Permissions Management

1.1 Creating a User and Granting SFS Permissions

1.1 Creating a User and Granting SFS Permissions

This chapter describes how to use IAM to implement fine-grained permissions control for your SFS resources. With IAM, you can:

- Create IAM users for employees based on your enterprise's organizational structure. Each IAM user will have their own security credentials for accessing SFS resources.
- Grant only the permissions required for users to perform a specific task.

If your Huawei Cloud account does not require individual IAM users, skip this section.

This section describes the procedure for granting permissions (see Figure 1-1).

Prerequisites

Learn about the permissions (see **System-defined roles and policies**) supported by SFS and choose policies or roles according to your requirements.

Restrictions

• Both system-defined policies and custom policies are supported in SFS Turbo file systems.

Process Flow

Figure 1-1 Process for granting SFS permissions

1. Create a user group and assign permissions to it.

Create a user group on the IAM console, and attach the **SFS Turbo ReadOnlyAccess** policy to the group.

2. Create a user and add it to a user group.

Create a user on the IAM console and add the user to the group created in 1.

3. Log in and verify permissions.

Log in to the SFS console using the created user, and verify that the user only has read permissions for SFS.

- Choose Scalable File Service. Click Create File System on the SFS console. If a message appears indicating that you have insufficient permissions to perform the operation, the SFS Turbo ReadOnlyAccess policy has already taken effect.
- Choose any other service. If a message appears indicating that you have insufficient permissions to access the service, the SFS Turbo ReadOnlyAccess policy has already taken effect.

2 File System Management

2.1 Viewing a File System

2.2 Deleting a File System

2.1 Viewing a File System

You can search for file systems by file system name keyword and view their basic information.

Procedure

- **Step 1** Log in to the SFS console.
- **Step 2** In the file system list, view the file systems you have created. **Table 2-1** describes the file system parameters.

Parameter	Description
Name	Name of the file system, for example, sfs-name-001
Status	Possible values are Available , Unavailable , Frozen , Creating , Deleting .
Туре	File system type
Protocol Type	File system protocol, which is NFS
Used Capacity (GB)	File system space already used for data storage NOTE This information is refreshed every 15 minutes.
Maximum Capacity (GB)	Maximum capacity of the file system
Encrypted	Encryption status of the file system. The value can be Yes or No .

Table 2-1 Parameter description

Parameter	Description
Enterprise Project	Enterprise project to which the file system belongs
Mount Point	File system mount point, which is in the format of <i>File system IP address.</i>
Operation	For an SFS Turbo file system, valid operations include capacity expansion, deletion, monitoring metric viewing, subscription renewal, and unsubscription.

Step 3 (Optional) Search for the specified file system by file system name.

----End

2.2 Deleting a File System

Data in a deleted file system cannot be restored. Ensure that files in a file system have been properly stored or backed up before you delete the file system.

Prerequisites

The file system to be deleted has been unmounted. For details about how to unmount the file system, see **Unmount a File System**.

Procedure

- **Step 1** In the file system list, locate the file system you want to delete and click **Delete** in the **Operation** column.
- **Step 2** In the displayed dialog box file system, as shown in , confirm the information and click **OK**.

After clicking **Unsubscribe** for a yearly/monthly SFS Turbo file system, complete the unsubscription as prompted.

NOTE

Only Available and Unavailable file systems can be deleted or unsubscribed from.

Step 3 Check that the file system disappears from the file system list.

3 Capacity Expansion

Scenarios

You can expand the capacity of a file system when needed.

Constraints

SFS Turbo file systems can only have their capacities expanded, not reduced. And only **In-use** file systems can be expanded.

Procedure

- **Step 1** Log in to the SFS console.
- **Step 2** In the file system list, click **Expand Capacity** in the row of the desired file system. The following dialog box is displayed
- Step 3 Enter a new capacity and click OK. Table 3-1 describes the parameters.

Parameter	Description
Current Capacity	Current storage capacity of the file system
New Capacity	 New storage capacity of the file system Value constraints: For a General file system, the minimum expansion increment is 100 GB. A Standard or Performance file system can be expanded to up to 32 TB, and a Standard - Enhanced or Performance - Enhanced file system can be expanded to up to 320 TB.

 Table 3-1 Capacity expansion parameters

Step 4 In the displayed dialog box, confirm the information and click **OK**.

Step 5 In the file system list, check the capacity information after resizing.

4_{Quotas}

What Is Quota?

Quotas can limit the number or amount of resources available to users, such as the maximum number of ECS or EVS disks that can be created.

If the existing resource quota cannot meet your service requirements, you can apply for a higher quota.

How Do I View My Quotas?

- 1. Log in to the management console.
- 2. Click \bigcirc in the upper left corner and select the desired region and project.
- In the upper right corner of the page, choose Resources > My Quotas. The Service Quota page is displayed.
- 4. View the used and total quota of each type of resources on the displayed page.

If a quota cannot meet service requirements, apply for a higher quota.

How Do I Apply for a Higher Quota?

- 1. Log in to the management console.
- In the upper right corner of the page, choose Resources > My Quotas. The Service Quota page is displayed.
- 3. Click **Increase Quota** in the upper right corner of the page.
- On the Create Service Ticket page, configure parameters as required. In the Problem Description area, fill in the content and reason for adjustment.
- 5. After all necessary parameters are configured, select I have read and agree to the Ticket Service Protocol and Privacy Statement and click Submit.

5 Encryption

Creating an Encrypted File System

To use the file system encryption function, you can directly select the encryption function when creating an SFS Turbo file system. Authorization is not required. For details, see **File System Encryption**.

You can create an encrypted or non-encrypted file system, but you cannot change the encryption settings of an existing file system.

For details about how to create an encrypted file system, see **Create a File System**.

Unmounting an Encrypted File System

If the custom key used by the encrypted file system is disabled or scheduled for deletion, the file system can only be used within a certain period of time (30s by default). Exercise caution in this case.

For details about how to unmount a file system, see Unmount a File System

6 Backup

You can back up SFS Turbo file systems using CBR.

Scenarios

A backup is a complete copy of an SFS Turbo file system at a specific time and it records all configuration data and service data at that time.

For example, if a file system is faulty or encounters a logical error (for example, mis-deletion, hacker attacks, and virus infection), you can use data backups to restore data quickly.

Creating a File System Backup

Ensure that the target file system is available. Or, the backup task cannot start. This procedure describes how to manually create a file system backup.

D NOTE

If any modification is made to a file system during the backup, inconsistencies may occur. For example, there may be duplicate or deleted data, or data discrepancies. Such a modification includes a write, rename, move or delete. To ensure backup data consistency, you are advised to stop the applications or programs that use the file system during the backup, or schedule the backup at off-peak hours.

- Step 1 In the navigation pane on the left, choose SFS Turbo Backups.
- Step 2 The system automatically backs up the file system.

You can view the backup creation status on the **Backups** tab page. When the **Status** of the backup changes to **Available**, the backup has been created.

Step 3 If the file system becomes faulty or an error occurred, you can restore the backup data to a new file system. For details, see Using a Backup to Create a File System.

Using a Backup to Create a File System

In case of a virus attack, accidental deletion, or software or hardware fault, you can use an SFS Turbo file system backup to create a new file system. Data on the new file system is the same as that in the backup.

- **Step 1** Log in to CBR Console.
 - 1. Log in to the management console.
 - 2. Click 💿 in the upper left corner and select your desired region and project.
 - 3. Choose Storage > Cloud Backup and Recovery > SFS Turbo Backups.
- Step 2 Click the Backups tab and locate the desired backup.
- **Step 3** If the status of the target backup is **Available**, click **Create File System** in the **Operation** column of the backup.
- **Step 4** Set the file system parameters.

NOTE

- For detailed parameter descriptions, see table "Parameter description" under **Create a File System**.
- Step 5 Click Next.
- **Step 6** Go back to the file system list and check whether the file system is successfully created.

You will see the file system status change as follows: **Creating**, **Available**, **Restoring**, **Available**. After the file system status has changed from **Creating** to **Available**, the file system is successfully created. After the status has changed from **Restoring** to **Available**, backup data has been successfully restored to the created file system.

7 Monitoring

7.1 SFS Turbo Metrics

7.1 SFS Turbo Metrics

Function

This section describes metrics reported by SFS Turbo to Cloud Eye as well as their namespaces and dimensions. You can use the console or APIs provided by Cloud Eye to query the metrics generated for SFS Turbo.

Namespace

SYS.EFS

Metrics

 Table 7-1 SFS Turbo metrics

Metric ID	Metric Name	Description	Value Range	Monitored Object	Monitorin g Period (Raw Data)
client_co nnection s	Client Connectio ns	Number of client connections NOTE Only active client connections are counted. A network connection is automatically disconnected when the client has no I/Os for a long time and is automatically re-established when there are I/Os.	≥ 0	SFS Turbo file system	1 minute
data_rea d_io_byt es	Read Bandwidt h	Data read I/O load Unit: byte/s	≥ 0 bytes/s	SFS Turbo file system	1 minute
data_wri te_io_byt es	Write Bandwidt h	Data write I/O load Unit: byte/s	≥ 0 bytes/s	SFS Turbo file system	1 minute
metadat a_io_byte s	Metadata Read and Write Bandwidt h	Metadata read and write I/O load Unit: byte/s	≥ 0 bytes/s	SFS Turbo file system	1 minute
total_io_ bytes	Total Bandwidt h	Total I/O load Unit: byte/s	≥ 0 bytes/s	SFS Turbo file system	1 minute
iops	IOPS	I/O operations per unit time	≥ 0	SFS Turbo file system	1 minute
used_cap acity	Used Capacity	Used capacity of a file system Unit: byte	≥ 0 bytes	SFS Turbo file system	1 minute
used_cap acity_per cent	Capacity Usage	Percentage of used capacity in the total capacity Unit: percent	0% to 100%	SFS Turbo file system	1 minute

Metric ID	Metric Name	Description	Value Range	Monitored Object	Monitorin g Period (Raw Data)
used_ino de	Used inodes	Number of inodes used in a file system	≥ 1	SFS Turbo file system	1 minute
used_ino de_perce nt	Inode Usage	Percentage of used inodes to total inodes in a file system Unit: percent	0% to 100%	SFS Turbo file system	1 minute

Dimension

Кеу	Value
efs_instance_id	Instance

Viewing Monitoring Statistics

- **Step 1** Log in to the management console.
- **Step 2** View the monitoring graphs using either of the following methods.
 - Method 1: Choose Service List > Storage > Scalable File Service. In the file system list, click View Metric in the Operation column of the target file system.
 - Method 2: Choose Management & Deployment > Cloud Eye > Cloud Service Monitoring > SFS Turbo. In the file system list, click View Metric in the Operation column of the target file system.
- **Step 3** View the SFS Turbo file system monitoring data by metric or monitored duration.

For more information about Cloud Eye, see the User Guide.

8 Auditing

8.1 Supported SFS Operations

8.1 Supported SFS Operations

Scenarios

Cloud Trace Service (CTS) records operations of SFS resources, facilitating query, audit, and backtracking.

Prerequisites

You have enabled CTS and the tracker is normal. For details about how to enable CTS, see **Enabling CTS** in the *Cloud Trace Service Getting Started*.

Operations

iddie o i bib capacity offerficed operations traced by ers
--

Operation	Resource Type	Trace
Creating a shared file system	sfs	createShare
Modifying a shared file system	sfs	updateShareInfo
Deleting a shared file system	sfs	deleteShare
Adding a share access rule	sfs	addShareACL
Deleting a share access rule	sfs	deleteShareACL

Table 8-2 SFS Turbo operations traced by CTS

Operation	Resource Type	Trace
Creating a file system	sfs_turbo	createShare
Deleting a file system	sfs_turbo	deleteShare

Querying Traces

- **Step 1** Log in to the management console.
- **Step 2** Click ¹ in the upper left corner and select a region and project.
- **Step 3** Choose Management & Deployment > Cloud Trace Service.

The **Cloud Trace Service** page is displayed.

- **Step 4** In the navigation pane on the left, choose **Trace List**.
- **Step 5** On the trace list page, set **Trace Source**, **Resource Type**, and **Search By**, and click **Query** to query the specified traces.

For details about other operations, see section "Querying Real-Time Traces" in the *Cloud Trace Service User Guide*.

----End

Disabling or Enabling a Tracker

This section describes how to disable an existing tracker on the CTS console. After the tracker is disabled, the system will stop recording operations, but you can still view existing operation records.

- **Step 1** Log in to the management console.
- Step 2 Choose > Cloud Trace Service.

The **Cloud Trace Service** page is displayed.

- **Step 3** Click **Trackers** in the left pane.
- **Step 4** Click **Disable** on the right of the tracker information.
- Step 5 Click Yes.
- Step 6 After the tracker is disabled, the available operation changes from Disable to Enable. To enable the tracker again, click Enable and then click Yes. The system will start recording operations again.

9 Typical Applications

9.1 Enterprise Website/App Background

9.2 Log Printing

9.1 Enterprise Website/App Background

Context

For I/O-intensive website services, SFS Turbo can provide shared website source code directories and storage for multiple web servers, enabling low-latency and high-IOPS concurrent share access. Features of such services are as follows:

- A large number of small files: Static website files need to be stored, including HTML files, JSON files, and static images.
- Read I/O intensive: Scope of data reading is large, and data writing is relatively small.
- Multiple web servers access an SFS Turbo background to achieve high availability of website services.

Configuration Process

- 1. Sort out the website files.
- 2. Log in to the SFS console. Create an SFS Turbo file system to store the website files.
- 3. Log in to the server that functions as the compute node and mount the file system.
- 4. On the head node, upload the files to the file system.
- 5. Start the web server.

Prerequisites

- A VPC has been created.
- Servers that function as head nodes and compute nodes have been created, and have been assigned to the VPC.

• SFS has been enabled.

Example Configuration

- **Step 1** Log in to the SFS console.
- **Step 2** In the upper right corner of the page, click **Create File System**.
- **Step 3** On the **Create File System** page, set parameters as instructed.
- Step 4 To mount a file system to Linux ECSs, see Mounting an NFS File System to ECSs (Linux). To mount a file system to Windows ECSs, see Mounting an NFS File System to ECSs (Windows).
- **Step 5** Log in to the head node and upload the files to the file system.
- **Step 6** Start the web server.

----End

9.2 Log Printing

Context

SFS Turbo can provide multiple service nodes for shared log output directories, facilitating log collection and management of distributed applications. Features of such services are as follows:

- A shared file system is mounted to multiple service hosts and logs are printed concurrently.
- Large file size and small I/O: The size of a single log file is large, but the I/O of each log writing is small.
- Write I/O intensive: Write I/O of small blocks is the major service.

Configuration Process

- 1. Log in to the SFS console. Create an SFS Turbo file system to store the log files.
- 2. Log in to the server that functions as the compute node and mount the file system.
- 3. Configure the log directory to the shared file system. It is recommended that each host use different log files.
- 4. Start applications.

Prerequisites

- A VPC has been created.
- Servers that function as head nodes and compute nodes have been created, and have been assigned to the VPC.
- SFS has been enabled.

Example Configuration

- **Step 1** Log in to the SFS console.
- **Step 2** In the upper right corner of the page, click **Create File System**.
- Step 3 On the Create File System page, set parameters as instructed.
- Step 4 To mount a file system to Linux ECSs, see Mounting an NFS File System to ECSs (Linux). To mount a file system to Windows ECSs, see Mounting an NFS File System to ECSs (Windows).
- **Step 5** Configure the log directory to the shared file system. It is recommended that each host use different log files.
- **Step 6** Start applications.

10 Other Operations

10.1 Testing SFS Turbo Performance

10.2 Mounting a File System to a Linux ECS as a Non-root User

10.3 Mounting a Subdirectory of an NFS File System to ECSs (Linux)

10.4 Data Migration

10.1 Testing SFS Turbo Performance

Fio is an open-source I/O tester. You can use fio to test the throughput and IOPS of SFS Turbo file systems.

Prerequisites

Fio has been installed on the ECS. It can be downloaded from **the official website** or from **GitHub**.

Note and Description

The test performance depends on the network bandwidth between the client and server, as well as the capacity of the file system.

Installing fio

The following uses a Linux CentOS system as an example:

- Download fio.
 yum install fio
- 2. Install the libaio engine.

yum install libaio-devel

Check the fio version.
 fio --version

File System Performance Data

The performance metrics of SFS Turbo file systems include IOPS and throughput. For details, see **Table 10-1**.

Paramet	General		НРС	
er	SFS Turbo Standard	SFS Turbo Performance	125 MB/s/TiB	250 MB/s/TiB
Maximu m capacity	32 TB	32 TB	1 PB	1 PB
Maximu m IOPS	5,000	20,000	1 million	1 million
Maximu m through put	150 MB/s	350 MB/s	20 GB/s	20 GB/s
Formula used to calculat e the IOPS	IOPS = Min. [5,000, (1,200 + 6 x Capacity)] Capacity unit: GB	IOPS = Min. [20,000, (1,500 + 20 x Capacity)] Capacity unit: GB	IOPS = Min. (1,000,000, 6,000 x Capacity) Capacity unit: TB	IOPS = Min. (1,000,000, 12,500 x Capacity) Capacity unit: TB

Table 10-1 File system performance data

Common Test Configuration Example

NOTE

The following estimated values are obtained from the test on a single ECS. You are advised to use multiple ECSs to test the performance of **SFS**.

In the following examples, SFS Turbo Performance and ECSs with the following specifications are used for illustration.

Specifications: General computing-plus | c3.xlarge.4 | 4 vCPUs | 16 GB

Image: CentOS 7.5 64-bit

• fio command:

```
fio --randrepeat=1 --ioengine=libaio --name=test -output=output.log --
direct=1 --filename=/mnt/nfs/test_fio --bs=1M --iodepth=128 --
size=10240M --readwrite=rw --rwmixwrite=30 --fallocate=none
```

NOTE

/mnt/nfs/test_fio indicates the location of the file to be tested. The location must be specific to the file name, which is the test_fio file in the /mnt/nfs directory in this example. Set it based on the site requirements.

• fio result:

10.2 Mounting a File System to a Linux ECS as a Nonroot User

Scenarios

By default, a Linux ECS allows only the **root** user to use the **mount** command to mount file systems, but you can grant the permissions of user **root** to other users. Then, such users can use the **mount** command to mount the file systems. The following describes how to mount a file system to a Linux ECS as a common user. EulerOS is used in this example.

Prerequisites

- A non-**root** user has been created on the ECS.
- A file system has been created and can be mounted to the ECS as **root**.
- The mount point of the file system has been obtained.

Procedure

- **Step 1** Log in to the ECS as user **root**.
- **Step 2** Assign the permissions of user **root** to the non-**root** user.
 - 1. Run the **chmod 777 /etc/sudoers** command to change the **sudoers** file to be editable.

2. Use the **which** command to view the **mount** and **umount** command paths.

Figure 10-1 Viewing command paths

```
IrootWecs-os-45di /J#
IrootWecs-os-45df /J#
IrootWecs-os-45df /J#
IrootWecs-os-45df /J#
IrootWecs-os-45df /J# which mount
/usr/bin/mount
IrootWecs-os-45df /J# which umount
/usr/bin/umount
IrootWecs-os-45df /J# ____
```

- 3. Run the vi /etc/sudoers command to edit the sudoers file.
- 4. Add a common user under the **root** account. In this example, user **Mike** is added.

Figure 10-2 Adding a user

# Defaults env_keep += "HOME"			
Defaults secure_path = /usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin			
## Next comes the main part: which users can run what software on ## which machines (the sudoers file can be shared between multiple ## systems). ## Syntax:			
## ## user MACHINE=COMMANDS			
## ## The COMMANDS section may have other options added to it. ##			
mike ALL=(ALL) NOPASSWD: /usr/bin/mount mike ALL=(ALL) NOPASSWD: /usr/bin/mount			
## Allows members of the 'sys' group to run networking, software, ## service management apps and more. # xsys ALL = NETWORKING, SOFTWARE, SERVICES, STORAGE, DELEGATING, PROCESSES, LOCATE, DRIVERS			
## Allows people in group wheel to run all commands zwheel ALL=(ALL) ALL			
## Same thing without a password # xwheel ALL=(ALL) NOPASSWD: ALL			
## Allows members of the users group to mount and unmount the ## cdrom as root			
# zusers ALL=/sbin/mount /mnt/cdrom, /sbin/umount /mnt/cdrom			
## Allows members of the users group to shutdown this system # xusers localhost=/sbin/shutdown -h now			
## Read drop-in files from /etc/sudoers.d (the # here does not mean a comment)			

- 5. Press Esc, input :wq, and press Enter to save and exit.
- 6. Run the **chmod 440 /etc/sudoers** command to change the **sudoers** file to be read-only.
- **Step 3** Log in to the ECS as user **Mike**.
- **Step 4** Run the following command to mount the file system. For details about the mounting parameters, see **Table 10-2**.

sudo mount -t nfs -o vers=3,timeo=600,noresvport,nolock Mount point Local
path

Parameter	Description
Mount Point	The format of an SFS Turbo file system is <i>File system IP address</i> ./, for example, 192.168.0.0:/ .
	NOTE <i>x</i> is a digit or letter.
	If the mount point is too long to display completely, you can adjust the column width.
Local path	A local directory on the ECS used to mount the file system, for example, /local_path .

 Table 10-2 Parameter description

Step 5 Run the following command to view the mounted file system:

mount -l

If the command output contains the following information, the file system has been mounted.

example.com:/share-xxx on /local_path type nfs (rw,vers=3,timeo=600,nolock,addr=)

----End

10.3 Mounting a Subdirectory of an NFS File System to ECSs (Linux)

This section describes how to mount a subdirectory of an NFS file system to Linux ECSs.

Prerequisites

You have mounted a file system to Linux ECSs by referring to **Mounting an NFS File System to ECSs (Linux)**.

Procedure

Step 1 Run the following command to create a subdirectory in the local path:

mkdir Local path/Subdirectory

NOTE

Variable *Local path* is an ECS local directory where the file system will be mounted on, for example, **/local_path**. Specify the local path used for mounting the root directory.

Step 2 Run the following command to mount the subdirectory to the ECSs that are in the same VPC as the file system: (Currently, the file system can be mounted to Linux ECSs using NFS v3 only.)

mount -t nfs -o vers=3,timeo=600,noresvport,nolock *Domain name or IP address of the file system:*/*Subdirectory Local path*

D NOTE

- *Domain name or IP address of the file system*. You can obtain it in the file system list from the console.
 - SFS Turbo: xx.xx.xx.xx:/subdirectory
- Subdirectory. Specify the subdirectory created in the previous step.
- *Local path*: An ECS local directory where the file system is mounted, for example, / **local_path**. Specify the local path used for mounting the root directory.
- **Step 3** Run the following command to view the mounted file system:

mount -l

If the command output contains the following information, the file system has been mounted.

Mount point on */local_path* type nfs (rw,vers=3,timeo=600,nolock,addr=)

Step 4 After the subdirectory has been mounted, you can access it from the server, and read or write data.

----End

Troubleshooting

If a subdirectory is not created before mounting, the mounting will fail.

Figure 10-3 Mounting without a subdirectory created

In the preceding figure, the root directory does not have the **subdir** subdirectory created so that the mounting fails. In this case, error message "Permission denied" is reported.

To troubleshoot this issue, mount the root directory, create a subdirectory, and then mount the subdirectory.

Figure 10-4 Mounting subdirectory

10.4 Data Migration

10.4.1 Migration Description

By default, an SFS Turbo file system can only be accessed by ECSs or CCE containers that reside in the same VPC as the file system. To access an SFS Turbo file system from an on-premises data center or a different VPC, you need to establish network connections by using Direct Connect, VPN, or VPC peering connections.

- Access from on premises or another cloud: Use Direct Connect or VPN.
- Access from a different VPC under the same account and in the same region: Use VPC peering.
- Access from a different account in the same region: Use VPC peering.
- Access from a different region: Use Cloud Connect.

Data can be migrated to SFS Turbo by using an ECS that can access the Internet.

 Mount the SFS Turbo file system to the ECS and migrate data from the local NAS storage to the SFS Turbo file system.

10.4.2 Using Direct Connect to Migrate Data

• If communication cannot be enabled through file system mounting, migrate data using the Huawei Cloud ECS via the Internet.

10.4.3 Using the Internet to Migrate Data

10.4.2 Using Direct Connect to Migrate Data

Context

You can migrate data from a local NAS to SFS Turbo using Direct Connect.

In this solution, a Linux ECS is created to connect the local NAS and SFS Turbo, and data is migrated to the cloud using an ECS.

You can also refer to this solution to migrate data from an on-cloud NAS to SFS Turbo. For details, see **Migrating Data from On-cloud NAS to SFS**.

Limitations and Constraints

- Only Linux ECSs can be used to migrate data.
- The UID and GID of your file will no longer be consistent after data migration.
- The file access modes will no longer be consistent after data migration.
- Incremental migration is supported, so that only changed data is migrated.

Prerequisites

• You have enabled and configured Direct Connect. For details, see *Direct Connect User Guide*.

- You have created a Linux ECS.
- You have created an SFS Turbo file system and have obtained the mount point of the file system.
- You have obtained the mount point of the local NAS.

Procedure

- **Step 1** Log in to the ECS console.
- **Step 2** Log in to the created Linux ECS to access the local NAS and SFS Turbo file system.
- **Step 3** Run the following mount command to access the local NAS: mount -t nfs -o vers=3,timeo=600,noresvport,nolock *Mount point of the local NAS* /mnt/src
- **Step 4** Run the following mount command to access the file system: mount -t nfs -o vers=3,timeo=600,noresvport,nolock *Mount point of the file system* /mnt/dst
- Step 5 Run the following commands on the Linux ECS to install the rclone tool: wget https://downloads.rclone.org/v1.53.4/rclone-v1.53.4-linux-amd64.zip --no-check-certificate unzip rclone-v1.53.4-linux-amd64.zip chmod 0755 ./rclone-*/rclone cp ./rclone-*/rclone /usr/bin/

rm -rf ./rclone-*

Step 6 Run the following command to synchronize data:

rclone copy /mnt/src /mnt/dst -P --transfers 32 --checkers 64 --links --create-empty-src-dirs

NOTE

Set **transfers** and **checkers** based on the system specifications. The parameters are described as follows:

- --transfers: number of files that can be transferred concurrently
- --checkers: number of local files that can be scanned concurrently
- -P: data copy progress
- --links: replicates the soft links from the source. They are saved as soft links in the destination.

--copy-links: replicates the content of files to which the soft links point. They are saved as files rather than soft links in the destination.

• --create-empty-src-dirs: replicates the empty directories from the source to the destination.

After data synchronization is complete, go to the target file system to check whether data is migrated.

----End

Migrating Data from On-cloud NAS to SFS

To migrate data from an on-cloud NAS to your SFS Turbo file system, ensure that the NAS and file system are in the same VPC, or you can use Cloud Connect to migrate data.

For details about how to configure Cloud Connect, see Cloud Connect User Guide.

10.4.3 Using the Internet to Migrate Data

Context

You can migrate data from a local NAS to SFS Turbo using the Internet.

In this solution, to migrate data from the local NAS to the cloud, a Linux server is created both on the cloud and on-premises. Inbound and outbound traffic is allowed on port 22 of these two servers. The on-premises server is used to access the local NAS, and the ECS is used to access SFS Turbo.

You can also refer to this solution to migrate data from an on-cloud NAS to SFS Turbo.

Limitations and Constraints

- Data cannot be migrated from the local NAS to SFS Capacity-Oriented using the Internet.
- Only Linux ECSs can be used to migrate data.
- The UID and GID of your file will no longer be consistent after data migration.
- The file access modes will no longer be consistent after data migration.
- Inbound and outbound traffic must be allowed on port 22.
- Incremental migration is supported, so that only changed data is migrated.

Prerequisites

- A Linux server has been created on the cloud and on-premises respectively.
- EIPs have been configured for the servers to ensure that the two servers can communicate with each other.
- You have created an SFS Turbo file system and have obtained the mount point of the file system.
- You have obtained the mount point of the local NAS.

Procedure

- **Step 1** Log in to the ECS console.
- **Step 2** Log in to the created on-premises server **client1** and run the following command to access the local NAS:

mount -t nfs -o vers=3,timeo=600,noresvport,nolock Mount point of the local NAS /mnt/src

Step 3 Log in to the created Linux ECS **client2** and run the following command to access the SFS Turbo file system:

mount -t nfs -o vers=3,timeo=600,noresvport,nolock Mount point of the SFS Turbo file system /mnt/dst

Step 4 Run the following commands on **client1** to install the rclone tool:

wget https://downloads.rclone.org/v1.53.4/rclone-v1.53.4-linux-amd64.zip --no-check-certificate unzip rclone-v1.53.4-linux-amd64.zip chmod 0755 ./rclone-*/rclone cp ./rclone-*/rclone /usr/bin/ rm -rf ./rclone-*

Step 5 Run the following commands on **client1** to configure the environment:

rclone config No remotes found - make a new one n) New remote s) Set configuration password q) Quit config n/s/q> n name> remote name (New name) Type of storage to configure. Enter a string value. Press Enter for the default (""). Choose a number from below, or type in your own value 24 / SSH/SFTP Connection \ "sftp" Storage> 24 (Select the SSH/SFTP number) SSH host to connect to Enter a string value. Press Enter for the default (""). Choose a number from below, or type in your own value 1 / Connect to example.com \ "example.com' host> ip address (IP address of client2) SSH username, leave blank for current username, root Enter a string value. Press Enter for the default (""). user> user name (Username of client2) SSH port, leave blank to use default (22) Enter a string value. Press Enter for the default (""). port> 22 SSH password, leave blank to use ssh-agent. y) Yes type in my own password g) Generate random password n) No leave this optional password blank y/g/n> y Enter the password: password: (Password for logging in to client2) Confirm the password: password: (Confirm the password for logging in to client2) Path to PEM-encoded private key file, leave blank or set key-use-agent to use ssh-agent. Enter a string value. Press Enter for the default (""). key file> (Press Enter) The passphrase to decrypt the PEM-encoded private key file. Only PEM encrypted key files (old OpenSSH format) are supported. Encrypted keys in the new OpenSSH format can't be used. y) Yes type in my own password g) Generate random password n) No leave this optional password blank y/g/n> n When set forces the usage of the ssh-agent. When key-file is also set, the ".pub" file of the specified key-file is read and only the associated key is requested from the ssh-agent. This allows to avoid `Too many authentication failures for *username*` errors when the ssh-agent contains many keys. Enter a boolean value (true or false). Press Enter for the default ("false"). key_use_agent> (Press Enter) Enable the use of the aes128-cbc cipher. This cipher is insecure and may allow plaintext data to be recovered by an attacker. Enter a boolean value (true or false). Press Enter for the default ("false"). Choose a number from below, or type in your own value 1 / Use default Cipher list. \ "false" 2 / Enables the use of the aes128-cbc cipher. \ "true" use_insecure_cipher> (Press Enter) Disable the execution of SSH commands to determine if remote file hashing is available. Leave blank or set to false to enable hashing (recommended), set to true to disable hashing. Enter a boolean value (true or false). Press Enter for the default ("false"). disable_hashcheck> Edit advanced config? (y/n) y) Yes n) No v/n > nRemote config

==== ==== remote_name sftp

e) Edit existing remote
n) New remote
d) Delete remote
r) Rename remote
c) Copy remote
s) Set configuration password
q) Quit config
e/n/d/r/c/s/q> q

Step 6 Run the following command to view the **rclone.conf** file in **/root/.config/rclone/ rclone.conf**:

```
cat /root/.config/rclone/rclone.conf
[remote_name]
type = sftp
host=(client2 ip)
user=(client2 user name)
port = 22
pass = ***
key_file_pass = ***
```

Step 7 Run the following command on **client1** to synchronize data:

rclone copy /mnt/src remote_name./mnt/dst -P --transfers 32 --checkers 64

D NOTE

- Replace *remote_name* in the command with the remote name in the environment.
- Set transfers and checkers based on the system specifications. The parameters are described as follows:
 - transfers: number of files that can be transferred concurrently
 - checkers: number of local files that can be scanned concurrently
 - P: data copy progress

After data synchronization is complete, go to the SFS Turbo file system to check whether data is migrated.

----End

10.4.4 Migrating Data Between File Systems

Solution Overview

You can migrate data from an SFS Capacity-Oriented file system to an SFS Turbo file system or the other way around.

This solution creates a Linux ECS to connect an SFS Capacity-Oriented file system with an SFS Turbo file system.

Limitations and Constraints

- Only Linux ECSs can be used to migrate data.
- The Linux ECS, SFS Capacity-Oriented file system, and SFS Turbo file system must be in the same VPC.
- Incremental migration is supported, so that only changed data is migrated.

Prerequisites

- You have created a Linux ECS.
- You have created an SFS Capacity-Oriented file system and an SFS Turbo file system and have obtained their mount points.

Procedure

- **Step 1** Log in to the ECS console.
- **Step 2** Log in to the created Linux ECS that can access SFS Capacity-Oriented and SFS Turbo file systems.
- **Step 3** Run the following command to mount file system 1 (either the SFS Capacity-Oriented or SFS Turbo file system). After that, you can access file system 1 on the Linux ECS.

mount -t nfs -o vers=3,timeo=600,noresvport,nolock [Mount point of file system 1] /mnt/src

Step 4 Run the following command to mount file system 2 (the other file system that you have not mounted in the previous step). After that, you can access file system 2 on the Linux ECS.

mount -t nfs -o vers=3,timeo=600,noresvport,nolock [Mount point of file system 2] /mnt/dst

- **Step 5** Download and install rclone. For the download address, see https://rclone.org/ downloads/.
- **Step 6** Run the following command to synchronize data: rclone copy /mnt/src /mnt/dst -P --transfers 32 --checkers 64 --links --create-empty-src-dirs

NOTE

Set **transfers** and **checkers** based on the system specifications. The parameters are described as follows:

- /mnt/src: source path
- /mnt/dst: destination path
- --transfers: number of files that can be transferred concurrently
- --checkers: number of local files that can be scanned concurrently
- -P: data copy progress
- --links: replicates the soft links from the source. They are saved as soft links in the destination.
- --copy-links: replicates the content of files to which the soft links point. They are saved as files rather than soft links in the destination.
- --create-empty-src-dirs: replicates the empty directories from the source to the destination.

After data synchronization is complete, go to the target file system to check whether data is migrated.

----End

Verification

- **Step 1** Log in to the created Linux ECS.
- Step 2 Run the following commands on the destination server to verify file synchronization: cd /mnt/dst ls | wc -l
- **Step 3** If the data volume is the same as that on the source server, the data is migrated successfully.
