC_TAB	INOUT	No	Description of the returned column

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_SQL.DESCRIBE_COLUMNS

  This stored procedure describes column information and can be used only for cursors defined by SELECT. This API is developed for compatibility purposes.

  The prototype of the DBE_SQL.DESCRIBE_COLUMNS stored procedure is as follows:

```
DBE_SQL.DESCRIBE_COLUMNS(
    context_id IN  int,
    col_cnt    OUT int,
    desc_t     OUT dbe_sql.desc_tab
)
```

  Table 10-343 DBE_SQL.DESCRIBE_COLUMNS parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
col_cnt	INT	OUT	No	Number of columns returned
desc_t	DBE_SQL.DESC_TAB	OUT	No	Description of the returned column

- DBE_SQL.BIND_VARIABLE

  This function is used to bind parameters. You are advised to use **DBE_SQL.SQL_BIND_VARIABLE**.

- DBE_SQL.SQL_SET_RESULTS_TYPE_C

  This function is used to dynamically define a column of the array type. You are advised not to use it.

  The prototype of the **DBE_SQL.SQL_SET_RESULTS_TYPE_C** function is as follows:

```
DBE_SQL.sql_set_results_type_c(
    context_id IN int,
    pos        IN int,
    column_ref IN anyarray,
    cnt        IN int,
    lower_bnd  IN int,
    col_type   IN anyelement,
    maxsize    IN int
)return integer;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-344 DBE_SQL.SQL_SET_RESULTS_TYPE_C parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Position of a dynamically defined column in the query
column_ref	ANY ARRAY	IN	No	Type of the returned array
cnt	INT	IN	No	Number of values obtained at a time
lower_bnd	INT	IN	No	Start index when an array is returned.
col_type	ANY ELEMENT	IN	No	Variable type corresponding to the returned array type
maxsize	INT	IN	No	Maximum length of the defined type

- DBE_SQL.SQL_GET_VALUES_C

  This function is used to read a dynamically defined column value. You are advised not to use it.

  The prototype of the **DBE_SQL.SQL_GET_VALUES_C** function is as follows:

```
DBE_SQL.sql_get_values_c(
    context_id   IN    int,
    pos          IN    int,
    results_type INOUT anyarray,
    result_type  IN    anyelement
)return anyarray;
```

Table 10-345 DBE_SQL.SQL_GET_VALUES_C parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	INT	IN	No	Parameter position
results_type	ANYARRAY	INOUT	No	Obtained result
result_type	ANYELEMENT	IN	No	Type of the obtained result

- DBE_SQL.GET_VARIABLE_RESULT

  This stored procedure returns the value of the bound OUT parameter and obtains the OUT parameter in a stored procedure.

  The prototype of the DBE_SQL.GET_VARIABLE_RESULT stored procedure is as follows:

```
DBE_SQL.get_variable_result(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyelement
);
```

pos	VARCHAR2	IN	No	Name of the bound parameter
column_value	ANYELEMENT	INOUT	No	Return value

- DBE_SQL.GET_VARIABLE_RESULT_CHAR

  This function is used to return the value of the bound OUT parameter of the CHAR type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_CHAR** function is as follows:

```
DBE_SQL.get_variable_result_char(
    context_id IN int,
    pos        IN VARCHAR2
)
RETURNS char
```

Table 10-347 DBE_SQL.GET_VARIABLE_RESULT_CHAR parameters

- DBE_SQL.GET_VARIABLE_RESULT_RAW

  This stored procedure returns the value of the bound OUT parameter of the RAW type and obtains the OUT parameter in a stored procedure.

  The prototype of the DBE_SQL.GET_VARIABLE_RESULT_RAW stored procedure is as follows:

```
DBE_SQL.get_variable_result_raw(
    context_id IN    int,
    pos        IN    VARCHAR2,
    value      INOUT anyelement
);
```

  Table 10-348 DBE_SQL.GET_VARIABLE_RESULT_RAW parameters

Parameter	Type	Input/OutputParameter	Can Be Empty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter
value	ANYELEMENT	INOUT	No	Return value

- DBE_SQL.GET_VARIABLE_RESULT_TEXT

  This function is used to return the value of the bound OUT parameter of the TEXT type and obtain the OUT parameter in a stored procedure.

  The prototype of the **DBE_SQL.GET_VARIABLE_RESULT_TEXT** function is as follows:

```
CREATE OR REPLACE FUNCTION DBE_SQL.get_variable_result_text(
    context_id IN int,
    pos        IN VARCHAR2
)
RETURNS text
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/OutputParameter	CanBeEmpty	Description
context_id	INT	IN	No	ID of the cursor to be queried
pos	VARCHAR2	IN	No	Name of the bound parameter

- DBE_SQL.GET_VARIABLE_RESULT_INT

  This stored procedure returns the value of the bound OUT parameter of the INT type and obtains the OUT parameter in a stored procedure.

  The prototype of the DBE_SQL.GET_VARIABLE_RESULT_INT stored procedure is as follows:

```
DBE_SQL.get_variable_result_int(
   context_id IN    int,
   pos        IN    VARCHAR2,
   value      INOUT anyelement
);
```

- DBE_SQL.GET_ARRAY_RESULT_TEXT

  This stored procedure returns the value of the bound OUT parameter of the TEXT array type and obtains the OUT parameter in a stored procedure.

  The prototype of the DBE_SQL.GET_ARRAY_RESULT_TEXT stored procedure is as follows:

```
DBE_SQL.get_array_result_text(
    context_id   IN    int,
    pos          IN    VARCHAR2,
    column_value INOUT anyarray
);

10.12.2.15 DBE_TASK

API Description

Table 10-355 lists all APIs supported by the **DBE_TASK** package.

Table 10-355 DBE_TASK

API	Description
DBE_TASK.SUBMIT	Commits a scheduled job. The job ID is automatically generated by the system.
DBE_TASK.JOB_SUBMIT	Same as DBE_TASK.SUBMIT. However, It provides syntax compatibility parameters.
DBE_TASK.ID_SUBMIT	Commits a scheduled job. The job ID is specified by the user.
DBE_TASK.CANCEL	Removes a scheduled task by job ID.
DBE_TASK.RUN	Executes a scheduled task.
DBE_TASK.FINISH	Disables or enables scheduled task execution.
DBE_TASK.UPDATE	Modifies user-definable attributes of a scheduled task, including the task content, next-execution time, and execution interval.
DBE_TASK.CHANGE	Same as DBE_TASK.UPDATE. However, It provides syntax compatibility parameters.
DBE_TASK.CONTENT	Modifies the content attribute of a scheduled task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_TASK.NEXT_TIME	Modifies the next-execution time attribute of a scheduled task.
DBE_TASK.INTERVAL	Modifies the execution interval attribute of a scheduled task.

NOTE

DBE_TASK scheduling in distributed mode does not ensure high reliability of task execution status information. The execution status of task scheduling can be queried only on the node where the task is committed. The information queried on other nodes may not be synchronized.

GaussDB provides a highly available, reliable, and flexible scheduling system using the DBE_SCHEDULER API (recommended in distributed mode).

- DBE_TASK.SUBMIT

  The stored procedure **SUBMIT** commits a scheduled job provided by the system.

  The function prototype of **DBE_TASK.SUBMIT** is as follows:

```
DBE_TASK.SUBMIT(
what          IN   TEXT,
next_time     IN   TIMESTAMP DEFAULT sysdate,
interval_time IN   TEXT  DEFAULT 'null',
id            OUT  INTEGER
)RETURN INTEGER;
```

  NOTE

  When a scheduled task is created (using **DBE_TASK**), the system binds the current database and the username to the task by default. The function can be called using CALL or SELECT. If the function is called using CALL, you do not need to set the output parameter. If the function is called using SELECT, you need to set the output parameter. To call this function within a stored procedure, use **perform**. If the committed SQL statement task uses a non-public schema, specify the schema to a table schema or a function schema, or add **set current_schema = xxx** before the SQL statement.

  Table 10-356 Parameters for DBE_TASK.SUBMIT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
what	Text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
next_time	Timestamp	IN	No	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
interval_time	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
id	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When SELECT is used for calling, this parameter cannot be added. When CALL is used for calling, this parameter must be added.

NOTICE

When you create a user using the **what** parameter, the plaintext password of the user is recorded in the log. Therefore, you are advised not to do so. Tasks created using this API may not be highly available. You are advised to use **PKG_SERVICE.SUBMIT_ON_N....** to create a task and specify the CCN as the job execution node.

Example:

```
gaussdb=# select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate+1');
 submit
--------
  31031
(1 row)

gaussdb=# select DBE_TASK.SUBMIT('call pro_xxx();', to_date('20180101','yyyymmdd'),'sysdate
+1.0/24');
 submit
--------
    512
(1 row)

gaussdb=# DECLARE
gaussdb-#     jobid int;
gaussdb-# BEGIN
gaussdb$#     PERFORM DBE_TASK.SUBMIT('call pro_xxx();', sysdate, 'interval ''5 minute''', jobid);
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_TASK.JOB_SUBMIT

  The stored procedure **SUBMIT** commits a scheduled job provided by the system. In addition, it provides additional compatibility parameters.

  The **DBE_TASK.JOB_SUBMIT** function prototype is as follows:

```
DBE_TASK.JOB_SUBMIT(
job           OUT  INTEGER,
what           IN   TEXT,
next_date      IN   TIMESTAMP  DEFAULT sysdate,
job_interval   IN   TEXT       DEFAULT 'null',
no_parse       IN   BOOLEAN    DEFAULT false,
instance       IN   INTEGER    DEFAULT 0,
force          IN   BOOLEAN    DEFAULT false
)RETURN INTEGER;
```

  Table 10-357 Parameters for DBE_TASK.JOB_SUBMIT

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	Integer	OUT	No	Specifies the job ID. The value ranges from 1 to 32767. When **dbe.job_submit** is called using SELECT, this parameter can be omitted.
what	Text	IN	No	SQL statement to be executed. One or multiple DDLs (excluding database-related operations), DMLs, anonymous blocks, and statements for calling stored procedures, or all four combined are supported.
next_date	Timestamp	IN	Yes	Specifies the next time the job will be executed. The default value is the current system time (**sysdate**). If the specified time has past, the job is executed at the time it is committed.
job_interval	Text	IN	Yes	Calculates the next time to execute the job. It can be an interval expression, or **sysdate** followed by a numeric value, for example, **sysdate+1.0/24**. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward.
no_parse	Boolean	IN	Yes	The default value is **false**, which is used only for syntax compatibility.
instance	Integer	IN	Yes	The default value is **0**, which is used only for syntax compatibility.
force	Boolean	IN	Yes	The default value is **false**, which is used only for syntax compatibility.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# DECLARE
gaussdb-#     id integer;
gaussdb-# BEGIN
gaussdb$#     id = DBE_TASK.JOB_SUBMIT(
gaussdb$#         what => 'insert into t1 values (1, 2)',
gaussdb$#         job_interval => 'sysdate + 1' --daily
gaussdb$#     );
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.ID_SUBMIT

  ID_SUBMIT has the same syntax function as **SUBMIT**, but the first parameter of **ID_SUBMIT** is an input parameter, that is, a specified job ID. In contrast, that last parameter of **ID_SUBMIT** is an output parameter, indicating the job ID automatically generated by the system.

  ```
  DBE_TASK.ID_SUBMIT(
  id             IN   BIGINT,
  what           IN   TEXT,
  next_time      IN   TIMESTAMP DEFAULT sysdate,
  interval_time IN    TEXT  DEFAULT 'null');
  ```

  Example:

  ```
  gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
   id_submit
  -----------

  (1 row)
  ```

- DBE_TASK.CANCEL

  The stored procedure **CANCEL** deletes a specified task.

  The function prototype of **DBE_TASK.CANCEL** is as follows:

  ```
  CANCEL(id  IN  INTEGER);
  ```

  Table 10-358 Parameters for DBE_TASK.CANCEL

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.

  Example:

  ```
  gaussdb=# CALL dbe_task.cancel(101);
   cancel
  --------

  (1 row)
  ```

- DBE_TASK.RUN

  The stored procedure runs a scheduled task.

  The prototype of the **DBE_TASK.RUN** function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_TASK.RUN(
job         IN   BIGINT,
force       IN   BOOLEAN DEFAULT FALSE);
```

Table 10-359 Parameters for DBE_TASK.RUN

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
job	bigint	IN	No	Specifies the job ID.
force	Boolean	IN	Yes	Used only for syntax compatibility.

Example:

```
gaussdb=# BEGIN
gaussdb$#     DBE_TASK.ID_SUBMIT(12345, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
gaussdb$#     DBE_TASK.RUN(12345);
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.FINISH

  The stored procedure **FINISH** disables or enables a scheduled task.

  The function prototype of **DBE_TASK.FINISH** is as follows:

  ```
  DBE_TASK.FINISH(
  id          IN   INTEGER,
  broken      IN   BOOLEAN,
  next_time   IN   TIMESTAMP  DEFAULT  sysdate);
  ```

  Table 10-360 Parameters for DBE_TASK.FINISH

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
broken	Boolean	IN	No	Specifies the status flag, **true** for broken and **false** for not broken. The current job is updated based on the parameter value **true** or **false**. If the parameter is left empty, the job status remains unchanged.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
next_time	Timestamp	IN	Yes	Specifies the next execution time. The default value is the current system time. If **broken** is set to **true**, **next_time** is updated to **'4000-1-1'**. If **broken** is set to **false** and **next_time** is not empty, **next_time** is updated for the job. If **next_time** is empty, it will not be updated. This parameter can be omitted, and its default value will be used in this case.

Example:

```
gaussdb=# CALL dbe_task.id_submit(101, 'insert_msg_statistic1;', sysdate, 'sysdate+3.0/24');
 id_submit
-----------

(1 row)

gaussdb=# CALL dbe_task.finish(101, true);
 finish
--------

(1 row)

gaussdb=# CALL dbe_task.finish(101, false, sysdate);
 finish
--------

(1 row)
```

- DBE_TASK.UPDATE

  The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The **DBE_TASK.UPDATE** function prototype is as follows:

```
dbe_task.UPDATE(
id              IN     INTEGER,
content         IN     TEXT,
next_time       IN     TIMESTAMP,
interval_time   IN  TEXT);
```

Table 10-361 Parameters for DBE_TASK.UPDATE

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
content	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **content** parameter for the specified job. Otherwise, the system updates the **content** parameter for the specified job.
next_time	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_time** parameter for the specified job.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **interval_time** parameter for the specified job. Otherwise, the system updates the **interval_time** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job state will change to **'d'** afterward.

Example:

```
gaussdb=# CALL dbe_task.update(101, 'call userproc();', sysdate, 'sysdate + 1.0/1440');
 update
--------

(1 row)

gaussdb=# CALL dbe_task.update(101, 'insert into tbl_a values(sysdate);', sysdate, 'sysdate +
1.0/1440');
 update
--------

(1 row)
```

- DBE_TASK.CHANGE

  The stored procedure **UPDATE** modifies user-definable attributes of a task, including the task content, next-execution time, and execution interval.

  The prototype of the **DBE_TASK.CHANGE** function is as follows:

```
DBE_TASK.CHANGE(
job             IN    INTEGER,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
what            IN    TEXT       DEFAULT NULL,
next_date       IN    TIMESTAMP  DEFAULT NULL,
job_interval    IN    TEXT       DEFAULT NULL,
instance        IN    INTEGER    DEFAULT NULL,
force           IN    BOOLEAN    DEFAULT false);
```

Table 10-362 Parameters for DBE_TASK.CHANGE

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
job	Integer	IN	No	Specifies the job ID.
what	Text	IN	Yes	Specifies the name of the stored procedure or SQL statement block that is executed. If this parameter is left empty, the system does not update the **what** parameter for the specified job. Otherwise, the system updates the **what** parameter for the specified job.
next_date	Timestamp	IN	Yes	Specifies the next execution time. If this parameter is left empty, the system does not update the **next_time** parameter for the specified job. Otherwise, the system updates the **next_date** parameter for the specified job.
job_interval	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty, the system does not update the **job_interval** parameter for the specified job. Otherwise, the system updates the **job_interval** parameter for the specified job after necessary validity check. If this parameter is set to **null**, the job will be executed only once, and the job state will change to **'d'** afterward.
instance	Integer	IN	Yes	Used only for syntax compatibility.
force	Boolean	IN	No	Used only for syntax compatibility.

Example:

```
gaussdb=# BEGIN
gaussdb$#     DBE_TASK.CHANGE(
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
gaussdb$#         job => 101,
gaussdb$#         what => 'insert into t2 values (2);'
gaussdb$#     );
gaussdb$# END;
gaussdb$# /
ANONYMOUS BLOCK EXECUTE
```

- DBE_TASK.CONTENT

  The stored procedure **CONTENT** modifies the procedures to be executed by a specified task.

  The function prototype of **DBE_TASK.CONTENT** is as follows:

```
DBE_TASK.CONTENT(
id          IN     INTEGER,
content      IN TEXT);
```

Table 10-363 Parameters for DBE_TASK.CONTENT

Parameter	Type	Input/ Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
content	Text	IN	No	Specifies the name of the stored procedure, SQL statement block, or program block that is executed.

NOTE

- If the value specified by the **content** parameter is one or multiple executable SQL statements, program blocks, or stored procedures, this procedure can be executed successfully; otherwise, it will fail to be executed.
- If the value specified by the **content** parameter is a simple statement such as **INSERT** and **UPDATE**, a schema name must be added in front of the table name.

Example:

```
gaussdb=# CALL dbe_task.content(101, 'call userproc();');
 content
---------

(1 row)

gaussdb=# CALL dbe_task.content(101, 'insert into tbl_a values(sysdate);');
 content
---------

(1 row)
```

- DBE_TASK.NEXT_TIME

  The stored procedure **NEXT_TIME** modifies the next-execution time attribute of a task.

  The function prototype of **DBE_TASK.NEXT_TIME** is as follows:

```
DBE_TASK.NEXT_TIME(
id          IN    BIGINT,
next_time   IN   TEXT);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-364 Parameters for DBE_TASK.NEXT_TIME

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	bigint	IN	No	Specifies the job ID.
next_time	Text	IN	No	Specifies the next execution time.

NOTE

If the specified **next_time** value is earlier than the current date, the job is executed once immediately.

Example:

```
gaussdb=# CALL dbe_task.next_time(101, sysdate);
 next_time
-----------

(1 row)
```

- DBE_TASK.INTERVAL

  The stored procedure **INTERVAL** modifies the execution interval attribute of a task.

  The function prototype of **DBE_TASK.INTERVAL** is as follows:

```
DBE_TASK.INTERVAL(
id              IN      INTEGER,
interval_time      IN   TEXT);
```

Table 10-365 Parameters for DBE_TASK.INTERVAL

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
id	Integer	IN	No	Specifies the job ID.
interval_time	Text	IN	Yes	Specifies the time expression for calculating the next time the job will be executed. If this parameter is left empty or set to **null**, the job will be executed only once, and the job status will change to **'d'** afterward. The job interval must be of a valid time type or interval type.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Example:

```
gaussdb=# CALL dbe_task.interval(101, 'sysdate + 1.0/1440');
 interval
----------

(1 row)

gaussdb=# CALL dbe_task.cancel(101);
 cancel
--------

(1 row)
```

NOTE

For a job that is currently running (that is, **job_status** is **'r'**), it is not allowed to use **cancel**, **update**, **next_time**, **content**, or **interval** to delete or modify job parameters.

Constraints

1. After a job is created by using **SUMMIT/ID_SUBMIT**, the job belongs to the current coordinator (that is, the job is scheduled and executed only on the current coordinator). Other coordinators do not schedule and execute the job. If the coordinator node is faulty, the job cannot be properly executed. You are advised to use the **PKG_SERVICE.SUBMIT_ON_N....** API to specify the job execution node as CCN to ensure that the job is still available when a node is faulty. Not all coordinators can query, modify, and delete tasks created on other CNs.
2. You can create, update, and delete tasks only using the procedures provided by the **dbe_task** package. These procedures synchronize task information between different CNs and associate primary keys between the **pg_job** and **pg_job_proc** catalogs. If you use DML statements to add, delete, or modify records in the **pg_job** catalog, task information will become inconsistent between CNs and system catalogs may fail to be associated, compromising internal task management.
3. Each task created by a user is bound to a CN. If the CN fails while a task is being executed, the task status cannot be updated in real time and will stay at **'r'**. The task status will be updated to **'s'** only after the CN recovers. When a CN fails, all tasks on this CN cannot be scheduled or executed until the CN is restored manually, or deleted and then replaced.
4. For each task, the bound CN updates the real-time task information (including the task status, last execution start time, last execution end time, next execution start time, the number of execution failures [if any]) to the **pg_job** catalog, and synchronizes the information to other CNs, ensuring consistent task information between different CNs. In the case of faults on other CNs, task information synchronization is reattempted by the bound CN, which increases job execution time. Although task information fails to be synchronized between CNs, task information can still be properly updated in pg_job on the bound CN and the task can be executed successfully. After the faulty CN recovers, task information such as task execution time and status in its **pg_job** catalog may be incorrect and will be updated only after the task is executed again on the bound CN.
5. For each job, a thread is established to execute it. If multiple jobs are triggered concurrently as scheduled, the system will need some time to start the required threads, resulting in a latency of 0.1 ms in job execution.

10.12.2.16 DBE_UTILITY

API Description

Table 10-366 provides all APIs supported by the **DBE_UTILITY** package.

Table 10-366 DBE_UTILITY

API	Description
DBE_UTILITY.FORMAT_ERROR_BACKTRACE	Outputs the call stack of an abnormal stored procedure.
DBE_UTILITY.FORMAT_ERROR_STACK	Outputs detailed information about a stored procedure exception.
DBE_UTILITY.FORMAT_CALL_STACK	Outputs the call stack of a stored procedure.
DBE_UTILITY.GET_TIME	Outputs the current time, which is used to obtain the execution duration.
DBE_UTILITY.CANONICALIZE	Canonicalizes the character string of a table name.
DBE_UTILITY.COMMA_TO_TABLE	Converts a comma-delimited string of names into a PL/SQL table of names.
DBE_UTILITY.DB_VERSION	Returns the version number and compatibility version number of the database.
DBE_UTILITY.EXEC_DDL_STATEMENT	Executes DDL statements entered by users.
DBE_UTILITY.EXPAND_SQL_TEXT_PROC	Expands the view of the SQL query.
DBE_UTILITY.GET_CPU_TIME	Returns the measured value of the current CPU processing time.
DBE_UTILITY.GET_ENDIANNESS	Obtains the big-endian and little-endian information of the byte order on the platform where the database is located.
DBE_UTILITY.GET_HASH_VALUE	Returns the hash value of a given string.
DBE_UTILITY.GET_SQL_HASH	Outputs the hash value of a given string. This stored procedure is used when **proc_outparam_override** is not enabled.
DBE_UTILITY.IS_BIT_SET	Checks whether parameter **n** exists in **r**.
DBE_UTILITY.IS_CLUSTER_DATABASE	Determines whether the current database is running in database cluster mode.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_UTILITY.NAME_RESOLVE	Parses the given object name, including synonym translation and necessary authorization checks.
DBE_UTILITY.NAME_TOKENIZE	Parses the name in the **a [. b [. c]][@ dblink]** format.
DBE_UTILITY.OLD_CURRENT_SCHEMA	Returns the name of the database schema in the current user environment.
DBE_UTILITY.OLD_CURRENT_USER	Returns the name of the current user.
DBE_UTILITY.TABLE_TO_COMMA	Converts a PL/SQL table of names into a comma-delimited string of names.
DBE_UTILITY.GET_SQL_HASH_FUNC	Equivalent to DBE_UTILITY.GET_SQL_HASH. This function is used when **proc_outparam_override** is enabled.
DBE_UTILITY.EXPAND_SQL_TEXT	This is an internal function and is not recommended.
DBE_UTILITY.CANONICALIZE_RET	This is an internal function and is not recommended.
DBE_UTILITY.COMMA_TO_TABLE_FUN	This is an internal function and is not recommended.
DBE_UTILITY.COMPILE_SCHEMA	This is an internal function and is deprecated. You are advised not to use this function.
DBE_UTILITY.NAME_SEPARATE	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_LOWER	This is an internal function and is not recommended.
DBE_UTILITY.NAME_TOKENIZE_LOWER_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.PRIVILEGE_CHECK	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_CLASS_WITH_NSPOID_ONAME_TYPE	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_OBJECTS_SYNONYM_FILL_SECHEMA	This is an internal function and is not recommended.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_UTILITY.SEARCH_PROCEDURE_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.SEARCH_SYNONM_WITH_NSPOID_ONAME	This is an internal function and is not recommended.
DBE_UTILITY.TABLE_TO_COMMA_FUNC	This is an internal function and is not recommended.
DBE_UTILITY.USER_NAME	This is an internal function and is not recommended.

- DBE_UTILITY.FORMAT_ERROR_BACKTRACE

  Returns the call stack where an error occurs during execution. The prototype of the DBE_UTILITY.FORMAT_ERROR_BACKTRACE function is as follows:

  ```
  DBE_UTILITY.FORMAT_ERROR_BACKTRACE()
  RETURN TEXT;
  ```

- DBE_UTILITY.FORMAT_ERROR_STACK

  Returns the detailed information about the error location when an error occurs during the execution. The prototype of the DBE_UTILITY.FORMAT_ERROR_STACK function is as follows:

  ```
  DBE_UTILITY.FORMAT_ERROR_STACK()
  RETURN TEXT;
  ```

- DBE_UTILITY.FORMAT_CALL_STACK

  Sets the call stack of the output function. The prototype of the DBE_UTILITY.FORMAT_CALL_STACK function is as follows:

  ```
  DBE_UTILITY.FORMAT_CALL_STACK()
  RETURN TEXT;
  ```

- DBE_UTILITY.GET_TIME

  Sets the output time, which is usually used for difference. A separate return value is meaningless. The prototype of the DBE_UTILITY.GET_TIME function is as follows:

  ```
  DBE_UTILITY.GET_TIME()
  RETURN BIGINT;
  ```

- DBE_UTILITY.CANONICALIZE

  Canonicalizes the character string of a table name. The procedure handles a single reserved word or keyword, and removes white spaces for a single identifier so that "table" becomes TABLE. The prototype of the DBE_UTILITY.CANONICALIZE function is as follows:

  ```
  DBE_UTILITY.CANONICALIZE(
     name       IN   VARCHAR2,
     canon_name OUT  VARCHAR2,
     canon_len  IN   BINARY_INTEGER DEFAULT 1024
  );
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-367 DBE_UTILITY.CANONICALIZE API parameters

Parameter	Type	Input / Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be canonicalized.
canon_name	VARCHAR2	OUT	Yes	Canonicalized character string.
canon_len	BINARY_INTEGER	IN	Yes	Length of the string to be canonicalized. The default value is **1024** (in bytes). If the value of this parameter is less than the actual length (in bytes) of the character string to be standardized, the character string is truncated by byte.

- DBE_UTILITY.COMMA_TO_TABLE

  Converts a comma-delimited string of names into a PL/SQL table of names. The prototype of the DBE_UTILITY.COMMA_TO_TABLE function is as follows:

```
DBE_UTILITY.COMMA_TO_TABLE (
   list   IN  VARCHAR2,
   tablen OUT BINARY_INTEGER,
   tab    OUT VARCHAR2[]
);
```

Table 10-368 DBE_UTILITY.COMMA_TO_TABLE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
list	VARCHAR2	IN	No	A comma-delimited string of names.
tablen	BINARY_INTEGER	OUT	Yes	Number of names in the table.
tab	VARCHAR2	OUT	Yes	Table which contains the string of names.

- DBE_UTILITY.DB_VERSION

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Returns the version number and compatibility version number of the database. The prototype of the DBE_UTILITY.DB_VERSION function is as follows:

```
DBE_UTILITY.DB_VERSION (
   version OUT VARCHAR2
);
```

Table 10-369 DBE_UTILITY.DB_VERSION API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
version	VARCHAR2	OUT	No	Output parameter, which indicates the internal database software version. The value is a character string.

- DBE_UTILITY.EXEC_DDL_STATEMENT

  Executes DDL statements entered by users. The prototype of the DBE_UTILITY.EXEC_DDL_STATEMENT function is as follows:

  ```
  DBE_UTILITY.EXEC_DDL_STATEMENT (
     parse_string IN TEXT
  );
  ```

  Table 10-370 DBE_UTILITY.EXEC_DDL_STATEMENT API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
parse_string	TEXT	IN	Yes	DDL statements to be executed.

- DBE_UTILITY.EXPAND_SQL_TEXT_PROC

  Expands the view of the SQL query. It recursively expands the view objects in the view until a table is displayed. The function prototype of DBE_UTILITY.EXPAND_SQL_TEXT_PROC is as follows:

  ```
  DBE_UTILITY.EXPAND_SQL_TEXT_PROC (
     input_sql_text  IN  CLOB,
     output_sql_text OUT CLOB
  );
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-371 DBE_UTILITY.EXPAND_SQL_TEXT_PROC API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
input_sql_text	CLOB	IN	No	Input SQL text.
output_sql_text	CLOB	OUT	No	Output SQL text of the expanded view.

NOTE

In the **input_sql_text** parameter entered by a user, a schema prefix must be added to the object in the SQL statement. Otherwise, the function reports an error indicating that no object is found. If **behavior_compat_options** is set to **bind_procedure_searchpath**, you do not need to forcibly specify the schema prefix.

- DBE_UTILITY.GET_CPU_TIME

  Returns the measured value of the current CPU processing time, in hundredths of a second. The prototype of the DBE_UTILITY.GET_CPU_TIME function is as follows:

```
DBE_UTILITY.GET_CPU_TIME()
RETURN BIGINT;
```

- DBE_UTILITY.GET_ENDIANNESS

  Obtains the big-endian and little-endian information of the byte order on the platform where the database is located. DBE_UTILITY. The prototype of the GET_ENDIANNESS function is as follows:

```
DBE_UTILITY.GET_ENDIANNESS
RETURN INTEGER;
```

- DBE_UTILITY.GET_HASH_VALUE

  Returns the hash value of a given string. The prototype of the DBE_UTILITY.GET_HASH_VALUE function is as follows:

```
DBE_UTILITY.GET_HASH_VALUE(
   name      IN VARCHAR2(n),
   base      IN INTEGER,
   hash_size IN INTEGER)
RETURN INTEGER;
```

Table 10-372 DBE_UTILITY.GET_HASH_VALUE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
base	INTEGER	IN	No	Start value of the returned hash value.
hash_size	INTEGER	IN	No	Size of the hash table to which the hash is mapped.

- DBE_UTILITY.GET_SQL_HASH

  Outputs the hash value of a given character string using the MD5 algorithm. The prototype of the DBE_UTILITY.GET_SQL_HASH function is as follows:

```
DBE_UTILITY.GET_SQL_HASH(
   name       IN  VARCHAR2,
   hash       OUT RAW,
   last4bytes OUT BIGINT
)RETURN BIGINT;
```

Table 10-373 DBE_UTILITY.GET_SQL_HASH API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

NOTE

After setting **behavior_compat_options** to a value other than **proc_outparam_override**, call the DBE_UTILITY.GET_SQL_HASH function. If DBE_UTILITY.GET_SQL_HASH_FUNC is called, the value assignment fails. (Contact an administrator for parameter setting.)

- DBE_UTILITY.IS_BIT_SET

  Checks whether parameter **n** exists in **r**. DBE_UTILITY. The prototype of the IS_BIT_SET function is as follows:

```
DBE_UTILITY.IS_BIT_SET (
   r IN RAW,
   n IN INTEGER)
RETURN INTEGER;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-374 DBE_UTILITY.IS_BIT_SET API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
r	RAW	IN	No	4 bytes plus the actual hexadecimal string.
n	INTEGER	IN	No	Determines whether the value exists in the binary system.

- DBE_UTILITY.IS_CLUSTER_DATABASE

  Determines whether the current database is running in database cluster mode. The prototype of the DBE_UTILITY.IS_CLUSTER_DATABASE function is as follows:

  ```
  DBE_UTILITY.IS_CLUSTER_DATABASE
  RETURN BOOLEAN;
  ```

- DBE_UTILITY.NAME_RESOLVE

  Parses the given object name, including synonym translation and necessary authorization checks. The prototype of the DBE_UTILITY.NAME_RESOLVE function is as follows:

  ```
  DBE_UTILITY.NAME_RESOLVE (
     name          IN   VARCHAR2,
     context       IN   INTEGER,
     schema          OUT VARCHAR2,
     part1         OUT VARCHAR2,
     part2         OUT VARCHAR2,
     dblink        OUT VARCHAR2,
     part1_type    OUT INTEGER,
     object_number OUT OID
  );
  ```

Table 10-375 DBE_UTILITY.NAME_RESOLVE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Name of the object to be parsed. The structure is [[a.]b.]c[@d].
context	INTEGER	IN	No	Start value of the returned hash value.
schema	VARCHAR2	OUT	No	Schema of an object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
part1	VARCHAR2	OUT	No	First part of the name. The type of this column is specified by **part1_type**.
part2	VARCHAR2	OUT	Yes	If this column is not empty, the value is the subprogram name.
dblink	VARCHAR2	OUT	Yes	Database link.
part1_type	INTEGER	OUT	No	Part 1 types: ● **5**: synonym ● **7**: procedure (top level) ● **8**: function (top level) ● **9**: package
object_number	OID	OUT	No	Object ID. In database ORA, **object_number** is of the numeric type, indicating the object ID. In GaussDB, **object_number** is of the OID type and does not support implicit conversion from a number to an OID.

- DBE_UTILITY.NAME_TOKENIZE

  Parses names in the **a [. b [. c]][@ dblink]** format. If a name contains double quotation marks, the double quotation marks are deleted. Otherwise, the name becomes uppercase letters. The prototype of the DBE_UTILITY.NAME_TOKENIZE function is as follows:

```
DBE_UTILITY.NAME_TOKENIZE (
name    IN  VARCHAR2,
a       OUT VARCHAR2,
b       OUT VARCHAR2,
c       OUT VARCHAR2,
dblink  OUT VARCHAR2,
nextpos OUT INTEGER
);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-376 DBE_UTILITY.NAME_TOKENIZE API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Name, consisting of SQL identifiers (for example, **scott.foo@dblink**).
a	VARCHAR2	OUT	No	First token of the name.
b	VARCHAR2	OUT	Yes	Second token of the name.
c	VARCHAR2	OUT	Yes	Third token of the name.
dblink	VARCHAR2	OUT	Yes	Database link.
nextpos	INTEGER	OUT	No	Next position of a parsed character string.

- DBE_UTILITY.OLD_CURRENT_SCHEMA

  Returns the name of the database schema in the current user environment. The prototype of the DBE_UTILITY.OLD_CURRENT_SCHEMA function is as follows:

  ```
  DBE_UTILITY.OLD_CURRENT_SCHEMA()
  RETURN VARCHAR;
  ```

- DBE_UTILITY.OLD_CURRENT_USER

  Returns the name of the current user. The prototype of the DBE_UTILITY.OLD_CURRENT_USER function is as follows:

  ```
  DBE_UTILITY.OLD_CURRENT_USER()
  RETURN TEXT;
  ```

- DBE_UTILITY.TABLE_TO_COMMA

  Converts a PL/SQL table of names into a comma-delimited string of names. The prototype of the DBE_UTILITY.TABLE_TO_COMMA function is as follows:

  ```
  DBE_UTILITY.TABLE_TO_COMMA (
     tab    IN  VARCHAR2[],
     tablen OUT BINARY_INTEGER,
     list   OUT VARCHAR2
  );
  ```

Table 10-377 DBE_UTILITY.TABLE_TO_COMMA API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
tab	VARCHAR2[]	IN	No	Structure table array that contains table names.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
tablen	BINARY_INTEGER	OUT	No	Number of tables in a structure table.
list	VARCHAR2	OUT	No	A comma-delimited string of names.

- DBE_UTILITY.GET_SQL_HASH_FUNC

  Uses the MD5 algorithm to output the hash value of a given character string. The prototype of the DBE_UTILITY.GET_SQL_HASH_FUNC function is:

```
DBE_UTILITY.GET_SQL_HASH_FUNC(
   name       IN  VARCHAR2,
   hash       OUT RAW,
   last4bytes OUT BIGINT
);
```

  Table 10-378 DBE_UTILITY.GET_SQL_HASH_FUNC API parameters

Parameter	Type	Input/Output Parameter	Can Be Empty	Description
name	VARCHAR2	IN	No	Character string to be hashed.
hash	RAW	OUT	No	Complete hexadecimal MD5 hash value.
last4bytes	BIGINT	OUT	No	Last four bytes of the MD5 hash value, which is displayed as an unsigned integer.

  NOTE

  After setting **behavior_compat_options** to **'proc_outparam_override'**, call the DBE_UTILITY.GET_SQL_HASH_FUNC function. If you call the DBE_UTILITY.GET_SQL_HASH function, a parameter mismatch error is reported.

Examples

```
-- Example 1
create or replace procedure print_err() as
DECLARE

10.12.2.17 DBE_XMLDOM

API Description

The advanced function package DBE_XMLDOM is used to access XMLType objects and implement Document Object Model (DOM), which is an API used to access HTML and XML documents. For details about all types supported by the advanced function package DBE_XMLDOM, see **Table 10-379**. For details about all APIs supported by DBE_XMLDOM, see **Table 10-380**.

NOTE

When the DBE_XMLDOM advanced package is used in the database whose character set is set to **SQL_ASCII**, an error is reported if characters beyond the ASCII range are input.

Table 10-379 DBE_XMLDOM data types

Type	Description
DOMATTR	Implements the DOMAttribute API.
DOMDOCUMENT	Implements the DOMDocument API.
DOMELEMENT	Implements the DOMElement API.
DOMNAMEDNODEMAP	Implements the DOMNamedNodeMap API.
DOMNODELIST	Implements the DOMNodeList API.
DOMNODE	Implements the DOMNode API.
DOMTEXT	Implements the DOMText API.

Table 10-380 DBE_XMLDOM parameters

API	Description
DBE_XMLDOM.APPENDCHILD	Adds the newchild node to the end of the parent(n) node and returns the newly added node.
DBE_XMLDOM.CREATEELEMENT	Creates a DOMElement object with the specified name.
DBE_XMLDOM.CREATETEXTNODE	Creates a DOMText node.
DBE_XMLDOM.FREEDOCUMENT	Frees resources related to DOMDocument nodes.
DBE_XMLDOM.FREEELEMENT	Frees resources related to DOMElement nodes.
DBE_XMLDOM.FREENODE	Frees resources related to DOMNode nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XMLDOM.FREENODELIST	Frees resources related to DOMNodeList nodes.
DBE_XMLDOM.GETATTRIBUTE	Returns the attribute values of a DOMElement object by name.
DBE_XMLDOM.GETATTRIBUTES	Returns the attribute values of a DOMNode node as a map.
DBE_XMLDOM.GETCHILDNODES	Converts several subnodes under a node into a node list.
DBE_XMLDOM.GETCHILDRENBYTAGNAME	Returns the subnodes of a DOMElement node by name.
DBE_XMLDOM.GETDOCUMENTELEMENT	Returns the first subnode of the specified document.
DBE_XMLDOM.GETFIRSTCHILD	Returns the first subnode.
DBE_XMLDOM.GETLASTCHILD	Returns the last subnode.
DBE_XMLDOM.GETLENGTH	Obtains the number of subnodes under a specified node.
DBE_XMLDOM.GETLOCALNAME	Returns the local name of a node.
DBE_XMLDOM.GETNAMEDITEM	Returns the node specified by name.
DBE_XMLDOM.GETNEXTSIBLING	Returns the next node of the specified node.
DBE_XMLDOM.GETNODENAME	Returns the name of a node.
DBE_XMLDOM.GETNODETYPE	Returns the type of a node.
DBE_XMLDOM.GETNODEVALUE	Obtains the value of a node, depending on its type.
DBE_XMLDOM.GETPARENTNODE	Returns the parent node of a node.
DBE_XMLDOM.GETTAGNAME	Returns the tag name of the specified DOMElement node.
DBE_XMLDOM.HASCHILDNODES	Checks whether the DOMNode object has any subnode.
DBE_XMLDOM.IMPORTNODE	Copies a node and specifies the document to which the node belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
DBE_XMLDOM.ISNULL	Checks whether a node is null.
DBE_XMLDOM.ITEM	Returns the item corresponding to the index parameter in the mapping.
DBE_XMLDOM.MAKEELEMENT	Converts a DOMNode object to the DOMElement type.
DBE_XMLDOM.MAKENODE	Forcibly converts a node to the DOMNode type.
DBE_XMLDOM.NEWDOMDOCUMENT	Returns a new DOMDocument object.
DBE_XMLDOM.SETATTRIBUTE	Sets the value of the DOMElement attribute by name.
DBE_XMLDOM.SETCHARSET	Sets the character set for a DOMDocument object.
DBE_XMLDOM.SETDOCTYPE	Sets the external DTD of a DOMDocument object.
DBE_XMLDOM.SETNODEVALUE	Sets the value of a node in the DOMNode object.
DBE_XMLDOM.WRITETOBUFFER	Writes an XML node to a specified buffer.
DBE_XMLDOM.WRITETOCLOB	Writes an XML node to a specified CLOB.
DBE_XMLDOM.WRITETOFILE	Writes an XML node to a specified file.
DBE_XMLDOM.GETSESSIONTREENUM	Displays the number of DOM trees of all types in the current session.
DBE_XMLDOM.GETDOCTREESINFO	Displays statistics such as the memory usage and number of nodes of the DOM tree of the document type.
DBE_XMLDOM.GETDETAILDOCTREEINFO	Displays the number of nodes of each type for a specific document variable.
DBE_XMLDOM.GETELEMENTSB....	Returns the list of DOMNodeList nodes that matches TAGNAME.

- DBE_XMLDOM.APPENDCHILD

  Adds the newchild node to the end of the parent(n) node and returns the newly added node. The prototype of the DBE_XMLDOM.APPENDCHILD function is as follows:

```
DBE_XMLDOM.APPENDCHILD(
  n IN DOMNode,
  newchild IN DOMNode)
RETURN DOMNODE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-381 DBE_XMLDOM.APPENDCHILD parameters

Parameter	Description
n	Node to be added
newchild	New node added

NOTE

1. The error message "operation not support" is displayed for the APPEND ATTR node under the DOCUMENT node. Database ORA does not report an error in this scenario, but the mounting fails.
2. The error message "operation not support" is displayed for the APPEND ATTR node under the ATTR node. Database ORA does not report an error in this scenario, but the mounting fails.
3. When multiple child nodes of the ATTR type are added to a parent node, the child nodes with the same key value cannot exist under the same parent node.

Example:

```
-- Add a DOMNode node to a specified DOC tree and use DBE_XMLDOM.HASCHILDNODES() to
check whether the subnode is successfully added.
DECLARE
   doc DBE_XMLDOM.DOMDocument;
   doc1 DBE_XMLDOM.DOMDocument;
   root DBE_XMLDOM.DOMElement;
   rootnode DBE_XMLDOM.DOMNode;
   child1 DBE_XMLDOM.DOMElement;
   child2 DBE_XMLDOM.DOMElement;
   attr DBE_XMLDOM.DOMAttr;
   text DBE_XMLDOM.DOMTEXT;
   node DBE_XMLDOM.DOMNode;
   child1_node DBE_XMLDOM.DOMNode;
   attr_node DBE_XMLDOM.DOMNode;
   parent DBE_XMLDOM.DOMNode;
   buf varchar2(1000);
BEGIN
   doc := DBE_XMLDOM.newDOMDocument();
   root := DBE_XMLDOM.createElement(doc, 'root');
   rootnode := DBE_xmldom.makeNode(root);
   node := DBE_XMLDOM.appendChild(DBE_xmldom.makeNode(doc), rootnode);
   child1 := DBE_XMLDOM.createElement(doc, 'child1');
   child1_node := DBE_XMLDOM.makeNode(child1);
   node := DBE_XMLDOM.appendChild(rootnode, child1_node);
   attr := DBE_XMLDOM.createAttribute(doc, 'abc');
   attr_node := DBE_XMLDOM.makeNode(attr);
   node := DBE_XMLDOM.appendChild(child1_node, attr_node);
   IF DBE_XMLDOM.HASCHILDNODES(child1_node) THEN
      DBE_OUTPUT.print_line('HAS CHILD NODES');
   ELSE
      DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
   END IF;
   parent := DBE_XMLDOM.GETPARENTNODE(attr_node);
   buf := DBE_XMLDOM.GETNODENAME(parent);
   DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
NOT HAS CHILD NODES
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.CREATEELEMENT

  Returns the DOMElement object with the specified name. The prototype of the DBE_XMLDOM.CREATEELEMENT function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XMLDOM.CREATEELEMENT(
  doc       IN      DOMDOCUMENT,
  tagName   IN      VARCHAR2)
 RETURN DOMELEMENT;
```

Returns the DOMElement object with the specified name and namespace. The prototype of the DBE_XMLDOM.CREATEELEMENT function is as follows:

```
DBE_XMLDOM.CREATEELEMENT(
  doc       IN     DOMDOCUMENT,
  tagName   IN     VARCHAR2,
  ns        IN     VARCHAR2)
 RETURN DOMELEMENT;
```

Table 10-382 DBE_XMLDOM.CREATEELEMENT parameters

Parameter	Description
doc	Specified DOMDocument object
tagName	Name of the new DOMElement object
ns	Namespace

NOTE

1. When the **tagName** parameter is set to null or an empty character string, the exception "NULL or invalid TagName argument specified" is thrown.
2. The default maximum length of **tagName** and **ns** is 32767. If the length exceeds 32767, an exception is thrown.

Example:

```
-- 1. Create a DOMElement object with the specified name.
DECLARE
  doc dbe_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMATTR;
  buf varchar2(1010);
BEGIN
   doc := dbe_xmldom.newdomdocument('<?xml version="1.0" encoding="UTF-8"?>
      <computer size="ITX"><cpu>Ryzen 9 3950X</cpu>

      <ssd>1TB NVMe Toshiba + 2TB NVMe WD Black</ssd>
      <hdd>12TB WD Digital</hdd>
      <psu>CORSAIR SF750</psu>
      <case>LIANLI TU150</case>
      </computer>');
   elem := dbe_xmldom.createelement(doc,'elem');
   DBE_XMLDOM.WRITETOBUFFER(dbe_xmldom.makenode(elem), buf);
   DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE

-- 2. Create a DOMElement object with the specified name and namespace.
DECLARE
  doc dbe_xmldom.domdocument;
  attr DBE_XMLDOM.DOMATTR;
  elem DBE_XMLDOM.DOMELEMENT;
  ans DBE_XMLDOM.DOMNODE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  buf varchar2(1010);
  list DBE_XMLDOM.DOMNODELIST;
  node DBE_XMLDOM.DOMNODE;
BEGIN
   doc := dbe_xmldom.newdomdocument('<h:data xmlns:h="http://www.w3.org/TR/html4/">
       <h:da1 len="10">test namespace</h:da1><h:da1>bbbbbbbbbb</h:da1></h:data>');
   elem := dbe_xmldom.createelement(doc,'elem','http://www.w3.org/TR/html5/');
   ans := DBE_XMLDOM.APPENDCHILD(dbe_xmldom.makenode(doc), dbe_xmldom.makenode(elem));
   DBE_XMLDOM.WRITETOBUFFER(doc, buf);
   DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
<?xml version="1.0" encoding="UTF-8"?>

</h:data>
<elem xmlns="http://www.w3.org/TR/html5/"/>

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.CREATETEXTNODE

  Creates and returns a DOMText object. The prototype of the DBE_XMLDOM.CREATETEXTNOD function is as follows:

```
DBE_XMLDOM.CREATETEXTNODE(
  doc IN DOMDocument,
  data IN VARCHAR2)
RETURN DOMTEXT;
```

Table 10-383 DBE_XMLDOM.CREATETEXTNODE parameters

Parameter	Description
doc	Specified DOMDocument object
data	Content of the DOMText node

NOTE

1. You can enter an empty string or null value for **data**.
2. The default maximum length of **data** is 32767. If the length exceeds 32767, an exception is thrown.

Example:

```
-- Add a DOMText node to the DOC tree and print the DOC tree to the buffer.
DECLARE
  doc DBE_XMLDOM.DOMDOCUMENT;
  doctext DBE_XMLDOM.DOMTEXT;
  node DBE_XMLDOM.DOMNODE;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>
       <from>Jani</from>

END;
/
-- Expected result:
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.FREEELEMENT

  Frees a DOMElement node. The prototype of the DBE_XMLDOM.FREEELEMENT function is as follows:

```
DBE_XMLDOM.FREEELEMENT(
  elem     IN     DOMELEMENT);
```

Table 10-385 DBE_XMLDOM.FREEELEMENT parameters

Parameter	Description
elem	Specified DOMElement node

Example:

```
-- Obtain a DOMElement node from the DOC tree and free the node. Check whether the node is
empty before and after the node is freed.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  node dbe_xmldom.domnode;
  node1 dbe_xmldom.domnode;
  nodelist DBE_XMLDOM.DOMNODELIST;
  len INTEGER;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
     <!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)>
     <!ELEMENT heading (#PCDATA)>
     <!ELEMENT body (#PCDATA)>]>
     <note>
       <to>Chinese</to>

```

- DBE_XMLDOM.FREENODE

  Frees a DOMNode node. The prototype of the DBE_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.FREENODE(
  n IN DOMNODE);
```

Table 10-386 DBE_XMLDOM.FREENODE parameters

Parameter	Description
n	Specified DOMNode node

NOTE

1. After GaussDB performs the FREENODE operation, the freed node is not available again. After the database ORA performs the FREENODE operation, the freed node is available again and becomes another node.
2. When other APIs call the freed DOMNode node, the calling is different from that in database ORA.

Example:

```
-- Obtain a DOMNode node from the DOC tree and free the node. Check whether the node is empty before and after the node is freed.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DECLARE
  doc dbe_xmldom.domdocument;
  node dbe_xmldom.domnode;

```

- DBE_XMLDOM.FREENODELIST

  Frees a DOMNodeList node. The prototype of the DBE_XMLDOM.FREENODE function is as follows:

```
DBE_XMLDOM.GETLENGTH(
  nl     IN    DOMNODELIST);
```

Table 10-387 DBE_XMLDOM.FREENODELIST parameters

Parameter	Description
nl	Specified DOMNodeList node

NOTE

1. A DOMNodeList node will be completed freed by FREENODELIST.
2. When other APIs call the freed DOMNodelist node, the calling is different from that in database ORA.
3. The input parameter **freenodelist** cannot be empty.

Example:

```
-- Obtain a DOMNodeList node from the DOC tree and free the node. Check the node length before and after the node is freed.
DECLARE
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
  doc dbe_xmldom.domdocument;

- DBE_XMLDOM.GETATTRIBUTE

  Returns the attribute values of a DOMElement object by name. The prototype of the DBE_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
  elem       IN      DOMELEMENT,
  name       IN      VARCHAR2)
RETURN VARCHAR2;
```

  Returns the attribute values of a DOMElement object by name and namespace URI. The prototype of the DBE_XMLDOM.GETATTRIBUTE function is as follows:

```
DBE_XMLDOM.GETATTRIBUTE(
  elem      IN     DOMELEMENT,
  name      IN     VARCHAR2,
  ns        IN     VARCHAR2)
RETURN VARCHAR2;
```

Table 10-388 DBE_XMLDOM.GETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMElement node
name	Attribute name
ns	Namespace

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

1. The **ns** parameter of the DBE_XMLDOM.GETATTRIBUTE API does not support the asterisk (*) parameter.
2. GaussDB does not support the namespace prefix as an attribute, and the value of the prefix cannot be queried through the DBE_XMLDOM.GETATTRIBUTE API.

Example:

```
-- 1. Return the attribute values of a DOMElement object by name.
DECLARE

- DBE_XMLDOM.GETLOCALNAME

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Returns the local name of the given DOMAttr node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
  a       IN     DOMATTR)
RETURN VARCHAR2;
```

Returns the local name of the given DOMElement node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
  elem       IN     DOMELEMENT)
RETURN VARCHAR2;
```

Returns the local name of the given DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

```
DBE_XMLDOM.GETLOCALNAME(
  n      IN     DOMNODE,
  data   OUT    VARCHAR2);
```

Table 10-396 DBE_XMLDOM.GETLOCALNAME parameters

Parameter	Description
a	Specified DOMAttr node
elem	Specified DOMElement node
n	Specified DOMNode node
data	Returned local name

Example:

```
-- 1. Use the createAttribute function to generate an attr node to obtain the local name.
DECLARE

- DBE_XMLDOM.GETNAMEDITEM

  Returns the node specified by name. The prototype of the DBE_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2)
RETURN DOMNODE;
```

  Returns the node specified by name and namespace. The prototype of the DBE_XMLDOM.GETNAMEDITEM function is as follows:

```
DBE_XMLDOM.GETNAMEDITEM(
  nnm IN DOMNAMEDNODEMAP,
  name IN VARCHAR2,
  ns IN VARCHAR2)
RETURN DOMNODE;
```

Table 10-397 DBE_XMLDOM.GETNAMEDITEM parameters

Parameter	Description
nnm	Specified DOMNamedNodeMap object
name	Name of the element to be retrieved.
ns	Namespace

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

1. The values of **name** and **nnm** can be null, but they are required arguments.
2. The default maximum length of **name** and **ns** is 32767. If the length exceeds 32767, an error is reported.
3. The values of **name** and **ns** can be of the int type and contain more than 127 bits.

Example:

```
-- 1. Return the node specified by name.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMElement;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;

  ELSE
    DBE_OUTPUT.print_line('NOT HAS CHILD NODES ');
  END IF;
END;
/
-- Expected result:
HAS CHILD NODES
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.IMPORTNODE

  Copies a node to another node and mounts the copied node to a specified document. If the type of the copied node does not belong to the 12 types specified by constants of XML DOM, an exception indicating that the type is not supported is thrown. The prototype of the DBE_XMLDOM.IMPORTNODE function is as follows:

```
DBE_XMLDOM.IMPORTNODE(
  doc IN DOMDOCUMENT,
  importedNode IN DOMNODE,
  deep IN BOOLEAN)
RETURN DOMNODE;
```

Table 10-405 DBE_XMLDOM.IMPORTNODE parameters

Parameter	Description
doc	Document to which the node is mounted
importedNode	Node to be imported

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
deep	Specifies whether to perform recursive import. • If the value is **TRUE**, the node and all its subnodes are imported. • If the value is **FALSE**, the node itself is imported.

Example:

```
-- Obtain the root2_node node in the DOC2 tree, copy it, and mount it to the DOC tree.
DECLARE
    doc dbe_xmldom.domdocument;
    doc2 dbe_xmldom.domdocument;
    doc_node dbe_xmldom.domnode;
    doc2_node dbe_xmldom.domnode;
     root_node dbe_xmldom.domnode;
    root2_node dbe_xmldom.domnode;
    import_node dbe_xmldom.domnode;
    result_node dbe_xmldom.domnode;
    buffer varchar2(1010);
BEGIN
    doc := dbe_xmldom.newdomdocument('<bookstore category="web" cover="paperback">

- DBE_XMLDOM.ISNULL

  Checks whether the given DOMAttr node is null. If it is null, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  a      IN     DOMATTR)
RETURN BOOLEAN;
```

  Checks whether the given DOMDocument node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  doc      IN     DOMDOCUMENT)
RETURN BOOLEAN;
```

  Checks whether the given DOMElement node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  elem     IN     DOMELEMENT)
RETURN BOOLEAN;
```

  Checks whether the given DOMNamedNodeMap node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  nnm      IN     DOMNAMEDNODEMAP)
RETURN BOOLEAN;
```

  Checks whether the given DOMNode node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  n      IN     DOMNODE)
RETURN BOOLEAN;
```

  Checks whether the given DOMNodeList node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  nl       IN     DOMNODELIST)
RETURN BOOLEAN;
```

  Checks whether the given DOMText node is null. If yes, **TRUE** is returned. Otherwise, **FALSE** is returned. The prototype of the DBE_XMLDOM.ISNULL function is as follows:

```
DBE_XMLDOM.ISNULL(
  t      IN     DOMTEXT)
RETURN BOOLEAN;
```

Table 10-406 DBE_XMLDOM.ISNULL parameters

doc	Specified DOMDocument node
elem	Specified DOMElement node
nnm	Specified DOMNamedNodeMap node

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
n	Specified DOMNode node
nl	Specified DOMNodeList node
t	Specified DOMText node

NOTE

Due to the implementation difference of DBE_XMLDOM.FREEDOCUMENT, an error is reported when the DBE_XMLDOM.ISNULL API calls the freed DOMDocument node.

Example:

```
-- 1. Use createAttribute to create a DOMAttr node and check whether the node is empty.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  attr DBE_XMLDOM.DOMATTR;
  buf VARCHAR2(1000);
BEGIN
  doc := DBE_xmldom.newdomdocument('<?xml version="1.0"?>
    <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)>
    <!ATTLIST note color CDATA #REQUIRED>
    <!ELEMENT to (#PCDATA)>
    <!ELEMENT from (#PCDATA)>
    <!ELEMENT heading (#PCDATA)>
    <!ELEMENT body (#PCDATA)>]>
    <note color="red"><to>Chinese</to>
    <from>Jani</from>
    <heading>Reminder</heading>
    <body>Don''t forget me this weekend!</body>
    </note>');
  attr := DBE_XMLDOM.CREATEATTRIBUTE (doc, 'length');
  if DBE_XMLDOM.ISNULL(attr) then
    DBE_OUTPUT.print_line('null');
  else
    DBE_OUTPUT.print_line('not null');
  end if;
END;
/
-- Expected result:
not null
ANONYMOUS BLOCK EXECUTE

-- 2. Declare (but not initialize) a DOMElement node and check whether the node is empty.
DECLARE
  docelem   DBE_XMLDOM.DOMElement;
BEGIN
  if DBE_XMLDOM.ISNULL(docelem) then
    DBE_OUTPUT.print_line('null');
  else
    DBE_OUTPUT.print_line('not null');
  end if;
END;
/
-- Expected result:
null
ANONYMOUS BLOCK EXECUTE

-- 3. Use newDomdocument to construct a good DOMDocument node and check whether the node is
empty.
Declare
 doc dbe_xmldom.domdocument;

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.ITEM

  Returns the element corresponding to the index in a list based on the index. The prototype of the DBE_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nl IN DOMNODELIST,
  index IN NUMBER)
RETURN DOMNODE;
```

  Returns the element corresponding to the index in a map based on the index. The prototype of the DBE_XMLDOM.ITEM function is as follows:

```
DBE_XMLDOM.ITEM(
  nnm IN DOMNAMEDNODEMAP,
  index IN NUMBER)
RETURN DOMNODE;
```

Table 10-407 DBE_XMLDOM.ITEM parameters

Parameter	Description
nl	Specified DOMNodeList object
nnm	Specified DOMNamedNodeMap object
index	Index of the element to be retrieved

NOTE

For improper input parameters such as Boolean and CLOB, the item function of the map type points to the value of the first index by default.

Example:

```
-- 1. Return the element corresponding to the index in a map based on the index.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  elem DBE_XMLDOM.DOMElement;
  map DBE_XMLDOM.DOMNAMEDNODEMAP;
  node DBE_XMLDOM.DOMNODE;
  node2 DBE_XMLDOM.DOMNODE;
  buf varchar2(1000);

  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
aaa
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.MAKENODE

  Forcibly converts a specified DOMAttr node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    a        IN     DOMATTR)
   RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMDocument node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    doc      IN     DOMDOCUMENT)
   RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMElement node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    elem       IN     DOMELEMENT)
   RETURN DOMNODE;
  ```

  Forcibly converts a specified DOMText node to a DOMNode node and returns the DOMNode node. The prototype of the DBE_XMLDOM.MAKENODE function is as follows:

  ```
  DBE_XMLDOM.MAKENODE(
    t       IN     DOMTEXT)
   RETURN DOMNODE;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-409 DBE_XMLDOM.MAKENODE parameters

Parameter	Description
a	Specified DOMAttr node
doc	Specified DOMDocument node
elem	Specified DOMElement node
t	Specified DOMText node

NOTE

Due to syntax restrictions, when DBE_XMLDOM.MAKENODE is used as the return value of a function, it cannot be directly implemented by running the following command:

```
return DBE_XMLDOM.MAKENODE(doc);
```

You are advised to run the following command:

```
tmp_node := DBE_XMLDOM.MAKENODE(doc );
return tmp_node;
```

Example:

```
-- 1. Use createattr to generate ATTR and convert it to a node.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  attr DBE_XMLDOM.DOMATTR;
  dom_node DBE_XMLDOM.DOMNode;
  buf VARCHAR2(1000);
BEGIN
  doc := DBE_xmldom.newdomdocument('<?xml version="1.0"?>

- DBE_XMLDOM.NEWDOMDOCUMENT

  Returns a new DOMDocument object. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XMLDOM.NEWDOMDOCUMENT
RETURN DOMDOCUMENT;
```

Returns a new DOMDocument instance object created from the specified XMLType type. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

```
DBE_XMLDOM.NEWDOMDOCUMENT(
  xmldoc    IN SYS.XMLTYPE)
RETURN DOMDOCUMENT;
```

Returns a new DOMDocument instance object created from the specified CLOB type. The prototype of the DBE_XMLDOM.NEWDOMDOCUMENT function is as follows:

```
DBE_XMLDOM.NEWDOMDOCUMENT(
  cl       IN    CLOB)
RETURN DOMDOCUMENT;
```

Table 10-410 DBE_XMLDOM.NEWDOMDOCUMENT parameters

Parameter	Description
xmldoc	Specified XMLType type
cl	Specified CLOB type

NOTE

- The size of the input parameter must be less than 1 GB.
- Currently, external DTD parsing is not supported.
- The document created by NEWDOMDOCUMENT uses the UTF-8 character set by default.
- Each document parsed from the same XMLType instance is independent, and the modification of the document does not affect the XMLType.
- For details about the differences between our database and database ORA, see **DBE_XMLPARSER.PARSECLOB**.

Example:

```
-- 1. Return a new DOMDocument object.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument();
  dbe_xmldom.setdoctype(doc, 'note', 'sysid', 'pubid');
  dbe_xmldom.writetobuffer(doc, buffer);

- DBE_XMLDOM.SETATTRIBUTE

  Sets the value of the DOMElement attribute by name. The prototype of the DBE_XMLDOM.SETATTRIBUTE function is as follows:

  ```
  DBE_XMLDOM.SETATTRIBUTE(
    elem    IN  DOMELEMENT,
    name    IN  VARCHAR2,
    value   IN  VARCHAR2);
  ```

  Sets the attribute values of a DOMElement object by name and namespace URI. The prototype of the DBE_XMLDOM.SETATTRIBUTE function is as follows:

  ```
  DBE_XMLDOM.SETATTRIBUTE(
    elem    IN  DOMELEMENT,
    name    IN  VARCHAR2,
    value   IN  VARCHAR2,
    ns      IN  VARCHAR2);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-411 DBE_XMLDOM.SETATTRIBUTE parameters

Parameter	Description
elem	Specified DOMElement node
name	Attribute name
value	Attribute value
ns	Namespace

NOTE

Multiple attributes can be added through the DBE_XMLDOM.SETATTRIBUTE API. The attribute name cannot be null, and attributes with the same name cannot exist in the same DOMElement node. If you want to add attributes with the same name, you should explicitly set a namespace for each attribute with the same name, but you are advised not to perform such operations. If an attribute exists in a namespace, the specified namespace must be displayed when you modify the attribute. Otherwise, the attribute with the same name is added.

Example:

```
-- 1. Set the value of the DOMElement attribute by name.
DECLARE
  doc dbe_xmldom.domdocument;
  elem dbe_xmldom.domelement;
  docnode DBE_XMLDOM.DOMNode;
  buffer varchar2(1010);
  value  varchar(1000);
BEGIN
  doc := dbe_xmldom.newDOMDocument();
  elem := DBE_XMLDOM.CREATEELEMENT(doc, 'root');
  DBE_XMLDOM.setattribute(elem, 'len', '50cm');
  docnode := DBE_XMLDOM.appendChild(DBE_XMLDOM.makeNode(doc),
DBE_XMLDOM.makeNode(elem));
  dbe_xmldom.writetobuffer(doc, buffer);
  dbe_output.print_line('buffer: ');

ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.SETCHARSET

  Sets the character set for a DOMDocument object. The prototype of the DBE_XMLDOM.SETCHARSET function is as follows:

```
DBE_XMLDOM.SETCHARSET(
  doc      IN     DOMDocument,
  charset  IN     VARCHAR2);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-412 DBE_XMLDOM.SETCHARSET parameters

Parameter	Description
doc	Specified DOMDocument node
charset	Character set

NOTE

- The value of **charset** contains a maximum of 60 bytes.
- Currently, the following character sets are supported: UTF-8, UTF-16, UCS-4, UCS-2, ISO-8859-1, ISO-8859-2, ISO-8859-3, ISO-8859-4, ISO-8859-5, ISO-8859-6, ISO-8859-7, ISO-8859-8, ISO-8859-9, ISO-2022-JP, Shift_JIS, EUC-JP and ASCII. If you enter other character sets, an error is reported or garbled characters may be displayed.

Example:

```
-- Set the UTF-16 character set for the DOC tree and print the DOC tree to the buffer.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
BEGIN
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
     <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>
     <!ELEMENT from (#PCDATA)><!ELEMENT heading (#PCDATA)><!ELEMENT body (#PCDATA)>]>
     <note><to>test</to><from>Jani</from><heading>Reminder</heading>
     <body>Don''t forget me this weekend!</body></note>');
  dbe_xmldom.setcharset(doc, 'utf-16');
  dbe_xmldom.writetobuffer(doc, buffer);

doc	Specified DOMDocument node
name	Name of the DOCType to be initialized
sysid	ID of the system whose DOCType needs to be initialized
pubid	Public ID of the DOCType to be initialized

NOTE

The total length of **name**, **sysid**, and **pubid** cannot exceed 32500 bytes.

Example:

```
-- After the initial system ID, public ID, and name are set for the external DTD of the DOMDocument, the DOC tree modified each time is output to the buffer.
DECLARE
  doc dbe_xmldom.domdocument;
  buffer varchar2(1010);
begin
  doc := dbe_xmldom.newdomdocument('<?xml version="1.0"?>
      <!DOCTYPE note [<!ELEMENT note (to,from,heading,body)><!ELEMENT to (#PCDATA)>

- DBE_XMLDOM.SETNODEVALUE

  Sets the value of a node in the DOMNode object. The prototype of the DBE_XMLDOM.SETNODEVALUE function is as follows:

```
DBE_XMLDOM.SETNODEVALUE(
 n IN DOMNODE,
 nodeValue IN VARCHAR2);
```

Table 10-414 DBE_XMLDOM.SETNODEVALUE parameters

Parameter	Description
n	Specified DOMNode object
nodeValue	String to be set in the DOMNode object

NOTE

1. You can enter an empty string or null value for **nodeValue**, but the node value will not be changed.
2. Currently, **nodeValue** does not support the escape character '&'. If the character string contains the escape character, the node value will be cleared.
3. The default maximum length of **nodeValue** is restricted by the VARCHAR2 type and is 32767 bytes. If the length exceeds 32767 bytes, an exception is thrown.

Example:

```
-- After setting a node value different from the initial value for the DOMNode node that is converted from DOMText, obtain and output the node value.
DECLARE
  buf VARCHAR2(1000);
  doc DBE_XMLDOM.DOMDocument;
  text DBE_XMLDOM.DOMText;
  elem2 DBE_XMLDOM.DOMElement;
  node DBE_XMLDOM.DOMNode;
BEGIN
  doc := DBE_XMLDOM.NEWDOMDOCUMENT();
  text := DBE_XMLDOM.createTextNode(doc, 'aaa');
  DBE_XMLDOM.SETNODEVALUE(DBE_XMLDOM.makeNode(text), 'ccc');
  buf := DBE_XMLDOM.GETNODEVALUE(DBE_XMLDOM.makeNode(text));
  DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
ccc
ANONYMOUS BLOCK EXECUTE
```

- DBE_XMLDOM.WRITETOBUFFER

  Writes an XML node to a specified buffer using the database character set. The prototype of the DBE_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
  doc      IN      DOMDOCUMENT,
  buffer   INOUT  VARCHAR2);
```

  Writes an XML document to a specified buffer using the database character set. The prototype of the DBE_XMLDOM.WRITETOBUFFER function is as follows:

```
DBE_XMLDOM.WRITETOBUFFER(
  n        IN      DOMNODE,
  buffer   INOUT  VARCHAR2);
```

Table 10-415 DBE_XMLDOM.WRITETOBUFFER parameters

Parameter	Description
doc	Specified DOMDocument node
buffer	Buffer for the write operation
n	Specified DOMNode node

NOTE

- The buffer to which the writetobuffer function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

Example:

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
   doc dbe_xmldom.domdocument;
   elem DBE_XMLDOM.DOMELEMENT;
   buf varchar2(1000);
BEGIN
    doc := dbe_xmldom.newdomdocument();
    elem := dbe_xmldom.createelement(doc,'elem');
    DBE_XMLDOM.WRITETOBUFFER(dbe_xmldom.makenode(elem), buf);
    DBE_OUTPUT.print_line(buf);
END;
/
-- Expected result:
<elem/>

- DBE_XMLDOM.WRITETOCLOB

  Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  doc     IN      DOMDOCUMENT,
  cl      INOUT  CLOB);
```

  Writes an XML node to a specified CLOB using the database character set. The prototype of the DBE_XMLDOM.WRITETOCLOB function is as follows:

```
DBE_XMLDOM.WRITETOCLOB(
  n       IN      DOMNODE,
  cl      INOUT  CLOB);
```

Table 10-416 DBE_XMLDOM.WRITETOCLOB parameters

Parameter	Description
doc	Specified DOMDocument node
cl	CLOB to be written
n	Specified DOMNode node

NOTE

- The **doc** parameter is an input parameter. The CLOB to which the writetoclob function writes is less than 1 GB.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- By default, XML files are output in the UTF-8 character set.

Example:

```
-- 1. Enter a parameter of the DOMNode type.
DECLARE
  CL  CLOB;
  N   DBE_XMLDOM.DOMNODE;
BEGIN
  DBE_XMLDOM.WRITETOCLOB(N, CL);
  DBE_OUTPUT.PRINT_LINE(CL);
END;
/
```

- DBE_XMLDOM.WRITETOFILE

  Writes an XML node to a specified file using the database character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    fileName   IN      VARCHAR2);
  ```

  Writes an XML node to a specified file using the database character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    fileName   IN      VARCHAR2);
  ```

  Writes an XML document to a specified file using the specified character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    doc     IN      DOMDOCUMENT,
    fileName   IN      VARCHAR2,
    charset   IN   VARCHAR2);
  ```

  Writes an XML document to a specified file using the specified character set. The prototype of the DBE_XMLDOM.WRITETOFILE function is as follows:

  ```
  DBE_XMLDOM.WRITETOCLOB(
    n       IN      DOMNODE,
    fileName   IN      VARCHAR2,
    charset   IN   VARCHAR2);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-417 DBE_XMLDOM.WRITETOFILE parameters

Parameter	Description
doc	Specified DOMDocument node
fileName	File to be written
n	Specified DOMNode node
charset	Specified character set

NOTE

- The **doc** parameter is an input parameter. The value of **filename** can contain a maximum of 255 bytes, and the value of **charset** can contain a maximum of 60 bytes. For details about the character sets supported by **charset**, see the **DBE_XMLDOM.SETCHARSET** API.
- This function adds content such as indentation to format the output. The output document will contain the XML declaration version and encoding.
- If newdomdocument() is used to create a document without parameters, no error is reported when **charset** is not specified. The UTF-8 character set is used by default.
- The **filename** must be in the path created in **pg_directory**. The backslash (\) in the filename will be converted to a slash (/). Only one slash (/) is allowed. The file name must be in the **pg_directory_name/file_name.xml** format. The output file must be in the XML format.
- When the GUC parameter **safe_data_path** is enabled, you can only use the advanced package to read and write files in the file path specified by **safe_data_path**.
- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory. For details about how to create a directory, see **CREATE DIRECTORY**.

Example:

```
-- Before creating a directory, ensure that the directory exists in the OS and the user has the read and write permissions on the directory.
create directory dir as '/tmp';
-- 1. Write an XML node to a specified file using the database character set.
DECLARE
  FPATH VARCHAR2(1000);
  DOC   DBE_XMLDOM.DOMDOCUMENT;
BEGIN
  DOC := DBE_XMLDOM.NEWDOMDOCUMENT('<ROOT>
    <A ATTR1="A_VALUE">
        <ACHILD>ACHILD TXT</ACHILD>
    </A>
    <B>B TXT</B>
    <C/>
  </ROOT>');
  FPATH := 'dir/simplexml.xml';
  DBE_XMLDOM.WRITETOFILE(DOC, FPATH);
END;
/
-- Expected result:

-- Clean the environment.
drop directory dir;
```

- DBE_XMLDOM.GETSESSIONTREENUM

  Queries the number of DOM trees of all types in the current session. The prototype of the DBE_XMLDOM.GETSESSIONTREENUM function is as follows:

  ```
  DBE_XMLDOM.GETSESSIONTREENUM()
  RETURN INTEGER;
  ```

  NOTE

  For DOM trees that have used FREEElement and FREENode, this function still counts them.

  Example:

  ```
  -- Create three documents and obtain the number of DOM trees in the current session.
  DECLARE
    doc DBE_XMLDOM.DOMDocument;
    doc2 DBE_XMLDOM.DOMDocument;
    doc3 DBE_XMLDOM.DOMDocument;

    buffer varchar2(1010);
  BEGIN
  -- Create three documents.
    doc := DBE_XMLDOM.NEWDOMDOCUMENT('<?xml version="1.0"?>

- DBE_XMLDOM.GETELEMENTSBYTAGNAM

  Searches for the DOMNodelist node by name in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

  ```
  DBE_XMLDOM.GETELEMENTSBYTAGNAME(
    doc        IN      DOMDOCUMENT,
    tagname    IN      VARCHAR2)
  RETURN DOMNODELIST;
  ```

  Searches for the DOMNodelist node by name in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

  ```
  DBE_XMLDOM.GETELEMENTSBYTAGNAME(
    elem       IN      DOMELEMENT,
    tagname       IN      VARCHAR2)
  RETURN DOMNODELIST;
  ```

  Searches for the DOMNodelist node by name and namespace in the XML file and returns the node. The prototype of the DBE_XMLDOM.GETELEMENTSBYTAGNAME function is:

  ```
  DBE_XMLDOM.GETELEMENTSBYTAGNAME(
    elem       IN      DOMELEMENT,
    tagname       IN      VARCHAR2,
    ns         IN      VARCHAR2)
   RETURN DOMNODELIST;
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-419 Parameters for DBE_XMLDOM.GETELEMENTSBYTAGNAME

Parameter	Description
doc	Specified DOMDocument node
elem	Specified DOMElement node
tagname	Tag name. Using the wildcard (*) will match any tag.
ns	Namespace. Using the wildcard (*) will match any namespace.

Example:

```
-- 1. Search the DOMDocument node by TAGNAME and return the matched DOMNodelist node list.
DECLARE
  doc DBE_XMLDOM.DOMDocument;
  root_elem DBE_XMLDOM.DOMElement;
  child_node DBE_XMLDOM.DOMNODE;
  node_list DBE_XMLDOM.DOMNODELIST;
  buffer VARCHAR2(1000);

10.12.2.18 DBE_XMLPARSER

API Description

The DBE_XMLPARSER API is used to deserialize XML character strings and convert the character strings that store XML documents to document nodes. **Table 10-420** lists all APIs supported by the DBE_XMLPARSER advanced package.

The XMLParser data type can be used to store XMLParser data. The maximum number of XMLParser data records that can be stored is 16777215. The XMLPARSER data type can parse and create the DOMDocument node according to the input character string. The advanced package also provides the corresponding set and get APIs to perform operations on the constraint attributes of the parsing process.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

When the DBE_XMLPARSER advanced package is used in the database whose character set is set to **SQL_ASCII**, an error is reported if characters beyond the ASCII range are input.

The DBE_XMLPARSER advanced package supports only the O-compatible mode.

Table 10-420 DBE_XMLPARSER parameters

API	Description
DBE_XMLPARSER.FREEPARSER	Frees a parser.
DBE_XMLPARSER.GETDOCUMEN...	Obtains the parsed document node.
DBE_XMLPARSER.GETVALIDAT...	Obtains the validation attribute.
DBE_XMLPARSER.NEWPARSER	Creates a parser instance.
DBE_XMLPARSER.PARSEBUFFE...	Parses the VARCHAR string.
DBE_XMLPARSER.PARSECLOB	Parses the CLOB string.
DBE_XMLPARSER.SETVALIDAT...	Sets the validation attribute.

- DBE_XMLPARSER.FREEPARSER

  Frees a given parser object.

  The stored procedure prototype of DBE_XMLPARSER.FREEPARSER is as follows:

```
DBE_XMLPARSER.FREEPARSER (
   p     IN     parser);
```

  Table 10-421 DBE_XMLPARSER.FREEPARSER parameters

Parameter	Description
p	Parser object

  Example:

```
-- Create a parser and then release it.
DECLARE
  l_parser dbe_xmlparser.parser;
  BEGIN
  l_parser := dbe_xmlparser.newparser();
-- Directly release the l_parser instance.
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Result: The operation is successful.

- DBE_XMLPARSER.GETDOCUMENT

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Returns the root node of the DOM tree document constructed by the parser. This function can be called only after the document is parsed.

The prototype of the DBE_XMLPARSER.GETDOCUMENT function is as follows:

```
DBE_XMLPARSER.GETDOCUMENT (
 p    IN    parser)
RETURN DOMDocument;
```

Table 10-422 DBE_XMLPARSER.GETDOCUMENT parameters

Parameter	Description
p	Parser object

NOTE

- If the GETDOCUMENT function has no input parameter, an error is reported.
- If the **parser** parameter of the GETDOCUMENT function is null, null is returned.
- If the parser input by the GETDOCUMENT function has not parsed any document, null is returned.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
  BEGIN
  l_parser := dbe_xmlparser.newparser();
 -- The l_parser parses the character string and obtains the DOMDocument node through
GETDOCUMENT.
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);
 -- Print the content in l_doc.
  dbe_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;

  dbe_xmlparser.freeparser(l_parser);
  dbe_xmldom.freedocument(l_doc);
END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- DBE_XMLPARSER.GETVALIDATIONMODE

  Obtains the parsing validation mode of a specified parser. If DTD validation is enabled, **TRUE** is returned. Otherwise, **FALSE** is returned.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

The prototype of the DBE_XMLPARSER.GETVALIDATIONMODE function is as follows:

```
DBE_XMLPARSER.GETVALIDATIONMODE (
 p     IN     parser)
 RETURN BOOLEAN;
```

Table 10-423 DBE_XMLPARSER.GETVALIDATIONMODE parameters

Parameter	Description
p	Parser object

Example:

```
-- Create a parser and use GETVALIDATIONMODE to check whether the parser validation mode is
enabled.
DECLARE
  l_parser dbe_xmlparser.parser;
BEGIN
  l_parser := dbe_xmlparser.newparser();
    if (dbe_xmlparser.GETVALIDATIONMODE(l_parser) = true) then
 RAISE NOTICE 'validation';
    else
    RAISE NOTICE 'no validation';
  end if;
  dbe_xmlparser.freeparser(l_parser);
END;
/
```

Execution result:

```
NOTICE:  validation
```

- DBE_XMLPARSER.NEWPARSER

  Creates a parser object and returns a new parser instance.

  The prototype of the DBE_XMLPARSER.NEWPARSER function is as follows:

  ```
  DBE_XMLPARSER.NEWPARSER
   RETURN Parser;
  ```

  Example:

  ```
  -- Create a parser to parse character strings and then free the parser.
  DECLARE
    -- Create a parser.
    l_parser dbe_xmlparser.parser;
    l_doc dbe_xmldom.domdocument;
    buffer varchar2(1000) :=
      '<?xml version="1.0" encoding="UTF-8"?>
      <note>
      <to>Tove</to>
      <from>Jani</from>
      <heading>Reminder</heading>
      <body>Donot forget me this weekend!</body>
      </note>';
    buffer2 varchar2(1000);
    BEGIN
    l_parser := dbe_xmlparser.newparser();
    -- Parse the document and create a new DOM document.
    dbe_xmlparser.PARSEBUFFER(l_parser, buffer);

    dbe_xmlparser.freeparser(l_parser);
  END;
  /
  ```

  Result: The operation is successful.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_XMLPARSER.PARSEBUFFER

  Parses XML documents stored in strings.

  The stored procedure prototype of DBE_XMLPARSER.PARSEBUFFER is as follows:

```
DBE_XMLPARSER.PARSEBUFFER (
  p    IN    parser,
  doc  IN VARCHAR2);
```

Table 10-424 DBE_XMLPARSER.PARSEBUFFER parameters

Parameter	Description
p	Parser object
doc	A string that stores XML documents

NOTE

- The maximum length of a character string that can be parsed by the PARSEBUFFER function is 32767. If the length exceeds the maximum, an error is reported.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE
  l_parser dbe_xmlparser.parser;
  l_doc dbe_xmldom.domdocument;
  buffer varchar2 :=
'<?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>';
  buffer2 varchar2;
  BEGIN
  l_parser := dbe_xmlparser.newparser();
  dbe_xmlparser.PARSEBUFFER(l_parser, buffer);
  l_doc := dbe_xmlparser.getdocument(l_parser);

  dbe_xmldom.writetobuffer(l_doc, buffer2);
  RAISE NOTICE '%', buffer2;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 dbe_xmlparser.freeparser(l_parser);
 dbe_xmldom.freedocument(l_doc);
END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
<to>Tove</to>
<from>Jani</from>
<heading>Reminder</heading>
<body>Donot forget me this weekend!</body>
</note>
```

- DBE_XMLPARSER.PARSECLOB

  Parses XML documents stored in a CLOB.

  The stored procedure prototype of DBE_XMLPARSER.PARSECLOB is as follows:

```
DBE_XMLPARSER.PARSECLOB (
  p     IN     parser,
  doc   IN CLOB);
```

Table 10-425 DBE_XMLPARSER.PARSECLOB parameters

Parameter	Description
p	Parser object
doc	A CLOB that stores XML documents

NOTE

- PARSECLOB cannot parse CLOBs larger than 1 GB.
- Different from the ORA database, this database supports only UTF-8 in terms of character encoding, and **version** can only be set to **1.0**. If versions 1.0 to 1.9 are parsed, a warning appears but the execution is normal. For versions later than 1.9, an error is reported.
- DTD validation differences:
  - **!ATTLIST to type (CHECK|check|Check) "Ch..."** reports an error because the default value **"Ch..."** is not an enumerated value in the brackets. However, the ORA database does not report this error.
  - **<!ENTITY baidu "www.baidu.com">..... &Baidu;&writer** reports an error because the letters are case-sensitive. **Baidu** cannot correspond to **baidu**. However, the ORA database does not report this error.
- Namespace validation difference: Undeclared namespace tags are parsed. However, the ORA database reports an error.
- Difference in parsing XML predefined entities: **'** and **"** are parsed and translated into ' and ". However, predefined entities in ORA database are not translated into characters.

Example:

```
-- Create a parser to parse character strings and print the obtained document.
DECLARE

 l_clob clob :=
'<?xml version="1.0" encoding="UTF-8"?>
 <note>
 <to>Tove</to>
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
<from>Jani</from>
<heading>Reminder</heading>
<body>this weekend!</body>
</note>';
-- Create a parser.
l_parser dbe_xmlparser.parser;
l_doc dbe_xmldom.domdocument;
buffer varchar2(1000);
BEGIN
l_parser := dbe_xmlparser.newparser();
-- Parse the document and create a new DOM document.
dbe_xmlparser.parseclob(l_parser, l_clob);
l_doc := dbe_xmlparser.getdocument(l_parser);
dbe_xmldom.writetobuffer(l_doc, buffer);
RAISE NOTICE '%',buffer;

dbe_xmlparser.freeparser(l_parser);
dbe_xmldom.freedocument(l_doc);

END;
/
```

Execution result:

```
NOTICE:  <?xml version="1.0" encoding="UTF-8"?>
<note>
  <to>Tove</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>this weekend!</body>
</note>
```

- DBE_XMLPARSER.SETVALIDATIONMODE

  Sets the parsing validation mode of a specified parser.

  The stored procedure prototype of DBE_XMLPARSER.SETVALIDATIONMODE is as follows:

  ```
  DBE_XMLPARSER.SETVALIDATIONMODE(
    p     IN     parser)
    yes   IN BOOLEAN);
  ```

  Table 10-426 DBE_XMLPARSER.SETVALIDATIONMODE parameters

Parameter	Description
p	Parser object
yes	Mode to be set: • **TRUE**: DTD validation is enabled. • **FALSE**: DTD validation is disabled.

  NOTE

  - If the input parameter **yes** of the SETVALIDATIONMODE function is null, the parsing validation mode of the parser is not changed.
  - By default, the DTD validation is enabled during parser initialization.

  Example 1:

  ```
  -- Create a parser. The XML character string to be parsed does not match the DTD format.
  -- If setValidationMode is set to false, the string can be parsed. If setValidationMode is set to true, an error is reported during parsing.
  DECLARE
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 l_clob clob :=
'<!DOCTYPE note [
<!ELEMENT note (to,from,heading,body)>
<!ELEMENT to (#PCDATA)>
<!ELEMENT from (#PCDATA)>
<!ELEMENT heading (#PCDATA)>
<!ELEMENT body (#PCDATA)>
]>
<table>

END;
/
```

Execution result:

```
An error is reported during xmlparser parsing.
ERROR:  invalid XML document
```

10.12.2.19 DBE_DESCRIBE

Data Types

The advanced package **DBE_DESCRIBE** has two built-in data types. The two data types are created using user-defined types and are used for the return values of the DESCRIBE_PROCEDURE API.

- DBE_DESCRIBE.NUMBER_TABLE

  This type is the TABLE type of NUMBER and is implemented through the TABLE OF syntax.

  The prototype of the DBE_DESCRIBE.NUMBER_TABLE type is as follows:

  ```
  CREATE TYPE DBE_DESCRIBE.NUMBER_TABLE AS TABLE OF NUMBER INDEX BY INTEGER;
  ```

- DBE_DESCRIBE.VARCHAR2_TABLE

  This type is the TABLE type of VARCHAR2 and is implemented through the TABLE OF syntax.

  The prototype of the DBE_DESCRIBE.VARCHAR2_TABLE type is as follows:

  ```
  CREATE TYPE DBE_DESCRIBE.VARCHAR2_TABLE AS TABLE OF VARCHAR2(30) INDEX BY INTEGER;
  ```

API Description

The advanced package **DBE_DESCRIBE** provides the DESCRIBE_PROCEDURE API to return the parameter information (such as parameter names and parameter data types) of functions or stored procedures in a list.

Table 10-427 DBE_DESCRIBE API overview

API	Description
DBE_DESCRIBE.DESCRIBE_PROCEDURE	Displays the parameters of a stored procedure or function.

DBE_DESCRIBE.DESCRIBE_PROCEDURE

The stored procedure DESCRIBE_PROCEDURE is used to display the parameter information of a stored procedure or function, such as the parameter name, parameter mode, and parameter location. The parameter information of a function or stored procedure is returned in a list.

The prototype of the DBE_DESCRIBE.DESCRIBE_PROCEDURE function is as follows:

```
DBE_DESCRIBE.DESCRIBE_PROCEDURE(
 object_name               IN  VARCHAR2,
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 reserved1                IN  VARCHAR2,
 reserved2                IN  VARCHAR2,
 overload                OUT DBE_DESCRIBE.NUMBER_TABLE,
 dataposition             OUT DBE_DESCRIBE.NUMBER_TABLE,
 datalevel               OUT DBE_DESCRIBE.NUMBER_TABLE,
 argument_name              OUT DBE_DESCRIBE.VARCHAR2_TABLE,

);
```

Table 10-428 DBE_DESCRIBE.DESCRIBE_PROCEDURE API

Parameter	Type	Whether NULL Is Allowed	Description
object_name	varchar2	No	Stored procedure name. The syntax format of this parameter is [[*schema*.]*package*.]*function*[@*dblink*], in which: ● *schema* (optional): schema name. ● *package* (optional): package name. ● *function* (required): name of a function or stored procedure. ● *dblink* (optional): remote connection name.
reserved1	varchar2	Yes	Reserved parameter.
reserved2	varchar2	Yes	Reserved parameter.
overload	number_table	Yes	Unique ID assigned to a stored procedure or function. If a stored procedure or function is overloaded, overload is each overload of the stored procedure or function. Overload is numbered from 1 in ascending order based on the entire stored procedure or function. If a stored procedure or function is not overloaded, **overload** is set to **0**.
dataposition	number_table	Yes	Position of a specified parameter in the parameter list.
datalevel	number_table	Yes	It is set to **0**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Type	Whether NULL Is Allowed	Description
argument_name	varchar2_table	Yes	Name of the parameter associated with the specified stored procedure.
datatype	number_table	Yes	OID of the data type of the specified parameter.
default_value	number_table	Yes	If the specified parameter has a default value, the value is **1**. Otherwise, the value is **0**.
in_out	number_table	Yes	Parameter mode. The options are as follows: • **0**: IN • **1**: OUT • **2**: IN OUT
datalength	number_table	Yes	Not supported. Set it to **0** by default.
dataprecision	number_table	Yes	Not supported. Set it to **0** by default.
scale	number_table	Yes	Not supported. Set it to **0** by default.
radix	number_table	Yes	If the value is of the numeric type (such as **NUMBER** and **INTEGER**), **10** is returned. Otherwise, **0** is returned. For details about the numeric type, see **numeric types**.
spare	number_table	Yes	Reserved parameter. Set it to **0** by default.
include_string_constraints	Boolean	Yes	Reserved parameter, which does not need to be processed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- The data type of the **datatype** parameter is different from that of the ORA-compatible database. The GaussDB returns the OID of the data type, and the ORA-compatible database returns the number of the data type in the ORA-compatible database.
- The **include_string_constraints** parameter does not take effect on the stored procedure. The value of the **include_string_constraints** parameter does not change, and the return values of other parameters are not affected.
- The OIDs of the data types created by the create type operation are uncertain. Therefore, do not use these OIDs for fixed judgment.
- For the **dataposition** parameter, if a stored procedure is specified, the return value starts from **1**. If a function is specified, the return value starts from **0**. **0** indicates the position sequence number of the return value of the function.
- For the **argument_name** parameter, if a function is specified, the first position of the return value is empty. This position indicates the name of the return value of the described function (that is, the empty name).
- Do not directly specify a package. Otherwise, an error is reported.
- If you do not have the execute permission on a stored procedure, function, or package, the system considers that the stored procedure, function, or package does not exist and reports an error.
- The input parameters **reserved1** and **reserved2** are not involved in internal processing. Entering any character string does not affect the returned result.
- The advanced package cannot specify the stored procedures or functions obtained through DBLINK.
- You are advised to add the schema prefix before the specified stored procedure or function. If the schema prefix is omitted, the advanced package uses the current schema of the session to search for the entity to which the advanced package belongs. In this case, you need to change the value of **behavior_compat_options** to **bind_procedure_searchpath** for the advanced package to take effect.
- If the %type operation is used to obtain the data type from a table column, the constraint on the data type (such as NUMBER(3) and VARCHAR2(10)) is not retained.

Example:

```
-- Create a stored procedure to encapsulate the advanced package for printing return values.
CREATE PROCEDURE PRINT_DESCRIBE (obj_name IN VARCHAR2)
AS

10.12.2.20 PRVT_ILM

The PRVT_ILM API is an internal API of the ILM feature and cannot be directly called by users. Only the API names are listed and the API prototypes are not described.

API	Description
be_active_ado_window	The maintenance window updates the ilmadowindow triggering time and action.
be_create_ado_window_for_each_db	The maintenance window creates ilmadowindow in each database of the instance.
be_execute_ilm	The ilmadowind performs automatic evaluation.
be_execute_ilm_dn	Automatic evaluation is performed on distributed DNs. This operation affects the overall ILM background scheduling of the cluster.
flush_task_executestate	The automatic scheduled job updates the task status.
generate_taskoid	CN generates a task ID for this scheduling.
evaluate_obj_policy	Data objects are evaluated after scheduling is triggered.
change_be_ilm	dbe_ilm_admin.enable_ilm() and disable_ilm() help functions. This operation affects the overall ILM background scheduling of the cluster.
get_compression_ratio	dbe_compression.get_compression_ratio() help function.
get_compression_type	dbe_compression.get_compression_type() help function.
get_lastmodified_time	dbe_heat_map.row_heat_map() help function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
ilm_job_action	Compression task executor, which is used for distributed DNs.
delete_expired_ilm_log	Expired logs are cleared in distributed mode.
delete_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_jobdetail	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
insert_gs_ilm_taskdetail	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_jobdetail	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_object	System catalog related to the operation feature, which is used for distributed DNs.
update_gs_ilm_param	System catalog related to the operation feature, which is used for distributed DNs. This operation affects the overall ILM background scheduling of the cluster.
update_gs_ilm_task	System catalog related to the operation feature, which is used for distributed DNs.
gs_ilm_ticker	The maintenance window performs an action, performs a dotting operation, and records the mapping between the LSN and time.
compress_blocks	prvt_ilm.ilm_job_action() help function.
compress_block_single	Do not use this API because it is discarded.
get_job_status	dbe_ilm.stop_ilm help function.
insert_gs_ilm_param	System catalogs related to the operation feature.
query_unfinishedjob_num	Queries whether there are jobs that are not complete, including jobs in the initial and running states.
update_gs_ilm_object_flag2	System catalog related to the operation feature, which is used for distributed DNs.
ilm_seq_nextval	Obtains the next sequence value of the ILM.
ilm_seq_setval	Sets the current sequence value of the ILM.
check_compatibility	Specifies a function used to determine a database compatibility mode in a unified manner.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

API	Description
set_pg_settings	Specifies a function used to set the GUC parameters for setting a database compatibility mode.
check_seq	Ensures that the current value of **gsilmtask_seq** is greater than the maximum value of **taskoid** in the gs_ilm_task catalog. This parameter is used on distributed CNs.

10.12.2.21 DBE_XMLGEN

Interface Description

The **DBE_XMLGEN** system package converts the result of an SQL query into a standard XML format and returns the result. For details about all supported interfaces, see **Table 2 DBE_XMLGEN**.

Table 10-429 DBE_XMLGEN data type

Type	Description
DBE_XMLGEN.CTXHANDLE	Data type used to store the XML output status.

NOTE

1. A maximum of 65,535 context handles can exist in a session. Closing the context handle does not reclaim the number.
2. The connect by statement is not supported in the distributed system. Therefore, the newcontextfromhierarchy function data cannot be constructed.
3. In a distributed system, the cursor cannot be moved reversely. Therefore, the restartquery function is unavailable.
4. The case of the table column and type in the output XML file is the same as that of the table column and type created by the user. If you need to write a large column and type name, use double quotation marks ("") to specify the column and type name.
5. During NEWCONTEXTFROMHIERARCHY initialization, the SETNULLHANDLING, USENULLATTRIBUTEINDICATOR, and SETCONVERTSPECIALCHARS methods are used to set this parameter, but the setting does not take effect.
6. If ORDER BY is not added for query, the query result is disordered, which affects the return result of the GETXML function.

Table 10-430 DBE_XMLGEN

Interface	Description
DBE_XMLGEN.CONVERT	Encodes or decodes the input character string in XML format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Interface	Description
DBE_XMLGEN.NEWCONTEXT	Initializes the common context handle.
DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY	Initializes the context handle with recursive elements.
DBE_XMLGEN.SETCONVERTSPECIALCHARS	Specifies whether the output XML needs to be encoded.
DBE_XMLGEN.SETNULLHANDLING	Sets how to display the null value in the XML file.
DBE_XMLGEN.SETROWSETTAG	Sets the name of the XML root node.
DBE_XMLGEN.SETROWTAG	Sets the tag name of each row of data in the XML file.
DBE_XMLGEN.USENULLATTRIBUTEINDICATOR	Adds the **xsi:nil="true"** attribute to the element where the **null** value is located in the XML file.
DBE_XMLGEN.USEITEMTAGSFORCOLL	Adds the suffix _**item** to the element where the variable of the array type is located.
DBE_XMLGEN.GETNUMROWSPROCESSED	Views the number of data rows returned by GETXML or GETXMLTYPE last time.
DBE_XMLGEN.SETMAXROWS	Sets the maximum number of rows returned for a GETXML operation.
DBE_XMLGEN.SETSKIPROWS	Sets the number of SQL rows to be skipped.
DBE_XMLGEN.RESTARTQUERY	Restarts the SQL.
DBE_XMLGEN.GETXMLTYPE	Returns the XML text of the XMLTYPE type.
DBE_XMLGEN.GETXML	Returns the XML text of the CLOB type.
DBE_XMLGEN.CLOSECONTEXT	Disables the context handle.

- DBE_XMLGEN.CONVERT

  Encodes or decodes the input character string in XML format. The conversion is performed according to the following rules.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-431 XML encoding rules

Original Value	Code Value
&	&
<	<
>	>
"	"
'	'

The function prototype of DBE_XMLGEN.CONVERT is:

```
DBE_XMLGEN.CONVERT(XMLSTR IN VARCHAR2, FLAG IN NUMBER := 0) RETURNS VARCHAR2;
DBE_XMLGEN.CONVERT(XMLCLOB IN CLOB, FLAG IN NUMBER := 0) RETURNS CLOB;
```

Table 10-432 DBE_XMLGEN.CONVERT interface parameters

Parameter	Description
XMLSTR	XML character string to be converted. The value is of the VARCHAR2 type.
XMLCLOB	XML character string to be converted. The value is of the CLOB type.
FLAG	Transcodes or decodes character strings. **0**: encoding. **1**: decoding.

Example:

```
-- XML decoding
SELECT DBE_XMLGEN.CONVERT('<foo/>', 1);
 convert
---------
 <foo/>
(1 row)
-- XML encoding
SELECT DBE_XMLGEN.CONVERT('<foo><qwe</foo>', 0);
            convert
---------------------------------
 &lt;foo&gt;&lt;qwe&lt;/foo&gt;
(1 row)
```

- DBE_XMLGEN.NEWCONTEXT

  Initializes the common context handle.

  The function prototype of DBE_XMLGEN.NEWCONTEXT is:

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XMLGEN.NEWCONTEXT(QUERYSTRING IN VARCHAR2) RETURNS DBE_XMLGEN.CTXHANDLE;
DBE_XMLGEN.NEWCONTEXT(QUERYSTRING IN SYS_REFCURSOR) RETURNS
DBE_XMLGEN.CTXHANDLE;
```

Table 10-433 DBE_XMLGEN.NEWCONTEXT interface parameters

Parameter	Description
QUERYSTRING	Queries SQL statement or SYS_REFCURSOR used to generate XML files.

- DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY

  Initializes the context handle with recursive elements. The data format must contain two columns. The first column is of the numeric type, and the second column is of the XML or XMLTYPE type. Generally, the value is generated by the connect by statement. The first column specifies the generation level. The distributed system does not support the connect by statement. Therefore, this function case cannot be constructed.

  NOTE

  The number of nested layers in the generated XML file cannot exceed 50 million.

  The function prototype of DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY is:

  ```
  DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY(QUERYSTRING IN VARCHAR2);
  ```

  Table 10-434 DBE_XMLGEN.NEWCONTEXTFROMHIERARCHY interface parameters

Parameter	Description
QUERYSTRING	XML character string to be converted. The value is of the VARCHAR2 type.

- DBE_XMLGEN.SETCONVERTSPECIALCHARS

  Specifies whether the output XML needs to be encoded. If XML encoding is canceled, XML injection may occur. If the XML is secured and the performance is considered, XML encoding is not required.

  The function prototype of DBE_XMLGEN.SETCONVERTSPECIALCHARS is:

  ```
  DBE_XMLGEN.SETCONVERTSPECIALCHARS(CTX IN DBE_XMLGEN.CTXHANDLE, CONV IN BOOLEAN);
  ```

  Table 10-435 DBE_XMLGEN.SETCONVERTSPECIALCHARS interface parameters

Parameter	Description
CTX	Context handle.
CONV	Specifies whether to encode the output XML file. • **true**: Perform XML encoding. • **false**: Do not perform XML encoding.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

- DBE_XMLGEN.SETNULLHANDLING

  Sets how to display the null value in the XML file.

  The function prototype of DBE_XMLGEN.SETNULLHANDLING is:

  ```
  DBE_XMLGEN.SETNULLHANDLING(CTX IN DBE_XMLGEN.CTXHANDLE, FLAG IN NUMBER := 0);
  ```

  Table 10-436 DBE_XMLGEN.SETNULLHANDLING interface parameters

Parameter	Description
CTX	Context handle.
FLAG	Null value display format. ● **0**: The element is not displayed. ● **1**: The **xsi:nil="true"** attribute is added to the element. ● **2**: Self-closed elements are displayed.

- DBE_XMLGEN.SETROWSETTAG

  Sets the name of the XML root node.

  The function prototype of DBE_XMLGEN.SETROWSETTAG is:

  ```
  DBE_XMLGEN.SETROWSETTAG(CTX IN DBE_XMLGEN.CTXHANDLE, ROWSETTAGNAME IN VARCHAR2);
  ```

  Table 10-437 DBE_XMLGEN.SETROWSETTAG interface parameters

Parameter	Description
CTX	Context handle.
ROWSETTAGNAME	Name of the XML root node.

- DBE_XMLGEN.SETROWTAG

  Sets the tag name of each row of data in the XML file.

  The function prototype of DBE_XMLGEN.SETROWTAG is:

  ```
  DBE_XMLGEN.SETROWTAG(CTX IN DBE_XMLGEN.CTXHANDLE, ROWTAGNAME IN VARCHAR2);
  ```

  Table 10-438 DBE_XMLGEN.SETROWTAG interface parameters

Parameter	Description
CTX	Context handle.
ROWTAGNAME	Tag name of each row of data.

- DBE_XMLGEN.USENULLATTRIBUTEINDICATOR

  Adds the **xsi:nil="true"** attribute to the element where the **null** value is located in the XML file.

  The function prototype of DBE_XMLGEN.USENULLATTRIBUTEINDICATOR is:

  ```
  DBE_XMLGEN.USENULLATTRIBUTEINDICATOR(CTX IN DBE_XMLGEN.CTXHANDLE, ATTRIND IN
  BOOLEAN);
  ```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-439 DBE_XMLGEN.USENULLATTRIBUTEINDICATOR interface parameters

Parameter	Description
CTX	Context handle.
ATTRIND	None.

- DBE_XMLGEN.USEITEMTAGSFORCOLL

  Adds the suffix **_item** to the element where the variable of the array type is located.

  The function prototype of DBE_XMLGEN.USEITEMTAGSFORCOLL is:

```
DBE_XMLGEN.USEITEMTAGSFORCOLL(CTX IN DBE_XMLGEN.CTXHANDLE);
```

Table 10-440 DBE_XMLGEN.USEITEMTAGSFORCOLL interface parameters

Parameter	Description
CTX	Context handle.

Example:

```
-- Preset data.
CREATE TABLE test_for_array(idd number, id INT[]);
INSERT INTO test_for_array VALUES(1, ARRAY[1,2,3]);
SELECT DBE_XMLGEN.GETXML('SELECT * from test_for_array');
-- Add the suffix _item to the array type.
DECLARE
qryctx DBE_XMLGEN.CTXHANDLE;
result CLOB;
BEGIN
    qryctx := DBE_XMLGEN.NEWCONTEXT('SELECT id from test_for_array');
    DBE_XMLGEN.useItemTagsForColl(qryctx);
    result:=DBE_XMLGEN.GETXML(qryctx);
    DBE_XMLGEN.CLOSECONTEXT(qryctx);
    DBE_OUTPUT.PUT_LINE(result);
END;
/
<?xml version="1.0"?>
<rowset>
<row>
  <id>
    <int4_ITEM>1</int4_ITEM>
    <int4_ITEM>2</int4_ITEM>
    <int4_ITEM>3</int4_ITEM>
  </id>
</row>
</rowset>
```

- DBE_XMLGEN.GETNUMROWSPROCESSED

  Views the number of data rows returned by GETXML or GETXMLTYPE last time.

  The function prototype of DBE_XMLGEN.GETNUMROWSPROCESSED is:

```
DBE_XMLGEN.GETNUMROWSPROCESSED(CTX IN DBE_XMLGEN.CTXHANDLE);
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 10-441 DBE_XMLGEN.GETNUMROWSPROCESSED interface parameters

Parameter	Description
CTX	Context handle.

- DBE_XMLGEN.SETMAXROWS
  Sets maximum number of rows returned by each GETXML operation.
  The function prototype of DBE_XMLGEN.SETMAXROWS is:

```
DBE_XMLGEN.SETMAXROWS(CTX IN DBE_XMLGEN.CTXHANDLE, MAXROWS IN NUMBER);
```

  Table 10-442 DBE_XMLGEN.SETMAXROWS interface parameters

Parameter	Description
CTX	Context handle.
MAXROWS	Maximum number of rows returned by each GETXML operation.

- DBE_XMLGEN.SETSKIPROWS
  Sets the number of SQL rows to be skipped.
  The function prototype of DBE_XMLGEN.SETSKIPROWS is:

```
DBE_XMLGEN.SETSKIPROWS(CTX IN DBE_XMLGEN.CTXHANDLE, SKIPROWS IN NUMBER);
```

  Table 10-443 DBE_XMLGEN.SETSKIPROWS interface parameters

Parameter	Description
CTX	Context handle.
SKIPROWS	Number of SQL header rows that are skipped.

- DBE_XMLGEN.RESTARTQUERY
  Restarts the SQL. This interface is not supported in distributed mode.
  The function prototype of DBE_XMLGEN.RESTARTQUERY is:

```
DBE_XMLGEN.RESTARTQUERY(CTX IN DBE_XMLGEN.CTXHANDLE);
```

  Table 10-444 DBE_XMLGEN.RESTARTQUERY interface parameters

Parameter	Description
CTX	Context handle.

- DBE_XMLGEN.GETXMLTYPE
  Returns the XML text of the XMLTYPE type.
  The function prototype of DBE_XMLGEN.GETXMLTYPE is:

```
DBE_XMLGEN.GETXMLTYPE(SQLQUERY IN VARCHAR2, DTDORSCHEMA IN NUMBER := 0) RETURNS
XMLTYPE;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
DBE_XMLGEN.GETXMLTYPE(CTX IN DBE_XMLGEN.CTXHANDLE, DTDORSCHEMA IN NUMBER := 0)
RETURNS XMLTYPE;
```

Table 10-445 DBE_XMLGEN.GETXMLTYP interface parameters

Parameter	Description
SQLQUERY	Query SQL statements that need to be converted into XML files.
DTDORSCHEMA	None.
CTX	Context handle.

- DBE_XMLGEN.GETXML

  Returns the XML text of the CLOB type.

  The function prototype of DBE_XMLGEN.GETXML is:

  ```
  DBE_XMLGEN.GETXML(SQLQUERY IN VARCHAR2, DTDORSCHEMA IN NUMBER := 0) RETURNS CLOB;
  DBE_XMLGEN.GETXML(CTX IN DBE_XMLGEN.CTXHANDLE, DTDORSCHEMA IN NUMBER := 0)
  RETURNS CLOB;
  DBE_XMLGEN.GETXML(CTX IN DBE_XMLGEN.CTXHANDLE, TMPCLOB INOUT CLOB, DTDORSCHEMA
  IN NUMBER := 0);
  ```

  Table 10-446 DBE_XMLGEN.GETXML interface parameters

Parameter	Description
SQLQUERY	Query SQL statements that need to be converted into XML files.
DTDORSCHEMA	None.
CTX	Context handle.
TMPCLOB	CLOB variable for storing the output XML.

- DBE_XMLGEN.CLOSECONTEXT

  Disables the context handle.

  The function prototype of DBE_XMLGEN.CLOSECONTEXT is:

  ```
  DBE_XMLGEN.CLOSECONTEXT(CTX IN DBE_XMLGEN.CTXHANDLE);
  ```

  Table 10-447 DBE_XMLGEN.CLOSECONTEXT interface parameters

Parameter	Description
CTX	Context handle.

  Example:

  ```
  CREATE TABLE IF NOT EXISTS department(department_id NUMBER, department_name
  VARCHAR2(30), manager NUMBER, location NUMBER);
  INSERT INTO department VALUES(10, 'administrator', 200, 1700);
  ```

  <manager>400</manager>
  <location>1600</location>
</row>
</rowset>
```

10.13 Retry Management

Retry is a process in which the database executes an SQL statement or stored procedure (including anonymous block) again in the case of execution failure, improving the execution success rate and user experience. In addition, the database checks the error code and retry configuration to determine whether to retry.

- If the execution fails, the system rolls back the executed statements and executes the stored procedure again.

  Example:

```
gaussdb=# CREATE OR REPLACE PROCEDURE retry_basic ( IN  x INT)
AS
BEGIN
   INSERT INTO t1 (a) VALUES (x);
   INSERT INTO t1 (a) VALUES (x+1);
END;
/

gaussdb=# CALL retry_basic(1);
```

10.14 PACKAGE

A package is a combination of PL/SQL programs, such as stored procedures, functions, variables, constants, and cursors. It is object-oriented and can encapsulate PL/SQL program design elements. Functions in a package are created, deleted, and modified in a unified manner.

A package contains two parts: package specifications and package body. The declaration contained in the package specifications can be accessed by external functions and anonymous blocks. The declaration contained in the package body

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

cannot be accessed by external functions or anonymous blocks, but can be accessed only by functions and stored procedures in the package body.

For details about how to create a package, see **CREATE PACKAGE**.

NOTICE

- Cross-package variables cannot be used as control variables in the for loops.
- Types defined in a package cannot be deleted or modified, and cannot be used to define tables.
- Cursor variables cannot be referenced in SCHEMA.PACKAGE.CURSOR mode.
- A cursor with parameters can be opened only in the current package.
- In distributed mode, PACKAGE can be used only in an ORA-compatible database.
- In distributed mode, if an SQL statement contains variables or functions in a package, pushdown is not supported.
- A package variable cannot be used as the default value of a function or stored procedure parameter.
- If the input parameters of a stored procedure in a package contain pseudo-type parameters (for example, **anyelement**), variable-length parameters cannot be specified during a call.

10.15 Debugging

Syntax

RAISE has the following five syntax formats.

Figure 10-46 raise_format::=

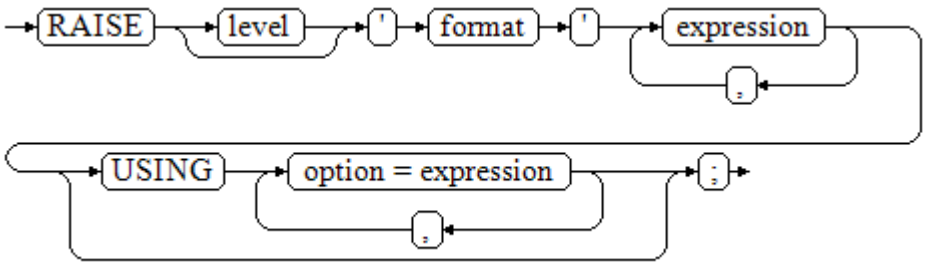

Figure 10-47 raise_condition::=

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Figure 10-48 raise_sqlstate::=

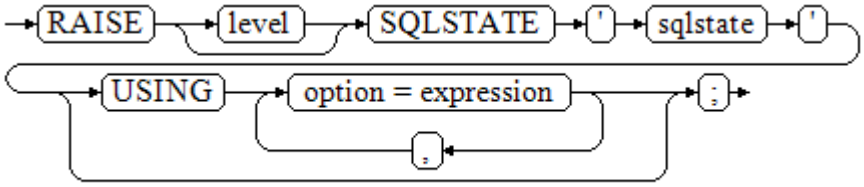

Figure 10-49 raise_option::=

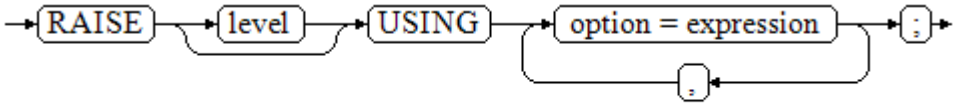

Figure 10-50 raise::=

Parameters:

- **level**: specifies the error level, that is, **DEBUG**, **LOG**, **INFO**, **NOTICE**, **WARNING**, or **EXCEPTION** (default). **EXCEPTION** throws an error that normally terminates the current transaction and the others only generate information at their levels. The GUC parameters **log_min_messages** and **client_min_messages** control whether the error messages of specific levels are reported to the client and are written to the server log.
- **format**: specifies the error message text to be reported, a format string. The format string can be appended with an expression for insertion to the message text. In a format string, **%** is replaced by the parameter value attached to format and **%%** is used to print **%**. For example:

```
-- v_job_id replaces % in the string.
RAISE NOTICE 'Calling cs_create_job(%)',v_job_id;
```

- **option = expression**: inserts additional information to an error report. The **keyword** option can be **MESSAGE**, **DETAIL**, **HINT**, or **ERRCODE**, and each expression can be any string.
  - **MESSAGE**: specifies the error message text. This option cannot be used in a **RAISE** statement that contains a format character string in front of **USING**.
  - **DETAIL**: specifies detailed information of an error.
  - **HINT**: prints hint information.
  - **ERRCODE**: designates an error code (SQLSTATE) to a report. A condition name or a five-character SQLSTATE error code can be used.
- **condition_name**: specifies the condition name corresponding to the error code.
- **sqlstate**: specifies the error code.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

If neither a condition name nor an SQLSTATE is specified in the **RAISE EXCEPTION** command, **RAISE EXCEPTION (P0001)** is used by default. If no message text is specified, the condition name or SQLSTATE is used as the message text by default.

NOTICE

- If the SQLSTATE specifies an error code, the error code is not limited to a defined error code. It can be any error code containing five digits or ASCII uppercase rather than **00000**. Do not use an error code ended with three zeros because such error codes are category codes and can be captured by the whole category.
- In ORA-compatible mode, SQLCODE is equivalent to SQLSTATE.

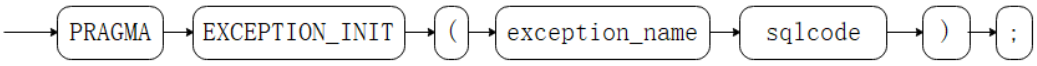
NOTE

The syntax described in **Figure 10-50** does not append any parameter. This form is used only for the **EXCEPTION** statement in a **BEGIN** block so that the error can be re-processed.

EXCEPTION_INIT

In ORA-compatible mode, EXCEPTION_INIT can be used to define the SQLCODE error code. The syntax is as follows:

Figure 10-51 exception_init::=



Parameters:

- **exception_name** indicates the name of the exception declared by the user. The EXCEPTION_INIT syntax must follow the declared exception.
- **sqlcode** is a customized SQL code, which must be a negative integer ranging from –2147483647 to –1.

Precautions:

- This function can be used in ORA-compatible mode but cannot be bound to system error codes.
- Only exception_init can be used to assign a value to sqlcode joined with exception. Other value assignment modes are invalid.
- Cross-database.schema.package.exception calling is not supported.

NOTICE

When **EXCEPTION_INIT** is used to customize an SQL code, SQLSTATE is equivalent to SQLCODE, and SQLERRM is in the format of *xxx*: **non-GaussDB Exception**. For example, if the customized SQL code is **–1**, SQLSTATE is **–1** and SQLERRM is **1: non-GaussDB Exception**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Examples

Display error and hint information when a transaction terminates:

```
CREATE OR REPLACE PROCEDURE proc_raise1(user_id in integer)
AS
BEGIN
RAISE EXCEPTION 'Noexistence ID --> %',user_id USING HINT = 'Please check your user ID';
END;
/

call proc_raise1(300011);

-- Execution result
ERROR:  Noexistence ID --> 300011
HINT:  Please check your user ID
```

Two methods are available for setting SQLSTATE:

```
CREATE OR REPLACE PROCEDURE proc_raise2(user_id in integer)
AS
BEGIN
RAISE 'Duplicate user ID: %',user_id USING ERRCODE = 'unique_violation';
END;
/

\set VERBOSITY verbose
call proc_raise2(300011);

-- Execution result
ERROR:  Duplicate user ID: 300011
SQLSTATE: 23505
```

If the main parameter is a condition name or SQLSTATE, the following applies:

RAISE division_by_zero;

RAISE SQLSTATE '22012';

For example:

```
CREATE OR REPLACE PROCEDURE division(div in integer, dividend in integer)
AS
DECLARE
res int;
    BEGIN
    IF dividend=0 THEN
        RAISE division_by_zero;
        RETURN;
    ELSE
        res := div/dividend;
        RAISE INFO 'division result: %', res;
        RETURN;
    END IF;
    END;
/
call division(3,0);

-- Execution result
ERROR:  division_by_zero
```

Alternatively:

```
RAISE unique_violation USING MESSAGE = 'Duplicate user ID: ' || user_id;
```

11 Autonomous Transaction

An autonomous transaction is an independent transaction that is started during the execution of a primary transaction. Committing and rolling back an autonomous transaction does not affect the data that has been committed by the primary transaction. In addition, an autonomous transaction is not affected by the primary transaction.

Autonomous transactions are defined in stored procedures, functions, and anonymous blocks, and are declared using the **PRAGMA AUTONOMOUS_TRANSACTION** keyword.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

11.1 Restrictions

CAUTION

- When an autonomous transaction is executed, an autonomous transaction session is started in the background. You can use **max_concurrent_autonomous_transactions** to set the maximum number of concurrent autonomous transactions. The value range is 0 to 10000, and the default value is **10**.
- When **max_concurrent_autonomous_transactions** is set to **0**, autonomous transactions cannot be executed.
- After a new session is started for an autonomous transaction, the default session parameters are used and objects (including session-level variables, local temporary variables, and global temporary table data) of the primary session are not shared.
- Theoretically, the upper limit of autonomous transactions is 10000. Actually, the upper limit is a dynamic value. For details, see the description of the GUC parameter **max_concurrent_autonomous_transactions**.
- Autonomous transactions are affected by the communication buffer. The size of the information returned to the client is limited by the length of the communication buffer. If the size exceeds the length of the communication buffer, an error is reported.
- During the execution of an autonomous transaction, the primary transaction adds a lock to the autonomous transaction. If this lock remains due to an exception, the residual lock needs to be cleared by gs_clean. The clearing period is controlled by the GUC parameter **gs_clean_timeout**, and the default value is 60 seconds. The lock of an autonomous transaction is not affected by lock timeout. The lock timeout interval is 2,147,483 seconds. If the execution time of an autonomous transaction exceeds this interval, an error is reported, indicating that the lock times out.
- For an autonomous transaction, the connection timeout interval is 5s and the number of connection attempts is 5. Signals are not responded to immediately during connection establishment. Signals are checked before each connection attempt. Timeout errors may occur in high concurrency, high CPU usage, high memory usage, and thread pool scale-out scenarios.
- If the PRAGMA AUTONOMOUS_TRANSACTION syntax is declared in PACKAGE SPECIFICATION or PACKAGE BODY SPECIFICATION, a package can be created, but the autonomous transaction does not take effect.

- A trigger function does not support autonomous transactions.

```
gaussdb=# CREATE TABLE test_trigger_des_tbl(id1 int, id2 int, id3 int);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'id1' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.

/
ERROR:  Autonomous transactions do not support RETURN SETOF.
DETAIL:  N/A
```

11.2 Stored Procedure Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure. For details, see **CREATE PROCEDURE**. The following is an example:

```
-- Create a table.
gaussdb=# CREATE TABLE t2(a INT, b INT);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
gaussdb=# INSERT INTO t2 VALUES(1,2);
INSERT 0 1
gaussdb=# SELECT * FROM t2;
 a | b
---+---
 1 | 2
(1 row)

-- Create a stored procedure that contains an autonomous transaction.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_4(a INT, b INT)  AS
DECLARE
    num3 INT := a;
    num4 INT := b;
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO t2 VALUES(num3, num4);
    DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
END;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
/
CREATE PROCEDURE

-- Create a common stored procedure that calls an autonomous transaction stored procedure.
gaussdb=# CREATE OR REPLACE PROCEDURE autonomous_5(a INT, b INT)  AS
DECLARE
BEGIN
    DBE_OUTPUT.PRINT_LINE('JUST NO USE CALL.');
    INSERT INTO t2 VALUES(666, 666);
    autonomous_4(a,b);
    ROLLBACK;
END;
/
CREATE PROCEDURE

-- Call a common stored procedure.
gaussdb=# SELECT autonomous_5(11,22);
JUST NO USE CALL.
JUST USE CALL.
 autonomous_5
--------------

(1 row)

-- View the table result.
gaussdb=# SELECT * FROM t2 ORDER BY a;
 a  | b
----+----
  1 |  2
 11 | 22
(2 rows)

gaussdb=# DROP TABLE t2;
DROP TABLE
```

In the preceding example, a stored procedure containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

11.3 Anonymous Block Supporting Autonomous Transaction

An autonomous transaction can be defined in an anonymous block. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating an anonymous block. For details, see **Anonymous Blocks**.

```
gaussdb=# CREATE TABLE t1(a INT ,B TEXT);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# START TRANSACTION;
START TRANSACTION
gaussdb=# DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    DBE_OUTPUT.PRINT_LINE('JUST USE CALL.');
    INSERT INTO t1 VALUES(1,'YOU ARE SO CUTE,WILL COMMIT!');
END;
/
JUST USE CALL.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
ANONYMOUS BLOCK EXECUTE

gaussdb=# INSERT INTO t1 VALUES(1,'YOU WILL ROLLBACK!');
INSERT 0 1
gaussdb=# ROLLBACK;
ROLLBACK
gaussdb=# SELECT * FROM t1;
 a |             b
---+-----------------------------
 1 | YOU ARE SO CUTE,WILL COMMIT!
(1 row)

gaussdb=# DROP TABLE t1;
DROP TABLE
```

In the preceding example, an anonymous block containing an autonomous transaction is finally executed before a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

11.4 Function Supporting Autonomous Transaction

An autonomous transaction can be defined in a function. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a function. For details, see **CREATE FUNCTION**.

```
gaussdb=# CREATE TABLE t4(a INT, b INT, c TEXT);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE

gaussdb=# CREATE OR REPLACE FUNCTION autonomous_32(a INT ,b INT ,c TEXT) RETURN INT AS
DECLARE
   PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
   INSERT INTO t4 VALUES(a, b, c);
   RETURN 1;
END;
/
CREATE FUNCTION
gaussdb=# CREATE OR REPLACE FUNCTION autonomous_33(num1 INT) RETURN INT AS
DECLARE
   num3 INT := 220;
   tmp INT;
   PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
   num3 := num3/num1;
   RETURN num3;
EXCEPTION
   WHEN DIVISION_BY_ZERO THEN
      SELECT autonomous_32(num3, num1, SQLERRM) INTO tmp;
      ROLLBACK;
      RETURN 0;
END;
/
CREATE FUNCTION
gaussdb=# SELECT autonomous_33(0);
 autonomous_33
---------------
             0
(1 row)

gaussdb=# SELECT * FROM t4;
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
 a  | b |        c
-----+---+------------------
 220 | 0 | division by zero
(1 row)

gaussdb=# DROP TABLE t4;
DROP TABLE
```

In the preceding example, a function containing an autonomous transaction is finally executed in a transaction block to be rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by the autonomous transaction.

11.5 Package Supporting Autonomous Transaction

An autonomous transaction can be defined in a stored procedure or function in a package. The identifier of an autonomous transaction is **PRAGMA AUTONOMOUS_TRANSACTION**. The syntax of an autonomous transaction is the same as that of creating a stored procedure or function in a package. For details, see **CREATE PACKAGE**.

```
gaussdb=# create database test DBCOMPATIBILITY = 'ORA';
CREATE DATABASE
test=# \c test
-- Create a table.
test=# CREATE TABLE t2(a INT, b INT);
NOTICE:  The 'DISTRIBUTE BY' clause is not specified. Using 'a' as the distribution column by default.
HINT:  Please use 'DISTRIBUTE BY' clause to specify suitable data distribution column.
CREATE TABLE
test=# INSERT INTO t2 VALUES(1,2);
INSERT 0 1
test=# SELECT * FROM t2;
 a | b
---+---
 1 | 2
(1 row)

-- Create a stored procedure or function in a package that contains autonomous transactions.
test=# CREATE OR REPLACE PACKAGE autonomous_pkg AS
  PROCEDURE autonomous_4(a INT, b INT);
  FUNCTION autonomous_32(a INT ,b INT) RETURN INT;
END autonomous_pkg;
/
CREATE PACKAGE
test=# CREATE OR REPLACE PACKAGE BODY autonomous_pkg AS
PROCEDURE autonomous_4(a INT, b INT)  AS
DECLARE
 num3 INT := a;
 num4 INT := b;
 PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO t2 VALUES(num3, num4);
END;
FUNCTION autonomous_32(a INT ,b INT) RETURN INT AS
DECLARE
    PRAGMA AUTONOMOUS_TRANSACTION;
BEGIN
    INSERT INTO t2 VALUES(a, b);
    RETURN 1;
END;
END autonomous_pkg;
/
CREATE PACKAGE BODY
-- Create a common stored procedure that calls a stored procedure or function from a package that
contains autonomous transactions.
```

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

```
test=# CREATE OR REPLACE PROCEDURE autonomous_5(a INT, b INT)  AS
DECLARE
va INT;
BEGIN
    INSERT INTO t2 VALUES(666, 666);
    autonomous_pkg.autonomous_4(a,b);
        va := autonomous_pkg.autonomous_32(a + 1, b + 1);
    ROLLBACK;
END;
/
CREATE PROCEDURE
-- Call a common stored procedure.
test=# SELECT autonomous_5(11,22);
 autonomous_5
--------------

(1 row)

-- View the table result.
test=# SELECT * FROM t2 ORDER BY a;
 a  | b
----+----
  1 |  2
 11 | 22
 12 | 23
(3 rows)

test=# DROP TABLE t2;
DROP TABLE
```

In the preceding example, a stored procedure or function in a package containing autonomous transactions is finally executed in a transaction block that is rolled back, which directly illustrates a characteristic of the autonomous transaction, that is, rollback of the primary transaction does not affect content that has been committed by an autonomous transaction.

12 System Catalogs and System Views

12.1 Overview of System Catalogs and System Views

System catalogs store the structured metadata of GaussDB. They are the source of information used by GaussDB to control system running and are a core component of the database system.

System views provide ways to query system catalogs and internal database status.

System catalogs and system views are visible to either system administrators or all users. Some of the following system catalogs and views have marked the need of administrator permissions. They are accessible only to administrators.

You can delete and rebuild the catalogs, add columns to them, and insert and update values in them, but doing so may make system information inconsistent and cause system faults. Generally, users should not modify system catalogs or system views, or rename their schemas. They are automatically maintained by the system.

NOTICE

- You are advised not to modify the permissions on system catalogs or system views.
- Do not add, delete, or modify system catalogs because doing so will result in exceptions or even cluster unavailability.
- System catalogs and views do not support foreign key-related columns.
- For details about column types in system catalogs and system views, see **Data Types**.
- For ADM views, the accessed objects are all objects of this type in the database. Therefore, unified permission management is required for ADM views. By default, only the system administrator has the permission to access ADM views. Some ADM view data comes from public and non-sensitive columns in base tables. For DB views, the objects that the current user has the permission to access in the database can be queried. Common users can access these views. For MY views, objects to which the current user belongs can be queried. Common users can access these views.

12.2 System Catalogs

12.2.1 Partitioned Table

12.2.1.1 PG_PARTITION

PG_PARTITION records all partitioned tables, table partitions, and index partitions in the database. Partitioned index information is not stored in the system catalog PG_PARTITION. The partitioned table does not have actual physical files. Therefore, pg_partition does not record information such as **relfilenode**, **relpages**, **reltuples**, **reltoastrelid**, and **reltoastidxid**.

Table 12-1 PG_PARTITION columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Names of the partitioned tables, table partitions, TOAST tables on table partitions, and index partitions.
parttype	"char"	Object type. • **'r'**: partitioned table. • **'p'**: table partition. • **'x'**: index partition.
parentid	oid	• OID of the partitioned table in PG_CLASS when the object is a partitioned table or a partition. • OID of the partitioned index when the object is an index partition.
rangenum	integer	Reserved column.
intervalnum	integer	Reserved column.
partstrategy	"char"	Partition policy of the partitioned table. • **'r'**: range partition. • **'l'**: list partition. • **'h'**: hash partition. • **'n'**: no partition policy. The object is not a table partition.
relfilenode	oid	Physical storage locations of the table partition, index partition, and TOAST table on the table partition.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
reltablespace	oid	OID of the tablespace containing the table partition, index partition, and TOAST table on the table partition.
relpages	double precision	Statistics: numbers of data pages of the table partition and index partition.
reltuples	double precision	Statistics: numbers of tuples of the table partition and index partition.
relallvisible	integer	Statistics: number of visible data pages of the table partition and index partition.
reltoastrelid	oid	OID of the TOAST table corresponding to the table partition.
reltoastidxid	oid	OID of the TOAST table index corresponding to the table partition.
indextblid	oid	OID of the table partition corresponding to the index partition.
indisusable	boolean	Specifies whether the index partition is available. • **t** (true): yes. • **f** (false): no.
relfrozenxid	xid32	Frozen transaction ID. To ensure forward compatibility, this column is reserved. The **relfrozenxid64** column is added to record the information.
intspnum	integer	Number of tablespaces that the interval partition belongs to.
partkey	int2vector	Column number of the partition key.
intervaltablespace	oidvector	Tablespace that the interval partition belongs to. Interval partitions fall in the tablespaces in the round-robin manner.
interval	text[]	Interval value of the interval partition.
boundaries	text[]	Upper boundary of the range partition and interval partition.
transit	text[]	Transit of the interval partition.
reloptions	text[]	Storage property of a partition used for collecting online scale-out information. Same as **pg_class.reloptions**, it is expressed in a string in the format of keyword=value.
relfrozenxid64	xid	Frozen transaction ID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relminmxid	xid	Frozen multi-transaction ID.
partitionno	integer	Used for maintaining the partition map of a partitioned table. • If the object is a partition, this column indicates the partition ID, which starts from 1 in ascending order. • If the object is a partitioned table, this column indicates the maximum partition ID and a negative value is used for special meaning. The value increases with the DDL syntax of some partitions. • If the object is of other types, this column is null and has no meaning. **partitionno** is a permanent auto-increment column, which can be reset or reclaimed by using the syntax ALTER TABLE t_name RESET PARTITION.
subpartitionno	integer	Reserved column.

12.2.2 Workload Management

12.2.2.1 PG_APP_WORKLOADGROUP_MAPPING

PG_APP_WORKLOADGROUP_MAPPING provides load mapping group information in the database.

Table 12-2 PG_APP_WORKLOADGROUP_MAPPING columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
appname	name	Application name
workload_gpname	name	Mapped workload group name

12.2.3 OLTP Table Compression

12.2.3.1 GS_ILM

The GS_ILM system catalog provides the main information about the ILM policy, including the policy name, policy owner, policy type, policy ID, and policy status.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-3 GS_ILM columns

Name	Type	Description
pidx	integer	Policy sequence number, which is globally unique and starts with 1.
creator	oid	Policy owner.
name	name	Policy name. Currently, the policy name cannot be customized. The default name is p +pidx.
ptype	"char"	Policy type: • **m**: data movement.
flag	smallint	Value range: • **0**: The policy is enabled. • **1**: The policy is disabled.

12.2.3.2 GS_ILM_JOBDETAIL

The GS_ILM_JOBDETAIL system catalog records policy action types and judgment conditions.

Table 12-4 GS_ILM_JOBDETAIL columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
jobtype	"char"	Current job type: compression ('c').
jobstatus	smallint	Current job status: • **1**: JOB CREATED • **2**: COMPLETED SUCCESSFULLY • **3**: FAILED • **4**: STOPPED • **5**: JOB CREATION FAILED
jobname	text	The ADO job name is unique in the table and is joined with **job_name** in the PG_JOB system catalog.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
payload	text	PL/SQL code of the current job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
statistics	text	Statistics of the current job.
comments	text	Description of the current job execution, such as the failure cause.

12.2.3.3 GS_ILM_OBJECT

GS_ILM_OBJECT records the relationships between data objects and policies as well as the scheduling information of policies on the data objects. When a policy is set for a partitioned table, this catalog generates an independent record for each partition or subpartition.

Table 12-5 GS_ILM_OBJECT columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	OID of a logical data object which has a partitioned table.
dataobjoid	oid	OID of a physical data object, which is the entity that needs to execute the policy and the leaf of the tree-level partition relationship.
objtype	"char"	Current data object type. The options are as follows: • Table ('r') • Partition ('p')
origobjoid	oid	OID of the original object that defines the policy.
origobjtype	"char"	Type of the original data object that defines the policy. The options are as follows: • Table ('r') • Partition ('p')
lastchktime	timestamp with time zone	Time of the last ADO task.
lastexetime	timestamp with time zone	Time of the last ADO job.
roundcnt	smallint	Number of successful rounds.
failcnt	smallint	Number of failures.
lastjobstatus	"char"	Execution status of the last job.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lastroundstarttime	timestamp with time zone	Start time of the full table scan.
lastjobblkid	bigint	ID of the block that has been processed by the job last time.
flag	smallint	Value range: • **0**: The object compression policy is enabled. • **1**: The object compression policy is disabled. • **2**: The object compression policy is enabled, and a full table scan is completed during the last compression scheduling.
lasthashbktpos	ARRAY	Records the last compression position of the previous compression scheduling by storing two values: **[bucketid, blockid]**.

12.2.3.4 GS_ILM_PARAM

GS_ILM_PARAM is a feature parameter table, which records the parameters related to the ILM feature, such as the control parameters of background scheduling.

Table 12-6 GS_ILM_PARAM columns

Name	Type	Description
idx	smallint	Parameter ID.
name	name	Parameter name.
value	double precision	Parameter value.

Table 12-7 GS_ILM_PARAM feature parameter range

Parameter ID	Parameter Value	Description
1	EXECUTION_INTERVAL	Specifies the frequency of executing an ADO task, in minutes. The default value is **15**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter Value	Description
2	RETENTION_TIME	Specifies the retention period of ADO-related history records, in days. The default value is **30**. The value is an integer or floating-point number greater than or equal to 1 and less than or equal to 2147483647. The value is rounded down.
7	ENABLE	Status of background scheduling. This parameter cannot be modified using DBE_ILM_ADMIN.CUSTOMIZE_ILM. Use DBE_ILM_ADMIN.DISABLE_ILM or DBE_ILM_ADMIN.ENABLE_ILM to modify it.
11	POLICY_TIME	Specifies whether the time unit of ADO is day or second. The time unit second is used only for testing. Value range: ● **0** (default): The unit is day. ● **1**: The unit is second, which is generally used in test scenarios.
12	ABS_JOBLIMIT	Specifies the maximum number of ADO jobs generated by an ADO task. The default value is **10**. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
13	JOB_SIZELIMIT	Specifies the maximum number of bytes that can be processed by a single ADO job. The unit is MB. The default value is **1024**. The value is an integer or floating-point number greater than or equal to 0 and less than or equal to 2147483647. The value is rounded down.
14	WIND_DURATION	Specifies the maintenance window duration, in minutes. The default value is 240 minutes (4 hours). The value is an integer greater than or equal to 0 and less than 1440 (24 hours).
15	BLOCK_LIMITS	Specifies the upper limit of the instance-level row-store compression rate. The default value is **40**. The value ranges from 0 to 10000, in block/ms, indicating the maximum number of blocks that can be compressed per millisecond. **0** indicates that the rate is not limited.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter Value	Description
16	ENABLE_META_COMPRESSION	Specifies whether to enable header compression. The default value is **0** (disabled), and the value **1** indicates that header compression is enabled. **NOTE** If this parameter is set to **1**, the compression ratio is improved for tables with short rows (less data in a single row), but the performance of accessing compressed rows greatly deteriorates. If most tables in the database have long rows, you are advised not to enable this parameter.
17	SAMPLE_MIN	Minimum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
18	SAMPLE_MAX	Maximum sampling step for constant encoding and equivalent encoding. The default value is **10**. The value range is [1,100]. Decimals can be entered and will be automatically rounded down.
19	CONST_PRIO	Constant encoding priority. The default value is **40**. The value range is [0,100]. The value **100** indicates that constant encoding is disabled. Decimals can be entered and will be automatically rounded down.
20	CONST_THRESHOLD	Constant encoding threshold. The default value is **90**. The value range is [1,100], indicating that constant encoding is performed when the proportion of constant values in a column exceeds the threshold. Decimals can be entered and will be automatically rounded down.
21	EQVALUE_PRIO	Equivalent encoding priority. The default value is **60**. The value range is [0,100]. The value **100** indicates that equivalent encoding is disabled. Decimals can be entered and will be automatically rounded down.
22	EQVALUE_THRESHOLD	Equivalent encoding threshold. The default value is **80**. The value range is [1,100], indicating that equivalent encoding is performed when the ratio of equal values in two columns exceeds the threshold. Decimals can be entered and will be automatically rounded down.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter ID	Parameter Value	Description
23	ENABLE_DELTA_ENCODE_SWITCH	Specifies whether to enable difference encoding. The default value is **1**. The value **0** indicates that difference encoding is disabled, and the value **1** indicates that difference encoding is enabled. Decimals can be entered and will be automatically rounded down.
24	LZ4_COMPRESSION_LEVEL	LZ4 compression level. The default value is **0**. The value range is [0,16]. Decimals can be entered and will be automatically rounded down.
25	ENABLE_LZ4_PARTIAL_DECOMPRESSION	Specifies whether to enable partial decompression. The default value is **1**. The value **0** indicates that partial decompression is disabled, and the value **1** indicates that partial decompression is enabled. Decimals can be entered and will be automatically rounded down.

12.2.3.5 GS_ILM_POLICY

The GS_ILM_POLICY system catalog records policy action types and judgment conditions.

Table 12-8 GS_ILM_POLICY columns

Name	Type	Description
pidx	integer	Policy ID.
action	"char"	Policy action. Only compression ('c') is supported.
ctype	"char"	Compression type. Only advanced row compression ('a') is supported.
condition	"char"	Condition type. Only LAST MODIFICATION('m') is supported.
days	smallint	Number of judgment days.
scope	"char"	Policy scope. Only row ('r') is supported.
predicate	pg_node_tree	Policy row-level expression.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.3.6 GS_ILM_TASK

The GS_ILM_TASK system catalog records ADO task information, such as the creation time, start time, end time, and execution status.

Table 12-9 GS_ILM_TASK columns

Name	Type	Description
taskoid	bigint	OID of an ADO task.
creator	oid	Creator of an ADO task.
createtime	timestamp with time zone	Creation time.
starttime	timestamp with time zone	Start time.
completetime	timestamp with time zone	Completion time.
executestate	smallint	Value range: • **1**: 'INACTIVE' • **2**: 'ACTIVE' • **3**: 'COMPLETED'
flag	smallint	Reserved column.

12.2.3.7 GS_ILM_TASKDETAIL

The GS_ILM_TASKDETAIL system catalog records the evaluation result of a specified data object and policy.

Table 12-10 GS_ILM_TASKDETAIL columns

Name	Type	Description
pidx	integer	Policy ID.
objoid	oid	Data OID.
objtype	"char"	Data object type.
taskoid	bigint	OID of an ADO task.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
evalresult	smallint	Evaluation result: • **0**: SELECTED FOR EXECUTION. The evaluation is passed. • **1**: PRECONDITION NOT SATISFIED. The condition is not met. • **2**: JOB ALREADY EXISTS. The job already exists.
jobname	text	ADO job name generated after the evaluation is passed is joined with the **jobname** column in the GS_ILM_JOBDETAIL system catalog.

12.2.3.8 GS_ILM_TICKER

The GS_ILM_TICKER system catalog records the mapping between LSNs and time. A maximum of 3650 lines of records can be retained.

Table 12-11 GS_ILM_TICKER columns

Name	Type	Description
ilm_ticker_lsn	bigint	LSN when the dotting operation is triggered.
ilm_ticker_time	timestamp with time zone	Time when the dotting operation is triggered.

12.2.4 Encrypted Equality Query

12.2.4.1 GS_CLIENT_GLOBAL_KEYS

GS_CLIENT_GLOBAL_KEYS records information about the CMK in the encrypted equality feature. Each record corresponds to a CMK.

Table 12-12 GS_CLIENT_GLOBAL_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_name	name	CMK name
key_namespace	oid	A namespace OID that contains this CMK

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
key_owner	oid	CMK owner
key_acl	aclitem[]	Access permissions that this key should have on creation
create_date	timestamp without time zone	Time when a key is created

12.2.4.2 GS_CLIENT_GLOBAL_KEYS_ARGS

GS_CLIENT_GLOBAL_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

Table 12-13 GS_CLIENT_GLOBAL_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
global_key_id	oid	CMK OID
function_name	name	The value is **encryption**.
key	name	CMK metadata name
value	bytea	Value of the CMK metadata name

12.2.4.3 GS_COLUMN_KEYS

GS_COLUMN_KEYS records information about the CEK in the encrypted equality feature. Each record corresponds to a CEK.

Table 12-14 GS_COLUMN_KEYS columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
column_key_name	name	CEK name.
column_key_distributed_id	oid	ID obtained based on the hash value of the fully qualified domain name (FQDN) of the CEK.
global_key_id	oid	A foreign key, which is the CMK OID.
key_namespace	oid	A namespace OID that contains this CEK.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
key_owner	oid	CEK owner.
create_date	timestamp without time zone	Time when the CEK is created.
key_acl	aclitem[]	Access permissions that this CEK should have on creation.

12.2.4.4 GS_COLUMN_KEYS_ARGS

GS_COLUMN_KEYS_ARGS records the metadata about the CMK in the encrypted equality feature. Each record corresponds to a key-value pair of the CMK.

Table 12-15 GS_COLUMN_KEYS_ARGS columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
column_key_id	oid	CEK OID
function_name	name	The value is **encryption**.
key	name	CEK metadata name
value	bytea	Value of the CEK metadata name

12.2.4.5 GS_ENCRYPTED_COLUMNS

GS_ENCRYPTED_COLUMNS records information about encrypted columns in the encrypted equality feature. Each record corresponds to an encrypted column.

Table 12-16 GS_ENCRYPTED_COLUMNS columns

Name	Type	Description
rel_id	oid	Table OID
column_name	name	Name of an encrypted column.
column_key_id	oid	A foreign key, which is the CEK OID
encryption_type	tinyint	Encryption type. The value can be **2(DETERMINISTIC)** or **1(RANDOMIZED)**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
data_type_original_oid	oid	ID of the original data type of the encrypted column. For details about the values, see the oid columns in the **PG_TYPE** system catalog.
data_type_original_mod	integer	Modifiers of the original data type of the encrypted column. For details about the values, see the atttypmod columns in the **PG_ATTRIBUTE** system catalog.
create_date	timestamp without time zone	Time when an encrypted column is created

12.2.4.6 GS_ENCRYPTED_PROC

GS_ENCRYPTED_PROC provides information such as the parameters of encrypted functions and stored procedure functions, original data type of return values, and encrypted columns.

Table 12-17 GS_ENCRYPTED_PROC columns

Name	Type	Description
oid	oid	Row identifier (hidden column).
func_id	oid	OID of the function, corresponding to the OID row identifier in the **PG_PROC** system catalog.
prorettype_orig	integer	Original data type of the return value.
last_change	timestamp without time zone	Last modification time of the encrypted function.
proargcachedcol	oidvector	OID of the encrypted column corresponding to the **INPUT** parameter of the function, corresponding to the OID row identifier in the **GS_ENCRYPTED_COLUMNS** system catalog.
proallargtypes_orig	oid[]	Original data type of all function parameters.

12.2.5 Communications

12.2.5.1 PGXC_NODE

PGXC_NODE records information about cluster nodes.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTICE

- PGXC_NODE stores information about database instance nodes. The PGXC_NODE system catalog has specific meanings only on CNs and its data is valid and correct.
- In the result of querying the PGXC_NODE system catalog on a DN, only the **node_id** column is meaningful. Other columns are meaningless and invalid.

Table 12-18 PGXC_NODE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
node_name	name	Node name.
node_type	"char"	Node type. • **C**: CN • **D**: DN • **S**: standby node
node_port	integer	Port number of the node.
node_host	name	Host name or IP address of a node. (If a virtual IP address is configured, its value is a virtual IP address.)
node_port1	integer	Port number of a replication node.
node_host1	name	Host name or IP address of a replication node. (If a virtual IP address is configured, its value is a virtual IP address.)
hostis_primary	Boolean	Specifies whether a primary/standby switchover occurs on the current node. • **t** (true): yes • **f** (false): no
nodeis_primary	Boolean	Specifies whether the current node is preferred to execute non-query operations in the **replication** table. • **t** (true): yes • **f** (false): no
nodeis_preferred	Boolean	Specifies whether the current node is preferred to execute queries in the **replication** table. • **t** (true): yes • **f** (false): no
node_id	integer	Node ID. The value is obtain by calculating the value of **node_name** using the hash function.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sctp_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port	integer	Port used by the TCP proxy communications library of the primary node to listen to the control channel.
sctp_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the data channel. (The SCTP communications library is no longer supported in the current version.)
control_port1	integer	Port used by the TCP proxy communications library of the standby node to listen to the control channel.
nodeis_central	Boolean	Specifies whether the current node is a central control node. It is used only for CNs and is invalid for DNs. • **t** (true): yes • **f** (false): no
nodeis_active	Boolean	Specifies whether the current node is normal. It is used to mark whether the CN is removed and is invalid for DNs. • **t** (true): yes • **f** (false): no

12.2.6 Ledger Database

12.2.6.1 GS_GLOBAL_CHAIN

GS_GLOBAL_CHAIN records information about modification operations performed by users on the tamper-proof user table. Each record corresponds to a table-level modification operation. Users with the audit administrator permission can query this system catalog, but no user is allowed to modify this system catalog.

Table 12-19 GS_GLOBAL_CHAIN columns

Name	Type	Description
blocknum	bigint	Block number, which is the sequence number of the current user operation recorded in the ledger.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dbname	name	Name of the database to which the modified tamper-proof user table belongs.
username	name	Username, which is the name of the user who performs the operation of modifying the user table.
starttime	timestamp with time zone	Time when a user performs an operation.
relid	oid	OID of the modified tamper-proof user table
relnsp	name	Schema name, which is the name of the schema to which the modified tamper-proof user table belongs.
relname	name	User table name, which is the name of the modified tamper-proof user table.
relhash	hash16	Table-level hash change amount generated by operations.
globalhash	hash32	Global digest, which is calculated based on the information of the current row and **globalhash** of the previous row. It connects the entire table to verify the integrity of GS_GLOBAL_CHAIN data.
txcommand	text	SQL statement whose operations are recorded.

12.2.7 SPM

12.2.7.1 GS_SPM_SQL

GS_SPM_SQL is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store SPM information. Users with sysadmin permissions can read the system catalog, but only the initial user can write the system catalog.

Table 12-20 GS_SPM_SQL columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
sql_text	text	SQL text string.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
param_num	integer	Number of parameters required for SQL execution.
user	oid	OID of the login user.
creation_time	timestamp with time zone	Time when a record is created.

12.2.7.2 GS_SPM_PARAM

GS_SPM_PARAM is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store SQL parameters. Each SQL statement stores only one group of parameters. Users with the sysadmin permission can read the system catalog, but only the initial user can write the system catalog.

Table 12-21 GS_SPM_PARAM columns

Name	Type	Description
sql_namespace	oid	Schema OID
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
position	integer	Position index of a parameter in the SQL statement, starting from 0.
datatype	integer	OID of the parameter type.
datatype_string	text	Character string of a parameter type.
value_string	text	Character string of a parameter value.
is_null	boolean	Determines whether a parameter value is **NULL**.
hash_value	bigint	Hash value of a parameter value.
user	oid	User who creates the record.
creation_time	timestamp with time zone	Time when a record is created.

12.2.7.3 GS_SPM_BASELINE

GS_SPM_BASELINE is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to store

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

baseline information. Users with sysadmin permissions can read the system catalog, but only the initial user can write the system catalog.

Table 12-22 GS_SPM_BASELINE columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Unique ID of a plan in the current SQL statement.
outline	text	Outline text, which can be used to fix a group of hints of the current plan.
cost	double precision	Total plan cost.
user	oid	User who creates the baseline.
status	integer	Baseline status. The options are as follows: ● **0** (UNACC): indicates that the plan is not accepted. ● **1** (ACC): indicates that the plan has been accepted. ● **2** (FIXED): indicates a special ACC plan. The matching priority of this plan is higher than that of other ACC plan.
source	text	Baseline source.
gplan	Boolean	Determines whether the plan is a gplan.
creation_time	timestamp with time zone	Time when the baseline is created.
last_used_time	timestamp with time zone	Last time when a plan was used.
modification_time	timestamp with time zone	Time when the baseline is modified.
jump_intercept_cnt	bigint	Number of baseline interception plan jumps.
invalid	Boolean	Specifies whether the current baseline is invalid.

12.2.7.4 GS_SPM_EVOLUTION

GS_SPM_EVOLUTION is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. It is a system catalog used to

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

store plan evolution result. Users with sysadmin permissions can read the system catalog, but only the initial user can write the system catalog.

Table 12-23 GS_SPM_EVOLTOIN columns

Name	Type	Description
sql_namespace	oid	Schema OID.
sql_hash	bigint	Unique ID of the SQL statement in the SPM.
plan_hash	bigint	Plan ID.
better	boolean	Determines whether it is a positive evolution. ● **t** indicates positive evolution. ● **f** indicates negative evolution.
refer_plan	bigint	Plan hash used as a reference for report generation.
status	integer	Determines whether exceptions occur during the evolution. ● The value **0** indicates that no exception occurs. ● The value **1** indicates that an exception occurs.
reason	text	Content of the evolution report.
user	oid	User who generates the evolution result.
creation_time	timestamp with time zone	Time when the evolution result is created.

12.2.7.5 GS_SPM_ID_HASH_JOIN

GS_SPM_ID_HASH_JOIN is a system catalog in the SPM feature. Currently, this feature is not supported in the distributed system. The system catalog stores the relationship between unique_sql_id and sql_hash. Users with sysadmin permissions can read the system catalog, but only the initial user can write data to the system catalog.

Table 12-24 GS_SPM_ID_HASH_JOIN columns

Name	Type	Description
unique_sql_id	bigint	Unique ID of an SQL statement in the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
sql_hash	bigint	Unique ID of the SQL statement in the SPM.

12.2.8 AI

12.2.8.1 GS_MODEL_WAREHOUSE

GS_MODEL_WAREHOUSE stores AI engine training models, including the models and detailed description of the training process.

Table 12-25 GS_MODEL_WAREHOUSE columns

Name	Data Type	Description
oid	oid	Hidden column
modelname	name	Unique constraint
modelowner	oid	OID of a model owner
createtime	timestamp without time zone	Time when a model is created
processedtuples	integer	Number of tuples involved in training
discardedtuples	integer	Number of unqualified tuples not involved in training
preprocesstime	real	Data preprocessing time
exectime	real	Training duration
iterations	integer	Iteration round
outputtype	oid	OID of the output data type
modeltype	text	AI operator type
query	text	Query statement executed to create a model
modeldata	bytea	Stored binary model information
weight	real[]	Currently, this column applies only to GD operator models.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Data Type	Description
hyperparametersnames	text[]	Involved hyperparameter name
hyperparametersvalues	text[]	Hyperparameter value
hyperparametersoids	oid[]	OID of the data type corresponding to a hyperparameter
coefnames	text[]	Model parameter
coefvalues	text[]	Value of a model parameter
coefoids	oid[]	OID of the data type corresponding to a model parameter
trainingscoresname	text[]	Method used to measure model performance
trainingscoresvalue	real[]	Value used to measure model performance
modeldescribe	text[]	Model description

12.2.8.2 GS_OPT_MODEL

GS_OPT_MODEL is a data table used when the AI engine is enabled to predict the planned time. It records the configurations, training results, features, corresponding system functions, and training history of machine learning models.

NOTE

In the distributed scenario, this system catalog is provided, but the AI capabilities are unavailable.

12.2.8.3 GS_ABO_MODEL_STATISTIC

GS_ABO_MODEL_STATISTIC records the metadata, model name, and operator information of the ABO-based model estimation based on the feedback cardinality.

NOTE

This system catalog is provided in distributed scenarios, but the capability of estimating based on the feedback cardinality is unavailable.

12.2.9 Auditing

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.9.1 GS_AUDITING_POLICY

GS_AUDITING_POLICY records the main information about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

Table 12-26 GS_AUDITING_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
polname	name	Policy name, which must be unique
polcomments	name	Policy description field, which records policy-related description information and is represented by the **COMMENTS** keyword
modifydate	timestamp without time zone	The latest timestamp when a policy is created or modified
polenabled	boolean	Specifies whether to enable the policy. • **t** (true): enabled. • **f** (false): disabled.

12.2.9.2 GS_AUDITING_POLICY_ACCESS

GS_AUDITING_POLICY_ACCESS records the unified audit information about DML database operations. Only the system administrator or security policy administrator can access this system catalog.

Table 12-27 GS_AUDITING_POLICY_ACCESS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
accesstype	name	DML database operation type. For example, SELECT, INSERT, and DELETE.
labelname	name	Specifies the resource label name. This parameter corresponds to the **polname** column in the system catalog in **GS_AUDITING_POLICY**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
policyoid	oid	OID of the audit policy, corresponding to the OID in the 12.2.9.1 GS_AUDITING_POLICY system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

12.2.9.3 GS_AUDITING_POLICY_FILTERS

GS_AUDITING_POLICY_FILTERS records the filtering policies about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

Table 12-28 GS_AUDITING_POLICY_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is **logical_expr**.
labelname	name	Name. Currently, the value is **logical_expr**.
policyoid	oid	OID of the audit policy, corresponding to the OID in the system catalog in GS_AUDITING_POLICY.
modifydate	timestamp without time zone	Latest creation or modification timestamp.
logicaloperator	text	Logical character string of a filter criterion.

12.2.9.4 GS_AUDITING_POLICY_PRIVILEGES

GS_AUDITING_POLICY_PRIVILEGES records the DDL database operations about the unified audit. Each record corresponds to a design policy. Only the system administrator or security policy administrator can access this system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-29 GS_AUDITING_POLICY_PRIVI columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
privilegetype	name	DDL database operation type, for example, **CREATE**, **ALTER**, and **DROP**.
labelname	name	Resource label name, which corresponds to the **polname** column in the 12.2.9.1 GS_AUDITING_POLICY system catalog.
policyoid	oid	Corresponds to OIDs in the 12.2.9.1 GS_AUDITING_POLICY system catalog.
modifydate	timestamp without time zone	Latest creation or modification timestamp.

12.2.10 User and Permission Management

12.2.10.1 GS_DB_PRIVILEGE

GS_DB_PRIVILEGE records the granting of ANY permissions. Each record corresponds to a piece of authorization information.

Table 12-30 GS_DB_PRIVILEGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
roleid	oid	User ID
privilege_type	text	ANY permission of a user. For details about the value, see **Table 7-272**.
admin_option	boolean	Whether the ANY permission recorded in the **privilege_type** column can be re-granted • **t**: yes • **f**: no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.10.2 PG_DB_ROLE_SETTING

PG_DB_ROLE_SETTING records the default values of configuration items bound to each role and data when the database is running.

Table 12-31 PG_DB_ROLE_SETTING columns

Name	Type	Description
setdatabase	oid	Database corresponding to the configuration items (**0** if no database is specified).
setrole	oid	Role corresponding to the configuration items (**0** if no role is specified).
setconfig	text[]	Default value of runtime configuration items. Contact an administrator to configure it.

12.2.10.3 PG_DEFAULT_ACL

PG_DEFAULT_ACL records initial permissions assigned to newly created objects.

Table 12-32 PG_DEFAULT_ACL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
defaclrole	oid	ID of the role associated with the permission
defaclnamespace	oid	Namespace associated with the permission (**0** if no ID)
defaclobjtype	"char"	Object type of the permission • **r**: table or view • **S**: sequence • **f**: function • **T**: type • **K**: client master key • **k**: column encryption key
defaclacl	aclitem[]	Access permissions that this type of object should have on creation

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.10.4 PG_RLSPOLICY

PG_RLSPOLICY records row-level security policies.

Table 12-33 PG_RLSPOLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Name of the row-level security policy.
polrelid	oid	OID of the table object on which the row-level security policy takes effect.
polcmd	"char"	SQL operations affected by the row-level security policy.
polpermissive	Boolean	Attribute of the row-level security policy. • **t**: OR condition concatenation of expressions. • **f**: AND condition concatenation of expressions.
polroles	oid[]	OID list of users affected by the row-level security policy. If this parameter is not specified, all users are affected.
polqual	pg_node_tree	Expression of the row-level security policy.

12.2.10.5 PG_SECLABEL

PG_SECLABEL records security labels on database objects.

See also **PG_SHSECLABEL**, which provides a similar function for security labels of database objects that are shared across a database cluster.

Table 12-34 PG_SECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object this security label pertains to.
classoid	oid	**PG_CLASS**.oid	OID of the system catalog that contains the current object.
objsubid	integer	-	No. of a column in the current object.
provider	text	-	Label provider associated with the current label.
label	text	-	Security label applied to this object.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.10.6 PG_SHSECLABEL

PG_SHSECLABEL records security labels on shared database objects. Security labels can be manipulated with the **SECURITY LABEL** command.

For an easier way to view security labels, see **PG_SECLABELS**.

See also **PG_SECLABEL**, which provides a similar function for security labels involving objects within a single database.

Unlike most system catalogs, PG_SHSECLABEL is shared across all databases of a cluster. There is only one copy of PG_SHSECLABEL per cluster, not one per database.

Table 12-35 PG_SHSECLABEL columns

Name	Type	Reference	Description
objoid	oid	Any OID column	OID of the object this security label pertains to.
classoid	oid	**PG_CLASS**.oid	OID of the system catalog that contains the current object.
provider	text	-	Label provider associated with the current label.
label	text	-	Security label applied to the current object.

12.2.10.7 PG_USER_MAPPING

PG_USER_MAPPING records mappings from local users to remote.

This system catalog is accessible only to system administrators. Common users can query the **PG_USER_MAPPINGS** view.

Table 12-36 PG_USER_MAPPING columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
umuser	oid	**PG_AUTHID**.oid	OID of the local role being mapped (**0** if the user mapping is public)
umserver	oid	**PG_FOREIGN_SERVER**.oid	OID of the foreign server that contains the current mapping.
umoptions	text[]	-	User mapping specific options, expressed in a string in the format of keyword=value

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.10.8 PG_USER_STATUS

PG_USER_STATUS records the states of users who access the database. This system catalog is accessible only to users with the system administrator permission.

Table 12-37 PG_USER_STATUS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role
failcount	integer	Number of failed attempts
locktime	timestamp with time zone	By default, the creation date of the role is displayed. If the role is locked by the administrator or the role is locked because the number of login failures exceeds the threshold, the date when the role is locked is displayed.
rolstatus	smallint	Role state. • **0**: normal. • **1**: The role is locked for a specific period of time because the failed login attempts exceed the threshold. • **2**: The role is locked by the administrator. • **3**: The failed login attempts exceed the threshold, but the role is not locked.
permspace	bigint	Size of the permanent table storage space used by a role.
tempspace	bigint	Size of the temporary table storage space used by a role.
password expired	smallint	Specifies whether a password is valid. • **0**: The password is valid. • **1**: The password is invalid.

12.2.11 Connection and Authentication

12.2.11.1 PG_AUTHID

PG_AUTHID records information about database authentication identifiers (roles). The concept of users is contained in that of roles. A user is actually a role whose

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

rolcanlogin has been set. Any role, whether its **rolcanlogin** is set or not, can use other roles as members.

For a cluster, only one PG_AUTHID exists, which is not available for every database. This system catalog is accessible only to system administrators.

Table 12-38 PG_AUTHID columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
rolname	name	Role name.
rolsuper	boolean	Specifies whether a role is the initial system administrator with the highest permission. • **t** (true): yes • **f** (false): no
rolinherit	boolean	Specifies whether a role automatically inherits permissions of roles of which it is a member. • **t** (true): automatically inherited • **f** (false): not automatically inherited
rolcreaterole	boolean	Specifies whether a role can create more roles. • **t** (true): yes • **f** (false): no
rolcreatedb	boolean	Specifies whether a role can create databases. • **t** (true): yes • **f** (false): no
rolcatupdate	boolean	Specifies whether the role can directly update system catalogs. Only the initial system administrator whose **usesysid** is **10** has this permission. It is unavailable for other users. • **t** (true): yes • **f** (false): no
rolcanlogin	boolean	Specifies whether the role can log in, that is, whether the role can be given as the initial session authorization identifier. • **t** (true): yes • **f** (false): no

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rolreplication	boolean	Specifies whether the role has the replication permission. • **t** (true): yes • **f** (false): no
rolauditadmin	boolean	Specifies whether the role has the audit administrator permission. • **t** (true): yes • **f** (false): no
rolsystemadmin	boolean	Specifies whether the role has the system administrator permission. • **t** (true): yes • **f** (false): no
rolconnlimit	integer	Maximum number of concurrent connections that this role can make (valid for roles that can log in). The value **–1** indicates there is no limit.
rolpassword	text	Password ciphertext. If there is no password, the value is **NULL**.
rolvalidbegin	timestamp with time zone	Account validity start time (**NULL** if no start time).
rolvaliduntil	timestamp with time zone	Password expiry time (**NULL** if no expiration).
rolrespool	name	Resource pool that a user can use.
roluseft	boolean	Specifies whether the role can perform operations on foreign tables. • **t** (true): yes • **f** (false): no
rolparentid	oid	OID of a group user to which the user belongs.
roltabspace	text	Maximum size of a user data table.
rolkind	"char"	Type of a user. • **n**: common user • **p**: permanent user
roltempspace	text	Maximum size of a user's temporary table, in KB.
rolspillspace	text	Maximum size of data that can be written to disks when a user executes a job, in KB.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rolexcpdata	text	Query rules that can be set by users (reserved).
rolmonitoradmin	boolean	Specifies whether the role has the monitor administrator permission. • **t** (true): yes • **f** (false): no
roloperatoradmin	boolean	Specifies whether the role has the O&M administrator permission. • **t** (true): yes • **f** (false): no
rolpolicyadmin	boolean	Specifies whether the role has the security policy administrator permission. • **t** (true): yes • **f** (false): no

12.2.11.2 PG_AUTH_HISTORY

PG_AUTH_HISTORY records the authentication history of a role. This system catalog is accessible only to system administrators.

Table 12-39 PG_AUTH_HISTORY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
roloid	oid	ID of a role.
passwordtime	timestamp with time zone	Time of password creation and change.
rolpassword	text	Ciphertext of the role password. The encryption mode is determined by the GUC parameter **password_encryption_type**.

12.2.11.3 PG_AUTH_MEMBERS

PG_AUTH_MEMBERS records the membership between roles.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-40 PG_AUTH_MEMBERS columns

Name	Type	Description
roleid	oid	ID of a role that has a member
member	oid	ID of a role that is a member of ROLEID
grantor	oid	ID of a role that grants this membership
admin_option	boolean	Whether a member can grant membership in ROLEID to others. The value can be **true** (yes) and **false** (no).

12.2.12 Dynamic Data Masking

12.2.12.1 GS_MASKING_POLICY

GS_MASKING_POLICY records the main information about dynamic data masking policies. Each record corresponds to a masking policy. Only the system administrator or security policy administrator can access this system catalog.

Table 12-41 GS_MASKING_POLICY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
polname	name	Policy name, which must be unique.
polcomments	name	Policy description field, which records policy-related description information and is represented by the **COMMENTS** keyword
modifydate	timestamp without time zone	Latest timestamp when a policy is created or modified.
polenabled	boolean	Specifies whether to enable the policy. • **t** (true): enabled • **f** (false): disabled

12.2.12.2 GS_MASKING_POLICY_ACTIONS

GS_MASKING_POLICY_ACTIONS records the masking actions of a masking policy in the dynamic data masking policies. One masking policy corresponds to one or more rows of records in the catalog. Only the system administrator or security policy administrator can access this system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-42 GS_MASKING_POLICY_ACTIONS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified)
actiontype	name	Name of a masking function used by a masking policy
actparams	name	Parameter information transferred to a masking function
actlabelname	name	Name of a masked label
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in **GS_MASKING_POLICY**.
actmodifydate	timestamp without time zone	Latest timestamp when a record is created or modified

12.2.12.3 GS_MASKING_POLICY_FILTERS

GS_MASKING_POLICY_FILTERS records the user filtering criteria corresponding to the dynamic data masking policies. The corresponding masking policy takes effect only when the user information meets the filter criteria. Only the system administrator or security policy administrator can access this system catalog.

Table 12-43 GS_MASKING_POLICY_FILTERS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
filtertype	name	Filter type. Currently, the value is **logical_expr**.
filterlabelname	name	Filtering range. Currently, the value is **logical_expr**.
policyoid	oid	OID of a masking policy to which a record belongs, corresponding to the OID in **GS_MASKING_POLICY**.
modifydate	timestamp without time zone	Latest timestamp when a user filter criterion is created or modified.
logicaloperator	text	Polish notation of the filter criteria.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.13 DATABASE LINK

12.2.13.1 GS_DATABASE_LINK

GS_DATABASE_LINK stores database link information, mainly recording detailed information about database links. Only sysadmin can read this system catalog.

Table 12-44 GS_DATABASE_LINK columns

Name	Type	Description
oid	oid	Unique ID of the current database link object (hidden attribute, which must be specified).
dlname	name	Name of the current database link.
dlowner	oid	ID of the owner of the current database link. If the owner is **public**, the value is **0**.
dlfdw	oid	OID of the foreign-data wrapper of the current database link.
dlcreater	oid	ID of the creator of the current database link.
options	text[]	Current database link connection information in the format of "keyword=value".
useroptions	text[]	User information used by the current database link to connect to the remote end, in the format of "keyword=value".
dlacl	aclitem[]	Current database link access permission.

12.2.14 Materialized Views

12.2.14.1 GS_MATVIEW

GS_MATVIEW provides information about each materialized view in the database.

Table 12-45 GS_MATVIEW columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
mapid	oid	OID of a map table associated with a materialized view. Each map table corresponds to one materialized view. If a complete-refresh materialized view does not correspond to a map table, the value of this column is **0**.
ivm	boolean	Type of a materialized view. The value **t** indicates a fast-refresh materialized view, and the value **f** indicates a complete-refresh materialized view.
needrefresh	boolean	Reserved column.
refreshtime	timestamp without time zone	Last time when a materialized view was refreshed. If the materialized view is not refreshed, the value is null. This column is maintained only for fast-refresh materialized views on DNs. In other cases, the value is null.

12.2.14.2 GS_MATVIEW_DEPENDENCY

GS_MATVIEW_DEPENDENCY provides association information about each fast-fresh materialized view, base table, and Mlog table in the database. The Mlog table corresponding to the base table does not exist in the complete-refresh materialized view. Therefore, no record is written into the Mlog table.

Table 12-46 GS_MATVIEW_DEPENDENCY columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
matviewid	oid	OID of a materialized view.
relid	oid	OID of a base table of a materialized view.
mlogid	oid	OID of a Mlog table which is the log table of a materialized view. Each Mlog table corresponds to one base table.
mxmin	integer	Reserved column.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.15 Logical Decoding

In the logical decoding independent multi-version dictionary, the logical decoding dictionary catalog used is the system catalog. Logical decoding system catalogs are instance-level system catalogs. Only administrators can view and modify system catalogs.

12.2.15.1 GS_LOGICAL_ATTRDEF

GS_LOGICAL_ATTRDEF records the default values of storage columns required for logical decoding.

Table 12-47 GS_LOGICAL_ATTRDEF columns

Column	Type	Description
adid	oid	Identifier of an attribute descriptor.
adrelid	oid	OID of the table to which the catalog belongs.
adnum	smallint	Attribute number.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.
adbin	pg_node_tree	Expression of the default value.
adgencol	"char"	Specifies whether a column is a GENERATED column.

12.2.15.2 GS_LOGICAL_ATTRIBUTE

GS_LOGICAL_ATTRIBUTE records information about catalog fields required for logical decoding.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-48 GS_LOGICAL_ATTRIBUTE columns

Column	Type	Description
attrelid	oid	RELATION OID that contains the attribute.
attname	name	Attribute name.
atttypid	oid	OID of the data type of the attribute.
attlen	smallint	Attribute length.
attnum	smallint	Attribute ID, which uniquely identifies an attribute in a relationship.
atthasdef	boolean	Specifies whether an attribute has a default value.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.
attndims	integer	If the value is of the array type, the value is the declared dimension number. Otherwise, the value is zero.
attcacheoff	integer	Used for the byte offset of the function cache attribute in the heap tuple.
attbyval	boolean	Specifies whether an attribute is transferred by value.
attstorage	"char"	Attribute storage mode.
attalign	"char"	Alignment mode of an attribute.
attisdropped	boolean	Specifies whether the data is deleted (logically invisible).
attinitdefval	bytea	Default value expression of a storage attribute.
attcollation	oid	Copy of attcollation in **PG_ATTRIBUTE** of the column type.
atttypmod	integer	Copy of atttypmod in **PG_ATTRIBUTE** of the column type.

12.2.15.3 GS_LOGICAL_AUTHID

GS_LOGICAL_AUTHID records user information required for logical decoding.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-49 GS_LOGICAL_AUTHID columns

Column	Type	Description
rolid	oid	User ID.
rolname	name	Username.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
originid	integer	Source identifier of a tuple.
rolkind	"char"	User type.

12.2.15.4 GS_LOGICAL_CLASS

GS_LOGICAL_CLASS records information about database objects required for logical decoding and the relationships between the database objects.

Table 12-50 GS_LOGICAL_CLASS columns

Column	Type	Description
relname	name	Table name.
relnamespace	oid	Namespace OID.
relpersistence	"char"	Catalog durability (for example, **p** indicates a permanent table).
relkind	"char"	Table type (for example, **r** indicates a relationship).
relnatts	smallint	Number of columns in the table.
relhaspkey	bool	Specifies whether the table has (or has ever had) a primary key index.
relcmprs	tinyint	Compression attribute of a row in a table.
relreplident	"char"	Replica identity replication mode.
spacenode	oid	Tablespace OID.
dbnode	oid	Database OID.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
relnode	oid	Identifier of the physical storage file corresponding to the table.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
originid	integer	Source identifier of a tuple.
relid	oid	Relationship identifier (table OID).
relowner	oid	Identifier of the table owner.
reltoastrelid	oid	OID of the TOAST table (if any).
relhasoids	boolean	Specifies whether the table has an OID column.
relam	oid	Identifier that indicates the indexing method used by the table.
reloptions	text[]	Additional options for saving the table, stored in text format.
relbucket	oid	Identifier of the hash partitioning bucket to which the table belongs.
parttype	"char"	Specifies whether the table is a partitioned table. **p** indicates that the table is a partitioned table, and **n** indicates that the table is not a partitioned table.

12.2.15.5 GS_LOGICAL_CONSTRAINT

GS_LOGICAL_CONSTRAINT records CHECK, PRIMARY KEY, and UNIQUE constraints on tables required for logical decoding.

Table 12-51 GS_LOGICAL_CONSTRAINT columns

Name	Type	Description
conname	name	Constraint name (not necessarily unique).
connamespace	oid	OID of a namespace that contains the constraint.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
contype	"char"	• **c**: check constraint. • **p**: primary key constraint. • **u**: unique constraint. • **t**: trigger constraint. • **x**: mutual exclusion constraint. • **f**: foreign key constraint. • **s**: clustering constraint. • **i**: invalid constraint.
condeferrable	boolean	Specifies whether the constraint is deferrable. • **true**: yes. • **false**: no.
condeferred	boolean	Specifies whether the constraint can be deferrable by default. • **true**: yes. • **false**: no.
convalidated	boolean	Specifies whether the constraint is valid. Currently, it can be set to **false** only for foreign key and check constraints. • **true**: valid. • **false**: invalid.
conrelid	oid	Table containing this constraint (**0** if it is not a table constraint).
contypid	oid	Domain containing this constraint (**0** if it is not a domain constraint).
conindid	oid	ID of an index joined with the constraint.
confrelid	oid	Referenced table if this constraint is a foreign key. Otherwise, the value is **0**.
confupdtype	"char"	Foreign key update action code. • **a**: no action. • **r**: restriction. • **c**: cascading. • **n**: The parameter is set to **null**. • **d**: The default value is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
confdeltype	"char"	Foreign key deletion action code. • **a**: no action. • **r**: restriction. • **c**: cascading. • **n**: The parameter is set to **null**. • **d**: The default value is used.
confmatchtype	"char"	Foreign key match type. • **f**: full match. • **p**: partial match. • **u**: unspecified (The **NULL** value can be matched if **f** is specified.)
conislocal	boolean	Specifies whether the constraint is defined locally for the relationship. • **true**: yes • **false**: no.
coninhcount	integer	Number of direct inheritance parent tables that this constraint has. When the value is not **0**, the constraint cannot be deleted or renamed.
connoinherit	boolean	Specifies whether the constraint can be inherited. • **true**: yes. • **false**: no.
consoft	boolean	Specifies whether the column indicates an informational constraint. • **true**: yes • **false**: no.
conopt	boolean	Specifies whether you can use the informational constraint to optimize the execution plan. • **true**: yes. • **false**: no.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
dbnode	oid	Database OID.
constroid	oid	Row identifier.
conkey	smallint[]	Column list of the constrained control if this column is a table constraint.
confkey	smallint[]	List of referenced columns if this column is a foreign key.
conpfeqop	oid[]	ID list of the equality operators for PK = FK comparisons if this column is a foreign key.
conppeqop	oid[]	ID list of the equality operators for PK = PK comparisons if this column is a foreign key.
conffeqop	oid[]	ID list of the equality operators for FK = FK comparisons if this column is a foreign key.
conexclop	oid[]	ID list of the per-column exclusion operators if this column is an exclusion constraint.
consrc	text	Readable representation of the expression if this column is a check constraint.
conincluding	smallint[]	Not for constraint, but will be included in the attribute column of **INDEX**.

12.2.15.6 GS_LOGICAL_DATABASE

GS_LOGICAL_DATABASE records information about available databases.

Table 12-52 GS_LOGICAL_DATABASE columns

Column	Type	Description
datname	name	Database name.
datid	oid	Database OID.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
datdba	oid	Owner of the database, usually the user who created it.
encoding	integer	Character encoding for the database.
datcollate	name	Character type used by the database.
datctype	name	Sequence used by the database.
dattablespace	oid	Default tablespace of the database.
datcompatibility	name	Database compatibility mode. Currently, five compatibility modes are supported: ORA, MYSQL, C, M, and PG, indicating compatibilities with Oracle Database, MySQL, Teradata, M-compatible and Postgres databases, respectively.
dattimezone	name	Database time zone. The default is PRC.

12.2.15.7 GS_LOGICAL_DICTIONARY

GS_LOGICAL_DICTIONARY records logical decoding data dictionary information.

Table 12-53 GS_LOGICAL_DICTIONARY columns

Column	Type	Description
status	integer	Specifies whether the logical decoding data dictionary is valid.
restart_lsn	bigint unsigned	Reserved column.
restart_lsn_time	timestamp with time zone	Baseline completion time.
dictionary_csn_min	bigint unsigned	Minimum version number in use.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
last_clean_time	timestamp with time zone	Time when the data dictionary table is cleared for the last time.
last_clean_result	bool	Result of the last cleanup of the data dictionary table.
originid	integer	Source identifier of a tuple.
last_flush_csn	bigint unsigned	CSN of the last metadata information modification.

12.2.15.8 GS_LOGICAL_INDEX

GS_LOGICAL_INDEX stores some index information, and GS_LOGICAL_CLASS stores other information.

Table 12-54 GS_LOGICAL_INDEX columns

Column	Type	Description
indexrelid	Oid	OID of the index.
indrelid	Oid	Referenced RELATION OID.
indnatts	smallint	Total number of columns in an index.
indisunique	boolean	Specifies whether the index is a unique index.
indisprimary	boolean	Specifies whether the index is a primary key.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.
indimmediate	boolean	Specifies whether to execute the uniqueness constraint immediately.
indisvalid	boolean	Specifies whether the index can be used for query.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
indisready	boolean	Specifies whether this index is ready to accept inserts.
indisusable	boolean	Specifies whether this index can be used for insertion and selection.
indkey	int2vector	Index column number.
indcollation	oidvector	Sorting identifier.
indpred	pg_node_tree	Expression tree of the predicate if it is a partial index; otherwise, the value is **NULL**.
indisreplident	boolean	Specifies whether an index is identified as a replication identifier index.

12.2.15.9 GS_LOGICAL_NAMESPACE

GS_LOGICAL_NAMESPACE records namespace information.

Table 12-55 GS_LOGICAL_NAMESPACE columns

Column	Type	Description
nspid	oid	Namespace OID.
nspname	name	Namespace name.
nspowner	oid	OID of the namespace owner.
nsptimeline	bigint	Timeline identifier of the namespace.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
originid	integer	Source identifier of a tuple.
dbnode	oid	Database OID.

12.2.15.10 GS_LOGICAL_PARTITION

GS_LOGICAL_PARTITION records partitioned table information.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-56 GS_LOGICAL_PARTITION columns

Column	Type	Description
partitionid	Oid	Partitioned table OID.
relname	name	Name of a partitioned table.
parttype	char	Partitioning type.
parentid	oid	OID of a parent table.
relfilenode	oid	Partitioned table relfilenode.
reltoastrelid	oid	OID of a TOAST table.
reltoastidxid	oid	OID of the TOAST index.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
reltablespace	oid	Tablespace OID.
dbnode	oid	Database OID.

12.2.15.11 GS_LOGICAL_TYPE

GS_LOGICAL_TYPE stores information about data types.

Table 12-57 GS_LOGICAL_TYPE columns

Column	Type	Description
typname	name	Type name.
typnamespace	oid	OID of the namespace that contains this type.
typlen	smallint	Number of bytes used by a value of this type.
typbyval	boolean	Specifies whether the value of this type is passed by value or by reference.
typtype	"char"	Row type of the catalog.
typisdefined	boolean	Specifies whether a type is completely defined.
typreceive	regproc	Receiving function in binary format.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
typsend	regproc	Sending function.
typmodin	regproc	Input function for optional type modifiers.
typmodout	regproc	Output function.
typid	oid	Type OID.
dbnode	oid	Database OID.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.
typstorage	"char"	Data storage mode of a specified column, including the following types: ● **p**: plain storage. Numbers are always stored in a simple way. ● **e**: external storage. Data is stored outside the main table (for example, in the TOAST table). The main table stores references to data form external storage. ● **m**: main storage. Data can be stored compressed inline, which is similar to plain storage. This method is usually used to store types that require customized storage, for example, customized composite types. ● **x**: extended storage. Values may be compressed and/or moved into a level-2 relational table. **x** is usually the storage mode of the TOAST type.
typelem	oid	If **typelem** is not zero, it represents another row in the **gs_logical_type** table that defines the type (such as array) obtained by index. If **typsubscript** is zero, **typelem** should be zero. If the handler does not need **typelem** to determine the index type, **typelem** can also be zero when **typsubscript** is not zero. Note that **typelem** dependencies represent physical constraints on element types in this type; therefore, using DDL to modify of a type may be restricted by the existence of this type.
typinput	regproc	Input conversion function (text format).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
typoutput	regproc	Output conversion function (text format).
typrelid	oid	If this is a composite type (see **typtype**), then this column points to the GS_LOGICAL_CLASS entry that defines the corresponding table. For a composite type, the type of GS_LOGICAL_CLASS is not a table. It is **0** for non-composite type.

12.2.15.12 GS_SQLAPPLY_SKIP

GS_SQLAPPLY_SKIP records rules that can be skipped during logical replay. This catalog is reserved in distributed scenarios.

Table 12-58 GS_SQLAPPLY_SKIP columns

Column	Type	Description
createtime	timestamp	Creation timestamp.
originid	int4	Replication source ID.
skiptype	int4	SKIP types: • **1**: SKIP OBJ • **2**: SKIP TXN • **3**: SKIP ERR
dumpcontext	char	Dumps transactions to a file. • **'a'**: The entire transaction is dumped. • **'n'**: no dumping. • **'s'**: Only changes skipped by the transaction are dumped.
param1	text	For details, see **Table 12-59** and **Table 12-60**.
param2	text	For details, see **Table 12-59** and **Table 12-60**.
param3	text	For details, see **Table 12-59**.
param4	text	For details, see **Table 12-59**.
param5	text	Reserved column.

Table 12-59 Columns of param1–4 in SKIP OBJ or SKIP ERR

Column	Type	Description
db_name	text	Database name.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
schema_name	text	Specifies the schema name.
object_name	text	Object name.
stmt_type	text	SQL statement type.

Table 12-60 Columns of param1–2 in SKIP TXN

Column	Type	Description
csn	text	Transaction SN.
xid	text	Transaction ID.

12.2.15.13 GS_TXN_LSN_TIME

GS_TXN_LSN_TIME records the mapping between logical decoding commit sequence numbers, log sequence numbers, and timestamps. In a distributed environment, it contains data only on DNs.

Table 12-61 GS_TXN_LSN_TIME columns

Column	Type	Description
create_csn	bigint	Commit sequence number.
create_lsn	bigint	Log sequence number.
snp_xmin	bigint	Minimum snapshot ID.
snp_snapshot	text	Serialized snapshot text.
barrier	text	Barrier information.
create_time	timestamp with time zone	Timestamp when a tuple is inserted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

NOTE

- **create_lsn** is stored as a number in the system catalog. An LSN can be converted to the common LSN format (for reference only), that is, *XXXXXXXX*/*XXXXXXXX*, using the SQL syntax. The conversion syntax is as follows:

```
SELECT CONCAT(to_hex(({lsn_num}::bigint >> 32) & x'ffffffff'::bigint), '/', to_hex(({lsn_num}::bigint << 32 >> 32) & x'ffffffff'::bigint));
```

  When using the preceding SQL statement, convert **lsn_num** to the required number. The following uses **607906688** as an example:

```
gaussdb=# SELECT CONCAT(to_hex((607906688::bigint >> 32) & x'ffffffff'::bigint), '/',
to_hex((607906688::bigint << 32 >> 32) & x'ffffffff'::bigint));
concat
------------
0/243beb80
(1 row)
```

- The M-compatible syntax is different from the GaussDB syntax. Therefore, in an M-compatible database, you need to perform the following conversion:

```
SELECT CONCAT(hex(({lsn_num} >> 32) & 4294967295), '/', hex((({lsn_num}<< 32) >> 32) & 4294967295));
```

  When using the preceding SQL statement, convert **lsn_num** to the required number. The following uses **607906688** as an example:

```
gaussdb_m=# SELECT CONCAT(hex((607906688 >> 32) & 4294967295), '/', hex(((607906688 << 32) >> 32) & 4294967295));
  concat
------------
 0/243BEB80
(1 row)
```

12.2.15.14 GS_LOGICAL_SET

GS_LOGICAL_SET records metadata defined by the SET data type.

Table 12-62 GS_LOGICAL_SET columns

Column	Type	Description
setid	oid	Row identifier.
settypid	oid	OID of the SET data type
setnum	tinyint	Number of members of the SET data type. A maximum of 64 members are supported.
setsortorder	tinyint	Sorting order of members when the SET data type is defined. The value starts from 0.
setlabel	text	Member name of the SET data type.
dbnode	oid	Database OID.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Column	Type	Description
numbers	integer	Number of members of the M-compatible SET and ENUM data types. This column is used only in M-compatible databases.
sortorder	integer	Sorting order of members when the M-compatible SET and ENUM data types are defined. This column is used only in M-compatible databases.

12.2.15.15 GS_LOGICAL_ENUM

GS_LOGICAL_ENUM contains entries showing the values and labels for each enumerated type.

Table 12-63 GS_LOGICAL_ENUM columns

Column	Type	Description
enumid	oid	Row identifier.
enumtypid	oid	OID of the **PG_TYPE** entry owning this enumerated value.
enumlabel	name	Textual label for this enumerated value.
enumsortorder	real	Sort position of this enumerated value within its enumerated type.
dbnode	oid	Database OID.
originid	integer	Source identifier of a tuple.
createtime	timestamp with time zone	Timestamp when a tuple is inserted.
csnmin	bigint	CSN when a tuple is inserted.
csnmax	bigint	CSN when a tuple is updated or deleted.

12.2.16 Multi-Tenant Databases

The following system catalogs are used for the multi-tenant database feature and are not supported in the current version.

12.2.16.1 GS_PDB

GS_PDB records information about the PDB. This is a system catalog of the multi-tenant database feature. You are advised not to use or view this system catalog.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.16.2 GS_RESOURCE_PLANS

GS_RESOURCE_PLANS is an instance-level system catalog. As a resource plan main catalog, GS_RESOURCE_PLANS records main information about resource plans. This is a system catalog of the multi-tenant database feature. You are advised not to use or view this system catalog.

12.2.16.3 GS_RESOURCE_PLAN_DIRECTIVES

GS_RESOURCE_PLANS is an instance-level system catalog. As a resource plan command table, GS_RESOURCE_PLANS records resource quotas and status of plan instructions. This is a system catalog of the multi-tenant database feature. You are advised not to use or view this system catalog.

12.2.17 Other System Catalogs

12.2.17.1 GS_ASP

GS_ASP displays the persistent ACTIVE SESSION PROFILE samples. This system catalog can be queried only in the system library.

Table 12-64 GS_ASP columns

Name	Type	Description
sampleid	bigint	Sampling ID.
sample_time	timestamp with time zone	Sampling time.
need_flush_sample	Boolean	Specifies whether the sample needs to be flushed to disks. • **t** (true): yes. • **f** (false): no.
databaseid	oid	Database ID.
thread_id	bigint	Thread ID.
sessionid	bigint	Session ID.
start_time	timestamp with time zone	Start time of a session.
event	text	Event name. For details about key events in the kernel, see **Table 12-453**, **Table 12-454**, **Table 12-455**, and **Table 12-456**. For details about the impact of each transaction lock on services, see **LOCK**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lwtid	integer	Lightweight thread ID of the current thread.
psessionid	bigint	Parent thread of the streaming thread.
tlevel	integer	Level of the streaming thread. The value corresponds to the level (ID) of the execution plan.
smpid	integer	Concurrent thread ID in SMP execution mode.
userid	oid	ID of a session user.
application_name	text	Name of an application.
client_addr	inet	IP address of a client.
client_hostname	text	Name of a client.
client_port	integer	TCP port number used by a client to communicate with the backend.
query_id	bigint	Debug query ID.
unique_query_id	bigint	Unique query ID.
user_id	oid	User ID in the key of the unique query.
cn_id	integer	CN from which the unique SQL statement comes. **cn_id** is in the key of the unique query.
unique_query	text	Standardized unique SQL text string.
locktag	text	Information of a lock that the session waits for, which can be parsed using **locktag_decode**.
lockmode	text	Mode of a lock that the session waits for. • **LW_EXCLUSIVE**: exclusive lock • **LW_SHARED**: shared lock • **LW_WAIT_UNTIL_FREE**: waits for **LW_EXCLUSIVE** to be available
block_sessionid	bigint	Blocks a session from obtaining the session ID of a lock if the session is waiting for the lock.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
wait_status	text	Provides more details about an event column.
global_sessionid	text	Global session ID. The structure is *nodeid*:*sessionid*#*seqid*. *nodeid*: ID of the delivery node. *sessionid*: session ID of the delivery node. *sequd*: sequence number in ascending order. The ID is 0 on the delivery node. The *nodeid* and *sessionid* values of this column are the same for sessions delivered to other nodes in the same session.
xact_start_time	timestamp with time zone	Start time of the transaction.
query_start_time	timestamp with time zone	Time when the statement starts to be executed.
state	text	Current statement state. The options are as follows: • **active**: The backend is executing a query. • **idle in transaction**: The backend is in a transaction, but there is no statement being executed in the transaction. • **idle in transaction (aborted)**: The backend is in a transaction, but there are statements failed in the transaction. • **fastpath function call**: The backend is executing a fast-path function. • **disabled**: This state is reported if **track_activities** is disabled in this backend.
event_start_time	timestamp with time zone	Start time of a wait event.
current_xid	xid	ID of the current transaction.
top_xid	xid	ID of the top-level transaction that is being executed.
instance_name	text	CN or DN to which the record belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parent_unique_sql_id	bigint	SQL_Id of the parent statement that calls the statement.
control_status	text	The value is **under_cpu_throttle** when CPU resource for abnormal SQL statements is controlled. Otherwise, the value is **normal**.
top_unique_query_id	bigint	This column displays the **unique_query_id** of the top-level SQL statement of the stored procedure.
top_unique_query	text	This column displays the **unique_query** of the top-level SQL statement of the stored procedure.

12.2.17.2 PGXC_COPY_ERROR_LOG

The PGXC_COPY_ERROR_LOG system catalog is used to capture error rows related to the COPY FROM procedure for future reference.

- If **enableSeparationOfDuty** is set to **on**, the user can be a common database user or an administrator. Before using this system catalog, you need to create **pgxc_copy_error_log** tables in their respective schemas. No authorization is required.
- If **enableSeparationOfDuty** is set to **off**, the user can be a common database user or an administrator. If the user is a common user, the administrator needs to grant permissions to the common user. The administrator account can be used directly.

Table 12-65 pgxc_copy_error_log columns

Name	Type	Description
relname	character varying	Table name, in the form of *Schema name*.*Table name*.
begintime	timestamp with time zone	Time when a data format error was reported.
filename	character varying	Name of the source data file where a data format error occurs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
lineno	bigint	Number of the row where a data format error occurs in a source data file.
rawrecord	text	Raw record of a data format error in the source data file.
detail	text	Error details.

12.2.17.3 GS_DEPENDENCIES

GS_DEPENDENCIES records object dependency information and has a one-to-many relationship with the **GS_DEPENDENCIES_OBJ** table.

Table 12-66 GS_DEPENDENCIES columns

Name	Type	Description
schemaname	name	Name of a namespace.
packagename	name	Name of a package.
refobjpos	integer	Position of the referenced object. • **1**: type. • **2**: package header. • **4**: function header. • **8**: function body. • **16**: package body. • **32**: view.
refobjoid	oid	OID of the referenced object.
objectname	text	Name of the dependent object.

12.2.17.4 GS_DEPENDENCIES_OBJ

GS_DEPENDENCIES_OBJ records the detailed information about the referenced object.

Table 12-67 GS_DEPENDENCIES_OBJ columns

Name	Type	Description
schemaname	name	Name of a namespace.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
packagename	name	Name of a package.
type	integer	Type of the referenced object. • **1**: unknown type. • **2**: variable. • **3**: type. • **4**: function. • **5**: view. • **6**: function header.
name	text	Name of the referenced object.
objnode	pg_node_tree	Detailed information about the referenced object.

12.2.17.5 GS_IMCV

GS_IMCV provides metadata about all IMCV catalogs.

The HTAP feature does not support the distributed mode, and **enable_htap** cannot be set to **on** in the distributed mode. Therefore, no information is displayed when you query this system catalog.

Table 12-68 GS_IMCV columns

Name	Type	Description
reloid	oid	Table ID.
relname	name	Table name.
dbname	name	Database name.
username	name	Username.
parentoid	oid	Parent table ID.
imcvispart	boolean	Specifies whether the table is a partitioned table.
imcvnattr	smallint	Number of columns to be loaded.
imcvkey	int2vector	Number of loaded columns.
priority	smallint	Loading priority.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

12.2.17.6 GS_GLOBAL_CONFIG

GS_GLOBAL_CONFIG records the parameter values specified by users during cluster initialization. In addition, it also stores weak passwords set by users and status of the cluster (whether it is being scaled, which is specified by **redis_bucket_expansion**). Initial database users can write, modify, and delete parameters in system catalogs by using ALTER and DROP. Only the initial user, system administrator, and security administrator can access this system catalog. Other users do not have such permission.

Table 12-69 GS_GLOBAL_CONFIG columns

Name	Type	Description
name	name	Specifies the preset parameter name, weak password name, name of parameter for redistribution after scale-out, or parameter required by users during cluster initialization.
value	text	Specifies the preset parameter value, weak password name, parameter for redistribution after scale-out, or parameter value required by users during cluster initialization.

NOTICE

You are advised not to write, modify, or delete the **redis_bucket_expansion** parameter. The parameter name has been used to indicate that the cluster is being scaled.

12.2.17.7 GS_JOB_ATTRIBUTE

GS_JOB_ATTRIBUTE records attributes of DBE_SCHEDULER scheduled tasks, including basic attributes of scheduled tasks, scheduled task classes, certificates, authorization, programs, and schedules. Common users do not have the permission to access the newly installed database cluster.

Table 12-70 GS_JOB_ATTRIBUTE columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
job_name	text	Names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized usernames.
attribute_name	text	Attribute names of scheduled tasks, scheduled task classes, certificates, programs, and schedules, and authorized content.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attribute_value	text	Attribute values of scheduled tasks, scheduled task classes, certificates, programs, and schedules.

12.2.17.8 GS_JOB_ARGUMENT

GS_JOB_ARGUMENT provides the parameter attributes of DBE_SCHEDULER scheduled tasks and programs.

Table 12-71 GS_JOB_ARGUMENT columns

Name	Type	Description
oid	oid	Row identifier (hidden column)
argument_position	integer	Location of a parameter of a scheduled task or program.
argument_type	name	Parameter type of a scheduled task or program.
job_name	text	Name of a scheduled task or program.
argument_name	text	Parameter name of a scheduled task or program. The scheduled task inherits the parameter name of the program. Therefore, this parameter is null.
argument_value	text	Parameter value of a scheduled task. (The program cannot bind a value.)
default_value	text	Default parameter value of a program.

12.2.17.9 GS_PACKAGE

GS_PACKAGE records package information.

Table 12-72 GS_PACKAGE columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
pkgnamespace	oid	Schema to which a package belongs.
pkgowner	oid	Owner of a package.
pkgname	name	Name of a package.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
pkgspecsrc	text	Package specification.
pkgbodydeclsrc	text	Package body.
pkgbodyinitsrc	text	Package initialization source.
pkgacl	aclitem[]	Access permission.
pkgsecdef	boolean	Specifies whether the package has the definer permission.

12.2.17.10 GS_PLAN_TRACE

GS_PLAN_TRACE is used to store plan traces. It records details about the plan generation process of DML statements. Only users with the sysadmin permission can use this system catalog. The plan trace feature is not supported in the distributed scenario. Therefore, no data is displayed in this view in the distributed scenario.

Table 12-73 GS_PLAN_TRACE columns

Name	Type	Description
query_id	text	Unique ID of the current request.
query	text	SQL statement of the current request. The value of this column cannot exceed the value of **track_activity_query_size**.
unique_sql_id	bigint	Unique ID of the SQL statement of the current request.
plan	text	Query plan text corresponding to the current request SQL statement. The value of this field cannot exceed 10 KB.
plan_trace	text	Details about the query plan generation process corresponding to the SQL statement of the current request. The value of this field cannot exceed 300 MB.
owner	oid	OID of the user who initiates the current SQL request.
modifydate	timestamp with time zone	Time when the current plan trace is updated (that is, time when the plan trace is created).

12.2.17.11 GS_POLICY_LABEL

GS_POLICY_LABEL records the resource label configuration information. One resource label corresponds to one or more records, and each record identifies the

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

resource label to which a database resource belongs. Only the system administrator or security policy administrator can access this system catalog.

Fully Qualified Domain Name (FQDN) identifies an absolute path of a database resource.

Table 12-74 GS_POLICY_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
labelname	name	Specifies the resource label name.
labeltype	name	Resource tag type. Currently, the value is **RESOURCE**.
fqdnnamespace	oid	OID of a namespace to which an identified database resource belongs.
fqdnid	oid	OID of an identified database resource. If the database resource is a column, this column is the OID of the catalog.
relcolumn	name	Column name. If the identified database resource is a column, this column indicates the column name. Otherwise, this column is empty.
fqdntype	name	Type of the identified database resource, for example, schema, table, column, or view.

12.2.17.12 GS_RECYCLEBIN

GS_RECYCLEBIN describes details about objects in the recycle bin of the flashback feature.

Table 12-75 GS_RECYCLEBIN columns

Name	Type	Description
oid	oid	System column.
rcybaseid	oid	Base table object ID, which references **gs_recyclebin.oid**.
rcydbid	oid	OID of the database to which the current object belongs.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rcyrelid	oid	OID of the current object.
rcyname	name	Name of the object in the recycle bin. The format is BIN*$unique_id$oid$*0. *unique_id* indicates the unique identifier with a maximum of 16 characters, and *oid* indicates the OID.
rcyoriginname	name	Original object name.
rcyoperation	char	Operation type. ● **d**: drop ● **t**: truncate
rcytype	integer	Object type. ● **0**: table ● **1**: index. ● **2**: TOAST table. ● **3**: TOAST index. ● **4**: sequence, indicating the sequence object that is automatically associated with the serial, bigserial, smallserial, and largeserial types. ● **5**: partition. ● **6**: global index. ● **7**: materialized view. ● **8**: global secondary index.
rcyrecyclecsn	bigint	CSN when an object is dropped or truncated.
rcyrecycletime	timestamp with time zone	Time when an object is dropped or truncated.
rcycreatecsn	bigint	CSN when an object is created.
rcychangecsn	bigint	CSN when an object definition is modified.
rcynamespace	oid	OID of the namespace that contains this relationship.
rcyowner	oid	Owner of the relationship.
rcytablespace	oid	Tablespace in which this relationship is stored. If the value is **0**, the default tablespace of the database is used. This column is meaningless if the relationship has no on-disk file.
rcyrelfilenode	oid	File name of the recycle bin object on a disk, or **0** if none, which is used to restore the physical file when the TRUNCATE object is restored.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
rcycanrestore	Boolean	Specifies whether flashback can be performed separately.
rcycanpurge	Boolean	Specifies whether the purge operation can be performed independently.
rcyfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcyfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table.
rcybucket	oid	Bucket information in **12.2.15.42 PG_HASHBUCKET**.

12.2.17.13 GS_SECURITY_LABEL

GS_SECURITY_LABEL is a shared system catalog that records information about security labels. Each record corresponds to a security label.

Table 12-76 GS_SECURITY_LABEL columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
label_name	name	Security label name.
label_content	text	Content of the security label.

12.2.17.14 GS_SLICEGROUP

GS_SLICEGROUP records information about slice groups created in the current database.

Table 12-77 GS_SLICEGROUP columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
slicename	name	Name of a slice group or slice, which is distinguished by **type**.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
type	"char"	Object type. ● **'t'**: slice group. ● **'s'**: slice.
strategy	"char"	Distribution policy. ● **'r'**: range distribution.
bucketgroup	smallint	Bucket group to which the bucket allocated to a slice group belongs (value range: [1,4]).
bucketcnt	integer	Total number of buckets allocated to a slice group.
sgroupoid	oid	Slice group OID.
sindex	integer	Reserved column. A slice index is recorded when a single slice is distributed to multiple DNs.
nodeid	integer	Index of a DN to which a slice is distributed.
redis_nodeid	smallint	Reserved column. This column is used as the default value on a DN. On a CN, this column specifies the index of a DN to which the current slice's bucket is to be migrated during scaling.
bucket	smallint	Bucket to which a slice is distributed.
slicecnt	integer	Total number of slices in the current slice group. If the object is a slice, the default value **-1** is used.
contained	boolean	Specifies whether the DN manages the bucket to which a slice is distributed. ● **t** (true): yes. ● **f** (false): no. The default value is **f** on a CN.
specified	boolean	Specifies whether a DN is specified for a slice. ● **t** (true): yes. ● **f** (false): no.
sliceorder	integer	Position of a slice in a slice group.
boundaries	text[]	Value range of a slice.
bucketversion	integer	Records the version number of the information that changes during subsequent range bucket scale-out.
bucketcsn	xid	Maximum CSN of each bucket on the source node before redistribution, which is used to determine the visibility of the new node.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
bucketxid	xid	**next_xid** set for bringing a new node online during scaling, which is used to check whether the value is within the threshold range.
distributetype	oidvector	OID of the range distribution key type specified by a slice group.

12.2.17.15 GS_SQL_PATCH

GS_SQL_PATCH records the status information about SQL_PATCH on the current node.

Table 12-78 GS_SQL_PATCH columns

Name	Type	Description
patch_name	name	Patch name.
unique_sql_id	bigint	Global unique ID.
owner	oid	ID of the user who creates the patch.
enable	boolean	Specifies whether the patch takes effect.
status	"char"	Patch status (reserved column).
abort	boolean	Specifies whether the patch is an abort hint.
hint_string	text	Hint text.
hint_node	pg_node_tree	Hint parsing and serialization result.
original_query	text	Original statement (reserved column).
patched_query	text	Patched statement (reserved column).
original_query_tree	pg_node_tree	Original statement parsing result (reserved column).
patched_query_tree	pg_node_tree	Patched statement parsing result (reserved column).
description	text	Patch description.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
parent_unique_sql_id	bigint	Globally unique ID of the SQL outer statement for which the patch takes effect. The value of this parameter is **0** for statements outside a stored procedure. For statements inside the stored procedure, and the value of this parameter is the globally unique ID of the statement that calls the stored procedure.

12.2.17.16 GS_STATISTIC_EXT_HISTORY

GS_STATISTIC_EXT_HISTORY is a multi-column historical statistics management table. It stores historical extended statistics about tables in the database, including multi-column statistics and expression statistics (supported later). This table is visible and unavailable in distributed mode.

Table 12-79 GS_STATISTIC_EXT_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of the object to which a table belongs. **'c'** indicates an ordinary table, and **'p'** indicates a partitioned table.
stainherit	Boolean	Determines whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadndistinct	real	Number of unique non-null data values in the **DN1** column. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. ● **d**: The original DUJ1 algorithm is used for estimation. ● **c**: The C19 algorithm is used for estimation.
staorigin	"char"	Source of the statistics collection mode. ● **a**: The collection is triggered by AUTOANALYZE. ● **m**: The collection is triggered by manual ANALYZE. ● **g**: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stakey	int2vector	Array of a column ID.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The returned value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The returned value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
staexprs	pg_node_tree	Expression corresponding to the extended statistics information.
stasource	"char"	Source of extended statistics: • **'a'**: indicates that the statistics data is automatically created, which is controlled by the GUC parameter **auto_statistic_ext_columns**. • **'m'**: indicates that a user manually creates the statistics data using analyze tablename ((column list)) or alter table tablename add statistics ((column list)).
stastatus	"char"	Status of extended statistics: • **'a'**: active and available. • **'d'**: disabled. Related information is not collected, and the optimizer does not use the data when generating a plan. You can use the alter table tablename disable/enable statistics((column list)) syntax to modify the status of extended statistics.
staextname	name	Alias of the multi-column group of multi-column statistics.

12.2.17.17 GS_STATISTIC_HISTORY

GS_STATISTIC_HISTORY is a single-column historical statistics management table that stores historical statistics about tables and index columns in a database. This table is visible and unavailable in distributed mode.

Table 12-80 GS_STATISTIC_HISTORY columns

Name	Type	Description
starelid	oid	Table or index that the described column belongs to.
starelkind	"char"	Type of an object.
staattnum	smallint	Number of the described column in the table, starting from 1.
stainherit	Boolean	Determines whether to collect statistics for objects that have inheritance relationship.
statimestamp	timestamp with time zone	Time when the statistics are collected.
stanullfrac	real	Percentage of column entries that are null.
stawidth	integer	Average stored width, in bytes, of non-null entries.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadistinct	real	Number of distinct, non-null data values in the column for database nodes. ● A value greater than 0 is the actual number of distinct values. ● A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. ● The value **0** indicates that the number of distinct values is unknown.
standvfunc	"char"	Algorithm used to calculate the NDV based on the statistics. ● **d**: The original DUJ1 algorithm is used for estimation. ● **c**: The C19 algorithm is used for estimation.
staorigin	"char"	Source of the statistics collection mode. ● **a**: The collection is triggered by AUTOANALYZE. ● **m**: The collection is triggered by manual ANALYZE. ● **g**: The gsstat thread is triggered to perform ANALYZE collection when a large amount of data is inserted.
stakindN	smallint	Code number stating that the type of statistics is stored in slot *N* of the *pg_statistic* row. The value of *N* ranges from 1 to 5.
staopN	oid	Operator used to generate the statistics stored in slot *N*. For example, a histogram slot shows the < operator that defines the sort order of the data. The value of *N* ranges from 1 to 5.
stanumbersN	real[]	Numerical statistics of the appropriate type for slot *N*. The returned value is **NULL** if the slot does not involve numerical values. The value of *N* ranges from 1 to 5.
stavaluesN	anyarray	Column data values of the appropriate type for slot *N*. The returned value is **NULL** if the slot type does not store any data values. Each array's element values are actually of the specific column's data type so there is no way to define these columns' type more specifically than anyarray. The value of *N* ranges from 1 to 5.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
stadndistinct	real	Number of unique non-null data values in the **DN1** column. • A value greater than 0 is the actual number of distinct values. • A value less than 0 is the ratio of the **distinct** value to the total number of rows. For example, if **stadndistinct** is **-0.5**, the actual **distinct** value is the total number of rows multiplied by 0.5. • The value **0** indicates that the number of distinct values is unknown.
staextinfo	text	Information about extension statistics. Reserved column.

12.2.17.18 GS_TABLESTATS_HISTORY

GS_TABLESTATS_HISTORY is a table for managing historical statistics at the table, index, and partition levels. It stores historical statistics about tables, indexes, and partitions in a database. This table is visible and unavailable in distributed mode.

Table 12-81 GS_TABLESTATS_HISTORY columns

Name	Type	Description
relid	oid	Unique ID of a table, index, or partition in **PG_CLASS** or **PG_PARTITION**.
relname	name	Name of a table, index, or partition.
relnamespace	oid	OID of the namespace that contains this object.
relkind	"char"	Object type. • **r**: ordinary table. • **I**: table-level index. • **i**: partitioned index. • **p**: level-1 partition. • **s**: level-2 partition.
reltimestamp	timestamp with time zone	Time when the statistics are collected.
relpages	double precision	Size of the table on disk in pages. This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relallvisible	integer	Number of pages marked as all visible in the table.

12.2.17.19 GS_TS_DICT_DEFINITION

GS_TS_DICT_DEFINITION stores the contents of user-defined dictionaries, used for creating and using user-defined dictionaries. In the current version, system catalogs can be viewed only.

Table 12-82 GS_TS_DICT_DEFINITION columns

Name	Type	Description
dict_oid	oid	OID of a dictionary to which the dictionary content belongs.
definition_type	"char"	Dictionary content type.
definition	text	Dictionary content definition.

12.2.17.20 GS_TXN_SNAPSHOT

GS_TXN_SNAPSHOT is a timestamp-CSN mapping table. It periodically samples and maintains an appropriate time range to estimate the CSN corresponding to the timestamp in the range.

Table 12-83 GS_TXN_SNAPSHOT columns

Name	Type	Description
snptime	timestamp with time zone	Snapshot time
snpxmin	bigint	Minimum snapshot ID
snpcsn	bigint	Snapshot CSN
snpsnapshot	text	Serialized snapshot text

12.2.17.21 GS_UID

GS_UID records the unique identification meta information of the **hasuids** attribute table in the database.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-84 GS_UID columns

Name	Type	Description
relid	oid	OID of a table
uid_backup	bigint	Largest unique identifier that can be assigned to a table

12.2.17.22 GS_WORKLOAD_RULE

The GS_WORKLOAD_RULE system catalog records information about SQL concurrency control rules. There is no permission restriction on this system catalog. All users can query this system catalog.

Table 12-85 GS_WORKLOAD_RULE columns

Name	Type	Description
rule_id	bigint	Concurrency control rule ID, which is automatically generated by the system.
rule_name	name	Name of the concurrency control rule, which is used for search. The name may not be unique and can be **NULL**.
databases	name[]	List of databases on which the concurrency control rules take effect. If the value is **NULL**, the concurrency control rules take effect for all databases.
max_workload	bigint	Maximum number of concurrent rule settings.
is_valid	boolean	Determines whether the concurrency control rules take effect. If the concurrency control rules time out, the value is set to **false**.
start_time	timestamp with time zone	Start time of the concurrency control rules. The value **NULL** indicates that the rules take effect from now on.
end_time	timestamp with time zone	End time of the concurrency control rules. The value **NULL** indicates that the rules are always effective.
rule_type	text	Concurrency control rule type. Currently, only **"sqlid"**, **"select"**, **"insert"**, **"update"**, **"delete"**, **"merge"**, and **"resource"** are supported. Other values are invalid.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
option_val	text[]	Parameter values of a concurrency control rule, including SQL ID, keyword list, and resource restriction. For details, see the description of the **gs_add_workload_rule(rule_type, rule_name, databases, start_time, end_time, max_workload, option_val)** API.
node_names	text[]	List of nodes on which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.
user_names	text[]	List of users for which the concurrency control rules take effect. This parameter is reserved and does not take effect currently.

12.2.17.23 PG_AGGREGATE

PG_AGGREGATE records information about aggregate functions. Each entry in PG_AGGREGATE is an extension of an entry in PG_PROC. The PG_PROC entry carries the aggregate's name, input and output data types, and other information that is similar to ordinary functions.

Table 12-86 PG_AGGREGATE columns

Name	Type	Reference	Description
aggfnoid	regproc	**PG_PROC**.proname	**PG_PROC** proname of the aggregate function.
aggtransfn	regproc	**PG_PROC**.proname	Transition function.
aggcollectfn	regproc	**PG_PROC**.proname	Collect function.
aggfinalfn	regproc	**PG_PROC**.proname	Final function (**0** if none).
aggsortop	oid	**PG_OPERATOR**.oid	Associated sort operator (**0** if none).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
aggtranstype	oid	PG_TYPE.oid	Data type of the aggregate function's internal transition (state) data. The possible values and their meanings are defined by the types in **pg_type.h**. The main two types are polymorphic (isPolymorphicType) and non-polymorphic.
agginitval	text	-	Initial value of the transition state. This is a text column containing the initial value in its external string representation. If this column is null, the transition state value starts from null.
agginitcollect	text	-	Initial value of the collection state. This is a text column containing the initial value in its external string representation. If this column is null, the collection state value starts from null.
aggkind	"char"	-	Type of the aggregate function: • **n**: normal aggregate. • **o**: ordered set aggregate.
aggnumdirectargs	smallint	-	Number of direct parameters (non-aggregation-related parameters) of the aggregate function of the ordered set aggregate type. For an aggregate function of the normal aggregate type, the value is **0**.
agginitfn	regproc	PG_PROC.proname	Initialization function.

12.2.17.24 PG_AM

PG_AM records information about index access methods. There is one row for each index access method supported by the system.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-87 PG_AM columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amname	name	-	Name of the access method
amstrategies	smallint	-	Number of operator strategies for the access method (**0** if the access method does not have a fixed set of operator strategies)
amsupport	smallint	-	Number of support routines for the access method
amcanorder	boolean	-	Whether the access method supports ordered scans sorted by the indexed column's value • **t (true)**: supported. • **f (false)**: not supported.
amcanorderbyop	boolean	-	Whether the access method supports ordered scans sorted by the result of an operator on the indexed column • **t** (true): supported. • **f** (false): not supported.
amcanbackward	boolean	-	Whether the access method supports backward scanning • **t (true)**: supported. • **f (false)**: not supported.
amcanunique	boolean	-	Whether the access method supports unique indexes • **t (true)**: supported. • **f (false)**: not supported.
amcanmulticol	boolean	-	Whether the access method supports composite indexes • **t (true)**: supported. • **f (false)**: not supported.
amoptionalkey	boolean	-	Whether the access method supports scanning without any constraint for the first index column • **t (true)**: supported. • **f (false)**: not supported.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amsearcharray	boolean	-	Whether the access method supports **ScalarArrayOpExpr** searches • **t** (true): supported. • **f** (false): not supported.
amsearchnulls	boolean	-	Whether the access method supports **IS NULL/NOT NULL** searches • **t (true)**: supported. • **f (false)**: not supported.
amstorage	boolean	-	Whether the index storage data type can differ from the column data type • **t** (true): allowed. • **f** (false): not allowed.
amclusterable	boolean	-	Whether an index of this type can be clustered on • **t (true)**: allowed. • **f (false)**: not allowed.
ampredlocks	boolean	-	Whether an index of this type manages fine-grained predicate locks • **t (true)**: allowed. • **f (false)**: not allowed.
amkeytype	oid	OID in **PG_TYPE**	Type of data stored in index (**0** if it is not a fixed type)
aminsert	regproc	**proname** in **PG_PROC**	"Insert this tuple" function
ambeginscan	regproc	**proname** in **PG_PROC**	"Prepare for index scan" function
amgettuple	regproc	**proname** in **PG_PROC**	"Next valid tuple" function (**0** if none)
amgetbitmap	regproc	**proname** in **PG_PROC**	"Fetch all valid tuples" function (**0** if none)
amrescan	regproc	**proname** in **PG_PROC**	"(Re)start index scan" function
amendscan	regproc	**proname** in **PG_PROC**	"Clean up after index scan" function

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
ammarkpos	regproc	**proname** in PG_PROC	"Mark current scan position" function
amrestrpos	regproc	**proname** in PG_PROC	"Restore marked scan position" function
ammerge	regproc	**proname** in PG_PROC	"Merge multiple indexes" function
ambuild	regproc	**proname** in PG_PROC	"Build new index" function
ambuildempty	regproc	**proname** in PG_PROC	"Build empty index" function
ambulkdelete	regproc	**proname** in PG_PROC	Bulk-delete function
amvacuumcleanup	regproc	**proname** in PG_PROC	Post-VACUUM cleanup function
amcanreturn	regproc	**proname** in PG_PROC	Function to check whether the index supports index-only scans (**0** if none)
amcostestimate	regproc	**proname** in PG_PROC	Function to estimate cost of an index scan
amoptions	regproc	**proname** in PG_PROC	Function to parse and validate **reloptions** for an index

12.2.17.25 PG_AMOP

PG_AMOP records information about operators associated with access method operator families. There is one row for each operator that is a member of an operator family. A family member can be either a search operator or an ordering operator. An operator can appear in more than one family, but cannot appear in more than one search position nor more than one ordering position within a family.

Table 12-88 PG_AMOP columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amopfamily	oid	PG_OPFAMILY.oid	Operator family of this entry

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Reference	Description
amoplefttype	oid	**oid** in **PG_TYPE**	Left-hand input data type of the operator. For details about the values and descriptions, see **Data Types**.
amoprighttype	oid	**oid** in **PG_TYPE**	Right-hand input data type of the operator For details about the values and descriptions, see **Data Types**.
amopstrategy	smallint	-	Number of operator strategies
amoppurpose	"char"	-	Purpose of the operator. • **s**: search • **o**: order
amopopr	oid	**PG_OPERATOR**.oid	OID of the operator
amopmethod	oid	**PG_AM**.oid	Operator family of the index access method
amopsortfamily	oid	**PG_OPFAMILY**.oid	The B-tree operator family according to which this entry sorts for an ordering operator (**0** for a search operator)

A search operator entry indicates that an index of this operator family can be searched to find all rows satisfying **WHERE indexed_column operator constant**. Such an operator must return a Boolean value, and its left-hand input type must match the index's column data type.

An ordering operator entry indicates that an index of this operator family can be scanned to return rows in the order represented by **ORDER BY indexed_column operator constant**. Such an operator could return any sortable data type, though again its left-hand input type must match the index's column data type. The exact semantics of the **ORDER BY** are specified by the **amopsortfamily** column, which must reference a btree operator family for the operator's result type.

12.2.17.26 PG_AMPROC

PG_AMPROC records information about the support procedures associated with the access method operator families. There is one row for each support procedure that belongs to an operator family.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Table 12-89 PG_AMPROC columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
amprocfamily	oid	**PG_OPFAMILY**.oid	Operator family of this entry
amproclefttype	oid	**oid** in **PG_TYPE**	Left-hand input data type of the associated operator For details about common data types, see **Data Types**.
amprocrighttype	oid	**oid** in **PG_TYPE**	Right-hand input data type of the associated operator For details about common data types, see **Data Types**.
amprocnum	smallint	-	Support procedure number
amproc	regproc	**PG_PROC**.proname	OID of the procedure

The usual interpretation of the **amproclefttype** and **amprocrighttype** columns is that they identify the left and right input types of the operator(s) that a particular support procedure supports. For some access methods, these match the input data type(s) of the support procedure itself; for others not. There is a notion of "default" support procedures for an index, which are those with **amproclefttype** and **amprocrighttype** both equal to the index opclass's **opcintype**.

12.2.17.27 PG_ATTRDEF

PG_ATTRDEF records default values of columns.

Table 12-90 PG_ATTRDEF columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
adrelid	oid	Table to which a column belongs
adnum	smallint	Number of columns
adbin	pg_node_tree	Internal representation of the default value of the column
adsrc	text	Internal representation of the readable default value.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
adgencol	"char"	Specifies whether a column is a generated column. The value **'s'** indicates that the column is a generated column, and the value **'\0'** indicates that the column is an ordinary column. The default value is **'\0'**.
adbin_on_update	pg_node_tree	Internal representation of the attribute expression **on update current_timestamp** of the column.
adsrc_on_update	text	Internal representation of the readable attribute expression **on update current_timestamp**.

12.2.17.28 PG_ATTRIBUTE

PG_ATTRIBUTE records information about table columns.

Table 12-91 PG_ATTRIBUTE columns

Name	Type	Description
attrelid	oid	Table to which a column belongs
attname	name	Column name
atttypid	oid	Column type
attstattarget	integer	Level of details of statistics collected for this column by ANALYZE. • The value **0** indicates that no statistics should be collected. • A negative value indicates that the system default statistic object is used. • The exact meaning of positive values is data type-dependent. For scalar data types, **attstattarget** is both the target number of "most common values" to collect, and the target number of histogram bins to create.
attlen	smallint	Copy of typlen in 12.2.15.78 PG_TYPE of the column type.
attnum	smallint	Number of the column
attndims	integer	Number of dimensions if the column is an array (**0** in other cases).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attcacheoff	integer	This column is always **-1** on disk. When it is loaded into a row descriptor in the memory, it may be updated to cache the offset of the columns in the row.
atttypmod	integer	Type-specific data supplied at the table creation time (for example, the maximum length of a **varchar** column). This column is used as the third parameter when passing to type-specific input functions and length coercion functions. The value will generally be **-1** for types that do not need ATTTYPMOD.
attbyval	boolean	Copy of typbyval in **12.2.15.78 PG_TYPE** of the column type.
attstorage	"char"	Copy of typstorage in **12.2.15.78 PG_TYPE** of the column type.
attalign	"char"	Copy of typalign in **12.2.15.78 PG_TYPE** of the column type.
attnotnull	boolean	A not null constraint. It is possible to change this column to enable or disable the constraint.
atthasdef	boolean	This column has a default value, in which case there will be a corresponding entry in the **12.2.15.25 PG_ATTRDEF** table that actually defines the value.
attisdropped	boolean	Indicates that this column has been deleted and is no longer valid. A deleted column is still physically present in the table but is ignored by the analyzer, so it cannot be accessed through SQL.
attislocal	boolean	Indicates that this column is locally defined in the relationship. Note that a column can be locally defined and inherited simultaneously.
attcmprmode	tinyint	Compressed modes for a specific column. The compressed mode includes: • **0**: not compressed (**ATT_CMPR_NOCOMPRESS**) • **1**: DELTA compression algorithm (**ATT_CMPR_DELTA**) • **2**: dictionary compression algorithm (**ATT_CMPR_DICTIONARY**) • **3**: prefix compression algorithm (**ATT_CMPR_PREFIX**) • **4**: digital string compression algorithm (**ATT_CMPR_NUMSTR**)
attinhcount	integer	Number of direct ancestors that this column has. A column with an ancestor cannot be dropped nor renamed.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
attcollation	oid	Defined collation of a column.
attacl	aclitem[]	Permissions for column-level access.
attoptions	text[]	Column attribute. Currently, the following attributes are supported: • **n_distinct**: number of **distinct** values of a column (excluding subtables). • **n_distinct_inherited**: number of **distinct** values of a column (including subtables).
attfdwoptions	text[]	Column attribute of a foreign table. Currently, **dist_fdw**, **file_fdw**, and **log_fdw** do not use foreign table column attributes.
attinitdefval	bytea	**attinitdefval** stores the default value expression. ADD COLUMN in the row-store table must use this column.
attkvtype	tinyint	Specifies a key value type for a column. Types include: **0**: default value (**ATT_KV_UNDEFINED**). **1**: dimension (**ATT_KV_TAG**). **2**: indicator (**ATT_KV_FIELD**). **3**: time column (**ATT_KV_TIMETAG**). **4**: hidden distribution key (**ATT_KV_HIDETAG**).
attidentity	"char"	Identity type of a column. Value: **'0'** or **'\0'**: The column is a non-IDENTITY column. **'a'**: The **IDENTITY** column attribute is of the **ALWAYS** type. **'d'**: The **IDENTITY** column attribute is of the **BY DEFAULT** type. **'n'**: The **IDENTITY** column attribute is of the **BY DEFAULT ON NULL** type.

12.2.17.29 PG_CAST

PG_CAST records the conversion relationship between data types.

Table 12-92 PG_CAST columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
castsource	oid	OID of the source data type.
casttarget	oid	OID of the target data type.
castfunc	oid	OID of the conversion function. The value **0** indicates that no conversion function is required.
castcontext	"char"	Conversion mode between the source and target data types. ● **'e'**: Only explicit conversion can be performed (using the CAST or :: syntax). ● **'i'**: Implicit conversion can be performed. ● **'a'**: Both explicit and implicit conversion can be performed between data types.
castmethod	"char"	Conversion method. ● **'f'**: Conversion is performed using the specified function in the **castfunc** column. ● **'b'**: Binary forcible conversion rather than the specified function in the **castfunc** column is performed between data types.

12.2.17.30 PG_CLASS

PG_CLASS records database objects and their relationship.

Table 12-93 PG_CLASS columns

Name	Type	Description
oid	oid	Row identifier (hidden attribute, which must be specified).
relname	name	Name of an object, such as a table, index, or view.
relnamespace	oid	OID of the namespace that contains the relationship.
reltype	oid	Data type that corresponds to the table's row type. The index is 0 because the index does not have PG_TYPE records.
reloftype	oid	OID of the composite type (**0** for other types).
relowner	oid	Owner of the relationship.
relam	oid	Access method used, such as B-tree, if the row is an index.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relfilenode	oid	Name of the on-disk file of this relationship (**0** if such file does not exist).
reltablespace	oid	Tablespace in which this relationship is stored. If the value is **0**, the default tablespace in this database is used. This column is meaningless if the relationship has no on-disk file.
relpages	double precision	Size of the on-disk representation of the table in pages (of size **BLCKSZ**). This is only an estimate used by the optimizer.
reltuples	double precision	Number of rows in the table. This is only an estimate used by the optimizer.
relallvisible	integer	Number of pages marked as all visible in the table. This column is used by the optimizer for optimizing SQL execution. It is updated by VACUUM, ANALYZE, and a few DDL statements such as CREATE INDEX.
reltoastrelid	oid	OID of the TOAST table associated with the table (**0** if no TOAST table exists). The TOAST table stores large columns "offline" in a secondary table.
reltoastidxid	oid	OID of the index for a TOAST table (**0** for a table other than a TOAST table)
relhasindex	boolean	Its value is **true** if this column is a table and has (or recently had) at least one index. It is set by CREATE INDEX but is not immediately cleared by DROP INDEX. If the VACUUM thread detects that a table has no index, it clears the **relhasindex** column and sets the value to **false**.
relisshared	boolean	Its value is **true** if the table is shared across all databases in the entire cluster. Otherwise, the value is **false**. Only certain system catalogs (such as PG_DATABASE) are shared.
relpersistence	"char"	• **p**: permanent table. • **u**: unlogged table. • **t**: temporary table. • **g**: global temporary table.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relkind	"char"	• **r**: ordinary table. • **i**: index. • **G**: global secondary index. • **s**: sequence. • **v**: view. • **c**: composite type. • **t**: TOAST table. • **f**: foreign table. • **m**: materialized view. • **e**: STREAM object. • **o**: CONTVIEW object.
relnatts	smallint	Number of user columns in the relationship (excluding system columns). **PG_ATTRIBUTE** has the same number of rows as the user columns.
relchecks	smallint	Number of check constraints in the table. For details, see the system catalog **PG_CONSTRAINT**.
relhasoids	boolean	Its value is **true** if an OID is generated for each row of the relationship. Otherwise, the value is **false**.
relhaspkey	boolean	Its value is **true** if the table has (or once had) a primary key. Otherwise, the value is **false**.
relhasrules	boolean	Its value is **true** if the table has rules. For details, see the system catalog **PG_REWRITE**.
relhastriggers	boolean	The value is **true** if the table has (or once had) triggers. Triggers of the table and view are recorded in the system catalog **PG_TRIGGER**.
relhassubclass	boolean	Its value is **true** if the table has (or once had) any inheritance child table. Otherwise, the value is **false**.
relcmprs	tinyint	Specifies whether the compression feature is enabled for the table. Note that only batch insertion triggers compression, so ordinary CRUD does not trigger compression. • **0**: Tables that do not support compression (primarily system catalogs, on which the compression attribute cannot be modified). • **1**: The compression feature of the table data is NOCOMPRESS or has no specified keyword. • **2**: The compression feature of the table data is COMPRESS.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relrowmovement	boolean	Specifies whether row migration is allowed when the partitioned table is updated. • **true**: Row migration is allowed. • **false**: Row migration is not allowed.
parttype	"char"	Specifies whether the table or index has the property of a partitioned table. • **p**: The table or index has the property of a partitioned table. • **n**: The table or index does not have the property of a partitioned table.
relfrozenxid	xid32	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table. To ensure forward compatibility, this column is reserved. The **relfrozenxid64** column is added to record the information.
relacl	aclitem[]	Access permissions. For details about the ACLItem type, see **ACLItem Type**. The command output of the query is as follows: *user1*=*privs*/*user2* indicates that the permission granted by user 2 to user 1 is **privs**. =*privs*/*user3* indicates that the permission granted to the **public** role by user 3 is **privs**. In the preceding command, user 1, user 2, and user 3 are the existing users or roles in the database, and **privs** indicates the permissions supported by the database. For details on permission descriptions, see **Table 12-94**.
reloptions	text[]	Table or index access method, using character strings in the format of *keyword*=*value*.
relreplident	"char"	Identifier of a decoding column in logical decoding. • **d**: default (primary key, if any). • **n**: none. • **f**: all columns. • **i**: The indisreplident of the index is specified or the default index is used.

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Name	Type	Description
relfrozenxid64	xid	All transaction IDs before this one have been replaced with a permanent ("frozen") transaction ID in the table. This column is used to track whether the table needs to be vacuumed to prevent transaction ID wraparound (or to allow PG_CLOG to be shrunk). The value is **0** (**InvalidTransactionId**) if the relationship is not a table. For a global temporary table, this column is meaningless. You can use the pg_catalog.gs_global_list_gtt_relfrozenxids function to view **relfrozenxid64** of the global temporary table of each session
relbucket	oid	Specifies whether the current catalog contains hash bucket shards. A valid OID points to the specific shard information recorded in the PG_HASHBUCKET catalog. **NULL** indicates that hash bucket shards are not included.
relbucketkey	int2vector	Hash partition key information. **NULL** indicates that the column information is not included.
relminmxid	xid	All multi-transaction IDs before this one have been replaced with a transaction ID in the table. This is used to track whether the table needs to be vacuumed in order to prevent multi-transaction IDs wraparound or to allow PG_CLOG to be shrunk. The value is **0** (**InvalidTransactionId**) if the relationship is not a table.

Table 12-94 Description of permissions

Parameter	Description
r	SELECT (read)
w	UPDATE (write)
a	INSERT (insert)
d	DELETE
D	TRUNCATE
x	REFERENCES
t	TRIGGER
X	EXECUTE
U	USAGE

 Copyright © Huawei Cloud Computing Technologies Co., Ltd.

Parameter	Description
C	CREATE
c	CONNECT
T	TEMPORARY
A	ALTER
P	DROP
m	COMMENT
i	INDEX
v	VACUUM
*	Authorization options for preceding permissions

12.2.17.31 PG_COLLATION

PG_COLLATION describes available collations, which are essentially mappings from an SQL name to OS locale categories.

Table 12-95 PG_COLLATION columns

Name	Type	Reference	Description
oid	oid	-	Row identifier (hidden attribute, which must be specified)
collname	name	-	Collation name (unique per namespace and encoding)
collnamespace	oid	OID in **PG_NAMESPACE**	OID of the namespace that contains this collation
collowner	oid	OID in **PG_AUTHID**	Owner of the collation
collencoding	integer	-	Encoding in which the collation is applicable, or **-1** if it works for any encoding. It is compatible with PostgreSQL.
collcollate	name	-	**LC_COLLATE** for this collation object
collctype	name	-	**LC_CTYPE** for this collation object
