1 Before You Start

1.1 Overview

Welcome to *MapReduce Service API Reference*. MapReduce Service (MRS) provides enterprise-level big data clusters on the cloud. Tenants can fully control the clusters and easily run big data components such as Hadoop, Spark, HBase, Kafka, and Storm in the clusters.

This document describes how to use application programming interfaces (APIs) to perform operations on MRS, such as creating or deleting clusters, adjusting nodes, as well as creating and executing jobs. For details about all supported operations, see [API Overview](#).

If you plan to access MRS through an API, ensure that you are familiar with MRS concepts. For details, see [Service Overview](#) in the *MapReduce Service User Guide*.

MRS 3.x does not support V1.1 APIs. You need to use V2 APIs. If you still need to use V1.1 APIs, obtain them from [Out-of-Date APIs](#).

1.2 API Calling

MRS support Representational State Transfer (REST) APIs, allowing you to call APIs using HTTPS. For details about API calling, see [Calling APIs](#).

1.3 Endpoints

An endpoint is the **request address** for calling an API. Endpoints vary depending on services and regions. For the endpoints of all services, see [Regions and Endpoints](#).

1.4 Constraints

- For more constraints, see API description.

1.5 Concepts

- Account

An account is created upon successful registration with Huawei Cloud. The account has full access permissions on all the resources and services that are subscribed under it. It can also reset user passwords and grant permissions to users. For security purposes, create IAM users and grant them permissions for routine management.

- User

An Identity and Access Management (IAM) user is created using an account to use cloud services. Each IAM user has its own identity credentials (password and access keys).

The account name, username, and password will be required for API authentication.

- Region

Regions are geographic areas isolated from each other. Resources are region-specific and cannot be used across regions through internal network connections. For low network latency and quick resource access, select the nearest region.

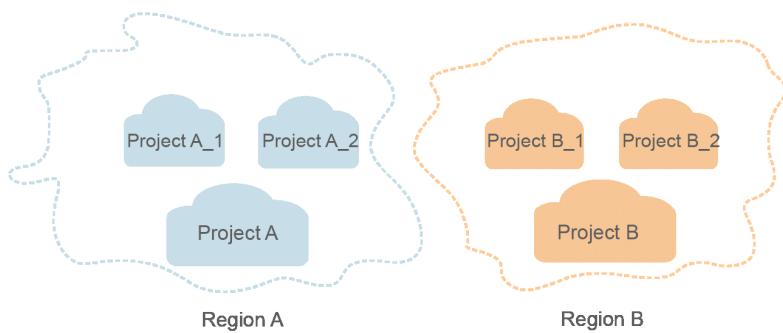

- AZ

An AZ contains one or more physical data centers. Each AZ has independent cooling, fire extinguishing, moisture-proof, and electricity facilities. Within an AZ, computing, network, storage, and other resources are logically divided into multiple clusters. AZs within a region are interconnected using high-speed optical fibers to support cross-AZ high-availability systems.

- Project

Projects group and isolate compute, storage, and network resources across physical regions. A default project is provided for each region, and subprojects can be created under each default project. Users can be granted permissions to access all resources in a specific project. For more refined access control, create sub-projects under a project and resources in the sub-projects. Users can then be assigned permissions to access only specific resources in the sub-projects.

Figure 1-1 Project isolation model

- Checkpoint

When an application consumes data, the latest SN of the consumed data is recorded as a checkpoint. When the data is reconsumed, the consumption can be continued based on this checkpoint.
- App

Multiple applications can consume data in the same stream, and their checkpoints are distinguished by App.

1.6 Selecting an API Type

Currently, MRS provides two types (V1.1 and V2) of APIs for cloud services with customized specifications. Only part of V2 APIs is available and mainly used for submitting jobs and SQL statements. If the API functions are the same, you are advised to use the V2 APIs first.

Based on the V1.1 APIs, the V2 APIs have the following enhancements:

- Jobs can be submitted in a security cluster.
- The HiveSQL, Spark Python, and Flink jobs are supported.
- The SparkSQL and SparkScript results can be queried.

For details about the APIs and their functions, see [API Overview](#).

2 API Overview

MRS provides APIs that meet RESTful API design standards, as listed in [Table 2-1](#) and [Table 2-2](#).

Some APIs are gradually discarded during MRS version evolution. For details, see [Table 2-3](#).

Table 2-1 V2 APIs

API	Function	API URI
Cluster management APIs	Creating a Cluster	POST /v2/{project_id}/clusters
Job object APIs	Adding and Executing a Job	POST /v2/{project_id}/clusters/{cluster_id}/job-executions
	Querying Information About a Job	GET /v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}
	Querying a List of Jobs	GET /v2/{project_id}/clusters/{cluster_id}/job-executions
	Terminating a Job	POST /v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}/kill
	Deleting Jobs in Batches	POST /v2/{project_id}/clusters/{cluster_id}/job-executions/batch-delete
SQL APIs	Submitting a SQL Statement	POST /v2/{project_id}/clusters/{cluster_id}/sql-execution

API	Function	API URI
	Querying SQL Results	GET /v2/{project_id}/clusters/{cluster_id}/sql-execution/{sql_id}
	Canceling a SQL Execution Task	POST /v2/{project_id}/clusters/{cluster_id}/sql-execution/{sql_id}/cancel
Cluster HDFS file APIs (V2)	Obtaining the List of Files from a Specified Directory	GET /v2/{project_id}/clusters/{cluster_id}/files? path={directory}&offset={offset}&limit={limit}&sort_key={sort_key}&order={order}
Agency management APIs (V2)	Querying the Mapping Between a User (Group) and an IAM Agency	GET /v2/{project_id}/clusters/{cluster_id}/agency-mapping
	Updating the Mapping Between a User (Group) and an IAM Agency	PUT /v2/{project_id}/clusters/{cluster_id}/agency-mapping

Table 2-2 V1.1 APIs

API	Function	API URI
Cluster management APIs	Creating a Cluster and Executing a Job	POST /v1.1/{project_id}/run-job-flow
	Resizing a Cluster	PUT /v1.1/{project_id}/cluster_infos/{cluster_id}
	Querying a Cluster List	GET /v1.1/{project_id}/cluster_infos
	Querying Cluster Details	GET /v1.1/{project_id}/cluster_infos/{cluster_id}
	Terminating a Cluster	DELETE /v1.1/{project_id}/clusters/{cluster_id}
	Querying a Host List	GET /v1.1/{project_id}/clusters/{cluster_id}/hosts
Job object APIs	Adding and Executing a Job (Deprecated)	POST /v1.1/{project_id}/jobs/submit-job
	Querying the exe Object List of Jobs (Deprecated)	GET /v1.1/{project_id}/job-exes

API	Function	API URI
	Querying exe Object Details (Deprecated)	GET /v1.1/{project_id}/job-exes/{job_exe_id}
Job execution object APIs	Deleting a Job Execution Object (Deprecated)	DELETE /v1.1/{project_id}/job-executions/{job_execution_id}
Auto scaling APIs	Configuring an Auto Scaling Rule	POST /v1.1/{project_id}/autoscaling-policy/{cluster_id}
Tag management APIs	Adding Tags to a Specified Cluster	POST /v1.1/{project_id}/clusters/{cluster_id}/tags
	Deleting Tags from a Specified Cluster	DELETE /v1.1/{project_id}/clusters/{cluster_id}/tags/{key}
	Querying Tags of a Specified Cluster	GET /v1.1/{project_id}/clusters/{cluster_id}/tags
	Adding Tags to a Cluster in Batches	POST /v1.1/{project_id}/clusters/{cluster_id}/tags/action
	Querying All Tags	GET /v1.1/{project_id}/clusters/tags
	Querying a List of Clusters with Specified Tags	POST /v1.1/{project_id}/clusters/resource_instances/action

Table 2-3 Historical APIs

API	Function	API URI
V1.1 Job Management API	Adding and Executing a Job	POST /v1.1/{project_id}/jobs/submit-job
	Querying the exe Object List	GET /v1.1/{project_id}/job-exes
	Querying exe Object Details	GET /v1.1/{project_id}/job-exes/{job_exe_id}
	Deleting a Job Execution Object	DELETE /v1.1/{project_id}/job-executions/{job_execution_id}

3 Calling APIs

3.1 Making an API Request

This section describes the structure of a REST API, and uses the IAM API for as an example to demonstrate how to call an API. The obtained token is used to authenticate the calling of other APIs.

Request URI

A request URI is in the following format:

{URI-scheme}://{Endpoint}/{resource-path}?{query-string}

Although a request URI is included in the request header, most programming languages or frameworks require the request URI to be passed separately.

Table 3-1 URI parameter description

Parameter	Description
URI-scheme	Protocol used to transmit requests. All APIs use HTTPS.
Endpoint	Domain name or IP address of the server bearing the REST service endpoint. The endpoint varies depending on the service and service region. For details about endpoints, see Endpoints .
resource-path	Access path of an API for performing a specified operation. Obtain the path from the URI of an API. For example, the resource-path of the API used to obtain a user token is /v3/auth/tokens .
query-string	Query parameter, which is optional. Ensure that a question mark (?) is included before each query parameter that is in the format of "Parameter name=Parameter value". For example, ? limit=10 indicates that a maximum of 10 data records will be displayed.

 NOTE

To simplify the URI display in this document, each API is provided only with a **resource-path** and a request method. The **URI-scheme** of all APIs is **HTTPS**, and the endpoints of all APIs in the same region are identical.

Request Methods

The HTTP protocol defines the following request methods that can be used to send a request to the server:

Table 3-2 HTTP methods

Method	Description
GET	Requests the server to return specified resources.
PUT	Requests the server to update specified resources.
POST	Requests the server to add resources or perform special operations.
DELETE	Requests the server to delete specified resources, for example, an object.
HEAD	Requests the server resource header.
PATCH	Requests the server to update partial content of a specified resource. If the resource does not exist, a new resource will be created.

In the URI of the API to obtain a user token, you can see that the request method is **POST**. The request is as follows:

```
POST https://{{endpoint}}/v3/auth/tokens
```

Request Header

You can also add additional header fields to a request, such as the fields required by a specified URI or HTTP method. For example, to request for the authentication information, add **Content-Type**, which specifies the request body type.

Table 3-3 lists common request header fields.

Table 3-3 Common request header fields

Name	Description	Mandatory	Example
X-Sdk-Date	Time when the request is sent. The time is in YYYYMMDDTHHMMSSZ format. The value is the current Greenwich Mean Time (GMT) of the system.	This field is mandatory for AK/SK-based authentication.	20150907T101459Z
Host	Server information of the resource being requested. The value can be obtained from the URL of a service API. The value is hostname[:port] . If the port number is not specified, the default port is used. The default port number for HTTPS is 443 .	This field is mandatory for AK/SK-based authentication.	code.test.com or code.test.com:443
Content-Type	MIME type of the request body. This field is mandatory and its default value is application/json . Other values of this field will be provided for specific APIs if any.	Yes	application/json
Content-Length	Length of the request body. The unit is byte.	This field is mandatory for POST and PUT requests, but must be left blank for GET requests.	3495
X-Project-Id	Project ID. This field is used to obtain the token for each project.	No	e9993fc787d94b6c886 cbaa340f9c0f4

Name	Description	Mandatory	Example
X-Auth-Token	User token. It is the response to the API used to obtain a user token. This API is the only one that does not require authentication. The token is the value of X-Subject-Token in the response header.	No This field is mandatory for token-based authentication.	-
X-Language	Request language. Possible values: <ul style="list-style-type: none">• zh-cn: Chinese• en-us: English	No	en-us
X-Domain-Id	Account ID.	No	-

NOTE

In addition to supporting token-based authentication, APIs also support authentication using access key ID/secret access key (AK/SK). During AK/SK-based authentication, an SDK is used to sign the request, and the **Authorization** (signature authentication) and **X-Sdk-Date** (time when the request is sent) header fields are automatically added to the request.

For more information, see **AK/SK-based Authentication** in [Authentication](#).

The API used to obtain a user token does not require authentication. Therefore, only the **Content-Type** field needs to be added to requests for calling the API. An example of such requests is as follows:

```
POST https://{{endpoint}}/v3/auth/tokens
Content-Type: application/json
```

(Optional) Request Body

This part is optional. The body of a request is often sent in a structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The request body transfers content except the request header. If the request body contains Chinese characters, these characters must be coded in UTF-8.

The request body varies between APIs. Some APIs do not require the request body, such as the APIs requested using the GET and DELETE methods.

In the case of the API used to obtain a user token, the request parameters and parameter description can be obtained from the API request. The following provides an example request with a body included. Replace *username*, *domainname*, ******* (login password), and *xxxxxxxxxxxxxx* (project ID) with the actual values. To learn how to obtain a project ID, see [Obtaining a Project ID](#).

 NOTE

The **scope** parameter specifies where a token takes effect. You can set **scope** to an account or a project under an account. In the following example, the token takes effect only for the resources in a specified project. For more information about this API, see Obtaining a User Token of the IAM service.

```
POST https://{{endpoint}}/v3/auth/tokens
Content-Type: application/json

{
  "auth": {
    "identity": {
      "methods": [
        "password"
      ],
      "password": {
        "user": {
          "name": "username",
          "password": "*****",
          "domain": {
            "name": "domainname"
          }
        }
      }
    },
    "scope": {
      "project": {
        "id": "xxxxxxxxxxxxxxxxxxxxxx"
      }
    }
  }
}
```

All data required for the API request is available. In the response to the API used to obtain a user token, **x-subject-token** is the desired user token. This token can then be used to authenticate the calling of other APIs.

3.2 Authentication

Requests for calling an API can be authenticated using either of the following methods:

- Token-based authentication: Requests are authenticated using a token.
- AK/SK-based authentication: Requests are authenticated by encrypting the request body using an AK/SK pair. AK/SK-based authentication is recommended because it is more secure than token-based authentication.

Token-based Authentication

 NOTE

The validity period of a token is 24 hours. When using a token for authentication, cache it to prevent frequently calling the IAM API used to obtain a user token.

A token specifies temporary permissions in a computer system. During API authentication using a token, the token is added to requests to get permissions for calling the API.

The token can be obtained by calling the API in Obtaining a User Token. A project-level token is required for calling this service API, that is, when calling the API for obtaining a user token, set the value of **auth.scope** in the request body to **project**.

```
{  
    "auth": {  
        "identity": {  
            "methods": [  
                "password"  
            ],  
            "password": {  
                "user": {  
                    "name": "username",  
                    "password": "*****",  
                    "domain": {  
                        "name": "domainname"  
                    }  
                }  
            }  
        },  
        "scope": {  
            "project": {  
                "id": "xxxxxxx"  
            }  
        }  
    }  
}
```

After a token is obtained, the **X-Auth-Token** header field must be added to requests to specify the token when calling other APIs. For example, if the token is **ABCDEFJ....**, **X-Auth-Token: ABCDEFJ....** can be added to a request as follows:

```
Content-Type: application/json  
X-Auth-Token: ABCDEFJ....
```

AK/SK-based Authentication

NOTE

AK/SK-based authentication supports API requests with a body not larger than 12 MB. For API requests with a larger body, token-based authentication is recommended.

In AK/SK-based authentication, AK/SK is used to sign requests and the signature is then added to the requests for authentication.

- AK: access key ID, which is a unique identifier used in conjunction with a secret access key to sign requests cryptographically.
- SK: secret access key used in conjunction with an AK to sign requests cryptographically. It identifies a request sender and prevents the request from being modified.

In AK/SK-based authentication, you can use an AK/SK to sign requests based on the signature algorithm or use the signing SDK to sign requests.

NOTICE

The signing SDK is only used for signing requests and is different from the SDKs provided by services.

3.3 Response

Status Code

After sending a request, you will receive a response, including a status code, response header, and response body.

A status code is a group of digits, ranging from 1xx to 5xx. It indicates the status of a request. For more information, see [Status Codes](#).

For the API to obtain a user token, if the status code **201** is returned after the API is called, the request is successful.

Response Header

Similar to a request, a response also has a header, for example, **Content-Type**.

[Figure 3-1](#) shows the response header fields for the API used to obtain a user token. The **x-subject-token** header field is the desired user token. This token can then be used to authenticate the calling of other APIs.

Figure 3-1 Header fields of the response to the request for obtaining a user token

```
connection → keep-alive
content-type → application/json
date → Tue, 12 Feb 2019 06:52:13 GMT
server → Web Server
strict-transport-security → max-age=31536000; includeSubdomains;
transfer-encoding → chunked
via → proxy A
x-content-type-options → nosniff
x-download-options → noopener
x-frame-options → SAMEORIGIN
x-iam-trace-id → 218d45ab-d674-4995-af3a-2d0255ba41b5
x-subject-token
x-xss-protection → 1; mode=block;
```

(Optional) Response Body

This part is optional. The body of a response is often returned in structured format (for example, JSON or XML) as specified in the **Content-Type** header field. The response body transfers content except the response header.

The following shows the response body for the API to obtain a user token. For the sake of space, only part of the content is displayed here.

```
{
  "token": {
```

```
"expires_at": "2019-02-13T06:52:13.855000Z",
"methods": [
    "password"
],
"catalog": [
    {
        "endpoints": [
            {
                ...
                "region_id": "aaa"/The region ID "aaa" is used as an example.
```

If an error occurs during API calling, an error code and a message will be displayed. The following shows an error response body.

```
{
    "error_msg": "Invalid cluster name.",
    "error_code": "12000002"
}
```

In the response body, **error_code** is an error code, and **error_msg** provides information about the error.

4 Application Cases

4.1 Creating an MRS Cluster

Scenario

This section describes how to create an MRS analysis cluster using APIs. For details on how to call APIs, see [Making an API Request](#).

Constraints

- A VPC and subnet have been created using the VPC service in the region where the cluster is to be created. For details about how to create a VPC, see . For details about how to create a subnet, see .
- You have obtained the region and AZ information of the cluster to be created. For details, see [Endpoints](#).
- You have obtained the project ID of the region where the cluster is to be created. For details, see [Obtaining a Project ID](#).
- You have determined the version of the cluster to be created and the components supported by the version.
- In this example, an analysis cluster is created.

Procedure

- API
URI format: POST /v2/{project_id}/clusters
For details, see [Creating a Cluster](#).
- Example request
POST: `https://{endpoint}/v2/{project_id}/clusters`
 - For details about `{endpoint}`, see [Endpoints](#).
 - For details about `{project_id}`, see [Obtaining a Project ID](#).
 - Obtain the value of `node_size` from the cluster creation page on the MRS console.Request body:

```
{  
    "cluster_version": "MRS 3.1.0",  
    "cluster_name": "mrs_Demo",  
    "cluster_type": "ANALYSIS",  
    "charge_info": {  
        "charge_mode": "postPaid"  
    },  
    "region": "",  
    "availability_zone": "",  
    "vpc_name": "vpc-37cd",  
    "subnet_name": "subnet-ed99",  
    "components": "Hadoop,Spark2x,HBase,Hive,Hue,Flink,Oozie,Ranger,Tez",  
    "safe_mode": "KERBEROS",  
    "manager_admin_password": "Mrs@1234",  
    "login_mode": "PASSWORD",  
    "node_root_password": "Mrs@1234",  
    "log_collection": 1,  
    "mrs_ecs_default_agency": "MRS_ECS_DEFAULT_AGENCY",  
    "tags": [  
        {  
            "key": "tag1",  
            "value": "111"  
        },  
        {  
            "key": "tag2",  
            "value": "222"  
        }  
    ],  
    "node_groups": [  
        {  
            "group_name": "master_node_default_group",  
            "node_num": 2,  
            "node_size": "rc3.4xlarge.4.linux.bigdata",  
            "root_volume": {  
                "type": "SAS",  
                "size": 480  
            },  
            "data_volume": {  
                "type": "SAS",  
                "size": 600  
            },  
            "data_volume_count": 1  
        },  
        {  
            "group_name": "core_node_analysis_group",  
            "node_num": 3,  
            "node_size": "rc3.4xlarge.4.linux.bigdata",  
            "root_volume": {  
                "type": "SAS",  
                "size": 480  
            },  
            "data_volume": {  
                "type": "SAS",

            }  
        }  
    ]  
}
```

For details about the parameters, see [Creating a Cluster](#).

- Example response

```
{  
    "cluster_id": "da1592c2-bb7e-468d-9ac9-83246e95447a"  
}
```

4.2 Scaling Out a Cluster

Scenario

After a cluster is created, add Core or Task nodes to the cluster. After an MRS cluster is created, the number of Master nodes cannot be adjusted. That is, Master nodes cannot be scaled in or out. For details on how to call APIs, see [Making an API Request](#).

Constraints

- A cluster has been created and is in the **Running** state.
- You have obtained the project ID of the region where the cluster is to be created. For details, see [Obtaining a Project ID](#).
- You have obtained the cluster ID, that is, the value of **cluster_id** in the command output returned after the cluster is successfully created. For details about how to obtain the cluster ID, see [Obtaining a Cluster ID](#).
- This section uses the Core node as an example.

Procedure

- API

URI format: PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

For details, see [Resizing a Cluster](#).

- Example request

PUT: `https://{endpoint}/v1.1/{project_id}/cluster_infos/{cluster_id}`

- For details about **{endpoint}**, see [Endpoints](#).
- For details about **{project_id}**, see [Obtaining a Project ID](#).
- **{cluster_id}** indicates the value of **cluster_id** in the command output returned after the cluster is successfully created. You can also obtain the value of **cluster_id** by referring to [Obtaining a Cluster ID](#).

Request body:

```
{  
    "service_id": "",  
    "plan_id": "",  
    "parameters": {  
        "order_id": "",  
        "scale_type": "scale_out",  
        "node_id": "node_orderadd",  
        "node_group": "core_node_default_group",  
        "instances": "1",  
        "skip_bootstrap_scripts":false,  
        "scale_without_start":false  
    },  
    "previous_values": {  
        "plan_id": ""  
    }  
}
```

For details about the parameters, see [Resizing a Cluster](#).

- Example response

```
{  
    "result": "succeeded"  
}
```

4.3 Scaling in a Cluster

Scenario

This section describes how to scale in a Core or Task node in the cluster after it is created. After an MRS cluster is created, the number of Master nodes cannot be adjusted. That is, Master nodes cannot be scaled in or out. For details on how to call APIs, see [Making an API Request](#).

Constraints

- A cluster has been created and is in the **Running** state.
- You have obtained the project ID of the region where the cluster is to be created. For details, see [Obtaining a Project ID](#).
- You have obtained the cluster ID, that is, the value of **cluster_id** in the command output returned after the cluster is successfully created. For details about how to obtain the cluster ID, see [Obtaining a Cluster ID](#).
- The Core node is used as an example.

Procedure

- API

URI format: PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

For details, see [Resizing a Cluster](#).

- Example request

PUT: `https://{endpoint}/v1.1/{project_id}/cluster_infos/{cluster_id}`

- For details about `{endpoint}`, see [Endpoints](#).
- For details about `{project_id}`, see [Obtaining a Project ID](#).
- `{cluster_id}` indicates the value of `cluster_id` in the command output returned after the cluster is successfully created. You can also obtain the value of `cluster_id` by referring to [Obtaining a Cluster ID](#).

Request body:

```
{  
    "service_id": "",  
    "plan_id": "",  
    "parameters": {  
        "order_id": "",  
        "scale_type": "scale_in",  
        "node_id": "node_orderadd",  
        "node_group": "core_node_default_group",  
        "instances": "1"  
  
    },  
    "previous_values": {  
        "plan_id": ""  
    }  
}
```

For details about the parameters, see [Resizing a Cluster](#).

- Example response

```
{  
    "result": "succeeded"  
}
```

4.4 Creating a Job

Scenario

This API is used to add and submit a job in an MRS cluster. For details on how to call APIs, see [Making an API Request](#).

Constraints

- A cluster has been created and is in the **Running** state.
- You have obtained the project ID of the region where the cluster is to be created. For details, see [Obtaining a Project ID](#).
- You have obtained the cluster ID, that is, the value of `cluster_id` in the command output returned after the cluster is successfully created. For details about how to obtain the cluster ID, see [Obtaining a Cluster ID](#).
- IAM users have been synchronized. On the Overview tab page of the cluster details page, click **Click to synchronize** on the right of **IAM User Sync** to synchronize IAM users.
- The job-related programs and input files have been stored in OBS.
- In this example, a MapReduce job is added.

Procedure

- API
URI format: POST /v2/{project_id}/clusters/{cluster_id}/job-executions
For details, see [Adding and Executing a Job](#).
- Example request
POST: https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions
 - For details about **{endpoint}**, see [Endpoints](#).
 - For details about **{project_id}**, see [Obtaining a Project ID](#).
 - **{cluster_id}** indicates the value of **cluster_id** in the command output returned after the cluster is successfully created. You can also obtain the value of **cluster_id** by referring to [Obtaining a Cluster ID](#).

Request body:

```
{  
    "job_name": "MapReduceTest",  
    "job_type": "MapReduce",  
    "arguments": [  
        "obs://obs-test/program/hadoop-mapreduce-examples-x.x.x.jar",  
        "wordcount",  
        "obs://obs-test/input/",  
        "obs://obs-test/job/mapreduce/output"  
    ],  
    "properties": {  
        "fs.obs.endpoint": "obs endpoint",  
        "fs.obs.access.key": "xxx",  
        "fs.obs.secret.key": "yyy"  
    }  
}
```

For details about the parameters, see [Adding and Executing a Job](#).

- Example response

```
{  
    "job_submit_result": {  
        "job_id": "44b37a20-ffe8-42b1-b42b-78a5978d7e40",  
        "state": "COMPLETE"  
    }  
}
```

4.5 Terminating a Job

Scenario

This API is used to manually terminate the job if a job is not completed after being submitted. For details on how to call APIs, see [Making an API Request](#).

Constraints

- A cluster has been created and is in the **Running** state.
- You have obtained the project ID of the region where the cluster is to be created. For details, see [Obtaining a Project ID](#).
- You have obtained the cluster ID, that is, the value of **cluster_id** in the command output returned after the cluster is successfully created. For details about how to obtain the cluster ID, see [Obtaining a Cluster ID](#).

- You have obtained the job ID, that is, the value of **job_id** in the returned result after the job is successfully submitted. For details about how to obtain the job ID, see [Obtaining a Job ID](#).
- IAM users have been synchronized. On the Overview tab page of the cluster details page, click **Click to synchronize** on the right of **IAM User Sync** to synchronize IAM users.
- The job-related programs and input files have been stored in OBS.
- In this example, a MapReduce job is added.

Procedure

- API
URI format: POST /v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}/kill
For details, see [Terminating a Job](#).
- Example request
POST: `https://{endpoint}/v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}/kill`
 - For details about **{endpoint}**, see [Endpoints](#).
 - For details about **{project_id}**, see [Obtaining a Project ID](#).
 - **{cluster_id}** indicates the value of **cluster_id** in the command output returned after the cluster is successfully created. You can also obtain the value of **cluster_id** by referring to [Obtaining a Cluster ID](#).
 - **{job_execution_id}** indicates the job ID returned after the job is successfully submitted. You can also obtain the job ID by referring to [Obtaining a Job ID](#).Request body: None
- Example response
None

4.6 Terminating a Cluster

Scenario

This API is used to delete a cluster after data processing and analysis are completed or the cluster is abnormal.

Clusters in any of the following states cannot be terminated:

- **Scaling-out**: The cluster is being scaled out.
- **Scaling-in**: The cluster is being scaled in.
- **Starting**: The cluster is being started.
- **Terminating**: The cluster is being deleted.
- **Terminated**: The cluster has been terminated.
- **Failed**: The cluster is failed.

For details on how to call APIs, see [Making an API Request](#).

Constraints

- You have obtained the project ID of the region where the cluster is to be created. For details, see [Obtaining a Project ID](#).
- You have obtained the cluster ID, that is, the value of **cluster_id** in the command output returned after the cluster is successfully created. For details about how to obtain the cluster ID, see [Obtaining a Cluster ID](#).

Procedure

- API
URI format: DELETE /V1.1/{project_id}/clusters/{cluster_id}
For details, see [Terminating a Cluster](#).
- Example request
DELETE: `https://{endpoint}/v1.1/{project_id}/clusters/{cluster_id}`
 - For details about **{endpoint}**, see [Endpoints](#).
 - For details about **{project_id}**, see [Obtaining a Project ID](#).
 - **{cluster_id}** indicates the value of **cluster_id** in the command output returned after the cluster is successfully created. You can also obtain the value of **cluster_id** by referring to [Obtaining a Cluster ID](#).Request body: None
- Example response

```
{  
    "result": "succeeded"  
}
```

5 API V2

5.1 Cluster Management APIs

5.1.1 Creating a Cluster

Function

This API is used to create an MRS cluster.

Before using the API, you need to obtain the resources listed in [Table 5-1](#).

Table 5-1 Obtaining resources

Resource	How to Obtain
VPC	See operation instructions in in the <i>VPC API Reference</i> .
Subnet	See operation instructions in in the <i>VPC API Reference</i> .
Key Pair	See operation instructions in in the <i>ECS API Reference</i> .
Zone	See Endpoints for details about regions and AZs.
Version	Currently, MRS 2.1.1, 3.0.5, and 3.1.0 are supported.

Resource	How to Obtain
Component	<ul style="list-style-type: none"> ● MRS 3.1.0 supports the following components: <ul style="list-style-type: none"> - An analysis cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, and Kudu. - A streaming cluster contains the following components: Kafka, Flume, ZooKeeper, and Ranger. - A hybrid cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, Kafka, and Flume. - A custom cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Kafka, Flume, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, ClickHouse, and Kudu. ● MRS 3.0.5 supports the following components: <ul style="list-style-type: none"> - An analysis cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, and Alluxio. - A streaming cluster contains the following components: Kafka, Storm, Flume, ZooKeeper, and Ranger. - A hybrid cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, Alluxio, Kafka, Storm, and Flume. - A custom cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Kafka, Storm, Flume, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, ClickHouse, Kudu, and Alluxio.

URI

POST /v2/{project_id}/clusters

Table 5-2 URI parameter

Parameter	Mandatory	Type	Description
project_id	Yes	String	Project ID. For details about how to obtain the project ID, see Obtaining a Project ID .

Request Parameters

Table 5-3 Request parameters

Parameter	Mandatory	Type	Description
cluster_version	Yes	String	Cluster version. Possible values: <ul style="list-style-type: none">• MRS 3.0.5• MRS 3.1.0
cluster_name	Yes	String	Cluster name. It must be unique. A cluster name can contain only 1 to 64 characters. Only letters, numbers, hyphens (-), and underscores (_) are allowed.
cluster_type	Yes	String	Cluster type. Possible values: <ul style="list-style-type: none">• ANALYSIS: analysis cluster• STREAMING: streaming cluster• MIXED: hybrid cluster• CUSTOM: custom cluster, which is supported only by MRS 3.x
region	Yes	String	Information about the region where the cluster is located. For details, see Endpoints .
vpc_name	Yes	String	Name of the VPC where the subnet locates. Perform the following operations to obtain the VPC name from the VPC management console: <ol style="list-style-type: none">1. Log in to the management console.2. Click Virtual Private Cloud and select Virtual Private Cloud from the left list. On the Virtual Private Cloud page, obtain the VPC name from the list.

Parameter	Mandatory	Type	Description
subnet_id	No	String	<p>Subnet ID, which can be obtained by performing the following operations on the VPC management console:</p> <ol style="list-style-type: none">1. Log in to the VPC management console.2. Click Virtual Private Cloud and select Virtual Private Cloud from the left list.3. Locate the row that contains the target VPC and click the number in the Subnets column to view the subnet information.4. Click the subnet name to obtain the network ID. At least one of subnet_id and subnet_name must be configured. If the two parameters are configured but do not match the same subnet, the cluster fails to create. subnet_id is recommended.

Parameter	Mandatory	Type	Description
subnet_name	Yes	String	<p>Subnet name. Perform the following operations to obtain the subnet name from the VPC management console:</p> <ol style="list-style-type: none"> 1. Log in to the management console. 2. Click Virtual Private Cloud and select Virtual Private Cloud from the left list. 3. Locate the row that contains the target VPC and click the number in the Subnets column to obtain the subnet name. At least one of subnet_id and subnet_name must be configured. If the two parameters are configured but do not match the same subnet, the cluster fails to create. If only subnet_name is configured and subnets with the same name exist in the VPC, the first subnet name in the VPC is used when a cluster is created. subnet_id is recommended.
components	Yes	String	List of component names, which are separated by commas (,). For details about the component names, see the component list of each version in Table 5-1 .
availability_zone	Yes	String	<p>AZ name. Multi-AZ clusters are not supported.</p> <p>See Endpoints for details about AZs.</p>

Parameter	Mandatory	Type	Description
security_groups_id	No	String	<p>Security group ID of the cluster.</p> <ul style="list-style-type: none"> If this parameter is left blank, MRS automatically creates a security group, whose name starts with mrs_{cluster_name}. If this parameter is not left blank, a fixed security group is used to create a cluster. The transferred ID must be the security group ID owned by the current tenant. The security group must include an inbound rule in which all protocols and all ports are allowed and the source is the IP address of the specified node on the management plane.
safe_mode	Yes	String	<p>Running mode of an MRS cluster.</p> <ul style="list-style-type: none"> SIMPLE: normal cluster. In a normal cluster, Kerberos authentication is disabled, and users can use all functions provided by the cluster. KERBEROS: security cluster. In a security cluster, Kerberos authentication is enabled, and common users cannot use the file management and job management functions of an MRS cluster or view cluster resource usage and the job records of Hadoop and Spark. To use more cluster functions, the users must contact the Manager administrator to assign more permissions.

Parameter	Mandatory	Type	Description
manager_admin_password	Yes	String	<p>Password of the MRS Manager administrator. The password must meet the following requirements:</p> <ul style="list-style-type: none">• Must contain 8 to 26 characters.• Must contain at least four of the following: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?), but must not contain spaces.• Cannot be the username or the username spelled backwards.
login_mode	Yes	String	<p>Node login mode.</p> <ul style="list-style-type: none">• PASSWORD: password-based login. If this value is selected, node_root_password cannot be left blank.• KEYPAIR: specifies the key pair used for login. If this value is selected, node_keypair_name cannot be left blank.
node_root_password	No	String	<p>Password of user root for logging in to a cluster node. A password must meet the following requirements:</p> <ul style="list-style-type: none">• Must be 8 to 26 characters long.• Must contain at least four of the following: uppercase letters, lowercase letters, digits, and special characters (!@#\$%^_=+[{}]:./?), but must not contain spaces.• Cannot be the username or the username spelled backwards.
node_keypair_name	No	String	Name of a key pair You can use a key pair to log in to the Master node in the cluster.

Parameter	Mandatory	Type	Description
enterprise_project_id	No	String	<p>Enterprise project ID.</p> <p>When creating a cluster, associate the enterprise project ID with the cluster.</p> <p>The default value is 0, indicating the default enterprise project.</p>
eip_address	No	String	An EIP bound to an MRS cluster can be used to access MRS Manager. The EIP must have been created and must be in the same region as the cluster.
eip_id	No	String	ID of the bound EIP. This parameter is mandatory when eip_address is configured. To obtain the EIP ID, log in to the VPC console, choose Network > Elastic IP and Bandwidth > Elastic IP , click the EIP to be bound, and obtain the ID in the Basic Information area.
mrs_ecs_default_agency	No	String	<p>Name of the agency bound to a cluster node by default. The value is fixed to MRS_ECS_DEFAULT_AGENCY.</p> <p>An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS.</p> <p>The MRS_ECS_DEFAULT_AGENCY agency has the OBS OperateAccess permission of OBS and the CES FullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.</p>

Parameter	Mandatory	Type	Description
template_id	No	String	<p>Template used for node deployment when the cluster type is CUSTOM.</p> <ul style="list-style-type: none">• mgmt_control_combined_v2: template for jointly deploying the management and control nodes. The management and control roles are co-deployed on the Master node, and data instances are deployed in the same node group. This deployment mode applies to scenarios where the number of control nodes is less than 100, reducing costs.• mgmt_control_separated_v2: The management and control roles are deployed on different master nodes, and data instances are deployed in the same node group. This deployment mode is applicable to a cluster with 100 to 500 nodes and delivers better performance in high-concurrency load scenarios.• mgmt_control_data_separated_v2: The management role and control role are deployed on different Master nodes, and data instances are deployed in different node groups. This deployment mode is applicable to a cluster with more than 500 nodes. Components can be deployed separately, which can be used for a larger cluster scale.
tags	No	Array of tag objects	<p>Cluster tag For more parameter description, see Table 5-4.</p> <p>A maximum of 10 tags can be added to a cluster.</p>

Parameter	Mandatory	Type	Description
log_collection	No	Integer	<p>Specifies whether to collect logs when cluster creation fails: The default value is 1, indicating that OBS buckets will be created and only used to collect logs that record MRS cluster creation failures. Possible values:</p> <ul style="list-style-type: none"> • 0: Do not collect. • 1: Collect. <p>The default value is 1, indicating that OBS buckets will be created and only used to collect logs that record MRS cluster creation failures.</p>
node_groups	Yes	Array of NodeGroupV2 objects	<p>Information about the node groups in the cluster. For details about the parameters, see Table 5-5.</p>
bootstrap_scripts	No	Array of bootstrap_script objects	<p>Bootstrap action script information. For more parameter description, see Table 5-7. MRS 3.x does not support this parameter.</p>
add_jobs	No	Array of add_jobs objects	<p>Jobs can be submitted when a cluster is created. Currently, only one job can be created. For details about job parameters, see Table 5-8. MRS 3.x does not support this parameter.</p>

Table 5-4 Tag parameters

Parameter	Mandatory	Type	Description
key	Yes	String	<p>Tag key.</p> <ul style="list-style-type: none">• It contains a maximum of 36 Unicode characters and cannot be an empty string.• The tag key cannot start or end with spaces or contain non-printable ASCII characters (0-31) and the following special characters: =*<>\, /• The tag key of a resource must be unique.
value	Yes	String	<p>Tag value.</p> <ul style="list-style-type: none">• The value can contain 0 to 43 unicode characters that can be blank.• The value cannot start or end with spaces or contain non-printable ASCII characters (0-31) and the following special characters: =*<>\, /

Table 5-5 NodeGroup parameters

Parameter	Mandatory	Type	Description
group_name	Yes	String	<p>Node group name. The value can contain a maximum of 64 characters, including uppercase and lowercase letters, digits and underscores (_). The rules for configuring node groups are as follows:</p> <ul style="list-style-type: none">• master_node_default_group: Master node group, which must be included in all cluster types.• core_node_analysis_group: analysis Core node group, which must be contained in the analysis cluster and hybrid cluster.• core_node_streaming_group: indicates the streaming Core node group, which must be included in both streaming and hybrid clusters.• task_node_analysis_group: Analysis Task node group. This node group can be selected for analysis clusters and hybrid clusters as required.• task_node_streaming_group: streaming Task node group. This node group can be selected for streaming clusters and hybrid clusters as required.• node_group{x}: node group of the customized cluster. You can add multiple node groups as required. A maximum of nine node groups can be added.
node_num	Yes	Integer	Number of nodes. The value ranges from 0 to 500. The maximum number of Core and Task nodes is 500.

Parameter	Mandatory	Type	Description
node_size	Yes	String	Instance specifications of a node. MRS supports host specifications determined by CPU, memory, and disk space. You are advised to obtain the value of this parameter from the cluster creation page on the MRS console.
root_volume	No	Volume object	System disk information of the node. This parameter is optional for some VMs or the system disk of the BMS. This parameter is mandatory in other cases. For details about the parameter description, see Table 5-6 .
data_volume	No	Volume object	Data disk information. This parameter is mandatory when data_volume_count is not 0.
data_volume_count	No	Integer	Number of data disks of a node. Value range: 0 to 10
auto_scaling_policy	No	auto_scaling_policy object	Autoscaling rule corresponding to the node group. For details about the parameters, see Table 5-9 .

Parameter	Mandatory	Type	Description
assigned_roles	No	Array of strings	<p>This parameter is mandatory when the cluster type is CUSTOM. You can specify the roles deployed in a node group. This parameter is a character string array. Each character string represents a role expression.</p> <p>Role expression definition:</p> <ul style="list-style-type: none">• If the role is deployed on all nodes in the node group, set this parameter to <code><role name></code>, for example, DataNode.• If the role is deployed on a specified subscript node in the node group: <code><role name>:<index1>,<index2>...,<indexN></code>, for example, NameNode:1,2. The subscript starts from 1.• Some roles support multi-instance deployment (that is, multiple instances of the same role are deployed on a node): <code><role name>[<instance count>]</code>, for example, EsNode[9]. <p>For details about available roles, see Roles and components supported by MRS.</p>

Table 5-6 Volume parameters

Parameter	Mandatory	Type	Description
type	Yes	String	<p>Disk type.</p> <p>The following disk types are supported:</p> <ul style="list-style-type: none">• SATA: common I/O disk• SAS: high I/O disk• SSD: ultra-high I/O disk
size	Yes	Integer	Specifies the data disk size, in GB. The value range is 10 to 32768 .

Table 5-7 bootstrap_script parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of a bootstrap action script. It must be unique in a cluster. The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space. The value can contain 1 to 64 characters.
uri	Yes	String	Path of a bootstrap action script. Set this parameter to an OBS bucket path or a local VM path. <ul style="list-style-type: none">• OBS bucket path: Enter a script path manually. For example, enter the path of the public sample script provided by MRS. Example: s3a://bootstrap/presto/presto-install.sh. If dualroles is installed, the parameter of the presto-install.sh script is dualroles. If worker is installed, the parameter of the presto-install.sh script is worker. Based on the Presto usage habit, you are advised to install dualroles on the active Master nodes and worker on the Core nodes.• Local VM path: Enter a script path. The script path must start with a slash (/) and end with .sh.
parameters	No	String	Bootstrap action script parameters.
nodes	Yes	Array of strings	Name of a node group where the bootstrap action script is executed. The value can be Master , Core , or Task .
active_master	No	Boolean	Whether the bootstrap action script runs only on active Master nodes. The default value is false , indicating that the bootstrap action script can run on all Master nodes.

Parameter	Mandatory	Type	Description
before_component_start	No	Boolean	<p>Time when the bootstrap action script is executed. Currently, the following two options are available: Before component start and After component start</p> <p>The default value is false, indicating that the bootstrap action script is executed after the component is started.</p>
fail_action	Yes	String	<p>Whether to continue executing subsequent scripts and creating a cluster after the bootstrap action script fails to be executed.</p> <ul style="list-style-type: none"> • continue: Continue to execute subsequent scripts. • errorout: Stop the action. <p>The default value is errorout, indicating that the action is stopped.</p> <p>NOTE You are advised to set this parameter to continue in the commissioning phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.</p>
action_stages	No	Array of strings	<p>Select the time when the bootstrap action script is executed.</p> <ul style="list-style-type: none"> • BEFORE_COMPONENT_FIRST_START: before initial component starts • AFTER_COMPONENT_FIRST_START: after initial component starts • BEFORE_SCALE_IN: before scale-in • AFTER_SCALE_IN: after scale-in • BEFORE_SCALE_OUT: before scale-out • AFTER_SCALE_OUT: after scale-out

Table 5-8 add_jobs parameters

Parameter	Mandatory	Type	Description
job_type	Yes	Integer	<p>Job type code.</p> <ul style="list-style-type: none">• 1: MapReduce• 2: Spark• 3: Hive Script• 4: HiveQL (not supported currently)• 5: DistCp, importing and exporting data (not supported currently)• 6: Spark Script• 7: Spark SQL, submitting Spark SQL statements (not supported currently).
job_name	Yes	String	<p>Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p>NOTE Identical job names are allowed but not recommended.</p>
jar_path	No	String	<p>Path of the JAR or SQL file for program execution. The parameter must meet the following requirements:</p> <ul style="list-style-type: none">• Contains a maximum of 1023 characters, excluding special characters such as ;&><\$. The parameter value cannot be empty or full of spaces.• Files can be stored in HDFS or OBS. The path varies depending on the file system.<ul style="list-style-type: none">- OBS: The path must start with s3a://. Files or programs encrypted by KMS are not supported.- HDFS: The path starts with a slash (/).• Spark Script must end with .sql while MapReduce and Spark Jar must end with .jar. sql and jar are case-insensitive.

Parameter	Mandatory	Type	Description
arguments	No	String	<p>Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter.</p> <p>The parameter contains a maximum of 2047 characters, excluding special characters such as ; &>'<\$, and can be left blank.</p>
input	No	String	<p>Address for inputting data.</p> <p>Files can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> • OBS: The path must start with s3a://. Files or programs encrypted by KMS are not supported. • HDFS: The path starts with a slash (/). <p>The parameter contains a maximum of 1023 characters, excluding special characters such as ; &>'<\$, and can be left blank.</p>
output	No	String	<p>Address for outputting data.</p> <p>Files can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> • OBS: The path must start with s3a://. • HDFS: The path starts with a slash (/). <p>If the specified path does not exist, the system will automatically create it.</p> <p>The parameter contains a maximum of 1023 characters, excluding special characters such as ; &>'<\$, and can be left blank.</p>

Parameter	Mandatory	Type	Description
job_log	No	String	<p>Path for storing job logs that record job running status.</p> <p>Files can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none">• OBS: The path must start with <code>s3a://</code>.• HDFS: The path starts with a slash (/). <p>The parameter contains a maximum of 1023 characters, excluding special characters such as ; &>'<\$, and can be left blank.</p>
shutdown_cluster	No	Bool	<p>Whether to delete the cluster after the job execution is complete.</p> <ul style="list-style-type: none">• true: Yes• false: No
file_action	No	String	<p>Data import and export.</p> <ul style="list-style-type: none">• import• export
submit_job_once_cluster_run	Yes	Bool	<ul style="list-style-type: none">• true: Submit a job during cluster creation.• false: Submit a job after the cluster is created. <p>Set this parameter to true in this example.</p>
hql	No	String	HiveQL statement

Parameter	Mandatory	Type	Description
hive_script_path	Yes	String	<p>SQL program path. This parameter is needed by Spark Script and Hive Script jobs only, and must meet the following requirements:</p> <ul style="list-style-type: none">• Contains a maximum of 1023 characters, excluding special characters such as ; &><\$. The address cannot be empty or full of spaces.• Files can be stored in HDFS or OBS. The path varies depending on the file system.<ul style="list-style-type: none">– OBS: The path must start with <code>s3a://</code>. Files or programs encrypted by KMS are not supported.– HDFS: The path starts with a slash (/).• Ends with <code>.sql</code>. <code>sql</code> is case-insensitive.

Table 5-9 auto_scaling_policy parameters

Parameter	Mandatory	Type	Description
auto_scaling_enable	Yes	Boolean	Whether to enable the auto scaling rule.
min_capacity	Yes	Integer	Minimum number of nodes left in the node group. Value range: 0 to 500
max_capacity	Yes	Integer	Maximum number of nodes in the node group. Value range: 0 to 500
resources_plans	No	Array of resources_plan objects	Resource plan list. For details, see Table 5-10 . If this parameter is left blank, the resource plan is disabled. When auto scaling is enabled, either a resource plan or an auto scaling rule must be configured.

Parameter	Mandatory	Type	Description
exec_scripts	No	Array of scale_script objects	List of custom scaling automation scripts. For details, see Table 5-11 . If this parameter is left blank, a hook script is disabled.
rules	No	Array of rules objects	List of auto scaling rules. For details, see Table 5-12 . When auto scaling is enabled, either a resource plan or an auto scaling rule must be configured.

Table 5-10 resources_plan parameters

Parameter	Mandatory	Type	Description
period_type	Yes	String	Cycle type of a resource plan. Currently, only the following cycle type is supported: <ul style="list-style-type: none">• daily
start_time	Yes	String	Start time of a resource plan. The value is in the format of hour:minute , indicating that the time ranges from 0:00 to 23:59.
end_time	Yes	String	End time of a resource plan. The value is in the same format as that of start_time . The interval between end_time and start_time must be greater than or equal to 30 minutes.
min_capacity	Yes	Integer	Minimum number of the preserved nodes in a node group in a resource plan. Value range: 0 to 500
max_capacity	Yes	Integer	Maximum number of the preserved nodes in a node group in a resource plan. Value range: 0 to 500

Table 5-11 scale_script parameters

Parameter	Mandatory	Type	Description
name	Yes	String	Name of a custom automation script. It must be unique in a same cluster. The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space. The value can contain 1 to 64 characters.
uri	Yes	String	Path of a custom automation script. Set this parameter to an OBS bucket path or a local VM path. <ul style="list-style-type: none">• OBS bucket path: Enter a script path manually. for example, s3a://XXX/scale.sh.• Local VM path: Enter a script path. The script path must start with a slash (/) and end with .sh.

Parameter	Mandatory	Type	Description
parameters	No	String	<p>Parameters of a custom automation script.</p> <ul style="list-style-type: none"> Multiple parameters are separated by space. The following predefined system parameters can be transferred: <ul style="list-style-type: none"> <code> \${mrs_scale_node_num}</code>: Number of the nodes to be added or removed <code> \${mrs_scale_type}</code>: Scaling type. The value can be scale_out or scale_in. <code> \${mrs_scale_node_hostnames}</code>: Host names of the nodes to be added or removed <code> \${mrs_scale_node_ips}</code>: IP addresses of the nodes to be added or removed <code> \${mrs_scale_rule_name}</code>: Name of the rule that triggers auto scaling Other user-defined parameters are used in the same way as those of common shell scripts. Parameters are separated by space.
nodes	Yes	List<String>	Type of a node where the custom automation script is executed. The node type can be Master, Core, or Task.
active_master	No	Boolean	<p>Whether the custom automation script runs only on the active Master node.</p> <p>The default value is false, indicating that the custom automation script can run on all Master nodes.</p>

Parameter	Mandatory	Type	Description
action_stage	Yes	String	<p>Time when a script is executed.</p> <p>The following four options are supported:</p> <ul style="list-style-type: none"> • before_scale_out: before scale-out • before_scale_in: before scale-in • after_scale_out: after scale-out • after_scale_in: after scale-in
fail_action	Yes	String	<p>Whether to continue to execute subsequent scripts and create a cluster after the custom automation script fails to be executed.</p> <ul style="list-style-type: none"> • continue: Continue to execute subsequent scripts. • errorout: Stop the action. <p>NOTE</p> <ul style="list-style-type: none"> • You are advised to set this parameter to continue in the commissioning phase so that the cluster can continue to be installed and started no matter whether the custom automation script is executed successfully. • The scale-in operation cannot be undone. Therefore, fail_action must be set to continue for the scripts that are executed after scale-in.

Table 5-12 rules parameters

Parameter	Mandatory	Type	Description
name	Yes	String	<p>Name of an auto scaling rule.</p> <p>A cluster name can contain only 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p>Rule names must be unique in a node group.</p>

Parameter	Mandatory	Type	Description
description	No	String	Description about an auto scaling rule. It contains a maximum of 1024 characters.
adjustment_type	Yes	String	Auto scaling rule adjustment type. Possible values: <ul style="list-style-type: none">• scale_out: cluster scale-out• scale_in: cluster scale-in
cool_down_minutes	Yes	Integer	Cluster cooling time after an auto scaling rule is triggered, when no auto scaling operation is performed. The unit is minute. Value range: 0 to 10,080. One week is equal to 10,080 minutes.
scaling_adjustment	Yes	Integer	Number of nodes that can be adjusted once. Value range: 1 to 100
trigger	Yes	Trigger object	Condition for triggering a rule. For details, see Table 5-13 .

Table 5-13 trigger parameters

Parameter	Mandatory	Type	Description
metric_name	Yes	String	Metric name. This triggering condition makes a judgment according to the value of the metric. A metric name contains a maximum of 64 characters.
metric_value	Yes	String	Metric threshold to trigger a rule. The value must be an integer or a number with two decimal places.
comparison_operator	No	String	Metric judgment logic operator. Possible values: <ul style="list-style-type: none">• LT: less than• GT: greater than• LTOE: less than or equal to• GTOE: greater than or equal to

Parameter	Mandatory	Type	Description
evaluation_periods	Yes	Integer	Number of consecutive five-minute periods, during which a metric threshold is reached. Value range: 1 to 288

Response Parameters

Status code: 200

Table 5-14 Response parameters

Parameter	Type	Description
cluster_id	String	Cluster ID, which is returned by the system after the cluster is created.

Example Request

- Creating an analysis cluster

```

### 5.1.2 Changing a Cluster Name

#### Function

Changing a Cluster Name

#### URI

PUT /v2/{project\_id}/clusters/{cluster\_id}/cluster-name

**Table 5-15** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |

#### Request Parameters

**Table 5-16** Request body parameter

| Parameter    | Mandatory | Type   | Description           |
|--------------|-----------|--------|-----------------------|
| cluster_name | Yes       | String | The new cluster name. |

#### Response Parameters

Status code: 200

**Table 5-17** Response body parameter

| Parameter | Type   | Description                                                                                                                                                                  |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result    | String | The operation result of the mapping update request. Value **succeeded** indicates that the operation is successful, and value **failed** indicates that the operation fails. |

### Status code: 400

**Table 5-18** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | The error code.    |
| error_msg  | String | The error message. |

## Example Request

```
{
 "cluster_name" : "mrs_jdRU_dm01"
}
```

## Example Response

### Status code: 200

The cluster name is changed.

```
{
 "result" : "succeeded"
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 5.2 Job Object APIs

### 5.2.1 Adding and Executing a Job

#### Function

This API is used to add and submit a job in an MRS cluster.

- On the **Dashboard** tab page of the cluster details page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users. Then submit a job through this API.

#### URI

POST /v2/{project\_id}/clusters/{cluster\_id}/job-executions

**Table 5-19** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                              |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id | Yes       | String | Cluster ID. For details on how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> .    |

## Request Parameters

**Table 5-20** Request parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_type  | Yes       | String | <p>Type of a job.</p> <ul style="list-style-type: none"><li>• MapReduce</li><li>• SparkSubmit</li><li>• SparkPython: Example request of a SparkPython job (Jobs of this type will be converted to SparkSubmit jobs for submission. The job type is displayed as SparkSubmit on the MRS console. Select SparkSubmit when you call an API to query the job list.)</li><li>• HiveScript</li><li>• HiveSql</li><li>• DistCp, importing and exporting data</li><li>• SparkScript</li><li>• SparkSql</li><li>• Flink</li></ul> <p><b>NOTE</b><br/>Spark, Hive, and Flink jobs can be added to only clusters that include Spark, Hive, and Flink components.</p> |

| Parameter  | Mandatory | Type                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| job_name   | Yes       | String              | <p>Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p><b>NOTE</b><br/>Identical job names are allowed but not recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| arguments  | No        | Array of strings    | <p>Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter.</p> <p>The value can contain a maximum of 150,000 characters. Special characters (; &amp;&gt;'&lt;\$!\\) are not allowed. This parameter can be left blank.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.</li> <li>For MRS 3.x or later, a file path on OBS can start with <b>obs://</b>. To use this format to submit HiveScript or HiveSQL jobs, choose <b>Components &gt; Hive &gt; Service Configuration</b> on the cluster details page. Set <b>Basic</b> to <b>All</b>, and search for <b>core.site.customized.configs</b>. Add the endpoint configuration item <b>fs.obs.endpoint</b> of OBS and enter the endpoint corresponding to OBS in <b>Value</b>. For details, see <a href="#">Endpoints</a>.</li> </ul> |
| properties | No        | Map<String, String> | <p>Program system parameter. The parameter contains a maximum of 2,048 characters, excluding special characters such as &gt;&lt; ^`&amp;!, and can be left blank.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Response Parameters

Status code: 200

**Table 5-21** Response body parameter

| Parameter         | Type                   | Description                                                                                  |
|-------------------|------------------------|----------------------------------------------------------------------------------------------|
| job_submit_result | JobSubmitResult object | The job execution result. For details about the parameters, see <a href="#">Table 5-22</a> . |

**Table 5-22** JobSubmitResult parameters

| Parameter | Type   | Description                                                                                                                                                                       |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_id    | String | Job ID                                                                                                                                                                            |
| state     | String | Job submission status. <ul style="list-style-type: none"><li>• <b>COMPLETE:</b> The job is submitted.</li><li>• <b>JOBSTAT_SUBMIT_FAILED:</b> Failed to submit the job.</li></ul> |

**Status code: 500****Table 5-23** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | The error code.    |
| error_msg  | String | The error message. |

## Example Request

You must have prepared the OBS paths, sample files, endpoints, and AKs/SKs when submitting a request.

- Example request of a MapReduce job:

```
POST https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions

{
 "job_name": "MapReduceTest",
 "job_type": "MapReduce",
 "arguments": [
 "obs://obs-test/program/hadoop-mapreduce-examples-x.x.x.jar",
 "wordcount",
 "obs://obs-test/input/",
 "obs://obs-test/job/mapreduce/output"
],
 "properties": {
 "fs.obs.endpoint": "obs endpoint",
 "fs.obs.access.key": "xxx",
 "fs.obs.secret.key": "yyy"
 }
}
```

- Example request of a SparkSubmit job:

```
POST https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions
```

```
{
 "job_name": "SparkSubmitTest",
 "job_type": "SparkSubmit",
 "arguments": [
 "--master",
 "yarn",
 "--deploy-mode",
 "cluster",
 "--py-files",
 "obs://obs-test/a.py",
 "--conf",
 "spark.yarn.appMasterEnv.PYTHONPATH=/tmp:$PYTHONPATH",
 "--conf",
 "spark.yarn.appMasterEnv.aaa=aaaa",
 "--conf",
 "spark.executorEnv.aaa=executoraaa",
 "--properties-file",
 "obs://obs-test/test-spark.conf",
 "obs://obs-test/pi.py",
 "100000"
],
 "properties": {
 "fs.obs.access.key": "xxx",
 "fs.obs.secret.key": "yyy"
 }
}
```

- Example request of a HiveScript job:

POST [https://{{endpoint}}/v2/{{project\\_id}}/clusters/{{cluster\\_id}}/job-executions](https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions)

```
{
 "job_name": "HiveScriptTest",
 "job_type": "HiveScript",
 "arguments": [
 "obs://obs-test/sql/test_script.sql"
],
 "properties": {
 "fs.obs.endpoint": "obs endpoint",
 "fs.obs.access.key": "xxx",
 "fs.obs.secret.key": "yyy"
 }
}
```

- Example request of a HiveSql job:

POST [https://{{endpoint}}/v2/{{project\\_id}}/clusters/{{cluster\\_id}}/job-executions](https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions)

```
{
 "job_name": "HiveSqlTest",
 "job_type": "HiveSql",
 "arguments": [
 "DROP TABLE IF EXISTS src_wordcount;\ncreate external table src_wordcount(line string) row format delimited fields terminated by '\\\\n' stored as textfile location 'obs://donotdel-gxc/input/';\ninsert into src_wordcount values('v1')",
 "properties": {
 "fs.obs.endpoint": "obs endpoint",
 "fs.obs.access.key": "xxx",
 "fs.obs.secret.key": "yyy"
 }
}
```

- Example request of a DistCp job:

POST [https://{{endpoint}}/v2/{{project\\_id}}/clusters/{{cluster\\_id}}/job-executions](https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions)

```
{
 "job_name": "DistCpTest",
 "job_type": "DistCp",
 "arguments": [
 "obs://obs-test/DistcpJob/",
 "/user/test/sparksqll/"
],
 "properties": {
 "fs.obs.endpoint": "obs endpoint",
 "fs.obs.access.key": "xxx",
 "fs.obs.secret.key": "yyy"
 }
}
```

```
 "fs.obs.access.key":"xxx",
 "fs.obs.secret.key":"yyy"
 }
}
```

- Example request of a SparkScript job:

POST [https://{{endpoint}}/v2/{{project\\_id}}/clusters/{{cluster\\_id}}/job-executions](https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions)

```
{
 "job_name":"SparkScriptTest",
 "job_type":"SparkScript",
 "arguments":[
 "op-key1",
 "op-value1",
 "op-key2",
 "op-value2",
 "obs://obs-test/sql/test_script.sql"
],
 "properties":{
 "fs.obs.access.key":"xxx",
 "fs.obs.secret.key":"yyy"
 }
}
```

- Example request of a SparkSql job:

POST [https://{{endpoint}}/v2/{{project\\_id}}/clusters/{{cluster\\_id}}/job-executions](https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions)

```
{
 "job_name":"SparkSqlTest",
 "job_type":"SparkSql",
 "arguments":[
 "op-key1",
 "op-value1",
 "op-key2",
 "op-value2",
 "create table student_info3 (id string,name string,gender string,age int,addr string);"
],
 "properties":{
 "fs.obs.access.key":"xxx",
 "fs.obs.secret.key":"yyy"
 }
}
```

- Example request of a Flink job:

POST [https://{{endpoint}}/v2/{{project\\_id}}/clusters/{{cluster\\_id}}/job-executions](https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions)

```
{
 "job_name":"FlinkTest",
 "job_type":"Flink",
 "arguments":[
 "run",
 "-d",
 "-ynm",
 "testExcutejobhdfsbatch",
 "-m",
 "yarn-cluster",
 "hdfs://test/examples/batch/WordCount.jar"
],
 "properties":{
 "fs.obs.endpoint":"obs endpoint",
 "fs.obs.access.key":"xxx",
 "fs.obs.secret.key":"yyy"
 }
}
```

- The following shows an example request of a SparkPython job (Jobs of this type will be converted to SparkSubmit jobs for submission. The job type is displayed as SparkSubmit on the MRS console. Select SparkSubmit when you call an API to query the job list.)

```
POST https://{{endpoint}}/v2/{{project_id}}/clusters/{{cluster_id}}/job-executions

{
 "job_name": "SparkPythonTest",
 "job_type": "SparkPython",
 "arguments": ["--master", "yarn", "--deploy-mode", "cluster", "--py-files", "obs://obs-test/a.py", "--conf", "spark.yarn.appMasterEnv.PYTHONPATH=/tmp:$PYTHONPATH", "--conf", "spark.yarn.appMasterEnv.aaa=aaaa", "--conf", "spark.executorEnv.aaa=executoraaa", "--properties-file", "obs://obs-test/test-spark.conf", "obs://obs-test/pi.py", "100000"],
 "properties": {
 "fs.obs.access.key": "xxx",
 "fs.obs.secret.key": "yyy"
 }
}
```

## Example Response

### Status code: 200

- Example of a successful response

```
{
 "job_submit_result": {
 "job_id": "44b37a20-ffe8-42b1-b42b-78a5978d7e40",
 "state": "COMPLETE"
 }
}
```

### Status code: 500

- Example of a failed response

```
{
 "error_msg": "Hive jobs cannot be submitted.",
 "error_code": "0168"
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 5.2.2 Querying Information About a Job

### Function

This API is used to query information about a specified job in an MRS cluster.

### URI

- Format  
GET /v2/{{project\_id}}/clusters/{{cluster\_id}}/job-executions/{{job\_execution\_id}}
- Parameter description

**Table 5-24** URI parameters

| Parameter        | Mandatory | Type   | Description                                                                                                  |
|------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id       | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id       | Yes       | String | The cluster ID. For details on how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> .    |
| job_execution_id | Yes       | String | The job ID. For details about how to obtain the job ID, see <a href="#">Obtaining a Job ID</a> .             |

## Request Parameters

### Request parameters

None

## Response Parameters

**Status code: 202**

**Table 5-25** Response parameter

| Parameter  | Type                | Description                                                                    |
|------------|---------------------|--------------------------------------------------------------------------------|
| job_detail | JobQueryBean object | Job details. For details about the parameter, see <a href="#">Table 5-26</a> . |

**Table 5-26** Job parameters

| Parameter | Type   | Description                             |
|-----------|--------|-----------------------------------------|
| job_id    | String | The job ID.                             |
| user      | String | The name of the user who submits a job. |
| job_name  | String | The job name.                           |

| Parameter    | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_result   | String | <p>The final result of a job. Possible values:</p> <ul style="list-style-type: none"><li>• <b>FAILED</b>: indicates that the job fails to be executed.</li><li>• <b>KILLED</b>: indicates that the job is manually terminated during execution.</li><li>• <b>UNDEFINED</b>: indicates that the job is being executed.</li><li>• <b>SUCCEEDED</b>: indicates that the job has been successfully executed.</li></ul>                                                                                                                                                                                                              |
| job_state    | String | <p>The job execution status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>FAILED</b>: indicates that the job failed.</li><li>• <b>KILLED</b>: indicates that the job is terminated.</li><li>• <b>New</b>: indicates that the job is created.</li><li>• <b>NEW_SAVING</b>: indicates that the job has been created and is being saved.</li><li>• <b>SUBMITTED</b>: indicates that the job is submitted.</li><li>• <b>ACCEPTED</b>: indicates that the job is accepted.</li><li>• <b>RUNNING</b>: indicates that the job is running.</li><li>• <b>FINISHED</b>: indicates that the job is completed.</li></ul> |
| job_progress | Float  | The job execution progress.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| job_type     | String | <p>The job type. Possible values:</p> <ul style="list-style-type: none"><li>• <b>MapReduce</b></li><li>• <b>SparkSubmit</b>: Select this value when you call an API to query SparkPython jobs.</li><li>• <b>HiveScript</b></li><li>• <b>HiveSql</b></li><li>• <b>DistCp</b>: imports and exports data.</li><li>• <b>SparkScript</b></li><li>• <b>SparkSql</b></li><li>• <b>Flink</b></li></ul>                                                                                                                                                                                                                                  |

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| started_time   | Long   | The time when a job starts to execute, in milliseconds.                                                                                                                                                                                                                                                                                                                              |
| submitted_time | Long   | The time when a job is submitted, in milliseconds.                                                                                                                                                                                                                                                                                                                                   |
| finished_time  | Long   | The time when a job execution is completed, in milliseconds.                                                                                                                                                                                                                                                                                                                         |
| elapsed_time   | Long   | The job execution duration, in milliseconds.                                                                                                                                                                                                                                                                                                                                         |
| arguments      | String | Run parameters.                                                                                                                                                                                                                                                                                                                                                                      |
| properties     | String | The configuration parameter, which is used to configure <b>-d</b> parameters. The value can contain a maximum of 2,048 characters. Special characters (; &>'<\$!\\) are not allowed. This parameter can be left blank.                                                                                                                                                               |
| launcher_id    | String | The launcher job ID.                                                                                                                                                                                                                                                                                                                                                                 |
| app_id         | String | The actual job ID.                                                                                                                                                                                                                                                                                                                                                                   |
| tracking_url   | String | The URL for accessing logs. Currently, only SparkSubmit jobs support this parameter. This parameter accesses the Yarn Web UI via the EIP bound to the cluster. If the EIP is unbound from the cluster on the VPC console, the MRS service data is not updated in a timely manner and the access fails. In this case, you can bind the EIP to the cluster again to rectify the fault. |
| queue          | String | The type of the resource queue used by a job.                                                                                                                                                                                                                                                                                                                                        |

#### Status code: 500

**Table 5-27** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | The error code.    |
| error_msg  | String | The error message. |

## Example

- Example request  
Querying information about a job  
GET https://{endpoint}/v2/{project\_id}/clusters/{cluster\_id}/job-executions/{job\_execution\_id}
- Example response

- Example of a successful response

```
{
 "job_detail": {
 "job_id": "431b135e-c090-489f-b1db-0abe3822b855",
 "user": "xxxx",
 "job_name": "pyspark1",
 "job_result": "SUCCEEDED",
 "job_state": "FINISHED",
 "job_progress": "100",
 "job_type": "SparkSubmit",
 "started_time": "1564626578817",
 "submitted_time": 1564626561541,
 "finished_time": 1564626664930,
 "elapsed_time": 86113,
 "queue": "default",
 "arguments": "[--class, org.apache.spark.examples.SparkPi, --driver-memory, 512MB, --num-executors, 1, --executor-cores, 1, --master, yarn-cluster, obs://obs-test/jobs/spark/spark-examples_2.11-2.1.0.jar, 10000]",
 "launcher_id": "application_1564622673393_0006",
 "app_id": "application_1564622673393_0007",
 "properties": "{}"
 }
}
```

- Example of a failed response

```
{
 "error_msg": "Failed to query the job."
 "error_code": "0162"
}
```

### 5.2.3 Querying a List of Jobs

#### Function

This API is used to query the job list in a specified MRS cluster.

#### URI

- Format  
GET /v2/{project\_id}/clusters/{cluster\_id}/job-executions
- Parameter description

**Table 5-28** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |

## Request Parameters

**Table 5-29** Request parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name  | No        | String | The job name. The value can contain 1 to 128 characters. Only letters, numbers, hyphens (-), and underscores (_) are allowed.                                                                                                                                                                                                                                                                                        |
| job_id    | No        | String | The job ID. The value can contain 1 to 64 characters. Only letters, numbers, and hyphens (-) are allowed.                                                                                                                                                                                                                                                                                                            |
| user      | No        | String | The username. The value can contain 1 to 32 characters. Only letters, numbers, hyphens (-), underscores (_), and periods (.) are allowed, but the value cannot start with a number.                                                                                                                                                                                                                                  |
| job_type  | No        | String | The job type. Possible values: <ul style="list-style-type: none"><li>• <b>MapReduce</b></li><li>• <b>SparkSubmit</b></li><li>• <b>SparkSubmit</b>: Select this value when you call an API to query SparkPython jobs.</li><li>• <b>HiveScript</b></li><li>• <b>HiveSql</b></li><li>• <b>DistCp</b>: imports and exports data.</li><li>• <b>SparkScript</b></li><li>• <b>SparkSql</b></li><li>• <b>Flink</b></li></ul> |

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_state  | No        | String | <p>The job execution status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>FAILED</b>: indicates that the job fails to be executed.</li><li>• <b>KILLED</b>: indicates that the job is terminated.</li><li>• <b>New</b>: indicates that the job is created.</li><li>• <b>NEW_SAVING</b>: indicates that the job has been created and is being saved.</li><li>• <b>SUBMITTED</b>: indicates that the job is submitted.</li><li>• <b>ACCEPTED</b>: indicates that the job is accepted.</li><li>• <b>RUNNING</b>: indicates that the job is running.</li><li>• <b>FINISHED</b>: indicates that the job is completed.</li></ul> |
| job_result | No        | String | <p>The job execution result. Possible values:</p> <ul style="list-style-type: none"><li>• <b>FAILED</b>: indicates that the job fails to be executed.</li><li>• <b>KILLED</b>: indicates that the job is manually terminated during execution.</li><li>• <b>UNDEFINED</b>: indicates that the job is being executed.</li><li>• <b>SUCCEEDED</b>: indicates that the job has been successfully executed.</li></ul>                                                                                                                                                                                                                             |
| queue      | No        | String | <p>The type of the resource queue used by a job. The value can contain 1 to 64 characters. Only letters, numbers, and hyphens (-) are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| limit      | No        | String | <p>The number of records displayed on each page in the returned result. The default value is <b>10</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| offset     | No        | String | <p>The default offset from which the job list starts to be queried is <b>1</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Parameter            | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                              |
|----------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sort_by              | No        | String | The sorting mode of returned results. The default value is <b>desc</b> . Possible values: <ul style="list-style-type: none"> <li>• <b>asc</b>: indicates that the returned results are ranked in ascending order.</li> <li>• <b>desc</b>: indicates that the returned results are ranked in descending order.</li> </ul> |
| submitted_time_begin | No        | Long   | The UTC timestamp after which a job is submitted, in milliseconds, for example, <b>1562032041362</b> .                                                                                                                                                                                                                   |
| submitted_time_end   | No        | Long   | The UTC timestamp before which a job is submitted, in milliseconds, for example, <b>1562032041362</b> .                                                                                                                                                                                                                  |

## Response Parameters

Status code: 202

**Table 5-30** Response parameter

| Parameter | Type                          | Description                                                                      |
|-----------|-------------------------------|----------------------------------------------------------------------------------|
| job_list  | Array of JobQueryBean objects | The job list. For details about the parameters, see <a href="#">Table 5-31</a> . |

**Table 5-31** Job parameters

| Parameter | Type   | Description                             |
|-----------|--------|-----------------------------------------|
| job_id    | String | The job ID.                             |
| user      | String | The name of the user who submits a job. |
| job_name  | String | The job name.                           |

| Parameter    | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_result   | String | <p>The final result of a job. Possible values:</p> <ul style="list-style-type: none"><li>• <b>FAILED</b>: indicates that the job fails to be executed.</li><li>• <b>KILLED</b>: indicates that the job is manually terminated during execution.</li><li>• <b>UNDEFINED</b>: indicates that the job is being executed.</li><li>• <b>SUCCEEDED</b>: indicates that the job has been successfully executed.</li></ul>                                                                                                                                                                                                                            |
| job_state    | String | <p>The job execution status. Possible values:</p> <ul style="list-style-type: none"><li>• <b>FAILED</b>: indicates that the job fails to be executed.</li><li>• <b>KILLED</b>: indicates that the job is terminated.</li><li>• <b>New</b>: indicates that the job is created.</li><li>• <b>NEW_SAVING</b>: indicates that the job has been created and is being saved.</li><li>• <b>SUBMITTED</b>: indicates that the job is submitted.</li><li>• <b>ACCEPTED</b>: indicates that the job is accepted.</li><li>• <b>RUNNING</b>: indicates that the job is running.</li><li>• <b>FINISHED</b>: indicates that the job is completed.</li></ul> |
| job_progress | Float  | The job execution progress.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| job_type     | String | <p>The job type. Possible values:</p> <ul style="list-style-type: none"><li>• <b>MapReduce</b></li><li>• <b>SparkSubmit</b>: Select this value when you call an API to query SparkPython jobs.</li><li>• <b>HiveScript</b></li><li>• <b>HiveSql</b></li><li>• <b>DistCp</b>: imports and exports data.</li><li>• <b>SparkScript</b></li><li>• <b>SparkSql</b></li><li>• <b>Flink</b></li></ul>                                                                                                                                                                                                                                                |

| Parameter      | Type   | Description                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| started_time   | Long   | The time when a job starts to execute, in milliseconds.                                                                                                                                                                                                                                                                                                                              |
| submitted_time | Long   | The time when a job is submitted, in milliseconds.                                                                                                                                                                                                                                                                                                                                   |
| finished_time  | Long   | The time when a job execution is completed, in milliseconds.                                                                                                                                                                                                                                                                                                                         |
| elapsed_time   | Long   | The job execution duration, in milliseconds.                                                                                                                                                                                                                                                                                                                                         |
| arguments      | String | The running parameters.                                                                                                                                                                                                                                                                                                                                                              |
| properties     | String | The configuration parameter, which is used to configure <b>-d</b> parameters. The value can contain a maximum of 2,048 characters. Special characters (; &>'<\$!\\) are not allowed. This parameter can be left blank.                                                                                                                                                               |
| launcher_id    | String | The actual job ID.                                                                                                                                                                                                                                                                                                                                                                   |
| app_id         | String | The actual job ID.                                                                                                                                                                                                                                                                                                                                                                   |
| tracking_url   | String | The URL for accessing logs. Currently, only SparkSubmit jobs support this parameter. This parameter accesses the Yarn Web UI via the EIP bound to the cluster. If the EIP is unbound from the cluster on the VPC console, the MRS service data is not updated in a timely manner and the access fails. In this case, you can bind the EIP to the cluster again to rectify the fault. |
| queue          | String | The type of the resource queue used by a job.                                                                                                                                                                                                                                                                                                                                        |

**Status code: 500****Table 5-32** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | The error code.    |
| error_msg  | String | The error message. |

## Example

- Example request

Querying a list of jobs

```
GET https://{endpoint}/v2/{project_id}/clusters/{cluster_id}/job-executions
```

- Example response

- Example of a successful response

```
{
 "job_list": [{
 "job_id": "981374c1-85da-44ee-be32-edfb4fba776c",
 "user": "xxxx",
 "job_name": "SparkSubmitTset",
 "job_result": "UNDEFINED",
 "job_state": "ACCEPTED",
 "job_progress": "0",
 "job_type": "SparkSubmit",
 "started_time": "0",
 "submitted_time": 1564714763119,
 "finished_time": "0",
 "elapsed_time": "0",
 "queue": "default",
 "arguments": "[--class, --driver-memory, --executor-cores, --master, yarn-cluster, obs://obs-test/hadoop-mapreduce-examples-3.1.1.jar, dddd]",
 "launcher_id": "application_1564622673393_0613",
 "properties": "{}"
 },
 {
 "job_id": "c54c8aa0-c277-4f83-8acc-521d85cfa32b",

## 5.2.4 Terminating a Job

### Function

This API is used to terminate a specified job in an MRS cluster.

### URI

- Format  
POST /v2/{project\_id}/clusters/{cluster\_id}/job-executions/{job\_execution\_id}/kill
- Parameter description

**Table 5-33** URI parameters

| Parameter        | Mandatory | Type   | Description                                                                                                  |
|------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id       | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id       | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |
| job_execution_id | Yes       | String | The job ID. For details about how to obtain the job ID, see <a href="#">Obtaining a Job ID</a> .             |

## 5.2.5 Obtaining SQL Results

### Function

This API is used to obtain results returned after the SQL statements for querying SparkSQL and SparkScript jobs in an MRS cluster are executed.

### URI

- Format  
GET /v2/{project\_id}/clusters/{cluster\_id}/job-executions/{job\_execution\_id}/sql-result
- Parameter description

**Table 5-34** URI parameters

| Parameter        | Mandatory | Type   | Description                                                                                                  |
|------------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id       | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id       | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |
| job_execution_id | Yes       | String | The job ID. For details about how to obtain the job ID, see <a href="#">Obtaining a Job ID</a> .             |

### Request Parameters

#### Request parameters

None

## Response Parameters

**Status code: 202**

**Table 5-35** Response parameter

| Parameter   | Type   | Description                           |
|-------------|--------|---------------------------------------|
| sql-results | Object | The query results of a SQL statement. |

**Status code: 500**

**Table 5-36** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | The error code.    |
| error_msg  | String | The error message. |

## Example Request

Example request for obtaining the SQL result

```
GET https://{endpoint}/v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}/sql-result
```

## Example Response

**Status code: 202**

The SQL statement execution result is obtained.

```
{
 "sql_results": [
 "0": [
 {
 "result": "succeed"
 }
],
 "1": [
 {
 "database": "default",
 "isTemporary": "false",
 "tableName": "src_wordcount"
 }
],
 "2": [
 {
 "result": "succeed"
 }
],
 "3": [
 {
 "result": "succeed"
 }
],
 "4": [
 {
 "name": "a",
 "id": 1
 },
 {
 "name": "b",
 "id": 2
 }
]
 }
}
```

### Status code: 500

Failed to obtain the SQL statement execution result.

```
{
 "error_msg" : "Failed to obtain SQL job results.",
 "error_code" : "0172"
}
```

## Status Codes

See [Status Codes](#).

See [Error Codes](#).

## 5.2.6 Deleting Jobs in Batches

### Function

This API is used to delete jobs in batches.

### URI

- Format  
POST /v2/{project\_id}/clusters/{cluster\_id}/job-executions/batch-delete
- Parameter description

**Table 5-37** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |

## Request Parameters

**Table 5-38** Request parameter

| Parameter   | Mandatory | Type             | Description                                                                                           |
|-------------|-----------|------------------|-------------------------------------------------------------------------------------------------------|
| job_id_list | Yes       | Array of strings | The job ID list. For details about how to obtain the job ID, see <a href="#">Obtaining a Job ID</a> . |

## Response Parameters

### Response parameters

None

## Example

- Example request  
POST https://{endpoint}/v2/{project\_id}/clusters/{cluster\_id}/job-executions/batch-delete  

```
{ "job_id_list" : ["48c45725-b699-4aa9-9bfd-f7ff87eb6fe8", "af846665-dd32-4349-a8b5-561e109c383c"] }
```
- Example response  
None

## 5.3 Auto Scaling APIs

### 5.3.1 Viewing Auto Scaling Policies

#### Function

This API is used to view all auto scaling policies of a specified cluster.

#### URI

GET /v2/{project\_id}/autoscaling-policy/{cluster\_id}

**Table 5-39** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |

## Request Parameters

None

## Response Parameters

**Status code: 200**

**Table 5-40** Response body parameter

| Parameter       | Type                                 | Description                                                                 |
|-----------------|--------------------------------------|-----------------------------------------------------------------------------|
| [Array element] | Array of AutoScalingPolicyV2 objects | The auto scaling policy list. For details, see <a href="#">Table 5-41</a> . |

**Table 5-41** AutoScalingPolicyV2

| Parameter           | Type                     | Description                                                            |
|---------------------|--------------------------|------------------------------------------------------------------------|
| node_group_name     | String                   | The node group name.                                                   |
| resource_pool_name  | String                   | The resource plan name.                                                |
| auto_scaling_policy | AutoScalingPolicy object | The auto scaling policy. For details, see <a href="#">Table 5-42</a> . |

**Table 5-42** AutoScalingPolicy

| Parameter           | Type    | Description                                |
|---------------------|---------|--------------------------------------------|
| auto_scaling_enable | Boolean | Whether to enable the auto scaling policy. |

| Parameter       | Type                           | Description                                                                                                                                                                                                                                                       |
|-----------------|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| min_capacity    | Integer                        | The minimum number of nodes reserved in the node group. The value ranges from 0 to 500.                                                                                                                                                                           |
| max_capacity    | Integer                        | The maximum number of nodes in the node group. The value ranges from 0 to 500.                                                                                                                                                                                    |
| resources_plans | Array of ResourcesPlan objects | The resource plan list. If this parameter is left blank, the resource plan is disabled. When <b>auto_scaling_enable</b> is set to <b>true</b> , either this parameter or <b>resources_plans</b> must be configured. For details, see <a href="#">Table 5-43</a> . |
| rules           | Array of Rule objects          | List of auto scaling rules. When <b>auto_scaling_enable</b> is set to <b>true</b> , either this parameter or <b>resources_plans</b> must be configured. For details, see <a href="#">Table 5-44</a> .                                                             |
| exec_scripts    | Array of ScaleScript objects   | The list of custom scaling automation scripts. If this parameter is left blank, the automation script is disabled. For details, see <a href="#">Table 5-46</a> .                                                                                                  |

**Table 5-43** ResourcesPlan

| Parameter    | Type    | Description                                                                                                                                                                                             |
|--------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period_type  | String  | The cycle type of a resource plan. Currently, only the following cycle type is supported:<br><b>daily</b>                                                                                               |
| start_time   | String  | The start time of a resource plan. The value is in the format of <b>hour:minute</b> , indicating that the time ranges from 00:00 to 23:59.                                                              |
| end_time     | String  | The end time of a resource plan. The value is in the same format as that of <b>start_time</b> . The interval between <b>end_time</b> and <b>start_time</b> must be greater than or equal to 30 minutes. |
| min_capacity | Integer | The minimum number of reserved nodes in a node group in a resource plan. The value ranges from 0 to 500.                                                                                                |

| Parameter    | Type    | Description                                                                                              |
|--------------|---------|----------------------------------------------------------------------------------------------------------|
| max_capacity | Integer | The maximum number of reserved nodes in a node group in a resource plan. The value ranges from 0 to 500. |

**Table 5-44** Rule

| Parameter          | Type           | Description                                                                                                                                                                                               |
|--------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name               | String         | The name of an auto scaling rule. The name can contain only 1 to 64 characters. Only letters, numbers, hyphens (-), and underscores (_) are allowed. Rule names must be unique in a node group.           |
| description        | String         | The description about an auto scaling rule. It contains a maximum of 1,024 characters.                                                                                                                    |
| adjustment_type    | String         | Auto scaling rule adjustment type. Possible values: <ul style="list-style-type: none"><li>● <b>scale_out</b>: cluster scale-out</li><li>● <b>scale_in</b>: cluster scale-in</li></ul>                     |
| cool_down_minutes  | Integer        | The cluster cooling time after an auto scaling rule is triggered, when no auto scaling operation is performed. The unit is minute. The value ranges from 0 to 10080. One week is equal to 10,080 minutes. |
| scaling_adjustment | Integer        | The number of cluster nodes that can be adjusted at a time. The value ranges from 1 to 100.                                                                                                               |
| trigger            | Trigger object | The condition for triggering a rule. For details, see <a href="#">Table 5-45</a> .                                                                                                                        |

**Table 5-45** Trigger

| Parameter   | Type   | Description                                                                                                                                          |
|-------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| metric_name | String | The metric name. This triggering condition makes a judgment according to the value of the metric. A metric name contains a maximum of 64 characters. |

| Parameter           | Type    | Description                                                                                                                                                                                                                                                   |
|---------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| metric_value        | String  | The metric threshold to trigger a rule.<br>The value must be an integer or a number with two decimal places.                                                                                                                                                  |
| comparison_operator | String  | The metric judgment logic operator.<br>Possible values: <ul style="list-style-type: none"><li>• <b>LT</b>: less than</li><li>• <b>GT</b>: greater than</li><li>• <b>LTOE</b>: less than or equal to</li><li>• <b>GTOE</b>: greater than or equal to</li></ul> |
| evaluation_periods  | Integer | The number of consecutive five-minute periods, during which a metric threshold is reached. The value ranges from 1 to 288.                                                                                                                                    |

**Table 5-46** ScaleScript

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | The name of a custom automation script. Names must be unique in a cluster. The value can contain only numbers, letters, spaces, hyphens (-), and underscores (_) and cannot start with a space. The value can contain 1 to 64 characters.                                                                                                        |
| uri       | String | The path of a custom automation script. Set this parameter to an OBS bucket path or a local VM path. <ul style="list-style-type: none"><li>• OBS bucket path: Enter a script path, for example, <b>obs://XXX/scale.sh</b>.</li><li>• Local VM path: Enter a script path. The script path must start with a slash (/) and end with .sh.</li></ul> |

| Parameter     | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| parameters    | String           | <p>Parameters of a custom automation script. Multiple parameters are separated by space. The following predefined system parameters can be transferred:</p> <ul style="list-style-type: none"><li>• <code> \${mrs_scale_node_num}</code>: The number of nodes to be added or removed</li><li>• <code> \${mrs_scale_type}</code>: The scaling type. The value can be <code>scale_out</code> or <code>scale_in</code>.</li><li>• <code> \${mrs_scale_node_hostnames}</code>: Host names of the nodes to be added or removed</li><li>• <code> \${mrs_scale_node_ip}</code>: IP addresses of the nodes to be added or removed</li><li>• <code> \${mrs_scale_rule_name}</code>: The name of the rule that triggers scaling. Other user-defined parameters are used in the same way as those of common shell scripts. Parameters are separated by spaces.</li></ul> |
| nodes         | Array of strings | The name of the node group where the custom automation script is executed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| active_master | Boolean          | Whether the custom automation script runs only on the active master node. The default value is <code>false</code> , indicating that the custom automation script can run on all master nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Parameter    | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fail_action  | String | <p>Whether to continue executing subsequent scripts and creating a cluster after the custom automation script fails to execute. Notes:</p> <ul style="list-style-type: none"> <li>• You are advised to set this parameter to <b>continue</b> in the commissioning phase so the cluster can continue to be installed and started no matter whether the custom automation script is executed successfully.</li> <li>• The scale-in operation cannot be undone. <b>fail_action</b> must be set to <b>continue</b> for the scripts that are executed after scale-in. Possible values:           <ul style="list-style-type: none"> <li>• <b>continue</b>: Continue to execute subsequent scripts.</li> <li>• <b>errorout</b>: Stop the action.</li> </ul> </li> </ul> |
| action_stage | String | <p>The time when a script is executed. Possible values:</p> <ul style="list-style-type: none"> <li>• <b>before_scale_out</b>: before scale-out</li> <li>• <b>before_scale_in</b>: before scale-in</li> <li>• <b>after_scale_out</b>: after scale-out</li> <li>• <b>after_scale_in</b>: after scale-in</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Status code: 400**

**Table 5-47** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | Error codes.       |
| error_msg  | String | The error message. |

## Example Request

None

## Example Response

**Status code: 200**

Auto scaling policies are displayed.

## 5.4 Cluster HDFS File API

### 5.4.1 Obtaining the List of Files from a Specified Directory

#### Function

This API is used to obtain the list of files from a specified directory in an MRS cluster.

#### URI

- Format  
    GET /v2/{project\_id}/clusters/{cluster\_id}/files
- Parameter description

**Table 5-48** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| cluster_id | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| path       | Yes       | String | <p>The file directory. For example, to access the <code>/tmp/test</code> directory list, the value must be a directory. The overall URI is as follows:</p> <p><code>/v2/{project_id}/clusters/{cluster_id}/files?path=%2Ftmp%2Ftest</code></p> <p>A single-level directory must comply with the following rules:</p> <ol style="list-style-type: none"><li>1. The directory path cannot be left blank.</li><li>2. The value cannot start or end with a period (.).</li><li>3. The value cannot contain the following characters: <code>/:*?"&lt;&gt; \\&amp;`!{}[]\$%+</code></li><li>4. The value cannot exceed 255 characters.</li></ol> |
| offset     | No        | String | The pagination parameter. The file list is queried from the offset. The default value is <b>0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| limit      | No        | String | The pagination parameter, indicating the maximum number of records on a page. The default value is <b>100</b> and the maximum value is <b>1000</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                   |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sort_key  | No        | String | The list is sorted by this attribute. The default value is <b>path_suffix</b> . The following attributes are supported: <ul style="list-style-type: none"><li>• <b>path_suffix</b>: file or directory name</li><li>• <b>length</b>: file size</li><li>• <b>modification_time</b>: modification time</li></ul> |
| order     | No        | String | The list sorting mode. Possible values: <ul style="list-style-type: none"><li>• <b>desc</b>: Files are displayed in descending order.</li><li>• <b>asc</b>: Files are displayed in ascending order.</li></ul> The default value is <b>desc</b> .                                                              |

## Response Parameters

**Table 5-49** Response parameters

| Parameter   | Type                          | Description                                                   |
|-------------|-------------------------------|---------------------------------------------------------------|
| total_count | Integer                       | The total number of files, which is irrelevant to pagination. |
| files       | Array of FileStatusV2 objects | The file list. For details, see <a href="#">Table 5-50</a> .  |

**Table 5-50** FileStatus parameters

| Parameter   | Type   | Description                                                                                                                                                                                             |
|-------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| path_suffix | String | The file name extension in the current directory. For example, if you obtain the <code>/tmp/test</code> file in the <code>/tmp</code> directory, the value of <b>path_suffix</b> is <code>test</code> . |

| Parameter         | Type    | Description                                                               |
|-------------------|---------|---------------------------------------------------------------------------|
| owner             | String  | The file owner.                                                           |
| group             | String  | The file owner group.                                                     |
| permission        | String  | The permission information.                                               |
| replication       | Integer | The number of replicas.                                                   |
| block_size        | Integer | The block size.                                                           |
| length            | Integer | The file length.                                                          |
| type              | String  | The file type. Possible values:<br>• FILE: file<br>• DIRECTORY: directory |
| children_num      | Integer | The number of files in the directory.                                     |
| access_time       | Long    | The file access time.                                                     |
| modification_time | Long    | The file modification time.                                               |

## Example

- Example request

```
GET /v2/{project_id}/clusters/{cluster_id}/files?
path={directory}&offset={offset}&limit={limit}&sort_key={sort_key}&order={order}
```

- Example response

- Example of a successful response

```

## 5.5 SQL APIs

### 5.5.1 Submitting a SQL Statement

#### Function

This API is used to submit and execute a SQL statement in an MRS cluster.

#### URI

- Format  
POST /v2/{project\_id}/clusters/{cluster\_id}/sql-execution
- Parameter description

**Table 5-51** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |

## Request Parameters

**Table 5-52** Request parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                  |
|--------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| sql_type     | Yes       | String | <p>The SQL type. Currently, only the SQL of the presto type is supported.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• The SQL of the presto type can be submitted and executed only in clusters containing the Presto component.</li><li>• This parameter is available only for MRS 2.0.6.1, 2.1.0.7, 3.1.2, or later clusters.</li></ul> |
| sql_content  | Yes       | String | <p>The SQL statement to be executed.</p> <p><b>NOTE</b></p> <p>Currently, only a single SQL statement can be executed at a time, and the statement cannot contain a semicolon (;).</p>                                                                                                                                                                       |
| database     | No        | String | <p>The database where the SQL statement to be executed is located. The default value is <b>default</b>.</p>                                                                                                                                                                                                                                                  |
| archive_path | No        | String | <p>The directory for storing the dumped SQL execution results.</p> <p><b>NOTE</b></p> <p>Only the <b>SELECT</b> statement dumps query results. Currently, the query results can be dumped only to OBS.</p>                                                                                                                                                   |

## Response Parameters

Status code: 200

**Table 5-53** Response parameters

| Parameter | Type   | Description                                                                                                                                                                            |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | <p>The execution ID of a SQL statement. The ID is generated only when the <b>SELECT</b>, <b>SHOW</b>, or <b>DESC</b> statement is executed. For other operations, the ID is empty.</p> |

| Parameter       | Type                 | Description                                                                                                                                                                                                                                                                                                                                |
|-----------------|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| message         | String               | The error message.                                                                                                                                                                                                                                                                                                                         |
| statement       | String               | The SQL statement to be executed.                                                                                                                                                                                                                                                                                                          |
| status          | String               | <p>The execution status of a SQL statement. Possible values:</p> <ul style="list-style-type: none"> <li>• <b>QUEUED</b></li> <li>• <b>WAITING_FOR_RESOURCES</b></li> <li>• <b>PLANNING</b></li> <li>• <b>STARTING</b></li> <li>• <b>RUNNING</b></li> <li>• <b>FINISHING</b></li> <li>• <b>FINISHED</b></li> <li>• <b>FAILED</b></li> </ul> |
| result_location | String               | <p>The path for archiving the final results of the SQL query statement.</p> <p><b>NOTE</b><br/>Only the <b>SELECT</b> statement dumps the SQL execution results to <b>result_location</b>.</p>                                                                                                                                             |
| content         | Array<Array<String>> | <p>The execution result of the SQL statement.</p> <p><b>NOTE</b><br/>Only non-SELECT statements return results in <b>content</b>. If the SQL statement does not return results, <b>content</b> is empty.</p>                                                                                                                               |

### Status code: 400

**Table 5-54** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | The error code.    |
| error_msg  | String | The error message. |

## Example Request

Example request for submitting a SQL statement

```
POST https://{endpoint}/v2/{project_id}/clusters/{cluster_id}/sql-execution
```

```
{
 "sql_type" : "presto",
 "sql_content" : "show tables",
 "database" : "default",
```

```
 "archive_path" : "obs://my-bucket/path"
 }
```

## Example Response

### Status code: 200

The SQL statement is submitted successfully.

```
{
 "id" : "20190909_011820_00151_xxxxx",
 "statement" : "show tables",
 "status" : "FINISHED",
 "result_location" : " obs://my_bucket/uuid_date/xxxx.csv",
 "content" : [["t1", null], [null, "t2"], [null, "t3"]]
}
```

### Status code: 400

Failed to submit the SQL statement.

```
{
 "error_code" : "MRS.0011",
 "message": "Failed to submit SQL to the executor. The cluster ID is xxxx"
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

## 5.5.2 Querying SQL Results

### Function

This API is used to query the execution result of a SQL statement in an MRS cluster.

### URI

- Format  
GET /v2/{project\_id}/clusters/{cluster\_id}/sql-execution/{sql\_id}
- Parameter description

**Table 5-55** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                                                            |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID. For details on how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> .                                  |
| sql_id     | Yes       | String | The execution ID of a SQL statement, that is, <code>sql_id</code> in the return result in <a href="#">Submitting a SQL Statement</a> . |

## Request Parameters

### Request parameters

None

## Response Parameters

Status code: 200

**Table 5-56** Response parameters

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                         |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id        | String | The execution ID of a SQL statement. The ID is generated only when the <code>SELECT</code> , <code>SHOW</code> , or <code>DESC</code> statement is executed. For other operations, the ID is empty.                                                                                                                                                                                 |
| message   | String | The error message.                                                                                                                                                                                                                                                                                                                                                                  |
| statement | String | The SQL statement to be executed.                                                                                                                                                                                                                                                                                                                                                   |
| status    | String | The execution status of a SQL statement. Possible values: <ul style="list-style-type: none"> <li>• <code>QUEUED</code></li> <li>• <code>WAITING_FOR_RESOURCES</code></li> <li>• <code>PLANNING</code></li> <li>• <code>STARTING</code></li> <li>• <code>RUNNING</code></li> <li>• <code>FINISHING</code></li> <li>• <code>FINISHED</code></li> <li>• <code>FAILED</code></li> </ul> |

| Parameter       | Type   | Description                                                                                                                                                                                       |
|-----------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result_location | String | The path for archiving the final results of the SQL query statement.<br><b>NOTE</b><br>Only the <b>SELECT</b> statement dumps the SQL execution results to <b>result_location</b> .               |
| content         | Array  | The execution result of the SQL statement.<br><b>NOTE</b><br>Only non-SELECT statements return results in <b>content</b> . If the SQL statement does not return results, <b>content</b> is empty. |

### Status code: 400

**Table 5-57** Response body parameters

| Parameter  | Type   | Description        |
|------------|--------|--------------------|
| error_code | String | The error code.    |
| error_msg  | String | The error message. |

## Example Request

Example request for querying the SQL execution result

```
GET https://{endpoint}/v2/{project_id}/clusters/{cluster_id}/sql-execution/{sql_id}
```

## Example Response

### Status code: 200

Querying the SQL execution result is successful.

```
{
 "id" : "20190909_011820_00151_xxxxx",
 "statement" : "show tables",
 "status" : "FINISHED",
 "result_location" : "obs://my_bucket/uuid_date/xxxx.csv",
 "content" : [["t1", null], [null, "t2"], [null, "t3"]]
}
```

### Status code: 400

Failed to query the SQL execution result.

```
{
 "error_code" : "MRS.0011",
 "message": "Failed to submit SQL to the executor. The cluster ID is xxxx"
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

### 5.5.3 Canceling a SQL Execution Task

#### Function

This API is used to cancel the execution task of a SQL statement in an MRS cluster.

#### URI

- Format  
POST /v2/{project\_id}/clusters/{cluster\_id}/sql-execution/{sql\_id}/cancel
- Parameter description

**Table 5-58** URI parameters

| Parameter  | Mandatory | Description                                                                                                                            |
|------------|-----------|----------------------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .                           |
| cluster_id | Yes       | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> .                           |
| sql_id     | Yes       | The execution ID of a SQL statement, that is, <code>sql_id</code> in the return result in <a href="#">Submitting a SQL Statement</a> . |

#### Request Parameters

##### Request parameters

None

## Response Parameters

**Table 5-59** Response parameters

| Parameter | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| status    | String | <p>The result of canceling the execution of the SQL statement. Possible values:</p> <ul style="list-style-type: none"><li>• <b>SUCCEED</b>: successful</li><li>• <b>FAILED</b>: failed</li></ul> <p><b>NOTE</b><br/>By default, <b>SUCCEED</b> is returned. <b>SUCCEED</b> is also returned when the task is completed. Only when the running SQL statement fails to be canceled, <b>FAILED</b> is returned.</p> |
| message   | String | The error message.                                                                                                                                                                                                                                                                                                                                                                                               |

## Example

- Example request  
POST https://{endpoint}/v2/{project\_id}/clusters/{cluster\_id}/sql-execution/{sql\_id}/cancel
- Example response
  - Example of a successful response

```
{ "status":"SUCCEED" }
```
  - Example of a failed response

```
{ "status":"FAILED", "message":"Cancel sql error" }
```

|-----------------|-----------|--------------------------------|------------------------------------------------------------------------------------------------------|
| agency_mappings | Yes       | Array of AgencyMapping objects | The mapping between users or user groups and agencies. For details, see <a href="#">Table 5-66</a> . |

**Table 5-66** agency\_mappings parameters

| Parameter       | Mandatory | Type            | Description                                                                                                                                                                                                                                                                                                                          |
|-----------------|-----------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| agency          | Yes       | String          | The name of the IAM agency bound to the mapping.                                                                                                                                                                                                                                                                                     |
| identifier_type | Yes       | String          | The agency type. Possible values: <ul style="list-style-type: none"><li>• <b>User</b>: indicates that the mapping is for users. The user name list is displayed in <b>identifiers</b>.</li><li>• <b>Group</b>: indicates that the mapping is for user groups. The user group name list is displayed in <b>identifiers</b>.</li></ul> |
| identifiers     | Yes       | Array of String | The list of users or user groups mapped to the IAM agency. Log in to the IAM management console and choose <b>Users</b> or <b>User Groups</b> in the left navigation pane to obtain the user or user group name list.                                                                                                                |
| agency_id       | Yes       | String          | The ID of the agency bound to the mapping. Log in to the IAM management console and choose <b>Agencies</b> in the left navigation pane. On the <b>Agencies</b> page that is displayed, move your cursor over the agency name to obtain the agency ID.                                                                                |

## Response Parameters

Status code: 200

**Table 5-67** Response body parameter

| Parameter | Type   | Description                                                                                                                                                                                                                  |
|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result    | String | The operation result of the request for updating a mapping. Possible values: <ul style="list-style-type: none"><li>• <b>succeeded</b>: The operation is successful.</li><li>• <b>failed</b>: The operation failed.</li></ul> |

**Status code: 400**

**Table 5-68** Response body parameters

| Parameter  | Type   | Description            |
|------------|--------|------------------------|
| error_code | String | The error code.        |
| error_msg  | String | The error description. |

## Example

- Example request

Example request for updating the mapping between a user or user group and an IAM agency

```
PUT https://[endpoint]/v2/{project_id}/clusters/{cluster_id}/agency-mapping
{
 "agency_mappings" : [{
 "agency" : "agency01",
 "identifier_type" : "User",
 "identifiers" : ["test"],
 "agency_id" : "xxxx"
 }]
}
```

- Example response

Updating the mapping between a user or user group and an IAM agency is successful.

```
{
 "result" : "succeeded"
}
```

## Status Codes

## Error Codes

See [Error Codes](#).

# 6 API V1.1

---

## 6.1 Cluster Management APIs

### 6.1.1 Creating a Cluster and Executing a Job

#### Function

This API is used to create an MRS cluster and submit a job in the cluster. This API is incompatible with Sahara.

A maximum of 10 clusters can be concurrently created.

Before using the API, you need to obtain the resources listed in [Table 6-1](#).

**Table 6-1** Obtaining resources

| Resource | How to Obtain                                                    |
|----------|------------------------------------------------------------------|
| VPC      | See operation instructions in in the <i>VPC API Reference</i> .  |
| Subnet   | See operation instructions in in the <i>VPC API Reference</i> .  |
| Key Pair | See operation instructions in in the <i>ECS API Reference</i> .  |
| Zone     | See <a href="#">Endpoints</a> for details about regions and AZs. |
| Version  | Currently, MRS 2.1.1, 3.0.5, and 3.1.0 are supported.            |

| Resource  | How to Obtain                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Component | <ul style="list-style-type: none"><li>● MRS 3.1.0 supports the following components:<ul style="list-style-type: none"><li>- An analysis cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, and Kudu.</li><li>- A streaming cluster contains the following components: Kafka, Flume, ZooKeeper, and Ranger.</li><li>- A hybrid cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, Kafka, and Flume.</li><li>- A custom cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Kafka, Flume, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, ClickHouse, and Kudu.</li></ul></li><li>● MRS 3.0.5 supports the following components:<ul style="list-style-type: none"><li>- An analysis cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, and Alluxio.</li><li>- A streaming cluster contains the following components: Kafka, Storm, Flume, ZooKeeper, and Ranger.</li><li>- A hybrid cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, Alluxio, Kafka, Storm, and Flume.</li><li>- A custom cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Kafka, Storm, Flume, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, ClickHouse, Kudu, and Alluxio.</li></ul></li></ul> |

## URI

POST /v1.1/{project\_id}/run-job-flow

**Table 6-2** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

**Table 6-3** Request parameters

| Parameter       | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_version | Yes       | String  | The cluster version.<br>Possible values: <ul style="list-style-type: none"><li>• MRS 3.0.5</li><li>• MRS 3.1.0</li></ul>                                                                                                                                                                                                                                                                                               |
| cluster_name    | Yes       | String  | The cluster name, which must be unique. A cluster name can contain only 1 to 64 characters. Only letters, numbers, hyphens (-), and underscores (_) are allowed.                                                                                                                                                                                                                                                       |
| master_node_num | Yes       | Integer | The number of master nodes. If cluster HA is enabled, set this parameter to <b>2</b> . If cluster HA is disabled, set this parameter to <b>1</b> . This parameter cannot be set to <b>1</b> in MRS 3.x.                                                                                                                                                                                                                |
| core_node_num   | Yes       | Integer | The number of core nodes.<br>Value range: 1 to 500<br>The default maximum number of core nodes is <b>500</b> . If more than 500 core nodes are required, apply for a higher quota.                                                                                                                                                                                                                                     |
| billing_type    | Yes       | Integer | The cluster billing mode.                                                                                                                                                                                                                                                                                                                                                                                              |
| data_center     | Yes       | String  | The information about the region where the cluster is located. For details, see <a href="#">Endpoints</a> .                                                                                                                                                                                                                                                                                                            |
| vpc             | Yes       | String  | The name of the VPC where the subnet is located. Obtain the VPC name by performing the following operations on the VPC management console: <ol style="list-style-type: none"><li>1. Log in to the management console.</li><li>2. Click <b>Virtual Private Cloud</b> and select <b>Virtual Private Cloud</b> from the left list.</li></ol> On the <b>Virtual Private Cloud</b> page, obtain the VPC name from the list. |

| Parameter         | Mandatory | Type                            | Description                                                                                                                                                                                                                                                                                                                                                          |
|-------------------|-----------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| master_node_size  | Yes       | String                          | The instance specifications of master nodes, for example, <b>c3.4xlarge.2.linux.bigdata</b> . The host specifications supported by MRS are determined by CPU, memory, and disk space. You are advised to obtain the specifications supported by the corresponding version in the corresponding region from the cluster creation page on the MRS console.             |
| core_node_size    | Yes       | String                          | The instance specifications of core nodes, for example, <b>c3.4xlarge.2.linux.bigdata</b> . You are advised to obtain the specifications supported by the corresponding version in the corresponding region from the cluster creation page on the MRS console.                                                                                                       |
| component_list    | Yes       | Array of component_list objects | The list of service components to be installed. For details about the parameters, see <a href="#">Table 6-4</a> .                                                                                                                                                                                                                                                    |
| available_zone_id | Yes       | String                          | The AZ ID.                                                                                                                                                                                                                                                                                                                                                           |
| vpc_id            | Yes       | String                          | The ID of the VPC where the subnet is located.<br>Obtain the VPC ID by performing the following operations on the VPC management console:<br>1. Log in to the management console.<br>2. Click <b>Virtual Private Cloud</b> and select <b>Virtual Private Cloud</b> from the left list.<br>On the <b>Virtual Private Cloud</b> page, obtain the VPC ID from the list. |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnet_id | Yes       | String | <p>The subnet ID.</p> <p>Obtain the subnet ID by performing the following operations on the VPC management console:</p> <ol style="list-style-type: none"><li>1. Log in to the management console.</li><li>2. Click <b>Virtual Private Cloud</b> and select <b>Virtual Private Cloud</b> from the left list.</li><li>3. Locate the row that contains the target VPC and click the number in the <b>Subnets</b> column to view the subnet information.</li><li>4. Click the subnet name to obtain the network ID.</li></ol> <p>At least one of <b>subnet_id</b> and <b>subnet_name</b> must be configured. If the two parameters are configured but do not match the same subnet, the cluster fails to create. <b>subnet_id</b> is recommended.</p> |

| Parameter          | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subnet_name        | Yes       | String | <p>The subnet name.</p> <p>Obtain the subnet name by performing the following operations on the VPC management console:</p> <ol style="list-style-type: none"><li>1. Log in to the management console.</li><li>2. Click <b>Virtual Private Cloud</b> and select <b>Virtual Private Cloud</b> from the left list.</li><li>3. Locate the row that contains the target VPC and click the number in the <b>Subnets</b> column to obtain the subnet name.</li></ol> <p>At least one of <b>subnet_id</b> and <b>subnet_name</b> must be configured. If the two parameters are configured but do not match the same subnet, the cluster fails to create. If only <b>subnet_name</b> is configured and subnets with the same name exist in the VPC, the first subnet name in the VPC is used when a cluster is created. <b>subnet_id</b> is recommended.</p> |
| security_groups_id | No        | String | <p>The ID of the security group configured for the cluster.</p> <ul style="list-style-type: none"><li>• If this parameter is left blank, MRS automatically creates a security group, whose name starts with <b>mrs_{cluster_name}</b>.</li><li>• If this parameter is not left blank, a fixed security group is used to create a cluster. The transferred ID must be the security group ID owned by the current tenant. The security group must include an inbound rule in which all protocols and all ports are allowed and the source is the IP address of the specified node on the management plane.</li></ul>                                                                                                                                                                                                                                   |

| Parameter   | Mandatory | Type                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| add_jobs    | No        | Array of add_jobs objects | Jobs can be submitted when a cluster is created. Currently, only one job can be created. For details about the parameters, see <a href="#">Table 6-5</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| volume_size | No        | Integer                   | <p>The data disk storage space of master and core nodes. To increase the data storage capacity, you can add disks when creating a cluster. Select a proper disk storage space based on the following application scenarios:</p> <ul style="list-style-type: none"><li>• Storage-compute decoupling: Data is stored in the OBS system. Costs of clusters are relatively low but computing performance is poor. The clusters can be deleted at any time. It is recommended when data computing is infrequently performed.</li><li>• Storage-compute integration: Data is stored in the HDFS system. Costs of clusters are relatively high but computing performance is good. The clusters cannot be deleted in a short term. It is recommended when data computing is frequently performed.</li></ul> <p>Value range: 100 GB to 32,000 GB. When assigning a value to this parameter, you only need to pass a number, without the unit. This parameter is not recommended. For details, see the description of the <b>volume_type</b> parameter.</p> |

| Parameter                | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volume_type              | No        | String  | <p>The data disk storage type of master and core nodes. Currently, SATA, SAS, SSD, and GPSSD are supported. Disk parameters can be represented by <b>volume_type</b> and <b>volume_size</b>, or multi-disk parameters. If the <b>volume_type</b> and <b>volume_size</b> parameters coexist with the multi-disk parameters, the system reads the <b>volume_type</b> and <b>volume_size</b> parameters first. You are advised to use the multi-disk parameters.</p> <p>Possible values:</p> <ul style="list-style-type: none"><li>• <b>SATA</b>: common I/O</li><li>• <b>SAS</b>: high I/O</li><li>• <b>SSD</b>: ultra-high I/O</li><li>• <b>GPSSD</b>: general-purpose SSD</li></ul> |
| master_data_volume_type  | No        | String  | This parameter is a multi-disk parameter, indicating the data disk storage type of the master node. Currently, SATA, SAS, SSD, and GPSSD are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| master_data_volume_size  | No        | Integer | <p>This parameter is a multi-disk parameter, indicating the data disk storage space of master nodes. When assigning a value to this parameter, you only need to pass a number, without the unit.</p>                                                                                                                                                                                                                                                                                                                                                     |
| master_data_volume_count | No        | Integer | This parameter is a multi-disk parameter, indicating the number of data disks of the master nodes. The value can only be <b>1</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| core_data_volume_type    | No        | String  | This parameter is a multi-disk parameter, indicating the data disk storage type of core nodes. Currently, SATA, SAS, SSD, and GPSSD are supported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter              | Mandatory | Type                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| core_data_volume_size  | No        | Integer                           | <p>This parameter is a multi-disk parameter, indicating the data disk storage space of core nodes. To increase the data storage capacity, you can add disks when creating a cluster.</p> <p>Value range: 100 GB to 32,000 GB. When assigning a value to this parameter, you only need to pass a number, without the unit.</p>                                                                                                                                                                         |
| core_data_volume_count | No        | Integer                           | <p>This parameter is a multi-disk parameter, indicating the number of data disks of the core nodes.</p> <p>Value range: 1 to 10</p>                                                                                                                                                                                                                                                                                                                                                                   |
| task_node_groups       | No        | Array of task_node_groups objects | The list of task nodes. For details about the parameters, see <a href="#">Table 6-6</a> .                                                                                                                                                                                                                                                                                                                                                                                                             |
| bootstrap_scripts      | No        | Array of bootstrap_script objects | The Bootstrap action script information. For details about the parameters, see <a href="#">Table 6-8</a> .                                                                                                                                                                                                                                                                                                                                                                                            |
| node_public_cert_name  | No        | String                            | The name of a key pair. You can use a key pair to log in to a cluster node. If <b>login_mode</b> is set to 1, the request body contains the <b>node_public_cert_name</b> field.                                                                                                                                                                                                                                                                                                                       |
| cluster_admin_sec ret  | No        | String                            | <p>The password of the MRS Manager administrator. A password must meet the following complexity requirements:</p> <ul style="list-style-type: none"><li>• Must contain 8 to 26 characters.</li><li>• Cannot be the username or the username spelled backwards.</li><li>• Must contain every type of the following:<ul style="list-style-type: none"><li>– Lowercase letters</li><li>– Uppercase letters</li><li>– Numbers</li><li>– Special characters (!@#\$%^&amp;_=+[{}]:.,/?)</li></ul></li></ul> |

| Parameter             | Mandatory | Type                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-----------|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_master_secret | Yes       | String               | <p>The password of user <b>root</b> for logging in to a cluster node. If <b>login_mode</b> is set to <b>0</b>, the request body contains the <b>cluster_master_secret</b> field.</p> <p>A password must meet the following complexity requirements:</p> <ul style="list-style-type: none"><li>• Must be 8 to 26 characters long.</li><li>• Must contain every type of the following: uppercase letters, lowercase letters, numbers, and special characters (!@#\$%^_=+[{}]:.,/?), but must not contain spaces.</li><li>• Cannot be the username or the username spelled backwards.</li></ul>                                                  |
| safe_mode             | Yes       | Integer              | <p>The running mode of an MRS cluster. Possible values:</p> <ul style="list-style-type: none"><li>• <b>0</b>: normal cluster. In a normal cluster, Kerberos authentication is disabled, and users can use all functions provided by the cluster.</li><li>• <b>1</b>: security cluster. In a security cluster, Kerberos authentication is enabled, and common users cannot use the file management and job management functions of an MRS cluster or view cluster resource usage and the job records of Hadoop and Spark. To use these functions, the users must obtain the relevant permissions from the MRS Manager administrator.</li></ul> |
| tags                  | No        | Array of tag objects | <p>The cluster tags. For details about the parameters, see <a href="#">Table 6-9</a>.</p> <ul style="list-style-type: none"><li>• A cluster allows a maximum of 10 tags. A tag name (key) must be unique in a cluster.</li><li>• A tag key or value cannot contain the following special characters: =*&lt;&gt;\, /</li></ul>                                                                                                                                                                                                                                                                                                                 |

| Parameter             | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| node_groups | No        | Array of NodeGroupV11 objects | <p>The list of nodes. For details about the parameters, see <a href="#">Table 6-10</a>.</p> <p>Note: Configure either this parameter or the following parameters:</p> <p><b>master_node_num,</b><br/><b>master_node_size,</b><br/><b>core_node_num, core_node_size,</b><br/><b>master_data_volume_type,</b><br/><b>master_data_volume_size,</b><br/><b>master_data_volume_count,</b><br/><b>core_data_volume_type,</b><br/><b>core_data_volume_size,</b><br/><b>core_data_volume_count,</b><br/><b>volume_type, volume_size,</b><br/><b>task_node_groups</b></p> |

**Table 6-4** component\_list parameter

| Parameter      | Mandatory | Type   | Description                                                                                   |
|----------------|-----------|--------|-----------------------------------------------------------------------------------------------|
| component_name | Yes       | String | The component name. For details, see the component information in <a href="#">Table 6-1</a> . |

**Table 6-5** add\_jobs parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_type  | Yes       | Integer | <p>The job type code. Possible values:</p> <ul style="list-style-type: none"><li>• <b>1</b>: MapReduce</li><li>• <b>2</b>: Spark</li><li>• <b>3</b>: Hive Script</li><li>• <b>4</b>: HiveQL (not supported currently)</li><li>• <b>5</b>: DistCp for importing and exporting data (not supported currently)</li><li>• <b>6</b>: Spark Script</li><li>• <b>7</b>: Spark SQL for submitting Spark SQL statements (not supported currently)</li></ul> <p><b>NOTE</b><br/>Spark and Hive jobs can be created only in clusters that where Spark and Hive are installed.</p> |
| job_name  | Yes       | String  | <p>The job name. The value can contain 1 to 64 characters. Only letters, numbers, hyphens (-), and underscores (_) are allowed.</p> <p><b>NOTE</b><br/>Identical job names are allowed but not recommended.</p>                                                                                                                                                                                                                                                                                                                                                        |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| jar_path  | No        | String | <p>The path of the JAR or SQL file for program execution. The value must meet the following requirements:</p> <ul style="list-style-type: none"> <li>• The value contains a maximum of 1,023 characters. It cannot contain special characters (; &amp;&gt;,&lt;'\$) and cannot be left blank or all spaces.</li> <li>• Files can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> <li>- OBS: The path must start with <b>s3a://</b>. Files or programs encrypted by KMS are not supported.</li> <li>- HDFS: The path starts with a slash (/).</li> </ul> </li> <li>• Spark Script must end with <b>.sql</b> while MapReduce and Spark Jar must end with <b>.jar</b>. <b>sql</b> and <b>jar</b> are case-insensitive.</li> </ul> |
| arguments | No        | String | <p>The key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter.</p> <p>The parameter can contain 0 to 150,000 characters, but special characters (; &amp;&gt;,&lt;'\$) are not allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| input     | No        | String | <p>The data input path. Files can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> <li>• OBS: The path must start with <b>s3a://</b>. Files or programs encrypted by KMS are not supported.</li> <li>• HDFS: The path starts with a slash (/).</li> </ul> <p>The value can contain 0 to 1,023 characters, but special characters (; &amp;&gt;,&lt;'\$) are not allowed.</p>                                                                                                                                                                                                                                                                                                                                                 |

| Parameter                   | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| output                      | No        | String  | <p>The data output path.</p> <p>Files can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> <li>• OBS: The path must start with <b>s3a://</b>.</li> <li>• HDFS: The path starts with a slash (/).</li> </ul> <p>If the specified path does not exist, the system will automatically create it.</p> <p>The value can contain 0 to 1,023 characters, but special characters (;&amp;&gt;'&lt;\$) are not allowed.</p> |
| job_log                     | No        | String  | <p>The path for storing job logs that record job running status.</p> <p>Files can be stored in HDFS or OBS. The path varies depending on the file system.</p> <ul style="list-style-type: none"> <li>• OBS: The path must start with <b>s3a://</b>.</li> <li>• HDFS: The path starts with a slash (/).</li> </ul> <p>The value can contain 0 to 1,023 characters, but special characters (;&amp;&gt;'&lt;\$) are not allowed.</p>                                               |
| shutdown_cluster            | No        | Boolean | <p>Whether to terminate the cluster after the job execution is complete.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: Terminate the cluster.</li> <li>• <b>false</b>: Do not terminate the cluster.</li> </ul>                                                                                                                                                                                                                                                     |
| file_action                 | No        | String  | <p>The action to be performed on a file. Possible values:</p> <ul style="list-style-type: none"> <li>• <b>import</b></li> <li>• <b>export</b></li> </ul>                                                                                                                                                                                                                                                                                                                        |
| submit_job_once_cluster_run | Yes       | Boolean | <ul style="list-style-type: none"> <li>• <b>true</b>: Submit a job during cluster creation.</li> <li>• <b>false</b>: Submit a job after the cluster is created.</li> </ul> <p>Set this parameter to <b>true</b> in this example.</p>                                                                                                                                                                                                                                            |

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Table 6-6** task\_node\_groups parameters

| Parameter | Mandatory | Type    | Description                                                                                                                                                                                                                                                     |
|-----------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_num  | Yes       | Integer | The number of task nodes. The value ranges from 0 to 500, and the total number of core and task nodes cannot exceed 500.                                                                                                                                        |
| node_size | Yes       | String  | <p>The instance specifications of task nodes, for example, <b>c6.4xlarge.4.linux.mrs</b>.</p> <p>Obtain the instance specifications of the corresponding version in the corresponding region from the cluster createion page of the MRS management console.</p> |

| Parameter           | Mandatory | Type                       | Description                                                                                                                                                                                                                                          |
|---------------------|-----------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| data_volume_type    | Yes       | String                     | The data disk storage type of task nodes. Possible values: <ul style="list-style-type: none"><li>• <b>SATA</b>: common I/O</li><li>• <b>SAS</b>: high I/O</li><li>• <b>SSD</b>: ultra-high I/O</li><li>• <b>GPSSD</b>: general-purpose SSD</li></ul> |
| data_volume_count   | Yes       | Integer                    | The number of data disks of a task node.<br>Value range: 0 to 10                                                                                                                                                                                     |
| data_volume_size    | Yes       | Integer                    | The data disk storage space of a task node.<br>Value range: 100 GB to 32,000 GB<br>You only need to enter a number and do not need to enter the unit GB.                                                                                             |
| auto_scaling_policy | No        | auto_scaling_policy object | The auto scaling policy. For details, see <a href="#">Table 6-7</a> .                                                                                                                                                                                |

**Table 6-7** auto\_scaling\_policy parameters

| Parameter           | Mandatory | Type                            | Description                                                                                                                                                                                                                                                    |
|---------------------|-----------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto_scaling_enable | Yes       | Boolean                         | Whether to enable the auto scaling policy.                                                                                                                                                                                                                     |
| min_capacity        | Yes       | Integer                         | The minimum number of nodes reserved in the node group.<br>Value range: 0 to 500                                                                                                                                                                               |
| max_capacity        | Yes       | Integer                         | The maximum number of nodes in the node group.<br>Value range: 0 to 500                                                                                                                                                                                        |
| resources_plans     | No        | Array of resources_plan objects | The resource plan list. For details, see <a href="#">Table 6-12</a> . If this parameter is left blank, the resource plan is disabled.<br><br>When <b>auto_scaling_enable</b> is set to <b>true</b> , either this parameter or <b>rules</b> must be configured. |

| Parameter    | Mandatory | Type                          | Description                                                                                                                                                                                                  |
|--------------|-----------|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| exec_scripts | No        | Array of scale_script objects | The list of custom scaling automation scripts. For details, see <a href="#">Table 6-15</a> . If this parameter is left blank, a hook script is disabled.                                                     |
| rules        | No        | Array of rules objects        | The list of auto scaling rules. For details, see <a href="#">Table 6-13</a> .<br>When <b>auto_scaling_enable</b> is set to <b>true</b> , either this parameter or <b>resources_plans</b> must be configured. |

**Table 6-8** bootstrap\_script parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                   |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | <p>The name of a bootstrap action script, which must be unique in a cluster.</p> <p>The value can contain only numbers, letters, spaces, hyphens (-), and underscores (_) and cannot start with a space.</p> <p>The value can contain 1 to 64 characters.</p> |

| Parameter     | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uri           | Yes       | String           | <p>The path of a Bootstrap action script. Set this parameter to an OBS bucket path or a local VM path.</p> <ul style="list-style-type: none"><li>• OBS bucket path: Enter a script path. For example, enter the path of the public sample script provided by MRS. Example: <b>s3a://bootstrap/presto/presto-install.sh</b>. If <b>dualroles</b> is installed, the parameter of the <b>presto-install.sh</b> script is <b>dualroles</b>. If <b>worker</b> is installed, the parameter of the <b>presto-install.sh</b> script is <b>worker</b>. Based on the Presto usage habit, you are advised to install <b>dualroles</b> on the active Master nodes and <b>worker</b> on the Core nodes.</li><li>• Local VM path: Enter a script path. The script path must start with a slash (/) and end with .sh.</li></ul> |
| parameters    | No        | String           | The bootstrap action script parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| nodes         | Yes       | Array of strings | <p>The type of a node where the bootstrap action script is executed. The value can be <b>Master</b>, <b>Core</b>, or <b>Task</b>.</p> <p>The node type must be represented in lowercase letters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| active_master | No        | Boolean          | <p>Whether the bootstrap action script runs only on active master nodes.</p> <p>The default value is <b>false</b>, indicating that the Bootstrap action script can run on all Master nodes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Parameter              | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| before_component_start | No        | Boolean          | <p>Time when the bootstrap action script is executed. Currently, the following two options are available: <b>Before component start</b> and <b>After component start</b></p> <p>The default value is <b>false</b>, indicating that the bootstrap action script is executed after the component is started.</p>                                                                                                                                                                                                                                                                                                                |
| fail_action            | Yes       | String           | <p>Whether to continue executing subsequent scripts and creating a cluster after the Bootstrap action script fails to be executed.</p> <ul style="list-style-type: none"> <li>• <b>continue</b>: Continue to execute subsequent scripts.</li> <li>• <b>errorout</b>: Stop the action.</li> </ul> <p>The default value is <b>errorout</b>, indicating that the action is stopped.</p> <p><b>NOTE</b><br/>           You are advised to set this parameter to <b>continue</b> in the commissioning phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.</p> |
| action_stages          | No        | Array of strings | <p>Select the time when the bootstrap action script is executed.</p> <ul style="list-style-type: none"> <li>• <b>BEFORE_COMPONENT_FIRST_START</b>: before initial component starts</li> <li>• <b>AFTER_COMPONENT_FIRST_START</b>: after initial component starts</li> <li>• <b>BEFORE_SCALE_IN</b>: before scale-in</li> <li>• <b>AFTER_SCALE_IN</b>: after scale-in</li> <li>• <b>BEFORE_SCALE_OUT</b>: before scale-out</li> <li>• <b>AFTER_SCALE_OUT</b>: after scale-out</li> </ul>                                                                                                                                       |

**Table 6-9** tag parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                  |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | <p>The tag key.</p> <ul style="list-style-type: none"><li>• It contains a maximum of 36 Unicode characters and cannot be an empty string.</li><li>• The tag key cannot start or end with spaces or contain non-printable ASCII characters (0-31) and special characters (=<i>&lt;&gt;</i>\ /).</li><li>• The tag key of a resource must be unique.</li></ul> |
| value     | Yes       | String | <p>The value.</p> <ul style="list-style-type: none"><li>• The value contains a maximum of 43 Unicode characters and can be an empty string.</li><li>• The tag value cannot start or end with spaces or contain non-printable ASCII characters (0-31) and special characters (=<i>&lt;&gt;</i>\ /).</li></ul>                                                 |

**Table 6-10** NodeGroupV11 parameters

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                             |
|------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| group_name | Yes       | String  | <p>The node group name. Possible values:</p> <ul style="list-style-type: none"><li>• <code>master_node_default_group</code></li><li>• <code>core_node_analysis_group</code></li><li>• <code>core_node_streaming_group</code></li><li>• <code>task_node_analysis_group</code></li><li>• <code>task_node_streaming_group</code></li></ul> |
| node_num   | Yes       | Integer | <p>The number of nodes. The value ranges from 0 to 500, and the default value is <b>0</b>. The total number of core and task nodes cannot exceed 500.</p>                                                                                                                                                                               |

| Parameter           | Mandatory | Type                       | Description                                                                                                                                                                                                                                                                                   |
|---------------------|-----------|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_size           | Yes       | String                     | The instance specifications of cluster nodes, for example, . Obtain the instance specifications of the corresponding version in the corresponding region from the cluster creation page of the MRS management console.                                                                        |
| root_volume_size    | Yes       | String                     | The system disk storage space of a node.                                                                                                                                                                                                                                                      |
| root_volume_type    | Yes       | String                     | The system disk storage type of a node. Possible values: <ul style="list-style-type: none"><li>• <b>SATA</b>: common I/O</li><li>• <b>SAS</b>: high I/O</li><li>• <b>SSD</b>: ultra-high I/O</li><li>• <b>GPSSD</b>: general-purpose SSD</li></ul>                                            |
| data_volume_type    | Yes       | String                     | The data disk storage type of a node. Possible values: <ul style="list-style-type: none"><li>• <b>SATA</b>: common I/O</li><li>• <b>SAS</b>: high I/O</li><li>• <b>SSD</b>: ultra-high I/O</li><li>• <b>GPSSD</b>: general-purpose SSD</li></ul>                                              |
| data_volume_count   | Yes       | Integer                    | The number of data disks of a node.<br>Value range: 0 to 10                                                                                                                                                                                                                                   |
| data_volume_size    | Yes       | Integer                    | The data disk storage space of a node.<br>Value range: 100 GB to 32,000 GB                                                                                                                                                                                                                    |
| auto_scaling_policy | No        | auto_scaling_policy object | The auto scaling rule information. This parameter is available only when <b>group_name</b> is set to <b>task_node_analysis_group</b> or <b>task_node_streaming_group</b> . For details, see <a href="#">Table 6-11</a> .<br>For details about the parameters, see <a href="#">Table 6-7</a> . |

**Table 6-11** Node configuration parameters

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                   |
|------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| master_node_num  | Yes       | Integer | The number of master nodes. If cluster HA is enabled, set this parameter to <b>2</b> . If cluster HA is disabled, set this parameter to <b>1</b> . This parameter cannot be set to <b>1</b> in MRS 3.x.                                                                                                       |
| master_node_size | Yes       | String  | The instance specifications of master nodes, for example, . The host specifications supported by MRS are determined by CPU, memory, and disk space. Obtain the instance specifications of the corresponding version in the corresponding region from the cluster creation page of the MRS management console. |
| core_node_num    | Yes       | Integer | The number of core nodes. Value range: 1 to 500 A maximum of 500 core nodes are supported by default. If more than 500 core nodes are required, .                                                                                                                                                             |

| Parameter                | Mandatory | Type    | Description                                                                                                                                                                                                          |
|--------------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| core_node_size           | Yes       | String  | The instance specifications of core nodes, for example, . Obtain the instance specifications of the corresponding version in the corresponding region from the cluster creation page of the MRS management console.  |
| master_data_volume_type  | No        | String  | This parameter is a multi-disk parameter, indicating the data disk storage type of master nodes. Currently, SATA, SAS, and SSD are supported.                                                                        |
| master_data_volume_size  | No        | Integer | This parameter is a multi-disk parameter, indicating the data disk storage space of master nodes. To increase the data storage capacity, you can add disks when creating a cluster. Value range: 100 GB to 32,000 GB |
| master_data_volume_count | No        | Integer | This parameter is a multi-disk parameter, indicating the number of data disks of the master nodes. The value can only be 1.                                                                                          |

| Parameter              | Mandatory | Type    | Description                                                                                                                                                                                                           |
|------------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| core_data_volume_type  | No        | String  | This parameter is a multi-disk parameter, indicating the data disk storage type of core nodes. Currently, SATA, SAS, and SSD are supported.                                                                           |
| core_data_volume_size  | No        | Integer | This parameter is a multi-disk parameter, indicating the data disk storage space of core nodes. To increase the data storage capacity, you can add disks when creating a cluster.<br>Value range: 100 GB to 32,000 GB |
| core_data_volume_count | No        | Integer | This parameter is a multi-disk parameter, indicating the number of data disks of core nodes.<br>Value range: 1 to 10                                                                                                  |

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volume_type | No        | String | <p>The data disk storage type of the master and core nodes. Currently, SATA, SAS, and SSD are supported. Disk parameters can be represented by <b>volume_type</b> and <b>volume_size</b>, or multi-disk parameters. If the <b>volume_type</b> and <b>volume_size</b> parameters coexist with the multi-disk parameters, the system reads the <b>volume_type</b> and <b>volume_size</b> parameters first. You are advised to use the multi-disk parameters.</p> <p>Possible values:</p> <ul style="list-style-type: none"><li>• <b>SATA</b>: common I/O</li><li>• <b>SAS</b>: high I/O</li><li>• <b>SSD</b>: ultra-high I/O</li></ul> |

| Parameter        | Mandatory | Type    | Description                                                                                                                                                                                                                                                                             |
|------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| volume_size      | No        | Integer | The data disk storage space of master and core nodes. To increase the data storage capacity, you can add disks when creating a cluster.<br>Value range: 100 GB to 32,000 GB<br>This parameter is not recommended. For details, see the description of the <b>volume_type</b> parameter. |
| task_node_groups | No        | Array   | The list of task nodes. For more parameter description, see <a href="#">Table 6-6</a> .                                                                                                                                                                                                 |

**Table 6-12** resources\_plan parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                         |
|-------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period_type | Yes       | String | Cycle type of a resource plan. Currently, only the following cycle type is supported:<br><b>daily</b>                                                                                               |
| start_time  | Yes       | String | Start time of a resource plan. The value is in the format of <b>hour:minute</b> , indicating that the time ranges from 0:00 to 23:59.                                                               |
| end_time    | Yes       | String | End time of a resource plan. The value is in the same format as that of <b>start_time</b> . The interval between <b>end_time</b> and <b>start_time</b> must be greater than or equal to 30 minutes. |

| Parameter    | Mandatory | Type    | Description                                                                                        |
|--------------|-----------|---------|----------------------------------------------------------------------------------------------------|
| min_capacity | Yes       | Integer | Minimum number of the preserved nodes in a node group in a resource plan.<br>Value range: 0 to 500 |
| max_capacity | Yes       | Integer | Maximum number of the preserved nodes in a node group in a resource plan.<br>Value range: 0 to 500 |

**Table 6-13** rules parameters

| Parameter          | Mandatory | Type           | Description                                                                                                                                                                                      |
|--------------------|-----------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name               | Yes       | String         | Name of an auto scaling rule.<br>It contains only 1 to 64 characters.<br>Only letters, digits, hyphens (-), and underscores (_) are allowed.<br>Rule names must be unique in a node group.       |
| description        | No        | String         | Description about an auto scaling rule.<br>It contains a maximum of 1024 characters.                                                                                                             |
| adjustment_type    | Yes       | String         | Auto scaling rule adjustment type.<br>Possible values: <ul style="list-style-type: none"><li>• <b>scale_out</b>: cluster scale-out</li><li>• <b>scale_in</b>: cluster scale-in</li></ul>         |
| cool_down_minutes  | Yes       | Integer        | Cluster cooling time after an auto scaling rule is triggered, when no auto scaling operation is performed. The unit is minute.<br>Value range: 0 to 10,080. One week is equal to 10,080 minutes. |
| scaling_adjustment | Yes       | Integer        | Number of nodes that can be adjusted once.<br>Value range: 1 to 100                                                                                                                              |
| trigger            | Yes       | trigger object | Condition for triggering a rule. For details, see <a href="#">Table 6-14</a> .                                                                                                                   |

**Table 6-14** trigger parameters

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                                          |
|---------------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| metric_name         | Yes       | String  | <p>Metric name.</p> <p>This triggering condition makes a judgment according to the value of the metric.</p> <p>A metric name contains a maximum of 64 characters.</p> <p><a href="#">Table 6-16</a> lists the supported metric names.</p>                            |
| metric_value        | Yes       | String  | <p>Metric threshold to trigger a rule</p> <p>The parameter value must be an integer or number with two decimal places only. <a href="#">Table 6-16</a> provides value types and ranges corresponding to <code>metric_name</code>.</p>                                |
| comparison_operator | No        | String  | <p>Metric judgment logic operator.</p> <p>Possible values:</p> <ul style="list-style-type: none"><li>• <b>LT</b>: less than</li><li>• <b>GT</b>: greater than</li><li>• <b>LTOE</b>: less than or equal to</li><li>• <b>GTOE</b>: greater than or equal to</li></ul> |
| evaluation_periods  | Yes       | Integer | <p>Number of consecutive five-minute periods, during which a metric threshold is reached</p> <p>Value range: 1 to 288</p>                                                                                                                                            |

**Table 6-15** scale\_script parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                 |
|-----------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | <p>Name of a custom automation script. It must be unique in a same cluster.</p> <p>The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and cannot start with a space.</p> <p>The value can contain 1 to 64 characters.</p> |

| Parameter  | Mandatory | Type            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|-----------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uri        | Yes       | String          | <p>Path of a custom automation script. Set this parameter to an OBS bucket path or a local VM path.</p> <ul style="list-style-type: none"> <li>• OBS bucket path: Enter a script path manually, for example, <code>s3a://XXX/scale.sh</code>.</li> <li>• Local VM path: Enter a script path. The script path must start with a slash (/) and end with <code>.sh</code>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| parameters | No        | String          | <p>Parameters of a custom automation script.</p> <ul style="list-style-type: none"> <li>• Multiple parameters are separated by space.</li> <li>• The following predefined system parameters can be transferred: <ul style="list-style-type: none"> <li>- <code> \${mrs_scale_node_num} </code>: Number of the nodes to be added or removed</li> <li>- <code> \${mrs_scale_type} </code>: Scaling type. The value can be <code>scale_out</code> or <code>scale_in</code>.</li> <li>- <code> \${mrs_scale_node_hostnames} </code>: Host names of the nodes to be added or removed</li> <li>- <code> \${mrs_scale_node_ip} </code>: IP addresses of the nodes to be added or removed</li> <li>- <code> \${mrs_scale_rule_name} </code>: Name of the rule that triggers auto scaling</li> </ul> </li> <li>• Other user-defined parameters are used in the same way as those of common shell scripts. Parameters are separated by space.</li> </ul> |
| nodes      | Yes       | Array of string | Type of a node where the custom automation script is executed. The node type can be Master, Core, or Task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Parameter     | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| active_master | No        | Boolean | <p>Whether the custom automation script runs only on the active Master node.</p> <p>The default value is <b>false</b>, indicating that the custom automation script can run on all Master nodes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| action_stage  | Yes       | String  | <p>Time when a script is executed.</p> <p>The following four options are supported:</p> <ul style="list-style-type: none"><li>• <b>before_scale_out</b>: before scale-out</li><li>• <b>before_scale_in</b>: before scale-in</li><li>• <b>after_scale_out</b>: after scale-out</li><li>• <b>after_scale_in</b>: after scale-in</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| fail_action   | Yes       | String  | <p>Whether to continue to execute subsequent scripts and create a cluster after the custom automation script fails to be executed.</p> <ul style="list-style-type: none"><li>• <b>continue</b>: Continue to execute subsequent scripts.</li><li>• <b>errorout</b>: Stop the action.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• You are advised to set this parameter to <b>continue</b> in the commissioning phase so that the cluster can continue to be installed and started no matter whether the custom automation script is executed successfully.</li><li>• The scale-in operation cannot be undone. Therefore, <b>fail_action</b> must be set to <b>continue</b> for the scripts that are executed after scale-in.</li></ul> |

**Table 6-16** Auto scaling metrics

| Cluster Type      | Metric Name        | Value Type | Description                                                      |
|-------------------|--------------------|------------|------------------------------------------------------------------|
| Streaming cluster | StormSlotAvailable | Integer    | Number of available Storm slots.<br>Value range: 0 to 2147483646 |

| Cluster Type     | Metric Name                              | Value Type  | Description                                                                                                                          |
|------------------|------------------------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------|
|                  | StormSlotAvailablePercentage             | Percentag e | Percentage of available Storm slots, that is, the proportion of the available slots to total slots.<br>Value range: 0 to 100         |
|                  | StormSlotUsed                            | Integer     | Number of the used Storm slots.<br>Value range: 0 to 2147483646                                                                      |

|              | YARNSMemoryAllocated           | Integer    | Memory allocated to Yarn. The unit is MB.<br>Value range: 0 to 2147483646                                                                    |
|              | YARNSMemoryAvailable           | Integer    | Available memory on Yarn. The unit is MB.<br>Value range: 0 to 2147483646                                                                    |
|              | YARNSMemoryAvailablePercentage | Percentage | Percentage of available memory on Yarn, that is, the proportion of available memory to total memory on Yarn.<br>Value range: 0 to 100        |
|              | YARNSMemoryPending             | Integer    | Pending memory on Yarn.<br>Value range: 0 to 2147483646                                                                                      |

#### NOTE

When the value type is percentage or ratio in [Table 6-16](#), the valid value can be accurate to percentile. The percentage metric value is a decimal value with a percent sign (%) removed. For example, 16.80 represents 16.80%.

## Response Parameters

Status code: 200

**Table 6-17** Response body parameters

| Parameter  | Type    | Description                                                                                                                                                 |
|------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_id | String  | Cluster ID, which is returned by the system after the cluster is created.                                                                                   |
| result     | Boolean | Operation result. <ul style="list-style-type: none"><li>• <b>true</b>: The operation is successful.</li><li>• <b>false</b>: The operation failed.</li></ul> |
| msg        | String  | System message, which can be empty.                                                                                                                         |

## Example Request

- Creating a cluster with **Cluster HA** enabled (using the **node\_groups** parameter group)

POST https://{endpoint}/v1.1/{project\_id}/run-job-flow

## Example Response

### Status code: 200

The cluster is created.

```
{
 "cluster_id": "da1592c2-bb7e-468d-9ac9-83246e95447a",
 "result": true,
 "msg": ""
}
```

## Status Codes

[Table 6-18](#) describes the status code.

**Table 6-18** Status code

| Status Code | Description                   |
|-------------|-------------------------------|
| 200         | The cluster has been created. |

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

### 6.1.2 Resizing a Cluster

#### Function

This API is used to manually scale out or scale in Core or Task nodes in a cluster that has been created. After an MRS cluster is created, the number of Master nodes cannot be adjusted. That is, Master nodes cannot be scaled in or out. This API is incompatible with Sahara.

Only clusters in the **Running** state can be scaled out or in.

The APIs described in this section support only streaming, analysis, and hybrid clusters.

#### URI

- Format  
PUT /v1.1/{project\_id}/cluster\_infos/{cluster\_id}
- Parameter description

**Table 6-19** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                            |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .               |
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the cluster ID, see <a href="#">Obtaining the MRS Cluster Information</a> . |

#### Request Parameters

**Table 6-20** Request parameters

| Parameter  | Mandatory | Type   | Description                                                                                  |
|------------|-----------|--------|----------------------------------------------------------------------------------------------|
| service_id | No        | String | Service ID. This parameter is reserved for extension. You do not need to set this parameter. |
| plan_id    | No        | String | Plan ID. This parameter is reserved for extension. You do not need to set this parameter.    |

| Parameter       | Mandatory | Type                | Description                                                                                        |
|-----------------|-----------|---------------------|----------------------------------------------------------------------------------------------------|
| parameters      | Yes       | Object              | Core parameters. For details, see <a href="#">Table 6-21</a> .                                     |
| previous_values | No        | Map<String, String> | This parameter is an extended API and needs to be reserved. You do not need to set this parameter. |

**Table 6-21** parameters description

| Parameter      | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| order_id       | No        | String | Order ID obtained by the system during scale-out or scale-in. You do not need to set the parameter.                                                                                                                                                                                                                                                                                              |
| scale_type     | Yes       | String | <ul style="list-style-type: none"><li>• <b>scale_in</b>: cluster scale-in</li><li>• <b>scale_out</b>: cluster scale-out</li></ul>                                                                                                                                                                                                                                                                |
| node_id        | Yes       | String | ID of the newly added or removed node. The parameter value is fixed to <b>node_orderadd</b> .                                                                                                                                                                                                                                                                                                    |
| node_group     | No        | String | Node group to be scaled out or in <ul style="list-style-type: none"><li>• If the value of <b>node_group</b> is <b>core_node_default_group</b>, the node group is a Core node group.</li><li>• If the value of <b>node_group</b> is <b>task_node_default_group</b>, the node group is a Task node group.</li></ul> If it is left blank, the default value <b>core_node_default_group</b> is used. |
| task_node_info | No        | Object | Task node specifications. For more parameter description, see <a href="#">Table 6-22</a> . <ul style="list-style-type: none"><li>• When the number of Task nodes is <b>0</b>, this parameter is used to specify Task node specifications.</li><li>• When the number of Task nodes is greater than <b>0</b>, this parameter is unavailable.</li></ul>                                             |

| Parameter              | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| instances              | Yes       | Integer | <p>Number of nodes to be added or removed</p> <ul style="list-style-type: none"><li>The maximum number of nodes to be added is 500 minus the number of Core and Task nodes. For example, the current number of Core nodes is 3, the number of nodes to be added must be less than or equal to 497.</li><li>A maximum of 500 Core and Task nodes are supported by default. If more than 500 Core and Task nodes are required, contact technical support engineers or call a background API to modify the database.</li><li>Nodes can be deleted for cluster scale-out when the number of Core nodes is greater than 3 or the number of Task nodes is greater than 0. For example, if there are 5 Core nodes and 5 Task nodes in a cluster, only 2 (5 minus 3) Core nodes are available for deletion and 5 or fewer than 5 Task nodes can be deleted.</li></ul> |
| skip_bootstrap_scripts | No        | String  | This parameter is valid only when a bootstrap action is configured during cluster creation and takes effect during scale-out. It indicates whether the bootstrap action specified during cluster creation is performed on nodes added during scale-out. The default value is <b>false</b> , indicating that the bootstrap action is performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| scale_without_start    | No        | Boolean | <p>Whether to start components on the added nodes after cluster scale-out</p> <ul style="list-style-type: none"><li><b>true</b>: Do not start components after scale-out.</li><li><b>false</b>: Start components after scale-out.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-----------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| server_ids | No        | Array of strings | <p>ID list of Task nodes to be deleted during task node scale-in.</p> <ul style="list-style-type: none"><li>• This parameter does not take effect when <b>scale_type</b> is set to <b>scale-out</b>.</li><li>• If <b>scale_type</b> is set to <b>scale-in</b> and cannot be left blank, the system deletes the specified Task nodes.</li><li>• When <b>scale_type</b> is set to <b>scale-in</b> and <b>server_ids</b> is left blank, the system automatically deletes the Task nodes based on the system rules.</li></ul> |

**Table 6-22** task\_node\_info parameters

| Parameter         | Mandatory | Type    | Description                                                                                                                                                                                                                                                                        |
|-------------------|-----------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_size         | Yes       | String  | Instance specifications of a Task node, Example:                                                                                                                                                                                                                                   |
| data_volume_type  | Yes       | String  | <p>Data disk storage type of the Task node, supporting SATA, SAS, and SSD currently.</p> <ul style="list-style-type: none"><li>• <b>SATA</b>: common I/O</li><li>• <b>SAS</b>: high I/O</li><li>• <b>SSD</b>: ultra-high I/O</li><li>• <b>GPSSD</b>: general-purpose SSD</li></ul> |
| data_volume_count | Yes       | Integer | <p>Number of data disks of a Task node</p> <p>Value range: 0 to 10</p>                                                                                                                                                                                                             |
| data_volume_size  | Yes       | Integer | <p>Data disk storage space of a Task node</p> <p>Value range: 100 GB to 32,000 GB.</p> <p>When assigning a value to this parameter, you only need to pass a number, without the unit.</p>                                                                                          |

## Response Parameters

### Response parameters

**Table 6-23** describes the response parameter.

**Table 6-23** Response parameter

| Parameter | Type   | Description                                                                                                                                                                                                       |
|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| result    | String | <p>Operation result</p> <ul style="list-style-type: none"><li>• <b>succeeded:</b> The operation is successful.</li><li>• <b>Error Codes</b> describes the error codes returned upon operation failures.</li></ul> |

## Example

- Example request

Example of adding core nodes

```
PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

{
 "service_id": "",
 "plan_id": "",
 "parameters": {
 "order_id": "",
 "scale_type": "scale_out",
 "node_id": "node_orderadd",
 "node_group": "core_node_default_group",
 "instances": "1",
 "skip_bootstrap_scripts":false,
 "scale_without_start":false
 },
 "previous_values": { }
}
```

Example of adding task nodes when the number of existing task nodes is greater than zero

```
PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

{
 "service_id": "",
 "plan_id": "",
 "parameters": {
 "order_id": "",
 "scale_type": "scale_out",
 "node_id": "node_orderadd",
 "node_group": "task_node_default_group",
 "instances": "1",
 "skip_bootstrap_scripts":false,
 "scale_without_start":false
 },
 "previous_values": { }
}
```

Example of adding task nodes when the number of existing task nodes is zero

```
PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

{
 "service_id": "",
 "plan_id": "",
 "parameters": {
 "order_id": ""
 }
}
```

```
"scale_type": "scale_out",
"node_id": "node_orderadd",
"node_group": "task_node_default_group",
"task_node_info": {
 "node_size": "",
 "data_volume_type": "SATA",
 "data_volume_count": 2,
 "data_volume_size": 600
},
"instances": "1",
"scale_without_start": false

},
"previous_values": { }
}
```

#### Example of adding core nodes

```
PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

{
 "service_id": "",
 "plan_id": "",
 "parameters": {
 "order_id": "",
 "scale_type": "scale_in",
 "node_id": "node_orderadd",
 "node_group": "core_node_default_group",
 "instances": "1"

 },
 "previous_values": { }
}
```

#### Example of removing task nodes

```
PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

{
 "service_id": "",
 "plan_id": "",
 "parameters": {
 "order_id": "",
 "scale_type": "scale_in",
 "node_id": "node_orderadd",
 "node_group": "task_node_default_group",
 "instances": "1"

 },
 "previous_values": { }
}
```

#### Example of removing specified task nodes

```
PUT /v1.1/{project_id}/cluster_infos/{cluster_id}

{
 "service_id": "",
 "plan_id": "",
 "parameters": {
 "order_id": "",
 "scale_type": "scale_in",
 "node_id": "node_orderadd",
 "node_group": "task_node_default_group",
 "instances": "2",
 "server_ids": ["c9573435-7814-4b2c-9131-ad78b814414c",
 "a4951009-6a0f-4e7b-9c81-9d4bd1f8c537"]
 },
 "previous_values": { }
}
```

- Example response

```
{
 "result": "succeeded"
}
```

## Status Codes

- [Table 6-24](#) describes the status code.

**Table 6-24** Status code

| Status Code | Description                                        |
|-------------|----------------------------------------------------|
| 200         | The core or task nodes have been added or removed. |

- See [Status Codes](#).

## Error Codes

See [Error Codes](#).

### 6.1.3 Querying a Cluster List

#### Function

This API is used to query a list of clusters created by a user. This API is incompatible with Sahara.

#### URI

- Format  
GET /v1.1/{project\_id}/cluster\_infos
- Parameter description

**Table 6-25** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

**Table 6-26** Query parameters

| Parameter    | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| pageSize     | No        | String | Maximum number of clusters displayed on a page<br>Value range: 1 to 2147483646                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| currentPage  | No        | String | Current page number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| clusterName  | No        | String | The cluster name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| clusterState | No        | String | You can query a cluster list by cluster status. <ul style="list-style-type: none"><li>• <b>existing</b>: Query a list of existing clusters except the terminated clusters.</li><li>• <b>history</b>: Query a list of history clusters, including the terminated clusters, clusters that fail to be terminated, clusters that fail to delete VMs, and clusters that fail to terminate a database update.</li><li>• <b>starting</b>: Query a list of clusters that are being started.</li><li>• <b>running</b>: Query a list of running clusters.</li><li>• <b>terminated</b>: Query a list of terminated clusters.</li><li>• <b>failed</b>: Query a list of failed clusters.</li><li>• <b>abnormal</b>: Query a list of abnormal clusters.</li><li>• <b>terminating</b>: Query a list of clusters that are being terminated.</li><li>• <b>frozen</b>: Query a list of frozen clusters.</li><li>• <b>scaling-out</b>: Query a list of clusters that are being scaled out.</li><li>• <b>scaling-in</b>: Query a list of clusters that are being scaled in.</li></ul> |

**Table 6-29** componentList parameters

| Parameter        | Type   | Description                                                                          |
|------------------|--------|--------------------------------------------------------------------------------------|
| componentId      | String | Component ID<br><br>For example, the <b>component_id</b> of Hadoop is MRS 3.1.0_001. |
| componentName    | String | Component name                                                                       |
| componentVersion | String | Component version                                                                    |
| componentDesc    | String | Component description                                                                |

**Table 6-30** BootstrapScript parameters

| Parameter  | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name       | String | The name of a bootstrap action script, which must be unique in a cluster.<br><br>The value can contain only numbers, letters, spaces, hyphens (-), and underscores (_) and cannot start with a space.<br><br>The value can contain 1 to 64 characters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| uri        | String | The path of a bootstrap action script. Set this parameter to an OBS bucket path or a local VM path. <ul style="list-style-type: none"><li>• OBS bucket path: Enter a script path. For example, enter the path of the public sample script provided by MRS. Example: <b>s3a://bootstrap/presto/presto-install.sh</b>. If <b>dualroles</b> is installed, the parameter of the <b>presto-install.sh</b> script is <b>dualroles</b>. If <b>worker</b> is installed, the parameter of the <b>presto-install.sh</b> script is <b>worker</b>. Based on the Presto usage habit, you are advised to install <b>dualroles</b> on the active master nodes and <b>worker</b> on the core nodes.</li><li>• Local VM path: Enter a script path. The script path must start with a slash (/) and end with .sh.</li></ul> |
| parameters | String | The bootstrap action script parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Parameter              | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nodes                  | Array of strings | Type of a node where the Bootstrap action script is executed. The value can be <b>master</b> , <b>core</b> , or <b>task</b> . The node type must be represented in lowercase letters.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| active_master          | Boolean          | Whether the bootstrap action script runs only on active master nodes. The default value is <b>false</b> , indicating that the Bootstrap action script can run on all master nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| fail_action            | String           | <p>Whether to continue executing subsequent scripts and creating a cluster after the bootstrap action script fails to execute.</p> <p>The default value is <b>errorout</b>, indicating that the action is stopped.</p> <p>Note: You are advised to set this parameter to <b>continue</b> in the commissioning phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.</p> <p>Possible values:</p> <ul style="list-style-type: none"><li>• <b>continue</b>: Continue to execute subsequent scripts.</li><li>• <b>errorout</b>: Stop the action.</li></ul> |
| before_component_start | Boolean          | Time when the bootstrap action script is executed. Currently, the following two options are available: <b>Before component start</b> and <b>After component start</b> . The default value is <b>false</b> , indicating that the bootstrap action script is executed after the component is started.                                                                                                                                                                                                                                                                                                                       |

| Parameter     | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action_stages | Array of strings | Select the time when the bootstrap action script is executed. <ul style="list-style-type: none"><li>• <b>BEFORE_COMPONENT_FIRST_START</b>: before initial component starts</li><li>• <b>AFTER_COMPONENT_FIRST_START</b>: after initial component starts</li><li>• <b>BEFORE_SCALE_IN</b>: before scale-in</li><li>• <b>AFTER_SCALE_IN</b>: after scale-in</li><li>• <b>BEFORE_SCALE_OUT</b>: before scale-out</li><li>• <b>AFTER_SCALE_OUT</b>: after scale-out</li></ul> |

**Table 6-31** NodeGroup parameters

| Parameter                  | Type    | Description                                                                                                                                                      |
|----------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GroupName                  | String  | Node group name.                                                                                                                                                 |
| NodeNum                    | Integer | Number of nodes. The value ranges from 0 to 500. The minimum number of Master and Core nodes is 1 and the total number of Core and Task nodes cannot exceed 500. |
| NodeSize                   | String  | Instance specifications of a node.                                                                                                                               |
| NodeSpecId                 | String  | Instance specification ID of a node                                                                                                                              |
| NodeProductId              | String  | Instance product ID of a node                                                                                                                                    |
| VmProductId                | String  | VM product ID of a node                                                                                                                                          |
| VmSpecCode                 | String  | VM specifications of a node                                                                                                                                      |
| RootVolumeSize             | Integer | System disk size of a node. This parameter is not configurable and its default value is <b>40 GB</b> .                                                           |
| RootVolumeProductId        | String  | System disk product ID of a node                                                                                                                                 |
| RootVolumeType             | String  | System disk type of a node                                                                                                                                       |
| RootVolumeResourceSpecCode | String  | System disk product specifications of a node                                                                                                                     |
| RootVolumeResourceType     | String  | System disk product type of a node                                                                                                                               |

| Parameter                  | Type    | Description                                                                                                                                                                                             |
|----------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataVolumeType             | String  | Data disk storage type of a node. Currently, SATA, SAS, and SSD are supported. <ul style="list-style-type: none"><li>• SATA: Common I/O</li><li>• SAS: High I/O</li><li>• SSD: Ultra-high I/O</li></ul> |
| DataVolumeCount            | Integer | Number of data disks of a node.                                                                                                                                                                         |
| DataVolumeSize             | Integer | Data disk storage space of a node.                                                                                                                                                                      |
| DataVolumeProductID        | String  | Data disk product ID of a node                                                                                                                                                                          |
| DataVolumeResourceSpecCode | String  | Data disk product specifications of a node                                                                                                                                                              |
| DataVolumeResourceType     | String  | Data disk product type of a node                                                                                                                                                                        |

## Example

- Example request  
GET /v1.1/{project\_id}/cluster\_infos?  
pageSize={page\_size}&currentPage={current\_page}&clusterState={cluster\_state}&tags={tags}
- Example response

## Status Codes

[Table 6-32](#) describes the status code.

**Table 6-32** Status code

| Status Code | Description                                    |
|-------------|------------------------------------------------|
| 200         | The cluster list information has been queried. |

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

### 6.1.4 Querying Cluster Details

#### Function

This API is used to query details about a specified cluster. This API is incompatible with Sahara.

#### URI

- Format  
GET /v1.1/{project\_id}/cluster\_infos/{cluster\_id}
- Parameter description

**Table 6-33** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                              |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                                      |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the value, see <a href="#">Obtaining the MRS Cluster Information.</a> |

## Request Parameters

### Request parameters

None

## Response Parameters

**Table 6-34** Response body parameter

| Parameter | Type           | Description                                                       |
|-----------|----------------|-------------------------------------------------------------------|
| cluster   | Cluster object | Cluster parameters. For details, see <a href="#">Table 6-35</a> . |

**Table 6-35** Response parameters

| Parameter     | Type   | Description                                  |
|---------------|--------|----------------------------------------------|
| clusterId     | String | Cluster ID                                   |
| clusterName   | String | Cluster name                                 |
| masterNodeNum | String | Number of Master nodes deployed in a cluster |
| coreNodeNum   | String | Number of Core nodes deployed in a cluster   |
| totalNodeNum  | String | Total number of nodes deployed in a cluster  |

| Parameter             | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| clusterState          | String | Cluster status. Valid values include: <ul style="list-style-type: none"><li>● <b>starting</b>: The cluster is being started.</li><li>● <b>running</b>: The cluster is running.</li><li>● <b>terminated</b>: The cluster has been terminated.</li><li>● <b>failed</b>: The cluster fails.</li><li>● <b>abnormal</b>: The cluster is abnormal.</li><li>● <b>terminating</b>: The cluster is being terminated.</li><li>● <b>frozen</b>: The cluster has been frozen.</li><li>● <b>scaling-out</b>: The cluster is being scaled out.</li><li>● <b>scaling-in</b>: The cluster is being scaled in.</li></ul> |
| createAt              | String | Cluster creation time, which is a 10-bit timestamp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| updateAt              | String | Cluster update time, which is a 10-bit timestamp                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Parameter                  | Type    | Description                                                                                                                                                      |
|----------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GroupName                  | String  | Node group name.                                                                                                                                                 |
| NodeNum                    | Integer | Number of nodes. The value ranges from 0 to 500. The minimum number of Master and Core nodes is 1 and the total number of Core and Task nodes cannot exceed 500. |
| NodeSize                   | String  | Instance specifications of a node.                                                                                                                               |
| NodeSpecId                 | String  | Instance specification ID of a node                                                                                                                              |
| NodeProductId              | String  | Instance product ID of a node                                                                                                                                    |
| VmProductId                | String  | VM product ID of a node                                                                                                                                          |
| VmSpecCode                 | String  | VM specifications of a node                                                                                                                                      |
| RootVolumeSize             | Integer | System disk size of a node. This parameter is not configurable and its default value is <b>40 GB</b> .                                                           |
| RootVolumeProductId        | String  | System disk product ID of a node                                                                                                                                 |
| RootVolumeType             | String  | System disk type of a node                                                                                                                                       |
| RootVolumeResourceSpecCode | String  | System disk product specifications of a node                                                                                                                     |
| RootVolumeResourceType     | String  | System disk product type of a node                                                                                                                               |

| Parameter                  | Type    | Description                                                                                                                                                                                             |
|----------------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DataVolumeType             | String  | Data disk storage type of a node. Currently, SATA, SAS, and SSD are supported. <ul style="list-style-type: none"><li>● SATA: Common I/O</li><li>● SAS: High I/O</li><li>● SSD: Ultra-high I/O</li></ul> |
| DataVolumeCount            | Integer | Number of data disks of a node.                                                                                                                                                                         |
| DataVolumeSize             | Integer | Data disk storage space of a node.                                                                                                                                                                      |
| DataVolumeProductld        | String  | Data disk product ID of a node                                                                                                                                                                          |
| DataVolumeResourceSpecCode | String  | Data disk product specifications of a node                                                                                                                                                              |
| DataVolumeResourceType     | String  | Data disk product type of a node                                                                                                                                                                        |

**Table 6-38** bootstrapscripts parameters

| Parameter | Type   | Description                                                                                                                                                                                                                            |
|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | String | Name of a bootstrap action script. It must be unique in a cluster.<br>The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and cannot start with a space.<br>The value can contain 1 to 64 characters. |

| Parameter              | Type         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uri                    | String       | <p>Path of the shell script. Set this parameter to an OBS bucket path or a local VM path.</p> <ul style="list-style-type: none"><li>• OBS bucket path: Enter a script path manually. For example, enter the path of the public sample script provided by MRS. Example: <b>s3a://bootstrap/presto/presto-install.sh</b>. If <b>dualroles</b> is installed, the parameter of the <b>presto-install.sh</b> script is <b>dualroles</b>. If <b>worker</b> is installed, the parameter of the <b>presto-install.sh</b> script is <b>worker</b>. Based on the Presto usage habit, you are advised to install <b>dualroles</b> on the active Master nodes and <b>worker</b> on the Core nodes.</li><li>• Local VM path: Enter a script path. The script path must start with a slash (/) and end with .sh.</li></ul> |
| parameters             | String       | Bootstrap action script parameters                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| nodes                  | Array String | Type of a node where the bootstrap action script is executed. The value can be Master, Core, or Task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| active_master          | Boolean      | Whether the bootstrap action script runs only on active Master nodes. The default value is <b>false</b> , indicating that the bootstrap action script can run on all Master nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| before_component_start | Boolean      | Time when the bootstrap action script is executed. Currently, the following two options are available: <b>Before component start</b> and <b>After component start</b> . The default value is <b>false</b> , indicating that the bootstrap action script is executed after the component is started.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter     | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Status Codes

[Table 6-39](#) describes the status code.

**Table 6-39** Status code

| Status Code | Description                        |
|-------------|------------------------------------|
| 200         | Cluster details have been queried. |

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

### 6.1.5 Querying a Host List

#### Function

This API is used to query a host list of a specified cluster.

## URI

- Format  
GET /v1.1/{project\_id}/clusters/{cluster\_id}/hosts
- Parameter description

**Table 6-40** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                       |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .          |
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the value, see <a href="#">Obtaining the MRS Cluster Information</a> . |

## Request Parameters

**Table 6-41** Request parameters

| Parameter   | Mandatory | Type    | Description                                                                                                     |
|-------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------|
| pageSize    | No        | Integer | Maximum number of clusters displayed on a page<br>Value range: [1-2147483646]. The default value is <b>10</b> . |
| currentPage | No        | Integer | Current page number The default value is <b>1</b> .                                                             |

## Response Parameters

**Table 6-42** Response parameters

| Parameter | Type    | Description                                                      |
|-----------|---------|------------------------------------------------------------------|
| total     | Integer | Total number of hosts in a list                                  |
| hosts     | Array   | Host parameters<br>For details, see <a href="#">Table 6-43</a> . |

**Table 6-43** Hosts parameters

| Parameter            | Type                      | Description                                                             |
|----------------------|---------------------------|-------------------------------------------------------------------------|
| id                   | String                    | VM ID                                                                   |
| ip                   | String                    | VM IP address                                                           |
| availability_zone_id | String                    | The AZ.                                                                 |
| tags                 | Array of TagPlain objects | The tag list. For details, see <a href="#">Table 6-44</a> .             |
| flavor               | String                    | VM flavor ID                                                            |
| type                 | String                    | VM type<br>Currently, MasterNode, CoreNode, and TaskNode are supported. |
| name                 | String                    | VM name                                                                 |
| status               | String                    | Current VM state                                                        |
| mem                  | String                    | Memory                                                                  |
| cpu                  | String                    | Number of CPU cores                                                     |
| root_volume_size     | String                    | OS disk capacity                                                        |
| data_volume_type     | String                    | Data disk type                                                          |
| data_volume_size     | Integer                   | Data disk capacity                                                      |
| data_volume_count    | Integer                   | Number of data disks                                                    |

**Table 6-44** TagPlain parameters

| Parameter | Type   | Description                                                                                      |
|-----------|--------|--------------------------------------------------------------------------------------------------|
| key       | String | The tag key. A tag key cannot contain special characters (=*<>\, /) or start or end with spaces. |
| value     | String | The value. A tag value cannot contain special characters (=*<>\, /) or start or end with spaces. |

## Status Codes

[Table 6-45](#) describes the status code.

**Table 6-45** Status code

| Status Code | Description                                 |
|-------------|---------------------------------------------|
| 200         | The host list information has been queried. |

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.1.6 Terminating a Cluster

### Function

This API is used to terminate a cluster after data processing and analysis are complete or the cluster is abnormal. This API is compatible with Sahara.

Clusters in any of the following states cannot be terminated:

- scaling-out
- scaling-in
- starting
- terminating
- terminated
- failed

### URI

- Format  
`DELETE /v1.1/{project_id}/clusters/{cluster_id}`
- Parameter description

**Table 6-46** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                            |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .               |
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the cluster ID, see <a href="#">Obtaining the MRS Cluster Information</a> . |

## Request Parameters

None

## Response Parameters

None

## Example

- Example request  
`DELETE /v1.1/{project_id}/clusters/{cluster_id}`
- Example response  
None

## Status Codes

[Table 6-47](#) describes the status codes.

**Table 6-47** Status codes

| Status Code | Description                      |
|-------------|----------------------------------|
| 200         | The request is executed.         |
| 204         | The cluster has been terminated. |

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.2 Job Object APIs

## 6.3 Job Execution Object APIs

## 6.4 Auto Scaling APIs

### 6.4.1 Configuring an Auto Scaling Rule

#### Function

This API is used to configure auto scaling rules.

The API used for cluster creation and job execution can also be used to create an auto scaling rule.

#### URI

- Format  
POST /v1.1/{project\_id}/autoscaling-policy/{cluster\_id}
- Parameter description

**Table 6-48** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                            |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .               |
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the cluster ID, see <a href="#">Obtaining the MRS Cluster Information</a> . |

#### Request Parameters

**Table 6-49** Request body parameters

| Parameter  | Mandatory | Type   | Description                                                                                                                                                                   |
|------------|-----------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| node_group | Yes       | String | Type of the node to which an auto scaling rule applies. Currently, only Task nodes support auto scaling rules, that is, the request value is <b>task_node_default_group</b> . |

| Parameter           | Mandatory | Type                     | Description                                                                     |
|---------------------|-----------|--------------------------|---------------------------------------------------------------------------------|
| auto_scaling_policy | Yes       | AutoScalingPolicy object | The auto scaling policy. <a href="#">Table 6-50</a> describes these parameters. |

**Table 6-50** AutoScalingPolicy object parameters

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                           |
|---------------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| auto_scaling_enable | Yes       | Boolean | Whether to enable the auto scaling rule.                                                                                                                                                                                              |
| min_capacity        | Yes       | Integer | Minimum number of nodes left in the node group.<br>Value range: 0 to 500                                                                                                                                                              |
| max_capacity        | Yes       | Integer | Maximum number of nodes in the node group.<br>Value range: 0 to 500                                                                                                                                                                   |
| resources_plans     | No        | List    | Resource plan list. For details, see <a href="#">Table 6-51</a> . If this parameter is left blank, the resource plan is disabled.<br>When auto scaling is enabled, either a resource plan or an auto scaling rule must be configured. |
| exec_scripts        | No        | List    | List of custom scaling automation scripts. For details, see <a href="#">Table 6-52</a> . If this parameter is left blank, a hook script is disabled.                                                                                  |
| rules               | No        | List    | List of auto scaling rules. For details, see <a href="#">Table 6-53</a> .<br>When auto scaling is enabled, either a resource plan or an auto scaling rule must be configured.                                                         |

**Table 6-51** resources\_plan parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                                                                                         |
|--------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| period_type  | Yes       | String  | Cycle type of a resource plan. Currently, only the following cycle type is supported:<br>daily                                                                                                      |
| start_time   | Yes       | String  | Start time of a resource plan. The value is in the format of <b>hour:minute</b> , indicating that the time ranges from 0:00 to 23:59.                                                               |
| end_time     | Yes       | String  | End time of a resource plan. The value is in the same format as that of <b>start_time</b> . The interval between <b>end_time</b> and <b>start_time</b> must be greater than or equal to 30 minutes. |
| min_capacity | Yes       | Integer | Minimum number of the preserved nodes in a node group in a resource plan.<br>Value range: 0 to 500                                                                                                  |
| max_capacity | Yes       | Integer | Maximum number of the preserved nodes in a node group in a resource plan.<br>Value range: 0 to 500                                                                                                  |

**Table 6-52** exec\_script parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                            |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name      | Yes       | String | Name of a custom automation script. It must be unique in a same cluster.<br><br>The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space.<br><br>The value can contain 1 to 64 characters. |

| Parameter  | Mandatory | Type             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|-----------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| uri        | Yes       | String           | <p>Path of a custom automation script. Set this parameter to an OBS bucket path or a local VM path.</p> <ul style="list-style-type: none"> <li>• OBS bucket path: Enter a script path manually, for example, <code>s3a://XXX/scale.sh</code>.</li> <li>• Local VM path: Enter a script path. The script path must start with a slash (/) and end with <code>.sh</code>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| parameters | No        | String           | <p>Parameters of a custom automation script.</p> <ul style="list-style-type: none"> <li>• Multiple parameters are separated by space.</li> <li>• The following predefined system parameters can be transferred: <ul style="list-style-type: none"> <li>- <code> \${mrs_scale_node_num}</code>: Number of the nodes to be added or removed</li> <li>- <code> \${mrs_scale_type}</code>: Scaling type. The value can be <code>scale_out</code> or <code>scale_in</code>.</li> <li>- <code> \${mrs_scale_node_hostnames}</code>: Host names of the nodes to be added or removed</li> <li>- <code> \${mrs_scale_node_ip}</code>: IP addresses of the nodes to be added or removed</li> <li>- <code> \${mrs_scale_rule_name}</code>: Name of the rule that triggers auto scaling</li> </ul> </li> <li>• Other user-defined parameters are used in the same way as those of common shell scripts. Parameters are separated by space.</li> </ul> |
| nodes      | Yes       | Array of strings | Type of a node where the custom automation script is executed. The node type can be Master, Core, or Task.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Parameter     | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---------------|-----------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| active_master | No        | Boolean | <p>Whether the custom automation script runs only on the active Master node.</p> <p>The default value is <b>false</b>, indicating that the custom automation script can run on all Master nodes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| action_stage  | Yes       | String  | <p>Time when a script is executed.</p> <p>The following four options are supported:</p> <ul style="list-style-type: none"><li>• <b>before_scale_out</b>: before scale-out</li><li>• <b>before_scale_in</b>: before scale-in</li><li>• <b>after_scale_out</b>: after scale-out</li><li>• <b>after_scale_in</b>: after scale-in</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| fail_action   | Yes       | String  | <p>Whether to continue to execute subsequent scripts and create a cluster after the custom automation script fails to be executed.</p> <ul style="list-style-type: none"><li>• <b>continue</b>: Continue to execute subsequent scripts.</li><li>• <b>errorout</b>: Stop the action.</li></ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"><li>• You are advised to set this parameter to <b>continue</b> in the commissioning phase so that the cluster can continue to be installed and started no matter whether the custom automation script is executed successfully.</li><li>• The scale-in operation cannot be undone. Therefore, <b>fail_action</b> must be set to <b>continue</b> for the scripts that are executed after scale-in.</li></ul> |

**Table 6-53** rules parameters

| Parameter          | Mandatory | Type           | Description                                                                                                                                                                                            |
|--------------------|-----------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| name               | Yes       | String         | Name of an auto scaling rule.<br>A cluster name can contain only 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.<br>Rule names must be unique in a node group. |
| description        | No        | String         | Description about an auto scaling rule.<br>It contains a maximum of 1,024 characters.                                                                                                                  |
| adjustment_type    | Yes       | String         | Auto scaling rule adjustment type.<br>Possible values: <ul style="list-style-type: none"><li>• <b>scale_out</b>: cluster scale-out</li><li>• <b>scale_in</b>: cluster scale-in</li></ul>               |
| cool_down_minutes  | Yes       | Integer        | Cluster cooling time after an auto scaling rule is triggered, when no auto scaling operation is performed. The unit is minute.<br>Value range: 0 to 10,080. One week is equal to 10,080 minutes.       |
| scaling_adjustment | Yes       | Integer        | Number of nodes that can be adjusted once.<br>Value range: 1 to 100                                                                                                                                    |
| trigger            | Yes       | Trigger object | Condition for triggering a rule. For details, see <a href="#">Table 6-54</a> .                                                                                                                         |

**Table 6-54** trigger parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                            |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| metric_name | Yes       | String | Metric name.<br>This triggering condition makes a judgment according to the value of the metric.<br>A metric name contains a maximum of 64 characters. |

| Parameter           | Mandatory | Type    | Description                                                                                                                                                                                                                                               |
|---------------------|-----------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| metric_value        | Yes       | String  | Metric threshold to trigger a rule<br>The parameter value can be an integer or number with two decimal places only.                                                                                                                                       |
| comparison_operator | No        | String  | Metric judgment logic operator.<br>Possible values: <ul style="list-style-type: none"><li>• <b>LT</b>: less than</li><li>• <b>GT</b>: greater than</li><li>• <b>LTOE</b>: less than or equal to</li><li>• <b>GTOE</b>: greater than or equal to</li></ul> |
| evaluation_periods  | Yes       | Integer | Number of consecutive five-minute periods, during which a metric threshold is reached<br>Value range: 1 to 288                                                                                                                                            |

## Response Parameters

Table 6-55 Response parameter

| Parameter | Type   | Description                                                                                                |
|-----------|--------|------------------------------------------------------------------------------------------------------------|
| result    | String | Operation result <ul style="list-style-type: none"><li>• succeeded: The operation is successful.</li></ul> |

## Example

- Example request

```
{
 "node_group": "task_node_default_group",

 }
 }
]
}
```

#### NOTE

A new auto scaling rule will overwrite the auto scaling rule saved in the original database. If you want to modify the original rule, query the original rule first, modify the rule, and submit a modification task. For details, see [Querying Cluster Details](#).

- Example response

```
{ "result": "succeeded" }
```

## Status Codes

[Table 6-56](#) describes the status code.

**Table 6-56** Status code

| Status Code | Description                   |
|-------------|-------------------------------|
| 200         | The cluster has been created. |

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.5 Tag Management APIs

### 6.5.1 Adding Tags to a Specified Cluster

#### Function

This API is used to add tags to a specified cluster.

A cluster has a maximum of 10 tags. This API is idempotent. If a tag to be created has the same key as an existing tag, the tag will overwrite the existing one.

#### URI

- Format  
POST /v1.1/{project\_id}/clusters/{cluster\_id}/tags
- Parameter description

**Table 6-57** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                            |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .               |
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the cluster ID, see <a href="#">Obtaining the MRS Cluster Information</a> . |

## Request Parameters

**Table 6-58** Request body parameter

| Parameter | Mandatory | Type                       | Description      |
|-----------|-----------|----------------------------|------------------|
| tag       | Yes       | <a href="#">Tag</a> object | The cluster tag. |

**Table 6-59** tags parameters

| Parameter | Mandatory | Type   | Description |
|-----------|-----------|--------|-------------|
| key       | Yes       | String | Key.        |
| value     | Yes       | String | Tag value.  |

## Response Parameters

None

## Example

- Example request

```
{
 "tag":
 {
 "key": "DEV",
 "value": "DEV1"
 }
}
```

- Example response

None

## Status Codes

[Table 6-60](#) describes the status code.

**Table 6-60** Status code

| Status Code | Description                  |
|-------------|------------------------------|
| 204         | The operation is successful. |

## Error Codes

See [Error Codes](#).

## 6.5.2 Querying Tags of a Specified Cluster

### Function

This API is used to query tags of a specified cluster.

### URI

- Format  
GET /v1.1/{project\_id}/clusters/{cluster\_id}/tags
- Parameter description

**Table 6-61** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                            |
|------------|-----------|--------|------------------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .               |
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the cluster ID, see <a href="#">Obtaining the MRS Cluster Information</a> . |

### Request Parameters

None

### Response Parameters

**Table 6-62** Response parameter

| Parameter | Type                      | Description                                             |
|-----------|---------------------------|---------------------------------------------------------|
| tags      | Array of TagPlain objects | Tag list. For details, see <a href="#">Table 6-63</a> . |

**Table 6-63** TagPlain parameters

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Tag value.  |

## Example

- Example request  
GET /v1.1/{project\_id}/clusters/{cluster\_id}/tags

- Example response

```
{
 "tags": [
 {
 "key": "key1",
 "value": "value1"
 },
 {
 "key": "key2",
 "value": "value3"
 }
]
}
```

## Status Codes

[Table 6-64](#) describes the status code.

**Table 6-64** Status code

| Status Code | Description                  |
|-------------|------------------------------|
| 200         | The operation is successful. |

## Error Codes

See [Error Codes](#).

### 6.5.3 Deleting Tags from a Specified Cluster

#### Function

This API is used to delete tags from a specified cluster.

#### URI

- Format  
DELETE /v1.1/{project\_id}/clusters/{cluster\_id}/tags/{key}
- Parameter description

**Table 6-65** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                              |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                             |
|------------|-----------|--------|---------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |
| key        | Yes       | String | The tag key.                                                                                            |

## Request Parameters

### Request parameters

None

## Response Parameters

### Response parameters

None

## Example

- Example request  
`DELETE /v1.1/{project_id}/clusters/{cluster_id}/tags/{key}`
- Example response  
None

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.5.4 Adding Tags to a Cluster in Batches

### Function

This API is used to add tags to a specified cluster in batches.

A cluster can have a maximum of 10 tags.

This API is idempotent. If a tag to be created has the same key as an existing tag in a cluster, the tag will overwrite the existing one.

### URI

`POST /v1.1/{project_id}/clusters/{cluster_id}/tags/action`

**Table 6-66** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                              |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| cluster_id | Yes       | String | Cluster ID For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> .  |

## Request Parameters

**Table 6-67** Request parameters

| Parameter | Mandatory | Type                 | Description                                                                             |
|-----------|-----------|----------------------|-----------------------------------------------------------------------------------------|
| action    | Yes       | String               | Operation to be performed. The value can be set to <b>create</b> or <b>delete</b> only. |
| tags      | Yes       | Array of tag objects | Tag list. For details about the parameter, see <a href="#">Table 6-68</a> .             |

**Table 6-68** tags parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                      |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | The tag key. <ul style="list-style-type: none"><li>• It contains a maximum of 36 Unicode characters and cannot be an empty string.</li><li>• The tag key of a resource must be unique.</li></ul> |
| value     | Yes       | String | The value. <ul style="list-style-type: none"><li>• The value contains a maximum of 43 Unicode characters and can be an empty string.</li></ul>                                                   |

## Response Parameters

None

## Example Request

Add tags to a cluster in batches.

```
POST /v1.1/{project_id}/clusters/{cluster_id}/tags/action

{
 "action" : "create",
 "tags" : [{
 "key" : "DEV1",
 "value" : "DEV1"
 }, {
 "key" : "DEV2",
 "value" : "DEV2"
 }]
}
```

## Example Response

None

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.5.5 Deleting Tags from a Cluster in Batches

### Function

This API is used to delete tags from a specified cluster in batches.

A cluster can have a maximum of 10 tags.

This API is idempotent.

- When tags are being deleted and some tags do not exist, the operation is considered to be successful by default. The character set of the tags will not be checked. A key and a value can respectively contain up to 36 and 43 Unicode characters. The tags structure cannot be missing. The key cannot be empty or an empty string.

### URI

```
POST /v1.1/{project_id}/clusters/{cluster_id}/tags/action
```

**Table 6-69** URI parameters

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| cluster_id | Yes       | String | The cluster ID. For details about how to obtain the cluster ID, see <a href="#">Obtaining a Cluster ID</a> . |

## Request Parameters

**Table 6-70** Request parameters

| Parameter | Mandatory | Type                 | Description                                                                      |
|-----------|-----------|----------------------|----------------------------------------------------------------------------------|
| action    | Yes       | String               | Operation to be performed. The value can be <b>create</b> or <b>delete</b> only. |
| tags      | Yes       | Array of tag objects | The tag list. For details about the parameter, see <a href="#">Table 6-71</a> .  |

**Table 6-71** tags parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                      |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| key       | Yes       | String | The tag key. <ul style="list-style-type: none"><li>• It contains a maximum of 36 Unicode characters and cannot be an empty string.</li><li>• The tag key of a resource must be unique.</li></ul> |
| value     | Yes       | String | The value. <ul style="list-style-type: none"><li>• The value contains a maximum of 43 Unicode characters and can be an empty string.</li></ul>                                                   |

## Response Parameters

None

## Example Request

Delete tags from a cluster in batches.

```
POST /v1.1/{project_id}/clusters/{cluster_id}/tags/action
```

```
{
```

```
"action" : "delete",
"tags" : [{
 "tag" : null,
 "key" : "DEV1",
 "value" : "DEV1"
}, {
 "tag" : null,
 "key" : "DEV2",
 "value" : "DEV2"
}],
"x-request-examples-text-1" : "{\n \"action\":\"create\",\n \"tags\":[\n {\n \"key\":\"DEV1\",\n \"value\":\"DEV1\"\n }, {\n \"key\":\"DEV2\",\n \"value\":\"DEV2\"\n }\n]\n}"
```

## Example Response

None

## Status Codes

## 6.5.6 Querying All Tags

### Function

This API is used to query all tags of a specified region.

### URI

- Format  
GET /v1.1/{project\_id}/clusters/tags
- Parameter description

**Table 6-72** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                              |
|------------|-----------|--------|----------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

### Request Parameters

#### Request parameters

None

## Response Parameters

**Table 6-73** Response parameter

| Parameter | Type                               | Description                                             |
|-----------|------------------------------------|---------------------------------------------------------|
| tags      | Array of TagWithMultiValue objects | Tag list. For details, see <a href="#">Table 6-74</a> . |

**Table 6-74** tags parameters

| Parameter | Type             | Description |
|-----------|------------------|-------------|
| key       | String           | Tag key.    |
| value     | Array of strings | Tag value.  |

## Example

- Example request  
GET https://{endpoint}/v1.1/{project\_id}/clusters/tags

- Example response

```
{
 "tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 },
 {
 "key": "key2",
 "values": [
 "value1",
 "value2"
]
 }
]
}
```

## Status Codes

See [Status Codes](#).

## Error Codes

See [Error Codes](#).

## 6.5.7 Querying a List of Clusters with Specified Tags

### Function

This API is used to filter clusters by tag.

By default, clusters and tags are sorted in descending order of creation time.

## URI

- Format  
POST /v1.1/{project\_id}/clusters/resource\_instances/action
- Parameter description

**Table 6-75** URI parameter

| Parameter  | Mandatory | Type   | Description                                                                                                  |
|------------|-----------|--------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | String | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

**Table 6-76** Request parameters

| Parameter | Mandatory | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tags      | No        | Array of TagWith MultiValue objects | The return result contains resources corresponding to all tags in this parameter. This parameter contains a maximum of 10 keys, and each key contains a maximum of 10 values. The structure body cannot be missing, and the key cannot be left blank or set to an empty string. For details about the parameters, see <a href="#">Table 6-77</a> .                                                        |
| tags_any  | No        | Array of TagWith MultiValue objects | The return result contains resources corresponding to any tag in this parameter. This parameter contains a maximum of 10 keys, and each key contains a maximum of 10 values. The structure body cannot be missing, and the key cannot be left blank or set to an empty string. Keys must be unique and values of a key must be unique. For details about the parameters, see <a href="#">Table 6-77</a> . |

| Parameter    | Mandatory | Type                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------|-----------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| not_tags     | No        | Array of TagWith MultiValue objects | The return result does not contain resources corresponding to all tags in this parameter. This parameter contains a maximum of 10 keys, and each key contains a maximum of 10 values. The structure body cannot be missing, and the key cannot be left blank or set to an empty string. Keys must be unique and values of a key must be unique.                                                                                                                                                                                                                     |
| not_tags_any | No        | Array of TagWith MultiValue objects | The return result does not contain resources corresponding to any tag in this parameter. This parameter contains a maximum of 10 keys, and each key contains a maximum of 10 values. The structure body cannot be missing, and the key cannot be left blank or set to an empty string. Keys must be unique and values of a key must be unique. For details about the parameters, see <a href="#">Table 6-77</a> .                                                                                                                                                   |
| limit        | No        | Integer                             | Number of records. This parameter is not available when <b>action</b> is set to <b>count</b> . The default value is <b>1000</b> when <b>action</b> is set to <b>filter</b> . The maximum value is <b>1000</b> , and the minimum value is <b>1</b> . The value cannot be a negative number.                                                                                                                                                                                                                                                                          |
| offset       | No        | Integer                             | Index position. The query starts from the next piece of data specified by the <b>offset</b> parameter. This parameter is not required when you query data on the first page. The value in the response body returned for querying data on the previous page will be included in this parameter for querying data on subsequent pages. This parameter is not available when <b>action</b> is set to <b>count</b> . If <b>action</b> is set to <b>filter</b> , the value must be a number, and the default value is <b>0</b> . The value cannot be a negative number. |

| Parameter | Mandatory | Type                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|-----------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| action    | Yes       | String                 | Operation to be performed. The value can be <b>filter</b> or <b>count</b> .<br>The value <b>filter</b> indicates pagination query. The value <b>count</b> indicates that the total number of query results meeting the search criteria will be returned.                                                                                                                                                                                                           |
| matches   | No        | Array of Match objects | Search field. <b>key</b> indicates the field to be matched, for example, <b>resource_name.value</b> indicates the matched value. This field is a fixed dictionary value.<br>Determine whether fuzzy match is required based on different fields. For example, if <b>key</b> is <b>resource_name</b> , fuzzy search is used by default. If <b>value</b> is an empty string, exact match is used. For details about the parameters, see <a href="#">Table 6-78</a> . |

**Table 6-77** tag parameters

| Parameter | Mandatory | Type             | Description                                                                                              |
|-----------|-----------|------------------|----------------------------------------------------------------------------------------------------------|
| key       | Yes       | String           | Key. A tag key cannot contain special characters (=*<>\, /) or start or end with spaces.                 |
| values    | No        | Array of strings | List of values.<br>A tag value cannot contain special characters (=*<>\, /) or start or end with spaces. |

**Table 6-78** match parameters

| Parameter | Mandatory | Type   | Description                                                                                                              |
|-----------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------|
| key       | No        | String | Key. Currently, only <b>resource_name</b> is available, indicating the cluster name. Other keys will be supported later. |

| Parameter | Mandatory | Type   | Description                                                 |
|-----------|-----------|--------|-------------------------------------------------------------|
| value     | No        | String | Value. A value contains a maximum of 64 Unicode characters. |

## Response

**Table 6-79** Response parameters

| Parameter   | Type                         | Description                                                     |
|-------------|------------------------------|-----------------------------------------------------------------|
| resources   | Array of MRSResource objects | Resource details. For details, see <a href="#">Table 6-80</a> . |
| total_count | Integer                      | Total number of resources.                                      |

**Table 6-80** resources parameters

| Parameter       | Type                      | Description                                             |
|-----------------|---------------------------|---------------------------------------------------------|
| resource_detail | String                    | Resource details.                                       |
| resource_id     | String                    | Resource ID.                                            |
| resource_name   | String                    | Resource name.                                          |
| tags            | Array of TagPlain objects | Tag list. For details, see <a href="#">Table 6-81</a> . |

**Table 6-81** tags parameters

| Parameter | Type   | Description |
|-----------|--------|-------------|
| key       | String | Key.        |
| value     | String | Tag value.  |

## Example

- Example request

Request body when **action** is set to **filter**

```
{
 "offset": "100",
 "limit": "100",
 "action": "filter",
}
```

```
"matches": [
 {
 "key": "resource_name",
 "value": "clusterA"
 }
],
"not_tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
],
"tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
],
"tags_any": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
],
"not_tags_any": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
]
```

#### Request body when **action** is set to **count**

```
{
 "action": "count",
 "not_tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
],
 "tags": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 },
 {
 "key": "key2",
 "values": [
 "value1",
 "value2"
]
 }
]
}
```

```
 }
],
 "tags_any": [
 {
 "key": "key1",
 "values": [
 "value1",
 "value2"
]
 }
],
 "not_tags_any": [
 {
 "key": "key1",
 "values": [
 "value1",

# 7 Out-of-Date APIs

## 7.1 Job API Management (Deprecated)

### 7.1.1 Adding and Executing a Job (Deprecated)

#### Function

This API is used to add a job to an MRS cluster and execute the job. This API is incompatible with Sahara.

#### URI

- Format  
POST /v1.1/{project\_id}/jobs/submit-job
- Parameter description

**Table 7-1** URI parameter

| Parameter  | Mandatory | Description                                                                                                  |
|------------|-----------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

**Table 7-2 Request parameters**

| Parameter  | Mandatory | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_type   | Yes       | Integer | <p>Job type code</p> <ul style="list-style-type: none"><li>• 1: MapReduce</li><li>• 2: Spark</li><li>• 3: Hive Script</li><li>• 4: HiveQL (not supported currently)</li><li>• 5: DistCp, importing and exporting data. For details, see <a href="#">Table 7-3</a>.</li><li>• 6: Spark Script</li><li>• 7: Spark SQL, submitting Spark SQL statements. For details, see <a href="#">Table 7-4</a>. (Not supported in this API currently.)</li></ul> <p><b>NOTE</b><br/>Spark and Hive jobs can be added to only clusters that include Spark and Hive components.</p> |
| job_name   | Yes       | String  | <p>Job name</p> <p>Contains only 1 to 64 letters, digits, hyphens (-), and underscores (_).</p> <p><b>NOTE</b><br/>Identical job names are allowed but not recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                         |
| cluster_id | Yes       | String  | Cluster ID                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------|-----------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| jar_path  | Yes       | String | <p>Path of the JAR or SQL file for program execution</p> <p>The parameter must meet the following requirements:</p> <ul style="list-style-type: none"> <li>• Contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;&lt;\$. The address cannot be empty or full of spaces.</li> <li>• Starts with / or <b>s3a://</b>. The OBS path does not support files or programs encrypted by KMS.</li> <li>• Spark Script must end with <b>.sql</b> while MapReduce and Spark Jar must end with <b>.jar.sql</b> and <b>jar</b> are case-insensitive.</li> </ul>                                                                                                                                                                                           |
| arguments | No        | String | <p>Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter.</p> <p>The parameter contains a maximum of 2,047 characters, excluding special characters such as ; &amp;&gt;&lt;\$, and can be left blank.</p> <p><b>NOTE</b><br/> When entering a parameter containing sensitive information (for example, login password), you can add an at sign (@) before the parameter name to encrypt the parameter value. This prevents the sensitive information from being persisted in plaintext. Therefore, when you view job information on the MRS, sensitive information will be displayed as asterisks (*).<br/> For example, <code>username=admin @password=admin_123</code>.</p> |

| Parameter        | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| input            | No        | String | <p>Path for inputting data, which must start with / or <b>s3a://</b>. Set this parameter to a correct OBS path. The OBS path does not support files or programs encrypted by KMS.</p> <p>The parameter contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;'&lt;\$, and can be left blank.</p>                                                                                                                                                                                                            |
| output           | No        | String | <p>Path for outputting data, which must start with / or <b>s3a://</b>. A correct OBS path is required. If the path does not exist, the system automatically creates it.</p> <p>The parameter contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;'&lt;\$, and can be left blank.</p>                                                                                                                                                                                                                      |
| job_log          | No        | String | <p>Path for storing job logs that record job running status. The path must start with / or <b>s3a://</b>. A correct OBS path is required.</p> <p>The parameter contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;'&lt;\$, and can be left blank.</p>                                                                                                                                                                                                                                                    |
| hive_script_path | Yes       | String | <p>SQL program path</p> <p>This parameter is needed by Spark Script and Hive Script jobs only, and must meet the following requirements:</p> <ul style="list-style-type: none"><li>• Contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;'&lt;\$. The address cannot be empty or full of spaces.</li><li>• The path must start with / or <b>s3a://</b>. The OBS path does not support files or programs encrypted by KMS.</li><li>• The path must end with <b>.sql.sql</b> is case-insensitive.</li></ul> |

**Table 7-3** DistCp parameters

| Parameter   | Mandatory | Type   | Description                                                                                                                                                                                                                                                  |
|-------------|-----------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_name    | Yes       | String | <p>Job name<br/>Contains only 1 to 64 letters, digits, hyphens (-), and underscores (_).</p> <p><b>NOTE</b><br/>Identical job names are allowed but not recommended.</p>                                                                                     |
| input       | No        | String | <p>Data source path</p> <ul style="list-style-type: none"><li>When you import data, the parameter is set to an OBS path. Files or programs encrypted by KMS are not supported.</li><li>When you export data, the parameter is set to an HDFS path.</li></ul> |
| output      | No        | String | <p>Data receiving path</p> <ul style="list-style-type: none"><li>When you import data, the parameter is set to an HDFS path.</li><li>When you export data, the parameter is set to an OBS path.</li></ul>                                                    |
| file_action | Yes       | String | Types of file operations, including: <ul style="list-style-type: none"><li>export: Export data from HDFS to OBS.</li><li>import: Import data from OBS to HDFS.</li></ul>                                                                                     |

**Table 7-4** Spark SQL parameters

| Parameter | Mandatory | Type   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|-----------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hql       | Yes       | String | <p>Spark SQL statement, which needs Base64 encoding and decoding.</p> <p><b>ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789+/-</b> is a standard encoding table. MRS uses <b>ABCDEFGHIJKLMNPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789+/-</b> for Base64 encoding. The value of the <b>hql</b> parameter is generated by adding any letter to the beginning of the encoded character string. The Spark SQL statement is generated by decoding the value in the background.</p> <p>Example:</p> <ol style="list-style-type: none"><li>1. Obtain the Base64 encoding tool.</li><li>2. Enter the <b>show tables;</b> Spark SQL statement in the encoding tool to perform Base64 encoding.</li><li>3. Obtain the encoded character string <b>c2hvdyB0YWLSZXM7.</b></li><li>4. At the beginning of <b>c2hvdyB0YWLSZXM7</b>, add any letter, for example, <b>g</b>. Then, the character string becomes <b>gc2hvdyB0YWLSZXM7</b>, that is, the value of the <b>hql</b> parameter.</li></ol> |
| job_name  | Yes       | String | <p>Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p><b>NOTE</b><br/>Identical job names are allowed but not recommended.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Response Parameters

**Table 7-5** Response parameter

| Parameter     | Type   | Description                                               |
|---------------|--------|-----------------------------------------------------------|
| job_execution | Object | Job details. For details, see <a href="#">Table 7-6</a> . |

**Table 7-6** job\_execution parameters

| Parameter     | Type    | Description                                                                                                                                              |
|---------------|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| templated     | Bool    | Whether job execution objects are generated by job templates.                                                                                            |
| created_at    | Integer | Creation time, which is a 10-bit timestamp.                                                                                                              |
| updated_at    | Integer | Update time, which is a 10-bit timestamp.                                                                                                                |
| id            | String  | Job ID                                                                                                                                                   |
| tenant_id     | String  | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .                                                 |
| job_id        | String  | Job application ID                                                                                                                                       |
| job_name      | String  | Job name                                                                                                                                                 |
| input_id      | String  | Data input ID                                                                                                                                            |
| output_id     | String  | Data output ID                                                                                                                                           |
| start_time    | Integer | Start time of job execution, which is a 10-bit timestamp.                                                                                                |
| end_time      | Integer | End time of job execution, which is a 10-bit timestamp.                                                                                                  |
| cluster_id    | String  | Cluster ID                                                                                                                                               |
| engine_job_id | String  | Workflow ID of Oozie                                                                                                                                     |
| return_code   | Integer | Returned code for an execution result                                                                                                                    |
| is_public     | Bool    | Whether a job is public<br><ul style="list-style-type: none"> <li>● true</li> <li>● false</li> </ul> The current version does not support this function. |

| Parameter    | Type    | Description                                                                                                                                                                                                                                                                              |
|--------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| is_protected | Bool    | <p>Whether a job is protected</p> <ul style="list-style-type: none"><li>● true</li><li>● false</li></ul> <p>The current version does not support this function.</p>                                                                                                                      |
| group_id     | String  | Group ID of a job                                                                                                                                                                                                                                                                        |
| jar_path     | String  | Path of the <b>.jar</b> file for program execution                                                                                                                                                                                                                                       |
| input        | String  | Address for inputting data                                                                                                                                                                                                                                                               |
| output       | String  | Address for outputting data                                                                                                                                                                                                                                                              |
| job_log      | String  | Address for storing job logs                                                                                                                                                                                                                                                             |
| job_type     | Integer | <p>Job type code</p> <ul style="list-style-type: none"><li>● 1: MapReduce</li><li>● 2: Spark</li><li>● 3: Hive Script</li><li>● 4: HiveQL (not supported currently)</li><li>● 5: DistCp</li><li>● 6: Spark Script</li><li>● 7: Spark SQL (not supported in this API currently)</li></ul> |
| file_action  | String  | Data import and export                                                                                                                                                                                                                                                                   |
| arguments    | String  | <p>Key parameter for program execution. The parameter is specified by the function of the user's internal program. MRS is only responsible for loading the parameter. This parameter can be empty.</p>                                                                                   |
| job_state    | Integer | <p>Job status code</p> <ul style="list-style-type: none"><li>● -1: Terminated</li><li>● 1: Starting</li><li>● 2: Running</li><li>● 3: Completed</li><li>● 4: Abnormal</li><li>● 5: Error</li></ul>                                                                                       |

| Parameter        | Type    | Description                                                                                                                                                                                 |
|------------------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_final_status | Integer | Final job status <ul style="list-style-type: none"><li>● 0: unfinished</li><li>● 1: terminated due to an execution error</li><li>● 2: executed successfully</li><li>● 3: canceled</li></ul> |
| hive_script_path | String  | Address of the Hive script                                                                                                                                                                  |
| create_by        | String  | User ID for creating jobs<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                                    |
| finished_step    | Integer | Number of completed steps<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                                    |
| job_main_id      | String  | Main ID of a job<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                                             |
| job_step_id      | String  | Step ID of a job<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                                             |
| postpone_at      | Integer | Delay time, which is a 10-bit timestamp.<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                     |
| step_name        | String  | Step name of a job<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                                           |
| step_num         | Integer | Number of steps<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                                              |
| task_num         | Integer | Number of tasks<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions.                                                              |

| Parameter        | Type   | Description                                                                                                                              |
|------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| update_by        | String | User ID for updating jobs                                                                                                                |
| credentials      | String | Token<br>The current version does not support this function.                                                                             |
| user_id          | String | User ID for creating jobs<br>This parameter is not used in the current version, but is retained for compatibility with earlier versions. |
| job_configs      | String | Key-value pair set for saving job running configurations                                                                                 |
| extra            | String | Authentication information<br>The current version does not support this function.                                                        |
| data_source_urls | String | Data source URL                                                                                                                          |
| info             | String | Key-value pair set, containing job running information returned by Oozie                                                                 |

## Example

- Example request

The following is an example of a MapReduce job request:

```
{
 "job_type": 1,
 "job_name": "mrs_test_jobone_20170602_141106",
 "cluster_id": "e955a7a3-d334-4943-a39a-994976900d56",
 "jar_path": "s3a://mrs-opsadm/jarpath/hadoop-mapreduce-examples-2.7.2.jar",
 "arguments": "wordcount",
 "input": "s3a://mrs-opsadm/input/",
 "output": "s3a://mrs-opsadm/output/",
 "job_log": "s3a://mrs-opsadm/log/",
 "file_action": "",
 "hql": "",
 "hive_script_path": ""}
```

Example request of a Spark job

```
{

## Status Codes

[Table 7-7](#) describes the status code.

**Table 7-7** Status code

| Status Code | Description             |
|-------------|-------------------------|
| 200         | The job has been added. |

See [Status Codes](#).

### 7.1.2 Querying the exe Object List of Jobs (Deprecated)

#### Function

This API is used to query the exe object list of all jobs. This API is incompatible with Sahara.

#### URI

- Format  
GET /v1.1/{project\_id}/job-exes
- Parameter description

**Table 7-8** URI parameter

| Parameter  | Mandatory | Description                                                                                                  |
|------------|-----------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |

## Request Parameters

**Table 7-9** Request parameters

| Parameter    | Mandatory | Type    | Description                                                                                                                                             |
|--------------|-----------|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| cluster_id   | Yes       | String  | Cluster ID                                                                                                                                              |
| id           | No        | String  | Job execution object ID                                                                                                                                 |
| page_size    | No        | Integer | Maximum number of jobs displayed on a page<br>Value range: 1 to 100                                                                                     |
| current_page | No        | Integer | Current page number                                                                                                                                     |
| job_name     | No        | String  | Job name                                                                                                                                                |
| state        | No        | Integer | Job status code <ul style="list-style-type: none"> <li>• -1: Terminated</li> <li>• 2: Running</li> <li>• 3: Completed</li> <li>• 4: Abnormal</li> </ul> |

## Response Parameters

**Table 7-10** Response parameters

| Parameter      | Type    | Description                                                         |
|----------------|---------|---------------------------------------------------------------------|
| totalRecord    | Integer | The total number of jobs in the job list.                           |
| job_executions | Array   | Job list parameter<br>For details, see <a href="#">Table 7-11</a> . |

**Table 7-11** job\_executions parameters

| Parameter   | Type    | Description                                                                                                                                                                                                                                                                       |
|-------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| id          | String  | Job ID                                                                                                                                                                                                                                                                            |
| create_at   | Integer | Creation time, which is a 13-bit timestamp.                                                                                                                                                                                                                                       |
| update_at   | Integer | Update time, which is a 13-bit timestamp.                                                                                                                                                                                                                                         |
| tenant_id   | String  | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .                                                                                                                                                                          |
| job_id      | String  | Job ID of the YARN                                                                                                                                                                                                                                                                |
| job_name    | String  | Job name                                                                                                                                                                                                                                                                          |
| start_time  | Integer | Start time of job execution, which is a 13-bit timestamp.                                                                                                                                                                                                                         |
| end_time    | Integer | End time of job execution, which is a 13-bit timestamp.                                                                                                                                                                                                                           |
| cluster_id  | String  | Cluster ID of a job                                                                                                                                                                                                                                                               |
| group_id    | String  | Group ID of a job                                                                                                                                                                                                                                                                 |
| jar_path    | String  | Path of the .jar file or .sql file for program execution                                                                                                                                                                                                                          |
| input       | String  | Address for inputting data                                                                                                                                                                                                                                                        |
| output      | String  | Address for outputting data                                                                                                                                                                                                                                                       |
| job_log     | String  | Address for storing job logs                                                                                                                                                                                                                                                      |
| job_type    | Integer | Job type code <ul style="list-style-type: none"><li>● 1: MapReduce</li><li>● 2: Spark</li><li>● 3: Hive Script</li><li>● 4: HiveQL (not supported currently)</li><li>● 5: DistCp</li><li>● 6: Spark Script</li><li>● 7: Spark SQL (not supported in this API currently)</li></ul> |
| file_action | String  | Data import and export                                                                                                                                                                                                                                                            |

| Parameter        | Type    | Description                                                                                                                                                                                     |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| arguments        | String  | Key parameter for program execution. The parameter is specified by the function of the user's internal program. MRS is only responsible for loading the parameter. This parameter can be empty. |
| hql              | String  | HiveQL statement                                                                                                                                                                                |
| job_state        | Integer | Job status code <ul style="list-style-type: none"><li>● -1: Terminated</li><li>● 2: Running</li><li>● 3: Completed</li><li>● 4: Abnormal</li></ul>                                              |
| job_final_status | Integer | Final job status. <ul style="list-style-type: none"><li>● 0: unfinished</li><li>● 1: terminated due to an execution error</li><li>● 2: executed successfully</li><li>● 3: canceled</li></ul>    |
| hive_script_path | String  | Address of the Hive script                                                                                                                                                                      |
| create_by        | String  | User ID for creating jobs                                                                                                                                                                       |
| finished_step    | Integer | Number of completed steps                                                                                                                                                                       |
| job_main_id      | String  | Main ID of a job                                                                                                                                                                                |
| job_step_id      | String  | Step ID of a job                                                                                                                                                                                |
| postpone_at      | Integer | Delay time, which is a 13-bit timestamp.                                                                                                                                                        |
| step_name        | String  | Step name of a job                                                                                                                                                                              |
| step_num         | Integer | Number of steps                                                                                                                                                                                 |
| task_num         | Integer | Number of tasks                                                                                                                                                                                 |
| update_by        | String  | User ID for updating jobs                                                                                                                                                                       |
| spend_time       | Integer | Duration of job execution (unit: s)                                                                                                                                                             |
| step_seq         | Integer | Step sequence of a job                                                                                                                                                                          |
| progress         | String  | Job execution progress                                                                                                                                                                          |

## Example

- Example request  
GET/v1.1/{project\_id}/job-exes?  
page\_size=10&current\_page=1&state=3&job\_name=myfirstjob&clusterId=20ca8601-72a2-4570-b788-2a20fec81a95

- Example response

## Status Codes

[Table 7-12](#) describes the status code.

**Table 7-12** Status code

| Status Code | Description                             |
|-------------|-----------------------------------------|
| 200         | The exe object list of jobs is queried. |

See [Status Codes](#).

## 7.1.3 Querying exe Object Details (Deprecated)

### Function

This API is used to query detailed information about the exe object of a job. This API is incompatible with Sahara.

### URI

- Format  
GET /v1.1/{project\_id}/job-exes/{job\_exe\_id}
- Parameter description

**Table 7-13** URI parameters

| Parameter  | Mandatory | Description                                                                                                  |
|------------|-----------|--------------------------------------------------------------------------------------------------------------|
| project_id | Yes       | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| job_exe_id | Yes       | The job ID.                                                                                                  |

### Request Parameters

#### Request parameters

None

### Response Parameters

**Table 7-14** Response parameter

| Parameter     | Type   | Description                                                |
|---------------|--------|------------------------------------------------------------|
| job_execution | Object | Job details. For details, see <a href="#">Table 7-15</a> . |

**Table 7-15** job\_execution parameters

| Parameter | Type    | Description                                 |
|-----------|---------|---------------------------------------------|
| id        | String  | Job ID                                      |
| create_at | Integer | Creation time, which is a 13-bit timestamp. |
| update_at | Integer | Update time, which is a 13-bit timestamp.   |

| Parameter   | Type    | Description                                                                                                                                                                                                                                                                       |
|-------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tenant_id   | String  | Project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> .                                                                                                                                                                          |
| job_id      | String  | Job ID                                                                                                                                                                                                                                                                            |
| job_name    | String  | Job name                                                                                                                                                                                                                                                                          |
| start_time  | Integer | Start time of job execution, which is a 13-bit timestamp.                                                                                                                                                                                                                         |
| end_time    | Integer | End time of job execution, which is a 13-bit timestamp.                                                                                                                                                                                                                           |
| cluster_id  | String  | Cluster ID of a job                                                                                                                                                                                                                                                               |
| group_id    | String  | Group ID of a job                                                                                                                                                                                                                                                                 |
| jar_path    | String  | Path of the .jar file or .sql file for program execution                                                                                                                                                                                                                          |
| input       | String  | Address for inputting data                                                                                                                                                                                                                                                        |
| output      | String  | Address for outputting data                                                                                                                                                                                                                                                       |
| job_log     | String  | Address for storing job logs                                                                                                                                                                                                                                                      |
| job_type    | Integer | Job type code <ul style="list-style-type: none"><li>• 1: MapReduce</li><li>• 2: Spark</li><li>• 3: Hive Script</li><li>• 4: HiveQL (not supported currently)</li><li>• 5: DistCp</li><li>• 6: Spark Script</li><li>• 7: Spark SQL (not supported in this API currently)</li></ul> |
| file_action | String  | Data import and export                                                                                                                                                                                                                                                            |
| arguments   | String  | Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. This parameter can be empty.                                                                                            |
| hql         | String  | HiveQL statement                                                                                                                                                                                                                                                                  |

| Parameter        | Type    | Description                                                                                                                                                                         |
|------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| job_state        | Integer | Job status code <ul style="list-style-type: none"><li>-1: Terminated</li><li>1: Starting</li><li>2: Running</li><li>3: Completed</li><li>4: Abnormal</li><li>5: Error</li></ul>     |
| job_final_status | Integer | Final job status <ul style="list-style-type: none"><li>0: unfinished</li><li>1: terminated due to an execution error</li><li>2: executed successfully</li><li>3: canceled</li></ul> |
| hive_script_path | String  | Address of the Hive script                                                                                                                                                          |
| create_by        | String  | User ID for creating jobs                                                                                                                                                           |
| finished_step    | Integer | Number of completed steps                                                                                                                                                           |
| job_main_id      | String  | Main ID of a job                                                                                                                                                                    |
| job_step_id      | String  | Step ID of a job                                                                                                                                                                    |
| postpone_at      | Integer | Delay time, which is a 13-bit timestamp.                                                                                                                                            |
| step_name        | String  | Step name of a job                                                                                                                                                                  |
| step_num         | Integer | Number of steps                                                                                                                                                                     |
| task_num         | Integer | Number of tasks                                                                                                                                                                     |
| update_by        | String  | User ID for updating jobs                                                                                                                                                           |
| spend_time       | Integer | Duration of job execution (unit: s)                                                                                                                                                 |
| step_seq         | Integer | Step sequence of a job                                                                                                                                                              |
| progress         | String  | Job execution progress                                                                                                                                                              |

## Status Code

[Table 7-16](#) describes the status code of this API.

**Table 7-16** Status code

| Status code | Description                                      |
|-------------|--------------------------------------------------|
| 200         | The exe object details are queried successfully. |

For the description about error status codes, see [Status Codes](#).

### 7.1.4 Deleting a Job Execution Object (Deprecated)

#### Function

This API is used to delete a job execution object. This API is compatible with Sahara.

#### URI

- Format  
`DELETE /v1.1/{project_id}/job-executions/{job_execution_id}`
- Parameter description

**Table 7-17** URI parameters

| Parameter        | Mandatory | Description                                                                                                  |
|------------------|-----------|--------------------------------------------------------------------------------------------------------------|
| project_id       | Yes       | The project ID. For details about how to obtain the project ID, see <a href="#">Obtaining a Project ID</a> . |
| job_execution_id | Yes       | The job ID.                                                                                                  |

## Example

- Example request  
None
- Example response  
None

## Status Codes

[Table 7-18](#) describes the status code.

**Table 7-18** Status code

| Status Code | Description                          |
|-------------|--------------------------------------|
| 204         | The job execution object is deleted. |

See [Status Codes](#).

# 8 Permissions Policies and Supported Actions

## 8.1 Introduction

Create IAM users and assign permissions to the users so you can perform fine-grained permissions management for your MRS resources. If your account meets service requirements, you do not need to create IAM users. In this case, skip this section.

By default, new IAM users do not have permissions assigned. You need to add them to one or more groups, and attach permissions policies or roles to these groups. Users inherit permissions from the groups to which they are added and can perform specified operations on cloud services based on the permissions.

You can grant users permissions by using roles and policies. Roles are a type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. Policies define API-based permissions for operations on specific resources under certain conditions, allowing for more fine-grained, secure access control of cloud resources.

### NOTE

Policy-based authorization is useful if you want to allow or deny the access to an API.

An account has all the permissions required to call all APIs, but IAM users must be assigned the required permissions. The permissions required for calling an API are determined by the actions supported by the API. Only users who have been granted permissions allowing the actions can call the API successfully. For example, if an IAM user queries MRS clusters using an API, the user must have been granted permissions that allow the **mrs:cluster:list** action.

## Supported Actions

MRS provides system-defined policies that can be directly used in IAM. MRS cluster administrators can also create custom policies and use them to supplement system-defined policies, implementing more refined access control. Operations supported by policies are specific to APIs. The following are common concepts related to policies:

- Permission: A statement in a policy that allows or denies certain operations.
- API: REST APIs that can be called by a user who has been granted specific permissions.
- Action: Specific operations that are allowed or denied.
- Related actions: Actions on which a specific action depends to take effect. When assigning permissions for the action to a user, you also need to assign permissions for the related actions.
- IAM or enterprise projects: Type of projects for which an action will take effect. Policies that contain actions for both IAM and enterprise projects can be used and take effect for both IAM and Enterprise Management. Policies that only contain actions for IAM projects can be used and only take effect for IAM.

 NOTE

The check mark (✓) indicates that an action takes effect. The cross mark (✗) indicates that an action does not take effect.

**Table 8-1** Actions

| Permissions                               | API                                                | Action             | IAM Project | Enterprise Project |
|-------------------------------------------|----------------------------------------------------|--------------------|-------------|--------------------|
| Creating a Cluster and Executing a Job    | POST /v1.1/{project_id}/run-job-flow               | mrs:cluster:create | ✓           | ✓                  |
| Resizing a Cluster                        | PUT /v1.1/{project_id}/cluster_infos/{cluster_id}  | mrs:cluster:resize | ✓           | ✓                  |
| Querying a Cluster List                   | GET /v1.1/{project_id}/cluster_infos               | mrs:cluster:list   | ✓           | ✓                  |
| Querying Cluster Details                  | GET /v1.1/{project_id}/cluster_infos/{cluster_id}  | mrs:cluster:get    | ✓           | ✓                  |
| Deleting a Cluster                        | DELETE /v1.1/{project_id}/clusters/{cluster_id}    | mrs:cluster:delete | ✓           | ✓                  |
| Querying a Host List                      | GET /v1.1/{project_id}/clusters/{cluster_id}/hosts | mrs:host:list      | ✓           | ✓                  |
| Adding and Executing a Job (V1)           | POST /v1.1/{project_id}/jobs/submit-job            | mrs:job:submit     | ✓           | ✓                  |
| Querying the exe Object List of Jobs (V1) | GET /v1.1/{project_id}/job-exes                    | mrs:job:list       | ✓           | ✓                  |

| Permissions                                     | API                                                                                     | Action                | IAM Project | Enterprise Project |
|-------------------------------------------------|-----------------------------------------------------------------------------------------|-----------------------|-------------|--------------------|
| Querying job Object Details (V1)                | GET /v1.1/{project_id}/job-exes/{job_exe_id}                                            | mrs:job:get           | ✓           | ✓                  |
| Configuring an Auto Scaling Rule                | POST /v1.1/{project_id}/autoscaling-policy/{cluster_id}                                 | mrs:cluster:policy    | ✓           | ✓                  |
| Querying Tags of a Specified Cluster            | GET /v1.1/{project_id}/clusters/{cluster_id}/tags                                       | mrs:tag:list          | ✓           | ✓                  |
| Adding or Deleting Cluster Tags in Batches      | POST /v1.1/{project_id}/clusters/{cluster_id}/tags/action                               | mrs:tag:batch Operate | ✓           | ✓                  |
| Querying All Tags                               | GET /v1.1/{project_id}/clusters/tags                                                    | mrs:tag:list          | ✓           | ✓                  |
| Querying a List of Clusters with Specified Tags | POST /v1.1/{project_id}/clusters/resource_instances/action                              | mrs:tag:listResource  | ✓           | ✗                  |
| Adding and Executing a Job (V2)                 | POST /v2/{project_id}/clusters/{cluster_id}/job-executions                              | mrs:job:submit        | ✓           | ✓                  |
| Querying Information About a Job (V2)           | GET /v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}            | mrs:job:list          | ✓           | ✓                  |
| Querying a List of Jobs (V2)                    | GET /v2/{project_id}/clusters/{cluster_id}/job-executions                               | mrs:job:list          | ✓           | ✓                  |
| Terminating a Job (V2)                          | POST /v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}/kill      | mrs:job:stop          | ✓           | ✓                  |
| Deleting Jobs in Batches (V2)                   | POST /v2/{project_id}/clusters/{cluster_id}/job-executions/batch-delete                 | mrs:job:batch Delete  | ✓           | ✓                  |
| Obtaining the SQL Result (V2)                   | GET /v2/{project_id}/clusters/{cluster_id}/job-executions/{job_execution_id}/sql-result | mrs:job:list          | ✓           | ✓                  |

# 9 Appendix

## 9.1 Status Codes

[Table 9-1](#) describes status codes.

**Table 9-1** Status codes

| Status Code | Message                       | Description                                                                                                                                                                                                |
|-------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 100         | Continue                      | The client should continue with its request.<br><br>This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the server. |
| 101         | Switching Protocols           | The protocol should be switched. The protocol can only be switched to a newer protocol.<br><br>For example, the current HTTPS protocol is switched to a later version.                                     |
| 200         | OK                            | The request has been fulfilled.                                                                                                                                                                            |
| 201         | Created                       | The request has been fulfilled and a new resource has been created.                                                                                                                                        |
| 202         | Accepted                      | The request has been accepted, but the processing has not been completed.                                                                                                                                  |
| 203         | Non-Authoritative Information | The server has successfully processed the request, but is returning information that may be from another source.                                                                                           |

| Status Code | Message           | Description                                                                                                                                                                                                                       |
|-------------|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 204         | NoContent         | The request has been fulfilled, but the HTTPS response does not contain a response body.<br>The status code is returned in response to an HTTPS OPTIONS request.                                                                  |
| 205         | Reset Content     | The server has fulfilled the request, but the requester is required to reset the content.                                                                                                                                         |
| 206         | Partial Content   | The server has successfully processed the partial GET request.                                                                                                                                                                    |
| 300         | Multiple Choices  | There are multiple options for the location of the requested resource. The response contains a list of resource characteristics and addresses from which a user terminal (such as a browser) can choose the most appropriate one. |
| 301         | Moved Permanently | The requested resource has been assigned a new permanent URI, and the new URI is contained in the response.                                                                                                                       |
| 302         | Found             | The requested resource resides temporarily under a different URI.                                                                                                                                                                 |
| 303         | See Other         | The response to the request can be found under a different URI.<br>It can be retrieved by using a GET or POST method.                                                                                                             |
| 304         | Not Modified      | The requested resource has not been modified. When the server returns this status code, it does not return any resources.                                                                                                         |
| 305         | Use Proxy         | The requested resource is available only through a proxy.                                                                                                                                                                         |
| 306         | Unused            | The HTTPS status code is no longer used.                                                                                                                                                                                          |
| 400         | BadRequest        | The request is invalid.<br>The client should not repeat the request without modifications.                                                                                                                                        |

| Status Code | Message                       | Description                                                                                                                                                                                                                                                                                        |
|-------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 401         | Unauthorized                  | This status code is returned after the client provides the authentication information, indicating that the authentication information is incorrect or invalid.                                                                                                                                     |
| 402         | Payment Required              | This status code is reserved for future use.                                                                                                                                                                                                                                                       |
| 403         | Forbidden                     | The server understood the request, but is refusing to fulfill it.<br>The client should not repeat the request without modifications.                                                                                                                                                               |
| 404         | NotFound                      | The requested resource cannot be found.<br>The client should not repeat the request without modifications.                                                                                                                                                                                         |
| 405         | MethodNotAllowed              | A request method is not supported for the requested resource.<br>The client should not repeat the request without modifications.                                                                                                                                                                   |
| 406         | Not Acceptable                | The server cannot fulfill the request according to the content characteristics of the request.                                                                                                                                                                                                     |
| 407         | Proxy Authentication Required | This status code is similar to 401, but indicates that the client must first authenticate itself with the proxy.                                                                                                                                                                                   |
| 408         | Request Time-out              | The server has timed out waiting for the request.<br>The client may repeat the request without modifications at a later time.                                                                                                                                                                      |
| 409         | Conflict                      | The request could not be processed due to a conflict with the current state of the resource.<br>This status code indicates that the resource that the client is attempting to create already exists, or that the request has failed to be processed because of the update of the conflict request. |
| 410         | Gone                          | The requested resource has been deleted permanently and is no longer available.                                                                                                                                                                                                                    |

| Status Code | Message                         | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 411         | Length Required                 | The server is refusing to process the request without a defined <b>Content-Length</b> .                                                                                                                                                                                                                                                                                                                      |
| 412         | Precondition Failed             | The server did not meet one of the preconditions that the requester put on the request.                                                                                                                                                                                                                                                                                                                      |
| 413         | Request Entity Too Large        | The server is refusing to process a request because the request entity is too large for the server to process. The server may close the connection to prevent the client from continuing the request. If the server is only temporarily unable to process the request, the response will contain a <b>Retry-After</b> header field.                                                                          |
| 414         | Request-URI Too Large           | The Request-URI is too long for the server to process.                                                                                                                                                                                                                                                                                                                                                       |
| 415         | Unsupported Media Type          | The server is unable to process the media format in the request.                                                                                                                                                                                                                                                                                                                                             |
| 416         | Requested range not satisfiable | The requested range is invalid.                                                                                                                                                                                                                                                                                                                                                                              |
| 417         | Expectation Failed              | The server has failed to meet the requirements of the <b>Expect</b> request-header field.                                                                                                                                                                                                                                                                                                                    |
| 422         | UnprocessableEntity             | The request is well-formed but is unable to be processed due to semantic errors.                                                                                                                                                                                                                                                                                                                             |
| 429         | TooManyRequests                 | The client has sent excessive number of requests to the server within a given time (exceeding the limit on the access frequency of the client), or the server has received an excessive number of requests within a given time (beyond its processing capability). In this case, the client should resend the request after the time specified in the <b>Retry-After</b> header of the response has elapsed. |
| 500         | InternalServerEr-<br>ror        | The server is able to receive the request but unable to understand it.                                                                                                                                                                                                                                                                                                                                       |
| 501         | Not Implemented                 | The server does not support the function required to fulfill the request.                                                                                                                                                                                                                                                                                                                                    |

| Status Code | Message                     | Description                                                                                                                                                       |
|-------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 502         | Bad Gateway                 | The server was acting as a gateway or proxy and received an invalid request from the remote server.                                                               |
| 503         | ServiceUnavailable          | The requested service is invalid.<br>The client should not repeat the request without modifications.                                                              |
| 504         | ServerTimeout               | The request cannot be fulfilled within a given time. This status code is returned to the client only if the <b>Timeout</b> parameter is specified in the request. |
| 505         | HTTPS Version not supported | The server does not support the HTTPS protocol version used in the request.                                                                                       |

## 9.2 Error Codes

| Status Code | Error Code | Error Message                                                                                                                                                                                                      | Measure |
|-------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| 400         | 0171       | Failed to collect job log details.                                                                                                                                                                                 | -       |
| 400         | 12000002   | The parameter is invalid.                                                                                                                                                                                          | -       |
| 400         | 12000003   | The cluster does not exist.                                                                                                                                                                                        | -       |
| 400         | 12000009   | The parameter is invalid.                                                                                                                                                                                          | -       |
| 400         | 12000012   | Tasks are being executed in the cluster.<br>Subcontract period cluster is not allowed for clusters that are in this state.<br>Scale-out or scale-in is not allowed for clusters that are not in the running state. | -       |

| Status Code | Error Code | Error Message                                                                                                                                           | Measure |
|-------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| 400         | 12000013   | Failed to scale in the cluster (ID: xxx). The type and the quantity of nodes to be deleted are xxx and xxx, respectively. The task node does not exist. | -       |
| 400         | 12000014   | Failed to scale out the cluster (ID: xxx). The type and the quantity of nodes to be added are xxx and xxx, respectively.                                | -       |
| 400         | 12000018   | Scale-out or scale-in cannot be performed again because it is in progress.                                                                              | -       |
| 400         | 12000019   | Failed to obtain hosts of the cluster.                                                                                                                  | -       |
| 400         | 12000021   | Clusters in the xxx state cannot be terminated.                                                                                                         | -       |
| 400         | 120000212  | Failed to obtain the AZs that you have permission to access.                                                                                            | -       |
| 400         | 12000023   | Failed to obtain cluster details.                                                                                                                       | -       |
| 400         | 12000027   | Failed to verify the subnet when creating the cluster xxx.                                                                                              | -       |
| 400         | 12000028   | The cluster has a maximum of xxx Core and Task nodes.                                                                                                   | -       |

## 9.3 Obtaining a Project ID

### Obtaining a Project ID from the Management Console

A project ID (**project\_id**) is required for some URLs when an API is called. To obtain a project ID, perform the following operations:

1. Log in to the management console.

If there are multiple projects in one region, expand **Region** and view subproject IDs in the **Project ID** column.

## 9.4

(**domain-id**) is required for some URLs when an API is called. To obtain on the management console, perform the following steps:

1. Log in to the management console.

## 9.5 Obtaining the MRS Cluster Information

### Components Supported by MRS

- MRS 3.1.0 supports the following components:
  - An analysis cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, and Kudu.
  - A streaming cluster contains the following components: Kafka, Flume, ZooKeeper, and Ranger.

- A hybrid cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, Kafka, and Flume.
- A custom cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Kafka, Flume, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, ClickHouse, and Kudu.
- MRS 3.0.5 supports the following components:
  - An analysis cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Hue, Loader, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, and Alluxio.
  - A streaming cluster contains the following components: Kafka, Storm, Flume, ZooKeeper, and Ranger.
  - A hybrid cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, Kudu, Alluxio, Kafka, Storm, and Flume.
  - A custom cluster contains the following components: Hadoop, Spark2x, HBase, Hive, Loader, Kafka, Storm, Flume, Flink, Oozie, ZooKeeper, Ranger, Tez, Impala, Presto, ClickHouse, Kudu, and Alluxio.

## Obtaining a Cluster ID

A cluster ID (**cluster\_id**) is required for some URLs when an API is called. To obtain a cluster ID, perform the following operations:

1. Log in to the MRS management console.
2. Choose **Clusters > Active Clusters**, and click the name of the cluster to be operated. The cluster details page is displayed.
3. Click the **Dashboard** tab and obtain the cluster ID in the **Basic Information** area.

## Obtaining a Job ID

A job ID (**job\_execution\_id**) is required for some URLs when an API is called. To obtain a job ID, perform the following operations:

1. Log in to the MRS management console.
2. Choose **Clusters > Active Clusters**, and click the name of the cluster to be operated. The cluster details page is displayed.
3. Click the **Jobs** tab and obtain the ID of the job to be operated from the job list.

## 9.6 Roles and components supported by MRS

**Table 9-2** Roles and components supported by MRS

| Role Name | Component |
|-----------|-----------|
| OMSServer | OMSServer |

| Role Name        | Component  |
|------------------|------------|
| NameNode         | HDFS       |
| Zkfc             | HDFS       |
| JournalNode      | HDFS       |
| DataNode         | HDFS       |
| ResourceManager  | Yarn       |
| NodeManager      | Yarn       |
| JobHistoryServer | MapReduce  |
| quorumpeer       | ZooKeeper  |
| HMaster          | HBase      |
| ThriftServer     | HBase      |
| RegionServer     | HBase      |
| SlapdServer      | LdapServer |
| KerberosServer   | KrbServer  |
| KerberosAdmin    | KrbServer  |
| Hue              | Hue        |
| LoaderServer     | Loader     |
| JDBCServer       | Spark      |
| JobHistory       | Spark      |
| SparkResource    | Spark      |
| JDBCServer2x     | Spark2x    |
| JobHistory2x     | Spark2x    |
| SparkResource2x  | Spark2x    |
| MetaStore        | Hive       |
| WebHCat          | Hive       |
| HiveServer       | Hive       |
| MonitorServer    | Flume      |
| Flume            | Flume      |
| oozie            | Oozie      |
| KerberosClient   | KrbClient  |
| SlapdClient      | LdapClient |

| Role Name          | Component  |
|--------------------|------------|
| meta               | meta       |
| DBServer           | DBService  |
| Broker             | Kafka      |
| Supervisor         | Storm      |
| Logviewer          | Storm      |
| Nimbus             | Storm      |
| UI                 | Storm      |
| FlinkResource      | Flink      |
| ClickHouseServer   | ClickHouse |
| ClickHouseBalancer | ClickHouse |

## 9.7 Change History

| Release Date | What's New                                                                                                                                                     |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2022-09-30   | This issue is the fifth official release.<br>Added error code reference. For details, see <a href="#">Error Codes</a> .                                        |
| 2022-07-15   | This issue is the fourth official release.<br>Gradually deprecated some APIs during MRS version evolution. For details, see <a href="#">Out-of-Date APIs</a> . |
| 2022-04-30   | This issue is the third official release.<br>Added the support for MRS 3.1.0.                                                                                  |
| 2021-03-30   | This issue is the second official issue.<br>Added the support for MRS 3.0.5.                                                                                   |
| 2020-02-26   | This issue is the first official release.                                                                                                                      |
