<b>1 Overview</b>	<b>1</b>
1.1 What Is MRS?	1
1.2 Application Scenarios	4
1.3 Components	6
1.3.1 Alluxio	6
1.3.2 CarbonData	7
1.3.3 ClickHouse	9
1.3.4 DBService	13
1.3.4.1 DBService Basic Principles	13
1.3.4.2 Relationship Between DBService and Other Components	14
1.3.5 Flink	15
1.3.5.1 Flink Basic Principles	15
1.3.5.2 Flink HA Solution	20
1.3.5.3 Relationship with Other Components	22
1.3.5.4 Flink Enhanced Open Source Features	23
1.3.5.4.1 Window	23
1.3.5.4.2 Job Pipeline	26
1.3.5.4.3 Configuration Table	30
1.3.5.4.4 Stream SQL Join	32
1.3.5.4.5 Flink CEP in SQL	33
1.3.6 Flume	35
1.3.6.1 Flume Basic Principles	35
1.3.6.2 Relationship Between Flume and Other Components	39
1.3.6.3 Flume Enhanced Open Source Features	39
1.3.7 HBase	39
1.3.7.1 HBase Basic Principles	39
1.3.7.2 HBase HA Solution	45
1.3.7.3 Relationship with Other Components	46
1.3.7.4 HBase Enhanced Open Source Features	47
1.3.8 HDFS	54
1.3.8.1 HDFS Basic Principles	54
1.3.8.2 HDFS HA Solution	58
1.3.8.3 Relationship Between HDFS and Other Components	59

1.3.8.4 HDFS Enhanced Open Source Features.....	62
1.3.9 Hive.....	68
1.3.9.1 Hive Basic Principles.....	68
1.3.9.2 Hive CBO Principles.....	72
1.3.9.3 Relationship Between Hive and Other Components.....	76
1.3.9.4 Enhanced Open Source Feature.....	76
1.3.10 Hue.....	78
1.3.10.1 Hue Basic Principles.....	78
1.3.10.2 Relationship Between Hue and Other Components.....	80
1.3.10.3 Hue Enhanced Open Source Features.....	82
1.3.11 Impala.....	82
1.3.12 Kafka.....	83
1.3.12.1 Kafka Basic Principles.....	83
1.3.12.2 Relationship Between Kafka and Other Components.....	86
1.3.12.3 Kafka Enhanced Open Source Features.....	87
1.3.13 KafkaManager.....	87
1.3.14 KrbServer and LdapServer.....	88
1.3.14.1 KrbServer and LdapServer Principles.....	88
1.3.14.2 KrbServer and LdapServer Enhanced Open Source Features.....	92
1.3.15 Kudu.....	92
1.3.16 Loader.....	93
1.3.16.1 Loader Basic Principles.....	93
1.3.16.2 Relationship Between Loader and Other Components.....	96
1.3.16.3 Loader Enhanced Open Source Features.....	96
1.3.17 Manager.....	97
1.3.17.1 Manager Basic Principles.....	97
1.3.17.2 Manager Key Features.....	100
1.3.18 MapReduce.....	101
1.3.18.1 MapReduce Basic Principles.....	101
1.3.18.2 Relationship Between MapReduce and Other Components.....	103
1.3.18.3 MapReduce Enhanced Open Source Features.....	103
1.3.19 Oozie.....	106
1.3.19.1 Oozie Basic Principles.....	107
1.3.19.2 Oozie Enhanced Open Source Feature.....	108
1.3.20 Presto.....	108
1.3.21 Ranger.....	109
1.3.21.1 Ranger Basic Principles.....	109
1.3.21.2 Relationship Between Ranger and Other Components.....	111
1.3.22 Spark.....	112
1.3.22.1 Basic Principles of Spark.....	112
1.3.22.2 Spark HA Solution.....	128
1.3.22.3 Relationship Among Spark, HDFS, and Yarn.....	134

1.3.22.4 Spark Enhanced Open Source Feature: Optimized SQL Query of Cross-Source Data.....	138
1.3.23 Spark2x.....	141
1.3.23.1 Basic Principles of Spark2x.....	141
1.3.23.2 Spark2x HA Solution.....	156
1.3.23.2.1 Spark2x Multi-active Instance.....	156
1.3.23.2.2 Spark2x Multi-tenant.....	159
1.3.23.3 Relationship Between Spark2x and Other Components.....	162
1.3.23.4 Spark2x Open Source New Features.....	166
1.3.23.5 Spark2x Enhanced Open Source Features.....	166
1.3.23.5.1 CarbonData Overview.....	166
1.3.23.5.2 Enhanced SQL Query of Multi-sourced Data.....	169
1.3.24 Storm.....	172
1.3.24.1 Storm Basic Principles.....	172
1.3.24.2 Relationship Between Storm and Other Components.....	176
1.3.24.3 Storm Enhanced Open Source Features.....	177
1.3.25 Tez.....	178
1.3.26 Yarn.....	179
1.3.26.1 Yarn Basic Principles.....	179
1.3.26.2 Yarn HA Solution.....	184
1.3.26.3 Relationship Between Yarn and Other Components.....	185
1.3.26.4 Yarn Enhanced Open Source Features.....	188
1.3.27 ZooKeeper.....	196
1.3.27.1 ZooKeeper Basic Principle.....	196
1.3.27.2 Relationship Between ZooKeeper and Other Components.....	198
1.3.27.3 ZooKeeper Enhanced Open Source Features.....	202
1.4 Functions.....	205
1.4.1 Multi-tenant.....	205
1.4.2 Security Hardening.....	207
1.4.3 Easy Access to Web UIs of Components.....	209
1.4.4 Reliability Enhancement.....	209
1.4.5 Job Management.....	211
1.4.6 Bootstrap Actions.....	211
1.4.7 Metadata.....	212
1.4.8 Cluster Management.....	212
1.4.8.1 Cluster Lifecycle Management.....	212
1.4.8.2 Manually Scale Out/In a Cluster.....	214
1.4.8.3 Auto Scaling.....	214
1.4.8.4 Task Node Creation.....	216
1.4.8.5 Isolating a Host.....	216
1.4.8.6 Managing Tags.....	217
1.4.9 Cluster O&M.....	217
1.4.10 Message Notification.....	218

1.5 Constraints.....	219
1.6 Permissions Management.....	220
1.7 Related Services.....	224
<b>2 IAM Permissions Management.....</b>	<b>226</b>
2.1 Creating a User and Granting Permissions.....	226
2.2 Creating MRS Custom Policies.....	227
2.3 Synchronizing IAM Users to MRS.....	228
<b>3 MRS Quick Start.....</b>	<b>234</b>
3.1 How to Use MRS.....	234
3.2 Creating a Cluster.....	235
3.3 Uploading Data and Programs.....	236
3.4 Creating a Job.....	239
3.5 Terminating a Cluster.....	242
<b>4 Configuring a Cluster.....</b>	<b>243</b>
4.1 Overview.....	243
4.2 Cluster List.....	244
4.3 Methods of Creating MRS Clusters.....	248
4.4 Quick Creation of a Hadoop Analysis Cluster.....	248
4.5 Quick Creation of an HBase Analysis Cluster.....	250
4.6 Quick Creation of a Kafka Streaming Cluster.....	251
4.7 Quick Creation of a ClickHouse Cluster.....	252
4.8 Quick Creation of a Real-time Analysis Cluster.....	254
4.9 Creating a Custom Cluster.....	255
4.10 Customizing a Topology Cluster.....	269
4.11 Adding a Tag to a Cluster.....	280
4.12 Communication Security Authorization.....	282
4.13 Installing the Third-Party Software Using Bootstrap Actions.....	285
4.13.1 Introduction to Bootstrap Actions.....	285
4.13.2 Preparing the Bootstrap Action Script.....	286
4.13.3 View Execution Records.....	287
4.13.4 Adding a Bootstrap Action.....	287
<b>5 Managing an Existing Cluster.....</b>	<b>290</b>
5.1 Managing and Monitoring a Cluster.....	290
5.1.1 Viewing Basic Cluster Information.....	290
5.1.2 Viewing Cluster Patch Information.....	294
5.1.3 Viewing and Customizing Cluster Monitoring Metrics.....	295
5.1.4 Managing Components and Monitoring Hosts.....	297
5.2 Manually Scaling Out a Cluster.....	302
5.3 Manually Scaling In a Cluster.....	304
5.4 Configuring an Auto Scaling Rule.....	307
5.5 Configuring Auto Scaling Rules When Creating a Cluster.....	317

5.6 Changing the Subnet of a Cluster.....	321
5.7 Configuring Message Notification.....	324
5.8 O&M.....	326
5.8.1 Authorizing O&M.....	326
5.8.2 Sharing Logs.....	327
5.9 Terminating a Cluster.....	327
5.10 Deleting a Failed Task.....	328
5.11 Job Management.....	328
5.11.1 Introduction to MRS Jobs.....	328
5.11.2 Running a MapReduce Job.....	333
5.11.3 Running a SparkSubmit Job.....	336
5.11.4 Running a HiveSQL Job.....	340
5.11.5 Running a SparkSql Job.....	344
5.11.6 Running a Flink Job.....	348
5.11.7 Running a Kafka Job.....	354
5.11.8 Viewing Job Configuration and Logs.....	356
5.11.9 Stopping a Job.....	356
5.11.10 Deleting a Job.....	357
5.11.11 Using Encrypted OBS Data for Job Running.....	357
5.11.12 Configuring Job Notification Rules.....	365
5.12 Importing and Exporting Data.....	365
5.13 Component Management.....	369
5.13.1 Object Management.....	369
5.13.2 Viewing Configuration.....	370
5.13.3 Managing Services.....	371
5.13.4 Configuring Service Parameters.....	371
5.13.5 Configuring Customized Service Parameters.....	372
5.13.6 Synchronizing Service Configuration.....	374
5.13.7 Managing Role Instances.....	374
5.13.8 Configuring Role Instance Parameters.....	375
5.13.9 Synchronizing Role Instance Configuration.....	376
5.13.10 Decommissioning and Recommissioning a Role Instance.....	376
5.13.11 Managing a Host (Node).....	378
5.13.12 Isolating a Host.....	378
5.13.13 Canceling Host Isolation.....	379
5.13.14 Starting and Stopping a Cluster.....	379
5.13.15 Synchronizing Cluster Configuration.....	380
5.13.16 Exporting Cluster Configuration.....	380
5.13.17 Performing Rolling Restart.....	381
5.14 Alarm Management.....	385
5.14.1 Viewing the Alarm List.....	385
5.14.2 Viewing the Event List.....	387

5.14.3 Viewing and Manually Clearing an Alarm.....	390
5.15 Patch Management.....	392
5.15.1 Patch Operation Guide for Versions Earlier Than MRS 3.x.....	392
5.15.2 Rolling Patches.....	393
5.15.3 Restoring Patches for the Isolated Hosts.....	396
5.16 Health Check Management.....	396
5.16.1 Before You Start.....	396
5.16.2 Performing a Health Check.....	396
5.16.3 Viewing and Exporting a Health Check Report.....	397
5.16.4 DBService Health Check Indicators.....	398
5.16.5 Flume Health Check Indicators.....	399
5.16.6 HBase Health Check Indicators.....	399
5.16.7 Host Health Check Indicators.....	400
5.16.8 HDFS Health Check Indicators.....	407
5.16.9 Hive Health Check Indicators.....	407
5.16.10 Kafka Health Check Indicators.....	408
5.16.11 KrbServer Health Check Indicators.....	409
5.16.12 LdapServer Health Check Indicators.....	410
5.16.13 Loader Health Check Indicators.....	410
5.16.14 MapReduce Health Check Indicators.....	412
5.16.15 OMS Health Check Indicators.....	412
5.16.16 Spark Health Check Indicators.....	417
5.16.17 Storm Health Check Indicators.....	417
5.16.18 Yarn Health Check Indicators.....	418
5.16.19 ZooKeeper Health Check Indicators.....	418
5.17 Tenant Management.....	419
5.17.1 Before You Start.....	419
5.17.2 Overview.....	419
5.17.3 Creating a Tenant.....	420
5.17.4 Creating a Sub-tenant.....	423
5.17.5 Deleting a Tenant.....	426
5.17.6 Managing a Tenant Directory.....	427
5.17.7 Restoring Tenant Data.....	429
5.17.8 Creating a Resource Pool.....	430
5.17.9 Modifying a Resource Pool.....	431
5.17.10 Deleting a Resource Pool.....	431
5.17.11 Configuring a Queue.....	432
5.17.12 Configuring the Queue Capacity Policy of a Resource Pool.....	435
5.17.13 Clearing Configuration of a Queue.....	436
5.18 Backup and Restoration.....	436
5.18.1 Before You Start.....	436
5.18.2 Introduction.....	437

5.18.3 Backing Up Metadata.....	439
5.18.4 Restoring Metadata.....	441
5.18.5 Modifying Backup Tasks.....	444
5.18.6 Viewing Backup and Restoration Tasks.....	445
5.19 MRS Multi-User Permission Management.....	446
5.19.1 Users and Permissions of MRS Clusters.....	446
5.19.2 Default Users of Clusters with Kerberos Authentication Enabled.....	450
5.19.3 Creating a Role.....	457
5.19.4 Creating a User Group.....	463
5.19.5 Creating a User.....	464
5.19.6 Modifying User Information.....	466
5.19.7 Locking a User.....	467
5.19.8 Unlocking a User.....	467
5.19.9 <b>Deleting a User</b> .....	468
5.19.10 Changing the Password of an Operation User.....	469
5.19.11 Initializing the Password of a System User.....	470
5.19.12 Downloading a User Authentication File.....	471
5.19.13 Modifying a Password Policy.....	472
5.19.14 Configuring Cross-Cluster Mutual Trust Relationships.....	474
5.19.15 Configuring Users to Access Resources of a Trusted Cluster.....	478
5.19.16 Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS.....	479
<b>6 Managing Historical Clusters.....</b>	<b>486</b>
6.1 Viewing Basic Information of a Historical Cluster.....	486
<b>7 Viewing Operation Logs.....</b>	<b>489</b>
<b>8 Metadata.....</b>	<b>491</b>
8.1 Configuring Data Connections.....	491
8.2 Configuring Ranger Data Connections.....	497
<b>9 Connecting to Clusters.....</b>	<b>503</b>
9.1 Logging In to a Cluster.....	503
9.1.1 Cluster Node Overview.....	503
9.1.2 Logging In to an ECS.....	504
9.1.3 Determining Active and Standby Management Nodes of Manager.....	508
9.2 Accessing Manager.....	510
9.2.1 Accessing Manager.....	510
9.2.2 Accessing FusionInsight Manager (MRS 3.x or Later).....	513
9.3 Accessing Web Pages of Open Source Components Managed in MRS Clusters.....	515
9.3.1 Web UIs of Open Source Components.....	515
9.3.2 List of Open Source Component Ports.....	519
9.3.3 Access Through Direct Connect.....	533
9.3.4 EIP-based Access.....	534
9.3.5 Access Using a Windows ECS.....	535

9.3.6 Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser.....	537
<b>10 Using an MRS Client.....</b>	<b>540</b>
10.1 Installing a Client.....	540
10.1.1 Installing a Client (Version 3.x or Later).....	540
10.1.2 Installing a Client (Versions Earlier Than 3.x).....	544
10.2 Updating a Client.....	549
10.2.1 Updating a Client (Version 3.x or Later).....	549
10.2.2 Updating a Client (Versions Earlier Than 3.x).....	551
10.3 Using the Client of Each Component.....	555
10.3.1 Using a ClickHouse Client.....	555
10.3.2 Using a Flink Client.....	557
10.3.3 Using a Flume Client.....	565
10.3.4 Using an HBase Client.....	571
10.3.5 Using an HDFS Client.....	573
10.3.6 Using a Hive Client.....	575
10.3.7 Using an Impala Client.....	579
10.3.8 Using a Kafka Client.....	582
10.3.9 Using a Kudu Client.....	583
10.3.10 Using the Oozie Client.....	585
10.3.11 Using a Storm Client.....	586
10.3.12 Using a Yarn Client.....	587
<b>11 MRS Manager Operation Guide (Applicable to 2.x and Earlier Versions).....</b>	<b>589</b>
11.1 Introduction to MRS Manager.....	589
11.2 Checking Running Tasks.....	592
11.3 Monitoring Management.....	592
11.3.1 Dashboard.....	592
11.3.2 Managing Services and Monitoring Hosts.....	594
11.3.3 Managing Resource Distribution.....	599
11.3.4 Configuring Monitoring Metric Dumping.....	599
11.4 Alarm Management.....	601
11.4.1 Viewing and Manually Clearing an Alarm.....	601
11.4.2 Configuring an Alarm Threshold.....	602
11.4.3 Configuring Syslog Northbound Interface Parameters.....	604
11.4.4 Configuring SNMP Northbound Interface Parameters.....	607
11.5 Alarm Reference (Applicable to Versions Earlier Than MRS 3.x).....	609
11.5.1 ALM-12001 Audit Log Dump Failure.....	609
11.5.2 ALM-12002 HA Resource Is Abnormal.....	611
11.5.3 ALM-12004 Oldap Resource Is Abnormal.....	613
11.5.4 ALM-12005 OKerberos Resource Is Abnormal.....	614
11.5.5 ALM-12006 Node Fault.....	616
11.5.6 ALM-12007 Process Fault.....	617
11.5.7 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes.....	619

11.5.8 ALM-12011 Data Synchronization Exception Between the Active and Standby Manager Nodes...	621
11.5.9 ALM-12012 NTP Service Is Abnormal.....	622
11.5.10 ALM-12016 CPU Usage Exceeds the Threshold.....	625
11.5.11 ALM-12017 Insufficient Disk Capacity.....	627
11.5.12 ALM-12018 Memory Usage Exceeds the Threshold.....	629
11.5.13 ALM-12027 Host PID Usage Exceeds the Threshold.....	631
11.5.14 ALM-12028 Number of Processes in the D State on the Host Exceeds the Threshold.....	632
11.5.15 ALM-12031 User omm or Password Is About to Expire.....	634
11.5.16 ALM-12032 User ommdba or Password Is About to Expire.....	636
11.5.17 ALM-12033 Slow Disk Fault.....	637
11.5.18 ALM-12034 Periodic Backup Failure.....	638
11.5.19 ALM-12035 Unknown Data Status After Recovery Task Failure.....	639
11.5.20 ALM-12037 NTP Server Is Abnormal.....	640
11.5.21 ALM-12038 Monitoring Indicator Dump Failure.....	642
11.5.22 ALM-12039 GaussDB Data Is Not Synchronized.....	644
11.5.23 ALM-12040 Insufficient System Entropy.....	647
11.5.24 ALM-13000 ZooKeeper Service Unavailable.....	648
11.5.25 ALM-13001 Available ZooKeeper Connections Are Insufficient .....	651
11.5.26 ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold.....	653
11.5.27 ALM-14000 HDFS Service Unavailable.....	655
11.5.28 ALM-14001 HDFS Disk Usage Exceeds the Threshold.....	657
11.5.29 ALM-14002 DataNode Disk Usage Exceeds the Threshold.....	659
11.5.30 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold.....	660
11.5.31 ALM-14004 Number of Damaged HDFS Blocks Exceeds the Threshold.....	662
11.5.32 ALM-14006 Number of HDFS Files Exceeds the Threshold.....	663
11.5.33 ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold.....	665
11.5.34 ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold.....	666
11.5.35 ALM-14009 Number of Faulty DataNodes Exceeds the Threshold.....	668
11.5.36 ALM-14010 NameService Service Is Abnormal.....	670
11.5.37 ALM-14011 HDFS DataNode Data Directory Is Not Configured Properly.....	672
11.5.38 ALM-14012 HDFS JournalNode Data Is Not Synchronized.....	676
11.5.39 ALM-16000 Percentage of Sessions Connected to the HiveServer to the Maximum Number Allowed Exceeds the Threshold.....	678
11.5.40 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold.....	679
11.5.41 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold.....	681
11.5.42 ALM-16004 Hive Service Unavailable.....	684
11.5.43 ALM-18000 Yarn Service Unavailable.....	687
11.5.44 ALM-18002 NodeManager Heartbeat Lost.....	689
11.5.45 ALM-18003 NodeManager Unhealthy.....	690
11.5.46 ALM-18004 NodeManager Disk Usability Ratio Is Lower Than the Threshold.....	691
11.5.47 ALM-18006 MapReduce Job Execution Timeout.....	693
11.5.48 ALM-19000 HBase Service Unavailable.....	694
11.5.49 ALM-19006 HBase Replication Sync Failed.....	696

11.5.50 ALM-25000 LdapServer Service Unavailable.....	698
11.5.51 ALM-25004 Abnormal LdapServer Data Synchronization .....	700
11.5.52 ALM-25500 KrbServer Service Unavailable .....	703
11.5.53 ALM-27001 DBService Is Unavailable.....	705
11.5.54 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes.....	707
11.5.55 ALM-27004 Data Inconsistency Between Active and Standby DBServices.....	709
11.5.56 ALM-28001 Spark Service Unavailable.....	711
11.5.57 ALM-26051 Storm Service Unavailable.....	713
11.5.58 ALM-26052 Number of Available Supervisors in Storm Is Lower Than the Threshold.....	715
11.5.59 ALM-26053 Slot Usage of Storm Exceeds the Threshold.....	716
11.5.60 ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold.....	718
11.5.61 ALM-38000 Kafka Service Unavailable.....	720
11.5.62 ALM-38001 Insufficient Kafka Disk Space.....	721
11.5.63 ALM-38002 Heap Memory Usage of Kafka Exceeds the Threshold.....	724
11.5.64 ALM-24000 Flume Service Unavailable.....	726
11.5.65 ALM-24001 Flume Agent Is Abnormal.....	727
11.5.66 ALM-24003 Flume Client Connection Failure.....	729
11.5.67 ALM-24004 Flume Fails to Read Data.....	731
11.5.68 ALM-24005 Data Transmission by Flume Is Abnormal.....	733
11.5.69 ALM-12041 Permission of Key Files Is Abnormal.....	736
11.5.70 ALM-12042 Key File Configurations Are Abnormal.....	737
11.5.71 ALM-23001 Loader Service Unavailable.....	739
11.5.72 ALM-12357 Failed to Export Audit Logs to OBS.....	742
11.5.73 ALM-12014 Device Partition Lost.....	744
11.5.74 ALM-12015 Device Partition File System Read-Only.....	745
11.5.75 ALM-12043 DNS Parsing Duration Exceeds the Threshold.....	747
11.5.76 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold.....	749
11.5.77 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold.....	753
11.5.78 ALM-12047 Read Packet Error Rate Exceeds the Threshold.....	755
11.5.79 ALM-12048 Write Packet Error Rate Exceeds the Threshold.....	757
11.5.80 ALM-12049 Read Throughput Rate Exceeds the Threshold.....	759
11.5.81 ALM-12050 Write Throughput Rate Exceeds the Threshold.....	761

11.13.8 Changing the Password of an Operation User.....	923
11.13.9 Initializing the Password of a System User .....	924
11.13.10 Downloading a User Authentication File.....	925
11.13.11 Modifying a Password Policy .....	926
11.14 Patch Operation Guide.....	928
11.14.1 Patch Operation Guide for Versions .....	928
11.14.2 Supporting Rolling Patches.....	929
11.15 Restoring Patches for the Isolated Hosts.....	932
11.16 Rolling Restart.....	932
<b>12 FusionInsight Manager Operation Guide (Applicable to 3.x).....</b>	<b>937</b>
12.1 Getting Started.....	937
12.1.1 FusionInsight Manager Introduction.....	937
12.1.2 Querying the FusionInsight Manager Version.....	938
12.1.3 Logging In to FusionInsight Manager.....	939
12.1.4 Logging In to the Management Node.....	940
12.2 Homepage.....	941
12.2.1 Overview.....	941
12.2.2 Managing the Monitoring Indicator Report.....	942
12.3 Cluster.....	944
12.3.1 Cluster Management.....	944
12.3.1.1 Overview.....	944
12.3.1.2 Performing a Rolling Restart of a Cluster.....	945
12.3.1.3 Managing Expired Configurations.....	948
12.3.1.4 Downloading the Client.....	949
12.3.1.5 Modifying Cluster Properties.....	950

12.3.1.6 Management Cluster Configuration.....	950
12.3.1.7 Static Service Pool.....	952
12.3.1.7.1 Static Service Resources.....	952
12.3.1.7.2 Configuring Cluster Static Resources.....	953
12.3.1.7.3 Viewing Cluster Static Resources.....	955
12.3.1.8 Client Management.....	956
12.3.1.8.1 Managing the Client.....	956
12.3.1.8.2 Batch Upgrading Clients.....	957
12.3.1.8.3 Updating the hosts File in Batches.....	959
12.3.2 Managing a Service.....	960
12.3.2.1 Overview.....	960
12.3.2.2 Other Service Management Operations.....	964
12.3.2.2.1 Service Details Page.....	964
12.3.2.2.2 Performing Active/Standby Switchover of a Role Instance.....	967
12.3.2.2.3 Resource Monitoring.....	967
12.3.2.2.4 Collecting Stack Information.....	971
12.3.2.2.5 Switching Ranger Authentication.....	972
12.3.2.3 Service Configuration.....	973
12.3.2.3.1 Modifying Service Configuration Parameters.....	974
12.3.2.3.2 Modifying Customized Configuration Parameters of a Service.....	975
12.3.3 Instance Management.....	977
12.3.3.1 Instance Management Overview.....	977
12.3.3.2 Decommissioning and Recommissioning an Instance.....	979
12.3.3.3 Managing Instance Configurations.....	981
12.3.3.4 Viewing the Instance Configuration File.....	982
12.3.3.5 Instance Group.....	983
12.3.3.5.1 Managing Instance Groups.....	983
12.3.3.5.2 Viewing Information About an Instance Group.....	985
12.3.3.5.3 Configuring Instantiation Group Parameters.....	986
12.4 Hosts.....	986
12.4.1 Host Management Page.....	986
12.4.1.1 Viewing the Host List.....	986
12.4.1.2 Viewing the Host Dashboard.....	987
12.4.1.3 Checking Processes and Resources on the Active Node.....	988
12.4.2 Host Maintenance Operations.....	989
12.4.2.1 Starting and Stopping All Instances on a Host.....	989
12.4.2.2 Performing a Host Health Check.....	989
12.4.2.3 Configuring Racks for Hosts.....	990
12.4.2.4 Isolating a Host.....	993
12.4.2.5 Exporting Host Information.....	994
12.4.3 Resource Overview.....	994
12.4.3.1 Distribution.....	994

12.4.3.2 Trend.....	996
12.4.3.3 Cluster.....	997
12.4.3.4 Host.....	998
12.5 O&M.....	998
12.5.1 Alarms.....	999
12.5.1.1 Overview of Alarms and Events.....	999
12.5.1.2 Configuring the Threshold.....	1002
12.5.1.3 Configuring the Alarm Masking Status.....	1021
12.5.2 Log.....	1022
12.5.2.1 Online Log Searching.....	1022
12.5.2.2 Log Downloading.....	1025
12.5.3 Perform a Health Check.....	1025
12.5.3.1 Viewing a Health Check Task.....	1025
12.5.3.2 Managing Health Check Reports.....	1026
12.5.3.3 Modifying Health Check Configuration.....	1027
12.5.4 Configuring Backup and Backup Restoration.....	1027
12.5.4.1 Creating a Backup Task.....	1027
12.5.4.2 Creating a Backup Restoration Task.....	1028
12.5.4.3 Managing Backup and Backup Restoration Tasks.....	1029
12.6 Audit.....	1030
12.6.1 Overview.....	1030
12.6.2 Configuring Audit Log Dumping.....	1031
12.7 Tenant Resources.....	1032
12.7.1 Introduction to Multi-Tenant.....	1033
12.7.1.1 Overview.....	1033
12.7.1.2 Technical Principles.....	1034
12.7.1.2.1 Multi-Tenant Management.....	1034
12.7.1.2.2 Models Related to Multi-Tenant.....	1037
12.7.1.2.3 Resource Overview.....	1040
12.7.1.2.4 Dynamic Resources.....	1041
12.7.1.2.5 Storage Resource.....	1044
12.7.1.3 Multi-Tenant Use.....	1044
12.7.1.3.1 Overview.....	1044
12.7.1.3.2 Process Overview.....	1045
12.7.2 Using the Superior Scheduler in Multi-Tenant Scenarios.....	1047
12.7.2.1 Creating Tenants.....	1047
12.7.2.1.1 Adding a Tenant.....	1047
12.7.2.1.2 Adding a Sub-Tenant.....	1050
12.7.2.1.3 Adding a User and Binding the User to a Tenant Role.....	1054
12.7.2.2 Managing Tenants.....	1056
12.7.2.2.1 Managing a Tenant Directory.....	1056
12.7.2.2.2 Restoring Tenant Data.....	1058

12.7.2.2.3 Deleting a Tenant.....	1059
12.7.2.3 Managing Resources.....	1060
12.7.2.3.1 Add a Resource Pool.....	1060
12.7.2.3.2 Modifying a Resource Pool.....	1061
12.7.2.3.3 Deleting a Resource Pool.....	1061
12.7.2.3.4 Configuring a Queue.....	1062
12.7.2.3.5 Configuring the Queue Capacity Policy of a Resource Pool.....	1064
12.7.2.3.6 Clearing Queue Configurations.....	1065
12.7.2.4 Managing Global User Policies.....	1065
12.7.3 Using the Capacity Scheduler in Multi-Tenant Scenarios.....	1066
12.7.3.1 Creating Tenants.....	1066
12.7.3.1.1 Adding a Tenant.....	1067
12.7.3.1.2 Adding a Sub-Tenant.....	1070
12.7.3.1.3 Adding a User and Binding the User to a Tenant Role.....	1073
12.7.3.2 Managing Tenants.....	1075
12.7.3.2.1 Managing a Tenant Directory.....	1075
12.7.3.2.2 Restoring Tenant Data.....	1077
12.7.3.2.3 Deleting a Tenant.....	1078
12.7.3.2.4 Clearing Unassociated Queues of a Tenant in Capacity Scheduler Mode.....	1078
12.7.3.3 Managing Resources.....	1080
12.7.3.3.1 Add a Resource Pool.....	1080
12.7.3.3.2 Modifying a Resource Pool.....	1080
12.7.3.3.3 Deleting a Resource Pool.....	1081
12.7.3.3.4 Configuring a Queue.....	1082
12.7.3.3.5 Configuring the Queue Capacity Policy of a Resource Pool.....	1083
12.7.3.3.6 Clearing Queue Configurations.....	1084
12.7.4 Switching the Scheduler.....	1085
12.8 System Configuration.....	1087
12.8.1 Configuring Permission.....	1087
12.8.1.1 Managing Users.....	1087
12.8.1.1.1 Creating a User.....	1087
12.8.1.1.2 Modifying User Information.....	1089
12.8.1.1.3 Exporting User Information.....	1089
12.8.1.1.4 Locking a User.....	1090
12.8.1.1.5 Unlocking a User.....	1091
12.8.1.1.6 Deleting a User.....	1091
12.8.1.1.7 Changing a User Password.....	1092
12.8.1.1.8 Initializing a Password.....	1093
12.8.1.1.9 Exporting an Authentication Credential File.....	1094
12.8.1.2 Managing User Groups.....	1095
12.8.1.3 Managing Roles.....	1096
12.8.1.4 Security Policy.....	1098

12.8.1.4.1 Configuring Password Policies.....	1098
12.8.1.4.2 Configuring the Independent Attribute.....	1100
12.8.2 Configuring Interconnections.....	1101
12.8.2.1 Configuring SNMP Northbound Parameters.....	1101
12.8.2.2 Configuring Syslog Northbound Parameters.....	1103
12.8.2.3 Configuring Monitoring Indicator Data Dump.....	1108
12.8.3 Importing a Certificate.....	1111
12.8.4 OMS Management.....	1112
12.8.4.1 Overview of the OMS Maintenance Page.....	1112
12.8.4.2 Changing the OMS Database Password.....	1113
12.8.4.3 Modifying OMS Service Configuration Parameters.....	1114
12.8.5 Component Management.....	1115
12.8.5.1 Viewing Component Packages.....	1116
12.9 Cluster Management.....	1116
12.9.1 Configuring Client.....	1116
12.9.1.1 Installing a Client.....	1116
12.9.1.2 Using a Client.....	1121
12.9.1.3 Updating the Configuration of the Installed Client.....	1122
12.9.2 Managing Mutual Trust Relationships Between Managers.....	1123
12.9.2.1 Introduction to Mutual Trust Relationships Between Clusters.....	1123
12.9.2.2 Changing Manager System Domain Name.....	1124
12.9.2.3 Configuring Cross-Manager Cluster Mutual Trust Relationships.....	1127
12.9.2.4 Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured.....	1130
12.9.3 Configuring Periodical Alarm and Audit Information Backup.....	1131
12.9.4 Modifying the Manager Routing Table.....	1132
12.9.5 Switching to Maintenance Mode.....	1134
12.9.6 Routine Maintenance.....	1137
12.10 Log Management.....	1140
12.10.1 About Logs.....	1140
12.10.2 Manager Log List.....	1157
12.10.3 Configuring the Log Level and Log File Size.....	1167
12.10.4 Configuring the Number of Local Backup Audit Log Files.....	1169
12.10.5 Viewing Role Instance Logs.....	1170
12.11 Backup and Recovery Management.....	1171
12.11.1 Introduction.....	1171
12.11.2 Enabling Cross-Cluster Replication.....	1178
12.11.3 Backing Up Data.....	1179
12.11.3.1 Backing Up Manager Data.....	1179
12.11.3.2 Backing Up DBService Data.....	1183
12.11.3.3 Backing Up HBase Metadata.....	1187
12.11.3.4 Backing Up HBase Service Data.....	1190
12.11.3.5 Backing Up NameNode Data.....	1195

12.11.3.6 Backing Up HDFS Service Data.....	1199
12.11.3.7 Backing Up Hive Service Data.....	1204
12.11.3.8 Backing Up Kafka Metadata.....	1209
12.11.3.9 Backing Up Yarn Resource Pool Data.....	1213
12.11.4 Recovering Data.....	1216
12.11.4.1 Recovering Manager Data.....	1216
12.11.4.2 Recovering DBService Data.....	1221
12.11.4.3 Recovering HBase Metadata.....	1224
12.11.4.4 Recovering HBase Service Data.....	1228
12.11.4.5 Recovering NameNode Data.....	1232
12.11.4.6 Recovering HDFS Service Data.....	1236
12.11.4.7 Recovering Hive Service Data.....	1240
12.11.4.8 Recovering Kafka Metadata.....	1245
12.11.4.9 Recovering Yarn Data.....	1248
12.11.5 Managing Local Quick Recovery Tasks.....	1251
12.11.6 Modifying a Backup Task.....	1252
12.11.7 Viewing Backup and Recovery Tasks.....	1253
12.12 Security Management.....	1254
12.12.1 Security Overview.....	1254
12.12.1.1 Rights Model.....	1254
12.12.1.2 Rights Mechanism.....	1256
12.12.1.3 Authentication Policies.....	1257
12.12.1.4 Permission Verification Policies.....	1259
12.12.1.5 User Information Overview.....	1261

12.12.2.1.3 Enabling and Disabling Permission Verification on Cluster Components.....	1299
12.12.2.1.4 Logging In to a Non-Cluster Node Using a Cluster User in Normal Mode.....	1301
12.12.2.2 Changing the Password for a System User.....	1303
12.12.2.2.1 Changing the Password for User admin.....	1303
12.12.2.2.2 Changing the Password for an OS User.....	1304
12.12.2.2.3 Changing the Password for a System Internal User.....	1304
12.12.2.2.3.1 Changing the Password for the Kerberos Administrator.....	1304
12.12.2.2.3.2 Changing the Password for the OMS Kerberos Administrator.....	1305
12.12.2.2.3.3 Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP) .....	1306
12.12.2.2.3.4 Changing the Password for the LDAP Administrator.....	1307
12.12.2.2.3.5 Changing the Password for a Component Running User.....	1309
12.12.2.4 Changing the Password for a Database User.....	1310

12.12.2.4.1 Changing the Password for the OMS Database Administrator.....	1310
12.12.2.4.2 Changing the Password for the OMS Database Data Access User.....	1311
12.12.2.4.3 Changing the Password for a Component Database User.....	1312
12.12.2.4.4 Changing the Password for User omm in DBService.....	1313
12.12.3 Security Hardening.....	1313
12.12.3.1 Hardening Policy.....	1314
12.12.3.2 Configuring a Trusted IP Address to Access LDAP.....	1315
12.12.3.3 HFile and WAL Encryption.....	1318
12.12.3.4 Security Configuration.....	1322
12.12.3.5 Configuring an IP Address Whitelist for Modifications Allowed by HBase.....	1325
12.12.3.6 Updating a Key for a Cluster.....	1326
12.12.3.7 Hardening the LDAP.....	1327
12.12.3.8 Configuring Kafka Data Encryption During Transmission.....	1328
12.12.3.9 Configuring HDFS Data Encryption During Transmission.....	1329
12.12.3.10 Configuring Communication Authentication for Storm Processes.....	1332
12.12.3.11 Encrypting the Communication Between Controller and Agent.....	1332
12.12.3.12 Updating SSH Keys for User omm.....	1333
12.12.4 Security Maintenance.....	1335
12.12.4.1 Account Maintenance Suggestions.....	1335
12.12.4.2 Password Maintenance Suggestions.....	1335
12.12.4.3 Logs Maintenance Suggestions.....	1336
12.12.5 Security Statement.....	1336
12.13 Alarm Reference (Applicable to MRS 3.x).....	1337
12.13.1 ALM-12001 Audit Log Dumping Failure.....	1337
12.13.2 ALM-12004 OLdap Resource Abnormal.....	1339
12.13.3 ALM-12005 OKerberos Resource Abnormal.....	1341
12.13.4 ALM-12006 Node Fault.....	1343
12.13.5 ALM-12007 Process Fault.....	1347
12.13.6 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes.....	1350
12.13.7 ALM-12011 Manager Data Synchronization Exception Between the Active and Standby Nodes.....	1353
12.13.8 ALM-12012 NTP Service Is Abnormal.....	1356
12.13.9 ALM-12014 Partition Lost.....	1364
12.13.10 ALM-12015 Partition Filesystem Readonly.....	1366
12.13.11 ALM-12016 CPU Usage Exceeds the Threshold.....	1368
12.13.12 ALM-12017 Insufficient Disk Capacity.....	1371
12.13.13 ALM-12018 Memory Usage Exceeds the Threshold.....	1374
12.13.14 ALM-12027 Host PID Usage Exceeds the Threshold.....	1376
12.13.15 ALM-12028 Number of Processes in the D State and Z State on a Host Exceeds the Threshold.....	1378
12.13.16 ALM-12033 Slow Disk Fault.....	1380
12.13.17 ALM-12034 Periodical Backup Failure.....	1387
12.13.18 ALM-12035 Unknown Data Status After Recovery Task Failure.....	1389
12.13.19 ALM-12037 NTP Server Abnormal.....	1391

12.13.20 ALM-12038 Monitoring Indicator Dumping Failure.....	1394
12.13.21 ALM-12039 Active/Standby OMS Databases Not Synchronized.....	1397
12.13.22 ALM-12040 Insufficient System Entropy.....	1399
12.13.23 ALM-12041 Incorrect Permission on Key Files.....	1402
12.13.24 ALM-12042 Incorrect Configuration of Key Files.....	1404
12.13.25 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold.....	1407
12.13.26 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold.....	1411
12.13.27 ALM-12047 Read Packet Error Rate Exceeds the Threshold.....	1413
12.13.28 ALM-12048 Write Packet Error Rate Exceeds the Threshold.....	1416
12.13.29 ALM-12049 Network Read Throughput Rate Exceeds the Threshold.....	1419
12.13.30 ALM-12050 Network Write Throughput Rate Exceeds the Threshold.....	1422
12.13.31 ALM-12051 Disk Inode Usage Exceeds the Threshold.....	1425
12.13.32 ALM-12052 TCP Temporary Port Usage Exceeds the Threshold.....	1427
12.13.33 ALM-12053 Host File Handle Usage Exceeds the Threshold.....	1430
12.13.34 ALM-12054 Invalid Certificate File.....	1432
12.13.35 ALM-12055 Certificate File Is About to Expire.....	1435
12.13.36 ALM-12057 Metadata Not Configured with the Task to Periodically Back Up Data to a Third-Party Server.....	1438
12.13.37 ALM-12061 Process Usage Exceeds the Threshold.....	1440
12.13.38 ALM-12062 OMS Parameter Configurations Mismatch with the Cluster Scale.....	1443
12.13.39 ALM-12063 Unavailable Disk.....	1446
12.13.40 ALM-12064 Host Random Port Range Conflicts with Cluster Used Port.....	1448
12.13.41 ALM-12066 Trust Relationships Between Nodes Become Invalid.....	1450
12.13.42 ALM-12067 Tomcat Resource Is Abnormal.....	1453
12.13.43 ALM-12068 ACS Resource Exception.....	1455
12.13.44 ALM-12069 AOS Resource Exception.....	1457
12.13.45 ALM-12070 Controller Resource Is Abnormal.....	1458
12.13.46 ALM-12071 Httpd Resource Is Abnormal.....	1460
12.13.47 ALM-12072 FloatIP Resource Is Abnormal.....	1462
12.13.48 ALM-12073 CEP Resource Is Abnormal.....	1464
12.13.49 ALM-12074 FMS Resource Is Abnormal.....	1466
12.13.50 ALM-12075 PMS Resource Is Abnormal.....	1468
12.13.51 ALM-12076 GaussDB Resource Is Abnormal.....	1470
12.13.52 ALM-12077 User omm Expired.....	1473
12.13.53 ALM-12078 Password of User omm Expired.....	1474
12.13.54 ALM-12079 User omm Is About to Expire.....	1476
12.13.55 ALM-12080 Password of User omm Is About to Expire.....	1478
12.13.56 ALM-12081 User ommdba Expired.....	1479
12.13.57 ALM-12082 User ommdba Is About to Expire.....	1481
12.13.58 ALM-12083 Password of User ommdba Is About to Expire.....	1483
12.13.59 ALM-12084 Password of User ommdba Expired.....	1484
12.13.60 ALM-12085 Service Audit Log Dump Failure.....	1486
12.13.61 ALM-12087 System Is in the Upgrade Observation Period.....	1489

12.13.62 ALM-12089 Inter-Node Network Is Abnormal.....	1491
12.13.63 ALM-12091 Abnormal disaster Resources.....	1493
12.13.64 ALM-12101 AZ Unhealthy.....	1494
12.13.65 ALM-12102 AZ HA Component Is Not Deployed Based on DR Requirements.....	1496
12.13.66 ALM-12103 Executor Resource Exception.....	1498
12.13.67 ALM-12104 Abnormal Knox Resources.....	1499
12.13.68 ALM-12110 Failed to get ECS temporary AK/SK.....	1501
12.13.69 ALM-12172 Failed to Report Metrics to Cloud Eye.....	1503
12.13.70 ALM-12180 Suspended Disk I/O.....	1505
12.13.71 ALM-12186 CGroup Task Usage Exceeds the Threshold.....	1508
12.13.72 ALM-12187 Failed to Expand Disk Partition Capacity.....	1510
12.13.73 ALM-12188 diskmgt Disk Monitoring Unavailable.....	1513
12.13.74 ALM-12190 Number of Knox Connections Exceeds the Threshold.....	1515
12.13.75 ALM-13000 ZooKeeper Service Unavailable.....	1517
12.13.76 ALM-13001 Available ZooKeeper Connections Are Insufficient.....	1520
12.13.77 ALM-13002 ZooKeeper Direct Memory Usage Exceeds the Threshold.....	1523
12.13.78 ALM-13003 GC Duration of the ZooKeeper Process Exceeds the Threshold.....	1525
12.13.79 ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold.....	1527
12.13.80 ALM-13005 Failed to Set the Quota of Top Directories of ZooKeeper Components.....	1530
12.13.81 ALM-13006 Znode Number or Capacity Exceeds the Threshold.....	1532
12.13.82 ALM-13007 Available ZooKeeper Client Connections Are Insufficient.....	1534
12.13.83 ALM-13008 ZooKeeper Znode Usage Exceeds the Threshold.....	1536
12.13.84 ALM-13009 ZooKeeper Znode Capacity Usage Exceeds the Threshold.....	1538
12.13.85 ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold.....	1540
12.13.86 ALM-14000 HDFS Service Unavailable.....	1542
12.13.87 ALM-14001 HDFS Disk Usage Exceeds the Threshold.....	1545
12.13.88 ALM-14002 DataNode Disk Usage Exceeds the Threshold.....	1548
12.13.89 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold.....	1550
12.13.90 ALM-14006 Number of HDFS Files Exceeds the Threshold.....	1553
12.13.91 ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold.....	1556
12.13.92 ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold.....	1560
12.13.93 ALM-14009 Number of Dead DataNodes Exceeds the Threshold.....	1562
12.13.94 ALM-14010 NameService Service Is Abnormal.....	1566
12.13.95 ALM-14011 DataNode Data Directory Is Not Configured Properly.....	1570
12.13.96 ALM-14012 JournalNode Is Out of Synchronization.....	1573
12.13.97 ALM-14013 Failed to Update the NameNode FsImage File.....	1576
12.13.98 ALM-14014 NameNode GC Time Exceeds the Threshold.....	1581
12.13.99 ALM-14015 DataNode GC Time Exceeds the Threshold.....	1583
12.13.100 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold.....	1585
12.13.101 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold.....	1588
12.13.102 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold.....	1590
12.13.103 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold.....	1593

12.13.104	ALM-14020	Number of Entries in the HDFS Directory Exceeds the Threshold.....	1596
12.13.105	ALM-14021	NameNode Average RPC Processing Time Exceeds the Threshold.....	1599
12.13.106	ALM-14022	NameNode Average RPC Queuing Time Exceeds the Threshold.....	1602
12.13.107	ALM-14023	Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold.....	1606
12.13.108	ALM-14024	Tenant Space Usage Exceeds the Threshold.....	1609
12.13.109	ALM-14025	Tenant File Object Usage Exceeds the Threshold.....	1611
12.13.110	ALM-14026	Blocks on DataNode Exceed the Threshold.....	1613
12.13.111	ALM-14027	DataNode Disk Fault.....	1616
12.13.112	ALM-14028	Number of Blocks to Be Supplemented Exceeds the Threshold.....	1619
12.13.113	ALM-14029	Number of Blocks in a Replica Exceeds the Threshold.....	1621
12.13.114	ALM-14030	HDFS Allows Write of Single-Replica Data.....	1624
12.13.115	ALM-14031	DataNode Process Is Abnormal.....	1625
12.13.116	ALM-14032	JournalNode Process Is Abnormal.....	1627
12.13.117	ALM-14033	ZKFC Process Is Abnormal.....	1629
12.13.118	ALM-14034	Router Process Is Abnormal.....	1631
12.13.119	ALM-14035	HttpFS Process Is Abnormal.....	1633
12.13.120	ALM-16000	Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold.....	1635
12.13.121	ALM-16001	Hive Warehouse Space Usage Exceeds the Threshold.....	1637
12.13.122	ALM-16002	Hive SQL Execution Success Rate Is Lower Than the Threshold.....	1639
12.13.123	ALM-16003	Background Thread Usage Exceeds the Threshold.....	1642
12.13.124	ALM-16004	Hive Service Unavailable.....	1644
12.13.125	ALM-16005	The Heap Memory Usage of the Hive Process Exceeds the Threshold.....	1649
12.13.126	ALM-16006	The Direct Memory Usage of the Hive Process Exceeds the Threshold.....	1652
12.13.127	ALM-16007	Hive GC Time Exceeds the Threshold.....	1654
12.13.128	ALM-16008	Non-Heap Memory Usage of the Hive Process Exceeds the Threshold.....	1657
12.13.129	ALM-16009	Map Number Exceeds the Threshold.....	1659
12.13.130	ALM-16045	Hive Data Warehouse Is Deleted.....	1661
12.13.131	ALM-16046	Hive Data Warehouse Permission Is Modified.....	1663
12.13.132	ALM-16047	HiveServer Has Been Deregistered from ZooKeeper.....	1664
12.13.133	ALM-16048	Tez or Spark Library Path Does Not Exist.....	1667
12.13.134	ALM-17003	Oozie Service Unavailable.....	1669
12.13.135	ALM-17004	Oozie Heap Memory Usage Exceeds the Threshold.....	1673
12.13.136	ALM-17005	Oozie Non Heap Memory Usage Exceeds the Threshold.....	1675
12.13.137	ALM-17006	Oozie Direct Memory Usage Exceeds the Threshold.....	1677
12.13.138	ALM-17007	Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold.....	1679
12.13.139	ALM-17008	Abnormal Connection Between Oozie and ZooKeeper.....	1681
12.13.140	ALM-17009	Abnormal Connection Between Oozie and DBService.....	1683
12.13.141	ALM-17010	Abnormal Connection Between Oozie and HDFS.....	1685
12.13.142	ALM-17011	Abnormal Connection Between Oozie and Yarn.....	1687
12.13.143	ALM-18000	Yarn Service Unavailable.....	1689
12.13.144	ALM-18002	NodeManager Heartbeat Lost.....	1691
12.13.145	ALM-18003	NodeManager Unhealthy.....	1695

12.13.146 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold.....	1697
12.13.147 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold.....	1700
12.13.148 ALM-18010 ResourceManager GC Time Exceeds the Threshold.....	1702
12.13.149 ALM-18011 NodeManager GC Time Exceeds the Threshold.....	1705
12.13.150 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold.....	1707
12.13.151 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold.....	1709
12.13.152 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold.....	1712
12.13.153 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold.....	1714
12.13.154 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold.....	1716
12.13.155 ALM-18017 Non Heap Memory Usage of NodeManager Exceeds the Threshold.....	1719
12.13.156 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold.....	1721
12.13.157 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold.....	1724
12.13.158 ALM-18020 Yarn Task Execution Timeout.....	1726
12.13.159 ALM-18021 Mapreduce Service Unavailable.....	1729
12.13.160 ALM-18022 Insufficient Yarn Queue Resources.....	1731
12.13.161 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold.....	1734
12.13.162 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold.....	1736
12.13.163 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold.....	1738
12.13.164 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold.....	1740
12.13.165 ALM-19000 HBase Service Unavailable.....	1742
12.13.166 ALM-19006 HBase Replication Sync Failed.....	1748
12.13.167 ALM-19007 HBase GC Time Exceeds the Threshold.....	1751
12.13.168 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold.....	1754
12.13.169 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold.....	1757
12.13.170 ALM-19011 RegionServer Region Number Exceeds the Threshold.....	1759
12.13.171 ALM-19012 HBase System Table Directory or File Lost.....	1763
12.13.172 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold.....	1765
12.13.173 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely.....	1767
12.13.174 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold.....	1770
12.13.175 ALM-19016 Quantity Quota Usage on ZooKeeper Exceeds the Threshold Severely.....	1772
12.13.176 ALM-19017 Capacity Quota Usage on ZooKeeper Exceeds the Threshold.....	1775
12.13.177 ALM-19018 HBase Compaction Queue Size Exceeds the Threshold.....	1777
12.13.178 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold.....	1779
12.13.179 ALM-19020 Number of HBase WAL Files to Be Synchronized Exceeds the Threshold.....	1782
12.13.180 ALM-19021 Handler Usage of RegionServer Exceeds the Threshold.....	1785
12.13.181 ALM-19022 HBase Hotspot Detection Is Unavailable.....	1788
12.13.182 ALM-19023 Region Traffic Restriction for HBase.....	1791
12.13.183 ALM-19024 RPC Requests P99 Latency on RegionServer Exceeds the Threshold.....	1793
12.13.184 ALM-19025 Damaged StoreFile in HBase.....	1796
12.13.185 ALM-19026 Damaged WAL Files in HBase.....	1798
12.13.186 ALM-20002 Hue Service Unavailable.....	1800
12.13.187 ALM-23001 Loader Service Unavailable.....	1802

12.13.188 ALM-23003 Loader Task Execution Failure.....	1806
12.13.189 ALM-23004 Loader Heap Memory Usage Exceeds the Threshold.....	1809
12.13.190 ALM-23005 Loader Non-Heap Memory Usage Exceeds the Threshold.....	1811
12.13.191 ALM-23006 Loader Direct Memory Usage Exceeds the Threshold.....	1813
12.13.192 ALM-23007 Garbage Collection (GC) Time of the Loader Process Exceeds the Threshold.....	1815
12.13.193 ALM-24000 Flume Service Unavailable.....	1817
12.13.194 ALM-24001 Flume Agent Exception.....	1819
12.13.195 ALM-24003 Flume Client Connection Interrupted.....	1822
12.13.196 ALM-24004 Exception Occurs When Flume Reads Data.....	1825
12.13.197 ALM-24005 Exception Occurs When Flume Transmits Data.....	1827
12.13.198 ALM-24006 Heap Memory Usage of Flume Server Exceeds the Threshold.....	1830
12.13.199 ALM-24007 Flume Server Direct Memory Usage Exceeds the Threshold.....	1832
12.13.200 ALM-24008 Flume Server Non Heap Memory Usage Exceeds the Threshold.....	1835
12.13.201 ALM-24009 Flume Server Garbage Collection (GC) Time Exceeds the Threshold.....	1837
12.13.202 ALM-24010 Flume Certificate File Is Invalid or Damaged.....	1839
12.13.203 ALM-24011 Flume Certificate File Is About to Expire.....	1841
12.13.204 ALM-24012 Flume Certificate File Has Expired.....	1843
12.13.205 ALM-24013 Flume MonitorServer Certificate File Is Invalid or Damaged.....	1846
12.13.206 ALM-24014 Flume MonitorServer Certificate Is About to Expire.....	1848
12.13.207 ALM-24015 Flume MonitorServer Certificate File Has Expired.....	1850
12.13.208 ALM-25000 LdapServer Service Unavailable.....	1853
12.13.209 ALM-25004 Abnormal LdapServer Data Synchronization.....	1855
12.13.210 ALM-25005 nscd Service Exception.....	1858
12.13.211 ALM-25006 Sssd Service Exception.....	1862
12.13.212 ALM-25007 Number of SlapdServer Connections Exceeds the Threshold.....	1865
12.13.213 ALM-25008 SlapdServer CPU Usage Exceeds the Threshold.....	1868
12.13.214 ALM-25500 KrbServer Service Unavailable.....	1870
12.13.215 ALM-26051 Storm Service Unavailable.....	1872
12.13.216 ALM-26052 Number of Available Supervisors of the Storm Service Is Less Than the Threshold .....	1874
12.13.217 ALM-26053 Storm Slot Usage Exceeds the Threshold.....	1876
12.13.218 ALM-26054 Nimbus Heap Memory Usage Exceeds the Threshold.....	1878
12.13.219 ALM-27001 DBService Service Unavailable.....	1881
12.13.220 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes.....	1884
12.13.221 ALM-27004 Data Inconsistency Between Active and Standby DBServices.....	1886
12.13.222 ALM-27005 Database Connections Usage Exceeds the Threshold.....	1888
12.13.223 ALM-27006 Disk Space Usage of the Data Directory Exceeds the Threshold.....	1893
12.13.224 ALM-27007 Database Enters the Read-Only Mode.....	1895
12.13.225 ALM-29010 Number of Queries Being Submitted by Impalad Exceeds the Threshold.....	1898
12.13.226 ALM-29011 Number of Queries Being Executed by Impalad Exceeds the Threshold.....	1900
12.13.227 ALM-29012 Number of Queries Being Waited by Impalad Exceeds the Threshold.....	1902
12.13.228 ALM-29016 Impalad Instance in the Sub-healthy State.....	1904
12.13.229 ALM-38000 Kafka Service Unavailable.....	1906

12.13.230 ALM-38001 Insufficient Kafka Disk Capacity.....	1909
12.13.231 ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold.....	1914
12.13.232 ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold.....	1916
12.13.233 ALM-38005 GC Duration of the Broker Process Exceeds the Threshold.....	1918
12.13.234 ALM-38006 Percentage of Kafka Partitions That Are Not Completely Synchronized Exceeds the Threshold.....	1920
12.13.235 ALM-38007 Status of Kafka Default User Is Abnormal.....	1922
12.13.236 ALM-38008 Abnormal Kafka Data Directory Status.....	1924
12.13.237 ALM-38009 Busy Broker Disk I/Os (Applicable to Versions Later Than MRS 3.1.0).....	1927
12.13.238 ALM-38010 Topics with Single Replica.....	1929
12.13.239 ALM-38011 User Connection Usage on Broker Exceeds the Threshold.....	1931
12.13.240 ALM-43001 Spark2x Service Unavailable.....	1935
12.13.241 ALM-43006 Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold.....	1938
12.13.242 ALM-43007 Non-Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold..	1940
12.13.243 ALM-43008 The Direct Memory Usage of the JobHistory2x Process Exceeds the Threshold..	1943
12.13.244 ALM-43009 JobHistory2x Process GC Time Exceeds the Threshold.....	1945
12.13.245 ALM-43010 Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold.....	1948
12.13.246 ALM-43011 Non-Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold	1950
12.13.247 ALM-43012 Direct Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold	1953
12.13.248 ALM-43013 JDBCServer2x Process GC Time Exceeds the Threshold.....	1955
12.13.249 ALM-43017 JDBCServer2x Process Full GC Number Exceeds the Threshold.....	1957
12.13.250 ALM-43018 JobHistory2x Process Full GC Number Exceeds the Threshold.....	1959
12.13.251 ALM-43019 Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold.....	1962
12.13.252 ALM-43020 Non-Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold	1964
12.13.253 ALM-43021 Direct Memory Usage of the IndexServer2x Process Exceeds the Threshold.....	1967
12.13.254 ALM-43022 IndexServer2x Process GC Time Exceeds the Threshold.....	1969
12.13.255 ALM-43023 IndexServer2x Process Full GC Number Exceeds the Threshold.....	1971
12.13.256 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold.....	1973
12.13.257 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold.....	1975
12.13.258 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold.....	1976
12.13.259 ALM-45000 HetuEngine Service Unavailable.....	1978
12.13.260 ALM-45001 Faulty HetuEngine Compute Instances.....	1982
12.13.261 ALM-45175 Average Time for Calling OBS Metadata APIs Is Greater than the Threshold.....	1984
12.13.262 ALM-45176 Success Rate of Calling OBS Metadata APIs Is Lower than the Threshold.....	1986
12.13.263 ALM-45177 Success Rate of Calling OBS Data Read APIs Is Lower than the Threshold.....	1988
12.13.264 ALM-45178 Success Rate of Calling OBS Data Write APIs Is Lower Than the Threshold.....	1990
12.13.265 ALM-45179 Number of Failed OBS readFully API Calls Exceeds the Threshold.....	1992
12.13.266 ALM-45180 Number of Failed OBS read API Calls Exceeds the Threshold.....	1994
12.13.267 ALM-45181 Number of Failed OBS write API Calls Exceeds the Threshold.....	1996

<b>17 FAQs.....</b>	<b>2255</b>
17.1 MRS Overview.....	2255
17.1.1 What Is MRS Used For?.....	2255
17.1.2 What Types of Distributed Storage Does MRS Support?.....	2255
17.1.3 How Do I Create an MRS Cluster Using a Custom Security Group?.....	2257
17.1.4 How Do I Use MRS?.....	2257
17.1.5 How Does MRS Ensure Security of Data and Services?.....	2257
17.1.6 Can I Configure a Phoenix Connection Pool?.....	2258
17.1.7 Does MRS Support Change of the Network Segment?.....	2258
17.1.8 Can I Downgrade the Specifications of an MRS Cluster Node?.....	2258
17.1.9 What Is the Relationship Between Hive and Other Components?.....	2258
17.1.10 Does an MRS Cluster Support Hive on Spark?.....	2259
17.1.11 What Are the Differences Between Hive Versions?.....	2259

17.1.12 Which MRS Cluster Version Supports Hive Connection and User Synchronization?.....	2259
17.1.13 What Are the Differences Between OBS and HDFS in Data Storage?.....	2259
17.1.14 How Do I Obtain the Hadoop Pressure Test Tool?.....	2260
17.1.15 What Is the Relationship Between Impala and Other Components?.....	2260
17.1.16 Statement About the Public IP Addresses in the Open-Source Third-Party SDK Integrated by MRS .....	2260
17.1.17 What Is the Relationship Between Kudu and HBase?.....	2260
17.1.18 Does MRS Support Running Hive on Kudu?.....	2261
17.1.19 What Are the Solutions for processing 1 Billion Data Records?.....	2261
17.1.20 Can I Change the IP address of DBService?.....	2261
17.1.21 Can I Clear MRS sudo Logs?.....	2261
17.1.22 Is the Storm Log also limited to 20 GB in MRS cluster 2.1.0?.....	2261
17.1.23 What Is Spark ThriftServer?.....	2261
17.1.24 What Access Protocols Are Supported by Kafka?.....	2262
17.1.25 What If Error 408 Is Reported When an MRS Node Accesses OBS?.....	2262
17.1.26 What Is the Compression Ratio of zstd?.....	2262
17.1.27 Why Are the HDFS, YARN, and MapReduce Components Unavailable When an MRS Cluster Is Created?.....	2262
17.1.28 Why Is the ZooKeeper Component Unavailable When an MRS Cluster Is Created?.....	2262
17.1.29 Which Python Versions Are Supported by Spark Tasks in an MRS 3.1.0 Cluster?.....	2262
17.1.30 How Do I Enable Different Service Programs to Use Different YARN Queues?.....	2262
17.1.31 Differences and Relationships Between the MRS Management Console and Cluster Manager.	2265
17.1.32 How Do I Unbind an EIP from an MRS Cluster Node?.....	2267
17.2 Account and Password.....	2267
17.2.1 What Is the Account for Logging In to Manager?.....	2267
17.2.2 How Do I Query and Change the Password Validity Period of an Account?.....	2267
17.3 Accounts and Permissions.....	2268
17.3.1 Does an MRS Cluster Support Access Permission Control If Kerberos Authentication Is not Enabled? .....	2269
17.3.2 How Do I Assign Tenant Management Permission to a New Account?.....	2269
17.3.3 How Do I Customize an MRS Policy?.....	2270
17.3.4 Why Is the Manage User Function Unavailable on the System Page on MRS Manager?.....	2270
17.3.5 Does Hue Support Account Permission Configuration?.....	2270
17.4 Client Usage.....	2270
17.4.1 How Do I Configure Environment Variables and Run Commands on a Component Client?.....	2270
17.4.2 How Do I Disable ZooKeeper SASL Authentication?.....	2271
17.4.3 An Error Is Reported When the kinit Command Is Executed on a Client Node Outside an MRS Cluster.....	2271
17.5 Web Page Access.....	2271
17.5.1 How Do I Change the Session Timeout Duration for an Open Source Component Web UI?.....	2271
17.5.2 Why Cannot I Refresh the Dynamic Resource Plan Page on MRS Tenant Tab?.....	2274
17.5.3 What Do I Do If the Kafka Topic Monitoring Tab Is Unavailable on Manager?.....	2274
17.5.4 How Do I Do If an Error Is Reported or Some Functions Are Unavailable When I Access the Web UIs of HDFS, Hue, YARN, and Flink?.....	2275

17.6 Alarm Monitoring.....	2276
17.6.1 In an MRS Streaming Cluster, Can the Kafka Topic Monitoring Function Send Alarm Notifications? .....	2276
17.6.2 Where Can I View the Running Resource Queues When the Alarm "ALM-18022 Insufficient Yarn Queue Resources" Is Reported?.....	2276
17.6.3 How Do I Understand the Multi-Level Chart Statistics in the HBase Operation Requests Metric?.....	2276
17.7 Performance Tuning.....	2277
17.7.1 Does an MRS Cluster Support System Reinstallation?.....	2278
17.7.2 Can I Change the OS of an MRS Cluster?.....	2278
17.7.3 How Do I Improve the Resource Utilization of Core Nodes in a Cluster?.....	2278
17.7.4 How Do I Stop the Firewall Service?.....	2278
17.8 Job Development.....	2278
17.8.1 How Do I Get My Data into OBS or HDFS?.....	2278
17.8.2 What Types of Spark Jobs Can Be Submitted in a Cluster?.....	2279
17.8.3 Can I Run Multiple Spark Tasks at the Same Time After the Minimum Tenant Resources of an MRS Cluster Is Changed to 0?.....	2279
17.8.4 What Are the Differences Between the Client Mode and Cluster Mode of Spark Jobs?.....	2279
17.8.5 How Do I View MRS Job Logs?.....	2280
17.8.6 How Do I Do If the Message "The current user does not exist on MRS Manager. Grant the user sufficient permissions on IAM and then perform IAM user synchronization on the Dashboard tab page." Is Displayed?.....	2280
17.8.7 LauncherJob Job Execution Is Failed And the Error Message "jobPropertiesMap is null." Is Displayed .....	2281
17.8.8 How Do I Do If the Flink Job Status on the MRS Console Is Inconsistent with That on Yarn?.....	2281
17.8.9 How Do I Do If a SparkStreaming Job Fails After Being Executed Dozens of Hours and the OBS Access 403 Error is Reported?.....	2281
17.8.10 How Do I Do If an Alarm Is Reported Indicating that the Memory Is Insufficient When I Execute a SQL Statement on the ClickHouse Client?.....	2281
17.8.11 How Do I Do If Error Message "java.io.IOException: Connection reset by peer" Is Displayed During the Execution of a Spark Job?.....	2282
17.8.12 How Do I Do If Error Message "requestId=4971883851071737250" Is Displayed When a Spark Job Accesses OBS?.....	2282
17.8.13 Why DataArtsStudio Occasionally Fail to Schedule Spark Jobs and the Rescheduling also Fails?.....	2283
17.8.14 How Do I Do If a Flink Job Fails to Execute and the Error Message "java.lang.NoSuchFieldError: SECURITY_SSL_ENCRYPT_ENABLED" Is Displayed?.....	2283
17.8.15 Why Submitted Yarn Job Cannot Be Viewed on the Web UI?.....	2283
17.8.16 How Do I Modify the HDFS NameSpace (fs.defaultFS) of an Existing Cluster?.....	2284
17.8.17 How Do I Do If the launcher-job Queue Is Stopped by YARN due to Insufficient Heap Size When I Submit a Flink Job on the Management Plane?.....	2284
17.8.18 How Do I Do If the Error Message "slot request timeout" Is Displayed When I Submit a Flink Job? .....	2284
17.8.19 Data Import and Export of DistCP Jobs.....	2285
17.9 Cluster Upgrade/Patching.....	2285
17.9.1 Can I Upgrade an MRS Cluster?.....	2285
17.9.2 Can I Change the MRS Cluster Version?.....	2285
17.10 Cluster Access.....	2285

17.10.1 Can I Switch Between the Two Login Modes of MRS?.....	2285
17.10.2 How Can I Obtain the IP Address and Port Number of a ZooKeeper Instance?.....	2285
17.10.3 How Do I Access an MRS Cluster from a Node Outside the Cluster?.....	2286
17.11 Big Data Service Development.....	2287
17.11.1 Can MRS Run Multiple Flume Tasks at a Time?.....	2287
17.11.2 How Do I Change FlumeClient Logs to Standard Logs?.....	2287
17.11.3 Where Are the .jar Files and Environment Variables of Hadoop Located?.....	2288
17.11.4 What Compression Algorithms Does HBase Support?.....	2288
17.11.5 Can MRS Write Data to HBase Through the HBase External Table of Hive?.....	2288
17.11.6 How Do I View HBase Logs?.....	2288
17.11.7 How Do I Set the TTL for an HBase Table?.....	2288
17.11.8 How Do I Balance HDFS Data?.....	2288
17.11.9 How Do I Change the Number of HDFS Replicas?.....	2289
17.11.10 What Is the Port for Accessing HDFS Using Python?.....	2289
17.11.11 How Do I Modify the HDFS Active/Standby Switchover Class?.....	2293
17.11.12 What Is the Recommended Number Type of DynamoDB in Hive Tables?.....	2293
17.11.13 Can the Hive Driver Be Interconnected with DBCP2?.....	2293
17.11.14 How Do I View the Hive Table Created by Another User?.....	2294
17.11.15 Can I Export the Query Result of Hive Data?.....	2295
17.11.16 How Do I Do If an Error Occurs When Hive Runs the <b>beeline -e</b> Command to Execute Multiple Statements?.....	2295
17.11.17 How Do I Do If a "hivesql/hivescript" Job Fails to Submit After Hive Is Added?.....	2296
17.11.18 What If an Excel File Downloaded on Hue Failed to Open?.....	2296
17.11.19 How Do I Do If Sessions Are Not Released After Hue Connects to HiveServer and the Error Message "over max user connections" Is Displayed?.....	2298
17.11.20 How Do I Reset Kafka Data?.....	2298
17.11.21 How Do I Obtain the Client Version of MRS Kafka?.....	2298
17.11.22 What Access Protocols Are Supported by Kafka?.....	2298
17.11.23 How Do I Do If Error Message "Not Authorized to access group xxx" Is Displayed When a Kafka Topic Is Consumed?.....	2299
17.11.24 What Compression Algorithms Does Kudu Support?.....	2299
17.11.25 How Do I View Kudu Logs?.....	2299
17.11.26 How Do I Handle the Kudu Service Exceptions Generated During Cluster Creation?.....	2299
17.11.27 Does OpenTSDB Support Python APIs?.....	2300
17.11.28 How Do I Configure Other Data Sources on Presto?.....	2300
17.11.29 How Do I Connect to Spark Shell from MRS?.....	2302
17.11.30 How Do I Connect to Spark Beeline from MRS?.....	2302
17.11.31 Where Are the Execution Logs of Spark Jobs Stored?.....	2303
17.11.32 How Do I Specify a Log Path When Submitting a Task in an MRS Storm Cluster?.....	2303
17.11.33 How Do I Check Whether the ResourceManager Configuration of Yarn Is Correct?.....	2303
17.11.34 How Do I Modify the allow_drop_detached Parameter of ClickHouse?.....	2306
17.11.35 How Do I Do If an Alarm Indicating Insufficient Memory Is Reported During Spark Task Execution?.....	2306

17.11.36 How Do I Do If ClickHouse Consumes Excessive CPU Resources?.....	2307
17.11.37 How Do I Enable the Map Type on ClickHouse?.....	2307
17.11.38 A Large Number of OBS APIs Are Called When Spark SQL Accesses Hive Partitioned Tables..	2308
17.12 API.....	2309
17.12.1 How Do I Configure the node_id Parameter When Using the API for Adjusting Cluster Nodes?	2309
17.13 Cluster Management.....	2309
17.13.1 How Do I View All Clusters?.....	2309
17.13.2 How Do I View Log Information?.....	2309
17.13.3 How Do I View Cluster Configuration Information?.....	2310
17.13.4 How Do I Install Kafka and Flume in an MRS Cluster?.....	2310
17.13.5 How Do I Stop an MRS Cluster?.....	2310
17.13.6 Can I Expand Data Disk Capacity for MRS?.....	2310
17.13.7 Can I Add Components to an Existing Cluster?.....	2310
17.13.8 Can I Delete Components Installed in an MRS Cluster?.....	2311
17.13.9 Can I Change MRS Cluster Nodes on the MRS Console?.....	2311
17.13.10 How Do I Shield Cluster Alarm/Event Notifications?.....	2311
17.13.11 Why Is the Resource Pool Memory Displayed in the MRS Cluster Smaller Than the Actual Cluster Memory?.....	2311
17.13.12 How Do I Configure the Knox Memory?.....	2311
17.13.13 What Is the Python Version Installed for an MRS Cluster?.....	2312
17.13.14 How Do I View the Configuration File Directory of Each Component?.....	2312
17.13.15 How Do I Do If the Time on MRS Nodes Is Incorrect?.....	2313
17.13.16 How Do I Query the Startup Time of an MRS Node?.....	2314
17.13.17 How Do I Do If Trust Relationships Between Nodes Are Abnormal?.....	2314
17.13.18 How Do I Adjust the Memory Size of the manager-executor Process?.....	2315
17.14 Kerberos Usage.....	2316
17.14.1 How Do I Change the Kerberos Authentication Status of a Created MRS Cluster?.....	2316
17.14.2 What Are the Ports of the Kerberos Authentication Service?.....	2316
17.14.3 How Do I Deploy the Kerberos Service in a Running Cluster?.....	2316
17.14.4 How Do I Access Hive in a Cluster with Kerberos Authentication Enabled?.....	2316
17.14.5 How Do I Access Presto in a Cluster with Kerberos Authentication Enabled?.....	2317
17.14.6 How Do I Access Spark in a Cluster with Kerberos Authentication Enabled?.....	2318
17.14.7 How Do I Prevent Kerberos Authentication Expiration?.....	2319
17.15 Metadata Management.....	2320
17.15.1 Where Can I View Hive Metadata?.....	2320
<b>18 Troubleshooting.....</b>	<b>2321</b>
18.1 Accessing the Web Pages.....	2321
18.1.1 Failed to Access MRS Manager.....	2321
18.1.2 Failed to Log In to MRS Manager After the Python Upgrade.....	2322
18.1.3 Failed to Log In to MRS Manager After Changing the Domain Name.....	2323
18.1.4 A Blank Page Is Displayed Upon Login to Manager.....	2324
18.1.5 Failed to Download Authentication Credentials When the Username Is Too Long.....	2324

18.2 Cluster Management.....	2326
18.2.1 Failed to Reduce Task Nodes.....	2326
18.2.2 OBS Certificate in a Cluster Expired.....	2327
18.2.3 Adding a New Disk to an MRS Cluster.....	2328
18.2.4 Replacing a Disk in an MRS Cluster (Applicable to 2.x and Earlier).....	2332
18.2.5 Replacing a Disk in an MRS Cluster (Applicable to 3.x).....	2334
18.2.6 MRS Backup Failure.....	2337
18.2.7 Inconsistency Between df and du Command Output on the Core Node.....	2338
18.2.8 Disassociating a Subnet from the ACL Network.....	2339
18.2.9 MRS Becomes Abnormal After hostname Modification.....	2339
18.2.10 DataNode Restarts Unexpectedly.....	2340
18.2.11 Network Is Unreachable When Using pip3 to Install the Python Package in an MRS Cluster....	2342
18.2.12 Failed to Download the MRS Cluster Client.....	2343
18.2.13 Failed to Scale Out an MRS Cluster.....	2343
18.2.14 Error Occurs When MRS Executes the Insert Command Using Beeline.....	2345
18.2.15 How Do I Upgrade EulerOS to Fix Vulnerabilities in an MRS Cluster?.....	2345
18.2.16 Using CDM to Migrate Data to HDFS.....	2347
18.2.17 Alarms Are Frequently Generated in the MRS Cluster.....	2348
18.2.18 Memory Usage of the PMS Process Is High.....	2350
18.2.19 High Memory Usage of the Knox Process.....	2351
18.2.20 It Takes a Long Time to Access HBase from a Client Installed on a Node Outside the Security Cluster.....	2352
18.2.21 How Do I Locate a Job Submission Failure?.....	2353
18.2.22 OS Disk Space Is Insufficient Due to Oversized HBase Log Files.....	2357
18.2.23 Failed to Delete a New Tenant on FusionInsight Manager.....	2358
18.3 Using Alluixo.....	2359
18.3.1 Error Message "Does not contain a valid host:port authority" Is Reported When Alluixo Is in HA Mode.....	2359
18.4 Using ClickHouse.....	2359
18.4.1 ClickHouse Fails to Start Due to Incorrect Data in ZooKeeper.....	2360
18.5 Using DBService.....	2361
18.5.1 DBServer Instance Is in Abnormal Status.....	2361
18.5.2 DBServer Instance Remains in the Restoring State.....	2363
18.5.3 Default Port 20050 or 20051 Is Occupied.....	2363
18.5.4 DBServer Instance Is Always in the Restoring State Because the Incorrect <b>/tmp</b> Directory Permission.....	2364
18.5.5 DBService Backup Failure.....	2365
18.5.6 Components Failed to Connect to DBService in Normal State.....	2366
18.5.7 DBServer Failed to Start.....	2367
18.5.8 DBService Backup Failed Because the Floating IP Address Is Unreachable.....	2368
18.5.9 DBService Failed to Start Due to the Loss of the DBService Configuration File.....	2369
18.6 Using Flink.....	2371

18.6.1 "IllegalConfigurationException: Error while parsing YAML configuration file: "security.kerberos.login.keytab" Is Displayed When a Command Is Executed on an Installed Client.....	2371
18.6.2 "IllegalConfigurationException: Error while parsing YAML configuration file" Is Displayed When a Command Is Executed After Configurations of the Installed Client Are Changed .....	2373
18.6.3 The yarn-session.sh Command Fails to Be Executed When the Flink Cluster Is Created.....	2373
18.6.4 Failed to Create a Cluster by Executing the yarn-session Command When a Different User Is Used .....	2375
18.6.5 Flink Service Program Fails to Read Files on the NFS Disk.....	2376
18.6.6 Failed to Customize the Flink Log4j Log Level.....	2377
18.7 Using Flume.....	2377
18.7.1 Class Cannot Be Found After Flume Submits Jobs to Spark Streaming.....	2378
18.7.2 Failed to Install a Flume Client.....	2378
18.7.3 A Flume Client Cannot Connect to the Server.....	2379
18.7.4 Flume Data Fails to Be Written to the Component.....	2380
18.7.5 Flume Server Process Fault.....	2381
18.7.6 Flume Data Collection Is Slow.....	2381
18.7.7 Failed to Start Flume.....	2381
18.8 Using HBase.....	2382
18.8.1 Slow Response to HBase Connection.....	2383
18.8.2 Failed to Authenticate the HBase User.....	2383
18.8.3 RegionServer Failed to Start Because the Port Is Occupied.....	2384
18.8.4 HBase Failed to Start Due to Insufficient Node Memory.....	2385
18.8.5 HBase Service Unavailable Due to Poor HDFS Performance.....	2385
18.8.6 HBase Failed to Start Due to Inappropriate Parameter Settings.....	2386
18.8.7 RegionServer Failed to Start Due to Residual Processes.....	2387
18.8.8 HBase Failed to Start Due to a Quota Set on HDFS.....	2387
18.8.9 HBase Failed to Start Due to Corrupted Version Files.....	2388
18.8.10 High CPU Usage Caused by Zero-Loaded RegionServer.....	2389
18.8.11 HBase Failed to Started with "FileNotFoundException" in RegionServer Logs.....	2391
18.8.12 The Number of RegionServers Displayed on the Native Page Is Greater Than the Actual Number After HBase Is Started.....	2392
18.8.13 RegionServer Instance Is in the Restoring State.....	2393
18.8.14 HBase Failed to Start in a Newly Installed Cluster.....	2394
18.8.15 HBase Failed to Start Due to the Loss of the ACL Table Directory.....	2394
18.8.16 HBase Failed to Start After the Cluster Is Powered Off and On.....	2395
18.8.17 Failed to Import HBase Data Due to Oversized File Blocks.....	2397
18.8.18 Failed to Load Data to the Index Table After an HBase Table Is Created Using Phoenix.....	2398
18.8.19 Failed to Run the <b>hbase shell</b> Command on the MRS Cluster Client.....	2399
18.8.20 Disordered Information Display on the HBase Shell Client Console Due to Printing of the INFO Information.....	2400
18.8.21 HBase Failed to Start Due to Insufficient RegionServer Memory.....	2401
18.9 Using HDFS.....	2402
18.9.1 All NameNodes Become the Standby State After the NameNode RPC Port of HDFS Is Changed	2402

18.9.2 An Error Is Reported When the HDFS Client Is Used After the Host Is Connected Using a Public Network IP Address.....	2403
18.9.3 Failed to Use Python to Remotely Connect to the Port of HDFS.....	2403
18.9.4 HDFS Capacity Usage Reaches 100%, Causing Unavailable Upper-layer Services Such as HBase and Spark.....	2404
18.9.5 An Error Is Reported During HDFS and Yarn Startup.....	2405
18.9.6 HDFS Permission Setting Error.....	2406
18.9.7 A DataNode of HDFS Is Always in the Decommissioning State.....	2408
18.9.8 HDFS Failed to Start Due to Insufficient Memory.....	2410
18.9.9 A Large Number of Blocks Are Lost in HDFS due to the Time Change Using ntpdate.....	2411
18.9.10 CPU Usage of a DataNode Reaches 100% Occasionally, Causing Node Loss (SSH Connection Is Slow or Fails).....	2413
18.9.11 Manually Performing Checkpoints When a NameNode Is Faulty for a Long Time.....	2414
18.9.12 Common File Read/Write Faults.....	2416
18.9.13 Maximum Number of File Handles Is Set to a Too Small Value, Causing File Reading and Writing Exceptions.....	2416
18.9.14 A Client File Fails to Be Closed After Data Writing.....	2418
18.9.15 File Fails to Be Uploaded to HDFS Due to File Errors.....	2420
18.9.16 After dfs.blocksize Is Configured and Data Is Put, Block Size Remains Unchanged.....	2420
18.9.17 Failed to Read Files, and "FileNotFoundException" Is Displayed.....	2421
18.9.18 Failed to Write Files to HDFS, and "item limit of / is exceeded" Is Displayed.....	2422
18.9.19 Adjusting the Log Level of the Shell Client.....	2422
18.9.20 File Read Fails, and "No common protection layer" Is Displayed.....	2423
18.9.21 Failed to Write Files Because the HDFS Directory Quota Is Insufficient.....	2424
18.9.22 Balancing Fails, and "Source and target differ in block-size" Is Displayed.....	2425
18.9.23 A File Fails to Be Queried or Deleted, and the File Can Be Viewed in the Parent Directory (Invisible Characters).....	2426
18.9.24 Uneven Data Distribution Due to Non-HDFS Data Residuals.....	2427
18.9.25 Uneven Data Distribution Due to the Client Installation on the DataNode.....	2428
18.9.26 Handling Unbalanced DataNode Disk Usage on Nodes.....	2428
18.9.27 Locating Common Balance Problems.....	2429
18.9.28 HDFS Displays Insufficient Disk Space But 10% Disk Space Remains.....	2430
18.9.29 An Error Is Reported When the HDFS Client Is Installed on the Core Node in a Common Cluster.....	2431
18.9.30 Client Installed on a Node Outside the Cluster Fails to Upload Files Using hdfs.....	2431
18.9.31 Insufficient Number of Replicas Is Reported During High Concurrent HDFS Writes.....	2432
18.9.32 HDFS Client Failed to Delete Overlong Directories.....	2433
18.9.33 An Error Is Reported When a Node Outside the Cluster Accesses MRS HDFS.....	2434
18.10 Using Hive.....	2435
18.10.1 Content Recorded in Hive Logs.....	2436
18.10.2 Causes of Hive Startup Failure.....	2437
18.10.3 "Cannot modify xxx at runtime" Is Reported When the set Command Is Executed in a Security Cluster.....	2437
18.10.4 How to Specify a Queue When Hive Submits a Job.....	2438

18.10.5 How to Set Map and Reduce Memory on the Client.....	2439
18.10.6 Specifying the Output File Compression Format When Importing a Table.....	2440
18.10.7 desc Table Cannot Be Completely Displayed.....	2440
18.10.8 NULL Is Displayed When Data Is Inserted After the Partition Column Is Added.....	2441
18.10.9 A Newly Created User Has No Query Permissions.....	2442
18.10.10 An Error Is Reported When SQL Is Executed to Submit a Task to a Specified Queue.....	2443
18.10.11 An Error Is Reported When the "load data inpath" Command Is Executed.....	2444
18.10.12 An Error Is Reported When the "load data local inpath" Command Is Executed.....	2445
18.10.13 An Error Is Reported When the "create external table" Command Is Executed.....	2446
18.10.14 An Error Is Reported When the <b>dfs -put</b> Command Is Executed on the Beeline Client.....	2446
18.10.15 Insufficient Permissions to Execute the <b>set role admin</b> Command.....	2447
18.10.16 An Error Is Reported When UDF Is Created Using Beeline.....	2448
18.10.17 Difference Between Hive Service Health Status and Hive Instance Health Status.....	2448
18.10.18 Hive Alarms and Triggering Conditions.....	2449
18.10.19 "authentication failed" Is Displayed During an Attempt to Connect to the Shell Client.....	2450
18.10.20 Failed to Access ZooKeeper from the Client.....	2451
18.10.21 "Invalid function" Is Displayed When a UDF Is Used.....	2452
18.10.22 Hive Service Status Is Unknown.....	2453
18.10.23 Health Status of a HiveServer or MetaStore Instance Is Unknown.....	2453
18.10.24 Health Status of a HiveServer or MetaStore Instance Is Concerning.....	2453
18.10.25 Garbled Characters Returned upon a select Query If Text Files Are Compressed Using ARC4..	2454
18.10.26 Hive Task Failed to Run on the Client But Successful on Yarn.....	2454
18.10.27 An Error Is Reported When the select Statement Is Executed.....	2455
18.10.28 Failed to Drop a Large Number of Partitions.....	2457
18.10.29 Failed to Start a Local Task.....	2457
18.10.30 Failed to Start WebHCat.....	2459
18.10.31 Sample Code Error for Hive Secondary Development After Domain Switching.....	2459
18.10.32 MetaStore Exception Occurs When the Number of DBService Connections Exceeds the Upper Limit.....	2460
18.10.33 "Failed to execute session hooks: over max connections" Reported by Beeline.....	2461
18.10.34 beeline Reports the "OutOfMemoryError" Error.....	2462
18.10.35 Task Execution Fails Because the Input File Number Exceeds the Threshold.....	2463
18.10.36 Task Execution Fails Because of Stack Memory Overflow.....	2465
18.10.37 Task Failed Due to Concurrent Writes to One Table or Partition.....	2466
18.10.38 Hive Task Failed Due to a Lack of HDFS Directory Permission.....	2466
18.10.39 Failed to Load Data to Hive Tables.....	2467
18.10.40 HiveServer and HiveHCat Process Faults.....	2468
18.10.41 An Error Occurs When the INSERT INTO Statement Is Executed on Hive But the Error Message Is Unclear.....	2469
18.10.42 Timeout Reported When Adding the Hive Table Field.....	2471
18.10.43 Failed to Restart the Hive Service.....	2473
18.10.44 Hive Failed to Delete a Table.....	2474
18.10.45 An Error Is Reported When msck repair table table_name Is Run on Hive.....	2475

18.10.46 How Do I Release Disk Space After Dropping a Table in Hive?.....	2476
18.10.47 Connection Timeout During SQL Statement Execution on the Client.....	2476
18.10.48 WebHCat Failed to Start Due to Abnormal Health Status.....	2478
18.10.49 WebHCat Failed to Start Because the mapred-default.xml File Cannot Be Parsed.....	2479
18.11 Using Hue.....	2479
18.11.1 A Job Is Running on Hue.....	2479
18.11.2 HQL Fails to Be Executed on Hue Using Internet Explorer.....	2480
18.11.3 Hue (Active) Cannot Open Web Pages.....	2480
18.11.4 Failed to Access the Hue Web UI.....	2481
18.11.5 HBase Tables Cannot Be Loaded on the Hue Web UI.....	2482
18.12 Using Impala.....	2482
18.12.1 Failed to Connect to impala-shell.....	2483
18.12.2 Failed to Create a Kudu Table.....	2483
18.12.3 Failed to Log In to the Impala Client.....	2484
18.13 Using Kafka.....	2486
18.13.1 An Error Is Reported When Kafka Is Run to Obtain a Topic.....	2486
18.13.2 Flume Normally Connects to Kafka But Fails to Send Messages.....	2487
18.13.3 Producer Failed to Send Data and Threw "NullPointerException".....	2488
18.13.4 Producer Fails to Send Data and "TOPIC_AUTHORIZATION_FAILED" Is Thrown.....	2491
18.13.5 Producer Occasionally Fails to Send Data and the Log Displays "Too many open files in system" .....	2493
18.13.6 Consumer Is Initialized Successfully, But the Specified Topic Message Cannot Be Obtained from Kafka.....	2495
18.13.7 Consumer Fails to Consume Data and Remains in the Waiting State.....	2500
18.13.8 SparkStreaming Fails to Consume Kafka Messages, and "Error getting partition metadata" Is Displayed.....	2502
18.13.9 Consumer Fails to Consume Data in a Newly Created Cluster, and the Message " GROUP_COORDINATOR_NOT_AVAILABLE" Is Displayed.....	2504
18.13.10 SparkStreaming Fails to Consume Kafka Messages, and the Message "Couldn't find leader offsets" Is Displayed.....	2505
18.13.11 Consumer Fails to Consume Data and the Message " SchemaException: Error reading field 'brokers'" Is Displayed.....	2507
18.13.12 Checking Whether Data Consumed by a Customer Is Lost.....	2508
18.13.13 Failed to Start a Component Due to Account Lock.....	2509
18.13.14 Kafka Broker Reports Abnormal Processes and the Log Shows "IllegalArgumentException"....	2509
18.13.15 Kafka Topics Cannot Be Deleted.....	2510
18.13.16 Error "AdminOperationException" Is Displayed When a Kafka Topic Is Deleted.....	2513
18.13.17 When a Kafka Topic Fails to Be Created, "NoAuthException" Is Displayed.....	2514
18.13.18 Failed to Set an ACL for a Kafka Topic, and "NoAuthException" Is Displayed.....	2516
18.13.19 When a Kafka Topic Fails to Be Created, "NoNode for /brokers/ids" Is Displayed.....	2518
18.13.20 When a Kafka Topic Fails to Be Created, "replication factor larger than available brokers" Is Displayed.....	2519
18.13.21 Consumer Repeatedly Consumes Data.....	2520
18.13.22 Leader for the Created Kafka Topic Partition Is Displayed as none.....	2522

18.13.23 Safety Instructions on Using Kafka.....	2524
18.13.24 Obtaining Kafka Consumer Offset Information.....	2529
18.13.25 Adding or Deleting Configurations for a Topic.....	2531
18.13.26 Reading the Content of the __consumer_offsets Internal Topic.....	2532
18.13.27 Configuring Logs for Shell Commands on the Client.....	2533
18.13.28 Obtaining Topic Distribution Information.....	2534
18.13.29 Kafka HA Usage Description.....	2536
18.13.30 Kafka Producer Writes Oversized Records.....	2539
18.13.31 Kafka Consumer Reads Oversized Records.....	2540
18.13.32 High Usage of Multiple Disks on a Kafka Cluster Node.....	2541
18.14 Using Oozie.....	2543
18.14.1 Oozie Jobs Do Not Run When a Large Number of Jobs Are Submitted Concurrently.....	2543
18.15 Using Presto.....	2544
18.15.1 During sql-standard-with-group Configuration, a Schema Fails to Be Created and the Error Message "Access Denied" Is Displayed.....	2544
18.15.2 The Presto coordinator cannot be started properly.....	2546
18.15.3 An Error Is Reported When Presto Is Used to Query a Kudu Table.....	2547
18.15.4 No Data is Found in the Hive Table Using Presto.....	2548
18.16 Using Spark.....	2549
18.16.1 An Error Occurs When the Split Size Is Changed in a Spark Application.....	2549
18.16.2 An Error Is Reported When Spark Is Used.....	2550
18.16.3 A Spark Job Fails to Run Due to Incorrect JAR File Import.....	2551
18.16.4 A Spark Job Is Pending Due to Insufficient Memory.....	2551
18.16.5 An Error Is Reported During Spark Running.....	2553
18.16.6 Executor Memory Reaches the Threshold Is Displayed in Driver.....	2553
18.16.7 Message "Can't get the Kerberos realm" Is Displayed in Yarn-cluster Mode.....	2554
18.16.8 Failed to Start spark-sql and spark-shell Due to JDK Version Mismatch.....	2556
18.16.9 ApplicationMaster Failed to Start Twice in Yarn-client Mode.....	2556
18.16.10 Failed to Connect to ResourceManager When a Spark Task Is Submitted.....	2558
18.16.11 DataArts Studio Failed to Schedule Spark Jobs.....	2559
18.16.12 Submission Status of the Spark Job API Is Error.....	2560
18.16.13 Alarm 43006 Is Repeatedly Generated in the Cluster.....	2560
18.16.14 Failed to Create or Delete a Table in Spark Beeline.....	2561
18.16.15 Failed to Connect to the Driver When a Node Outside the Cluster Submits a Spark Job to Yarn.....	2563
18.16.16 Large Number of Shuffle Results Are Lost During Spark Task Execution.....	2564
18.16.17 Disk Space Is Insufficient Due to Long-Term Running of JDBCServer.....	2564
18.16.18 Failed to Load Data to a Hive Table Across File Systems by Running SQL Statements Using Spark Shell.....	2566
18.16.19 Spark Task Submission Failure.....	2566
18.16.20 Spark Task Execution Failure.....	2567
18.16.21 JDBCServer Connection Failure.....	2568
18.16.22 Failed to View Spark Task Logs.....	2568

18.16.23 Authentication Fails When Spark Connects to Other Services.....	2569
18.16.24 An Error Occurs When Spark Connects to Redis.....	2570
18.16.25 An Error Is Reported When spark-beeline Is Used to Query a Hive View.....	2571
18.17 Using Sqoop.....	2573
18.17.1 Connecting Sqoop to MySQL.....	2573
18.17.2 Failed to Find the <b>HBaseAdmin.&lt;init&gt;</b> Method When Sqoop Reads Data from the MySQL Database to HBase.....	2574
18.17.3 Failed to Export HBase Data to HDFS Through Hue's Sqoop Task.....	2575
18.17.4 A Format Error Is Reported When Sqoop Is Used to Export Data from Hive to MySQL 8.0.....	2579
18.17.5 An Error Is Reported When sqoop import Is Executed to Import PostgreSQL Data to Hive.....	2580
18.17.6 Sqoop Failed to Read Data from MySQL and Write Parquet Files to OBS.....	2581
18.18 Using Storm.....	2582
18.18.1 Invalid Hyperlink of Events on the Storm UI.....	2582
18.18.2 Failed to Submit a Topology.....	2583
18.18.3 Topology Submission Fails and the Message "Failed to check principle for keytab" Is Displayed.....	2585
18.18.4 The Worker Log Is Empty After a Topology Is Submitted.....	2586
18.18.5 Worker Runs Abnormally After a Topology Is Submitted and Error "Failed to bind to: host:ip" Is Displayed.....	2588
18.18.6 "well-known file is not secure" Is Displayed When the jstack Command Is Used to Check the Process Stack.....	2590
18.18.7 When the Storm-JDBC plug-in is used to develop Oracle write Bolts, data cannot be written into the Bolts.....	2592
18.18.8 The GC Parameter Configured for the Service Topology Does Not Take Effect.....	2594
18.18.9 Internal Server Error Is Displayed When the User Queries Information on the UI.....	2595
18.19 Using Ranger.....	2596
18.19.1 After Ranger Authentication Is Enabled for Hive, Unauthorized Tables and Databases Can Be Viewed on the Hue Page.....	2596
18.20 Using Yarn.....	2597
18.20.1 Plenty of Jobs Are Found After Yarn Is Started.....	2598

19.1 Precautions for MRS 3.x..... 2610

# 1 Overview

---

## 1.1 What Is MRS?

Big data is a huge challenge facing the Internet era as the data volume and types increase rapidly. Conventional data processing technologies, such as single-node storage and relational databases, are unable to solve the emerging big data problems. In this case, the Apache Software Foundation (ASF) has launched an open source Hadoop big data processing solution. Hadoop is an open source distributed computing platform that can fully utilize computing and storage capabilities of clusters to process massive amounts of data. If enterprises deploy Hadoop systems by themselves, the disadvantages include high costs, long deployment period, difficult maintenance, and inflexible use.

To solve the preceding problems, the cloud provides MapReduce Service (MRS) for managing the Hadoop system. With MRS, you can deploy a Hadoop cluster in just one click. MRS provides enterprise-level big data clusters on the cloud. Tenants can fully control clusters and easily run big data components such as Hadoop, Spark, HBase, Kafka, and Storm. MRS is fully compatible with open source APIs, and incorporates advantages of the cloud computing and storage and big data industry experience to provide customers with a full-stack big data platform featuring high performance, low cost, flexibility, and ease-of-use. In addition, the platform can be customized based on service requirements to help enterprises quickly build a massive data processing system and discover new value points and business opportunities by analyzing and mining massive amounts of data in real time or in non-real time.

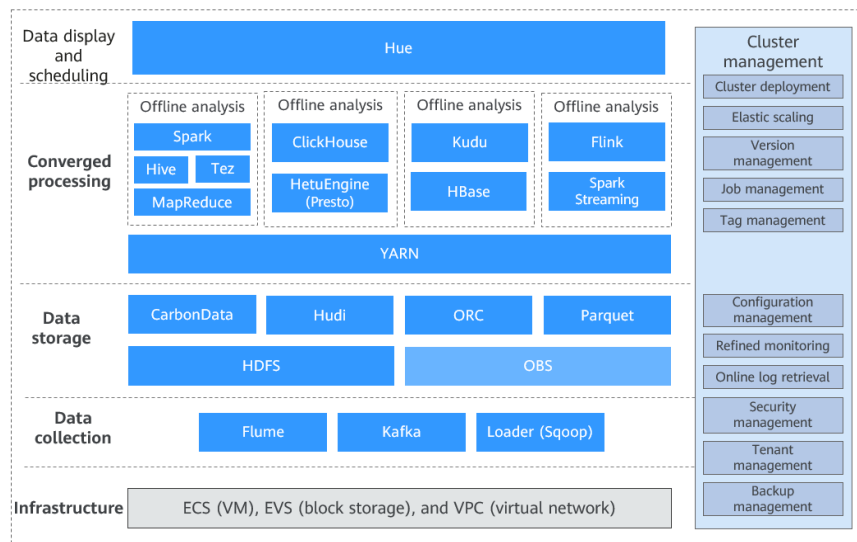

### Product Architecture

[Figure 1-1](#) shows the MRS logical architecture.

#### NOTE

MRS 3.x or later does not support patch management on the management console.

**Figure 1-1** MRS architecture

MRS architecture includes infrastructure and big data processing phases.

- **Infrastructure**  
MRS big data clusters are built based on Elastic Cloud Server (ECS), and make full use of the high reliability and security capabilities of the virtualization layer.
  - A Virtual Private Cloud (VPC) is a virtual internal network provided for each tenant. It is isolated from other networks by default.
  - Elastic Volume Service (EVS) provides highly reliable and high-performance storage.
  - ECS provides scalable VMs, and works with VPCs, security groups, and the EVS multi-replica mechanism to build an efficient, reliable, and secure computing environment.
- **Data integration**  
The data integration layer provides data access capabilities of MRS clusters, including components Flume (data ingestion), Loader (relational data import), and Kafka (highly reliable message queue). Data can be imported to MRS clusters from various data sources.
- **Data storage**  
MRS clusters can store structured and unstructured data, and support multiple efficient formats to meet the requirements of different computing engines.
  - HDFS is a general-purpose distributed file system on a big data platform.
  - OBS is an object storage service that features high availability and low cost.
  - HBase supports data storage with indexes, and is applicable to high-performance index-based query scenarios.
- **Data computing**  
MRS provides multiple mainstream computing engines, including MapReduce (batch processing), Tez (DAG model), Spark (in-memory computing),

SparkStreaming (micro-batch stream computing), Storm (stream computing), and Flink (stream computing), to meet the requirements of various big data application scenarios. The engines convert data structures and logic into data models that meet service requirements.

- Data analysis

Based on the preset data model and easy-to-use SQL data analysis, users can select Hive (data warehouse), SparkSQL, and Presto (interactive query engine).

- Data display and scheduling

To present data analysis results, MRS is integrated with Data Lake Factory (DLF), which is a one-stop big data collaboration development platform, to help you easily complete multiple tasks, such as data modeling, data integration, script development, job scheduling, and job monitoring. This makes big data more accessible than ever before, helping you quickly build big data processing centers.

- Cluster management

All components of the Hadoop-based big data ecosystem are deployed in distributed mode, and their deployment, management, and O&M are complex.

MRS provides a unified O&M management platform for cluster management, supporting one-click cluster deployment, multi-version selection, as well as manual scaling and auto scaling of clusters without service interruption. In addition, MRS provides job management, resource tag management, and O&M of the preceding data processing components at each layer. It also provides one-stop O&M capabilities, covering monitoring, alarm reporting, configuration, and patch upgrade.

## Product Advantages

MRS has a powerful Hadoop kernel team and is deployed based on enterprise-level FusionInsight big data platform. MRS has been deployed on tens of thousands of nodes and can ensure Service Level Agreements (SLAs) for multi-level users.

MRS has the following advantages:

- High performance

MRS supports self-developed CarbonData storage technology. CarbonData is a high-performance big data storage solution. It allows one data set to apply to multiple scenarios and supports features, such as multi-level indexing, dictionary encoding, pre-aggregation, dynamic partitioning, and quasi-real-time data query. This improves I/O scanning and computing performance and returns analysis results of tens of billions of data records in seconds. In addition, MRS supports self-developed enhanced scheduler Superior, which breaks the scale bottleneck of a single cluster and is capable of scheduling over 10,000 nodes in a cluster.

- Cost-effectiveness

Based on diversified cloud infrastructure, MRS provides various computing and storage choices and separates computing from storage, delivering cost-effective massive data storage solutions. MRS supports auto scaling to address peak and off-peak service loads, releasing idle resources on the big

data platform for customers. MRS clusters can be created and scaled out when you need them, and can be terminated or scaled in after you use them, minimizing cost.

- High security

MRS delivers enterprise-level big data multi-tenant permissions management and security management to support table-based and column-based access control and data encryption.

- Easy O&M

MRS provides a visualized big data cluster management platform, improving O&M efficiency. MRS supports rolling patch upgrade and provides visualized patch release information and one-click patch installation without manual intervention, ensuring long-term stability of user clusters.

- High reliability

The proven large-scale reliability and long-term stability of MRS meet enterprise-level high reliability requirements. In addition, MRS supports automatic data backup across AZs and regions, as well as automatic anti-affinity. It allows VMs to be distributed on different physical machines.

## 1.2 Application Scenarios

Big data is ubiquitous in people's lives. MRS is suitable to process big data in the industries such as the Internet of things (IoT), e-commerce, finance, manufacturing, healthcare, energy, and government departments.

### Large-scale data analysis

Large-scale data analysis is a major scenario in modern big data systems. Generally, an enterprise has multiple data sources. After data is accessed, extract, transform, and load (ETL) processing is required to generate modeled data for each service module to analyze and sort out data. This type of service has the following characteristics:

- The requirements for real-time execution are not high, and job execution time ranges from dozens of minutes to hours.
- The data volume is large.
- There are various data sources and diversified formats.
- Data processing usually consists of multiple tasks, and resources need to be planned in detail.

In the environmental protection industry, climate data is stored on OBS and periodically dumped into HDFS for batch analysis. 10 TB of climate data can be analyzed in 1 hour.

**Figure 1-2** Large-scale data analysis in the environmental protection industry

MRS has the following advantages in this scenario.

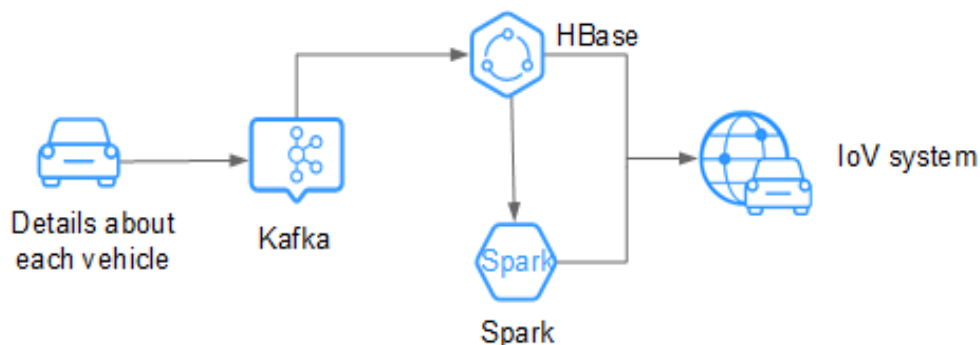

- Low cost: OBS offers cost-effective storage.
- Massive data analysis: TB/PB-level data is analyzed by Hive.
- Visualized data import and export tool: Loader exports data to Data Warehouse Service (DWS) for business intelligence (BI) analysis.

## Large-scale data storage

A user who has a large amount of structured data usually requires index-based quasi-real-time query capabilities. For example, in an Internet of Vehicles (IoV) scenario, vehicle maintenance information is queried by vehicle number. Therefore, vehicle information is indexed based on vehicle numbers when it is being stored, to implement second-level response in this scenario. Generally, the data volume is large. The user may store data for one to three years.

For example, in the IoV industry, an automobile company stores data on HBase, which supports PB-level storage and CDR queries in milliseconds.

**Figure 1-3** Large-scale data storage in the IoV industry

MRS has the following advantages in this scenario.

- Real time: Kafka accesses massive amounts of vehicle messages in real time.
- Massive data storage: HBase stores massive volumes of data and supports data queries in milliseconds.

- Distributed data query: Spark analyzes and queries massive volumes of data.

## Real-time data processing

Real-time data processing is usually used in scenarios such as anomaly detection, fraud detection, rule-based alarming, and service process monitoring. Data is processed while it is being inputted to the system.

For example, in the Internet of elevators & escalators (IoEE) industry, data of smart elevators and escalators is imported to MRS streaming clusters in real time for real-time alarming.

**Figure 1-4** Low-latency streaming processing in the IoEE industry

MRS has the following advantages in this scenario.

- Real-time data ingestion: Flume implements real-time data ingestion and provides various data collection and storage access methods.
- Data source access: Kafka accesses data of tens of thousands of elevators and escalators in real time.

## 1.3 Components

### 1.3.1 Alluxio

Alluxio is data orchestration technology for analytics and AI for the cloud. In the MRS big data ecosystem, Alluxio lies between computing and storage. It provides a data abstraction layer for computing frameworks including Apache Spark, Presto, MapReduce, and Apache Hive, so that upper-layer computing applications can access persistent storage systems including HDFS and OBS through unified client APIs and a global namespace. In this way, computing and storage are separated.

**Figure 1-5** Alluxio architecture

Advantages:

- Provides in-memory I/O throughput, and makes elastically scale data-driven applications cost effective.
- Simplified cloud and object storage access
- Simplified data management and a single point of access to multiple data sources
- Easy application deployment

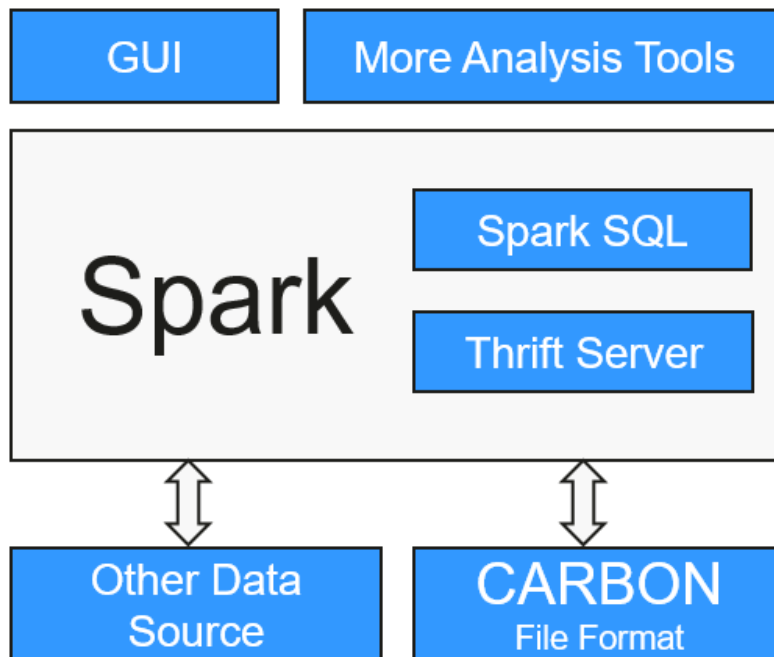

For details about Alluxio, visit <https://docs.alluxio.io/os/user/stable/en/Overview.html>.

### 1.3.2 CarbonData

CarbonData is a new Apache Hadoop native data-store format. CarbonData allows faster interactive queries over PetaBytes of data using advanced columnar storage, index, compression, and encoding techniques to improve computing efficiency. In addition, CarbonData is also a high-performance analysis engine that integrates data sources with Spark.

**Figure 1-6** Basic architecture of CarbonData

The purpose of using CarbonData is to provide quick response to ad hoc queries of big data. Essentially, CarbonData is an Online Analytical Processing (OLAP) engine, which stores data using tables similar to those in Relational Database Management System (RDBMS). You can import more than 10 TB data to tables created in CarbonData format, and CarbonData automatically organizes and stores data using the compressed multi-dimensional indexes. After data is loaded to CarbonData, CarbonData responds to ad hoc queries in seconds.

CarbonData integrates data sources into the Spark ecosystem. You can use Spark SQL to query and analyze data, or use the third-party tool ThriftServer provided by Spark to connect to Spark SQL.

**CarbonData features**

- SQL: CarbonData is compatible with Spark SQL and supports SQL query operations performed on Spark SQL.
- Simple Table dataset definition: CarbonData allows you to define and create datasets by using user-friendly Data Definition Language (DDL) statements. CarbonData DDL is flexible and easy to use, and can define complex tables.
- Easy data management: CarbonData provides various data management functions for data loading and maintenance. It can load historical data and incrementally load new data. The loaded data can be deleted according to the loading time and specific data loading operations can be canceled.
- CarbonData file format is a columnar store in HDFS. It has many features that a modern columnar format has, such as splittable and compression schema.

**Unique features of CarbonData**

- Stores data along with index: Significantly accelerates query performance and reduces the I/O scans and CPU resources, when there are filters in the query. CarbonData index consists of multiple levels of indices. A processing

framework can leverage this index to reduce the task it needs to schedule and process, and it can also perform skip scan in more finer grain unit (called blocklet) in task side scanning instead of scanning the whole file.

- Operable encoded data: Through supporting efficient compression and global encoding schemes, CarbonData can query on compressed/encoded data. The data can be converted just before returning the results to the users, which is "late materialized".
- Supports various use cases with one single data format: like interactive OLAP-style query, Sequential Access (big scan), and Random Access (narrow scan).

#### Key technologies and advantages of CarbonData

- Quick query response: CarbonData features high-performance query. The query speed of CarbonData is 10 times of that of Spark SQL. It uses dedicated data formats and applies multiple index technologies, global dictionary code, and multiple push-down optimizations, providing quick response to TB-level data queries.
- Efficient data compression: CarbonData compresses data by combining the lightweight and heavyweight compression algorithms. This significantly saves 60% to 80% data storage space and the hardware storage cost.

For details about CarbonData architecture and principles, see <https://carbodata.apache.org/>.

## 1.3.3 ClickHouse

### Introduction to ClickHouse

ClickHouse is an open-source columnar database oriented to online analysis and processing. It is independent of the Hadoop big data system and features ultimate compression rate and fast query performance. In addition, ClickHouse supports SQL query and provides good query performance, especially the aggregation analysis and query performance based on large and wide tables. The query speed is one order of magnitude faster than that of other analytical databases.

The core functions of ClickHouse are as follows:

#### Comprehensive DBMS functions

ClickHouse has comprehensive database management functions, including the basic functions of a Database Management System (DBMS):

- Data Definition Language (DDL): allows databases, tables, and views to be dynamically created, modified, or deleted without restarting services.
- Data Manipulation Language (DML): allows data to be queried, inserted, modified, or deleted dynamically.
- Permission control: supports user-based database or table operation permission settings to ensure data security.
- Data backup and restoration: supports data backup, export, import, and restoration to meet the requirements of the production environment.
- Distributed management: provides the cluster mode to automatically manage multiple database nodes.

#### Column-based storage and data compression

ClickHouse is a database that uses column-based storage. Data is organized by column. Data in the same column is stored together, and data in different columns is stored in different files.

During data query, columnar storage can reduce the data scanning range and data transmission size, thereby improving data query efficiency.

In a traditional row-based database system, data is stored in the sequence in [Table 1-1](#):

**Table 1-1** Row-based database

row	ID	Flag	Name	Event	Time
0	12345678901	0	name1	1	2020/1/11 15:19
1	32345678901	1	name2	1	2020/5/12 18:10
2	42345678901	1	name3	1	2020/6/13 17:38
N	...	...	...	...	...

In a row-based database, data in the same row is physically stored together. In a column-based database system, data is stored in the sequence in [Table 1-2](#):

**Table 1-2** Columnar database

row:	0	1	2	N
ID:	12345678901	32345678901	42345678901	...
Flag:	0	1	1	...
Name:	name1	name2	name3	...
Event:	1	1	1	...
Time:	2020/1/11 15:19	2020/5/12 18:10	2020/6/13 17:38	...

This example shows only the arrangement of data in a columnar database. Columnar databases store data in the same column together and data in different columns separately. Columnar databases are more suitable for online analytical processing (OLAP) scenarios.

### Vectorized executor

ClickHouse uses CPU's Single Instruction Multiple Data (SIMD) to implement vectorized execution. SIMD is an implementation mode that uses a single instruction to operate multiple pieces of data and improves performance with data

parallelism (other methods include instruction-level parallelism and thread-level parallelism). The principle of SIMD is to implement parallel data operations at the CPU register level.

### Relational model and SQL query

ClickHouse uses SQL as the query language and provides standard SQL query APIs for existing third-party analysis visualization systems to easily integrate with ClickHouse.

In addition, ClickHouse uses a relational model. Therefore, the cost of migrating the system built on a traditional relational database or data warehouse to ClickHouse is lower.

### Data sharding and distributed query

The ClickHouse cluster consists of one or more shards, and each shard corresponds to one ClickHouse service node. The maximum number of shards depends on the number of nodes (one shard corresponds to only one service node).

ClickHouse introduces the concepts of local table and distributed table. A local table is equivalent to a data shard. A distributed table itself does not store any data. It is an access proxy of the local table and functions as the sharding middleware. With the help of distributed tables, multiple data shards can be accessed by using the proxy, thereby implementing distributed query.

## ClickHouse Applications

ClickHouse is short for Click Stream and Data Warehouse. It is initially applied to a web traffic analysis tool to perform OLAP analysis for data warehouses based on page click event flows. Currently, ClickHouse is widely used in Internet advertising, app and web traffic analysis, telecommunications, finance, and Internet of Things (IoT) fields. It is applicable to business intelligence application scenarios and has a large number of applications and practices worldwide. For details, visit <https://clickhouse.tech/docs/en/introduction/adopters/>.

## ClickHouse Enhanced Open Source Features

MRS ClickHouse has advantages such as automatic cluster mode, HA deployment, and smooth and elastic scaling.

- Automatic Cluster Mode

As shown in [Figure 1-7](#), a cluster consists of multiple ClickHouse nodes, which has no central node. It is more of a static resource pool. If the ClickHouse cluster mode is used for services, you need to pre-define the cluster information in the configuration file of each node. Only in this way, services can be correctly accessed.

**Figure 1-7** ClickHouse cluster

Users are unaware of data partitions and replica storage in common database systems. However, ClickHouse allows you to proactively plan and define detailed configurations such as shards, partitions, and replica locations. The ClickHouse instance of MRS packs the work in a unified manner and adapts it to the automatic mode, implementing unified management, which is flexible and easy to use. A ClickHouse instance consists of three ZooKeeper nodes and multiple ClickHouse nodes. The Dedicated Replica mode is used to ensure high reliability of dual data copies.

**Figure 1-8** ClickHouse cluster structure

- Smooth and Elastic Scaling

With the rapid growth of services, MRS provides smooth and elastic scaling capabilities to quickly meet service growth requirements in scenarios where the cluster storage capacity or CPU computing resources are not enough. When you expand the capacity of ClickHouse nodes in a cluster, MRS provides a one-click data balancing tool and gives you the initiative to balance data. You can determine the data balancing mode and time based on service characteristics to ensure service availability, implementing smooth scaling.

- HA Deployment Architecture

MRS uses the ELB-based high availability (HA) deployment architecture to automatically distribute user access traffic to multiple backend nodes, expanding service capabilities to external systems and improving fault tolerance. As shown in [Figure 1-9](#), when a client application requests a cluster, Elastic Load Balance (ELB) is used to distribute traffic. With the ELB polling mechanism, data is written to local tables and read from distributed tables on different nodes. In this way, data read/write load and high availability of application access are guaranteed.

Figure 1-9 HA deployment architecture

## 1.3.4 DBService

### 1.3.4.1 DBService Basic Principles

#### Overview

DBService is a HA storage system for relational databases, which is applicable to the scenario where a small amount of data (about 10 GB) needs to be stored, for example, component metadata. DBService can only be used by internal components of a cluster and provides data storage, query, and deletion functions.

DBService is a basic component of a cluster. Components such as Hive, Hue, Oozie, Loader, and Redis, and Loader store their metadata in DBService, and provide the metadata backup and restoration functions by using DBService.

#### DBService Architecture

DBService in the cluster works in active/standby mode. Two DBServer instances are deployed and each instance contains three modules: HA, Database, and FloatIP.

[Figure 1-10](#) shows the DBService logical architecture.

**Figure 1-10** DBService architecture

**Table 1-3** describes the modules shown in **Figure 1-10**

**Table 1-3** Module description

Name	Description
HA	HA management module. The active/standby DBServer uses the HA module for management.
Database	Database module. This module stores the metadata of the Client module.
FloatIP	Floating IP address that provides the access function externally. It is enabled only on the active DBServer instance and is used by the Client module to access Database.
Client	Client using the DBService component, which is deployed on the component instance node. The client connects to the database by using FloatIP and then performs metadata adding, deleting, and modifying operations.

### 1.3.4.2 Relationship Between DBService and Other Components

DBService is a basic component of a cluster. Components such as Hive, Hue, Oozie, Loader, Metadata, and Redis, and Loader store their metadata in DBService, and provide the metadata backup and restoration functions by using DBService.

## 1.3.5 Flink

### 1.3.5.1 Flink Basic Principles

#### Overview

**Flink** is a unified computing framework that supports both batch processing and stream processing. It provides a stream data processing engine that supports data distribution and parallel computing. Flink features stream processing and is a top open source stream processing engine in the industry.

Flink provides high-concurrency pipeline data processing, millisecond-level latency, and high reliability, making it extremely suitable for low-latency data processing.

**Figure 1-11** shows the technology stack of Flink.

**Figure 1-11** Technology stack of Flink

Flink provides the following features in the current version:

- DataStream
- Checkpoint
- Window
- Job Pipeline
- Configuration Table

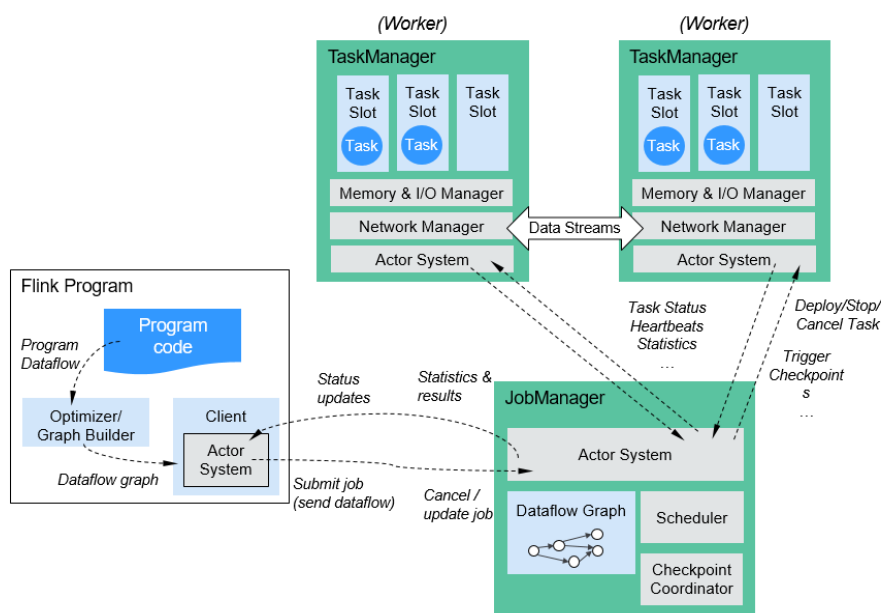

Other features are inherited from the open source community and are not enhanced. For details, visit <https://ci.apache.org/projects/flink/flink-docs-release-1.12/>.

#### Flink Architecture

**Figure 1-12** shows the Flink architecture.

Figure 1-12 Flink architecture

As shown in the above figure, the entire Flink system consists of three parts:

- **Client**  
Flink client is used to submit jobs (streaming jobs) to Flink.
- **TaskManager**  
TaskManager is a service execution node of Flink. It executes specific tasks. A Flink system can have multiple TaskManagers. These TaskManagers are equivalent to each other.
- **JobManager**  
JobManager is a management node of Flink. It manages all TaskManagers and schedules tasks submitted by users to specific TaskManagers. In high-availability (HA) mode, multiple JobManagers are deployed. Among these JobManagers, one is selected as the active JobManager, and the others are standby.

For more information about the Flink architecture, visit <https://ci.apache.org/projects/flink/flink-docs-master/docs/concepts/flink-architecture/>.

## Flink Principles

- **Stream & Transformation & Operator**  
A Flink program consists of two building blocks: stream and transformation.
  - a. Conceptually, a stream is a (potentially never-ending) flow of data records, and a transformation is an operation that takes one or more streams as input, and produces one or more output streams as a result.
  - b. When a Flink program is executed, it is mapped to a streaming dataflow. A streaming dataflow consists of a group of streams and transformation operators. Each dataflow starts with one or more source operators and ends in one or more sink operators. A dataflow resembles a directed acyclic graph (DAG).

Figure 1-13 shows the streaming dataflow to which a Flink program is mapped.

Figure 1-13 Example of Flink DataStream

As shown in Figure 1-13, **FlinkKafkaConsumer** is a source operator; Map, KeyBy, TimeWindow, and Apply are transformation operators; RollingSink is a sink operator.

- **Pipeline Dataflow**

Applications in Flink can be executed in parallel or distributed modes. A stream can be divided into one or more stream partitions, and an operator can be divided into multiple operator subtasks.

The executor of streams and operators are automatically optimized based on the density of upstream and downstream operators.

- Operators with low density cannot be optimized. Each operator subtask is separately executed in different threads. The number of operator subtasks is the parallelism of that particular operator. The parallelism (the total number of partitions) of a stream is that of its producing operator. Different operators of the same program may have different levels of parallelism, as shown in Figure 1-14.

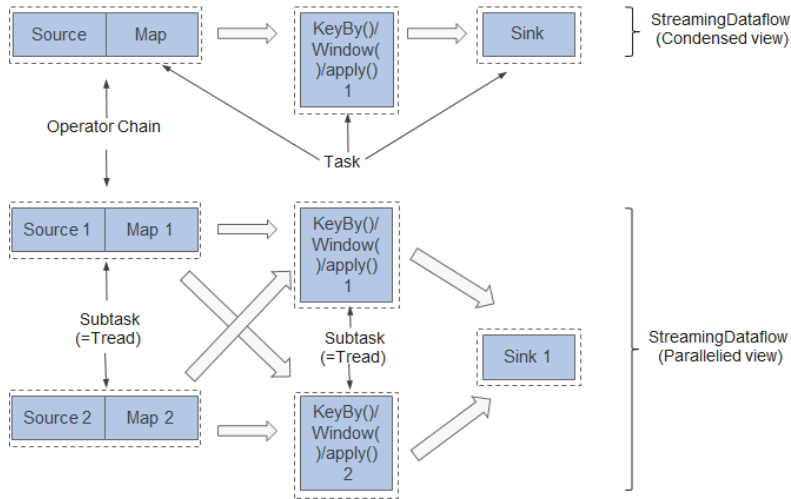

Figure 1-14 Operator

- Operators with high density can be optimized. Flink chains operator subtasks together into a task, that is, an operator chain. Each operator

chain is executed by one thread on TaskManager, as shown in [Figure 1-15](#).

**Figure 1-15** Operator chain

- In the upper part of [Figure 1-15](#), the condensed Source and Map operators are chained into an Operator Chain, that is, a larger operator. The Operator Chain, KeyBy, and Sink all represent an operator respectively and are connected with each other through streams. Each operator corresponds to one task during the running. Namely, there are three tasks in the upper part.
- In the lower part of [Figure 1-15](#), each task, except Sink, is paralleled into two subtasks. The parallelism of the Sink operator is one.

## Key Features

- Stream processing
 

The real-time stream processing engine features high throughput, high performance, and low latency, which can provide processing capability within milliseconds.
- Various status management
 

The stream processing application needs to store the received events or intermediate result in a certain period of time for subsequent access and processing at a certain time point. Flink provides diverse features for status management, including:

  - Multiple basic status types: Flink provides various states for data structures, such as ValueState, ListState, and MapState. Users can select the most efficient and suitable status type based on the service model.
  - Rich State Backend: State Backend manages the status of applications and performs Checkpoint operations as required. Flink provides different State Backends. State can be stored in the memory or RocksDB, and supports the asynchronous and incremental Checkpoint mechanism.
  - Exactly-once state consistency: The Checkpoint and fault recovery capabilities of Flink ensure that the application status of tasks is consistent before and after a fault occurs. Flink supports transactional

output for some specific storage devices. In this way, exactly-once output can be ensured even when a fault occurs.

- Various time semantics

Time is an important part of stream processing applications. For real-time stream processing applications, operations such as window aggregation, detection, and matching based on time semantics are very common. Flink provides various time semantics.

- Event-time: The timestamp provided by the event is used for calculation, making it easier to process the events that arrive at a random sequence or arrive late.
- Watermark: Flink introduces the concept of Watermark to measure the development of event time. Watermark also provides flexible assurance for balancing processing latency and data integrity. When processing event streams with Watermark, Flink provides multiple processing options if data arrives after the calculation, for example, redirecting data (side output) or updating the calculation result.
- Processing-time and Ingestion-time are supported.
- Highly flexible streaming window: Flink supports the time window, count window, session window, and data-driven customized window. You can customize the triggering conditions to implement the complex streaming calculation mode.

- Fault tolerance mechanism

In a distributed system, if a single task or node breaks down or is faulty, the entire task may fail. Flink provides a task-level fault tolerance mechanism, which ensures that user data is not lost when an exception occurs in a task and can be automatically restored.

- Checkpoint: Flink implements fault tolerance based on checkpoint. Users can customize the checkpoint policy for the entire task. When a task fails, the task can be restored to the status of the latest checkpoint and data after the snapshot is resent from the data source.
- Savepoint: A savepoint is a consistent snapshot of application status. The savepoint mechanism is similar to that of checkpoint. However, the savepoint mechanism needs to be manually triggered. The savepoint mechanism ensures that the status information of the current stream application is not lost during task upgrade or migration, facilitating task suspension and recovery at any time point.

- Flink SQL

Table APIs and SQL use Apache Calcite to parse, verify, and optimize queries. Table APIs and SQL can be seamlessly integrated with DataStream and DataSet APIs, and support user-defined scalar functions, aggregation functions, and table value functions. The definition of applications such as data analysis and ETL is simplified. The following code example shows how to use Flink SQL statements to define a counting application that records session times.

```
SELECT userId, COUNT(*)  
FROM clicks  
GROUP BY SESSION(clicktime, INTERVAL '30' MINUTE), userId
```

For more information about Flink SQL, see <https://ci.apache.org/projects/flink/flink-docs-master/dev/table/sqlClient.html>.

- CEP in SQL

Flink allows users to represent complex event processing (CEP) query results in SQL for pattern matching and evaluate event streams on Flink.

CEP SQL is implemented through the **MATCH\_RECOGNIZE** SQL syntax. The **MATCH\_RECOGNIZE** clause is supported by Oracle SQL since Oracle Database 12c and is used to indicate event pattern matching in SQL. The following is an example of CEP SQL:

```
SELECT T.aid, T.bid, T.cid
FROM MyTable
MATCH_RECOGNIZE (
  PARTITION BY userid
  ORDER BY proctime
  MEASURES
    A.id AS aid,
    B.id AS bid,
    C.id AS cid
  PATTERN (A B C)
  DEFINE
    A AS name = 'a',
    B AS name = 'b',
    C AS name = 'c'
) AS T
```

### 1.3.5.2 Flink HA Solution

#### Flink HA Solution

A Flink cluster has only one JobManager. This has the risks of single point of failures (SPOFs). There are three modes of Flink: Flink On Yarn, Flink Standalone, and Flink Local. Flink On Yarn and Flink Standalone modes are based on clusters and Flink Local mode is based on a single node. Flink On Yarn and Flink Standalone provide an HA mechanism. With such a mechanism, you can recover the JobManager from failures and thereby eliminate SPOF risks. This section describes the HA mechanism of the Flink On Yarn.

Flink supports the HA mode and job exception recovery that highly depend on ZooKeeper. If you want to enable the two functions, configure ZooKeeper in the **flink-conf.yaml** file in advance as follows:

```
high-availability: zookeeper
high-availability.zookeeper.quorum: ZooKeeper IP address:2181
high-availability.storageDir: hdfs:///flink/recovery
```

#### Flink On Yarn

Flink JobManager and Yarn ApplicationMaster are in the same process. Yarn ResourceManager monitors ApplicationMaster. If ApplicationMaster is abnormal, Yarn restarts it and restores all JobManager metadata from HDFS. During the recovery, existing tasks cannot run and new tasks cannot be submitted. ZooKeeper stores JobManager metadata, such as information about jobs, to be used by the new JobManager. A TaskManager failure is listened and processed by the DeathWatch mechanism of Akka on JobManager. When a TaskManager fails, a container is requested again from Yarn and a TaskManager is created.

For more information about the HA solution of Flink on Yarn, visit <https://hadoop.apache.org/docs/r3.1.1/hadoop-yarn/hadoop-yarn-site/ResourceManagerHA.html>.

For details about how to set `yarn-site.xml`, visit [https://ci.apache.org/projects/flink/flink-docs-release-1.12/ops/jobmanager\\_high\\_availability.html](https://ci.apache.org/projects/flink/flink-docs-release-1.12/ops/jobmanager_high_availability.html).

### Standalone

In the standalone mode, multiple JobManagers can be started and ZooKeeper elects one as the leader JobManager. In this mode, there is a leader JobManager and multiple standby JobManagers. If the leader JobManager fails, a standby JobManager takes over the leadership. **Figure 1-16** shows the process of a leader/standby JobManager switchover.

**Figure 1-16** Switchover process

### Restoring TaskManager

A TaskManager failure is listened and processed by the DeathWatch mechanism of Akka on JobManager. If the TaskManager fails, the JobManager creates a TaskManager and migrates services to the created TaskManager.

### Restoring JobManager

Flink JobManager and Yarn ApplicationMaster are in the same process. Yarn ResourceManager monitors ApplicationMaster. If ApplicationMaster is abnormal, Yarn restarts it and restores all JobManager metadata from HDFS. During the recovery, existing tasks cannot run and new tasks cannot be submitted.

### Restoring Jobs

If you want to restore jobs, ensure that the startup policy is configured in Flink configuration files. Supported restart policies are **fixed-delay**, **failure-rate**, and

**none**. Jobs can be restored only when the policy is configured to **fixed-delay** or **failure-rate**. If the restart policy is configured to **none** and checkpoint is configured for jobs, the restart policy is automatically configured to **fixed-delay** and the value of **restart-strategy.fixed-delay.attempts** (which specifies the number of retry times) is configured to **Integer.MAX\_VALUE**.

For details about the three strategies, visit [https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/task\\_failure\\_recovery.html](https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/task_failure_recovery.html). The following is an example of the restart policy configuration:

```
restart-strategy: fixed-delay
restart-strategy.fixed-delay.attempts: 3
restart-strategy.fixed-delay.delay: 10 s
```

Jobs will be restored in the following scenarios:

- If a JobManager fails, all its jobs are stopped, and will be recovered after another JobManager is created and running.
- If a TaskManager fails, all tasks on the TaskManager are stopped, and will be started until there are available resources.
- When a task of a job fails, the job is restarted.

**NOTE**

For details about how to configure the restart policy of a job, visit [https://ci.apache.org/projects/flink/flink-docs-release-1.12/ops/jobmanager\\_high\\_availability.html](https://ci.apache.org/projects/flink/flink-docs-release-1.12/ops/jobmanager_high_availability.html).

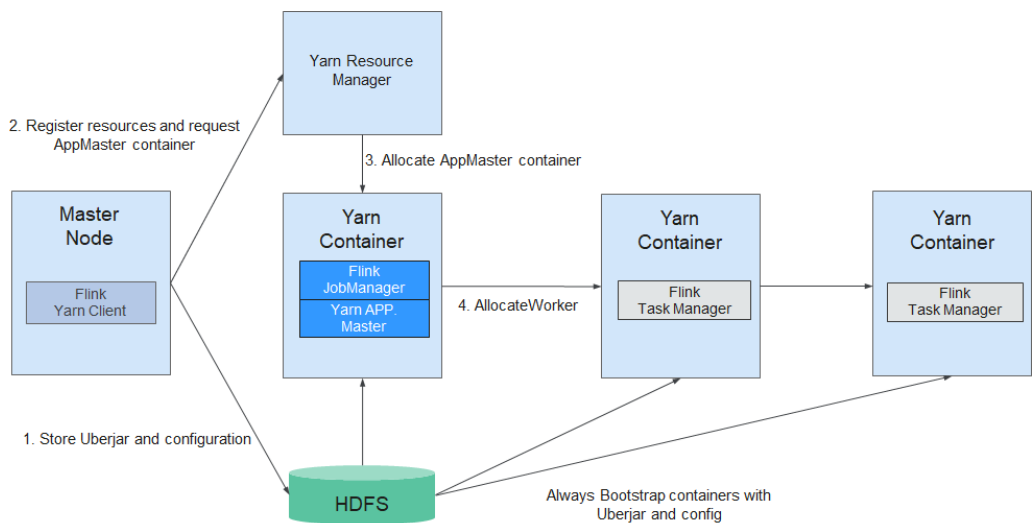

### 1.3.5.3 Relationship with Other Components

#### Relationship between Flink and Yarn

Flink supports Yarn-based cluster management mode. In this mode, Flink serves as an application of Yarn and runs on Yarn.

**Figure 1-17** shows how Flink interacts with Yarn.

**Figure 1-17** Flink interaction with Yarn

1. The Flink Yarn Client first checks whether there are sufficient resources for starting the Yarn cluster. If yes, the Flink Yarn client uploads JAR packages and configuration files to HDFS.
2. Flink Yarn client communicates with Yarn ResourceManager to request a container for starting ApplicationMaster. After all Yarn NodeManagers finish downloading the JAR package and configuration files, the ApplicationMaster is started.
3. During the startup, the ApplicationMaster interacts with the Yarn ResourceManager to request the container for starting a TaskManager. After the container is ready, the TaskManager process is started.
4. In the Flink Yarn cluster, the ApplicationMaster and Flink JobManager are running in the same container. The ApplicationMaster informs each TaskManager of the RPC address of the JobManager. After TaskManagers are started successfully, they register with the JobManager.
5. After all TaskManagers have registered with the JobManager successfully, Flink starts up in the Yarn cluster. Then, the Flink Yarn client can submit Flink jobs to the JobManager, and Flink can perform mapping, scheduling, and computing for the jobs.

### 1.3.5.4 Flink Enhanced Open Source Features

#### 1.3.5.4.1 Window

#### Enhanced Open Source Feature: Window

This section describes the sliding window of Flink and provides the sliding window optimization method. For details about windows, visit <https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/stream/operators/windows.html>.

##### Introduction to Window

Data in a window is saved as intermediate results or original data. If you perform a sum operation (`window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds(5))).sum`) on data in the window, only the intermediate result will be retained. If a custom window (`window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds(5))).apply(new UDF)`) is used, all original data in the window will be saved.

If custom windows `SlidingEventTimeWindow` and `SlidingProcessingTimeWindow` are used, data is saved as multiple backups. Assume that the window is defined as follows:

```
window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds(5))).apply(new UDFWindowFunction)
```

If a block of data arrives, it is assigned to four different windows ( $20/5 = 4$ ). That is, the data is saved as four copies in the memory. When the window size or sliding period is set to a large value, data will be saved as excessive copies, causing redundancy.

**Figure 1-18** Original structure of a window

If a data block arrives at the 102nd second, it is assigned to windows [85, 105), [90, 110), [95, 115), and [100, 120).

**Window Optimization**

As mentioned in the preceding, there are excessive data copies when original data is saved in SlidingEventTimeWindow and SlidingProcessingTimeWindow. To resolve this problem, the window that stores the original data is restructured, which optimizes the storage and greatly lowers the storage space. The window optimization scheme is as follows:

1. Use the sliding period as a unit to divide a window into different panes. A window consists of one or multiple panes. A pane is essentially a sliding period. For example, the sliding period (namely, the pane) of **window(SlidingEventTimeWindows.of(Time.seconds(20), Time.seconds.of(5)))** lasts for 5 seconds. If this window ranges from [100, 120), this window can be divided into panes [100, 105), [105, 110), [110, 115), and [115, 120).

**Figure 1-19** Window optimization

2. When a data block arrives, it is not assigned to a specific window. Instead, Flink determines the pane to which the data block belongs based on the timestamp of the data block, and saves the data block into the pane. A data block is saved only in one pane. In this case, only a data copy exists in the memory.

**Figure 1-20** Saving data in a window

3. To trigger a window, compute all panes contained in the window, and combine all these panes into a complete window.

**Figure 1-21** Triggering a window

4. If a pane is not required, you can delete it from the memory.

**Figure 1-22** Deleting a window

After optimization, the quantity of data copies in the memory and snapshot is greatly reduced.

### 1.3.5.4.2 Job Pipeline

#### Enhanced Open Source Feature: Job Pipeline

Generally, logic code related to a service is stored in a large JAR package, which is called Fat JAR. Disadvantages of Fat JAR are as follows:

- When service logic becomes more and more complex, the size of the Fat JAR increases.
- Fat Jar makes coordination complex. Developers of all services are working with the same service logic. Even though the service logic can be divided into several modules, all modules are tightly coupled with each other. If the requirement needs to be changed, the entire flow diagram needs to be replanned.

Splitting of jobs is facing the following problems:

- Data transmission between jobs can be achieved using Kafka. For example, job A transmits data to the topic A in Kafka, and then job B and job C read data from the topic A in Kafka. This solution is simple and easy to implement, but the latency is always longer than 100 ms.
- Operators are connected using the TCP protocol. In distributed environment, operators can be scheduled to any node and upstream and downstream services cannot detect the scheduling.

#### Job Pipeline

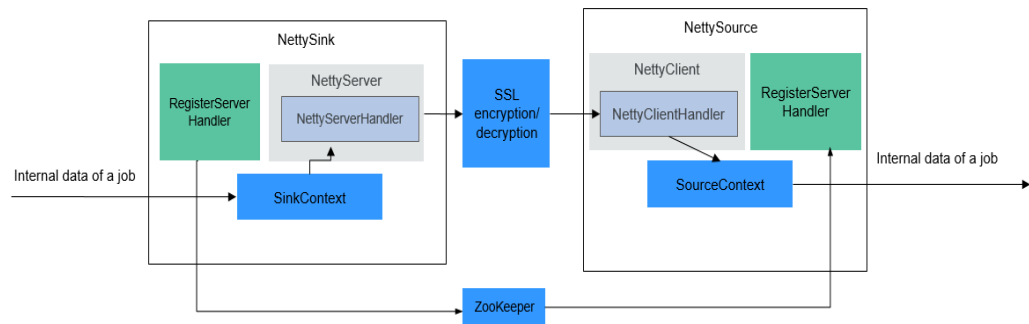

A pipeline consists of multiple Flink jobs connected through TCP. Upstream jobs can send data to downstream jobs. The flow diagram about data transmission is called a job pipeline, as shown in [Figure 1-23](#).

**Figure 1-23** Job pipeline

#### Job Pipeline Principles

**Figure 1-24** Job pipeline principles

- **NettySink and NettySource**  
In a pipeline, upstream jobs and downstream jobs communicate with each other through Netty. The Sink operator of the upstream job works as a server and the Source operator of the downstream job works as a client. The Sink operator of the upstream job is called NettySink, and the Source operator of the downstream job is called NettySource.
- **NettyServer and NettyClient**  
NettySink functions as the server of Netty. In NettySink, NettyServer achieves the function of a server. NettySource functions as the client of Netty. In NettySource, NettyClient achieves the function of a client.
- **Publisher**  
The job that sends data to downstream jobs through NettySink is called a publisher.
- **Subscriber**  
The job that receives data from upstream jobs through NettySource is called a subscriber.
- **RegisterServer**  
RegisterServer is the third-party memory that stores the IP address, port number, and concurrency information about NettyServer.
- **The general outside-in architecture is as follows:**
  - NettySink->NettyServer->NettyServerHandler
  - NettySource->NettyClient->NettyClientHandler

**Job Pipeline Functions**

- **NettySink**  
NettySink consists of the following major modules:
  - RichParallelSinkFunction  
NettySink inherits RichParallelSinkFunction and attributes of Sink operators. The RichParallelSinkFunction API implements following functions:
    - Starts the NettySink operator.
    - Runs the NettySink operator and receives data from the upstream operator.

- Cancels the running of NettySink operators.

Following information can be obtained using the attribute of RichParallelSinkFunction:

- subtaskIndex about the concurrency of each NettySink operator.
  - Concurrency of the NettySink operator.
- RegisterServerHandler
- RegisterServerHandler interacts with the component of RegisterServer and defines following APIs:
- **start();** Starts the RegisterServerHandler and establishes a contact with the third-party RegisterServer.
  - **createTopicNode();** Creates a topic node.
  - **register();** Registers information such as the IP address, port number, and concurrency to the topic node.
  - **deleteTopicNode();** Deletes a topic node.
  - **unregister();** Deletes registration information.
  - **query();** Queries registration information.
  - **isExist();** Verifies that a specific piece of information exists.
  - **shutdown();** Disables the RegisterServerHandler and disconnects from the third-party RegisterServer.

#### NOTE

- RegisterServerHandler API enables ZooKeeper to work as the handler of RegisterServer. You can customize your handler as required. Information is stored in ZooKeeper in the following form:

```
Namespace
|---Topic-1
|   |--parallel-1
|   |--parallel-2
|   |...
|   |--parallel-n
|---Topic-2
|   |--parallel-1
|   |--parallel-2
|   |...
|   |--parallel-m
|...
```

- Information about NameSpace can be obtained from the following parameters of the **flink-conf.yaml** file:  
nettyconnector.registerserver.topic.storage: /flink/nettyconnector
- The simple authentication and security layer (SASL) authentication between ZookeeperRegisterServerHandler and ZooKeeper is implemented through the Flink framework.
- Ensure that each job has a unique topic. Otherwise, the subscription relationship may be unclear.
- When calling **shutdown()**, ZookeeperRegisterServerHandler deletes the registration information about the current concurrency, and then attempts to delete the topic node. If the topic node is not empty, deletion will be canceled, because not all concurrency has exited.

- NettyServer  
NettyServer is the core of the NettySink operator, whose main function is to create a NettyServer and receive connection requests from NettyClient. Use NettyServerHandler to send data received from upstream operators of a same job. The port number and subnet of NettyServer needs to be configured in the **flink-conf.yaml** file.

- Port range

```
nettyconnector.sinkserver.port.range: 28444-28943
```

- Subnet

```
nettyconnector.sinkserver.subnet: 10.162.222.123/24
```

 **NOTE**

The **nettyconnector.sinkserver.subnet** parameter is set to the subnet (service IP address) of the Flink client by default. If the client and TaskManager are not in the same subnet, an error may occur. Therefore, you need to manually set this parameter to the subnet (service IP address) of TaskManager.

- NettyServerHandler  
The handler enables the interaction between NettySink and subscribers. After NettySink receives messages, the handler sends these messages out. To ensure data transmission security, this channel is encrypted using SSL. The **nettyconnector.ssl.enabled** configures whether to enable SSL encryption. The SSL encryption is enabled only when **nettyconnector.ssl.enabled** is set to **true**.

- **NettySource**

NettySource consists of the following major modules:

- RichParallelSourceFunction

NettySource inherits RichParallelSinkFunction and attributes of Source operators. The RichParallelSourceFunction API implements following functions:

- Starts the NettySink operator.
- Runs the NettySink operator, receives data from subscribers, and injects the data to jobs.
- Cancels the running of Source operators.

Following information can be obtained using the attribute of RichParallelSourceFunction:

- `subtaskIndex` about the concurrency of each NettySource operator.
- Concurrency of the NettySource operator.

When the NettySource operator enters the running stage, the NettyClient status is monitored. Once abnormality occurs, NettyClient is restarted and reconnected to NettyServer, preventing data confusion.

- RegisterServerHandler

RegisterServerHandler of NettySource has similar function as the RegisterServerHandler of NettySink. It obtains the IP address, port number, and information of concurrent operators of each subscribed job obtained in the NettySource operator.

- NettyClient  
NettyClient establishes a connection with NettyServer and uses NettyClientHandler to receive data. Each NettySource operator must have a unique name (specified by the user). NettyServer determines whether each client comes from different NettySources based on unique names. When a connection is established between NettyClient and NettyServer, NettyClient is registered with NettyServer and the NettySource name of NettyClient is transferred to NettyServer.
- NettyClientHandler  
The NettyClientHandler enables the interaction with publishers and other operators of the job. When messages are received, NettyClientHandler transfers these messages to the job. To ensure secure data transmission, SSL encryption is enabled for the communication with NettySink. The SSL encryption is enabled only when SSL is enabled and **nettyconnector.ssl.enabled** is set to **true**.

The relationship between the jobs may be many-to-many. The concurrency between each NettySink and NettySource operator is one-to-many, as shown in [Figure 1-25](#).

**Figure 1-25** Relationship diagram

### 1.3.5.4.3 Configuration Table

#### Enhanced Open Source Feature: Configuration Table

In some scenarios, users have fixed configuration tables that store basic information. After Flink receives stream data, Flink needs to be configured to match configuration tables. Redis is recommended for storage because the configuration table may be of large size. Redis is a high-performance key-value database with low query latency for stream data.

The detailed process is as follows:

**Figure 1-26** Process flow

### Data Stored on Redis

Redis is a data structure server supporting various types of values, in addition to key-value storage. The following data types are supported:

- Binary-safe string.
- List: A collection of string elements sorted by their insertion order. It is basically a linked list.
- Sets: Disordered collection of character string elements without repetition.
- Sorted sets: Each string element is associated with a score floating number value. Elements are sorted by score and can be searched.
- Hashes: The map that consists of fields and related values. Fields and values are strings.
- Bit arrays: You can process strings as a series of bits by running certain commands. For example, you are allowed to configure and clear certain bits, calculate the number of bits that are configured to 1, and find the first bit that is configured to 1 or 0.
- HyperLogLogs: A probabilistic data structure which is used to estimate the cardinality of a set.

Redis clusters are used to store configuration tables containing a maximum of 500 million pieces of data, enabling quick query response. Asynchronous I/Os of streams are used to query messages, improving throughput of the data processing.

#### NOTE

- Redis cluster: In a Redis cluster, Redis is deployed on all nodes in the cluster and data is stored on all nodes with high storage capacity. MRS provides Redis.
- Asynchronous I/O: Asynchronous I/O is used to processes data with maximized data processing throughput, improving the processing efficiency.

Operations on Redis are as follows:

1. Install Redis.

When installing clusters, you can select Redis provided by MRS.

2. Import configuration tables to Redis.

You are allowed to select the main key or multiple key columns as the keys based on the feature of the configuration table. If to-be-stored configuration tables contain a large number of attributes, you are advised to storage them in the Hashes data format.

The Redis provided by MRS provides Jedis client for inserting queries. For details, see Redis sample code.

**NOTE**

For details about Redis data types, visit the official website at <https://redis.io/topics/data-types-intro>.

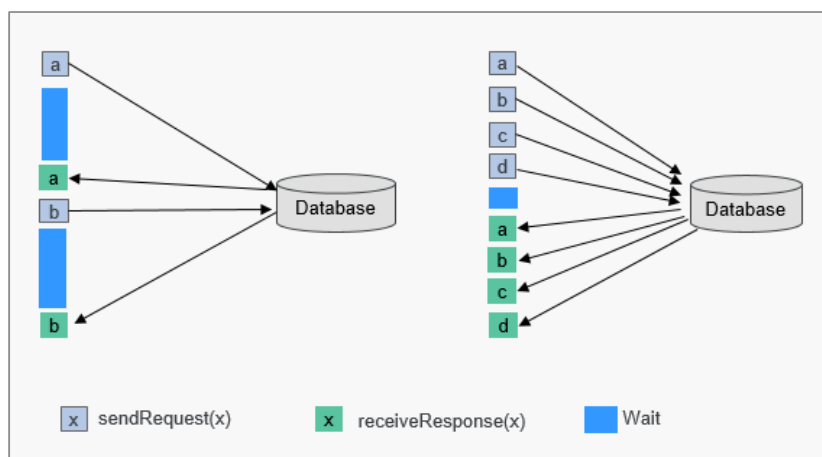

**Asynchronous I/Os**

When Flink interacts with external systems, such as external databases, the waiting time for responses is too long, reducing data processing efficiency. In asynchronous I/O mode, other requests can be sent without waiting for the response to the previous request, improving data throughput.

The following requirements are required for achieving the API of asynchronous I/O:

- You need to rewrite the **asyncInvoke** method of the AsyncFunction function to implement asynchronous data processing.
- Callback function obtains operator results and AsyncCollector collects the obtained results.

**Figure 1-27** Comparison of Async.I/O

- You need to configure the timeout period and maximum capacity. Timeout period defines the maximum allowed period for an asynchronous request. The maximum capacity refers to the maximum concurrent number of asynchronous requests. You are advised to configure maximum capacity based on data source features, because an improperly large value will cause high resources consumption and an improperly small value will reduce the throughput.

**1.3.5.4.4 Stream SQL Join**

**Enhanced Open Source Feature: Stream SQL Join**

Flink's Table API&SQL is an integrated query API for Scala and Java that allows the composition of queries from relational operators such as selection, filter, and join in an intuitive way. For details about Table API&SQL, visit the official website at <https://ci.apache.org/projects/flink/flink-docs-release-1.12/dev/table/index.html>.

## Introduction to Stream SQL Join

SQL Join is used to query data based on the relationship between columns in two or more tables. Flink Stream SQL Join allows you to join two streaming tables and query results from them. Queries similar to the following are supported:

```
SELECT o.proctime, o.productId, o.orderId, s.proctime AS shipTime
FROM Orders AS o
JOIN Shipments AS s
ON o.orderId = s.orderId
AND o.proctime BETWEEN s.proctime AND s.proctime + INTERVAL '1' HOUR;
```

Currently, Stream SQL Join needs to be performed within a specified window. The join operation for data within the window requires at least one equi-join predicate and a join condition that bounds the time on both sides. Such a condition can be defined by two appropriate range predicates (<, <=, >=, >), a **BETWEEN** predicate, or a single equality predicate that compares the same type of time attributes (such as processing time or event time) of both input tables.

The following example will join all orders with their corresponding shipments if the order was shipped four hours after the order was received.

```
SELECT *
FROM Orders o, Shipments s
WHERE o.id = s.orderId AND
o.ordertime BETWEEN s.shiptime - INTERVAL '4' HOUR AND s.shiptime
```

### NOTE

1. Stream SQL Join supports only inner join.
2. The **ON** clause should include an equal join condition.
3. Time attributes support only the processing time and event time.
4. The window condition supports only the bounded time range, for example, **o.proctime BETWEEN s.proctime - INTERVAL '1' HOUR AND s.proctime + INTERVAL '1' HOUR**. The unbounded range such as **o.proctime > s.proctime** is not supported. The **proctime** attribute of two streams must be included. **o.proctime BETWEEN proctime () AND proctime () + 1** is not supported.

### 1.3.5.4.5 Flink CEP in SQL

## Flink CEP in SQL

Flink allows users to represent complex event processing (CEP) query results in SQL for pattern matching and evaluate event streams on Flink engines.

## SQL Query Syntax

CEP SQL is implemented through the **MATCH\_RECOGNIZE** SQL syntax. The **MATCH\_RECOGNIZE** clause is supported by Oracle SQL since Oracle Database 12c and is used to indicate event pattern matching in SQL. Apache Calcite also supports the **MATCH\_RECOGNIZE** clause.

Flink uses Calcite to analyze SQL query results. Therefore, this operation complies with the Apache Calcite syntax.

```
MATCH_RECOGNIZE (
  [ PARTITION BY expression [, expression ]* ]
  [ ORDER BY orderItem [, orderItem ]* ]
  [ MEASURES measureColumn [, measureColumn ]* ]
  [ ONE ROW PER MATCH | ALL ROWS PER MATCH ]
```

```
[ AFTER MATCH
  ( SKIP TO NEXT ROW
  | SKIP PAST LAST ROW
  | SKIP TO FIRST variable
  | SKIP TO LAST variable
  | SKIP TO variable )
]
PATTERN ( pattern )
[ WITHIN intervalLiteral ]
[ SUBSET subsetItem [, subsetItem ]* ]
DEFINE variable AS condition [, variable AS condition ]*
)
```

The syntax elements of the **MATCH\_RECOGNIZE** clause are defined as follows:

(Optional) **-PARTITION BY**: defines partition columns. This clause is optional. If this parameter is not defined, the parallelism 1 is used.

(Optional) **-ORDER BY**: defines the sequence of events in a data flow. The **ORDER BY** clause is optional. If it is ignored, non-deterministic sorting is used. Since the order of events is important in pattern matching, this clause should be specified in most cases.

(Optional) **-MEASURES**: specifies the attribute value of the successfully matched event.

(Optional) **-ONE ROW PER MATCH | ALL ROWS PER MATCH**: defines how to output the result. **ONE ROW PER MATCH** indicates that only one row is output for each matching. **ALL ROWS PER MATCH** indicates that one row is output for each matching event.

(Optional) **-AFTER MATCH**: specifies the start position for processing after the next pattern is successfully matched.

**-PATTERN**: defines the matching pattern as a regular expression. The following operators can be used in the **PATTERN** clause: join operators, quantifier operators (\*, +, ?, {n}, {n,}, {n,m}, and {,m}), branch operators (vertical bar |), and differential operators ('{- -}').

(Optional) **-WITHIN**: outputs a pattern clause match only when the match occurs within the specified time.

(Optional) **-SUBSET**: combines one or more associated variables defined in the **DEFINE** clause.

**-DEFINE**: specifies the Boolean condition, which defines the variables used in the **PATTERN** clause.

In addition, the **MATCH\_RECOGNIZE** clause supports the following functions:

**-MATCH\_NUMBER()**: Used in the **MEASURES** clause to allocate the same number to each row that is successfully matched.

**-CLASSIFIER()**: Used in the **MEASURES** clause to indicate the mapping between matched rows and variables.

**-FIRST()** and **LAST()**: Used in the **MEASURES** clause to return the value of the expression evaluated in the first or last row of the row set mapped to the schema variable.

**-NEXT()** and **PREV()**: Used in the **DEFINE** clause to evaluate an expression using the previous or next row in a partition.

-**RUNNING** and **FINAL** keywords: Used to determine the semantics required for aggregation. **RUNNING** can be used in the **MEASURES** and **DEFINE** clauses, whereas **FINAL** can be used only in the **MEASURES** clause.

- Aggregate functions (**COUNT**, **SUM**, **AVG**, **MAX**, **MIN**): Used in the **MEASURES** and **DEFINE** clauses.

## Query Example

The following query finds the V-shaped pattern in the stock price data flow.

```
SELECT *
FROM MyTable
MATCH_RECOGNIZE (
  ORDER BY rowtime
  MEASURES
    STRT.name as s_name,
    LAST(DOWN.name) as down_name,
    LAST(UP.name) as up_name
  ONE ROW PER MATCH
  PATTERN (STRT DOWN+ UP+)
  DEFINE
    DOWN AS DOWN.v < PREV(DOWN.v),
    UP AS UP.v > PREV(UP.v)
)
```

In the following query, the aggregate function **AVG** is used in the **MEASURES** clause of **SUBSET E** consisting of variables related to A and C.

```
SELECT *
FROM Ticker
MATCH_RECOGNIZE (
  MEASURES
    AVG(E.price) AS avgPrice
  ONE ROW PER MATCH
  AFTER MATCH SKIP PAST LAST ROW
  PATTERN (A B+ C)
  SUBSET E = (A,C)
  DEFINE
    A AS A.price < 30,
    B AS B.price < 20,
    C AS C.price < 30
)
```

## 1.3.6 Flume

### 1.3.6.1 Flume Basic Principles

**Flume** is a distributed, reliable, and HA system that supports massive log collection, aggregation, and transmission. Flume supports customization of various data senders in the log system for data collection. In addition, Flume can roughly process data and write data to various data receivers (customizable). A Flume-NG is a branch of Flume. It is simple, small, and easy to deploy. The following figure shows the basic architecture of the Flume-NG.

**Figure 1-28** Flume-NG architecture

A Flume-NG consists of agents. Each agent consists of three components (source, channel, and sink). A source is used for receiving data. A channel is used for transmitting data. A sink is used for sending data to the next end.

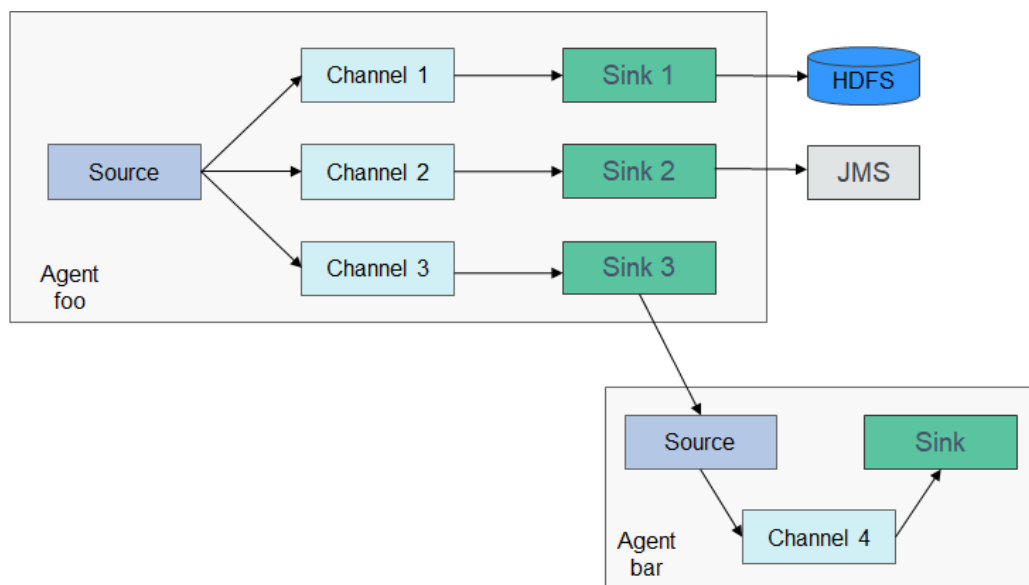

**Table 1-4** Module description

Module	Description
Source	<p>A source receives data or generates data by using a special mechanism, and places the data in batches in one or more channels. The source can work in data-driven or polling mode.</p> <p>Typical source types are as follows:</p> <ul style="list-style-type: none"> <li>• Sources that are integrated with the system, such as Syslog and Netcat</li> <li>• Sources that automatically generate events, such as Exec and SEQ</li> <li>• IPC sources that are used for communication between agents, such as Avro</li> </ul> <p>A source must be associated with at least one channel.</p>
Channel	<p>A channel is used to buffer data between a source and a sink. The channel caches data from the source and deletes that data after the sink sends the data to the next-hop channel or final destination.</p> <p>Different channels provide different persistence levels.</p> <ul style="list-style-type: none"> <li>• Memory channel: non-persistence</li> <li>• File channel: Write-Ahead Logging (WAL)-based persistence</li> <li>• JDBC channel: persistence implemented based on the embedded database</li> </ul> <p>The channel supports the transaction feature to ensure simple sequential operations. A channel can work with sources and sinks of any quantity.</p>

Module	Description
Sink	<p>A sink sends data to the next-hop channel or final destination. Once completed, the transmitted data is removed from the channel.</p> <p>Typical sink types are as follows:</p> <ul style="list-style-type: none"> <li>• Sinks that send storage data to the final destination, such as HDFS and HBase</li> <li>• Sinks that are consumed automatically, such as Null Sink</li> <li>• IPC sinks used for communication between Agents, such as Avro</li> </ul> <p>A sink must be associated with a specific channel.</p>

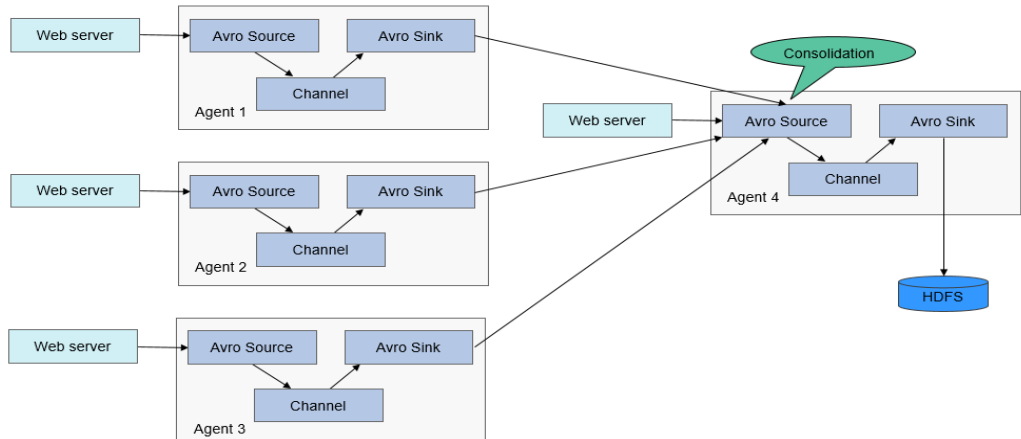

As shown in [Figure 1-29](#), a Flume client can have multiple sources, channels, and sinks.

**Figure 1-29** Flume structure

The reliability of Flume depends on transaction switchovers between agents. If the next agent breaks down, the channel stores data persistently and transmits data until the agent recovers. The availability of Flume depends on the built-in load balancing and failover mechanisms. Both the channel and agent can be configured with multiple entities between which they can use load balancing policies. Each agent is a Java Virtual Machine (JVM) process. A server can have multiple agents. Collection nodes (for example, Agents 1, 2, 3) process logs. Aggregation nodes (for example, Agent 4) write the logs into HDFS. The agent of each collection node can select multiple aggregation nodes for load balancing.

**Figure 1-30** Flume cascading

For details about Flume architecture and principles, see <https://flume.apache.org/releases/1.9.0.html>.

## Principle

### Reliability Between Agents

**Figure 1-31** shows the data exchange between agents.

**Figure 1-31** Data transmission process

1. Flume ensures reliable data transmission based on transactions. When data flows from one agent to another agent, the two transactions take effect. The sink of Agent 1 (agent that sends a message) needs to obtain a message from a channel and sends the message to Agent 2 (agent that receives the

message). If Agent 2 receives and successfully processes the message, Agent 1 will submit a transaction, indicating a successful and reliable data transmission.

2. When Agent 2 receives the message sent by Agent 1 and starts a new transaction, after the data is processed successfully (written to a channel), Agent 2 submits the transaction and sends a success response to Agent 1.
3. Before a commit operation, if the data transmission fails, the last transcription starts and retransmits the data that fails to be transmitted last time. The commit operation has written the transaction into a disk. Therefore, the last transaction can continue after the process fails and restores.

### 1.3.6.2 Relationship Between Flume and Other Components

#### Relationship Between Flume and HDFS

If HDFS is configured as the Flume sink, HDFS functions as the final data storage system of Flume. Flume installs, configures, and writes all transmitted data into HDFS.

#### Relationship Between Flume and HBase

If HBase is configured as the Flume sink, HBase functions as the final data storage system of Flume. Flume writes all transmitted data into HBase based on configurations.

### 1.3.6.3 Flume Enhanced Open Source Features

#### Flume Enhanced Open Source Features

- Improving transmission speed: Multiple lines instead of only one line of data can be specified as an event. This improves the efficiency of code execution and reduces the times of disk writes.
- Transferring ultra-large binary files: According to the current memory usage, Flume automatically adjusts the memory used for transferring ultra-large binary files to prevent out-of-memory.
- Supporting the customization of preparations before and after transmission: Flume supports customized scripts to be run before or after transmission for making preparations.
- Managing client alarms: Flume receives Flume client alarms through MonitorServer and reports the alarms to the alarm management center on MRS Manager.

## 1.3.7 HBase

### 1.3.7.1 HBase Basic Principles

HBase undertakes data storage. HBase is an open source, column-oriented, distributed storage system that is suitable for storing massive amounts of unstructured or semi-structured data. It features high reliability, high performance,

and flexible scalability, and supports real-time data read/write. For more information about HBase, see <https://hbase.apache.org/>.

Typical features of a table stored in HBase are as follows:

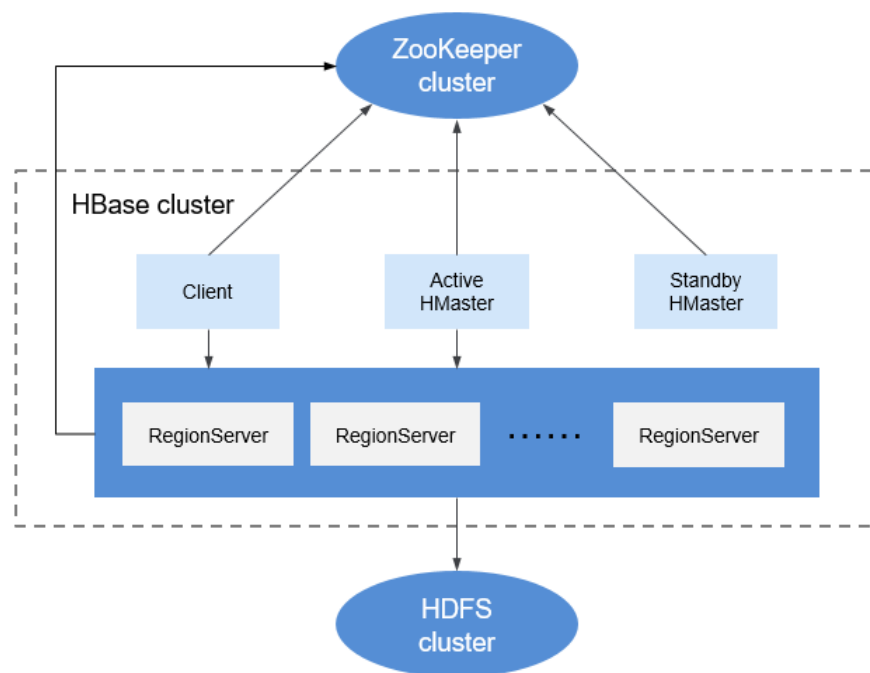

- Big table (BigTable): One table contains hundred millions of lines and millions of columns.
- Column-oriented: Column-oriented storage, retrieval, and permission control
- Sparse: Null columns in the table do not occupy any storage space.

The HBase component of MRS separates computing from storage. Data can be stored in cloud storage services at low cost, for example, Object Storage Service (OBS), and can be backed up across AZs. MRS supports secondary indexes for HBase and allows adding indexes for column values to filter data by column through native HBase APIs.

## HBase architecture

An HBase cluster consists of active and standby HMaster processes and multiple RegionServer processes, as shown in [Figure 1-32](#).

**Figure 1-32** HBase architecture

**Table 1-5** Module description

Module	Description
Master	<p>Master is also called HMaster. In HA mode, HMaster consists of an active HMaster and a standby HMaster.</p> <ul style="list-style-type: none"> <li>• Active Master: manages RegionServer in HBase, including the creation, deletion, modification, and query of a table, balances the load of RegionServer, adjusts the distribution of Region, splits Region and distributes Region after it is split, and migrates Region after RegionServer expires.</li> <li>• Standby Master: takes over services when the active HMaster is faulty. The original active HMaster demotes to the standby HMaster after the fault is rectified.</li> </ul>
Client	Client communicates with Master for management and with RegionServer for data protection by using the Remote Procedure Call (RPC) mechanism of HBase.
RegionServer	<p>RegionServer provides read and write services of table data as a data processing and computing unit in HBase.</p> <p>RegionServer is deployed with DataNodes of HDFS clusters to store data.</p>
ZooKeeper cluster	ZooKeeper provides distributed coordination services for processes in HBase clusters. Each RegionServer is registered with ZooKeeper so that the active Master can obtain the health status of each RegionServer.
HDFS cluster	HDFS provides highly reliable file storage services for HBase. All HBase data is stored in the HDFS.

## HBase Principles

- **HBase Data Model**

HBase stores data in tables, as shown in [Figure 1-33](#). Data in a table is divided into multiple Regions, which are allocated by Master to RegionServers for management.

Each Region contains data within a RowKey range. An HBase data table contains only one Region at first. As the number of data increases and reaches the upper limit of the Region capacity, the Region is split into two Regions. You can define the RowKey range of a Region when creating a table or define the Region size in the configuration file.

**Figure 1-33** HBase data model

Row Key	Timestamp	Column Family 1		Column Family N		
		URI	Content	Column 1	Column 2	
row1	t2	www. .com	"<html>..."	...	...	Region
	t1	www. .com	"<html>..."	...	...	
...	...	...	...	...	...	
rowM						
rowM+1	t1	...	...	...	...	Region
rowM+2	t3	...	...	...	...	
	t2	...	...	...	...	
...	t1	...	...	...	...	
rowN	t1	...	...	...	...	Region
...	...	...	...	...	...	

**Table 1-6** Concepts

Module	Description
RowKey	Similar to the primary key in a relationship table, which is the unique ID of the data in each row. A RowKey can be a string, integer, or binary string. All records are stored after being sorted by RowKey.
Timestamp	The timestamp of a data operation. Data can be specified with different versions by time stamp. Data of different versions in each cell is stored by time in descending order.
Cell	Minimum storage unit of HBase, consisting of keys and values. A key consists of six fields, namely row, column family, column qualifier, timestamp, type, and MVCC version. Values are the binary data objects.
Column Family	One or multiple horizontal column families form a table. A column family can consist of multiple random columns. A column is a label under a column family, which can be added as required when data is written. The column family supports dynamic expansion so the number and type of columns do not need to be predefined. Columns of a table in HBase are sparsely distributed. The number and type of columns in different rows can be different. Each column family has the independent time to live (TTL). You can lock the row only. Operations on the row in a column family are the same as those on other rows.
Column	Similar to traditional databases, HBase tables also use columns to store data of the same type.

- **RegionServer Data Storage**

RegionServer manages the regions allocated by HMaster. [Figure 1-34](#) shows the data storage structure of RegionServer.

**Figure 1-34** RegionServer data storage structure

[Table 1-7](#) lists each component of Region described in [Figure 1-34](#).

**Table 1-7** Region structure description

Module	Description
Store	A Region consists of one or multiple Stores. Each Store maps a column family in <a href="#">Figure 1-33</a> .
MemStore	A Store contains one MemStore. The MemStore caches data inserted to a Region by the client. When the MemStore capacity reaches the upper limit, RegionServer flushes data in MemStore to the HDFS.
StoreFile	The data flushed to the HDFS is stored as a StoreFile in the HDFS. As more data is inserted, multiple StoreFiles are generated in a Store. When the number of StoreFiles reaches the upper limit, RegionServer merges multiple StoreFiles into a big StoreFile.
HFile	HFile defines the storage format of StoreFiles in a file system. HFile is the underlying implementation of StoreFile.
HLog	HLogs prevent data loss when RegionServer is faulty. Multiple Regions in a RegionServer share the same HLog.

- **Metadata Table**

The metadata table is a special HBase table, which is used by the client to locate a region. Metadata table includes **hbase:meta** table to record region

information of user tables, such as the region location and start and end RowKey.

**Figure 1-35** shows the mapping relationship between metadata tables and user tables.

**Figure 1-35** Mapping relationships between metadata tables and user tables

- **Data Operation Process**

**Figure 1-36** shows the HBase data operation process.

**Figure 1-36** Data processing

- a. When you add, delete, modify, and query HBase data, the HBase client first connects to ZooKeeper to obtain information about the RegionServer where the **hbase:meta** table is located. If you modify the namespace, such as creating and deleting a table, you need to access HMaster to update the meta information.
- b. The HBase client connects to the RegionServer where the region of the **hbase:meta** table is located and obtains the RegionServer location where the region of the user table resides.
- c. Then the HBase client connects to the RegionServer where the region of the user table is located and issues a data operation command to the RegionServer. The RegionServer executes the command.

To improve data processing efficiency, the HBase client caches region information of the **hbase:meta** table and user table. When an application initiates a second data operation, the HBase client queries the region information from the memory. If no match is found in the memory, the HBase client performs the preceding operations to obtain region information.

### 1.3.7.2 HBase HA Solution

#### HBase HA

HMaster in HBase allocates Regions. When one RegionServer service is stopped, HMaster migrates the corresponding Region to another RegionServer. The HMaster HA feature is brought in to prevent HBase functions from being affected by the HMaster single point of failure (SPOF).

**Figure 1-37** HMaster HA implementation architecture

The HMaster HA architecture is implemented by creating the ephemeral ZooKeeper node in a ZooKeeper cluster.

Upon startup, HMaster nodes try to create a master znode in the ZooKeeper cluster. The HMaster node that creates the master znode first becomes the active HMaster, and the other is the standby HMaster.

It will add watch events to the master node. If the service on the active HMaster is stopped, the active HMaster disconnects from the ZooKeeper cluster. After the

session expires, the active HMaster disappears. The standby HMaster detects the disappearance of the active HMaster through watch events and creates a master node to make itself be the active one. Then, the active/standby switchover completes. If the failed node detects existence of the master node after being restarted, it enters the standby state and adds watch events to the master node.

When the client accesses the HBase, it first obtains the HMaster's address based on the master node information on the ZooKeeper and then establishes a connection to the active HMaster.

### 1.3.7.3 Relationship with Other Components

#### Relationship Between HDFS and HBase

HDFS is the subproject of Apache Hadoop. HBase uses the Hadoop Distributed File System (HDFS) as the file storage system. HBase is located in structured storage layer. The HDFS provides highly reliable support for lower-layer storage of HBase. All the data files of HBase can be stored in the HDFS, except some log files generated by HBase.

#### Relationship Between ZooKeeper and HBase

Figure 1-38 describes the relationship between ZooKeeper and HBase.

Figure 1-38 Relationship between ZooKeeper and HBase

1. HRegionServer registers itself to ZooKeeper in Ephemeral node. ZooKeeper stores the HBase information, including the HBase metadata and HMaster addresses.
2. HMaster detects the health status of each HRegionServer using ZooKeeper, and monitors them.

3. HBase can deploy multiple HMaster (like HDFS NameNode). When the active HMaster node is faulty, the standby HMaster node obtains the state information of the entire cluster using ZooKeeper, which means that HBase single point faults can be avoided using ZooKeeper.

### 1.3.7.4 HBase Enhanced Open Source Features

#### HIndex

HBase is a distributed storage database of the Key-Value type. Data of a table is sorted in the alphabetic order based on row keys. If you query data based on a specified row key or scan data in the scale of a specified row key, HBase can quickly locate the target data, enhancing the efficiency.

However, in most actual scenarios, you need to query the data of which the column value is *XXX*. HBase provides the Filter feature to query data with a specific column value. All data is scanned in the order of row keys, and then the data is matched with the specific column value until the required data is found. The Filter feature scans some unnecessary data to obtain the only required data. Therefore, the Filter feature cannot meet the requirements of frequent queries with high performance standards.

HBase HIndex is designed to address these issues. HBase HIndex enables HBase to query data based on specific column values.

Figure 1-39 HIndex

- Rolling upgrade is not supported for index data.
- Restrictions of combined indexes:
  - All columns involved in combined indexes must be entered or deleted in a single mutation. Otherwise, inconsistency will occur.

Index: **IDX1=>cf1:[q1->datatype],[q2];cf2:[q2->datatype]**

Correct write operations:

```
Put put = new Put(Bytes.toBytes("row"));
put.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
```

```
put.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
put.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueC"));
table.put(put);
```

Incorrect write operations:

```
Put put1 = new Put(Bytes.toBytes("row"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
table.put(put1);
Put put2 = new Put(Bytes.toBytes("row"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
table.put(put2);
Put put3 = new Put(Bytes.toBytes("row"));
put3.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueC"));
table.put(put3);
```

- The combined conditions-based query is supported only when the combined index column contains filter criteria, or StartRow and StopRow are not specified for some index columns.

Index: **IDX1=>cf1:[q1->datatype],[q2];cf2:[q1->datatype]**

Correct query operations:

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',>=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true) " }
```

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',='binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) " }
```

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',>=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true)",STARTROW=>'row001',STOPROW
=>'row100' }
```

Incorrect query operations:

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',>=,'binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true) AND
SingleColumnValueFilter('cf2','q2',>=,'binary:valueD',true,true) " }
```

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',='binary:valueA',true,true) AND
SingleColumnValueFilter('cf2','q1',>=,'binary:valueC',true,true) " }
```

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',='binary:valueA',true,true) AND
SingleColumnValueFilter('cf2','q2',>=,'binary:valueD',true,true) " }
```

```
scan 'table', {FILTER=>"SingleColumnValueFilter('cf1','q1',='binary:valueA',true,true) AND
SingleColumnValueFilter('cf1','q2',>=,'binary:valueB',true,true) ",STARTROW=>'row001',STOPROW
=>'row100' }
```

- Do not explicitly configure any split policy for tables with index data.
- Other mutation operations, such as **increment** and **append**, are not supported.
- Index of the column with **maxVersions** greater than 1 is not supported.
- The data index column in a row cannot be updated.

Index 1: **IDX1=>cf1:[q1->datatype],[q2];cf2:[q1->datatype]**

Index 2: **IDX2=>cf2:[q2->datatype]**

Correct update operations:

```
Put put1 = new Put(Bytes.toBytes("row"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q1"), Bytes.toBytes("valueC"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueD"));
table.put(put1);
```

```
Put put2 = new Put(Bytes.toBytes("row"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q3"), Bytes.toBytes("valueE"));
put2.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q3"), Bytes.toBytes("valueF"));
table.put(put2);
```

#### Incorrect update operations:

```
Put put1 = new Put(Bytes.toBytes("row"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA"));
put1.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q1"), Bytes.toBytes("valueC"));
put1.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueD"));
table.put(put1);
```

```
Put put2 = new Put(Bytes.toBytes("row"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q1"), Bytes.toBytes("valueA_new"));
put2.addColumn(Bytes.toBytes("cf1"), Bytes.toBytes("q2"), Bytes.toBytes("valueB_new"));
put2.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q1"), Bytes.toBytes("valueC_new"));
put2.addColumn(Bytes.toBytes("cf2"), Bytes.toBytes("q2"), Bytes.toBytes("valueD_new"));
table.put(put2);
```

- The table to which an index is added cannot contain a value greater than 32 KB.
- If user data is deleted due to the expiration of the column-level TTL, the corresponding index data is not deleted immediately. It will be deleted in the major compaction operation.
- The TTL of the user column family cannot be modified after the index is created.
  - If the TTL of a column family increases after an index is created, delete the index and re-create one. Otherwise, some generated index data will be deleted before user data is deleted.
  - If the TTL value of the column family decreases after an index is created, the index data will be deleted after user data is deleted.
- The index query does not support the reverse operation, and the query results are disordered.
- The index does not support the **clone snapshot** operation.
- The index table must use HIndexWALPlayer to replay logs. WALPlayer cannot be used to replay logs.

```
hbase org.apache.hadoop.hbase.index.mapreduce.HIndexWALPlayer
Usage: WALPlayer [options] <wal inputdir> <tables> [<tableMappings>]
Read all WAL entries for <tables>.
If no tables ("") are specific, all tables are imported.
(Careful, even -ROOT- and hbase:meta entries will be imported in that case.)
Otherwise <tables> is a comma separated list of tables.
```

The WAL entries can be mapped to new set of tables via <tableMapping>.  
<tableMapping> is a command separated list of targettables.  
If specified, each table in <tables> must have a mapping.

By default WALPlayer will load data directly into HBase.  
To generate HFiles for a bulk data load instead, pass the option:  
-Dwal.bulk.output=/path/for/output  
(Only one table can be specified, and no mapping is allowed!)  
Other options: (specify time range to WAL edit to consider)  
-Dwal.start.time=[date|ms]  
-Dwal.end.time=[date|ms]  
For performance also consider the following options:  
-Dmapreduce.map.speculative=false  
-Dmapreduce.reduce.speculative=false

- When the **deleteall** command is executed for the index table, the performance is low.

- The index table does not support HCK. To use HCK to repair the index table, delete the index data first.

## Multi-point Division

When you create tables that are pre-divided by region in HBase, you may not know the data distribution trend so the division by region may be inappropriate. After the system runs for a period, regions need to be divided again to achieve better performance. Only empty regions can be divided.

The region division function delivered with HBase divides regions only when they reach the threshold. This is called "single point division".

To achieve better performance when regions are divided based on user requirements, multi-point division is developed, which is also called "dynamic division". That is, an empty region is pre-divided into multiple regions to prevent performance deterioration caused by insufficient region space.

**Figure 1-40** Multi-point division

## Connection Limitation

Too many sessions mean that too many queries and MapReduce tasks are running on HBase, which compromises HBase performance and even causes service rejection. You can configure parameters to limit the maximum number of sessions that can be established between the client and the HBase server to achieve HBase overload protection.

## Improved Disaster Recovery

The disaster recovery (DR) capabilities between the active and standby clusters can enhance HA of the HBase data. The active cluster provides data services and the standby cluster backs up data. If the active cluster is faulty, the standby cluster takes over data services. Compared with the open source replication function, this function is enhanced as follows:

1. The standby cluster whitelist function is only applicable to pushing data to a specified cluster IP address.
2. In the open source version, replication is synchronized based on WAL, and data backup is implemented by replaying WAL in the standby cluster. For

BulkLoad operations, since no WAL is generated, data will not be replicated to the standby cluster. By recording BulkLoad operations on the WAL and synchronizing them to the standby cluster, the standby cluster can read BulkLoad operation records through WAL and load HFile in the active cluster to the standby cluster to implement data backup.

3. In the open source version, HBase filters ACLs. Therefore, ACL information will not be synchronized to the standby cluster. By adding a filter (**org.apache.hadoop.hbase.replication.SystemTableWALEntryFilterAllowACL**), ACL information can be synchronized to the standby cluster. You can configure **hbase.replication.filter.sytemWALEntryFilter** to enable the filter and implement ACL synchronization.
4. As for read-only restriction of the standby cluster, only super users within the standby cluster can modify the HBase of the standby cluster. In other words, HBase clients outside the standby cluster can only read the HBase of the standby cluster.

## HBase MOB

In the actual application scenarios, data in various sizes needs to be stored, for example, image data and documents. Data whose size is smaller than 10 MB can be stored in HBase. HBase can yield the best read-and-write performance for data whose size is smaller than 100 KB. If the size of data stored in HBase is greater than 100 KB or even reaches 10 MB and the same number of data files are inserted, the total data amount is large, causing frequent compaction and split, high CPU consumption, high disk I/O frequency, and low performance.

MOB data (whose size ranges from 100 KB to 10 MB) is stored in a file system (for example, HDFS) in HFile format. The `expiredMobFileCleaner` and `Sweeper` tools are used to manage HFiles and save the address and size information about the HFiles to the store of HBase as values. This greatly decreases the compaction and split frequency in HBase and improves performance.

As shown in [Figure 1-41](#), MOB indicates mobstore stored on HRegion. Mobstore stores keys and values. Wherein, a key is the corresponding key in HBase, and a value is the reference address and data offset stored in the file system. When reading data, mobstore uses its own scanner to read key-value data objects and uses the address and data size information in the value to obtain target data from the file system.

**Figure 1-41** MOB data storage principle

## HFS

HBase FileStream (HFS) is an independent HBase file storage module. It is used in MRS upper-layer applications by encapsulating HBase and HDFS interfaces to provide these upper-layer applications with functions such as file storage, read, and deletion.

In the Hadoop ecosystem, the HDFS and HBase face tough problems in mass file storage in some scenarios:

- If a large number of small files are stored in HDFS, the NameNode will be under great pressure.
- Some large files cannot be directly stored on HBase due to HBase APIs and internal mechanisms.

HFS is developed for the mixed storage of massive small files and some large files in Hadoop. Simply speaking, massive small files (smaller than 10 MB) and some large files (greater than 10 MB) need to be stored in HBase tables.

For such a scenario, HFS provides unified operation APIs similar to HBase function APIs.

## Multiple RegionServers Deployed on the Same Server

Multiple RegionServers can be deployed on one node to improve HBase resource utilization.

If only one RegionServer is deployed, resource utilization is low due to the following reasons:

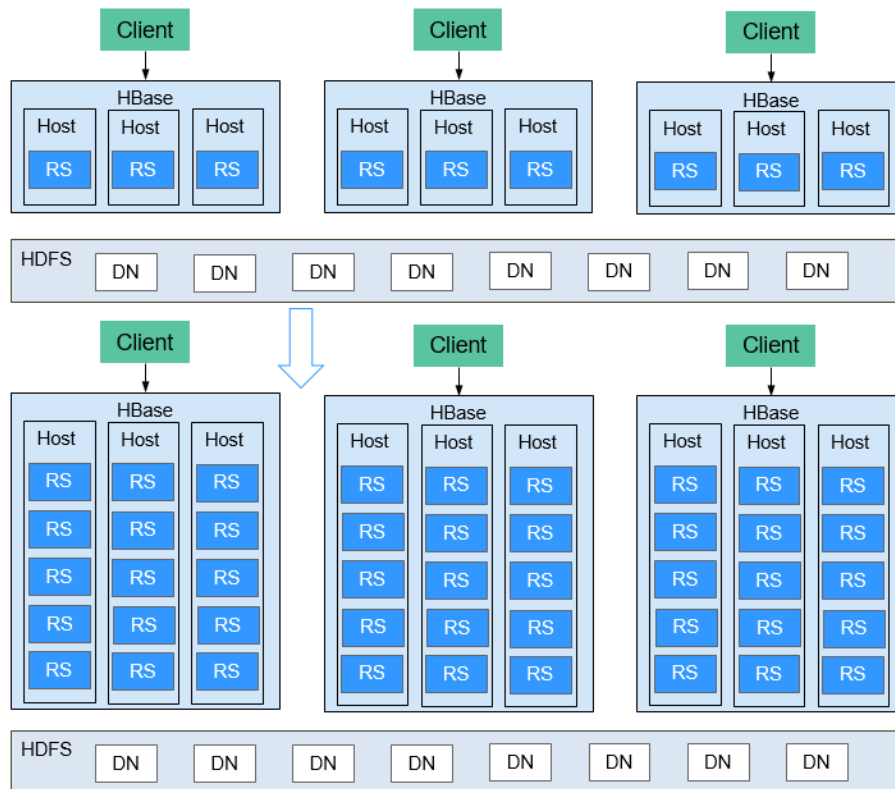

1. A RegionServer supports a limited number of regions, and therefore memory and CPU resources cannot be fully used.
2. A single RegionServer supports a maximum of 20 TB data, of which two copies require 40 TB, and three copies require 60 TB. In this case, 96 TB capacity cannot be used up.

- Poor write performance: One RegionServer is deployed on a physical server, and only one HLog exists. Only three disks can be written at the same time.

The HBase resource utilization can be improved when multiple RegionServers are deployed on the same server.

- A physical server can be configured with a maximum of five RegionServers. The number of RegionServers deployed on each physical server can be configured as required.
- Resources such as memory, disks, and CPUs can be fully used.
- A physical server supports a maximum of five HLogs and allows data to be written to 15 disks at the same time, significantly improving write performance.

**Figure 1-42** Improved HBase resource utilization

## HBase Dual-Read

In the HBase storage scenario, it is difficult to ensure 99.9% query stability due to GC, network jitter, and bad sectors of disks. The HBase dual-read feature is added to meet the requirements of low glitches during large-data-volume random read.

The HBase dual-read feature is based on the DR capability of the active and standby clusters. The probability that the two clusters generate glitches at the same time is far less than that of one cluster. The dual-cluster concurrent access mode is used to ensure query stability. When a user initiates a query request, the HBase service of the two clusters is queried at the same time. If the active cluster does not return any result after a period of time (the maximum tolerable glitch

time), the data of the cluster with the fastest response can be used. The following figure shows the working principle.

## 1.3.8 HDFS

### 1.3.8.1 HDFS Basic Principles

Hadoop Distributed File System (HDFS) implements reliable and distributed read/write of massive amounts of data. HDFS is applicable to the scenario where data read/write features "write once and read multiple times". However, the write operation is performed in sequence, that is, it is a write operation performed during file creation or an adding operation performed behind the existing file. HDFS ensures that only one caller can perform write operation on a file but multiple callers can perform read operation on the file at the same time.

### Architecture

HDFS consists of active and standby NameNodes and multiple DataNodes, as shown in [Figure 1-43](#).

HDFS works in master/slave architecture. NameNodes run on the master (active) node, and DataNodes run on the slave (standby) node. ZKFC should run along with the NameNodes.

The communication between NameNodes and DataNodes is based on Transmission Control Protocol (TCP)/Internet Protocol (IP). The NameNode, DataNode, ZKFC, and JournalNode can be deployed on Linux servers.

**Figure 1-43** HA HDFS architecture

**Table 1-8** describes the functions of each module shown in **Figure 1-43**.

**Table 1-8** Module description

Module	Description
Name Node	<p>A NameNode is used to manage the namespace, directory structure, and metadata information of a file system and provide the backup mechanism. The NameNode is classified into the following two types:</p> <ul style="list-style-type: none"> <li>• Active NameNode: manages the namespace, maintains the directory structure and metadata of file systems, and records the mapping relationships between data blocks and files to which the data blocks belong.</li> <li>• Standby NameNode: synchronizes with the data in the active NameNode, and takes over services from the active NameNode when the active NameNode is faulty.</li> <li>• Observer NameNode: synchronizes with the data in the active NameNode, and processes read requests from the client.</li> </ul>
DataNode	<p>A DataNode is used to store data blocks of each file and periodically report the storage status to the NameNode.</p>
JournalNode	<p>In HA cluster, synchronizes metadata between the active and standby NameNodes.</p>
ZKFC	<p>ZKFC must be deployed for each NameNode. It monitors NameNode status and writes status information to ZooKeeper. ZKFC also has permissions to select the active NameNode.</p>

Module	Description
ZK Cluster	ZooKeeper is a coordination service which helps the ZKFC to elect the active NameNode.
HttpFS gateway	HttpFS is a single stateless gateway process which provides the WebHDFS REST API for external processes and FileSystem API for the HDFS. HttpFS is used for data transmission between different versions of Hadoop. It is also used as a gateway to access the HDFS behind a firewall.

• **HDFS HA Architecture**

HA is used to resolve the SPOF problem of NameNode. This feature provides a standby NameNode for the active NameNode. When the active NameNode is faulty, the standby NameNode can quickly take over to continuously provide services for external systems.

In a typical HDFS HA scenario, there are usually two NameNodes. One is in the active state, and the other in the standby state.

A shared storage system is required to support metadata synchronization of the active and standby NameNodes. This version provides Quorum Journal Manager (QJM) HA solution, as shown in [Figure 1-44](#). A group of JournalNodes are used to synchronize metadata between the active and standby NameNodes.

Generally, an odd number (2N+1) of JournalNodes are configured, and at least three JournalNodes are required. For one metadata update message, data writing is considered successful as long as data writing is successful on N +1 JournalNodes. In this case, data writing failure of a maximum of N JournalNodes is allowed. For example, when there are three JournalNodes, data writing failure of one JournalNode is allowed; when there are five JournalNodes, data writing failure of two JournalNodes is allowed.

JournalNode is a lightweight daemon process and shares a host with other services of Hadoop. It is recommended that the JournalNode be deployed on the control node to prevent data writing failure on the JournalNode during massive data transmission.

**Figure 1-44** QJM-based HDFS architecture

## Principle

MRS uses the HDFS copy mechanism to ensure data reliability. One backup file is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The number of HDFS copies can be queried using the **dfs.replication** parameter.

- When the Core node specification of the MRS cluster is set to non-local hard disk drive (HDD) and the cluster has only one Core node, the default number of HDFS copies is 1. If the number of Core nodes in the cluster is greater than or equal to 2, the default number of HDFS copies is 2.
- When the Core node specification of the MRS cluster is set to local disk and the cluster has only one Core node, the default number of HDFS copies is 1. If there are two Core nodes in the cluster, the default number of HDFS copies is 2. If the number of Core nodes in the cluster is greater than or equal to 3, the default number of HDFS copies is 3.

Figure 1-45 HDFS architecture

The HDFS component of MRS supports the following features:

- Supports erasure code, reducing data redundancy to 50% and improving reliability. In addition, the striped block storage structure is introduced to maximize the use of the capability of a single node and multiple disks in an existing cluster. After the coding process is introduced, the data write performance is improved, and the performance is close to that with the multi-copy redundancy.
- Supports balanced node scheduling on HDFS and balanced disk scheduling on a single node, improving HDFS storage performance after node or disk scale-out.

For details about the Hadoop architecture and principles, see <https://hadoop.apache.org/>.

### 1.3.8.2 HDFS HA Solution

#### HDFS HA Background

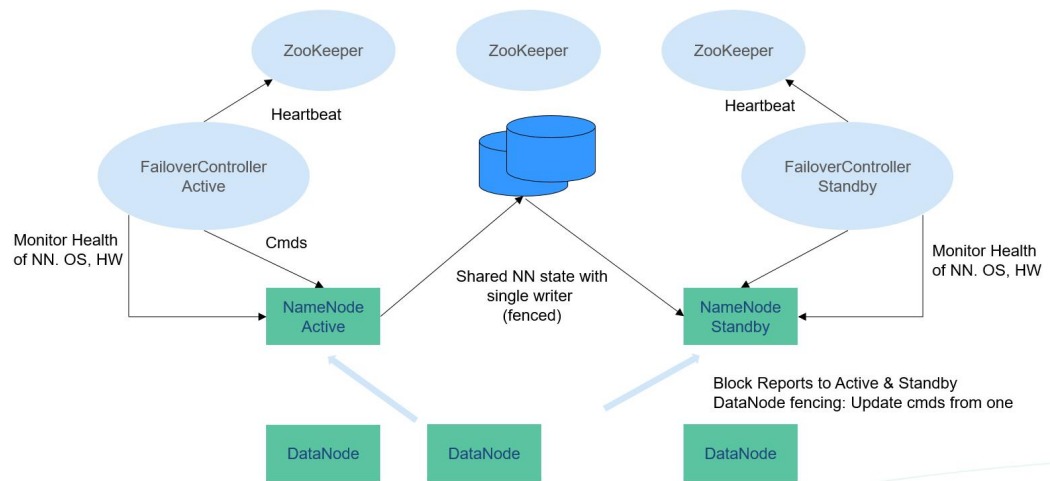

In versions earlier than Hadoop 2.0.0, SPOF occurs in the HDFS cluster. Each cluster has only one NameNode. If the host where the NameNode is located is faulty, the HDFS cluster cannot be used unless the NameNode is restarted or started on another host. This affects the overall availability of HDFS in the following aspects:

1. In the case of an unplanned event such as host breakdown, the cluster would be unavailable until the NameNode is restarted.
2. Planned maintenance tasks, such as software and hardware upgrade, will cause the cluster stop working.

To solve the preceding problems, the HDFS HA solution enables a hot-swap NameNode backup for NameNodes in a cluster in automatic or manual (configurable) mode. When a machine fails (due to hardware failure), the active/standby NameNode switches over automatically in a short time. When the active NameNode needs to be maintained, the MRS cluster administrator can manually perform an active/standby NameNode switchover to ensure cluster availability during maintenance. For details about the automatic failover of HDFS, see [https://hadoop.apache.org/docs/r3.1.1/hadoop-project-dist/hadoop-hdfs/HDFSHighAvailabilityWithQJM.html#Automatic\\_Failover](https://hadoop.apache.org/docs/r3.1.1/hadoop-project-dist/hadoop-hdfs/HDFSHighAvailabilityWithQJM.html#Automatic_Failover).

#### HDFS HA Implementation

Figure 1-46 Typical HA deployment

In a typical HA cluster (as shown in [Figure 1-46](#)), two NameNodes need to be configured on two independent servers, respectively. At any time point, one NameNode is in the active state, and the other NameNode is in the standby state. The active NameNode is responsible for all client operations in the cluster, while the standby NameNode maintains synchronization with the active node to provide fast switchover if necessary.

To keep the data synchronized with each other, both nodes communicate with a group of JournalNodes. When the active node modifies any file system's metadata,

it will store the modification log to a majority of these JournalNodes. For example, if there are three JournalNodes, then the log will be saved on two of them at least. The standby node monitors changes of JournalNodes and synchronizes changes from the active node. Based on the modification log, the standby node applies the changes to the metadata of the local file system. Once a switchover occurs, the standby node can ensure its status is the same as that of the active node. This ensures that the metadata of the file system is synchronized between the active and standby nodes if the switchover is incurred by the failure of the active node.

To ensure fast switchover, the standby node needs to have the latest block information. Therefore, DataNodes send block information and heartbeat messages to two NameNodes at the same time.

It is vital for an HA cluster that only one of the NameNodes be active at any time. Otherwise, the namespace state would split into two parts, risking data loss or other incorrect results. To prevent the so-called "split-brain scenario", the JournalNodes will only ever allow a single NameNode to write data to it at a time. During switchover, the NameNode which is to become active will take over the role of writing data to JournalNodes. This effectively prevents the other NameNodes from being in the active state, allowing the new active node to safely proceed with switchover.

For more information about the HDFS HA solution, visit the following website:

<http://hadoop.apache.org/docs/r3.1.1/hadoop-project-dist/hadoop-hdfs/HDFSHighAvailabilityWithQJM.html>

### 1.3.8.3 Relationship Between HDFS and Other Components

#### Relationship Between HDFS and HBase

HDFS is a subproject of Apache Hadoop, which is used as the file storage system for HBase. HBase is located in the structured storage layer. HDFS provides highly reliable support for lower-layer storage of HBase. All the data files of HBase can be stored in the HDFS, except some log files generated by HBase.

#### Relationship Between HDFS and MapReduce

- HDFS features high fault tolerance and high throughput, and can be deployed on low-cost hardware for storing data of applications with massive data sets.
- MapReduce is a programming model used for parallel computation of large data sets (larger than 1 TB). Data computed by MapReduce comes from multiple data sources, such as Local FileSystem, HDFS, and databases. Most data comes from the HDFS. The high throughput of HDFS can be used to read massive data. After being computed, data can be stored in HDFS.

#### Relationship Between HDFS and Spark

Data computed by Spark comes from multiple data sources, such as local files and HDFS. Most data comes from HDFS which can read data in large scale for parallel computing. After being computed, data can be stored in HDFS.

Spark involves Driver and Executor. Driver schedules tasks and Executor runs tasks.

Figure 1-47 shows how data is read from a file.

Figure 1-47 File reading process

The file reading process is as follows:

1. Driver interconnects with HDFS to obtain the information of File A.
2. The HDFS returns the detailed block information about this file.
3. Driver sets a parallel degree based on the block data amount, and creates multiple tasks to read the blocks of this file.
4. Executor runs the tasks and reads the detailed blocks as part of the Resilient Distributed Dataset (RDD).

Figure 1-48 shows how data is written to a file.

Figure 1-48 File writing process

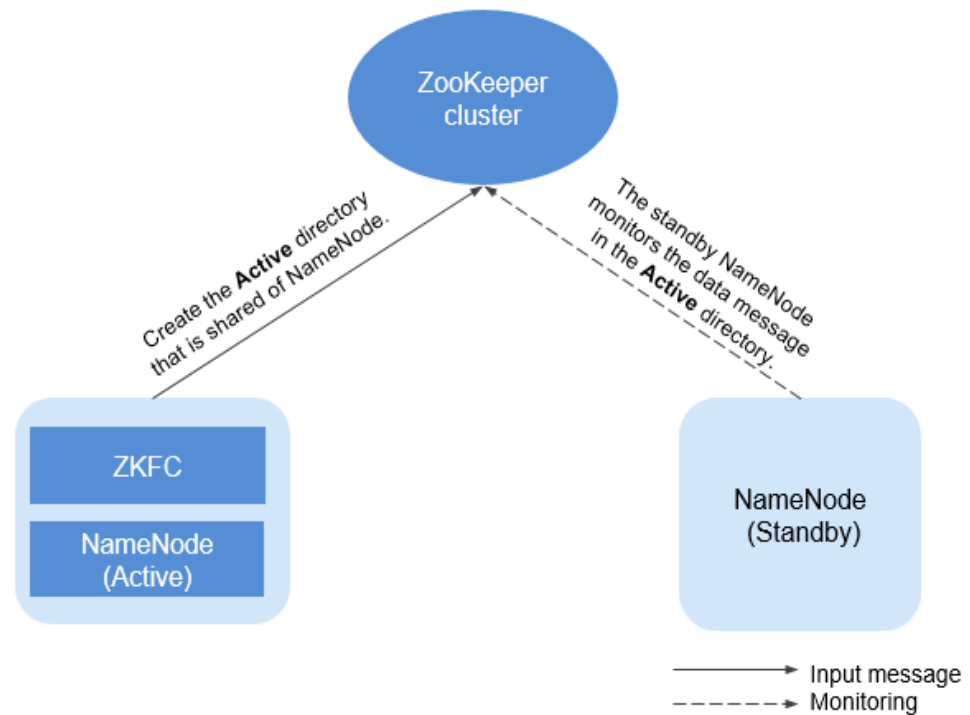

The file writing process is as follows:

1. Driver creates a directory where the file is to be written.
2. Based on the RDD distribution status, the number of tasks related to data writing is computed, and these tasks are sent to Executor.
3. Executor runs these tasks, and writes the computed RDD data to the directory created in 1.

## Relationship Between HDFS and ZooKeeper

Figure 1-49 shows the relationship between ZooKeeper and HDFS.

Figure 1-49 Relationship between ZooKeeper and HDFS

As the client of a ZooKeeper cluster, ZKFailoverController (ZKFC) monitors the status of NameNode. ZKFC is deployed only in the node where NameNode resides, and in both the active and standby HDFS NameNodes.

1. The ZKFC connects to ZooKeeper and saves information such as host names to ZooKeeper under the znode directory **/hadoop-ha**. NameNode that creates the directory first is considered as the active node, and the other is the standby node. NameNodes read the NameNode information periodically through ZooKeeper.
2. When the process of the active node ends abnormally, the standby NameNode detects changes in the **/hadoop-ha** directory through ZooKeeper, and then takes over the service of the active NameNode.

### 1.3.8.4 HDFS Enhanced Open Source Features

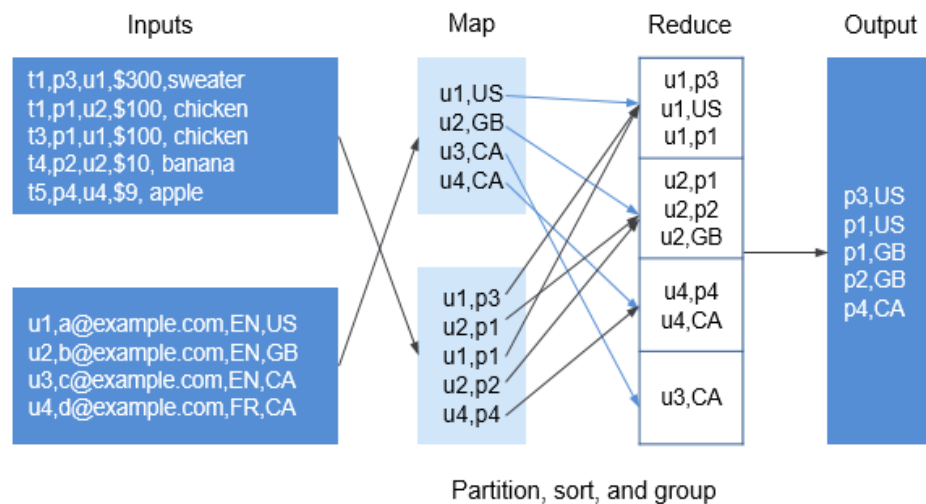

#### Enhanced Open Source Feature: File Block Colocation

In the offline data summary and statistics scenario, Join is a frequently used computing function, and is implemented in MapReduce as follows:

1. The Map task processes the records in the two table files into Join Key and Value, performs hash partitioning by Join Key, and sends the data to different Reduce tasks for processing.
2. Reduce tasks read data in the left table recursively in the nested loop mode and traverse each line of the right table. If join key values are identical, join results are output.

The preceding method sharply reduces the performance of the join calculation. Because a large amount of network data transfer is required when the data stored in different nodes is sent from MAP to Reduce, as shown in [Figure 1-50](#).

**Figure 1-50** Data transmission in the non-colocation scenario

Data tables are stored in physical file system by HDFS block. Therefore, if two to-be-joined blocks are put into the same host accordingly after they are partitioned by join key, you can obtain the results directly from Map join in the local node without any data transfer in the Reduce process of the join calculation. This will greatly improve the performance.

With the identical distribution feature of HDFS data, a same distribution ID is allocated to files, FileA and FileB, on which association and summation calculations need to be performed. In this way, all the blocks are distributed together, and calculation can be performed without retrieving data across nodes, which greatly improves the MapReduce join performance.

**Figure 1-51** Data block distribution in colocation and non-colocation scenarios

## Enhanced Open Source Feature: Damaged Hard Disk Volume Configuration

In the open source version, if multiple data storage volumes are configured for a DataNode, the DataNode stops providing services by default if one of the volumes is damaged. If the configuration item `dfs.datanode.failed.volumes.tolerated` is set to specify the number of damaged volumes that are allowed, DataNode continues to provide services when the number of damaged volumes does not exceed the threshold.

The value of `dfs.datanode.failed.volumes.tolerated` ranges from -1 to the number of disk volumes configured on the DataNode. The default value is -1, as shown in [Figure 1-52](#).

**Figure 1-52** Item being set to 0

For example, three data storage volumes are mounted to a DataNode, and `dfs.datanode.failed.volumes.tolerated` is set to 1. In this case, if one data storage volume of the DataNode is unavailable, this DataNode can still provide services, as shown in [Figure 1-53](#).

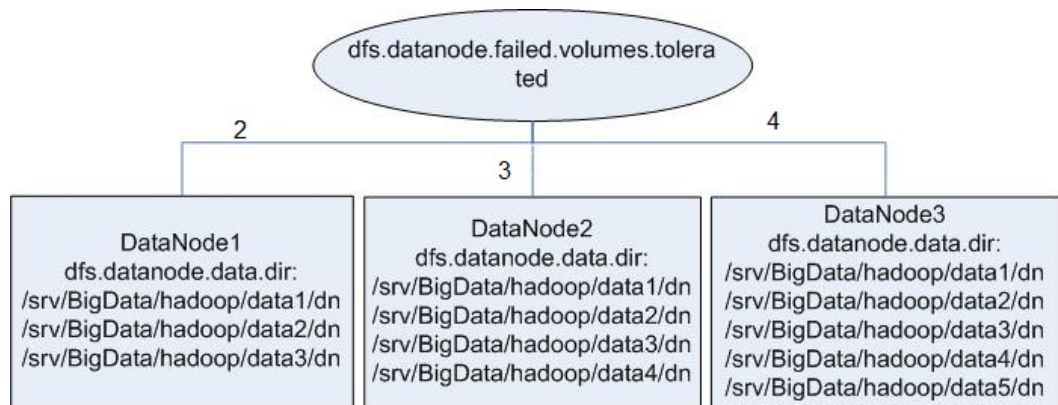

**Figure 1-53** Item being set to 1

This native configuration item has some defects. When the number of data storage volumes in each DataNode is inconsistent, you need to configure each DataNode independently instead of generating the unified configuration file for all nodes.

Assume that there are three DataNodes in a cluster. The first node has three data directories, the second node has four, and the third node has five. If you want to ensure that DataNode services are available when only one data directory is available, you need to perform the configuration as shown in [Figure 1-54](#).

**Figure 1-54** Attribute configuration before being enhanced

In self-developed enhanced HDFS, this configuration item is enhanced, with a value **-1** added. When this configuration item is set to **-1**, all DataNodes can provide services as long as one data storage volume in all DataNodes is available.

To resolve the problem in the preceding example, set this configuration to **-1**, as shown in [Figure 1-55](#).

**Figure 1-55** Attribute configuration after being enhanced

## Enhanced Open Source Feature: HDFS Startup Acceleration

In HDFS, when NameNodes start, the metadata file Fslmage needs to be loaded. Then, DataNodes will report the data block information after the DataNodes startup. When the data block information reported by DataNodes reaches the preset percentage, NameNodes exits safe mode to complete the startup process. If the number of files stored on the HDFS reaches the million or billion level, the two processes are time-consuming and will lead to a long startup time of the NameNode. Therefore, this version optimizes the process of loading metadata file Fslmage.

In the open source HDFS, Fslmage stores all types of metadata information. Each type of metadata information (such as file metadata information and folder metadata information) is stored in a section block, respectively. These section blocks are loaded in serial mode during startup. If a large number of files and folders are stored on the HDFS, loading of the two sections is time-consuming, prolonging the HDFS startup time. HDFS NameNode divides each type of metadata by segments and stores the data in multiple sections when generating the Fslmage files. When the NameNodes start, sections are loaded in parallel mode. This accelerates the HDFS startup.

## Enhanced Open Source Feature: Label-based Block Placement Policies (HDFS Nodelabel)

You need to configure the nodes for storing HDFS file data blocks based on data features. You can configure a label expression to an HDFS directory or file and assign one or more labels to a DataNode so that file data blocks can be stored on specified DataNodes. If the label-based data block placement policy is used for selecting DataNodes to store the specified files, the DataNode range is specified based on the label expression. Then proper nodes are selected from the specified range.

- You can store the replicas of data blocks to the nodes with different labels accordingly. For example, store two replicas of the data block to the node labeled with L1, and store other replicas of the data block to the nodes labeled with L2.
- You can set the policy in case of block placement failure, for example, select a node from all nodes randomly.

**Figure 1-56** gives an example:

- Data in **/HBase** is stored in A, B, and D.
- Data in **/Spark** is stored in A, B, D, E, and F.
- Data in **/user** is stored in C, D, and F.
- Data in **/user/shl** is stored in A, E, and F.

**Figure 1-56** Example of label-based block placement policy

## Enhanced Open Source Feature: HDFS Load Balance

The current read and write policies of HDFS are mainly for local optimization without considering the actual load of nodes or disks. Based on I/O loads of different nodes, the load balance of HDFS ensures that when read and write operations are performed on the HDFS client, the node with low I/O load is selected to perform such operations to balance I/O load and fully utilize the overall throughput of the cluster.

If HDFS Load Balance is enabled during file writing, the NameNode selects a DataNode (in the order of local node, local rack, and remote rack). If the I/O load of the selected node is heavy, the NameNode will choose another DataNode with lighter load.

If HDFS Load Balance is enabled during file reading, an HDFS client sends a request to the NameNode to provide the list of DataNodes that store the block to be read. The NameNode returns a list of DataNodes sorted by distance in the network topology. With the HDFS Load Balance feature, the DataNodes on the list

are also sorted by their I/O load. The DataNodes with heavy load are at the bottom of the list.

## Enhanced Open Source Feature: HDFS Auto Data Movement

Hadoop has been used for batch processing of immense data in a long time. The existing HDFS model is used to fit the needs of batch processing applications very well because such applications focus more on throughput than delay.

However, as Hadoop is increasingly used for upper-layer applications that demand frequent random I/O access such as Hive and HBase, low latency disks such as solid state disk (SSD) are favored in delay-sensitive scenarios. To cater to the trend, HDFS supports a variety of storage types. Users can choose a storage type according to their needs.

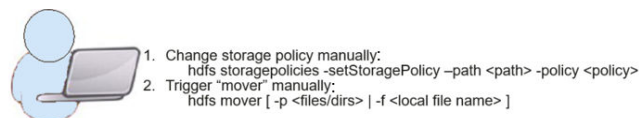

Storage policies vary depending on how frequently data is used. For example, if data that is frequently accessed in the HDFS is marked as **ALL\_SSD** or **HOT**, the data that is accessed several times may be marked as **WARM**, and data that is rarely accessed (only once or twice access) can be marked as **COLD**. You can select different data storage policies based on the data access frequency.

However, low latency disks are far more expensive than spinning disks. Data typically sees heavy initial usage with decline in usage over a period of time. Therefore, it can be useful if data that is no longer used is moved out from expensive disks to cheaper ones storage media.

A typical example is storage of detail records. New detail records are imported into SSD because they are frequently queried by upper-layer applications. As access frequency to these detail records declines, they are moved to cheaper storage.

Before automatic data movement is achieved, you have to manually determine by service type whether data is frequently used, manually set a data storage policy, and manually trigger the HDFS Auto Data Movement Tool, as shown in the figure below.

Policy ID	PolicyName	Block Placement (n replicas)	Fallback storages for creation	Fallback storages for replication
15	Lazy_Persist	RAN_DISK:1 DISK:n-1	DISK	DISK
12	All_SSD	SSD:n	DISK	DISK
10	One_SSD	SSD:1,DISK:n-1	SSD,DISK	SSD,DISK
7	Hot(default)	DISK:n	<none>	ARCHIVE
5	Warm	DISK:1,ARCHIVE:n-1	ARCHIVE, DISK	ARCHIVE, DISK
2	Cold	ARCHIVE:n	<none>	<none>

If aged data can be automatically identified and moved to cheaper storage (such as disk/archive), you will see significant cost cuts and data management efficiency improvement.

The HDFS Auto Data Movement Tool is at the core of HDFS Auto Data Movement. It automatically sets a storage policy depending on how frequently data is used. Specifically, functions of the HDFS Auto Data Movement Tool can:

- Mark a data storage policy as **All\_SSD**, **One\_SSD**, **Hot**, **Warm**, **Cold**, or **FROZEN** according to age, access time, and manual data movement rules.
- Define rules for distinguishing cold and hot data based on the data age, access time, and manual migration rules.
- Define the action to be taken if age-based rules are met.

**MARK**: the action for identifying whether data is frequently or rarely used based on the age rules and setting a data storage policy. **MOVE**: the action for invoking the HDFS Auto Data Movement Tool and moving data based on the age rules to identify whether data is frequently or rarely used after you have determined the corresponding storage policy.

- **MARK**: identifies whether data is frequently or rarely used and sets the data storage policy.
- **MOVE**: the action for invoking the HDFS Auto Data Movement Tool and moving data across tiers.
- **SET\_REPL**: the action for setting new replica quantity for a file.
- **MOVE\_TO\_FOLDER**: the action for moving files to a target folder.
- **DELETE**: the action for deleting a file or directory.
- **SET\_NODE\_LABEL**: the action for setting node labels of a file.

With the HDFS Auto Data Movement feature, you only need to define age based on access time rules. HDFS Auto Data Movement Tool matches data according to age-based rules, sets storage policies, and moves data. In this way, data management efficiency and cluster resource efficiency are improved.

## 1.3.9 Hive

### 1.3.9.1 Hive Basic Principles

**Hive** is a data warehouse infrastructure built on Hadoop. It provides a series of tools that can be used to extract, transform, and load (ETL) data. Hive is a mechanism that can store, query, and analyze mass data stored on Hadoop. Hive defines simple SQL-like query language, which is known as HiveQL. It allows a user familiar with SQL to query data. Hive data computing depends on MapReduce, Spark, and Tez.

The new execution engine **Tez** is used to replace the original MapReduce, greatly improving performance. Tez can convert multiple dependent jobs into one job, so only once HDFS write is required and fewer transit nodes are needed, greatly improving the performance of DAG jobs.

Hive provides the following functions:

- Analyzes massive structured data and summarizes analysis results.

- Allows complex MapReduce jobs to be compiled in SQL languages.
- Supports flexible data storage formats, including JavaScript object notation (JSON), comma separated values (CSV), TextFile, RCFile, SequenceFile, and ORC (Optimized Row Columnar).

Hive system structure:

- User interface: Three user interfaces are available, that is, CLI, Client, and WUI. CLI is the most frequently-used user interface. A Hive transcript is started when CLI is started. Client refers to a Hive client, and a client user connects to the Hive Server. When entering the client mode, you need to specify the node where the Hive Server resides and start the Hive Server on this node. WUI is used to access Hive through a browser. MRS can access Hive only in client mode.
- Metadata storage: Hive stores metadata into databases, for example, MySQL and Derby. Metadata in Hive includes a table name, table columns and partitions and their properties, table properties (indicating whether a table is an external table), and the directory where table data is stored.

## Hive Framework

Hive is a single-instance service process that provides services by translating HQL into related MapReduce jobs or HDFS operations. [Figure 1-57](#) shows how Hive is connected to other components.

**Figure 1-57** Hive framework

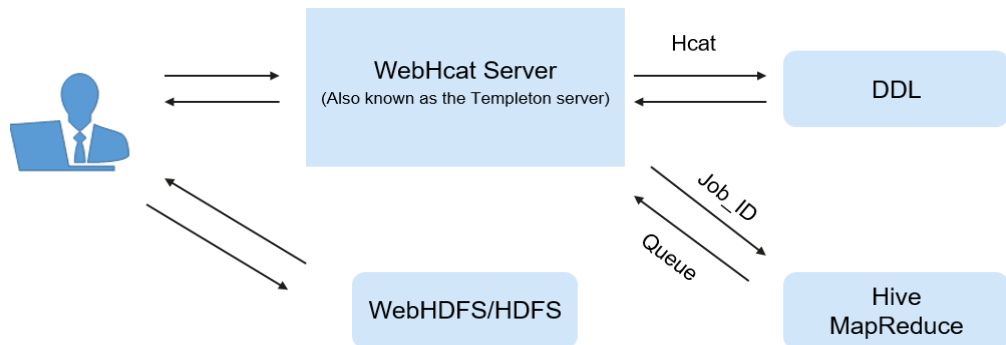

**Table 1-9** Module description

Module	Description
HiveServer	Multiple HiveServers can be deployed in a cluster to share loads. HiveServer provides Hive database services externally, translates HQL statements into related Yarn tasks or HDFS operations to complete data extraction, conversion, and analysis.
MetaStore	<ul style="list-style-type: none"> <li>Multiple MetaStores can be deployed in a cluster to share loads. MetaStore provides Hive metadata services as well as reads, writes, maintains, and modifies the structure and properties of Hive tables.</li> <li>MetaStore provides Thrift APIs for HiveServer, Spark, WebHCat, and other MetaStore clients to access and operate metadata.</li> </ul>
WebHCat	Multiple WebHCats can be deployed in a cluster to share loads. WebHCat provides REST APIs and runs the Hive commands through the REST APIs to submit MapReduce jobs.
Hive client	Hive client includes the human-machine command-line interface (CLI) Beeline, JDBC drive for JDBC applications, Python driver for Python applications, and HCatalog JAR files for MapReduce.
ZooKeeper cluster	As a temporary node, ZooKeeper records the IP address list of each HiveServer instance. The client driver connects to ZooKeeper to obtain the list and selects corresponding HiveServer instances based on the routing mechanism.
HDFS/HBase cluster	The HDFS cluster stores the Hive table data.
MapReduce/Yarn cluster	Provides distributed computing services. Most Hive data operations rely on MapReduce. The main function of HiveServer is to translate HQL statements into MapReduce jobs to process massive data.

HCatalog is built on Hive Metastore and incorporates the DDL capability of Hive. HCatalog is also a Hadoop-based table and storage management layer that enables convenient data read/write on tables of HDFS by using different data processing tools such as MapReduce. Besides, HCatalog also provides read/write APIs for these tools and uses a Hive CLI to publish commands for defining data and querying metadata. After encapsulating these commands, WebHcat Server can provide RESTful APIs, as shown in [Figure 1-58](#).

**Figure 1-58** WebHCat logical architecture

## Principles

Hive functions as a data warehouse based on HDFS and MapReduce architecture and translates HQL statements into MapReduce jobs or HDFS operations. For details about Hive and HQL, see [HiveQL Language Manual](#).

**Figure 1-59** shows the Hive structure.

- **Metastore:** reads, writes, and updates metadata such as tables, columns, and partitions. Its lower layer is relational databases.
- **Driver:** manages the lifecycle of HiveQL execution and participates in the entire Hive job execution.
- **Compiler:** translates HQL statements into a series of interdependent Map or Reduce jobs.
- **Optimizer:** is classified into logical optimizer and physical optimizer to optimize HQL execution plans and MapReduce jobs, respectively.
- **Executor:** runs Map or Reduce jobs based on job dependencies.
- **ThriftServer:** functions as the servers of JDBC, provides Thrift APIs, and integrates with Hive and other applications.
- **Clients:** include the WebUI and JDBC APIs and provides APIs for user access.

**Figure 1-59** Hive framework

### 1.3.9.2 Hive CBO Principles

#### Hive CBO Principles

CBO is short for Cost-Based Optimization.

It will optimize the following:

During compilation, the CBO calculates the most efficient join sequence based on tables and query conditions involved in query statements to reduce time and resources required for query.

In Hive, the CBO is implemented as follows:

Hive uses open-source component Apache Calcite to implement the CBO. SQL statements are first converted into Hive Abstract Syntax Trees (ASTs) and then into RelNodes that can be identified by Calcite. After Calcite adjusts the join sequence in RelNodes, RelNodes are converted into ASTs by Hive to continue the logical and physical optimization. [Figure 1-60](#) shows the working flow.

**Figure 1-60** CBO Implementation process

Calcite adjusts the join sequence as follows:

1. A table is selected as the first table from the tables to be joined.
2. The second and third tables are selected based on the cost. In this way, multiple different execution plans are obtained.
3. A plan with the minimum costs is calculated and serves as the final sequence.

The cost calculation method is as follows:

In the current version, costs are measured based on the number of data entries after joining. Fewer data entries mean less cost. The number of joined data entries depends on the selection rate of joined tables. The number of data entries in a table is obtained based on the table-level statistics.

The number of data entries in a table after filtering is estimated based on the column-level statistics, including the maximum values (max), minimum values (min), and Number of Distinct Values (NDV).

For example, there is a table **table\_a** whose total number of data records is 1,000,000 and NDV is 50. The query conditions are as follows:

```
Select * from table_a where colum_a='value1';
```

The estimated number of queried data entries is:  $1,000,000 \times 1/50 = 20,000$ . The selection rate is 2%.

The following takes the TPC-DS Q3 as an example to describe how the CBO adjusts the join sequence:

```
select
  dt.d_year,
  item.i_brand_id brand_id,
  item.i_brand brand,
  sum(ss_ext_sales_price) sum_agg
from
  date_dim dt,
  store_sales,
  item
where
  dt.d_date_sk = store_sales.ss_sold_date_sk
  and store_sales.ss_item_sk = item.i_item_sk
```

```

and item.i_manufact_id = 436
and dt.d_moy = 12
group by dt.d_year , item.i_brand , item.i_brand_id
order by dt.d_year , sum_agg desc , brand_id
limit 10;

```

Statement explanation: This statement indicates that inner join is performed for three tables: table **store\_sales** is a fact table with about 2,900,000,000 data entries, table **date\_dim** is a dimension table with about 73,000 data entries, and table **item** is a dimension table with about 18,000 data entries. Each table has filtering conditions. **Figure 1-61** shows the join relationship.

**Figure 1-61** Join relationship

The CBO must first select the tables that bring the best filtering effect for joining.

By analyzing min, max, NDV, and the number of data entries, the CBO estimates the selection rates of different dimension tables, as shown in **Table 1-10**.

**Table 1-10** Data filtering

Table	Number of Original Data Entries	Number of Data Entries After Filtering	Selection Rate
date_dim	73,000	6,200	8.5%
item	18,000	19	0.1%

The selection rate can be estimated as follows: Selection rate = Number of data entries after filtering/Number of original data entries

As shown in the preceding table, the **item** table has a better filtering effect. Therefore, the CBO joins the **item** table first before joining the **date\_dim** table.

**Figure 1-62** shows the join process when the CBO is disabled.

**Figure 1-62** Join process when the CBO is disabled

**Figure 1-63** shows the join process when the CBO is enabled.

**Figure 1-63** Join process when the CBO is enabled

After the CBO is enabled, the number of intermediate data entries is reduced from 495,000,000 to 2,900,000 and thus the execution time can be remarkably reduced.

### 1.3.9.3 Relationship Between Hive and Other Components

#### Relationship Between Hive and HDFS

Hive is a sub-project of Apache Hadoop, which uses HDFS as the file storage system. It parses and processes structured data with highly reliable underlying storage supported by HDFS. All data files in the Hive database are stored in HDFS, and all data operations on Hive are also performed using HDFS APIs.

#### Relationship Between Hive and MapReduce

Hive data computing depends on MapReduce. MapReduce is also a sub-project of Apache Hadoop and is a parallel computing framework based on HDFS. During data analysis, Hive parses HQL statements submitted by users into MapReduce tasks and submits the tasks for MapReduce to execute.

#### Relationship Between Hive and Tez

Tez, an open-source project of Apache, is a distributed computing framework that supports directed acyclic graphs (DAGs). When Hive uses the Tez engine to analyze data, it parses HQL statements submitted by users into Tez tasks and submits the tasks to Tez for execution.

#### Relationship Between Hive and DBService

MetaStore (metadata service) of Hive processes the structure and attribute information of Hive metadata, such as Hive databases, tables, and partitions. The information needs to be stored in a relational database and is managed and processed by MetaStore. In the product, the metadata of Hive is stored and maintained by the DBService component, and the metadata service is provided by the Metadata component.

### 1.3.9.4 Enhanced Open Source Feature

#### Enhanced Open Source Feature: HDFS Colocation

HDFS Colocation is the data location control function provided by HDFS. The HDFS Colocation API stores associated data or data on which associated operations are performed on the same storage node.

Hive supports HDFS Colocation. When Hive tables are created, after the locator information is set for table files, the data files of related tables are stored on the same storage node. This ensures convenient and efficient data computing among associated tables.

#### Enhanced Open Source Feature: Column Encryption

Hive supports encryption of one or more columns. The columns to be encrypted and the encryption algorithm can be specified when a Hive table is created. When data is inserted into the table using the INSERT statement, the related columns are encrypted. The Hive column encryption does not support views and the Hive over HBase scenario.

The Hive column encryption mechanism supports two encryption algorithms that can be selected to meet site requirements during table creation:

- AES (the encryption class is **org.apache.hadoop.hive.serde2.AESRewriter**)
- SMS4 (the encryption class is **org.apache.hadoop.hive.serde2.SMS4Rewriter**)

## Enhanced Open Source Feature: HBase Deletion

Due to the limitations of underlying storage systems, Hive does not support the ability to delete a single piece of table data. In Hive on HBase, Hive in the MRS solution supports the ability to delete a single piece of HBase table data. Using a specific syntax, Hive can delete one or more pieces of data from an HBase table.

## Enhanced Open Source Feature: Row Delimiter

In most cases, a carriage return character is used as the row delimiter in Hive tables stored in text files, that is, the carriage return character is used as the terminator of a row during queries.

However, some data files are delimited by special characters, and not a carriage return character.

MRS Hive allows you to specify different characters or character combinations as row delimiters for Hive data in text files.

## Enhanced Open Source Feature: HTTPS/HTTP-based REST API Switchover

WebHCat provides external REST APIs for Hive. By default, the open source community version uses the HTTP protocol.

MRS Hive supports the HTTPS protocol that is more secure, and enables switchover between the HTTP protocol and the HTTPS protocol.

## Enhanced Open Source Feature: Transform Function

The Transform function is not allowed by Hive of the open source version. MRS Hive supports the configuration of the Transform function. The function is disabled by default, which is the same as that of the open source community version.

Users can modify configurations of the Transform function to enable the function. However, security risks exist when the Transform function is enabled.

## Enhanced Open Source Feature: Temporary Function Creation Without ADMIN Permission

You must have **ADMIN** permission when creating temporary functions on Hive of the open source community version. MRS Hive supports the configuration of the function for creating temporary functions with **ADMIN** permission. The function is disabled by default, which is the same as that of the open-source community version.

You can modify configurations of this function. After the function is enabled, you can create temporary functions without **ADMIN** permission.

## Enhanced Open Source Feature: Database Authorization

In the Hive open source community version, only the database owner can create tables in the database. You can be granted with the **CREATE** and **SELECT** permissions on tables by MRS Hive in a database. After you are granted with the permission to query data in the database, the system automatically associates the query permission on all tables in the database.

## Enhanced Open Source Feature: Column Authorization

The Hive open source community version supports only table-level permission control. MRS Hive supports column-level permission control. You can be granted with column-level permissions, such as **SELECT**, **INSERT**, and **UPDATE**.

### 1.3.10 Hue

#### 1.3.10.1 Hue Basic Principles

Hue is a group of web applications that interact with MRS big data components. It helps you browse HDFS, perform Hive query, and start MapReduce jobs. Hue bears applications that interact with all MRS big data components.

Hue provides the file browser and query editor functions:

- File browser allows you to directly browse and operate different HDFS directories on the GUI.
- Query editor can write simple SQL statements to query data stored on Hadoop, for example, HDFS, HBase, and Hive. With the query editor, you can easily create, manage, and execute SQL statements and download the execution results as an Excel file.

On the WebUI provided by Hue, you can perform the following operations on the components:

- HDFS:
  - View, create, manage, rename, move, and delete files or directories.
  - File upload and download
  - Search for files, directories, file owners, and user groups; change the owners and permissions of the files and directories.
  - Manually configure HDFS directory storage policies and dynamic storage policies.
- Hive:
  - Edit and execute SQL/HQL statements. Save, copy, and edit the SQL/HQL template. Explain SQL/HQL statements. Save the SQL/HQL statement and query it.
  - Database presentation and data table presentation
  - Supporting different types of Hadoop storage
  - Use MetaStore to add, delete, modify, and query databases, tables, and views.

 NOTE

If Internet Explorer is used to access the Hue page to execute HiveSQL statements, the execution fails, because the browser has functional problems. You are advised to use a compatible browser, for example, Google Chrome.

- Impala:
  - Edit and execute SQL/HQL statements. Save, copy, and edit the SQL/HQL template. Explain SQL/HQL statements. Save the SQL/HQL statement and query it.
  - Database presentation and data table presentation
  - Supporting different types of Hadoop storage
  - Use MetaStore to add, delete, modify, and query databases, tables, and views.

 NOTE

If Internet Explorer is used to access the Hue page to execute HiveSQL statements, the execution fails, because the browser has functional problems. You are advised to use a compatible browser, for example, Google Chrome.

- MapReduce: Check MapReduce tasks that are being executed or have been finished in the clusters, including their status, start and end time, and run logs.
- Oozie: Hue provides the Oozie job manager function, in this case, you can use Oozie in GUI mode.
- ZooKeeper: Hue provides the ZooKeeper browser function for you to use ZooKeeper in GUI mode.

For details about Hue, visit <https://gethue.com/>.

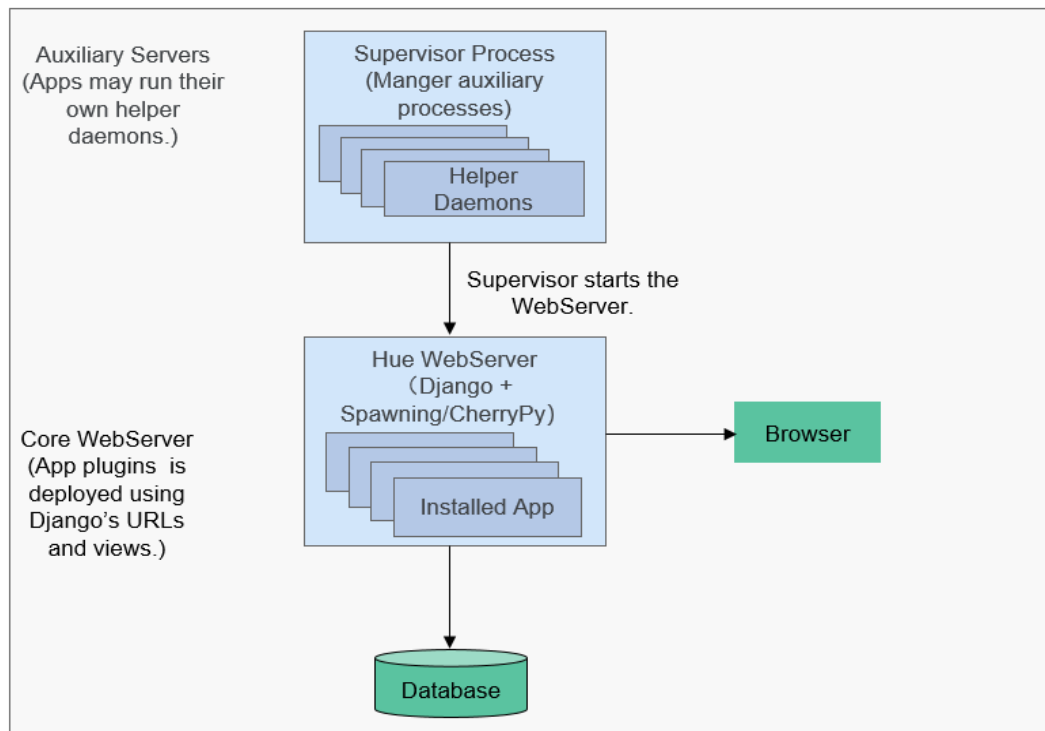

## Architecture

Hue, adopting the MTV (Model-Template-View) design, is a web application program running on Django Python. (Django Python is a web application framework that uses open source codes.)

Hue consists of Supervisor Process and WebServer. Supervisor Process is the core Hue process that manages application processes. Supervisor Process and WebServer interact with applications on WebServer through Thrift/REST APIs, as shown in [Figure 1-64](#).

**Figure 1-64** Hue architecture

**Table 1-11** describes the components shown in **Figure 1-64**.

**Table 1-11** Architecture description

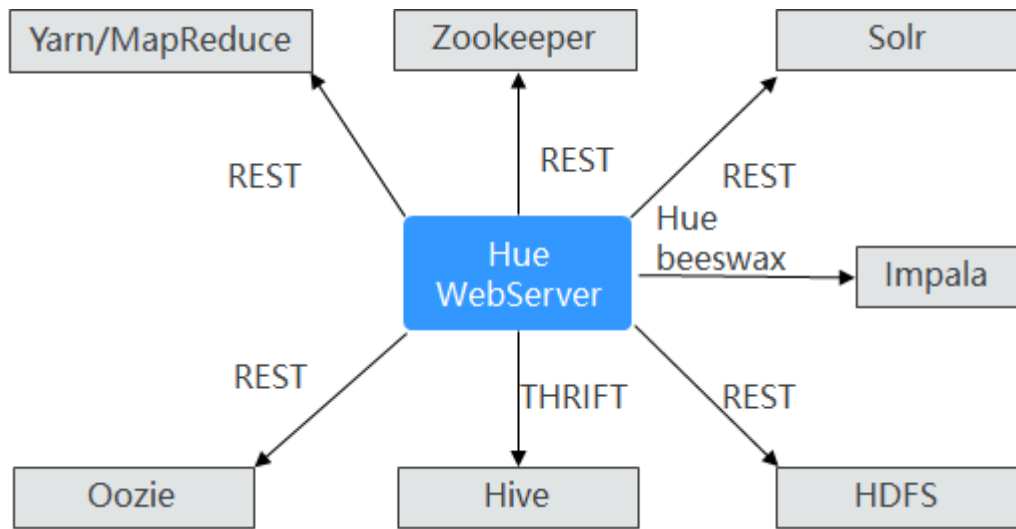

Connection Name	Description
Supervisor Process	Manages processes of WebServer applications, such as starting, stopping, and monitoring the processes.
Hue WebServer	Provides the following functions through the Django Python web framework: <ul style="list-style-type: none"> <li>• Deploys applications.</li> <li>• Provides the GUI.</li> <li>• Connects to databases to store persistent data of applications.</li> </ul>

### 1.3.10.2 Relationship Between Hue and Other Components

#### Relationship Between Hue and Hadoop Clusters

**Figure 1-65** shows how Hue interacts with Hadoop clusters.

**Figure 1-65** Hue and Hadoop clusters

**Table 1-12** Relationship Between Hue and Other Components

Connection Name	Description
HDFS	HDFS provides REST APIs to interact with Hue to query and operate HDFS files. Hue packages a user request into interface data, sends the request to HDFS through REST APIs, and displays execution results on the web UI.
Hive	Hive provides Thrift interfaces to interact with Hue, execute Hive SQL statements, and query table metadata. If you edit HQL statements on the Hue web UI, then, Hue submits the HQL statements to the Hive server through the Thrift APIs and displays execution results on the web UI.
Yarn/MapReduce	MapReduce provides REST APIs to interact with Hue and query Yarn job information. If you go to the Hue web UI, enter the filter parameters, the UI sends the parameters to the background, and Hue invokes the REST APIs provided by MapReduce (MR1/MR2-YARN) to obtain information such as the status of the task running, the start/end time, the run log, and more.
Oozie	Oozie provides REST APIs to interact with Hue, create workflows, coordinators, and bundles, and manage and monitor tasks. A graphical workflow, coordinator, and bundle editor are provided on the Hue web UI. Hue invokes the REST APIs of Oozie to create, modify, delete, submit, and monitor workflows, coordinators, and bundles.

Connection Name	Description
ZooKeeper	ZooKeeper provides REST APIs to interact with Hue and query ZooKeeper node information.  ZooKeeper node information is displayed in the Hue web UI. Hue invokes the REST APIs of ZooKeeper to obtain the node information.
Impala	Impala provides Hue Beeswax APIs to interact with Hue, execute Hive SQL statements, and query table metadata.  If you edit HQL statements on the Hue web UI, then, Hue submits the HQL statements to the Hive server through the Hue Beeswax APIs and displays execution results on the web UI.

### 1.3.10.3 Hue Enhanced Open Source Features

#### Hue Enhanced Open Source Features

- **Storage policy:** The number of HDFS file copies varies depending on the storage media. This feature allows you to manually set an HDFS directory storage policy or can automatically adjust the file storage policy, modify the number of file copies, move the file directory, and delete files based on the latest access time and modification time of HDFS files to fully utilize storage capacity and improve storage performance.
- **MR engine:** You can use the MapReduce engine to execute Hive SQL statements.
- **Reliability enhancement:** Hue is deployed in active/standby mode. When interconnecting with HDFS, Oozie, Hive, and Yarn, Hue can work in failover or load balancing mode.

### 1.3.11 Impala

**Impala** provides fast, interactive SQL queries directly on your Apache Hadoop data stored in HDFS, HBase, or the Object Storage Service (OBS). In addition to using the same unified storage platform, Impala also uses the same metadata, SQL syntax (Hive SQL), ODBC driver, and user interface (Impala query UI in Hue) as Apache Hive. This provides a familiar and unified platform for real-time or batch-oriented queries. Impala is an addition to tools available for querying big data. Impala does not replace the batch processing frameworks built on MapReduce such as Hive. Hive and other frameworks built on MapReduce are best suited for long running batch jobs.

Impala provides the following features:

- Most common SQL-92 features of Hive Query Language (HiveQL) including SELECT, JOIN, and aggregate functions
- HDFS, HBase, and OBS storage, including:
  - HDFS file formats: delimited text files, Parquet, Avro, SequenceFile, and RCFile

- Compression codecs: Snappy, GZIP, Deflate, BZIP
- Common data access interfaces including:
  - JDBC driver
  - ODBC driver
  - Hue Beeswax and the Impala query UI
- **impala-shell** command line interface
- Kerberos authentication

Impala applies to offline analysis (such as log and cluster status analysis) of real-time data queries, large-scale data mining (such as user behavior analysis, interest region analysis, and region display), and other scenarios.

## 1.3.12 Kafka

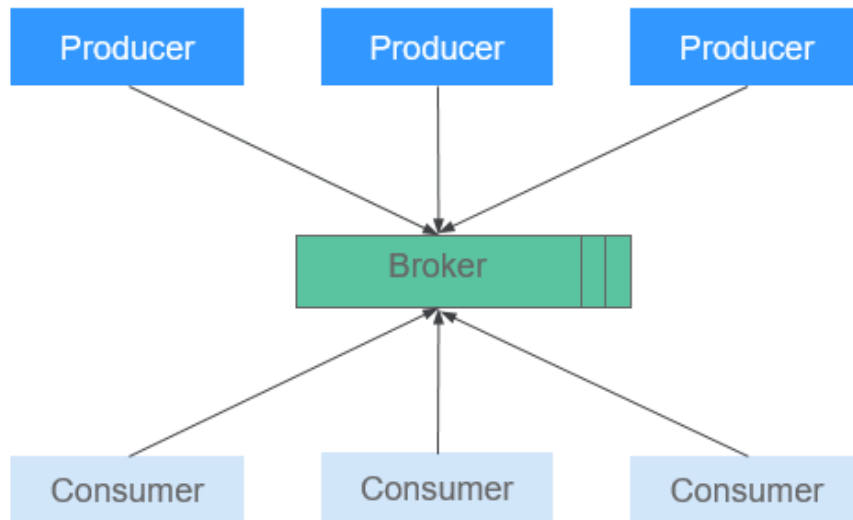

### 1.3.12.1 Kafka Basic Principles

**Kafka** is an open source, distributed, partitioned, and replicated commit log service. Kafka is publish-subscribe messaging, rethought as a distributed commit log. It provides features similar to Java Message Service (JMS) but another design. It features message endurance, high throughput, distributed methods, multi-client support, and real time. It applies to both online and offline message consumption, such as regular message collection, website activeness tracking, aggregation of statistical system operation data (monitoring data), and log collection. These scenarios engage large amounts of data collection for Internet services.

### Kafka Structure

Producers publish data to topics, and consumers subscribe to the topics and consume messages. A broker is a server in a Kafka cluster. For each topic, the Kafka cluster maintains partitions for scalability, parallelism, and fault tolerance. Each partition is an ordered, immutable sequence of messages that is continually appended to - a commit log. Each message in a partition is assigned a sequential ID, which is called offset.

**Figure 1-66** Kafka architecture

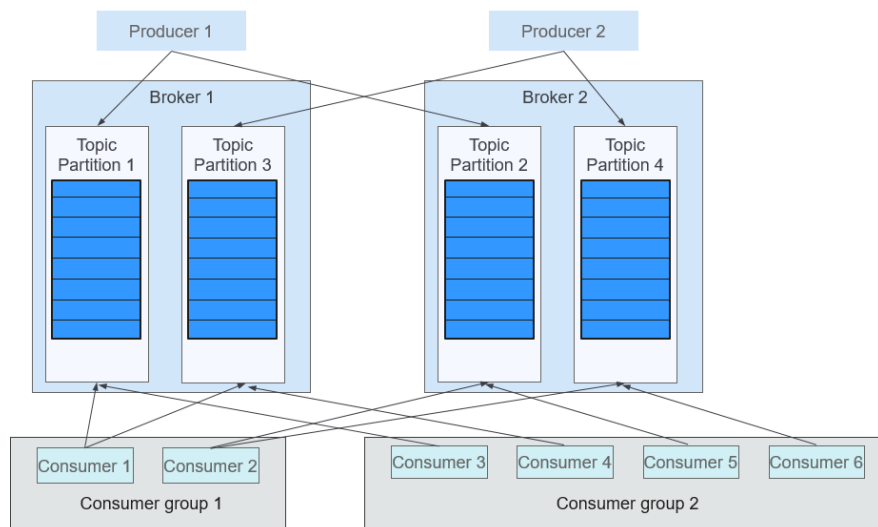

**Table 1-13** Kafka architecture description

Name	Description
Broker	A broker is a server in a Kafka cluster.
Topic	A topic is a category or feed name to which messages are published. A topic can be divided into multiple partitions, which can act as a parallel unit.
Partition	A partition is an ordered, immutable sequence of messages that is continually appended to - a commit log. The messages in the partitions are each assigned a sequential ID number called the offset that uniquely identifies each message within the partition.
Producer	Producers publish messages to a Kafka topic.
Consumer	Consumers subscribe to topics and process the feed of published messages.

**Figure 1-67** shows the relationships between modules.

**Figure 1-67** Relationships between Kafka modules

Consumers label themselves with a consumer group name, and each message published to a topic is delivered to one consumer instance within each subscribing consumer group. If all the consumer instances belong to the same consumer group, loads are evenly distributed among the consumers. As shown in the preceding figure, Consumer1 and Consumer2 work in load-sharing mode; Consumer3, Consumer4, Consumer5, and Consumer6 work in load-sharing mode. If all the consumer instances belong to different consumer groups, messages are broadcast to all consumers. As shown in the preceding figure, the messages in Topic 1 are broadcast to all consumers in Consumer Group1 and Consumer Group2.

For details about Kafka architecture and principles, see <https://kafka.apache.org/24/documentation.html>.

## Principle

- **Message Reliability**

When a Kafka broker receives a message, it stores the message on a disk persistently. Each partition of a topic has multiple replicas stored on different broker nodes. If one node is faulty, the replicas on other nodes can be used.

- **High Throughput**

Kafka provides high throughput in the following ways:

- Messages are written into disks instead of being cached in the memory, fully utilizing the sequential read and write performance of disks.
- The use of zero-copy eliminates I/O operations.
- Data is sent in batches, improving network utilization.
- Each topic is divided into multiple partitions, which increases concurrent processing. Concurrent read and write operations can be performed between multiple producers and consumers. Producers send messages to specified partitions based on the algorithm used.

- **Message Subscribe-Notify Mechanism**

Consumers subscribe to interested topics and consume data in pull mode. Consumers can choose the consumption mode, such as batch consumption, repeated consumption, and consumption from the end, and control the message pulling speed based on actual situation. Consumers need to maintain the consumption records by themselves.

- **Scalability**

When broker nodes are added to expand the Kafka cluster capacity, the newly added brokers register with ZooKeeper. After the registration is successful, procedures and consumers can sense the change in a timely manner and make related adjustment.

## Open Source Features

- Reliability

Message processing methods such as **At-Least Once**, **At-Most Once**, and **Exactly Once** are provided. The message processing status is maintained by consumers. Kafka needs to work with the application layer to implement **Exactly Once**.

- High throughput

High throughput is provided for message publishing and subscription.

- Persistence

Messages are stored on disks and can be used for batch consumption and real-time application programs. Data persistence and replication prevent data loss.

- Distribution

A distributed system is easy to be expanded externally. All producers, brokers, and consumers support the deployment of multiple distributed clusters. Systems can be scaled without stopping the running of software or shutting down the machines.

### 1.3.12.2 Relationship Between Kafka and Other Components

As a message publishing and subscription system, Kafka provides high-speed data transmission methods for data transmission between different subsystems of the FusionInsight platform. It can receive external messages in a real-time manner and provides the messages to the online and offline services for processing. The following figure shows the relationship between Kafka and other components.

**Figure 1-68** Relationship with Other Components

### 1.3.12.3 Kafka Enhanced Open Source Features

#### Kafka Enhanced Open Source Features

- Monitors the following topic-level metrics:
  - Topic Input Traffic
  - Topic Output Traffic
  - Topic Rejected Traffic
  - Number of Failed Fetch Requests Per Second
  - Number of Failed Produce Requests Per Second
  - Number of Topic Input Messages Per Second
  - Number of Fetch Requests Per Second
  - Number of Produce Requests Per Second
- Queries the mapping between broker IDs and node IP addresses. On Linux clients, **kafka-broker-info.sh** can be used to query the mapping between broker IDs and node IP addresses.

### 1.3.13 KafkaManager

KafkaManager is a tool for managing Apache Kafka and provides GUI-based metric monitoring and management of Kafka clusters.

KafkaManager supports the following operations:

- Manage multiple Kafka clusters.
- Easy inspection of cluster states (topics, consumers, offsets, partitions, replicas, and nodes)
- Run preferred replica election.
- Generate partition assignments with option to select brokers to use.

- Run reassignment of partition (based on generated assignments).
- Create a topic with optional topic configurations (Multiple Kafka cluster versions are supported).
- Delete a topic (only supported on 0.8.2+ and **delete.topic.enable=true** is set in broker configuration).
- Batch generate partition assignments for multiple topics with option to select brokers to use.
- Batch run reassignment of partitions for multiple topics.
- Add partitions to an existing topic.
- Update configurations for an existing topic.
- Optionally enable JMX polling for broker-level and topic-level metrics.
- Optionally filter out consumers that do not have ids/ owner / & offsets/ directories in ZooKeeper.

## 1.3.14 KrbServer and LdapServer

### 1.3.14.1 KrbServer and LdapServer Principles

#### Overview

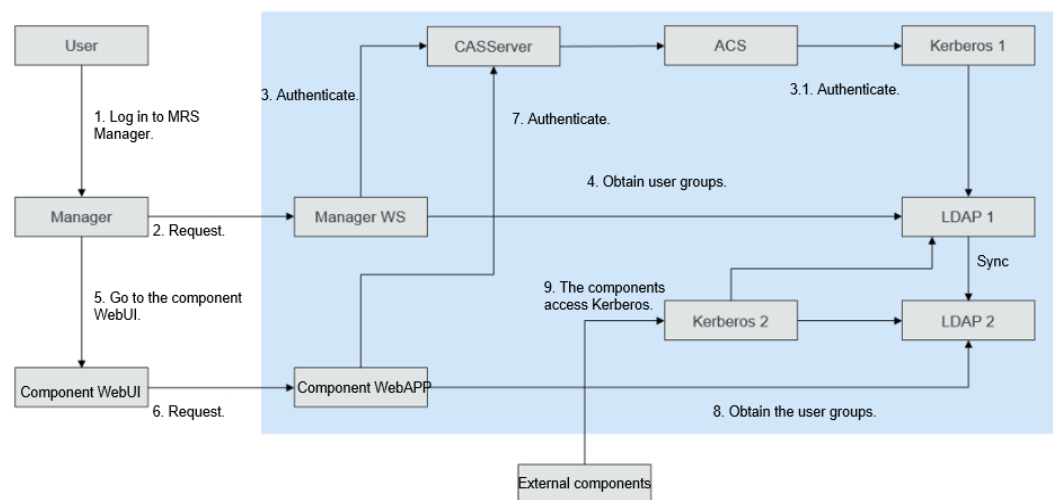

To manage the access control permissions on data and resources in a cluster, it is recommended that the cluster be installed in security mode. In security mode, a client application must be authenticated and a secure session must be established before the application accesses any resource in the cluster. MRS uses KrbServer to provide Kerberos authentication for all components, implementing a reliable authentication mechanism.

LdapServer supports Lightweight Directory Access Protocol (LDAP) and provides the capability of storing user and user group data for Kerberos authentication.

#### Architecture

The security authentication function for user login depends on Kerberos and LDAP.

**Figure 1-69** Security authentication architecture

**Figure 1-69** includes three scenarios:

- Logging in to the MRS Manager Web UI  
The authentication architecture includes steps 1, 2, 3, and 4.
- Logging in to a component web UI  
The authentication architecture includes steps 5, 6, 7, and 8.
- Accessing between components  
The authentication architecture includes step 9.

**Table 1-14** Key modules

Connection Name	Description
Manager	Cluster Manager
Manager WS	WebBrowser
Kerberos1	KrbServer (management plane) service deployed in MRS Manager, that is, OMS Kerberos
Kerberos2	KrbServer (service plane) service deployed in the cluster
LDAP1	LdapServer (management plane) service deployed in MRS Manager, that is, OMS LDAP
LDAP2	LdapServer (service plane) service deployed in the cluster

Data operation mode of Kerberos1 in LDAP: The active and standby instances of LDAP1 and the two standby instances of LDAP2 can be accessed in load balancing mode. Data write operations can be performed only in the active LDAP1 instance. Data read operations can be performed in LDAP1 or LDAP2.

Data operation mode of Kerberos2 in LDAP: Data read operations can be performed in LDAP1 and LDAP2. Data write operations can be performed only in the active LDAP1 instance.

## Principle

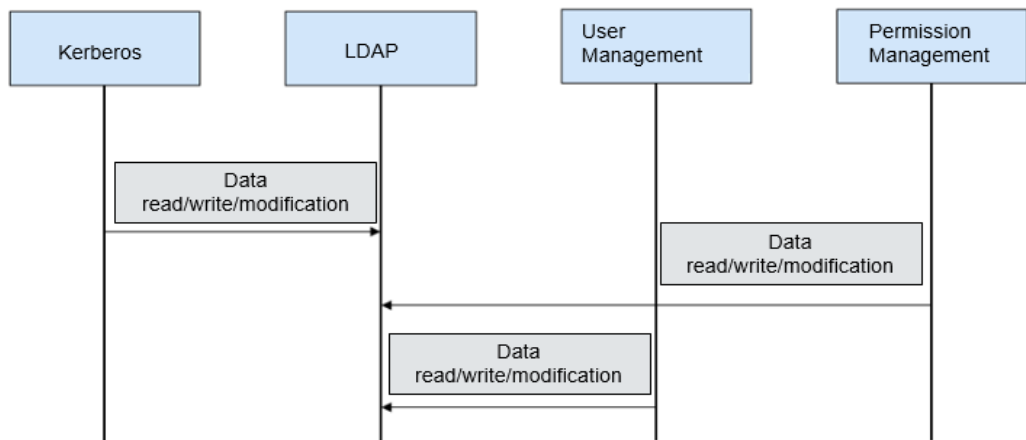

### Kerberos authentication

Figure 1-70 Authentication process

### LDAP data read and write

Figure 1-71 Data modification process

### LDAP data synchronization

- OMS LDAP data synchronization before cluster installation

**Figure 1-72** OMS LDAP data synchronization

Data synchronization direction before cluster installation: Data is synchronized from the active OMS LDAP to the standby OMS LDAP.

- LDAP data synchronization after cluster installation

**Figure 1-73** LDAP data synchronization

Data synchronization direction after cluster installation: Data is synchronized from the active OMS LDAP to the standby OMS LDAP, standby component LDAP, and standby component LDAP.

### 1.3.14.2 KrbServer and LdapServer Enhanced Open Source Features

#### Enhanced open-source features of KrbServer and LdapServer: intra-cluster service authentication

In an MRS cluster that uses the security mode, mutual access between services is implemented based on the Kerberos security architecture. When a service (such as HDFS) in the cluster is to be started, the corresponding sessionkey (keytab, used for identity authentication of the application) is obtained from Kerberos. If another service (such as YARN) needs to access HDFS and add, delete, modify, or query data in HDFS, the corresponding TGT and ST must be obtained for secure access.

#### Enhanced Open-Source Features of KrbServer and LdapServer: Application Development Authentication

MRS components provide application development interfaces for customers or upper-layer service product clusters. During application development, a cluster in security mode provides specified application development authentication interfaces to implement application security authentication and access. For example, the UserGroupInformation class provided by the hadoop-common API provides multiple security authentication APIs.

- **setConfiguration()** is used to obtain related configuration and set parameters such as global variables.
- **loginUserFromKeytab()**: is used to obtain TGT interfaces.

#### Enhanced Open-Source Features of KrbServer and LdapServer: Cross-System Mutual Trust

MRS provides the mutual trust function between two Managers to implement data read and write operations between systems.

### 1.3.15 Kudu

**Kudu** is a columnar storage manager developed for the Apache Hadoop platform. Kudu shares the common technical properties of Hadoop ecosystem applications: it runs on commodity hardware, is horizontally scalable, and supports highly available operation.

Kudu's design has the following benefits:

- Fast processing of OLAP workloads
- Integration with MapReduce, Spark and other Hadoop ecosystem components
- Tight integration with Apache Impala, making it a good, mutable alternative to using HDFS with Apache Parquet
- Strong but flexible consistency model, allowing you to choose consistency requirements on a per-request basis, including the option for strict-serializable consistency
- Strong performance for running sequential and random workloads simultaneously

- Easy to manage
- High availability Tablet Servers and Masters use the Raft Consensus Algorithm, which ensures that as long as more than half the total number of replicas is available, the tablet is available for reads and writes. For example, if 2 out of 3 replicas or 3 out of 5 replicas are available, the tablet is available. Reads can be serviced by read-only follower tablets, even in the event of a leader tablet failure.
- Structured data model

By combining all of these properties, Kudu targets support for families of applications that are difficult or impossible to implement on current generation Hadoop storage technologies.

A few examples of applications for which Kudu is a great solution are:

- Reporting applications where newly-arrived data needs to be immediately available for end users
- Time-series applications that must simultaneously support queries across large amounts of historic data and granular queries about an individual entity that must return very quickly
- Applications that use predictive models to make real-time decisions with periodic refreshes of the predictive model based on all historic data

## 1.3.16 Loader

### 1.3.16.1 Loader Basic Principles

**Loader** is developed based on the open source Sqoop component. It is used to exchange data and files between MRS and relational databases and file systems. Loader can import data from relational databases or file servers to the HDFS and HBase components, or export data from HDFS and HBase to relational databases or file servers.

A Loader model consists of Loader Client and Loader Server, as shown in [Figure 1-74](#).

**Figure 1-74** Loader model

**Table 1-15** describes the functions of each module shown in the preceding figure.

**Table 1-15** Components of the Loader model

Module	Description
Loader Client	Loader client. It provides two interfaces: web UI and CLI.
Loader Server	Loader server. It processes operation requests sent from the client, manages connectors and metadata, submits MapReduce jobs, and monitors MapReduce job status.
REST API	It provides a Representational State Transfer (RESTful) APIs (HTTP + JSON) to process the operation requests sent from the client.
Job Scheduler	Simple job scheduler. It periodically executes Loader jobs.
Transform Engine	Data transformation engine. It supports field combination, string cutting, and string reverse.
Execution Engine	Loader job execution engine. It executes Loader jobs in MapReduce manner.
Submission Engine	Loader job submission engine. It submits Loader jobs to MapReduce.
Job Manager	It manages Loader jobs, including creating, querying, updating, deleting, activating, deactivating, starting, and stopping jobs.

Module	Description
Metadata Repository	Metadata repository. It stores and manages data about Loader connectors, transformation procedures, and jobs.
HA Manager	It manages the active/standby status of Loader Server processes. The Loader Server has two nodes that are deployed in active/standby mode.

Loader imports or exports jobs in parallel using MapReduce jobs. Some job import or export may involve only the Map operations, while some may involve both Map and Reduce operations.

Loader implements fault tolerance using MapReduce. Jobs can be rescheduled upon a job execution failure.

- **Importing data to HBase**

When the Map operation is performed for MapReduce jobs, Loader obtains data from an external data source.

When a Reduce operation is performed for a MapReduce job, Loader enables the same number of Reduce tasks based on the number of Regions. The Reduce tasks receive data from Map tasks, generate HFiles by Region, and store the HFiles in a temporary directory of HDFS.

When a MapReduce job is submitted, Loader migrates HFiles from the temporary directory to the HBase directory.

- **Importing Data to HDFS**

When a Map operation is performed for a MapReduce job, Loader obtains data from an external data source and exports the data to a temporary directory (named *export directory-ldtmp*).

When a MapReduce job is submitted, Loader migrates data from the temporary directory to the output directory.

- **Exporting data to a relational database**

When a Map operation is performed for a MapReduce job, Loader obtains data from HDFS or HBase and inserts the data to a temporary table (Staging Table) through the Java DataBase Connectivity (JDBC) API.

When a MapReduce job is submitted, Loader migrates data from the temporary table to a formal table.

- **Exporting data to a file system**

When a Map operation is performed for a MapReduce job, Loader obtains data from HDFS or HBase and writes the data to a temporary directory of the file server.

When a MapReduce job is submitted, Loader migrates data from the temporary directory to a formal directory.

For details about the Loader architecture and principles, see <https://sqoop.apache.org/docs/1.99.3/index.html>.

### 1.3.16.2 Relationship Between Loader and Other Components

The components that interact with Loader include HDFS, HBase, MapReduce, and ZooKeeper. Loader works as a client to use certain functions of these components, such as storing data to HDFS and HBase and reading data from HDFS and HBase tables. In addition, Loader functions as a MapReduce client to import or export data.

### 1.3.16.3 Loader Enhanced Open Source Features

#### Loader Enhanced Open-Source Feature: Data Import and Export

Loader is developed based on Sqoop. In addition to the Sqoop functions, Loader has the following enhanced features:

- Provides data conversion functions.
- Supports GUI-based configuration conversion.
- Imports data from an SFTP/FTP server to HDFS/OBS.
- Imports data from an SFTP/FTP server to an HBase table.
- Imports data from an SFTP/FTP server to a Phoenix table.
- Imports data from an SFTP/FTP server to a Hive table.
- Exports data from HDFS/OBS to an SFTP/FTP server.
- Exports data from an HBase table to an SFTP/FTP server.
- Exports data from a Phoenix table to an SFTP/FTP server.
- Imports data from a relational database to an HBase table.
- Imports data from a relational database to a Phoenix table.
- Imports data from a relational database to a Hive table.
- Exports data from an HBase table to a relational database.
- Exports data from a Phoenix table to a relational database.
- Imports data from an Oracle partitioned table to HDFS/OBS.
- Imports data from an Oracle partitioned table to an HBase table.
- Imports data from an Oracle partitioned table to a Phoenix table.
- Imports data from an Oracle partitioned table to a Hive table.
- Exports data from HDFS/OBS to an Oracle partitioned table.
- Exports data from HBase to an Oracle partitioned table.
- Exports data from a Phoenix table to an Oracle partitioned table.
- Imports data from HDFS to an HBase table, a Phoenix table, and a Hive table in the same cluster.
- Exports data from an HBase table and a Phoenix table to HDFS/OBS in the same cluster.
- Imports data to an HBase table and a Phoenix table by using **bulkload** or **put list**.
- Imports all types of files from an SFTP/FTP server to HDFS. The open source component Sqoop can import only text files.
- Exports all types of files from HDFS/OBS to an SFTP server. The open source component Sqoop can export only text files and SequenceFile files.

- Supports file coding format conversion during file import and export. The supported coding formats include all formats supported by Java Development Kit (JDK).
- Retains the original directory structure and file names during file import and export.
- Supports file combination during file import and export. For example, if a large number of files are to be imported, these files can be combined into  $n$  files ( $n$  can be configured).
- Supports file filtering during file import and export. The filtering rules support wildcards and regular expressions.
- Supports batch import and export of ETL tasks.
- Supports query by page and key word and group management of ETL tasks.
- Provides floating IP addresses for external components.

## 1.3.17 Manager

### 1.3.17.1 Manager Basic Principles

#### Overview

Manager is the O&M management system of MRS and provides unified cluster management capabilities for services deployed in clusters.

Manager provides functions such as performance monitoring, alarms, user management, permission management, auditing, service management, health check, and log collection.

#### Architecture

**Figure 1-75** shows the overall logical architecture of FusionInsight Manager.

**Figure 1-75** Manager logical architecture

Manager consists of OMS and OMA.

- OMS: serves as management node in the O&M system. There are two OMS nodes deployed in active/standby mode.
- OMA: managed node in the O&M system. Generally, there are multiple OMA nodes.

Figure 1-75 describes the modules shown in Table 1-16.

**Table 1-16** Service module description

Module	Description
Web Service	A web service deployed under Tomcat, providing HTTPS API of Manager. It is used to access Manager through the web browser. In addition, it provides the northbound access capability based on the Syslog and SNMP protocols.
OMS	Management node of the O&M system. Generally, there are two OMS nodes that work in active/standby mode.
OMA	Managed node in the O&M system. Generally, there are multiple OMA nodes.
Controller	The control center of Manager. It can converge information from all nodes in the cluster and display it to MRS cluster administrators, as well as receive from MRS cluster administrators, and synchronize information to all nodes in the cluster according to the operation instruction range. Control process of Manager. It implements various management actions: <ol style="list-style-type: none"> <li>1. The web service delivers various management actions (such as installation, service startup and stop, and configuration modification) to Controller.</li> <li>2. Controller decomposes the command and delivers the action to each Node Agent, for example, starting a service involves multiple roles and instances.</li> <li>3. Controller is responsible for monitoring the implementation of each action.</li> </ol>
Node Agent	Node Agent exists on each cluster node and is an enabler of Manager on a single node. <ul style="list-style-type: none"> <li>• Node Agent represents all the components deployed on the node to interact with Controller, implementing convergence from multiple nodes of a cluster to a single node.</li> <li>• Node Agent enables Controller to perform all operations on the components deployed on the node. It allows Controller functions to be implemented.</li> </ul> Node Agent sends heartbeat messages to Controller at an interval of 3 seconds. The interval cannot be configured.
IAM	Records audit logs. Each non-query operation on the Manager UI has a related audit log.

Module	Description
PMS	The performance monitoring module. It collects the performance monitoring data on each OMA and provides the query function.
CEP	Convergence function module. For example, the used disk space of all OMAs is collected as a performance indicator.
FMS	Alarm module. It collects and queries alarms on each OMA.
OMM Agent	Agent for performance monitoring and alarm reporting on the OMA. It collects performance monitoring data and alarm data on Agent Node.
CAS	Unified authentication center. When a user logs in to the web service, CAS authenticates the login. The browser automatically redirects the user to the CAS through URLs.
AOS	Permission management module. It manages the permissions of users and user groups.
ACS	User and user group management module. It manages users and user groups to which users belong.
Kerberos	<p>LDAP is deployed in OMS and a cluster, respectively.</p> <ul style="list-style-type: none"> <li>• OMS Kerberos provides the single sign-on (SSO) and authentication between Controller and Node Agent.</li> <li>• Kerberos in the cluster provides the user security authentication function for components. The service name is <b>KrbServer</b>, which contains two role instances: <ul style="list-style-type: none"> <li>– KerberosServer: is an authentication server that provides security authentication for MRS.</li> <li>– KerberosAdmin: manages processes of Kerberos users.</li> </ul> </li> </ul>
Ldap	<p>LDAP is deployed in OMS and a cluster, respectively.</p> <ul style="list-style-type: none"> <li>• OMS LDAP provides data storage for user authentication.</li> <li>• The LDAP in the cluster functions as the backup of the OMS LDAP. The service name is <b>LdapServer</b> and the role instance is <b>SlapdServer</b>.</li> </ul>
Database	Manager database used to store logs and alarms.
HA	HA management module that manages the active and standby OMSs.
NTP Server NTP Client	It synchronizes the system clock of each node in the cluster.

## 1.3.17.2 Manager Key Features

### Key Feature: Unified Alarm Monitoring

Manager provides the visualized and convenient alarm monitoring function. Users can quickly obtain key cluster performance indicators, evaluate cluster health status, customize performance indicator display, and convert indicators to alarms. Manager can monitor the running status of all components and report alarms in real time when faults occur. The online help on the GUI allows you to view performance counters and alarm clearance methods to quickly rectify faults.

### Key Feature: Unified User Permission Management

Manager provides permission management of components in a unified manner.

Manager introduces the concept of role and uses role-based access control (RBAC) to manage system permissions. It centrally displays and manages scattered permission functions of each component in the system and organizes the permissions of each component in the form of permission sets (roles) to form a unified system permission concept. By doing so, common users cannot obtain internal permission management details, and permissions become easy for MRS cluster administrators to manage, greatly facilitating permission management and improving user experience.

### Key Feature: SSO

Single sign-on (SSO) is provided between the Manager web UI and component web UI as well as for integration between MRS and third-party systems.

This function centrally manages and authenticates Manager users and component users. The entire system uses LDAP to manage users and uses Kerberos for authentication. A set of Kerberos and LDAP management mechanisms are used between the OMS and components. SSO (including single sign-on and single sign-out) is implemented through CAS. With SSO, users can easily switch tasks between the Manager web UI, component web UIs, and third-party systems, without switching to another user.

#### NOTE

- To ensure security, the CAS Server can retain a ticket-granting ticket (TGT) used by a user only for 20 minutes.
- If a user does not perform any operation on the page (including on the Manager web UI and component web UIs) within 20 minutes, the page is automatically locked.

### Key Feature: Automatic Health Check and Inspection

Manager provides users with automatic inspection on system running environments and helps users check and audit system running health by one click, ensuring correct system running and lowering system operation and maintenance costs. After viewing inspection results, you can export reports for archiving and fault analysis.

## Key Feature: Tenant Management

Manager introduces the multi-tenant concept. The CPU, memory, and disk resources of a cluster can be integrated into a set. The set is called a tenant. A mode involving different tenants is called multi-tenant mode.

Manager provides the multi-tenant function, supports a level-based tenant model and allows tenants to be added and deleted dynamically, achieving resource isolation. As a result, it can dynamically manage and configure the computing resources and the storage resources of tenants.

- The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.
- The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

As a unified tenant management platform of MRS, MRS Manager allows users to create and manage tenants in clusters based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

Manager also provides the multi-instance function so that users can use the HBase, Hive, or Spark alone in the resource control and service isolation scenario. The multi-instance function is disabled by default and can be manually enabled.

## 1.3.18 MapReduce

### 1.3.18.1 MapReduce Basic Principles

MapReduce is the core of Hadoop. As a software architecture proposed by Google, MapReduce is used for parallel computing of large-scale datasets (larger than 1 TB). The concepts "Map" and "Reduce" and their main thoughts are borrowed from functional programming language and also borrowed from the features of vector programming language.

Current software implementation is as follows: Specify a Map function to map a series of key-value pairs into a new series of key-value pairs, and specify a Reduce function to ensure that all values in the mapped key-value pairs share the same key.

**Figure 1-76** Distributed batch processing engine

MapReduce is a software framework for processing large datasets in parallel. The root of MapReduce is the Map and Reduce functions in functional programming. The Map function accepts a group of data and transforms it into a key-value pair list. Each element in the input domain corresponds to a key-value pair. The Reduce function accepts the list generated by the Map function, and then shrinks the key-value pair list based on the keys. MapReduce divides a task into multiple parts and allocates them to different devices for processing. In this way, the task can be finished in a distributed environment instead of a single powerful server.

For more information, see [MapReduce Tutorial](#).

## MapReduce structure

As shown in [Figure 1-77](#), MapReduce is integrated into YARN through the Client and ApplicationMaster interfaces of YARN, and uses YARN to apply for computing resources.

**Figure 1-77** Basic architecture of Apache YARN and MapReduce

## 1.3.18.2 Relationship Between MapReduce and Other Components

### Relationship Between MapReduce and HDFS

- HDFS features high fault tolerance and high throughput, and can be deployed on low-cost hardware for storing data of applications with massive data sets.
- MapReduce is a programming model used for parallel computation of large data sets (larger than 1 TB). Data computed by MapReduce comes from multiple data sources, such as Local FileSystem, HDFS, and databases. Most data comes from the HDFS. The high throughput of HDFS can be used to read massive data. After being computed, data can be stored in HDFS.

### Relationship Between MapReduce and Yarn

MapReduce is a computing framework running on Yarn, which is used for batch processing. MRv1 is implemented based on MapReduce in Hadoop 1.0, which is composed of programming models (new and old programming APIs), running environment (JobTracker and TaskTracker), and data processing engine (MapTask and ReduceTask). This framework is still weak in scalability, fault tolerance (JobTracker SPOF), and compatibility with multiple frameworks. (Currently, only the MapReduce computing framework is supported.) MRv2 is implemented based on MapReduce in Hadoop 2.0. The source code reuses MRv1 programming models and data processing engine implementation, and the running environment is composed of ResourceManager and ApplicationMaster. ResourceManager is a brand new resource manager system, and ApplicationMaster is responsible for cutting MapReduce job data, assigning tasks, applying for resources, scheduling tasks, and tolerating faults.

## 1.3.18.3 MapReduce Enhanced Open Source Features

### MapReduce Enhanced Open-Source Feature: JobHistoryServer HA

JobHistoryServer (JHS) is the server used to view historical MapReduce task information. Currently, the open source JHS supports only single-instance services. JHS HA can solve the problem that an application fails to access the MapReduce API when SPOFs occur on the JHS, which causes the application fails to be executed. This greatly improves the high availability of the MapReduce service.

**Figure 1-78** Status transition of the JobHistoryServer HA active/standby switchover

### JobHistoryServer High Availability

- ZooKeeper is used to implement active/standby election and switchover.
- JHS uses the floating IP address to provide services externally.
- Both the JHS single-instance and HA deployment modes are supported.
- Only one node starts the JHS process at a time point to prevent multiple JHS operations from processing the same file.
- You can perform scale-out, scale-in, instance migration, upgrade, and health check.

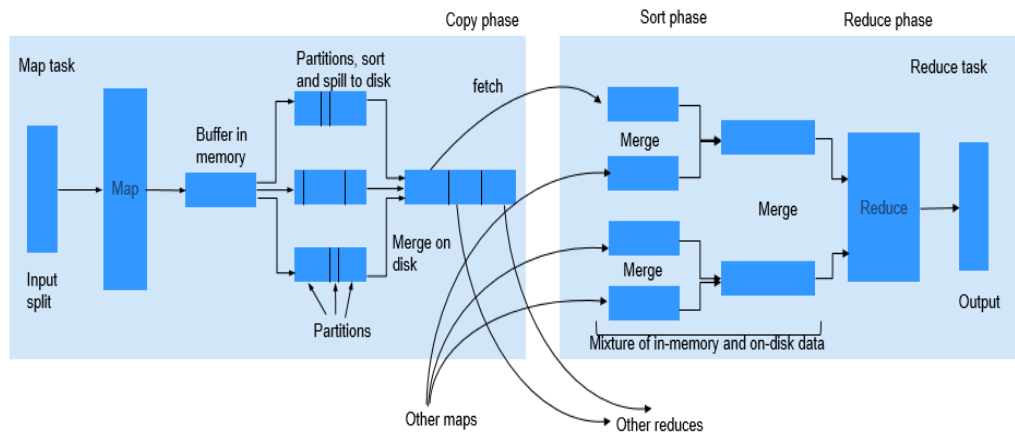

### Enhanced Open Source Feature: Improving MapReduce Performance by Optimizing the Merge/Sort Process in Specific Scenarios

The figure below shows the workflow of a MapReduce task.

**Figure 1-79** MapReduce job

**Figure 1-80** MapReduce job execution flow

The Reduce process is divided into three different steps: Copy, Sort (actually supposed to be called Merge), and Reduce. In Copy phase, Reducer tries to fetch the output of Maps from NodeManagers and store it on Reducer either in memory or on disk. Shuffle (Sort and Merge) phase then begins. All the fetched map outputs are being sorted, and segments from different map outputs are merged before being sent to Reducer. When a job has a large number of maps to be processed, the shuffle process is time-consuming. For specific tasks (for example, SQL tasks such as hash join and hash aggregation), sorting is not mandatory during the shuffle process. However, the sorting is required by default in the shuffle process.

This feature is enhanced by using the MapReduce API, which can automatically close the Sort process for such tasks. When the sorting is disabled, the API directly merges the fetched Maps output data and sends the data to Reducer. This greatly saves time, and significantly improves the efficiency of SQL tasks.

## Enhanced Open Source Feature: Small Log File Problem Solved After Optimization of MR History Server

After the job running on Yarn is executed, NodeManager uses LogAggregationService to collect and send generated logs to HDFS and deletes them from the local file system. After the logs are stored to HDFS, they are managed by MR HistoryServer. LogAggregationService will merge local logs generated by containers to a log file and upload it to the HDFS, reducing the number of log files to some extent. However, in a large-scale and busy cluster, there will be excessive log files on HDFS after long-term running.

For example, if there are 20 nodes, about 18 million log files are generated within the default clean-up period (15 days), which occupy about 18 GB of the memory of a NameNode and slow down the HDFS system response.

Only the reading and deletion are required for files stored on HDFS. Therefore, Hadoop Archives can be used to periodically archive the directory of collected log files.

### Archiving Logs

The AggregatedLogArchiveService module is added to MR HistoryServer to periodically check the number of files in the log directory. When the number of files reaches the threshold, AggregatedLogArchiveService starts an archiving task to archive log files. After archiving, it deletes the original log files to reduce log files on HDFS.

### Cleaning Archived Logs

Hadoop Archives does not support deletion in archived files. Therefore, the entire archive log package must be deleted upon log clean-up. The latest log generation time is obtained by modifying the AggregatedLogDeletionService module. If all log files meet the clean-up requirements, the archive log package can be deleted.

### Browsing Archived Logs

Hadoop Archives allows URI-based access to file content in the archive log package. Therefore, if MR History Server detects that the original log files do not exist during file browsing, it directly redirects the URI to the archive log package to access the archived log file.

#### NOTE

- This function invokes Hadoop Archives of HDFS for log archiving. Because the execution of an archiving task by Hadoop Archives is to run an MR application. Therefore, after an archiving task is executed, an MR execution record is added.
- This function of archiving logs is based on the log collection function. Therefore, this function is valid only when the log collection function is enabled.

## 1.3.19 Oozie

### 1.3.19.1 Oozie Basic Principles

#### Introduction to Oozie

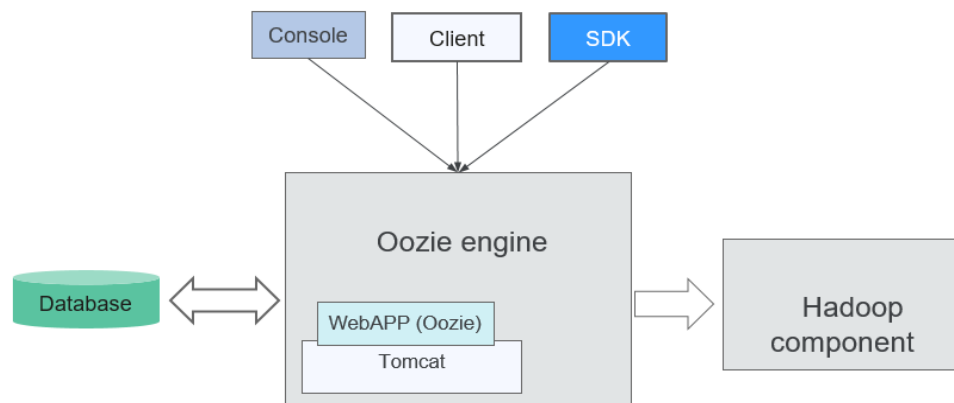

**Oozie** is an open-source workflow engine that is used to schedule and coordinate Hadoop jobs.

#### Architecture

The Oozie engine is a web application integrated into Tomcat by default. Oozie uses PostgreSQL databases.

Oozie provides an Ext-based web console, through which users can view and monitor Oozie workflows. Oozie provides an external REST web service API for the Oozie client to control workflows (such as starting and stopping operations), and orchestrate and run Hadoop MapReduce tasks. For details, see [Figure 1-81](#).

**Figure 1-81** Oozie architecture

[Table 1-17](#) describes the functions of each module shown in [Figure 1-81](#).

**Table 1-17** Architecture description

Connection Name	Description
Console	Allows users to view and monitor Oozie workflows.
Client	Controls workflows, including submitting, starting, running, planting, and restoring workflows, through APIs.
SDK	Is short for software development kit. An SDK is a set of development tools used by software engineers to establish applications for particular software packages, software frameworks, hardware platforms, and operating systems.
Database	PostgreSQL database

Connection Name	Description
WebApp (Oozie)	Functions as the Oozie server. It can be deployed on a built-in or an external Tomcat container. Information recorded by WebApp (Oozie) including logs is stored in the PostgreSQL database.
Tomcat	A free open-source web application server
Hadoop components	Underlying components, such as MapReduce and Hive, that execute the workflows orchestrated by Oozie.

## Principle

Oozie is a workflow engine server that runs MapReduce workflows. It is also a Java web application running in a Tomcat container.

Oozie workflows are constructed using Hadoop Process Definition Language (HPDL). HPDL is an XML-defined language, similar to JBoss jBPM Process Definition Language (jPDL). An Oozie workflow consists of the Control Node and Action Node.

- Control Node controls workflow orchestration, such as **start, end, error, decision, fork, and join**.
- An Oozie workflow contains multiple Action Nodes, such as MapReduce and Java.

All Action Nodes are deployed and run in Direct Acyclic Graph (DAG) mode. Therefore, Action Nodes run in direction. That is, the next Action Node can run only when the running of the previous Action Node ends. When one Action Node ends, the remote server calls back the Oozie interface. Then Oozie executes the next Action Node of workflow in the same manner until all Action Nodes are executed (execution failures are counted).

Oozie workflows provide various types of Action Nodes, such as MapReduce, Hadoop distributed file system (HDFS), Secure Shell (SSH), Java, and Oozie sub-flows, to support a wide range of business requirements.

### 1.3.19.2 Oozie Enhanced Open Source Feature

#### Enhanced Security

Provides permission management and identifies two roles, that is, MRS cluster administrators and common users.

Supports single sign-on (SSO) and Hypertext Transfer Protocol Secure (HTTPS)-based access, and provides audit logs.

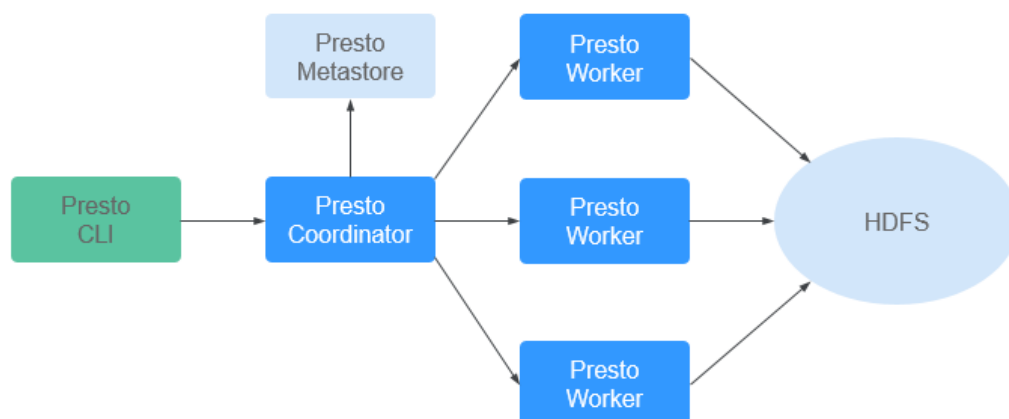

### 1.3.20 Presto

Presto is an open source SQL query engine for running interactive analytic queries against data sources of all sizes. It applies to massive structured/semi-structured

data analysis, massive multi-dimensional data aggregation/report, ETL, ad-hoc queries, and more scenarios.

Presto allows querying data where it lives, including HDFS, Hive, HBase, Cassandra, relational databases or even proprietary data stores. A Presto query can combine different data sources to perform data analysis across the data sources.

**Figure 1-82** Presto architecture

Presto runs in a cluster in distributed mode and contains one coordinator and multiple worker processes. Query requests are submitted from clients (for example, CLI) to the coordinator. The coordinator parses SQL statements, generates execution plans, and distributes the plans to multiple worker processes for execution.

For details about Presto, visit <https://prestodb.github.io/> or <https://prestosql.io/>.

## Multiple Presto Instances

MRS supports the installation of multiple Presto instances for a large-scale cluster by default. That is, multiple Worker instances, such as Worker1, Worker2, and Worker3, are installed on a Core/Task node. Multiple Worker instances interact with the Coordinator to execute computing tasks, greatly improving node resource utilization and computing efficiency.

Presto multi-instance applies only to the Arm architecture. Currently, a single node supports a maximum of four instances.

For more Presto deployment information, see <https://prestodb.io/docs/current/installation/deployment.html> or <https://trino.io/docs/current/installation/deployment.html>.

## 1.3.21 Ranger

### 1.3.21.1 Ranger Basic Principles

**Apache Ranger** offers a centralized security management framework and supports unified authorization and auditing. It manages fine grained access

control over Hadoop and related components, such as HDFS, Hive, HBase, Kafka, and Storm. You can use the front-end web UI console provided by Ranger to configure policies to control users' access to these components.

Figure 1-83 shows the Ranger architecture.

Figure 1-83 Ranger structure

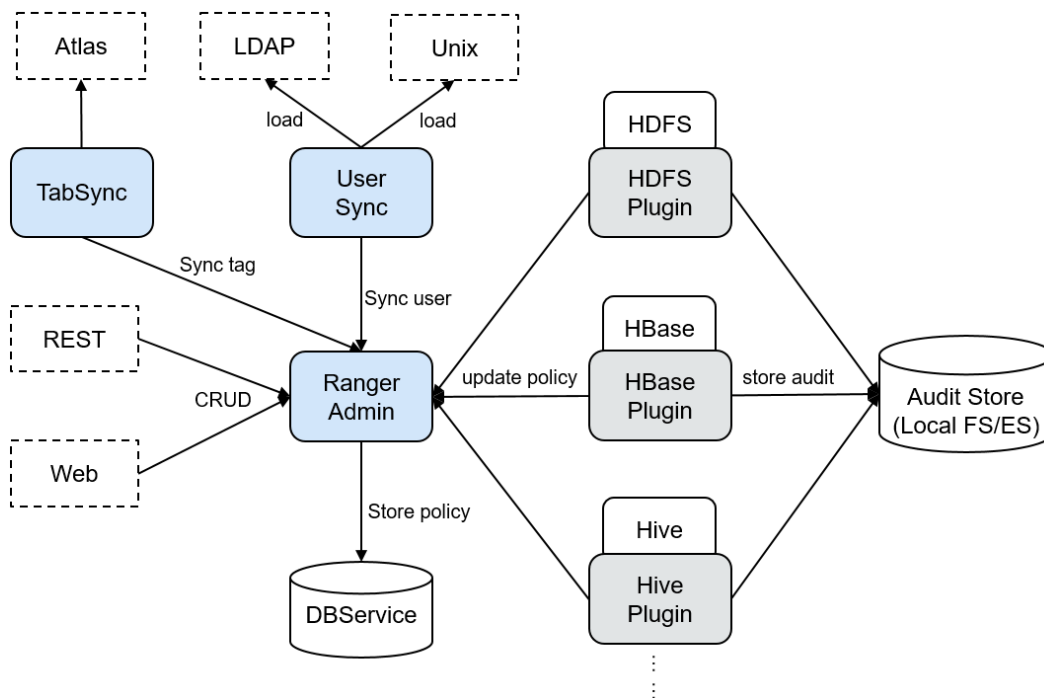

Table 1-18 Architecture description

Connection Name	Description
RangerAdmin	Provides a WebUI and RESTful API to manage policies, users, and auditing.
UserSync	Periodically synchronizes user and user group information from an external system and writes the information to RangerAdmin.
TagSync	Periodically synchronizes tag information from the external Atlas service and writes the tag information to RangerAdmin.

## Ranger Principles

- Ranger Plugins**  
 Ranger provides policy-based access control (PBAC) plug-ins to replace the original authentication plug-ins of the components. Ranger plug-ins are developed based on the authentication interface of the components. Users set permission policies for specified services on the Ranger WebUI. Ranger plug-ins periodically update policies from the RangerAdmin and caches them in the

local file of the component. When a client request needs to be authenticated, the Ranger plug-in matches the user carried in the request with the policy and then returns an accept or reject message.

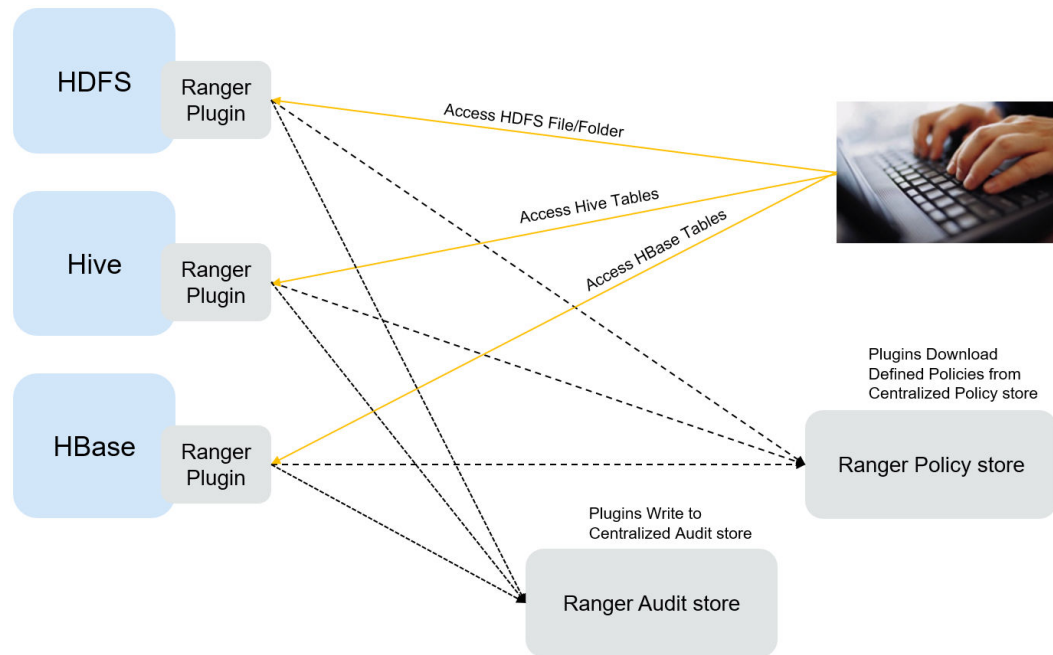

- **UserSync User Synchronization**  
UserSync periodically synchronizes data from LDAP/Unix to RangerAdmin. In security mode, data is synchronized from LDAP. In non-security mode, data is synchronized from Unix. By default, the incremental synchronization mode is used. In each synchronization period, UserSync updates only new or modified users and user groups. When a user or user group is deleted, UserSync does not synchronize the change to RangerAdmin. That is, the user or user group is not deleted from the RangerAdmin. To improve performance, UserSync does not synchronize user groups to which no user belongs to RangerAdmin.
- **Unified auditing**  
Ranger plug-ins can record audit logs. Currently, audit logs can be stored in local files.
- **High reliability**  
Ranger supports two RangerAdmins working in active/active mode. Two RangerAdmins provide services at the same time. If either RangerAdmin is faulty, Ranger continues to work.
- **High performance**  
Ranger provides the Load-Balance capability. When a user accesses Ranger WebUI using a browser, the Load-Balance automatically selects the RangerAdmin with the lightest load to provide services.

### 1.3.21.2 Relationship Between Ranger and Other Components

Ranger provides PABC-based authentication plug-ins for components to run on their servers. Ranger currently supports authentication for the following components like HDFS, Yarn, Hive, HBase, Kafka, Storm, and Spark2x. More components will be supported in the future.

**Figure 1-84** Relationship Between Ranger and Other Components

## 1.3.22 Spark

### 1.3.22.1 Basic Principles of Spark

NOTE

The Spark component applies to versions earlier than MRS 3.x.

#### Description

**Spark** is an open source parallel data processing framework. It helps you to easily develop unified big data applications and perform offline processing, stream processing, and interactive analysis on data.

Spark provides a framework featuring fast computing, write, and interactive query. Spark has obvious advantages over Hadoop in terms of performance. Spark uses the in-memory computing mode to avoid I/O bottlenecks in scenarios where multiple tasks in a MapReduce workflow process the same dataset. Spark is implemented by using Scala programming language. Scala enables distributed datasets to be processed in a method that is the same as that of processing local data. In addition to interactive data analysis, Spark supports interactive data mining. Spark adopts in-memory computing, which facilitates iterative computing. By coincidence, iterative computing of the same data is a general problem facing data mining. In addition, Spark can run in Yarn clusters where Hadoop 2.0 is installed. The reason why Spark cannot only retain various features like MapReduce fault tolerance, data localization, and scalability but also ensure high performance and avoid busy disk I/Os is that a memory abstraction structure called Resilient Distributed Dataset (RDD) is created for Spark.

Original distributed memory abstraction, for example, key-value store and databases, supports small-granularity update of variable status. This requires

backup of data or log updates to ensure fault tolerance. Consequently, a large amount of I/O consumption is brought about to data-intensive workflows. For the RDD, it has only one set of restricted APIs and only supports large-granularity update, for example, map and join. In this way, Spark only needs to record the transformation operation logs generated during data establishment to ensure fault tolerance without recording a complete dataset. This data transformation link record is a source for tracing a data set. Generally, parallel applications apply the same computing process for a large dataset. Therefore, the limit to the mentioned large-granularity update is not large. As described in Spark theses, the RDD can function as multiple different computing frameworks, for example, programming models of MapReduce and Pregel. In addition, Spark allows you to explicitly make a data transformation process be persistent on hard disks. Data localization is implemented by allowing you to control data partitions based on the key value of each record. (An obvious advantage of this method is that two copies of data to be associated will be hashed in the same mode.) If memory usage exceeds the physical limit, Spark writes relatively large partitions into hard disks, thereby ensuring scalability.

Spark has the following features:

- **Fast:** The data processing speed of Spark is 10 to 100 times higher than that of MapReduce.
- **Easy-to-use:** Java, Scala, and Python can be used to simply and quickly compile parallel applications for processing massive amounts of data. Spark provides over 80 operators to help you compile parallel applications.
- **Universal:** Spark provides many tools, for example, [Spark SQL](#) and [Spark Streaming](#). These tools can be combined flexibly in an application.
- **Integration with Hadoop:** Spark can directly run in a Hadoop cluster and read existing Hadoop data.

The Spark component of MRS has the following advantages:

- The Spark Streaming component of MRS supports real-time data processing rather than triggering as scheduled.
- The Spark component of MRS provides Structured Streaming and allows you to build streaming applications using the Dataset API. Spark supports exactly-once semantics and inner and outer joins for streams.
- The Spark component of MRS uses **pandas\_udf** to replace the original user-defined functions (UDFs) in PySpark to process data, which reduces the processing duration by 60% to 90% (affected by specific operations).
- The Spark component of MRS also supports graph data processing and allows modeling using graphs during graph computing.
- Spark SQL of MRS is compatible with some Hive syntax (based on the 64 SQL statements of the Hive-Test-benchmark test set) and standard SQL syntax (based on the 99 SQL statements of the TPC-DS test set).

## Architecture

[Figure 1-85](#) describes the Spark architecture and [Table 1-19](#) lists the Spark modules.

**Figure 1-85** Spark architecture

**Table 1-19** Basic concepts

Module	Description
Cluster Manager	Cluster manager manages resources in the cluster. Spark supports multiple cluster managers, including Mesos, Yarn, and the Standalone cluster manager that is delivered with Spark.
Application	Spark application. It consists of one Driver Program and multiple executors.
Deploy Mode	Deployment in cluster or client mode. In cluster mode, the driver runs on a node inside the cluster. In client mode, the driver runs on the client (outside the cluster).
Driver Program	The main process of the Spark application. It runs the <b>main()</b> function of an application and creates SparkContext. It is used for parsing applications, generating stages, and scheduling tasks to executors. Usually, SparkContext represents Driver Program.
Executor	A process started on a Work Node. It is used to execute tasks, and manage and process the data used in applications. A Spark application usually contains multiple executors. Each executor receives commands from the driver and executes one or multiple tasks.
Worker Node	A node that starts and manages executors and resources in a cluster.
Job	A job consists of multiple concurrent tasks. One action operator (for example, a collect operator) maps to one job.
Stage	Each job consists of multiple stages. Each stage is a task set, which is separated by Directed Acyclic Graph (DAG).

Module	Description
Task	A task carries the computation unit of the service logics. It is the minimum working unit that can be executed on the Spark platform. An application can be divided into multiple tasks based on the execution plan and computation amount.

## Spark Application Running Principle

Figure 1-86 shows the Spark application running architecture. The running process is as follows:

1. An application is running in the cluster as a collection of processes. Driver coordinates the running of the application.
2. To run an application, Driver connects to the cluster manager (such as Standalone, Mesos, and Yarn) to apply for the executor resources, and start ExecutorBackend. The cluster manager schedules resources between different applications. Driver schedules DAGs, divides stages, and generates tasks for the application at the same time.
3. Then, Spark sends the codes of the application (the codes transferred to SparkContext, which is defined by JAR or Python) to an executor.
4. After all tasks are finished, the running of the user application is stopped.

Figure 1-86 Spark application running architecture

Figure 1-87 shows the Master and Worker modes adopted by Spark. A user submits an application on the Spark client, and then the scheduler divides a job into multiple tasks and sends the tasks to each Worker for execution. Each Worker reports the computation results to Driver (Master), and then the Driver aggregates and returns the results to the client.

**Figure 1-87** Spark Master-Worker mode

Note the following about the architecture:

- Applications are isolated from each other. Each application has an independent executor process, and each executor starts multiple threads to execute tasks in parallel. Whether in terms of scheduling or task running on executors. Each driver independently schedules its own tasks. Different application tasks run on different JVMs, that is, different executors.
- Different Spark applications do not share data, unless data is stored in the external storage system such as HDFS.
- You are advised to deploy the Driver program in a location that is close to the Worker node because the Driver program schedules tasks in the cluster. For example, deploy the Driver program on the network where the Worker node is located.

Spark on YARN can be deployed in two modes:

- In Yarn-cluster mode, the Spark driver runs inside an ApplicationMaster process which is managed by Yarn in the cluster. After the ApplicationMaster is started, the client can exit without interrupting service running.
- In Yarn-client mode, the driver is started in the client process, and the ApplicationMaster process is used only to apply for resources from the Yarn cluster.

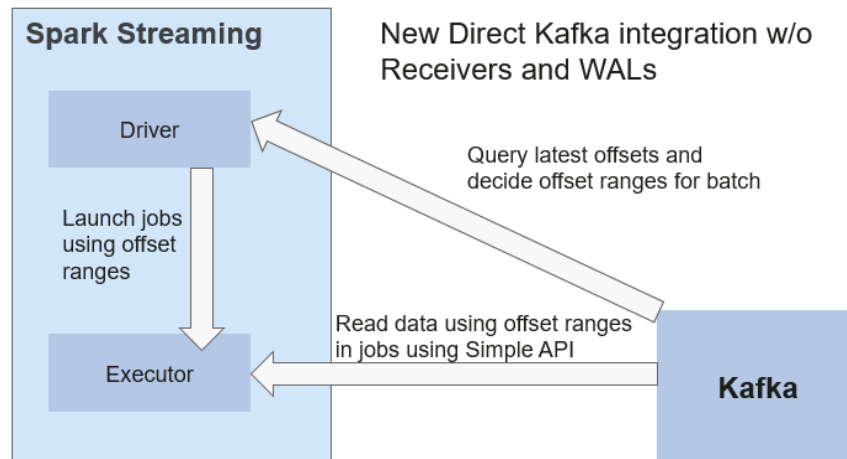

## Spark Streaming Principle

Spark Streaming is a real-time computing framework built on the Spark, which expands the capability for processing massive streaming data. Currently, Spark supports the following data processing methods:

- Direct Streaming

In Direct Streaming approach, Direct API is used to process data. Take Kafka Direct API as an example. Direct API provides offset location that each batch range will read from, which is much simpler than starting a receiver to continuously receive data from Kafka and written data to write-ahead logs (WALs). Then, each batch job is running and the corresponding offset data is ready in Kafka. These offset information can be securely stored in the checkpoint file and read by applications that failed to start.

**Figure 1-88** Data transmission through Direct Kafka API

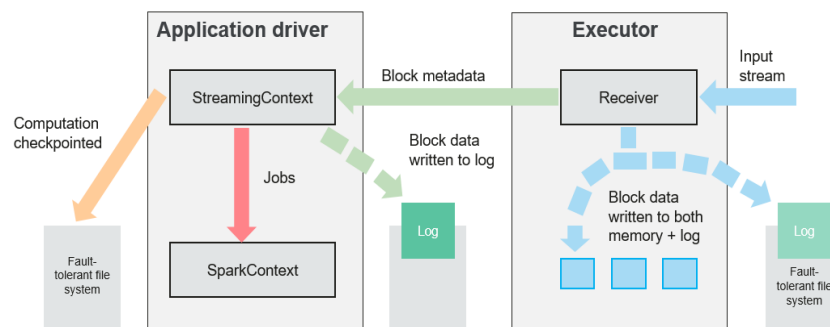

After the failure, Spark Streaming can read data from Kafka again and process the data segment. The processing result is the same no matter Spark Streaming fails or not, because the semantic is processed only once.

Direct API does not need to use the WAL and Receivers, and ensures that each Kafka record is received only once, which is more efficient. In this way, the Spark Streaming and Kafka can be well integrated, making streaming channels be featured with high fault-tolerance, high efficiency, and ease-of-use. Therefore, you are advised to use Direct Streaming to process data.

- Receiver

When a Spark Streaming application starts (that is, when the driver starts), the related StreamingContext (the basis of all streaming functions) uses SparkContext to start the receiver to become a long-term running task. These receivers receive and save streaming data to the Spark memory for processing. [Figure 1-89](#) shows the data transfer lifecycle.

**Figure 1-89** Data transfer lifecycle

- a. Receive data (blue arrow).  
Receiver divides a data stream into a series of blocks and stores them in the executor memory. In addition, after WAL is enabled, it writes data to the WAL of the fault-tolerant file system.
- b. Notify the driver (green arrow).  
The metadata in the received block is sent to StreamingContext in the driver. The metadata includes:
  - Block reference ID used to locate the data position in the Executor memory.
  - Block data offset information in logs (if the WAL function is enabled).
- c. Process data (red arrow).  
For each batch of data, StreamingContext uses block information to generate resilient distributed datasets (RDDs) and jobs. StreamingContext executes jobs by running tasks to process blocks in the executor memory.
- d. Periodically set checkpoints (orange arrows).  
For fault tolerance, StreamingContext periodically sets checkpoints and saves them to external file systems.

### Fault Tolerance

Spark and its RDD allow seamless processing of failures of any Worker node in the cluster. Spark Streaming is built on top of Spark. Therefore, the Worker node of Spark Streaming also has the same fault tolerance capability. However, Spark Streaming needs to run properly in case of long-time running. Therefore, Spark must be able to recover from faults through the driver process (main process that coordinates all Workers). This poses challenges to the Spark driver fault-tolerance because the Spark driver may be any user application implemented in any computation mode. However, Spark Streaming has internal computation architecture. That is, it periodically executes the same Spark computation in each batch data. Such architecture allows it to periodically store checkpoints to reliable storage space and recover them upon the restart of Driver.

For source data such as files, the Driver recovery mechanism can ensure zero data loss because all data is stored in a fault-tolerant file system such as HDFS. However, for other data sources such as Kafka and Flume, some received data is cached only in memory and may be lost before being processed. This is caused by the distribution operation mode of Spark applications. When the driver process fails, all executors running in the Cluster Manager, together with all data in the memory, are terminated. To avoid such data loss, the WAL function is added to Spark Streaming.

WAL is often used in databases and file systems to ensure persistence of any data operation. That is, first record an operation to a persistent log and perform this operation on data. If the operation fails, the system is recovered by reading the log and re-applying the preset operation. The following describes how to use WAL to ensure persistence of received data:

Receiver is used to receive data from data sources such as Kafka. As a long-time running task in Executor, Receiver receives data, and also confirms received data if supported by data sources. Received data is stored in the Executor memory, and Driver delivers a task to Executor for processing.

After WAL is enabled, all received data is stored to log files in the fault-tolerant file system. Therefore, the received data does not lose even if Spark Streaming fails. Besides, receiver checks correctness of received data only after the data is pre-written into logs. Data that is cached but not stored can be sent again by data sources after the driver restarts. These two mechanisms ensure zero data loss. That is, all data is recovered from logs or re-sent by data sources.

To enable the WAL function, perform the following operations:

- Set **streamingContext.checkpoint** to configure the checkpoint directory, which is an HDFS file path used to store streaming checkpoints and WALs.
- Set **spark.streaming.receiver.writeAheadLog.enable** of SparkConf to **true** (the default value is **false**).

After WAL is enabled, all receivers have the advantage of recovering from reliable received data. You are advised to disable the multi-replica mechanism because the fault-tolerant file system of WAL may also replicate the data.

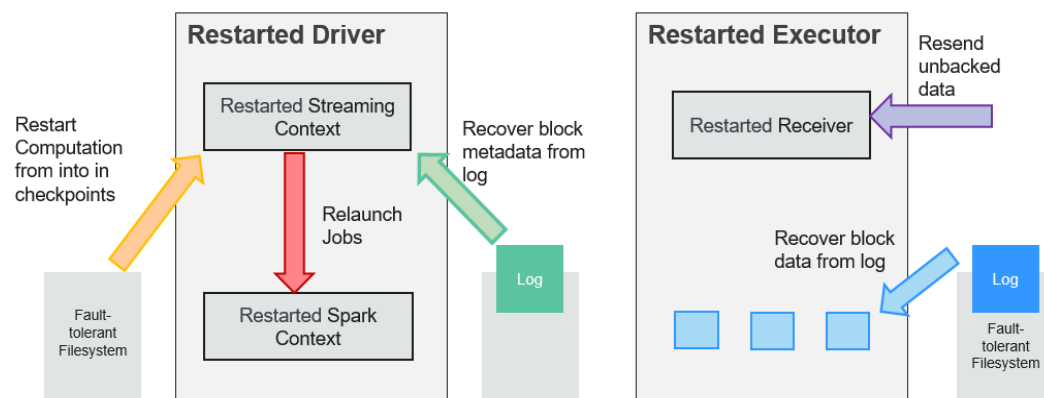

**NOTE**

The data receiving throughput is lowered after WAL is enabled. All data is written into the fault-tolerant file system. As a result, the write throughput of the file system and the network bandwidth for data replication may become the potential bottleneck. To solve this problem, you are advised to create more receivers to increase the degree of data receiving parallelism or use better hardware to improve the throughput of the fault-tolerant file system.

**Recovery Process**

When a failed driver is restarted, restart it as follows:

**Figure 1-90** Computing recovery process

1. Recover computing. (Orange arrow)  
Use checkpoint information to restart Driver, reconstruct SparkContext and restart Receiver.
2. Recover metadata block. (Green arrow)  
This operation ensures that all necessary metadata blocks are recovered to continue the subsequent computing recovery.
3. Relaunch unfinished jobs. (Red arrow)  
Recovered metadata is used to generate RDDs and corresponding jobs for interrupted batch processing due to failures.

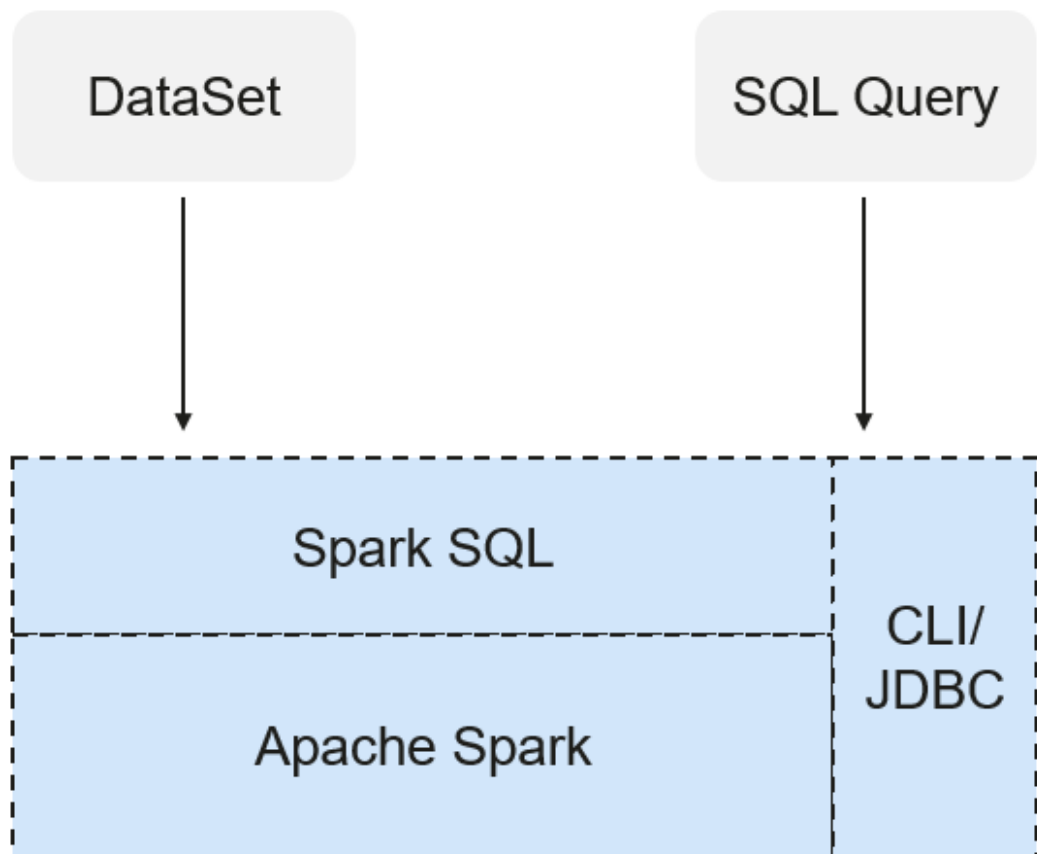

4. Read block data saved in logs. (Blue arrow)  
Block data is directly read from WALs during execution of the preceding jobs, and therefore all essential data reliably stored in logs is recovered.
5. Resend unconfirmed data. (Purple arrow)  
Data that is cached but not stored to logs upon failures is re-sent by data sources, because the receiver does not confirm the data.

Therefore, by using WALs and reliable Receiver, Spark Streaming can avoid input data loss caused by Driver failures.

## SparkSQL and DataSet Principle

### SparkSQL

Figure 1-91 SparkSQL and DataSet

Spark SQL is a module for processing structured data. In Spark application, SQL statements or DataSet APIs can be seamlessly used for querying structured data.

Spark SQL and DataSet also provide a universal method for accessing multiple data sources such as Hive, CSV, Parquet, ORC, JSON, and JDBC. These data sources also allow data interaction. Spark SQL reuses the Hive frontend processing logic and metadata processing module. With the Spark SQL, you can directly query existing Hive data.

In addition, Spark SQL also provides API, CLI, and JDBC APIs, allowing diverse accesses to the client.

## Spark SQL Native DDL/DML

In Spark 1.5, lots of Data Definition Language (DDL)/Data Manipulation Language (DML) commands are pushed down to and run on the Hive, causing coupling with the Hive and inflexibility such as unexpected error reports and results.

Spark 3.1.1 realizes command localization and replaces the Hive with Spark SQL Native DDL/DML to run DDL/DML commands. Additionally, the decoupling from the Hive is realized and commands can be customized.

## DataSet

A DataSet is a strongly typed collection of domain-specific objects that can be transformed in parallel using functional or relational operations. Each Dataset also has an untyped view called a DataFrame, which is a Dataset of Row.

The DataFrame is a structured and distributed dataset consisting of multiple columns. The DataFrame is equal to a table in the relationship database or the DataFrame in the R/Python. The DataFrame is the most basic concept in the Spark SQL, which can be created by using multiple methods, such as the structured dataset, Hive table, external database or RDD.

Operations available on DataSets are divided into transformations and actions.

- A transformation operation can generate a new DataSet, for example, **map**, **filter**, **select**, and **aggregate (groupBy)**.
- An action operation can trigger computation and return results, for example, **count**, **show**, or write data to the file system.

You can use either of the following methods to create a DataSet:

- The most common way is by pointing Spark to some files on storage systems, using the **read** function available on a SparkSession.  

```
val people = spark.read.parquet("...").as[Person] // Scala
DataSet<Person> people = spark.read().parquet("...").as(Encoders.bean(Person.class)); // Java
```
- You can also create a DataSet using the transformation operation available on an existing one.

For example, apply the map operation on an existing DataSet to create a DataSet:

```
val names = people.map(_.name) // In Scala: names is Dataset.
Dataset<String> names = people.map((Person p) -> p.name, Encoders.STRING); // Java
```

## CLI and JDBCServer

In addition to programming APIs, Spark SQL also provides the CLI/JDBC APIs.

- Both **spark-shell** and **spark-sql** scripts can provide the CLI for debugging.
- JDBCServer provides JDBC APIs. External systems can directly send JDBC requests to calculate and parse structured data.

## SparkSession Principle

SparkSession is a unified API for Spark programming and can be regarded as a unified entry for reading data. SparkSession provides a single entry point to perform many operations that were previously scattered across multiple classes, and also provides accessor methods to these older classes to maximize compatibility.

A `SparkSession` can be created using a builder pattern. The builder will automatically reuse the existing `SparkSession` if there is a `SparkSession`; or create a `SparkSession` if it does not exist. During I/O transactions, the configuration item settings in the builder are automatically synchronized to Spark and Hadoop.

```
import org.apache.spark.sql.SparkSession
val sparkSession = SparkSession.builder
  .master("local")
  .appName("my-spark-app")
  .config("spark.some.config.option", "config-value")
  .getOrCreate()
```

- `SparkSession` can be used to execute SQL queries on data and return results as `DataFrame`.  

```
sparkSession.sql("select * from person").show
```
- `SparkSession` can be used to set configuration items during running. These configuration items can be replaced with variables in SQL statements.  

```
sparkSession.conf.set("spark.some.config", "abcd")
sparkSession.conf.get("spark.some.config")
sparkSession.sql("select ${spark.some.config}")
```
- `SparkSession` also includes a "catalog" method that contains methods to work with Metastore (data catalog). After this method is used, a dataset is returned, which can be run using the same Dataset API.  

```
val tables = sparkSession.catalog.listTables()
val columns = sparkSession.catalog.listColumns("myTable")
```
- Underlying `SparkContext` can be accessed by `SparkContext` API of `SparkSession`.  

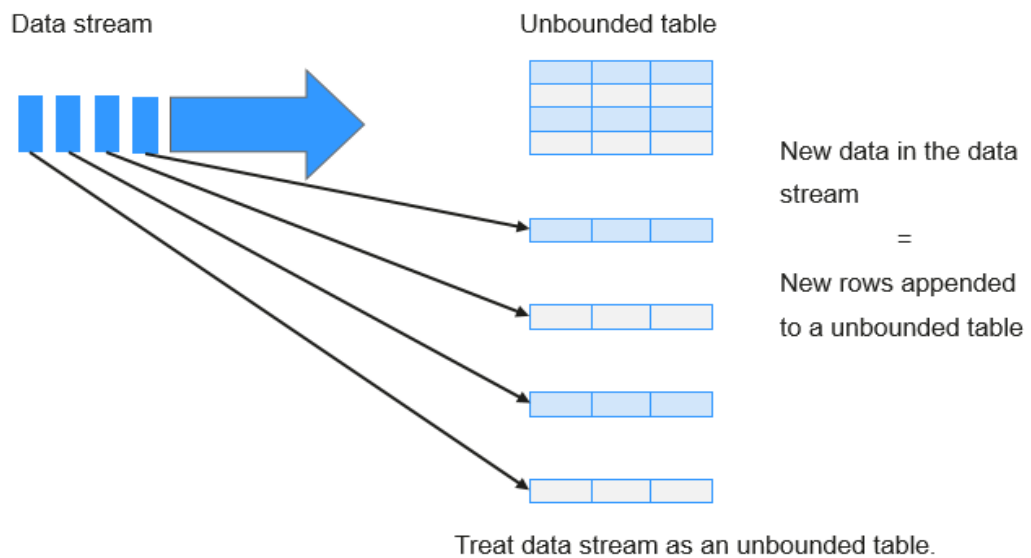

```
val sparkContext = sparkSession.sparkContext
```

## Structured Streaming Principle

Structured Streaming is a stream processing engine built on the Spark SQL engine. You can use the `Dataset/DataFrame` API in Scala, Java, Python, or R to express streaming aggregations, event-time windows, and stream-stream joins. If streaming data is incrementally and continuously produced, Spark SQL will continue to process the data and synchronize the result to the result set. In addition, the system ensures end-to-end exactly-once fault-tolerance guarantees through checkpoints and WALs.

The core of Structured Streaming is to take streaming data as an incremental database table. Similar to the data block processing model, the streaming data processing model applies query operations on a static database table to streaming computing, and Spark uses standard SQL statements for query, to obtain data from the incremental and unbounded table.

**Figure 1-92** Unbounded table of Structured Streaming

Each query operation will generate a result table. At each trigger interval, updated data will be synchronized to the result table. Whenever the result table is updated, the updated result will be written into an external storage system.

**Figure 1-93** Structured Streaming data processing model

### Programming Model for Structured Streaming

Storage modes of Structured Streaming at the output phase are as follows:

- **Complete Mode:** The updated result sets are written into the external storage system. The write operation is performed by a connector of the external storage system.

- **Append Mode:** If an interval is triggered, only added data in the result table will be written into an external system. This is applicable only on the queries where existing rows in the result table are not expected to change.
- **Update Mode:** If an interval is triggered, only updated data in the result table will be written into an external system, which is the difference between the Complete Mode and Update Mode.

## Basic Concepts

- **RDD**

Resilient Distributed Dataset (RDD) is a core concept of Spark. It indicates a read-only and partitioned distributed dataset. Partial or all data of this dataset can be cached in the memory and reused between computations.

### RDD Creation

- An RDD can be created from the input of HDFS or other storage systems that are compatible with Hadoop.
- A new RDD can be converted from a parent RDD.
- An RDD can be converted from a collection of datasets through encoding.

### RDD Storage

- You can select different storage levels to store an RDD for reuse. (There are 11 storage levels to store an RDD.)
- By default, the RDD is stored in the memory. When the memory is insufficient, the RDD overflows to the disk.

- **RDD Dependency**

The RDD dependency includes the narrow dependency and wide dependency.

**Figure 1-94** RDD dependency

- **Narrow dependency:** Each partition of the parent RDD is used by at most one partition of the child RDD.
- **Wide dependency:** Partitions of the child RDD depend on all partitions of the parent RDD.

The narrow dependency facilitates the optimization. Logically, each RDD operator is a fork/join (the join is not the join operator mentioned above but the barrier used to synchronize multiple concurrent tasks); fork the RDD to each partition, and then perform the computation. After the computation, join the results, and then perform the fork/join operation on the next RDD operator. It is uneconomical to directly translate the RDD into physical implementation. The first is that every RDD (even intermediate result) needs to be physicalized into memory or storage, which is time-consuming and occupies much space. The second is that as a global barrier, the join operation is very expensive and the entire join process will be slowed down by the slowest node. If the partitions of the child RDD narrowly depend on that of the parent RDD, the two fork/join processes can be combined to implement classic fusion optimization. If the relationship in the continuous operator sequence is narrow dependency, multiple fork/join processes can be combined to reduce a large number of global barriers and eliminate the physicalization of many RDD intermediate results, which greatly improves the performance. This is called pipeline optimization in Spark.

- **Transformation and Action (RDD Operations)**

Operations on RDD include transformation (the return value is an RDD) and action (the return value is not an RDD). **Figure 1-95** shows the RDD operation process. The transformation is lazy, which indicates that the transformation from one RDD to another RDD is not immediately executed. Spark only records the transformation but does not execute it immediately. The real computation is started only when the action is started. The action returns results or writes the RDD data into the storage system. The action is the driving force for Spark to start the computation.

**Figure 1-95** RDD operation

The data and operation model of RDD are quite different from those of Scala.

```
val file = sc.textFile("hdfs://...")
val errors = file.filter(_.contains("ERROR"))
errors.cache()
errors.count()
```

- a. The `textFile` operator reads log files from the HDFS and returns files (as an RDD).
- b. The `filter` operator filters rows with **ERROR** and assigns them to errors (a new RDD). The `filter` operator is a transformation.
- c. The `cache` operator caches errors for future use.
- d. The `count` operator returns the number of rows of errors. The `count` operator is an action.

#### Transformation includes the following types:

- The RDD elements are regarded as simple elements.

The input and output has the one-to-one relationship, and the partition structure of the result RDD remains unchanged, for example, `map`.

The input and output has the one-to-many relationship, and the partition structure of the result RDD remains unchanged, for example, `flatMap` (one element becomes a sequence containing multiple elements after `map` and then flattens to multiple elements).

The input and output has the one-to-one relationship, but the partition structure of the result RDD changes, for example, `union` (two RDDs integrates to one RDD, and the number of partitions becomes the sum of the number of partitions of two RDDs) and `coalesce` (partitions are reduced).

Operators of some elements are selected from the input, such as `filter`, `distinct` (duplicate elements are deleted), `subtract` (elements only exist in this RDD are retained), and `sample` (samples are taken).

- The RDD elements are regarded as key-value pairs.

Perform the one-to-one calculation on the single RDD, such as `mapValues` (the partition mode of the source RDD is retained, which is different from `map`).

Sort the single RDD, such as `sort` and `partitionBy` (partitioning with consistency, which is important to the local optimization).

Restructure and reduce the single RDD based on key, such as `groupByKey` and `reduceByKey`.

Join and restructure two RDDs based on the key, such as `join` and `cogroup`.

#### NOTE

The later three operations involving sorting are called shuffle operations.

#### Action includes the following types:

- Generate scalar configuration items, such as **count** (the number of elements in the returned RDD), **reduce**, **fold/aggregate** (the number of scalar configuration items that are returned), and **take** (the number of elements before the return).

- Generate the Scala collection, such as **collect** (import all elements in the RDD to the Scala collection) and **lookup** (look up all values corresponds to the key).
- Write data to the storage, such as **saveAsTextFile** (which corresponds to the preceding **textFile**).
- Check points, such as the **checkpoint** operator. When Lineage is quite long (which occurs frequently in graphics computation), it takes a long period of time to execute the whole sequence again when a fault occurs. In this case, checkpoint is used as the check point to write the current data to stable storage.

- **Shuffle**

Shuffle is a specific phase in the MapReduce framework, which is located between the Map phase and the Reduce phase. If the output results of Map are to be used by Reduce, the output results must be hashed based on a key and distributed to each Reducer. This process is called Shuffle. Shuffle involves the read and write of the disk and the transmission of the network, so that the performance of Shuffle directly affects the operation efficiency of the entire program.

The figure below shows the entire process of the MapReduce algorithm.

**Figure 1-96** Algorithm process

Shuffle is a bridge to connect data. The following describes the implementation of shuffle in Spark.

Shuffle divides a job of Spark into multiple stages. The former stages contain one or more ShuffleMapTasks, and the last stage contains one or more ResultTasks.

- **Spark Application Structure**

The Spark application structure includes the initialized SparkContext and the main program.

- Initialized SparkContext: constructs the operating environment of the Spark Application.

Constructs the SparkContext object. The following is an example:

```
new SparkContext(master, appName, [SparkHome], [jars])
```

Parameter description:

**master:** indicates the link string. The link modes include local, Yarn-cluster, and Yarn-client.

**appName:** indicates the application name.

**SparkHome:** indicates the directory where Spark is installed in the cluster.

**jars:** indicates the code and dependency package of an application.

- Main program: processes data.

For details about how to submit an application, visit <https://archive.apache.org/dist/spark/docs/3.1.1/submitting-applications.html>.

- **Spark Shell Commands**

The basic Spark shell commands support the submission of Spark applications. The Spark shell commands are as follows:

```
./bin/spark-submit \  
--class <main-class> \  
--master <master-url> \  
... # other options  
<application-jar> \  
[application-arguments]
```

Parameter description:

**--class:** indicates the name of the class of a Spark application.

**--master:** indicates the master to which the Spark application links, such as Yarn-client and Yarn-cluster.

**application-jar:** indicates the path of the JAR file of the Spark application.

**application-arguments:** indicates the parameter required to submit the Spark application. This parameter can be left blank.

- **Spark JobHistory Server**

The Spark web UI is used to monitor the details in each phase of the Spark framework of a running or historical Spark job and provide the log display, which helps users to develop, configure, and optimize the job in more fine-grained units.

### 1.3.22.2 Spark HA Solution

#### Spark Multi-Active Instance HA Principles and Implementation Solution

Based on existing JDBCServer in the community, multi-active-instance mode is used to achieve HA. In this mode, multiple JDBCServer coexist in the cluster and the client can randomly connect any JDBCServer to perform service operations. When one or multiple JDBCServer stop working, a client can connect to another normal JDBCServer.

Compared with active/standby HA mode, multi-active instance mode has following advantages:

- In active/standby HA, when the active/standby switchover occurs, the unavailable period cannot be controlled by JDBCServer, but it depends on Yarn service resources.
- In Spark, the Thrift JDBC similar to HiveServer2 provides services and users access services through Beeline and JDBC API. Therefore, the processing capability of the JDBCServer cluster depends on the single-point capability of the primary server, and the scalability is insufficient.

The multi-active instance HA mode not only can prevent service interruption caused by switchover, but also enables cluster scale-out to improve high concurrency.

- **Implementation**

The following figure shows the basic principle of multi-active instance HA of Spark JDBCServer.

**Figure 1-97** Spark JDBCServer HA

1. When a JDBCServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the instance IP address, port number, version, and serial number.
2. To connect to JDBCServer, the client must specify the namespace, which is the directory of JDBCServer instances in ZooKeeper. During the connection, a JDBCServer instance is randomly selected from the specified namespace.
3. After the connection succeeds, the client sends SQL statements to JDBCServer.
4. JDBCServer executes received SQL statements and returns results to the client.

If multi-active instance HA of Spark JDBCServer is enabled, all JDBCServer instances are independent and equivalent. When one JDBCServer instance is interrupted during upgrade, other JDBCServer instances can accept the connection request from the client.

The rules below must be followed in the multi-active instance HA of Spark JDBCServer.

- If a JDBCServer instance exits abnormally, no other instance will take over the sessions and services running on the abnormal instance.
- When the JDBCServer process is stopped, corresponding nodes are deleted from ZooKeeper.
- The client randomly selects the server, which may result in uneven session allocation caused by random distribution of policy results, and finally result in load imbalance of instances.

- After the instance enters the maintenance mode (in which no new connection requests from clients are accepted), services running on the instance may fail when the decommissioning times out.

- **URL Connection**

- Multi-active instance mode

In multi-active instance mode, the client reads content from the ZooKeeper node and connects to JDBCServer. The connection strings are list below.

- Security mode:

If Kinit authentication is enabled, the JDBCURL is as follows:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_P
ort>;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;sasl
Qop=auth-conf;auth=KERBEROS;principal=spark/hadoop.<System domain
name>@<System domain name>;
```

 **NOTE**

- In the above JDBCURL, **<zkNode\_IP>:<zkNode\_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs, Example: 192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181.
- **sparkthriftserver2x** indicates the ZooKeeper directory, where a random JDBCServer instance is connected to the client.

For example, when you use Beeline client to connect JDBCServer, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkN
ode3_IP>:<zkNode3_Port>;serviceDiscoveryMode=zooKeeper;zooK
eeperNamespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark/hadoop.<System domain
name>@<System domain name>;"
```

If Keytab authentication is enabled, the JDBCURL is as follows:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_P
ort>;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;sasl
Qop=auth-conf;auth=KERBEROS;principal=spark/hadoop.<System domain
name>@<System domain
name>;user.principal=<principal_name>;user.keytab=<path_to_keytab>
```

In the above URL, **<principal\_name>** indicates the principal of the Kerberos user, for example, **test@<System domain name>**; **<path\_to\_keytab>** indicates the Keytab file path corresponding to **<principal\_name>**, for example, **/opt/auth/test/user.keytab**.

- Common mode:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_P
ort>;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;
```

For example, when you use Beeline client, in normal mode, for connection, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkN
ode3_IP>:<zkNode3_Port>;serviceDiscoveryMode=zooKeeper;zooK
eeperNamespace=sparkthriftserver2x;"
```

- Non-multi-active instance mode

In this mode, a client connects to a specified JDBCServer node. Compared with multi-active instance mode, the connection string in this mode does not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

For example, when you use Beeline client, in security mode, to connect JDBCServer in non-multi-active instance mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://  
<server_IP>:<server_Port>;user.principal=spark/hadoop.<System  
domain name>@<System domain name>;sasLQop=auth-  
conf;auth=KERBEROS;principal=spark/hadoop.<System domain  
name>@<System domain name>;"
```

 NOTE

- In the above command, **<server\_IP>:<server\_Port>** indicates the URL of the specified JDBCServer node.
- **CLIENT\_HOME** indicates the client path.

Except the connection method, other operations of JDBCServer API in the two modes are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive. For details about how to use Spark JDBCServer, see <https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients>.

## Spark Multi-Tenant HA

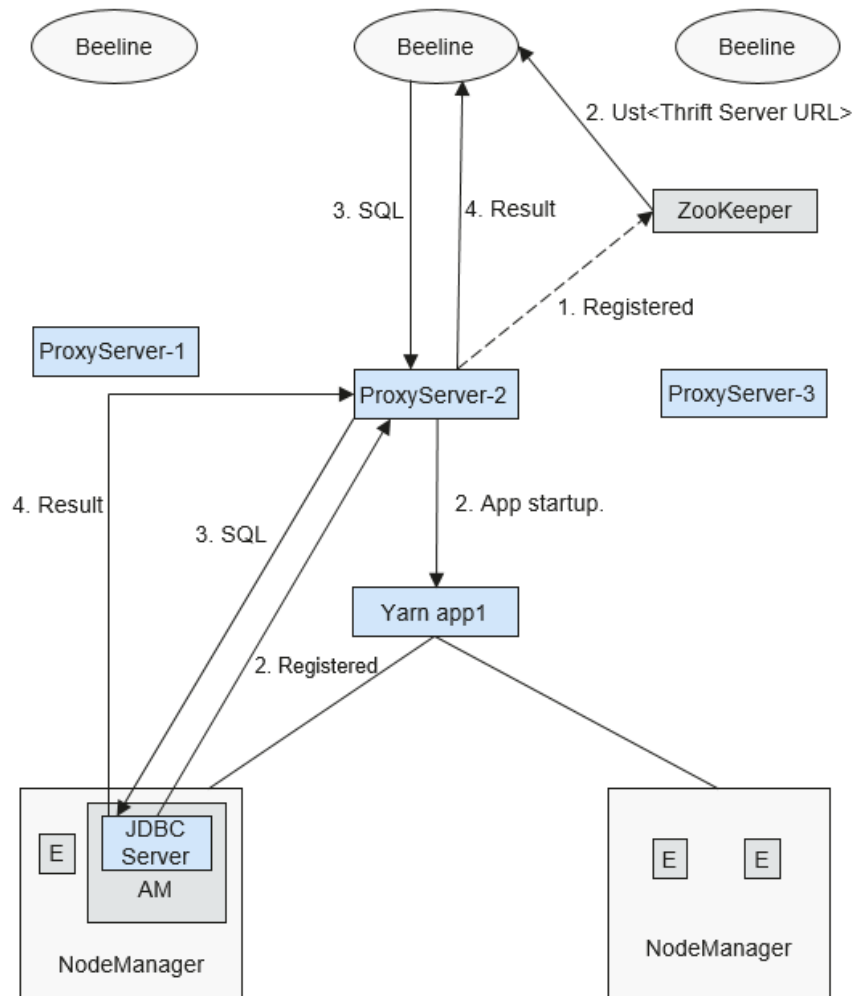

In the JDBCServer multi-active instance solution, JDBCServer uses the Yarn-client mode, but there is only one Yarn resource queue available. To solve this resource limitation problem, the multi-tenant mode is introduced.

In multi-tenant mode, JDBCServers are bound with tenants. Each tenant corresponds to one or more JDBCServers, and a JDBCServer provides services for only one tenant. Different tenants can be configured with different Yarn queues to implement resource isolation. In addition, JDBCServer can be dynamically started as required to avoid resource waste.

- **Implementation**

**Figure 1-98** shows the HA solution of the multi-tenant mode.

**Figure 1-98** Multi-tenant mode of Spark JDBCServer

- a. When ProxyServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the instance IP address, port number, version, and serial number.

**NOTE**

In multi-tenant mode, the JDBCServer instance refers to the ProxyServer (JDBCServer proxy).

- b. To connect to ProxyServer, the client must specify a namespace, which is the directory of the ProxyServer instance where you want to access ZooKeeper. When the client connects to the ProxyServer, a random instance under the namespace is selected for connection. For details about the URL, see [URL Connection Overview](#).
- c. After the client successfully connects to the ProxyServer, which first checks whether the JDBCServer of a tenant exists. If yes, Beeline connects the JDBCServer. If no, a new JDBCServer is started in Yarn-cluster mode. After the startup of JDBCServer, ProxyServer obtains the IP address of the JDBCServer and establishes the connection between Beeline and JDBCServer.

- d. The client sends SQL statements to ProxyServer, which forwards statements to the connected JDBCServer. JDBCServer returns the results to ProxyServer, which then returns the results to the client.

In the multi-active instance HA mode, all instances are independent and equivalent. If one instance is interrupted during upgrade, other instances can accept the connection request from the client.

- **URL Connection Overview**

- Multi-tenant mode

In multi-tenant mode, the client reads content from the ZooKeeper node and connects to ProxyServer. The connection strings are list below.

- Security mode:

If Kinit authentication is enabled, the client URL is as follows:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_P
ort>;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;sasl
Qop=auth-conf;auth=KERBEROS;principal=spark/hadoop.<System domain
name>@<System domain name>;
```

 **NOTE**

- In the above URL, **<zkNode\_IP>:<zkNode\_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs,

Example:

**192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181.**

- **sparkthriftserver2x** indicates the ZooKeeper directory, where a random JDBCServer instance is connected to the client.

For example, when you use Beeline client for connection, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkN
ode3_IP>:<zkNode3_Port>;serviceDiscoveryMode=zooKeeper;zooK
eeperNamespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark/hadoop.<System domain
name>@<System domain name>;"
```

If Keytab authentication is enabled, the URL is as follows:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_P
ort>;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;sasl
Qop=auth-conf;auth=KERBEROS;principal=spark/hadoop.<System domain
name>@<System domain
name>;user.principal=<principal_name>;user.keytab=<path_to_keytab>
```

In the above URL, **<principal\_name>** indicates the principal of the Kerberos user, for example, **test@<System domain name>**;

**<path\_to\_keytab>** indicates the Keytab file path corresponding to **<principal\_name>**, for example, **/opt/auth/test/user.keytab**.

- Common mode:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_P
ort>;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;
```

For example, run the following command when you use Beeline client for connection in normal mode:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkN
```

```
ode3_IP>:<zkNode3_Port>/;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;"
```

– Non-multi-tenant mode

In non-multi-tenant mode, a client connects to a specified JDBCServer node. Compared with multi-tenant instance mode, the connection string in this mode does not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

For example, when you use Beeline client to connect JDBCServer in non-multi-tenant instance mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://<server_IP>:<server_Port>/;user.principal=spark/hadoop.<System domain name>@<System domain name>;sasLQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.<System domain name>@<System domain name>;"
```

 NOTE

- In the above command, **<server\_IP>:<server\_Port>** indicates the URL of the specified JDBCServer node.
- **CLIENT\_HOME** indicates the client path.

Except the connection method, other operations of JDBCServer API in multi-tenant mode and non-multi-tenant mode are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive. For details about how to use Spark JDBCServer, go to the official Hive website at <https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients>.

### Specifying a Tenant

Generally, the client submitted by a user connects to the default JDBCServer of the tenant to which the user belongs. If you want to connect the client to the JDBCServer of a specified tenant, add the **--hiveconf mapreduce.job.queueName** parameter.

If you use Beeline client for connection, run the following command (**aaa** is the tenant name):

```
beeline --hiveconf mapreduce.job.queueName=aaa -u 'jdbc:hive2://192.168.39.30:2181,192.168.40.210:2181,192.168.215.97:2181;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;sasLQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.<System domain name>@<System domain name>'
```

## 1.3.22.3 Relationship Among Spark, HDFS, and Yarn

### Relationship Between Spark and HDFS

Data computed by Spark comes from multiple data sources, such as local files and HDFS. Most data computed by Spark comes from the HDFS. The HDFS can read data in large scale for parallel computing. After being computed, data can be stored in the HDFS.

Spark involves Driver and Executor. Driver schedules tasks and Executor runs tasks.

**Figure 1-99** shows the process of reading a file.

**Figure 1-99** File reading process

The file reading process is as follows:

1. Driver interconnects with the HDFS to obtain the information of File A.
2. The HDFS returns the detailed block information about this file.
3. Driver sets a parallel degree based on the block data amount, and creates multiple tasks to read the blocks of this file.
4. Executor runs the tasks and reads the detailed blocks as part of the Resilient Distributed Dataset (RDD).

**Figure 1-100** shows the process of writing data to a file.

**Figure 1-100** File writing process

The file writing process is as follows:

1. Driver creates a directory where the file is to be written.
2. Based on the RDD distribution status, the number of tasks related to data writing is computed, and these tasks are sent to Executor.
3. Executor runs these tasks, and writes the RDD data to the directory created in 1.

## Relationship Between Spark and Yarn

The Spark computing and scheduling can be implemented using Yarn mode. Spark enjoys the computing resources provided by Yarn clusters and runs tasks in a distributed way. Spark on Yarn has two modes: Yarn-cluster and Yarn-client.

- Yarn-cluster mode

**Figure 1-101** shows the running framework of Spark on Yarn-cluster.

**Figure 1-101** Spark on Yarn-cluster operation framework

Spark on Yarn-cluster implementation process:

- a. The client generates the application information, and then sends the information to Resource Manager.
- b. Resource Manager allocates the first container (ApplicationMaster) to SparkApplication and starts driver on the container.
- c. ApplicationMaster applies for resources from Resource Manager to run the container.

Resource Manager allocates the container to ApplicationMaster, which communicates with Node Manager, and starts the executor in the obtained container. After the executor is started, it registers with the driver and applies for tasks.

- d. The driver allocates tasks to the executor.
- e. The executor runs tasks and reports the operating status to the driver.
- Yarn-client mode

**Figure 1-102** shows the running framework of Spark on Yarn-cluster.

**Figure 1-102** Spark on Yarn-client operation framework

Spark on Yarn-client implementation process:

**NOTE**

In Yarn-client mode, Driver is deployed on the client and started on the client. In Yarn-client mode, the client of the earlier version is incompatible. You are advised to use the Yarn-cluster mode.

- a. The client sends the Spark application request to ResourceManager, then ResourceManager returns the results. The results include information such as Application ID and the maximum and minimum available resources. The client packages all information required to start ApplicationMaster, and sends the information to ResourceManager.
- b. After receiving the request, ResourceManager finds a proper node for ApplicationMaster and starts it on this node. ApplicationMaster is a role in Yarn, and the process name in Spark is ExecutorLauncher.
- c. Based on the resource requirements of each task, ApplicationMaster can apply for a series of Containers to run tasks from ResourceManager.
- d. After receiving the newly allocated container list (from ResourceManager), ApplicationMaster sends information to the related NodeManagers to start the containers.

ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers, and starts the executors in the obtained containers. After the executors are started, it registers with drivers and applies for tasks.

 NOTE

Running containers are not suspended and resources are not released.

- e. The drivers allocate tasks to the executors. The executor executes tasks and reports the operating status to the driver.

### 1.3.22.4 Spark Enhanced Open Source Feature: Optimized SQL Query of Cross-Source Data

#### Scenario

Enterprises usually store massive data, such as from various databases and warehouses, for management and information collection. However, diversified data sources, hybrid dataset structures, and scattered data storage lower query efficiency.

The open source Spark only supports simple filter pushdown during querying of multi-source data. The SQL engine performance is deteriorated due of a large amount of unnecessary data transmission. The pushdown function is enhanced, so that **aggregate**, complex **projection**, and complex **predicate** can be pushed to data sources, reducing unnecessary data transmission and improving query performance.

Only the JDBC data source supports pushdown of query operations, such as **aggregate**, **projection**, **predicate**, **aggregate over inner join**, and **aggregate over union all**. All pushdown operations can be enabled based on your requirements.

**Table 1-20** Enhanced Query of Cross-Source Query

Module	Before Enhancement	After Enhancement
aggregate	The pushdown of <b>aggregate</b> is not supported.	<ul style="list-style-type: none"> <li>● Aggregation functions including <b>sum</b>, <b>avg</b>, <b>max</b>, <b>min</b>, and <b>count</b> are supported. Example: select count(*) from table</li> <li>● Internal expressions of aggregation functions are supported. Example: select sum(a+b) from table</li> <li>● Calculation of aggregation functions is supported. Example: select avg(a) + max(b) from table</li> <li>● Pushdown of <b>having</b> is supported. Example: select sum(a) from table where a&gt;0 group by b having sum(a)&gt;10</li> <li>● Pushdown of some functions is supported. Pushdown of lines in mathematics, time, and string functions, such as <b>abs()</b>, <b>month()</b>, and <b>length()</b> are supported. In addition to the preceding built-in functions, you can run the <b>SET</b> command to add functions supported by data sources. Example: select sum(abs(a)) from table</li> <li>● Pushdown of <b>limit</b> and <b>order by</b> after <b>aggregate</b> is supported. However, the pushdown is not supported in Oracle, because Oracle does not support <b>limit</b>. Example: select sum(a) from table where a&gt;0 group by b order by sum(a) limit 5</li> </ul>
projection	Only pushdown of simple <b>projection</b> is supported. Example: select a, b from table	<ul style="list-style-type: none"> <li>● Complex expressions can be pushed down. Example: select (a+b)*c from table</li> <li>● Some functions can be pushed down. For details, see the description below the table. Example: select length(a)+abs(b) from table</li> <li>● Pushdown of <b>limit</b> and <b>order by</b> after <b>projection</b> is supported. Example: select a, b+c from table order by a limit 3</li> </ul>

Module	Before Enhancement	After Enhancement
predicate	<p>Only simple filtering with the column name on the left of the operator and values on the right is supported. Example: select * from table where a&gt;0 or b in ("aaa", "bbb")</p>	<ul style="list-style-type: none"> <li>Complex expression pushdown is supported. Example: select * from table where a +b&gt;c*d or a/c in (1, 2, 3)</li> <li>Some functions can be pushed down. For details, see the description below the table. Example: select * from table where length(a)&gt;5</li> </ul>
aggregate over inner join	<p>Related data from the two tables must be loaded to Spark. The join operation must be performed before the <b>aggregate</b> operation.</p>	<p>The following functions are supported:</p> <ul style="list-style-type: none"> <li>Aggregation functions including <b>sum</b>, <b>avg</b>, <b>max</b>, <b>min</b>, and <b>count</b> are supported.</li> <li>All <b>aggregate</b> operations can be performed in a same table. aggregate over union all	<p>Related data from the two tables must be loaded to Spark. <b>union</b> must be performed before <b>aggregate</b>.</p>	<p>Supported scenarios: Aggregation functions including <b>sum</b>, <b>avg</b>, <b>max</b>, <b>min</b>, and <b>count</b> are supported.</p> <p>Unsupported scenarios:</p> <ul style="list-style-type: none"> <li><b>aggregate</b> contains operations, for example, sum(a+b).</li> <li><b>aggregate</b> operations, for example, sum(a)+min(b).</li> </ul>

## Precautions

- If external data source is Hive, query operation cannot be performed on foreign tables created by Spark.
- Only MySQL and MPPDB data sources are supported.

## 1.3.23 Spark2x

### 1.3.23.1 Basic Principles of Spark2x

#### NOTE

The Spark2x component applies to MRS 3.x and later versions.

## Description

Spark is a memory-based distributed computing framework. In iterative computation scenarios, the computing capability of Spark is 10 to 100 times higher than MapReduce, because data is stored in memory when being processed. Spark can use HDFS as the underlying storage system, enabling users to quickly switch to Spark from MapReduce. Spark provides one-stop data analysis capabilities, such as the streaming processing in small batches, offline batch processing, SQL query, and data mining. Users can seamlessly use these functions in a same application. For details about the new open-source features of Spark2x, see [Spark2x Open Source New Features](#).

Features of Spark are as follows:

- Improves the data processing capability through distributed memory computing and directed acyclic graph (DAG) execution engine. The delivered performance is 10 to 100 times higher than that of MapReduce.
- Supports multiple development languages (Scala/Java/Python) and dozens of highly abstract operators to facilitate the construction of distributed data processing applications.
- Builds data processing stacks using [SQL](#), [Streaming](#), MLlib, and GraphX to provide one-stop data processing capabilities.
- Fits into the Hadoop ecosystem, allowing Spark applications to run on Standalone, Mesos, or Yarn, enabling access of multiple data sources such as HDFS, HBase, and Hive, and supporting smooth migration of the MapReduce application to Spark.

## Architecture

[Figure 1-103](#) describes the Spark architecture and [Table 1-21](#) lists the Spark modules.

**Figure 1-103** Spark architecture

**Table 1-21** Basic concepts

Module	Description
Cluster Manager	Cluster manager manages resources in the cluster. Spark supports multiple cluster managers, including Mesos, Yarn, and the Standalone cluster manager that is delivered with Spark. By default, Spark clusters adopt the Yarn cluster manager.
Application	Spark application. It consists of one Driver Program and multiple executors.
Deploy Mode	Deployment in cluster or client mode. In cluster mode, the driver runs on a node inside the cluster. In client mode, the driver runs on the client (outside the cluster).
Driver Program	The main process of the Spark application. It runs the <b>main()</b> function of an application and creates SparkContext. It is used for parsing applications, generating stages, and scheduling tasks to executors. Usually, SparkContext represents Driver Program.
Executor	A process started on a Work Node. It is used to execute tasks, and manage and process the data used in applications. A Spark application usually contains multiple executors. Each executor receives commands from the driver and executes one or multiple tasks.
Worker Node	A node that starts and manages executors and resources in a cluster.
Job	A job consists of multiple concurrent tasks. One action operator (for example, a collect operator) maps to one job.
Stage	Each job consists of multiple stages. Each stage is a task set, which is separated by Directed Acyclic Graph (DAG).

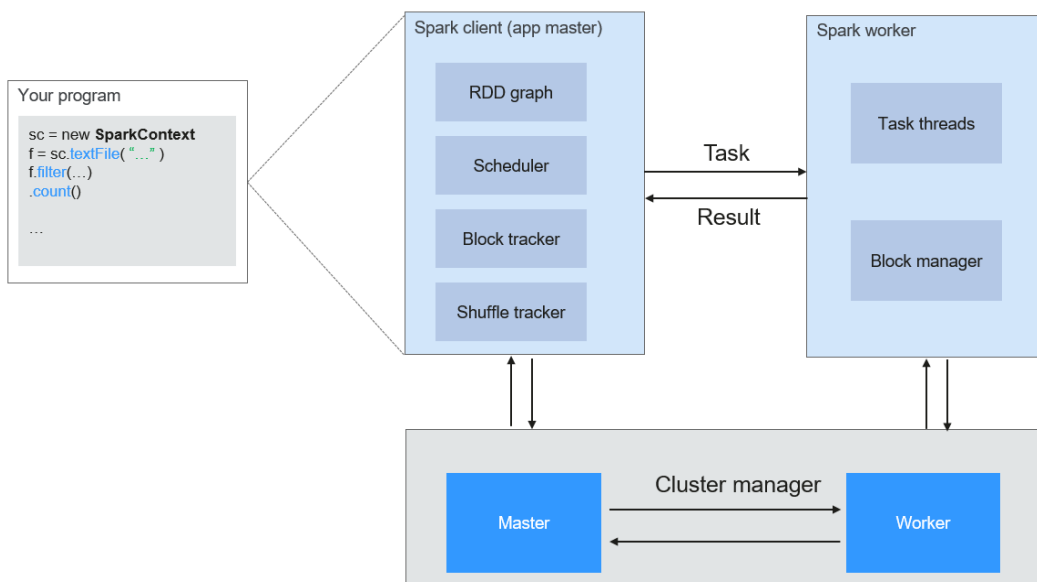

Module	Description
Task	A task carries the computation unit of the service logics. It is the minimum working unit that can be executed on the Spark platform. An application can be divided into multiple tasks based on the execution plan and computation amount.

## Spark Principle

Figure 1-104 describes the application running architecture of Spark.

1. An application is running in the cluster as a collection of processes. Driver coordinates the running of the application.
2. To run an application, Driver connects to the cluster manager (such as Standalone, Mesos, and Yarn) to apply for the executor resources, and start ExecutorBackend. The cluster manager schedules resources between different applications. Driver schedules DAGs, divides stages, and generates tasks for the application at the same time.
3. Then, Spark sends the codes of the application (the codes transferred to SparkContext, which is defined by JAR or Python) to an executor.
4. After all tasks are finished, the running of the user application is stopped.

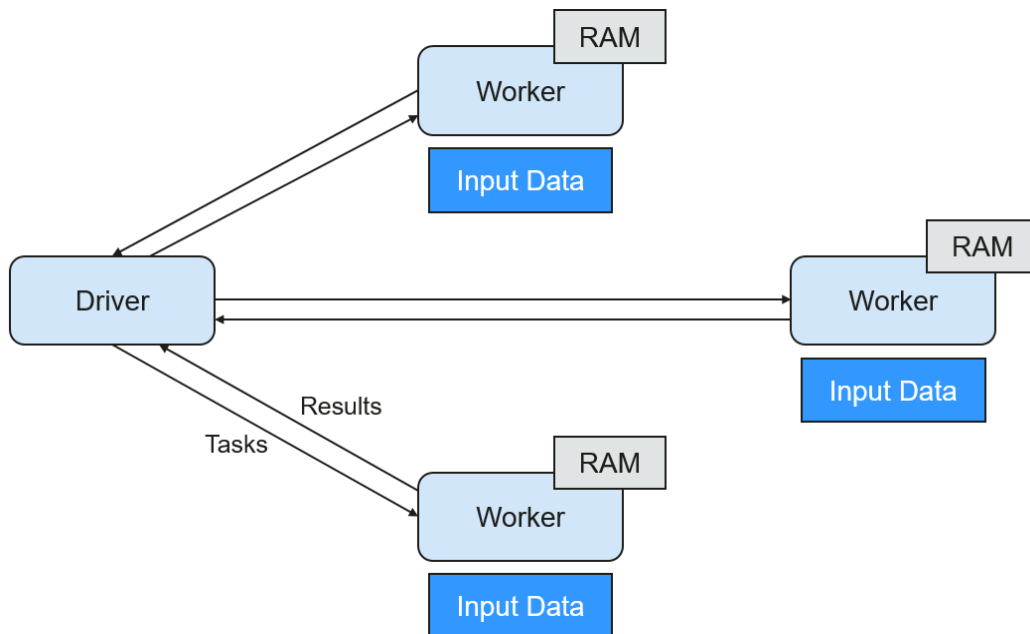

Figure 1-104 Spark application running architecture

Spark uses Master and Worker modes, as shown in Figure 1-105. A user submits an application on the Spark client, and then the scheduler divides a job into multiple tasks and sends the tasks to each Worker for execution. Each Worker reports the computation results to Driver (Master), and then the Driver aggregates and returns the results to the client.

**Figure 1-105** Spark Master-Worker mode

Note the following about the architecture:

- Applications are isolated from each other. Each application has an independent executor process, and each executor starts multiple threads to execute tasks in parallel. Each driver schedules its own tasks, and different application tasks run on different JVMs, that is, different executors.
- Different Spark applications do not share data, unless data is stored in the external storage system such as HDFS.
- You are advised to deploy the Driver program in a location that is close to the Worker node because the Driver program schedules tasks in the cluster. For example, deploy the Driver program on the network where the Worker node is located.

Spark on YARN can be deployed in two modes:

- In Yarn-cluster mode, the Spark driver runs inside an ApplicationMaster process which is managed by Yarn in the cluster. After the ApplicationMaster is started, the client can exit without interrupting service running.
- In Yarn-client mode, Driver runs in the client process, and the ApplicationMaster process is used only to apply for requesting resources from Yarn.

## Spark Streaming Principle

Spark Streaming is a real-time computing framework built on the Spark, which expands the capability for processing massive streaming data. Spark supports two data processing approaches: Direct Streaming and Receiver.

### Direct Streaming computing process

In Direct Streaming approach, Direct API is used to process data. Take Kafka Direct API as an example. Direct API provides offset location that each batch range will

read from, which is much simpler than starting a receiver to continuously receive data from Kafka and written data to write-ahead logs (WALs). Then, each batch job is running and the corresponding offset data is ready in Kafka. These offset information can be securely stored in the checkpoint file and read by applications that failed to start.

**Figure 1-106** Data transmission through Direct Kafka API

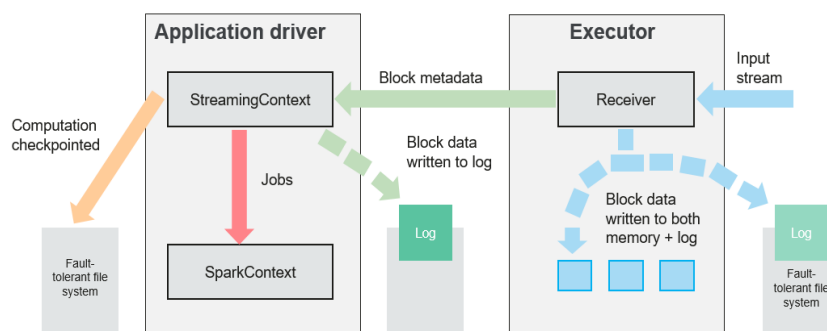

After the failure, Spark Streaming can read data from Kafka again and process the data segment. The processing result is the same no matter Spark Streaming fails or not, because the semantic is processed only once.

Direct API does not need to use the WAL and Receivers, and ensures that each Kafka record is received only once, which is more efficient. In this way, the Spark Streaming and Kafka can be well integrated, making streaming channels be featured with high fault-tolerance, high efficiency, and ease-of-use. Therefore, you are advised to use Direct Streaming to process data.

**Receiver computing process**

When a Spark Streaming application starts (that is, when the driver starts), the related StreamingContext (the basis of all streaming functions) uses SparkContext to start the receiver to become a long-term running task. These receivers receive and save streaming data to the Spark memory for processing. [Figure 1-107](#) shows the data transfer lifecycle.

**Figure 1-107** Data transfer lifecycle

1. Receive data (blue arrow).  
Receiver divides a data stream into a series of blocks and stores them in the executor memory. In addition, after WAL is enabled, it writes data to the WAL of the fault-tolerant file system.
2. Notify the driver (green arrow).  
The metadata in the received block is sent to StreamingContext in the driver. The metadata includes:
  - Block reference ID used to locate the data position in the Executor memory.
  - Block data offset information in logs (if the WAL function is enabled).
3. Process data (red arrow).  
For each batch of data, StreamingContext uses block information to generate resilient distributed datasets (RDDs) and jobs. StreamingContext executes jobs by running tasks to process blocks in the executor memory.
4. Periodically set checkpoints (orange arrows).
5. For fault tolerance, StreamingContext periodically sets checkpoints and saves them to external file systems.

### Fault Tolerance

Spark and its RDD allow seamless processing of failures of any Worker node in the cluster. Spark Streaming is built on top of Spark. Therefore, the Worker node of Spark Streaming also has the same fault tolerance capability. However, Spark Streaming needs to run properly in case of long-time running. Therefore, Spark must be able to recover from faults through the driver process (main process that coordinates all Workers). This poses challenges to the Spark driver fault-tolerance because the Spark driver may be any user application implemented in any computation mode. However, Spark Streaming has internal computation architecture. That is, it periodically executes the same Spark computation in each batch data. Such architecture allows it to periodically store checkpoints to reliable storage space and recover them upon the restart of Driver.

For source data such as files, the Driver recovery mechanism can ensure zero data loss because all data is stored in a fault-tolerant file system such as HDFS. However, for other data sources such as Kafka and Flume, some received data is cached only in memory and may be lost before being processed. This is caused by the distribution operation mode of Spark applications. When the driver process fails, all executors running in the Cluster Manager, together with all data in the memory, are terminated. To avoid such data loss, the WAL function is added to Spark Streaming.

WAL is often used in databases and file systems to ensure persistence of any data operation. That is, first record an operation to a persistent log and perform this operation on data. If the operation fails, the system is recovered by reading the log and re-applying the preset operation. The following describes how to use WAL to ensure persistence of received data:

Receiver is used to receive data from data sources such as Kafka. As a long-time running task in Executor, Receiver receives data, and also confirms received data if supported by data sources. Received data is stored in the Executor memory, and Driver delivers a task to Executor for processing.

After WAL is enabled, all received data is stored to log files in the fault-tolerant file system. Therefore, the received data does not lose even if Spark Streaming

fails. Besides, receiver checks correctness of received data only after the data is pre-written into logs. Data that is cached but not stored can be sent again by data sources after the driver restarts. These two mechanisms ensure zero data loss. That is, all data is recovered from logs or re-sent by data sources.

To enable the WAL function, perform the following operations:

- Set **streamingContext.checkpoint** (path-to-directory) to configure the checkpoint directory, which is an HDFS file path used to store streaming checkpoints and WALs.
- Set **spark.streaming.receiver.writeAheadLog.enable** of SparkConf to **true** (the default value is **false**).

After WAL is enabled, all receivers have the advantage of recovering from reliable received data. You are advised to disable the multi-replica mechanism because the fault-tolerant file system of WAL may also replicate the data.

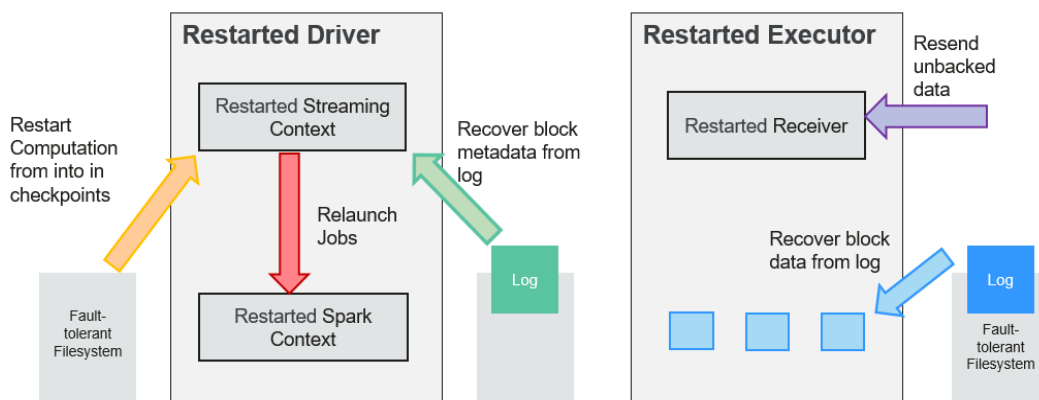

**NOTE**

The data receiving throughput is lowered after WAL is enabled. All data is written into the fault-tolerant file system. As a result, the write throughput of the file system and the network bandwidth for data replication may become the potential bottleneck. To solve this problem, you are advised to create more receivers to increase the degree of data receiving parallelism or use better hardware to improve the throughput of the fault-tolerant file system.

**Recovery Process**

When a failed driver is restarted, restart it as follows:

**Figure 1-108** Computing recovery process

1. Recover computing. (Orange arrow)  
Use checkpoint information to restart Driver, reconstruct SparkContext and restart Receiver.
2. Recover metadata block. (Green arrow)  
This operation ensures that all necessary metadata blocks are recovered to continue the subsequent computing recovery.
3. Relaunch unfinished jobs. (Red arrow)  
Recovered metadata is used to generate RDDs and corresponding jobs for interrupted batch processing due to failures.

4. Read block data saved in logs. (Blue arrow)  
Block data is directly read from WALs during execution of the preceding jobs, and therefore all essential data reliably stored in logs is recovered.
5. Resend unconfirmed data. (Purple arrow)  
Data that is cached but not stored to logs upon failures is re-sent by data sources, because the receiver does not confirm the data.

Therefore, by using WALs and reliable Receiver, Spark Streaming can avoid input data loss caused by Driver failures.

## SparkSQL and DataSet Principle

### SparkSQL

Figure 1-109 SparkSQL and DataSet

Spark SQL is a module for processing structured data. In Spark application, SQL statements or DataSet APIs can be seamlessly used for querying structured data.

Spark SQL and DataSet also provide a universal method for accessing multiple data sources such as Hive, CSV, Parquet, ORC, JSON, and JDBC. These data sources also allow data interaction. Spark SQL reuses the Hive frontend processing logic and metadata processing module. With the Spark SQL, you can directly query existing Hive data.

In addition, Spark SQL also provides API, CLI, and JDBC APIs, allowing diverse accesses to the client.

## Spark SQL Native DDL/DML

In Spark 1.5, lots of Data Definition Language (DDL)/Data Manipulation Language (DML) commands are pushed down to and run on the Hive, causing coupling with the Hive and inflexibility such as unexpected error reports and results.

Spark2x realizes command localization and replaces the Hive with Spark SQL Native DDL/DML to run DDL/DML commands. Additionally, the decoupling from the Hive is realized and commands can be customized.

## DataSet

A DataSet is a strongly typed collection of domain-specific objects that can be transformed in parallel using functional or relational operations. Each Dataset also has an untyped view called a DataFrame, which is a Dataset of Row.

The DataFrame is a structured and distributed dataset consisting of multiple columns. The DataFrame is equal to a table in the relationship database or the DataFrame in the R/Python. The DataFrame is the most basic concept in the Spark SQL, which can be created by using multiple methods, such as the structured dataset, Hive table, external database or RDD.

Operations available on DataSets are divided into transformations and actions.

- A transformation operation can generate a new DataSet, for example, **map**, **filter**, **select**, and **aggregate (groupBy)**.
- An action operation can trigger computation and return results, for example, **count**, **show**, or write data to the file system.

You can use either of the following methods to create a DataSet:

- The most common way is by pointing Spark to some files on storage systems, using the **read** function available on a SparkSession.  

```
val people = spark.read.parquet("...").as[Person] // Scala
DataSet<Person> people = spark.read().parquet("...").as(Encoders.bean(Person.class)); // Java
```
- You can also create a DataSet using the transformation operation available on an existing one. For example, apply the map operation on an existing DataSet to create a DataSet:  

```
val names = people.map(_.name) // In Scala: names is Dataset.
Dataset<String> names = people.map((Person p) -> p.name, Encoders.STRING); // Java
```

## CLI and JDBCServer

In addition to programming APIs, Spark SQL also provides the CLI/JDBC APIs.

- Both **spark-shell** and **spark-sql** scripts can provide the CLI for debugging.
- JDBCServer provides JDBC APIs. External systems can directly send JDBC requests to calculate and parse structured data.

## SparkSession Principle

SparkSession is a unified API in Spark2x and can be regarded as a unified entry for reading data. SparkSession provides a single entry point to perform many operations that were previously scattered across multiple classes, and also provides accessor methods to these older classes to maximize compatibility.

A SparkSession can be created using a builder pattern. The builder will automatically reuse the existing SparkSession if there is a SparkSession; or create

a `SparkSession` if it does not exist. During I/O transactions, the configuration item settings in the builder are automatically synchronized to Spark and Hadoop.

```
import org.apache.spark.sql.SparkSession
val sparkSession = SparkSession.builder
  .master("local")
  .appName("my-spark-app")
  .config("spark.some.config.option", "config-value")
  .getOrCreate()
```

- `SparkSession` can be used to execute SQL queries on data and return results as `DataFrame`.  

```
sparkSession.sql("select * from person").show
```
- `SparkSession` can be used to set configuration items during running. These configuration items can be replaced with variables in SQL statements.  

```
sparkSession.conf.set("spark.some.config", "abcd")
sparkSession.conf.get("spark.some.config")
sparkSession.sql("select ${spark.some.config}")
```
- `SparkSession` also includes a "catalog" method that contains methods to work with Metastore (data catalog). After this method is used, a dataset is returned, which can be run using the same Dataset API.  

```
val tables = sparkSession.catalog.listTables()
val columns = sparkSession.catalog.listColumns("myTable")
```
- Underlying `SparkContext` can be accessed by `SparkContext` API of `SparkSession`.  

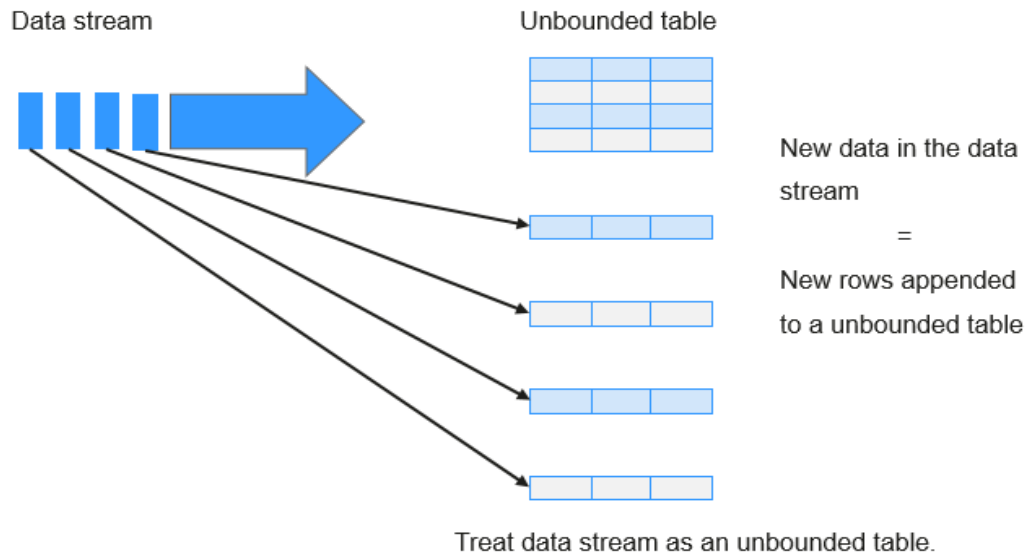

```
val sparkContext = sparkSession.sparkContext
```

## Structured Streaming Principle

Structured Streaming is a stream processing engine built on the Spark SQL engine. You can use the Dataset/DataFrame API in Scala, Java, Python, or R to express streaming aggregations, event-time windows, and stream-stream joins. If streaming data is incrementally and continuously produced, Spark SQL will continue to process the data and synchronize the result to the result set. In addition, the system ensures end-to-end exactly-once fault-tolerance guarantees through checkpoints and WALs.

The core of Structured Streaming is to take streaming data as an incremental database table. Similar to the data block processing model, the streaming data processing model applies query operations on a static database table to streaming computing, and Spark uses standard SQL statements for query, to obtain data from the incremental and unbounded table.

**Figure 1-110** Unbounded table of Structured Streaming

Each query operation will generate a result table. At each trigger interval, updated data will be synchronized to the result table. Whenever the result table is updated, the updated result will be written into an external storage system.

**Figure 1-111** Structured Streaming data processing model

### Programming Model for Structured Streaming

Storage modes of Structured Streaming at the output phase are as follows:

- **Complete Mode:** The updated result sets are written into the external storage system. The write operation is performed by a connector of the external storage system.

- Append Mode: If an interval is triggered, only added data in the result table will be written into an external system. This is applicable only on the queries where existing rows in the result table are not expected to change.
- Update Mode: If an interval is triggered, only updated data in the result table will be written into an external system, which is the difference between the Complete Mode and Update Mode.

## Concepts

- **RDD**

Resilient Distributed Dataset (RDD) is a core concept of Spark. It indicates a read-only and partitioned distributed dataset. Partial or all data of this dataset can be cached in the memory and reused between computations.

### RDD Creation

- An RDD can be created from the input of HDFS or other storage systems that are compatible with Hadoop.
- A new RDD can be converted from a parent RDD.
- An RDD can be converted from a collection of datasets through encoding.

### RDD Storage

- You can select different storage levels to store an RDD for reuse. (There are 11 storage levels to store an RDD.)
- By default, the RDD is stored in the memory. When the memory is insufficient, the RDD overflows to the disk.

- **RDD Dependency**

The RDD dependency includes the narrow dependency and wide dependency.

Figure 1-112 RDD dependency

- **Narrow dependency:** Each partition of the parent RDD is used by at most one partition of the child RDD.
- **Wide dependency:** Partitions of the child RDD depend on all partitions of the parent RDD.

The narrow dependency facilitates the optimization. Logically, each RDD operator is a fork/join (the join is not the join operator mentioned above but the barrier used to synchronize multiple concurrent tasks); fork the RDD to each partition, and then perform the computation. After the computation, join the results, and then perform the fork/join operation on the next RDD operator. It is uneconomical to directly translate the RDD into physical implementation. The first is that every RDD (even intermediate result) needs to be physicalized into memory or storage, which is time-consuming and occupies much space. The second is that as a global barrier, the join operation is very expensive and the entire join process will be slowed down by the slowest node. If the partitions of the child RDD narrowly depend on that of the parent RDD, the two fork/join processes can be combined to implement classic fusion optimization. If the relationship in the continuous operator sequence is narrow dependency, multiple fork/join processes can be combined to reduce a large number of global barriers and eliminate the physicalization of many RDD intermediate results, which greatly improves the performance. This is called pipeline optimization in Spark.

- **Transformation and Action (RDD Operations)**

Operations on RDD include transformation (the return value is an RDD) and action (the return value is not an RDD). [Figure 1-113](#) shows the RDD operation process. The transformation is lazy, which indicates that the transformation from one RDD to another RDD is not immediately executed. Spark only records the transformation but does not execute it immediately. The real computation is started only when the action is started. The action returns results or writes the RDD data into the storage system. The action is the driving force for Spark to start the computation.

**Figure 1-113** RDD operation

The data and operation model of RDD are quite different from those of Scala.

```
val file = sc.textFile("hdfs://...")
val errors = file.filter(_.contains("ERROR"))
errors.cache()
errors.count()
```

- a. The `textFile` operator reads log files from the HDFS and returns files (as an RDD).
- b. The `filter` operator filters rows with **ERROR** and assigns them to errors (a new RDD). The `filter` operator is a transformation.
- c. The `cache` operator caches errors for future use.
- d. The `count` operator returns the number of rows of errors. The `count` operator is an action.

#### Transformation includes the following types:

- The RDD elements are regarded as simple elements.

The input and output has the one-to-one relationship, and the partition structure of the result RDD remains unchanged, for example, `map`.

The input and output has the one-to-many relationship, and the partition structure of the result RDD remains unchanged, for example, `flatMap` (one element becomes a sequence containing multiple elements after `map` and then flattens to multiple elements).

The input and output has the one-to-one relationship, but the partition structure of the result RDD changes, for example, `union` (two RDDs integrates to one RDD, and the number of partitions becomes the sum of the number of partitions of two RDDs) and `coalesce` (partitions are reduced).

Operators of some elements are selected from the input, such as `filter`, `distinct` (duplicate elements are deleted), `subtract` (elements only exist in this RDD are retained), and `sample` (samples are taken).

- The RDD elements are regarded as key-value pairs.

Perform the one-to-one calculation on the single RDD, such as `mapValues` (the partition mode of the source RDD is retained, which is different from `map`).

Sort the single RDD, such as `sort` and `partitionBy` (partitioning with consistency, which is important to the local optimization).

Restructure and reduce the single RDD based on key, such as `groupByKey` and `reduceByKey`.

Join and restructure two RDDs based on the key, such as `join` and `cogroup`.

#### NOTE

The later three operations involving sorting are called shuffle operations.

#### Action includes the following types:

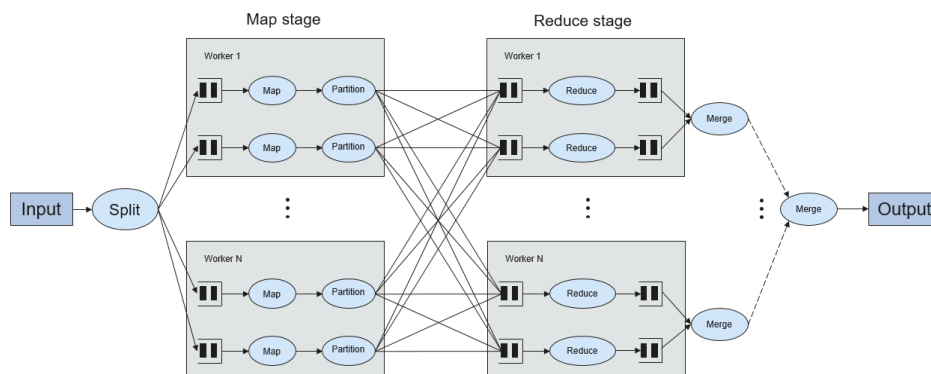

- Generate scalar configuration items, such as **count** (the number of elements in the returned RDD), **reduce**, **fold/aggregate** (the number of scalar configuration items that are returned), and **take** (the number of elements before the return).

- Generate the Scala collection, such as **collect** (import all elements in the RDD to the Scala collection) and **lookup** (look up all values corresponds to the key).
  - Write data to the storage, such as **saveAsTextFile** (which corresponds to the preceding **textFile**).
  - Check points, such as the **checkpoint** operator. When Lineage is quite long (which occurs frequently in graphics computation), it takes a long period of time to execute the whole sequence again when a fault occurs. In this case, checkpoint is used as the check point to write the current data to stable storage.
- **Shuffle**

Shuffle is a specific phase in the MapReduce framework, which is located between the Map phase and the Reduce phase. If the output results of Map are to be used by Reduce, the output results must be hashed based on a key and distributed to each Reducer. This process is called Shuffle. Shuffle involves the read and write of the disk and the transmission of the network, so that the performance of Shuffle directly affects the operation efficiency of the entire program.

The figure below shows the entire process of the MapReduce algorithm.

**Figure 1-114** Algorithm process

Shuffle is a bridge to connect data. The following describes the implementation of shuffle in Spark.

Shuffle divides a job of Spark into multiple stages. The former stages contain one or more ShuffleMapTasks, and the last stage contains one or more ResultTasks.

- **Spark Application Structure**

The Spark application structure includes the initialized SparkContext and the main program.

- Initialized SparkContext: constructs the operating environment of the Spark Application.

Constructs the SparkContext object. The following is an example:

```
new SparkContext(master, appName, [SparkHome], [jars])
```

Parameter description:

**master:** indicates the link string. The link modes include local, Yarn-cluster, and Yarn-client.

**appName:** indicates the application name.

**SparkHome:** indicates the directory where Spark is installed in the cluster.

**jars:** indicates the code and dependency package of an application.

- Main program: processes data.

For details about how to submit an application, visit <https://archive.apache.org/dist/spark/docs/3.1.1/submitting-applications.html>.

- **Spark Shell Commands**

The basic Spark shell commands support the submission of Spark applications. The Spark shell commands are as follows:

```
./bin/spark-submit \  
--class <main-class> \  
--master <master-url> \  
... # other options  
<application-jar> \  
[application-arguments]
```

Parameter description:

**--class:** indicates the name of the class of a Spark application.

**--master:** indicates the master to which the Spark application links, such as Yarn-client and Yarn-cluster.

**application-jar:** indicates the path of the JAR file of the Spark application.

**application-arguments:** indicates the parameter required to submit the Spark application. This parameter can be left blank.

- **Spark JobHistory Server**

The Spark web UI is used to monitor the details in each phase of the Spark framework of a running or historical Spark job and provide the log display, which helps users to develop, configure, and optimize the job in more fine-grained units.

## 1.3.23.2 Spark2x HA Solution

### 1.3.23.2.1 Spark2x Multi-active Instance

#### Background

Based on existing JDBCServer in the community, multi-active-instance HA is used to achieve the high availability. In this mode, multiple JDBCServer coexist in the cluster and the client can randomly connect any JDBCServer to perform service operations. When one or multiple JDBCServer stop working, a client can connect to another normal JDBCServer.

Compared with active/standby HA, multi-active instance HA eliminates the following restrictions:

- In active/standby HA, when the active/standby switchover occurs, the unavailable period cannot be controlled by JDBCServer, but determined by Yarn service resources.
- In Spark, the Thrift JDBC similar to HiveServer2 provides services and users access services through Beeline and JDBC API. Therefore, the processing

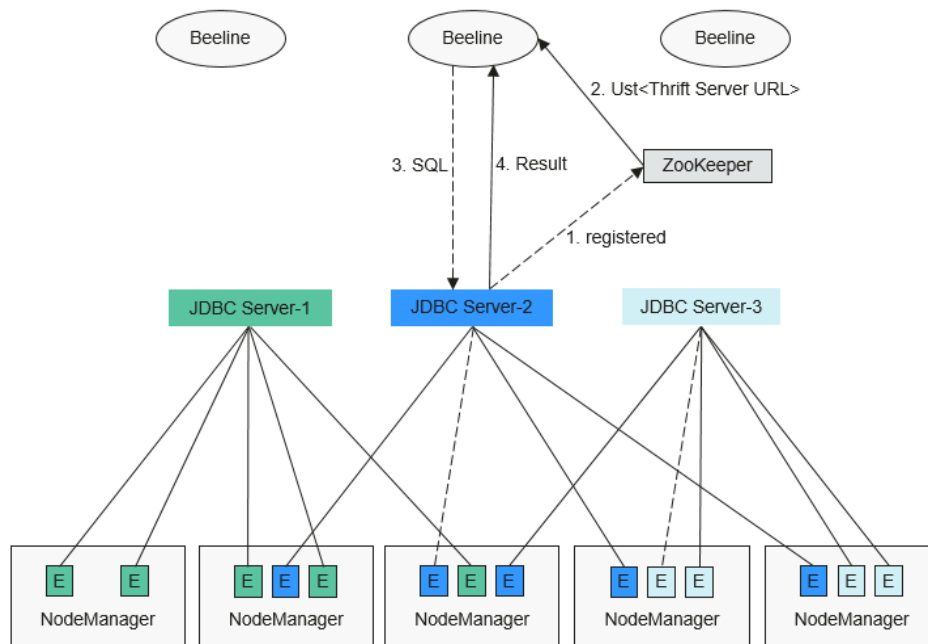

capability of the JDBCServer cluster depends on the single-point capability of the primary server, and the scalability is insufficient.

Multi-active instance HA not only prevents service interruption caused by switchover, but also enables cluster scale-out to secure high concurrency.

## Implementation

The following figure shows the basic principle of multi-active instance HA of Spark JDBCServer.

**Figure 1-115** Spark JDBCServer HA

1. After JDBCServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the JDBCServer instance IP, port number, version, and serial number (information of different nodes is separated by commas).

An example is provided as follows:

```
[serverUri=192.168.169.84:22550
;version=8.0.2.1;sequence=0000001244,serverUri=192.168.195.232:22550 ;version=8.0.2.1;sequence=000
0001242,serverUri=192.168.81.37:22550 ;version=8.0.2.1;sequence=0000001243]
```

2. To connect to JDBCServer, the client must specify the namespace, which is the directory of JDBCServer instances in ZooKeeper. During the connection, a JDBCServer instance is randomly selected from the specified namespace. For details about URL, see [URL Connection](#).
3. After the connection succeeds, the client sends SQL statements to JDBCServer.
4. JDBCServer executes received SQL statements and sends results back to the client.

In multi-active instance HA mode, all JDBCServer instances are independent and equivalent. When one instance is interrupted during upgrade, other JDBCServer instances can accept the connection request from the client.

Following rules must be followed in the multi-active instance HA of Spark JDBCServer:

- If a JDBCServer instance exits abnormally, no other instance will take over the sessions and services running on this abnormal instance.
- When the JDBCServer process is stopped, corresponding nodes are deleted from ZooKeeper.
- The client randomly selects the server, which may result in uneven session allocation, and finally result in imbalance of instance load.
- After the instance enters the maintenance mode (in which no new connection request from the client is accepted), services still running on the instance may fail when the decommissioning times out.

## URL Connection

### Multi-active instance mode

In multi-active instance mode, the client reads content from the ZooKeeper node and connects to JDBCServer. The connection strings are as follows:

- Security mode:
  - If Kinit authentication is enabled, the JDBCURL is as follows:
 

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>;s
erviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain name>@<System domain
name>;
```

#### NOTE

- **<zkNode\_IP>:<zkNode\_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs,  
For example,  
**192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181.**
- **sparkthriftserver2x** indicates the directory in ZooKeeper, where a random JDBCServer instance is connected to the client.

For example, when you use Beeline client for connection in security mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3
_IP>:<zkNode3_Port>;serviceDiscoveryMode=zooKeeper;zooKeeperNa
amespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain
name>@<System domain name>;"
```

- If Keytab authentication is enabled, the JDBCURL is as follows:
 

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>;s
erviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain name>@<System domain
name>;user.principal=<principal_name>;user.keytab=<path_to_keytab>

<principal_name> indicates the principal of Kerberos user, for example,
test@<System domain name>. <path_to_keytab> indicates the Keytab file
path corresponding to <principal_name>, for example, /opt/auth/test/
user.keytab.
```
- Common mode:

```
jdbc:hive2://  
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>;service  
DiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;
```

For example, when you use Beeline client for connection in common mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://  
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:  
<zkNode3_Port>;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=  
sparkthriftserver2x;"
```

### Non-multi-active instance mode

In non-multi-active instance mode, a client connects to a specified JDBCServer node. Compared with multi-active instance mode, the connection string in non-multi-active instance mode does not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

For example, when you use Beeline client to connect JDBCServer in non-multi-active instance mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://  
<server_IP>:<server_Port>;user.principal=spark2x/hadoop.<System domain  
name>@<System domain name>;sasLQop=auth-  
conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain  
name>@<System domain name>;"
```

#### NOTE

- **<server\_IP>:<server\_Port>** indicates the URL of the specified JDBCServer node.
- **CLIENT\_HOME** indicates the client path.

Except the connection method, operations of JDBCServer API in multi-active instance mode and non-multi-active instance mode are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive. For details about other operations, see official website of Hive at <https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients>.

## 1.3.23.2.2 Spark2x Multi-tenant

### Background

In the JDBCServer multi-active instance mode, JDBCServer implements the Yarn-client mode but only one Yarn resource queue is available. To solve the resource limitation problem, the multi-tenant mode is introduced.

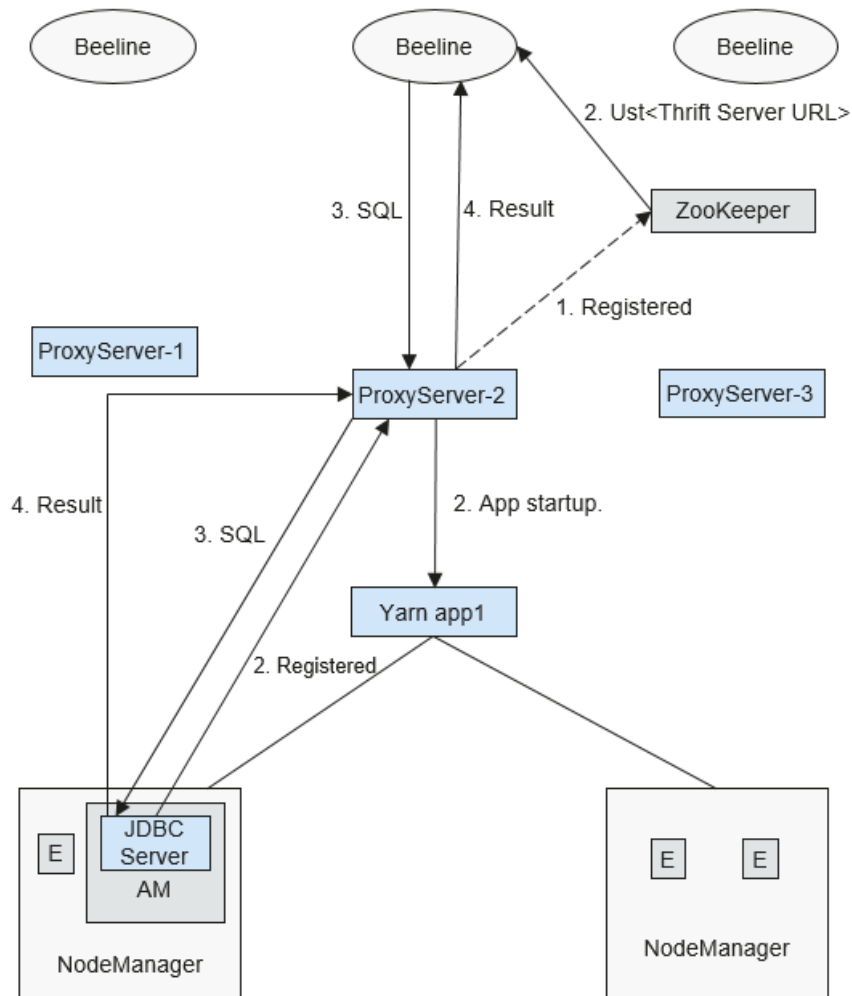

In multi-tenant mode, JDBCServer are bound with tenants. Each tenant corresponds to one or more JDBCServer, and a JDBCServer provides services for only one tenant. Different tenants can be configured with different Yarn queues to implement resource isolation. In addition, JDBCServer can be dynamically started as required to avoid resource waste.

### Implementation

**Figure 1-116** shows the HA solution of the multi-tenant mode.

**Figure 1-116** Multi-tenant mode of Spark JDBCServer

1. When ProxyServer is started, it registers with ZooKeeper by writing node information in a specified directory. Node information includes the instance IP, port number, version, and serial number (information of different nodes is separated by commas).

**NOTE**

In multi-tenant mode, the JDBCServer instance on MRS page indicates ProxyServer, the JDBCServer agent.

An example is provided as follows:

```
serverUri=192.168.169.84:22550
;version=8.0.2.1;sequence=0000001244,serverUri=192.168.195.232:22550
;version=8.0.2.1;sequence=0000001242,serverUri=192.168.81.37:22550
;version=8.0.2.1;sequence=0000001243,
```

2. To connect to ProxyServer, the client must specify a namespace, which is the directory of the ProxyServer instance that you want to access in ZooKeeper. When the client connects to ProxyServer, an instance under Namespace is randomly selected for connection. For details about the URL, see [URL Connection](#).
3. After the client successfully connects to ProxyServer, ProxyServer checks whether the JDBCServer of a tenant exists. If yes, Beeline connects the

JDBCServer. If no, a new JDBCServer is started in Yarn-cluster mode. After the startup of JDBCServer, ProxyServer obtains the IP address of the JDBCServer and establishes the connection between Beeline and JDBCServer.

4. The client sends SQL statements to ProxyServer, which then forwards statements to the connected JDBCServer. JDBCServer returns the results to ProxyServer, which then returns the results to the client.

In multi-tenant HA mode, all ProxyServer instances are independent and equivalent. If one instance is interrupted during upgrade, other instances can accept the connection request from the client.

## URL Connection

### Multi-tenant mode

In multi-tenant mode, the client reads content from the ZooKeeper node and connects to ProxyServer. The connection strings are as follows:

- Security mode:

- If Kinit authentication is enabled, the client URL is as follows:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>|;s
erviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain name>@<System domain
name>;
```

#### NOTE

- **<zkNode\_IP>:<zkNode\_Port>** indicates the ZooKeeper URL. Use commas (,) to separate multiple URLs.  
For example,  
**192.168.81.37:2181,192.168.195.232:2181,192.168.169.84:2181.**
- **sparkthriftserver2x** indicates the ZooKeeper directory, where a random JDBCServer instance is connected to the client.

For example, when you use Beeline client for connection in security mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3
_IP>:<zkNode3_Port>|;serviceDiscoveryMode=zooKeeper;zooKeeperNa
amespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain
name>@<System domain name>;"
```

- If Keytab authentication is enabled, the URL is as follows:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>|;s
erviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;saslQop=auth-
conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain name>@<System domain
name>;user.principal=<principal_name>;user.keytab=<path_to_keytab>
```

**<principal\_name>** indicates the principal of Kerberos user, for example, **test@<System domain name>**. **<path\_to\_keytab>** indicates the Keytab file path corresponding to **<principal\_name>**, for example, **/opt/auth/test/user.keytab**.

- Common mode:

```
jdbc:hive2://
<zkNode1_IP>:<zkNode1_Port>,<zkNode2_IP>:<zkNode2_Port>,<zkNode3_IP>:<zkNode3_Port>|;service
DiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;
```

For example, when you use Beeline client for connection in common mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://  
<zookeeper1_IP>:<zookeeper1_Port>,<zookeeper2_IP>:<zookeeper2_Port>,<zookeeper3_IP>:<zookeeper3_Port>|;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;"
```

### Non-multi-tenant mode

In non-multi-tenant mode, a client connects to a specified JDBCServer node. Compared with multi-active instance mode, the connection string in non-multi-active instance mode does not contain **serviceDiscoveryMode** and **zooKeeperNamespace** parameters about ZooKeeper.

For example, when you use Beeline client to connect JDBCServer in non-multi-tenant instance mode, run the following command:

```
sh CLIENT_HOME/spark/bin/beeline -u "jdbc:hive2://  
<server_IP>:<server_Port>|;user.principal=spark/hadoop.<System domain name>@<System domain name>;sasLQop=auth-conf;auth=KERBEROS;principal=spark/hadoop.<System domain name>@<System domain name>;"
```

#### NOTE

- **<server\_IP>:<server\_Port>** indicates the URL of the specified JDBCServer node.
- **CLIENT\_HOME** indicates the client path.

Except the connection method, other operations of JDBCServer API in multi-tenant mode and non-multi-tenant mode are the same. Spark JDBCServer is another implementation of HiveServer2 in Hive. For details about other operations, see official website of Hive at <https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients>.

### Specifying a Tenant

Generally, the client submitted by a user connects to the default JDBCServer of the tenant to which the user belongs. If you want to connect the client to the JDBCServer of a specified tenant, add the **--hiveconf mapreduce.job.queueName** parameter.

Command for connecting Beeline is as follows (**aaa** indicates the tenant name):

```
beeline --hiveconf mapreduce.job.queueName=aaa -u  
'jdbc:hive2://192.168.39.30:2181,192.168.40.210:2181,192.168.215.97:2181;serviceDiscoveryMode=zooKeeper;zooKeeperNamespace=sparkthriftserver2x;sasLQop=auth-conf;auth=KERBEROS;principal=spark2x/hadoop.<System domain name>@<System domain name>'
```

## 1.3.23.3 Relationship Between Spark2x and Other Components

### Relationship Between Spark and HDFS

Data computed by Spark comes from multiple data sources, such as local files and HDFS. Most data comes from HDFS which can read data in large scale for parallel computing. After being computed, data can be stored in HDFS.

Spark involves Driver and Executor. Driver schedules tasks and Executor runs tasks. [Figure 1-117](#) describes the file reading process.

**Figure 1-117** File reading process

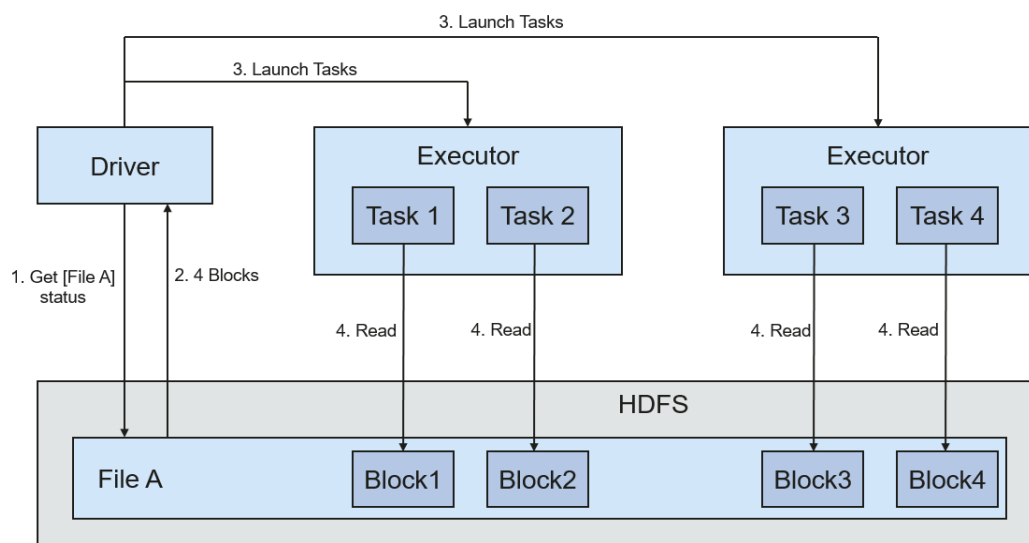

The file reading process is as follows:

1. Driver interconnects with HDFS to obtain the information of File A.
2. The HDFS returns the detailed block information about this file.
3. Driver sets a parallel degree based on the block data amount, and creates multiple tasks to read the blocks of this file.
4. Executor runs the tasks and reads the detailed blocks as part of the Resilient Distributed Dataset (RDD).

[Figure 1-118](#) describes the file writing process.

**Figure 1-118** File writing process

The file writing process is as follows:

1. Driver creates a directory where the file is to be written.
2. Based on the RDD distribution status, the number of tasks related to data writing is computed, and these tasks are sent to Executor.
3. Executor runs these tasks, and writes the RDD data to the directory created in 1.

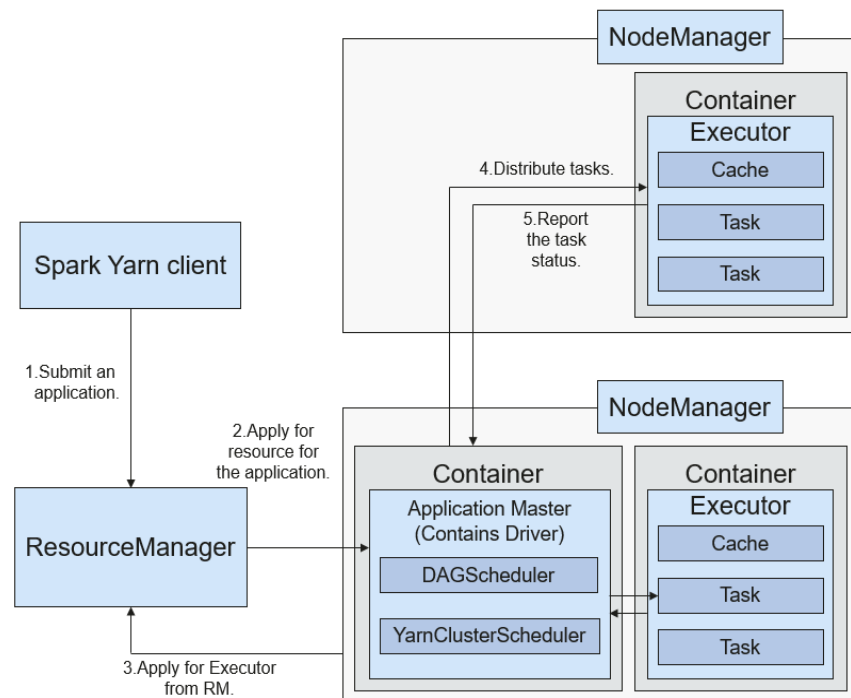

## Relationship with Yarn

The Spark computing and scheduling can be implemented using Yarn mode. Spark enjoys the computing resources provided by Yarn clusters and runs tasks in a distributed way. Spark on Yarn has two modes: Yarn-cluster and Yarn-client.

- Yarn-cluster mode

**Figure 1-119** describes the operation framework.

**Figure 1-119** Spark on Yarn-cluster operation framework

Spark on Yarn-cluster implementation process:

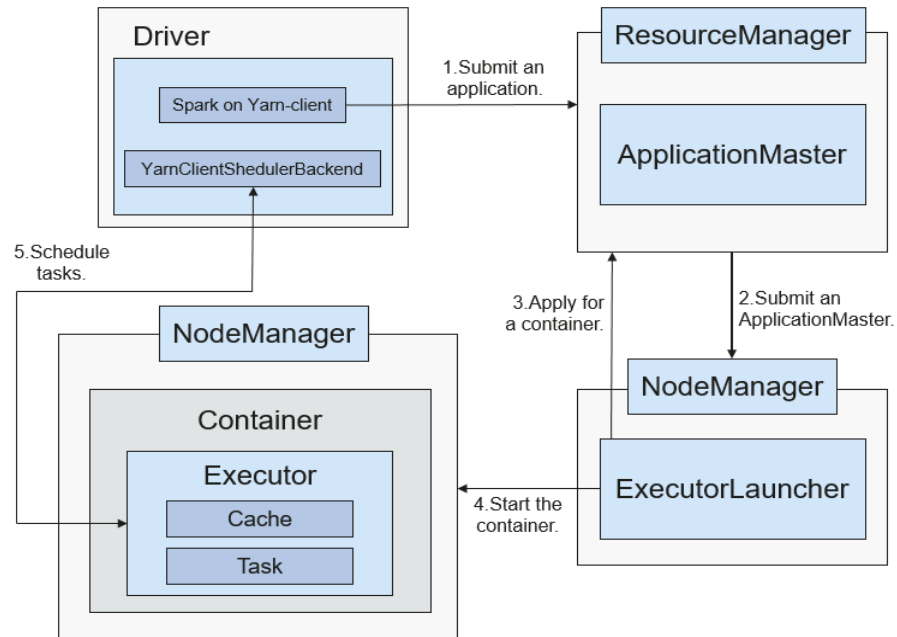

- a. The client generates the application information, and then sends the information to ResourceManager.
- b. ResourceManager allocates the first container (ApplicationMaster) to SparkApplication and starts the driver on the container.
- c. ApplicationMaster applies for resources from ResourceManager to run the container.

ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.

- d. Drivers allocate tasks to the executors.
- e. Executors run tasks and report the operating status to Drivers.
- Yarn-client mode

**Figure 1-120** describes the operation framework.

**Figure 1-120** Spark on Yarn-client operation framework

Spark on Yarn-client implementation process:

**NOTE**

In Yarn-client mode, the Driver is deployed and started on the client. In Yarn-client mode, the client of an earlier version is incompatible. The Yarn-cluster mode is recommended.

- a. The client sends the Spark application request to ResourceManager, and packages all information required to start ApplicationMaster and sends the information to ResourceManager. ResourceManager then returns the results to the client. The results include information such as ApplicationId, and the upper limit as well as lower limit of available resources. After receiving the request, ResourceManager finds a proper node for ApplicationMaster and starts it on this node. ApplicationMaster is a role in Yarn, and the process name in Spark is ExecutorLauncher.
- b. Based on the resource requirements of each task, ApplicationMaster can apply for a series of containers to run tasks from ResourceManager.
- c. After receiving the newly allocated container list (from ResourceManager), ApplicationMaster sends information to the related NodeManagers to start the containers.

ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.

 NOTE

Running Containers will not be suspended to release resources.

- d. Drivers allocate tasks to the executors. Executors run tasks and report the operating status to Drivers.

### 1.3.23.4 Spark2x Open Source New Features

#### Purpose

Compared with Spark 1.5, Spark2x has some new open-source features. The specific features or concepts are as follows:

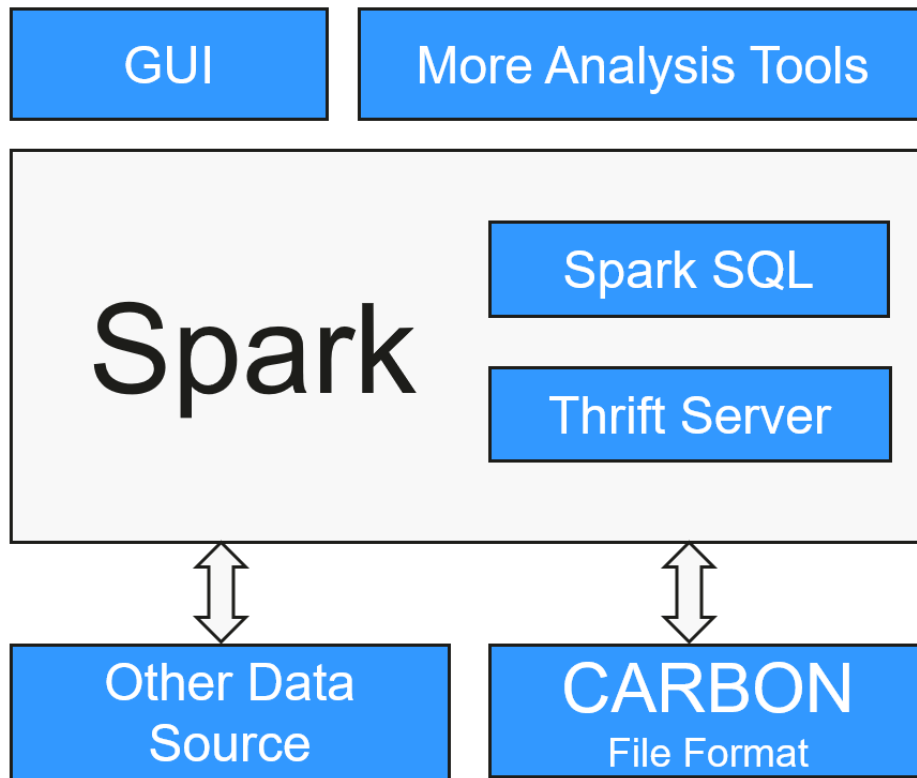

- DataSet: For details, see [SparkSQL and DataSet Principle](#).
- Spark SQL Native DDL/DML: For details, see [SparkSQL and DataSet Principle](#).
- SparkSession: For details, see [SparkSession Principle](#).
- Structured Streaming: For details, see [Structured Streaming Principle](#).
- Optimizing Small Files
- Optimizing the Aggregate Algorithm
- Optimizing Datasource Tables
- Merging CBO

### 1.3.23.5 Spark2x Enhanced Open Source Features

#### 1.3.23.5.1 CarbonData Overview

CarbonData is a new Apache Hadoop native data-store format. CarbonData allows faster interactive queries over PetaBytes of data using advanced columnar storage, index, compression, and encoding techniques to improve computing efficiency. In addition, CarbonData is also a high-performance analysis engine that integrates data sources with Spark.

**Figure 1-121** Basic architecture of CarbonData

The purpose of using CarbonData is to provide quick response to ad hoc queries of big data. Essentially, CarbonData is an Online Analytical Processing (OLAP) engine, which stores data by using tables similar to those in Relational Database Management System (RDBMS). You can import more than 10 TB data to tables created in CarbonData format, and CarbonData automatically organizes and stores data using the compressed multi-dimensional indexes. After data is loaded to CarbonData, CarbonData responds to ad hoc queries in seconds.

CarbonData integrates data sources into the Spark ecosystem and you can query and analyze the data using Spark SQL. You can also use the third-party tool JDBCServer provided by Spark to connect to SparkSQL.

### Topology of CarbonData

CarbonData runs as a data source inside Spark. Therefore, CarbonData does not start any additional processes on nodes in clusters. CarbonData engine runs inside the Spark executor.

**Figure 1-122** Topology of CarbonData

Data stored in CarbonData Table is divided into several CarbonData data files. Each time when data is queried, CarbonData Engine reads and filters data sets. CarbonData Engine runs as a part of the Spark Executor process and is responsible for handling a subset of data file blocks.

Table data is stored in HDFS. Nodes in the same Spark cluster can be used as HDFS data nodes.

## CarbonData Features

- SQL: CarbonData is compatible with Spark SQL and supports SQL query operations performed on Spark SQL.
- Simple Table dataset definition: CarbonData allows you to define and create datasets by using user-friendly Data Definition Language (DDL) statements. CarbonData DDL is flexible and easy to use, and can define complex tables.
- Easy data management: CarbonData provides various data management functions for data loading and maintenance. CarbonData supports bulk loading of historical data and incremental loading of new data. Loaded data can be deleted based on load time and a specific loading operation can be undone.
- CarbonData file format is a columnar store in HDFS. This format has many new column-based file storage features, such as table splitting and data compression. CarbonData has the following characteristics:
  - Stores data along with index: Significantly accelerates query performance and reduces the I/O scans and CPU resources, when there are filters in the query. CarbonData index consists of multiple levels of indices. A processing framework can leverage this index to reduce the task that needs to be scheduled and processed, and it can also perform skip scan in more finer grain unit (called blocklet) in task side scanning instead of scanning the whole file.
  - Operable encoded data: Through supporting efficient compression and global encoding schemes, CarbonData can query on compressed/encoded

data. The data can be converted just before returning the results to the users, which is called late materialized.

- Supports various use cases with one single data format: like interactive OLAP-style query, sequential access (big scan), and random access (narrow scan).

## Key Technologies and Advantages of CarbonData

- Quick query response: CarbonData features high-performance query. The query speed of CarbonData is 10 times of that of Spark SQL. It uses dedicated data formats and applies multiple index technologies, global dictionary code, and multiple push-down optimizations, providing quick response to TB-level data queries.
- Efficient data compression: CarbonData compresses data by combining the lightweight and heavyweight compression algorithms. This significantly saves 60% to 80% data storage space and the hardware storage cost.

## CarbonData Index Cache Server

To solve the pressure and problems brought by the increasing data volume to the driver, an independent index cache server is introduced to separate the index from the Spark application side of Carbon query. All index content is managed by the index cache server. Spark applications obtain required index data in RPC mode. In this way, a large amount of memory on the service side is released so that services are not affected by the cluster scale and the performance or functions are not affected.

### 1.3.23.5.2 Enhanced SQL Query of Multi-sourced Data

#### Scenario

Enterprises usually store mass data, such as various databases and warehouses, for management and information collection. However, diversified data sources, hybrid dataset structures, and scattered data storage lower query efficiency.

The open-sourced Spark only supports pushdown of simple FILTER during querying of multi-sourced data. The SQL engine performance is deteriorated due of a large amount of unnecessary data transmission. The pushdown function is enhanced, so that AGGREGATE, COMPLEX PROJECTION, and COMPLEX PREDICATE can be pushed to the data source, reducing unnecessary data transmission and improving query performance.

Only the JDBC data source supports pushdown of query operations, such AS AGGREGATE, PROJECTION, PREDICATE, AGGREGATE OVER INNER JOIN, and AGGREGATE OVER UNION ALL. All pushdown operation can be enabled based on the requirements of scenarios.

**Table 1-22** Enhanced query of multi-sourced data

Operation	Before Enhancement	After Enhancement
aggregate	The pushdown of AGGREGATE is not supported	<ul style="list-style-type: none"> <li>• Aggregation functions including SUM, AVG, MAX, MIN, and COUNT are supported. For example: <code>select count(*) from table</code></li> <li>• Internal expressions of aggregation functions are supported. For example: <code>select sum(a+b) from table</code></li> <li>• Calculation of aggregation functions is supported. For example: <code>select avg(a) + max(b) from table</code></li> <li>• Pushdown of HAVING is supported For example: <code>select sum(a) from table where a&gt;0 group by b having sum(a)&gt;10</code></li> <li>• Pushdown of functions is supported. Pushdown of lines in mathematics, time, and character string functions, such as <code>abs()</code>, <code>month()</code>, and <code>length()</code> are supported. In addition to the preceding built-in functions, functions supported by data sources can be added by SET command. For example: <code>select sum(abs(a)) from table</code></li> <li>• Pushdown of LIMIT and ORDER BY after AGGREGATE is supported. However, pushdown of LIMIT and ORDER BY is not supported in Oracle, because Oracle does not support LIMIT. For example: <code>select sum(a) from table where a&gt;0 group by b order by sum(a) limit 5</code></li> </ul>

Operation	Before Enhancement	After Enhancement
projection	Only pushdown of simple PROJECTION is supported. For example: select a, b from table	<ul style="list-style-type: none"> <li>● Pushdown of complex expressions is supported For example: select (a+b)*c from table</li> <li>● Pushdown of functions listed in the nodes following the table is supported. For example: select length(a)+abs(b) from table</li> <li>● Pushdown of LIMIT and ORDER BY after PROJECTION is supported. For example: select a, b+c from table order by a limit 3</li> </ul>
predicate	Only simple filter with the column name on the left of the operator and values on the right is supported. For example: select * from table where a>0 or b in ("aaa", "bbb")	<ul style="list-style-type: none"> <li>● Pushdown of complex expressions is supported. For example: select * from table where a+b&gt;c*d or a/c in (1, 2, 3)</li> <li>● Pushdown of functions listed in the nodes following the table is supported. For example: select * from table where length(a)&gt;5</li> </ul>
aggregate over inner join	Related data from the two tables must be loaded to Spark. JOIN must be performed before AGGREGATE.	<p>Following scenarios are supported:</p> <ul style="list-style-type: none"> <li>● Aggregation functions including SUM, AVG, MAX, MIN, and COUNT are supported.</li> <li>● All AGGREGATE operations can be performed in a same table. GROUP BY can be performed on one or two tables and only inner join is supported.</li> </ul> <p>Following scenarios are not supported:</p> <ul style="list-style-type: none"> <li>● AGGREGATE both the left table and right table.</li> <li>● AGGREGATE contains operations, for example, sum(a+b).</li> <li>● AGGREGATE operations, for example, sum(a)+min(b).</li> </ul>

Operation	Before Enhancement	After Enhancement
aggregate over union all	Related data from the two tables must be loaded to Spark. UNION must be performed before AGGREGATE.	Aggregation functions including SUM, AVG, MAX, MIN, and COUNT are supported. Following scenarios are not supported: <ul style="list-style-type: none"> <li>• AGGREGATE contains operations, for example, sum(a+b).</li> <li>• AGGREGATE operations, for example, sum(a)+min(b).</li> </ul>

### Precautions

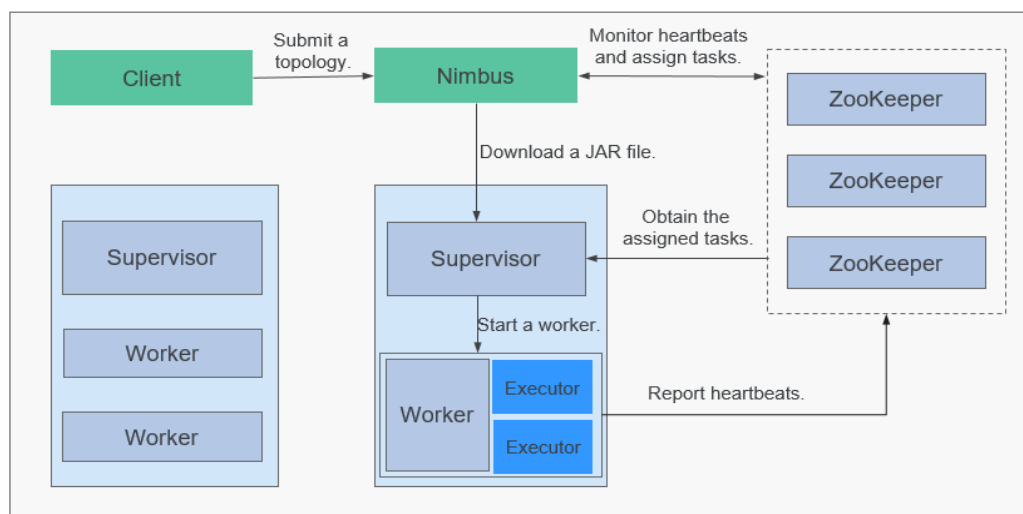

- If the external data source is Hive, query operation cannot be performed on external tables created by Spark.
- The data source only supports MySQL and MPPDB.

## 1.3.24 Storm

### 1.3.24.1 Storm Basic Principles

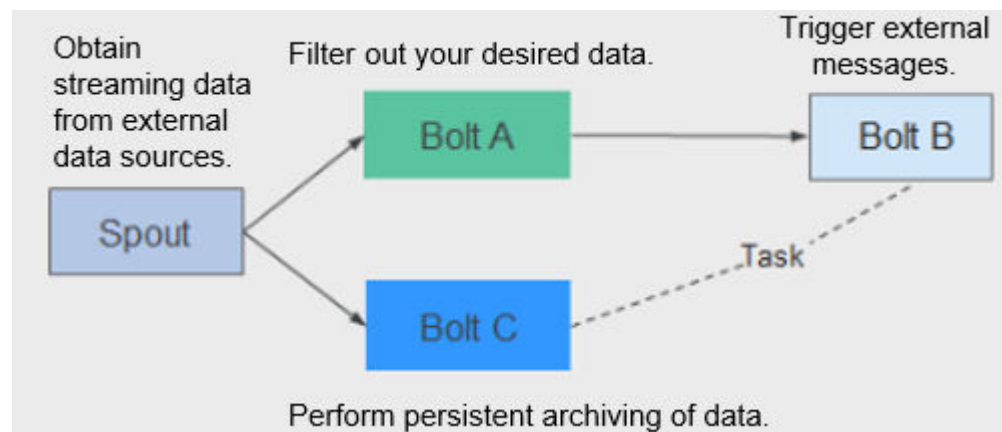

Apache Storm is a distributed, reliable, and fault-tolerant real-time stream data processing system. In Storm, a graph-shaped data structure called topology needs to be designed first for real-time computing. The topology will be submitted to a cluster. Then a master node in the cluster distributes codes and assigns tasks to worker nodes. A topology contains two roles: spout and bolt. A spout sends messages and sends data streams in tuples. A bolt converts the data streams and performs computing and filtering operations. The bolt can randomly send data to other bolts. Tuples sent by a spout are unchangeable arrays and map to fixed key-value pairs.

**Figure 1-123** System architecture of Storm

Service processing logic is encapsulated in the topology of Storm. A topology is a set of spout (data sources) and bolt (logical processing) components that are connected using Stream Groupings in DAG mode. All components (spout and bolt) in a topology are working in parallel. In a topology, you can specify the parallelism for each node. Then, Storm allocates tasks in the cluster for computing to improve system processing capabilities.

**Figure 1-124** Topology

Storm is applicable to real-time analysis, continuous computing, and distributed extract, transform, and load (ETL). It has the following advantages:

- Wide applications
- High scalability
- Zero data loss
- High fault tolerance
- Easy to construct and control
- Multi-language support

Storm is a computing platform and provides Continuous Query Language (CQL) in the service layer to facilitate service implementation. CQL has the following features:

- Easy to use: The CQL syntax is similar to the SQL syntax. Users who have basic knowledge of SQL can easily learn CQL and use it to develop services.
- Rich functions: In addition to basic expressions provided by SQL, CQL provides functions, such as windows, filtering, and concurrency setting, for stream processing.
- Easy to scale: CQL provides an extension API to support increasingly complex service scenarios. Users can customize the input, output, serialization, and deserialization to meet specific service requirements.
- Easy to debug: CQL provides detailed explanation of error codes, facilitating users to rectify faults.

For details about Storm architecture and principles, see <https://storm.apache.org/>.

## Principle

- **Basic Concepts**

**Table 1-23** Concepts

Concept	Description
Tuple	A tuple is an invariable key-value pair used to transfer data. Tuples are created and processed in distributed manner.
Stream	A stream is an unbounded sequence of tuples.
Topology	A topology is a real-time application running on the Storm platform. It is a Directed Acyclic Graph (DAG) composed of components. A topology can concurrently run on multiple machines. Each machine runs a part of the DAG. A topology is similar to a MapReduce job. The difference is that the topology is a resident program. Once started, the topology cannot stop unless it is manually terminated.
Spout	A spout is the source of tuples. For example, a spout may read data from a message queue, database, file system, or TCP connection and converts them as tuples, which are processed by the next component.
Bolt	In a Topology, a bolt is a component that receives data and executes specific logic, such as filtering or converting tuples, joining or aggregating streams, and performing statistics and result persistence.
Worker	A Worker is a physical processing in running state in a Topology. Each Worker is a JVM process. Each Topology may be executed by multiple Workers. Each Worker executes a logic subset of the Topology.
Task	A task is a spout or bolt thread of a Worker.
Stream groupings	A stream grouping specifies the tuple dispatching policies. It instructs the subsequent bolt how to receive tuples. The supported policies include Shuffle Grouping, Fields Grouping, All Grouping, Global Grouping, Non Grouping, and Directed Grouping.

**Figure 1-125** shows a Topology (DAG) consisting of a Spout and Bolt. In the figure, a rectangle indicates a Spout or Bolt, the node in each rectangle indicate tasks, and the lines between tasks indicate streams.

**Figure 1-125** Topology

- **Reliability**

Storm provides three levels of data reliability:

- At Most Once: The processed data may be lost, but it cannot be processed repeatedly. This reliability level offers the highest throughput.
- At Least Once: Data may be processed repeatedly to ensure reliable data transmission. If a response is not received within the specified time, the Spout resends the data to Bolts for processing. This reliability level may slightly affect system performance.
- Exactly Once: Data is successfully transmitted without loss or redundancy processing. This reliability level delivers the poorest performance.

Select the reliability level based on service requirements. For example, for the services requiring high data reliability, use Exactly Once to ensure that data is processed only once. For the services insensitive to data loss, use other levels to improve system performance.

- **Fault Tolerance**

Storm is a fault-tolerant system that offers high availability. [Table 1-24](#) describes the fault tolerance of the Storm components.

**Table 1-24** Fault tolerance

Scenario	Description
Nimbus failed	Nimbus is fail-fast and stateless. If the active Nimbus is faulty, the standby Nimbus takes over services immediately, and provide external services.
Supervisor failed	Supervisor is a background daemon of Workers. It is fail-fast and stateless. If a Supervisor is faulty, the Workers running on the node are not affected but cannot receive new tasks. The OMS can detect the fault of the Supervisor and restart the processes.

Scenario	Description
Worker failed	If a Worker is faulty, the Supervisor on the Worker will restart it again. If the restart fails for multiple times, Nimbus reassigns tasks to other nodes.
Node failed	If a node is faulty, all the tasks being processed by the node time out and Nimbus will assign the tasks to another node for processing.

## Open Source Features

- Distributed real-time computing  
In a Storm cluster, each machine supports the running of multiple work processes and each work process can create multiple threads. Each thread can execute multiple tasks. A task indicates concurrent data processing.
- High fault tolerance  
During message processing, if a node or a process is faulty, the message processing unit can be redeployed.
- Reliable messages  
Data processing methods including At-Least Once, At-Most Once, and Exactly Once are supported.
- Security mechanism  
Storm provides Kerberos-based authentication and pluggable authorization mechanisms, supports SSL Storm UI and Log Viewer UI, and supports security integration with other big data platform components (such as ZooKeeper and HDFS).
- Flexible topology defining and deployment  
The Flux framework is used to define and deploy service topologies. If the service DAG is changed, users only need to modify YAML domain specific language (DSL), but do not need to recompile or package service code.
- Integration with external components  
Storm supports integration with multiple external components such as Kafka, HDFS, HBase, Redis, and JDBC/RDBMS, implementing services that involve multiple data sources.

### 1.3.24.2 Relationship Between Storm and Other Components

Storm provides a real-time distributed computing framework. It can obtain real-time messages from data sources (such as Kafka and TCP connection), perform high-throughput and low-latency real-time computing on a real-time platform, and export results to message queues or implement data persistence. [Figure 1-126](#) shows the relationship between Storm and other components.

**Figure 1-126** Relationship with other components

## Relationship between Storm and Streaming

Both Storm and Streaming use the open source Apache Storm kernel. However, the kernel version used by Storm is 1.2.1 whereas that used by Streaming is 0.10.0. Streaming is used to inherit transition services in upgrade scenarios. For example, if Streaming has been deployed in an earlier version and services are running, Streaming can still be used after the upgrade. Storm is recommended in a new cluster.

Storm 1.2.1 has the following new features:

- **Distributed cache:** Provides external resources (configurations) required for sharing and updating the topology using CLI tools. You do not need to re-package and re-deploy the topology.
- **Native Streaming Window API:** Provides window-based APIs.
- **Resource scheduler:** Added the resource scheduler plug-in. When defining a topology, you can specify the maximum resources available and assign resource quotas to users, thus to manage topology resources of the users.
- **State management:** Provides the Bolt API with the checkpoint mechanism. When an event fails, Storm automatically manages the Bolt status and restore the event.
- **Message sampling and debugging:** On the Storm UI, you can enable or disable topology- or component-level debugging to output stream messages to specified logs based on the sampling ratio.
- **Worker dynamic analysis:** On the Storm UI, you can collect jstack and heap logs of the Worker process and restart the Worker process.
- **Dynamic adjustment of topology logs:** You can dynamically change the running topology logs on the CLI or Storm UI.
- **Improved performance:** Compared with earlier versions, the performance of Storm is greatly improved. Although the topology performance is closely related to the use case scenario and dependency on external services, the performance is three times higher in most scenarios.

### 1.3.24.3 Storm Enhanced Open Source Features

- **CQL**  
Continuous Query Language (CQL) is an SQL-like language used for real-time stream processing. Compared with SQL, CQL has introduced the concept of

(time-sequencing) window, which allows data to be stored and processed in the memory. The CQL output is the computing results of data streams at specific time. The use of CQL accelerates service development, enables tasks to be easily submitted to the Storm platform for real-time processing, facilitates output of results, and allows tasks to be terminated at the appropriate time.

- High Availability

Nimbus HA ensures continuous service processing such as adding topologies and management even if one Nimbus is faulty, improving cluster availability.

### 1.3.25 Tez

Tez is Apache's latest open source computing framework that supports Directed Acyclic Graph (DAG) jobs. It can convert multiple dependent jobs into one job, greatly improving the performance of DAG jobs.

MRS uses Tez as the default execution engine of Hive. Tez remarkably surpasses the original MapReduce computing engine in terms of execution efficiency.

For details about Tez, see <https://tez.apache.org/>.

### Relationship Between Tez and MapReduce

Tez uses a DAG to organize MapReduce tasks. In the DAG, a node is an RDD, and an edge indicates an operation on the RDD. The core idea is to further split Map tasks and Reduce tasks. A Map task is split into the Input-Processor-Sort-Merge-Output tasks, and the Reduce task is split into the Input-Shuffle-Sort-Merge-Process-output tasks. Tez flexibly regroups several small tasks to form a large DAG job.

**Figure 1-127** Processes for submitting tasks using Hive on MapReduce and Hive on Tez

A Hive on MapReduce task contains multiple MapReduce tasks. Each task stores intermediate results to HDFS. The reducer in the previous step provides data for the mapper in the next step. A Hive on Tez task can complete the same processing process in only one task, and HDFS does not need to be accessed between tasks.

## Relationship Between Tez and Yarn

Tez is a computing framework running on Yarn. The runtime environment consists of ResourceManager and ApplicationMaster of Yarn. ResourceManager is a brand new resource manager system, and ApplicationMaster is responsible for cutting MapReduce job data, assigning tasks, applying for resources, scheduling tasks, and tolerating faults. In addition, TezUI depends on TimelineServer provided by Yarn to display the running process of Tez tasks.

### 1.3.26 Yarn

#### 1.3.26.1 Yarn Basic Principles

The Apache open source community introduces the unified resource management framework **Yarn** to share Hadoop clusters, improve their scalability and reliability, and eliminate a performance bottleneck of JobTracker in the early MapReduce framework.

The fundamental idea of Yarn is to split up the two major functionalities of the JobTracker, resource management and job scheduling/monitoring, into separate daemons. The idea is to have a global ResourceManager (RM) and per-application ApplicationMaster (AM).

#### NOTE

An application is either a single job in the classical sense of MapReduce jobs or a Directed Acyclic Graph (DAG) of jobs.

## Architecture

ResourceManager is the essence of the layered structure of Yarn. This entity controls an entire cluster and manages the allocation of applications to underlying compute resources. The ResourceManager carefully allocates various resources (compute, memory, bandwidth, and so on) to underlying NodeManagers (Yarn's per-node agents). The ResourceManager also works with ApplicationMasters to allocate resources, and works with the NodeManagers to start and monitor their underlying applications. In this context, the ApplicationMaster has taken some of the role of the prior TaskTracker, and the ResourceManager has taken the role of the JobTracker.

ApplicationMaster manages each instance of an application running in Yarn. The ApplicationMaster negotiates resources from the ResourceManager and works with the NodeManagers to monitor container execution and resource usage (CPU and memory resource allocation).

The NodeManager manages each node in a Yarn cluster. The NodeManager provides per-node services in a cluster, from overseeing the management of a container over its lifecycle to monitoring resources and tracking the health of its nodes. MRv1 manages execution of the Map and Reduce tasks through slots, whereas the NodeManager manages abstract containers, which represent per-node resources available for a particular application.

**Figure 1-128 Architecture**

**Table 1-25** describes the components shown in **Figure 1-128**.

**Table 1-25** Architecture description

Name	Description
Client	Client of a Yarn application. You can submit a task to ResourceManager and query the operating status of an application using the client.
ResourceM anager(R M)	RM centrally manages and allocates all resources in the cluster. It receives resource reporting information from each node (NodeManager) and allocates resources to applications on the basis of the collected resources according a specified policy.
NodeMan ager(NM)	NM is the agent on each node of Yarn. It manages the computing node in Hadoop cluster, establishes communication with ResourceManger, monitors the lifecycle of containers, monitors the usage of resources such as memory and CPU of each container, traces node health status, and manages logs and auxiliary services used by different applications.

Name	Description
ApplicationMaster(AM)	AM (App Mstr in the figure above) is responsible for all tasks through the lifecycle of in an application. The tasks include the following: Negotiate with an RM scheduler to obtain a resource; further allocate the obtained resources to internal tasks (secondary allocation of resources); communicate with the NM to start or stop tasks; monitor the running status of all tasks; and apply for resources for tasks again to restart the tasks when the tasks fail to be executed.
Container	A resource abstraction in Yarn. It encapsulates multi-dimensional resources (including only memory and CPU) on a certain node. When ApplicationMaster applies for resources from ResourceManager, the ResourceManager returns resources to the ApplicationMaster in a container. Yarn allocates one container for each task and the task can only use the resources encapsulated in the container.

In Yarn, resource schedulers organize resources through hierarchical queues. This ensures that resources are allocated and shared among queues, thereby improving the usage of cluster resources. The core resource allocation model of Superior Scheduler is the same as that of Capacity Scheduler, as shown in the following figure.

A scheduler maintains queue information. You can submit applications to one or more queues. During each NM heartbeat, the scheduler selects a queue according to a specific scheduling rule, selects an application in the queue, and then allocates resources to the application. If resources fail to be allocated to the application due to the limit of some parameters, the scheduler will select another application. After the selection, the scheduler processes the resource request of this application. The scheduler gives priority to the requests for local resources first, and then for resources on the same rack, and finally for resources from any machine.

**Figure 1-129** Resource allocation model

## Principle

The new Hadoop MapReduce framework is named MRv2 or Yarn. Yarn consists of ResourceManager, ApplicationMaster, and NodeManager.

- ResourceManager is a global resource manager that manages and allocates resources in the system. ResourceManager consists of Scheduler and Applications Manager.
  - Scheduler allocates system resources to all running applications based on the restrictions such as capacity and queue (for example, allocates a certain amount of resources for a queue and executes a specific number of jobs). It allocates resources based on the demand of applications, with container being used as the resource allocation unit. Functioning as a dynamic resource allocation unit, Container encapsulates memory, CPU, disk, and network resources, thereby limiting the resource consumed by each task. In addition, the Scheduler is a pluggable component. You can design new schedulers as required. Yarn provides multiple directly available schedulers, such as Fair Scheduler and Capacity Scheduler.
  - Applications Manager manages all applications in the system and involves submitting applications, negotiating with schedulers about resources, enabling and monitoring ApplicationMaster, and restarting ApplicationMaster upon the startup failure.
- NodeManager is the resource and task manager of each node. On one hand, NodeManager periodically reports resource usage of the local node and the running status of each Container to ResourceManager. On the other hand, NodeManager receives and processes requests from ApplicationMaster for starting or stopping Containers.
- ApplicationMaster is responsible for all tasks through the lifecycle of an application, these channels include the following:

- Negotiate with the RM scheduler to obtain resources.
- Assign resources to internal components (secondary allocation of resources).
- Communicates with NodeManager to start or stop tasks.
- Monitor the running status of all tasks, and applies for resources again for tasks when tasks fail to run to restart the tasks.

## Capacity Scheduler Principle

Capacity Scheduler is a multi-user scheduler. It allocates resources by queue and sets the minimum/maximum resources that can be used for each queue. In addition, the upper limit of resource usage is set for each user to prevent resource abuse. Remaining resources of a queue can be temporarily shared with other queues.

Capacity Scheduler supports multiple queues. It configures a certain amount of resources for each queue and adopts the first-in-first-out queuing (FIFO) scheduling policy. To prevent one user's applications from exclusively using the resources in a queue, Capacity Scheduler sets a limit on the number of resources used by jobs submitted by one user. During scheduling, Capacity Scheduler first calculates the number of resources required for each queue, and selects the queue that requires the least resources. Then, it allocates resources based on the job priority and time that jobs are submitted as well as the limit on resources and memory. Capacity Scheduler supports the following features:

- **Guaranteed capacity:** You can set the lower and upper limits of resource usage for each queue. All applications submitted to this queue share the resources.
- **High flexibility:** Temporarily, the remaining resources of a queue can be shared with other queues. However, such resources must be released in case of new application submission to the queue. Such flexible resource allocation helps notably improve resource usage.
- **Multi-tenancy:** Multiple users can share a cluster, and multiple applications can run concurrently. To avoid exclusive resource usage by a single application, user, or queue, you can add multiple constraints (for example, limit on concurrent tasks of a single application).
- **Assured protection:** An ACL list is provided for each queue to strictly limit user access. You can specify the users who can view your application status or control the applications. Additionally, you can specify a queue administrator and a cluster system administrator.
- **Dynamic update of configuration files:** you can dynamically modify configuration parameters to manage clusters online.

Each queue in Capacity Scheduler can limit the resource usage. However, the resource usage of a queue determines its priority when resources are allocated to queues, indicating that queues with smaller capacity are competitive. If the throughput of a cluster is big, delay scheduling enables an application to give up cross-machine or cross-rack scheduling, and to request local scheduling.

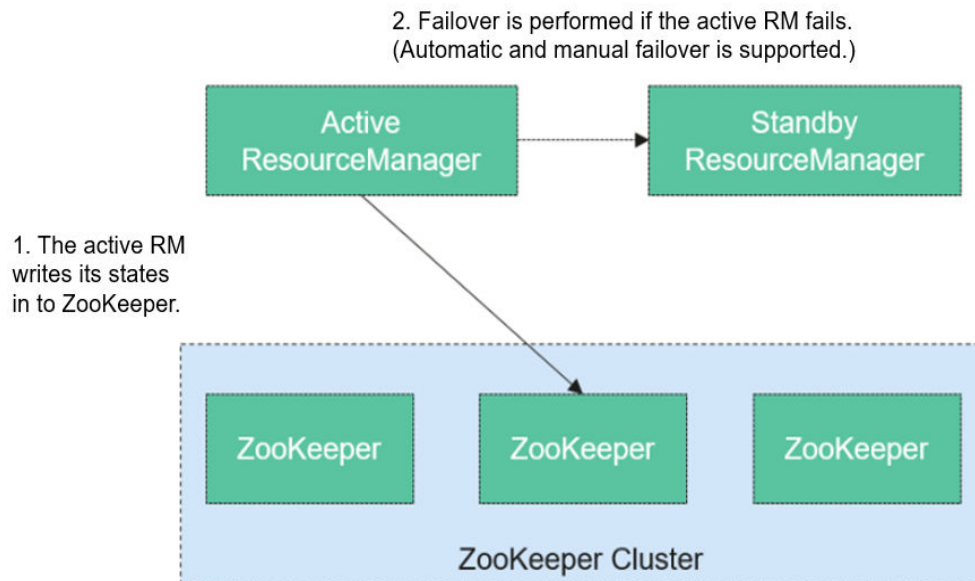

### 1.3.26.2 Yarn HA Solution

#### HA Principles and Implementation Solution

ResourceManager in Yarn manages resources and schedules tasks in the cluster. In versions earlier than Hadoop 2.4, SPOFs may occur on ResourceManager in the Yarn cluster. The Yarn HA solution uses redundant ResourceManager nodes to tackle challenges of service reliability and fault tolerance.

**Figure 1-130** ResourceManager HA architecture

ResourceManager HA is achieved using active-standby ResourceManager nodes, as shown in [Figure 1-130](#). Similar to the HDFS HA solution, the ResourceManager HA allows only one ResourceManager node to be in the active state at any time. When the active ResourceManager fails, the active-standby switchover can be triggered automatically or manually.

When the automatic failover function is not enabled, after the Yarn cluster is enabled, you need to run the `yarn rmadmin` command to manually switch one of the ResourceManager nodes to the active state. Upon a planned maintenance event or a fault, they are expected to first demote the active ResourceManager to the standby state and the standby ResourceManager promote to the active state.

When the automatic switchover is enabled, a built-in ActiveStandbyElector that is based on ZooKeeper decide which ResourceManager node should be the active one. When the active ResourceManager is faulty, another ResourceManager node is automatically selected to be the active one to take over the faulty node.

When ResourceManager nodes in the cluster are deployed in HA mode, the configuration `yarn-site.xml` used by clients needs to list all the ResourceManager nodes. The client (including ApplicationMaster and NodeManager) searches for the active ResourceManager in polling mode. That is, the client needs to provide the fault tolerance mechanism. If the active ResourceManager cannot be connected with, the client continuously searches for a new one in polling mode.

After the standby ResourceManager promotes to be the active one, the upper-layer applications can recover to their status when the fault occurs. (For details,

see [ResourceManger Restart](#).) When ResourceManger Restart is enabled, the restarted ResourceManger node loads the information of the previous active ResourceManger node, and takes over container status information on all NodeManger nodes to continue service running. In this way, status information can be saved by periodically executing checkpoint operations, avoiding data loss. Ensure that both active and standby ResourceManger nodes can access the status information. Currently, three methods are provided for sharing status information by file system (FileSystemRMStateStore), LevelDB database (LeveldbRMStateStore), and ZooKeeper (ZKRMStateStore). Among them, only ZKRMStateStore supports the Fencing mechanism. By default, Hadoop uses ZKRMStateStore.

For more information about the Yarn HA solution, visit the following website:

<http://hadoop.apache.org/docs/r3.1.1/hadoop-yarn/hadoop-yarn-site/ResourceManagerHA.html>

### 1.3.26.3 Relationship Between Yarn and Other Components

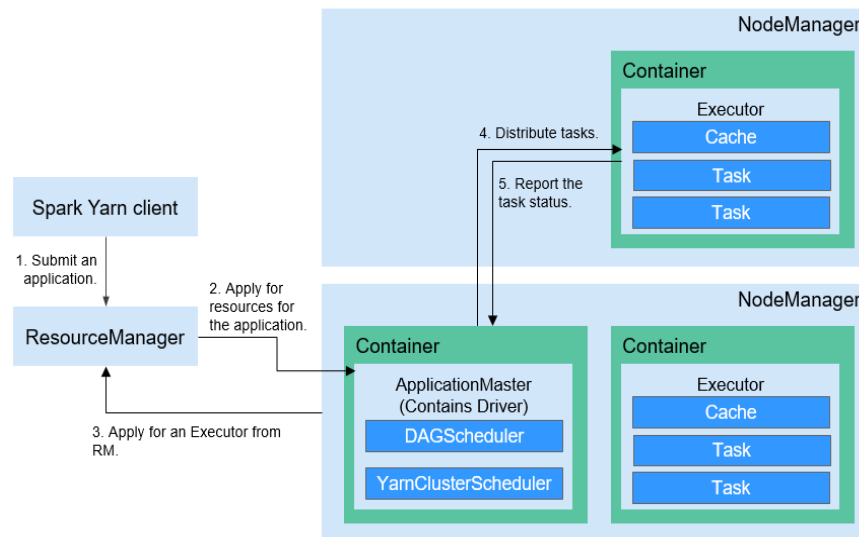

#### Relationship Between Yarn and Spark

The Spark computing and scheduling can be implemented using Yarn mode. Spark enjoys the computing resources provided by Yarn clusters and runs tasks in a distributed way. Spark on Yarn has two modes: Yarn-cluster and Yarn-client.

- Yarn Cluster mode

[Figure 1-131](#) describes the operation framework.

**Figure 1-131** Spark on Yarn-cluster operation framework

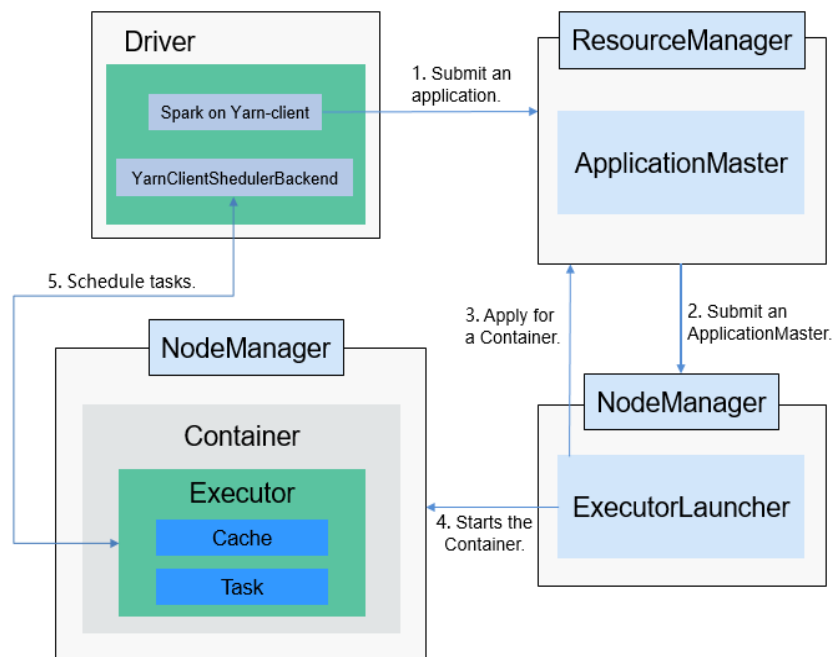

Spark on Yarn-cluster implementation process:

- The client generates the application information, and then sends the information to ResourceManager.
- ResourceManager allocates the first container (ApplicationMaster) to SparkApplication and starts the driver on the container.

- c. ApplicationMaster applies for resources from ResourceManager to run the container.  
ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.
  - d. Drivers allocate tasks to the executors.
  - e. Executors run tasks and report the operating status to Drivers.
- Yarn Client mode

Figure 1-132 describes the operation framework.

Figure 1-132 Spark on Yarn-client operation framework

Spark on Yarn-client implementation process:

**NOTE**

In Yarn-client mode, the driver is deployed and started on the client. In Yarn-cluster mode, the client of an earlier version is incompatible. You are advised to use the Yarn-cluster mode.

- a. The client sends the Spark application request to ResourceManager, then ResourceManager returns the results. The results include information such as Application ID and the maximum and minimum available resources. The client packages all information required to start ApplicationMaster, and sends the information to ResourceManager.
- b. After receiving the request, ResourceManager finds a proper node for ApplicationMaster and starts it on this node. ApplicationMaster is a role in Yarn, and the process name in Spark is ExecutorLauncher.
- c. Based on the resource requirements of each task, ApplicationMaster can apply for a series of containers to run tasks from ResourceManager.

- d. After receiving the newly allocated container list (from ResourceManager), ApplicationMaster sends information to the related NodeManagers to start the containers.

ResourceManager allocates the containers to ApplicationMaster, which communicates with the related NodeManagers and starts the executor in the obtained container. After the executor is started, it registers with drivers and applies for tasks.

**NOTE**

Running containers are not suspended and resources are not released.

- e. Drivers allocate tasks to the executors. Executors run tasks and report the operating status to Drivers.

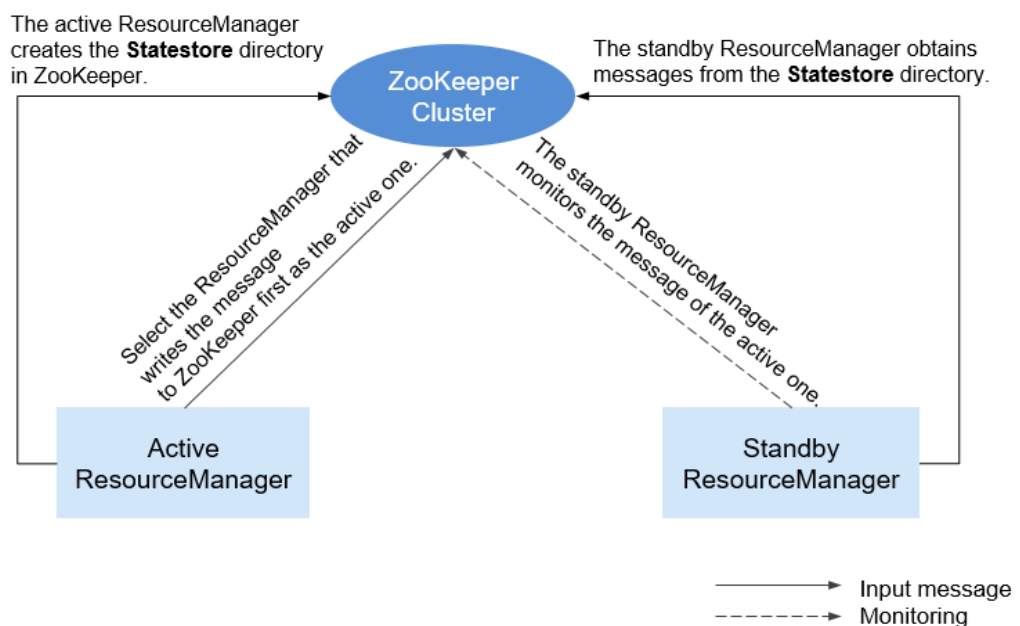

### Relationship Between Yarn and MapReduce

MapReduce is a computing framework running on Yarn, which is used for batch processing. MRv1 is implemented based on MapReduce in Hadoop 1.0, which is composed of programming models (new and old programming APIs), running environment (JobTracker and TaskTracker), and data processing engine (MapTask and ReduceTask). This framework is still weak in scalability, fault tolerance (JobTracker SPOF), and compatibility with multiple frameworks. (Currently, only the MapReduce computing framework is supported.) MRv2 is implemented based on MapReduce in Hadoop 2.0. The source code reuses MRv1 programming models and data processing engine implementation, and the running environment is composed of ResourceManager and ApplicationMaster. ResourceManager is a brand new resource manager system, and ApplicationMaster is responsible for cutting MapReduce job data, assigning tasks, applying for resources, scheduling tasks, and tolerating faults.

### Relationship Between Yarn and ZooKeeper

Figure 1-133 shows the relationship between ZooKeeper and Yarn.

Figure 1-133 Relationship Between ZooKeeper and Yarn

1. When the system is started, ResourceManager attempts to write state information to ZooKeeper. ResourceManager that first writes state information to ZooKeeper is selected as the active ResourceManager, and others are standby ResourceManagers. The standby ResourceManagers periodically monitor active ResourceManager election information in ZooKeeper.
2. The active ResourceManager creates the **Statestore** directory in ZooKeeper to store application information. If the active ResourceManager is faulty, the standby ResourceManager obtains application information from the **Statestore** directory and restores the data.

## Relationship Between Yarn and Tez

The Hive on Tez job information requires the TimeLine Server capability of Yarn so that Hive tasks can display the current and historical status of applications, facilitating storage and retrieval.

### 1.3.26.4 Yarn Enhanced Open Source Features

#### Priority-based task scheduling

In the native Yarn resource scheduling mechanism, if the whole Hadoop cluster resources are occupied by those MapReduce jobs submitted earlier, jobs submitted later will be kept in pending state until all running jobs are executed and resources are released.

The MRS cluster provides the task priority scheduling mechanism. With this feature, you can define jobs of different priorities. Jobs of high priority can preempt resources released from jobs of low priority though the high-priority jobs are submitted later. The low-priority jobs that are not started will be suspended unless those jobs of high priority are completed and resources are released, then they can properly be started.

This feature enables services to control computing jobs more flexibly, thereby achieving higher cluster resource utilization.

#### NOTE

Container reuse is in conflict with task priority scheduling. If container reuse is enabled, resources are being occupied, and task priority scheduling does not take effect.

## Yarn Permission Control

The permission mechanism of Hadoop Yarn is implemented through ACLs. The following describes how to grant different permission control to different users:

- Admin ACL  
An O&M administrator is specified for the Yarn cluster. The Admin ACL is determined by **yarn.admin.acl**. The cluster O&M administrator can access the ResourceManager web UI and operate NodeManager nodes, queues, and NodeLabel, **but cannot submit tasks**.
- Queue ACL  
To facilitate user management in the cluster, users or user groups are divided into several queues to which each user and user group belongs. Each queue

contains permissions to submit and manage applications (for example, terminate any application).

Open source functions:

Currently, Yarn supports the following roles for users:

- Cluster O&M administrator
- Queue administrator
- Common user

However, the APIs (such as the web UI, REST API, and Java API) provided by Yarn do not support role-specific permission control. Therefore, all users have the permission to access the application and cluster information, which does not meet the isolation requirements in the multi-tenant scenario.

This is an enhanced function.

In security mode, permission management is enhanced for the APIs such as web UI, REST API, and Java API provided by Yarn. Permission control can be performed based on user roles.

Role-based permissions are as follows:

- Cluster O&M administrator: performs management operations in the Yarn cluster, such as accessing the ResourceManager web UI, refreshing queues, setting NodeLabel, and performing active/standby switchover.
- Queue administrator: has the permission to modify and view queues managed by the Yarn cluster.
- Common user: has the permission to modify and view self-submitted applications in the Yarn cluster.

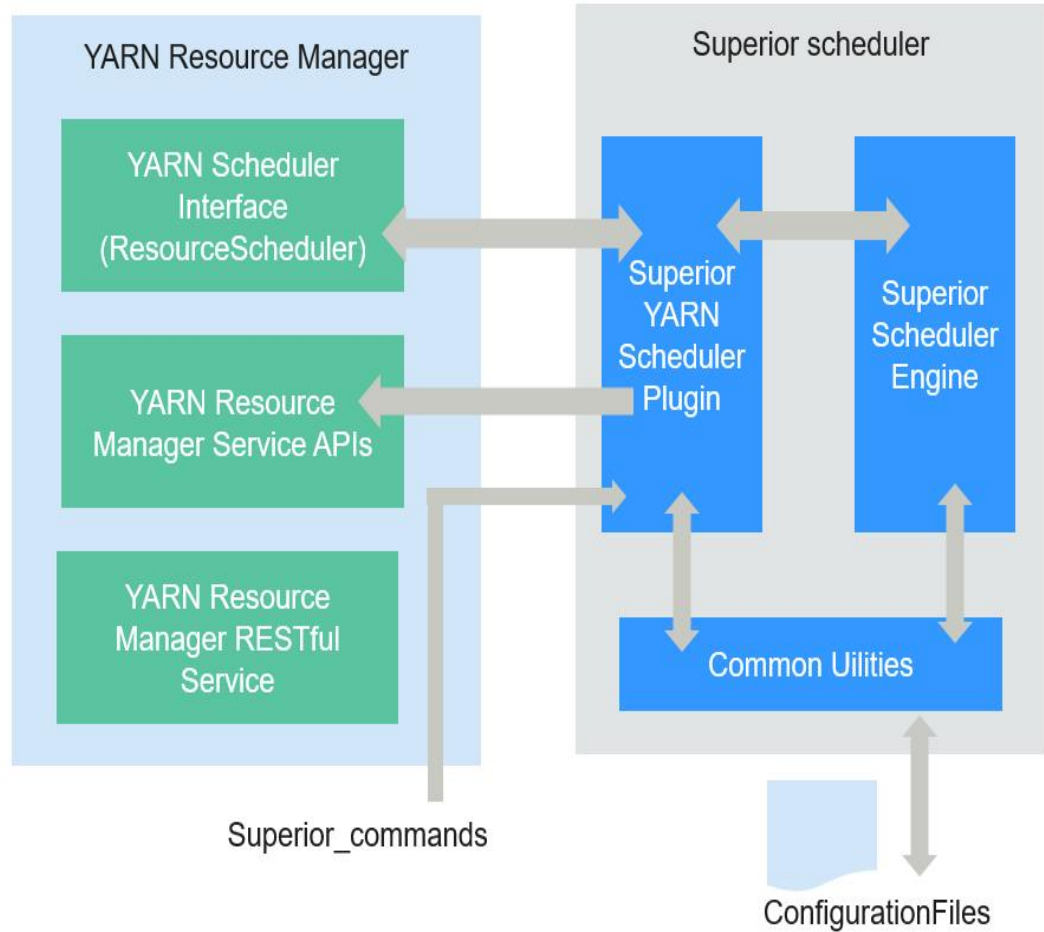

## Superior Scheduler Principle (Self-developed)

Superior Scheduler is a scheduling engine designed for the Hadoop Yarn distributed resource management system. It is a high-performance and enterprise-level scheduler designed for converged resource pools and multi-tenant service requirements.

Superior Scheduler achieves all functions of open source schedulers, Fair Scheduler, and Capacity Scheduler. Compared with the open source schedulers, Superior Scheduler is enhanced in the enterprise multi-tenant resource scheduling policy, resource isolation and sharing among users in a tenant, scheduling performance, system resource usage, and cluster scalability. Superior Scheduler is designed to replace open source schedulers.

Similar to open source Fair Scheduler and Capacity Scheduler, Superior Scheduler follows the Yarn scheduler plugin API to interact with Yarn ResourceManager to offer resource scheduling functionalities. [Figure 1-134](#) shows the overall system diagram.

**Figure 1-134** Internal architecture of Superior Scheduler

In **Figure 1-134**, Superior Scheduler consists of the following modules:

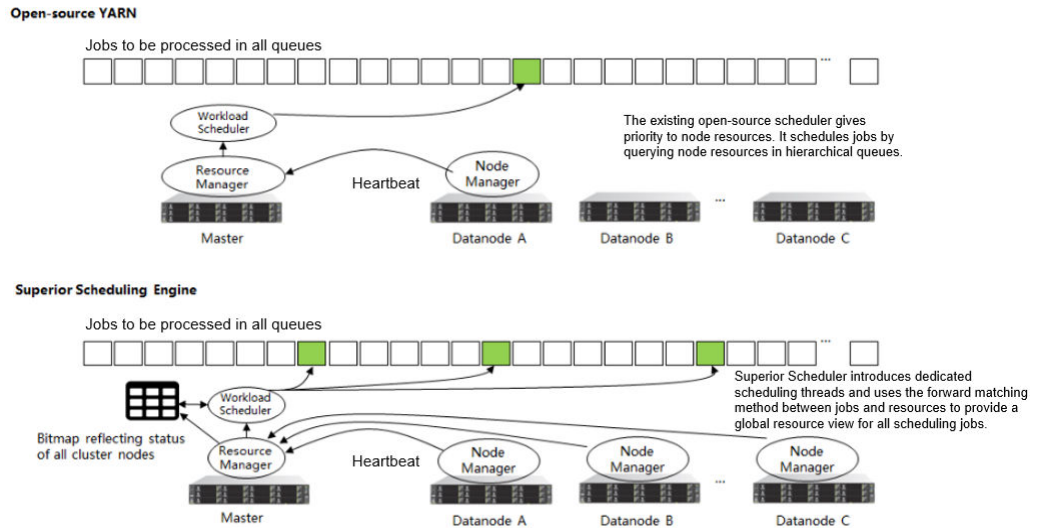

- Superior Scheduler Engine is a high performance scheduler engine with rich scheduling policies.
- Superior Yarn Scheduler Plugin functions as a bridge between Yarn ResourceManager and Superior Scheduler Engine and interacts with Yarn ResourceManager.

The scheduling principle of open source schedulers is that resources match jobs based on the heartbeats of computing nodes. Specifically, each computing node periodically sends heartbeat messages to ResourceManager of Yarn to notify the node status and starts the scheduler to assign jobs to the node itself. In this scheduling mechanism, the scheduling period depends on the heartbeat. If the cluster scale increases, bottleneck on system scalability and scheduling performance may occur. In addition, because resources match jobs, the scheduling accuracy of an open source scheduler is limited. For example, data affinity is random and the system does not support load-based scheduling policies. The scheduler may not make the best choice due to lack of the global resource view when selecting jobs.

Superior Scheduler adopts multiple scheduling mechanisms. There are dedicated scheduling threads in Superior Scheduler, separating heartbeats with scheduling and preventing system heartbeat storms. Additionally,

Superior Scheduler matches jobs with resources, providing each scheduled job with a global resource view and increasing the scheduling accuracy. Compared with the open source scheduler, Superior Scheduler excels in system throughput, resource usage, and data affinity.

**Figure 1-135** Comparison of Superior Scheduler with open source schedulers

Apart from the enhanced system throughput and utilization, Superior Scheduler provides following major scheduling features:

- **Multiple resource pools**  
Multiple resource pools help logically divide cluster resources and share them among multiple tenants or queues. The division of resource pools supports heterogeneous resources. Resource pools can be divided exactly according to requirements on the application resource isolation. You can configure further policies for different queues in a pool.
- **Multi-tenant scheduling (**reserve**, **min**, **share**, and **max**) in each resource pool**  
Superior Scheduler provides flexible hierarchical multi-tenant scheduling policy. Different policies can be configured for different tenants or queues that can access different resource pools. The following figure lists supported policies:

**Table 1-26** Policy description

Name	Description
reserve	This policy is used to reserve resources for a tenant. Even though tenant has no jobs available, other tenant cannot use the reserved resource. The value can be a percentage or an absolute value. If both the percentage and absolute value are configured, the percentage is automatically calculated into an absolute value, and the larger value is used. The default <b>reserve</b> value is <b>0</b> . Compared with the method of specifying a dedicated resource pool and hosts, the <b>reserve</b> policy provides a flexible floating reservation function. In addition, because no specific hosts are specified, the data affinity for calculation is improved and the impact by the faulty hosts is avoided.
min	This policy allows preemption of minimum resources. Other tenants can use these resources, but the current tenant has the priority to use them. The value can be a percentage or an absolute value. If both the percentage and absolute value are configured, the percentage is automatically calculated into an absolute value, and the larger value is used. The default value is <b>0</b> .
share	This policy is used for shared resources that cannot be preempted. To use these resources, the current tenant needs to wait for other tenants to complete jobs and release resources. The value can be a percentage or an absolute value.
max	This policy is used for the maximum resources that can be utilized. The tenant cannot obtain more resources than the allowed maximum value. The value can be a percentage or an absolute value. If both the percentage and absolute value are configured, the percentage is automatically calculated into an absolute value, and the larger value is used. By default value, there is no restriction on resources.

Figure 1-136 shows the tenant resource allocation policy.

**Figure 1-136** Resource scheduling policies

 **NOTE**

In the above figure, **Total** indicates the total number of resources, not the scheduling policy.

Compared with open source schedulers, Superior Scheduler supports both percentage and absolute value of tenants for allocating resources, flexibly addressing resource scheduling requirements of enterprise-level tenants. For example, resources can be allocated according to the absolute value of level-1 tenants, avoiding impact caused by changes of cluster scale. However, resources can be allocated according to the allocation percentage of sub-tenants, improving resource usages in the level-1 tenant.

- Heterogeneous and multi-dimensional resource scheduling

Superior Scheduler supports following functions except CPU and memory scheduling:

- **Node labels** can be used to identify multi-dimensional attributes of nodes such as **GPU\_ENABLED** and **SSD\_ENBALED**, and can be scheduled based on these labels.
- Resource pools can be used to group resources of the same type and allocate them to specific tenants or queues.

- Fair scheduling of multiple users in a tenant

In a leaf tenant, multiple users can use the same queue to submit jobs. Compared with the open source schedulers, Superior Scheduler supports configuring flexible resource sharing policy among different users in a same tenant. For example, VIP users can be configured with higher resource access weight.

- Data locality aware scheduling

Superior Scheduler adopts the job-to-node scheduling policy. That is, Superior Scheduler attempts to schedule specified jobs between available nodes so that the selected node is suitable for the specified jobs. By doing so, the scheduler will have an overall view of the cluster and data. Localization is ensured if there is an opportunity to place tasks closer to the data. The open source scheduler uses the node-to-job scheduling policy to match the appropriate jobs to a given node.

- Dynamic resource reservation during container scheduling

In a heterogeneous and diversified computing environment, some containers need more resources or multiple resources. For example, Spark job may require large memory. When such containers compete with containers requiring fewer resources, containers requiring more resources may not obtain sufficient resources within a reasonable period. Open source schedulers allocate resources to jobs, which may cause unreasonable resource reservation for these jobs. This mechanism leads to the waste of overall system resources. Superior Scheduler differs from open source schedulers in following aspects:

- Requirement-based matching: Superior Scheduler schedules jobs to nodes and selects appropriate nodes to reserve resources to improve the startup time of containers and avoid waste.
- Tenant rebalancing: When the reservation logic is enabled, the open source schedulers do not comply with the configured sharing policy. Superior Scheduler uses different methods. In each scheduling period, Superior Scheduler traverses all tenants and attempts to balance

resources based on the multi-tenant policy. In addition, Superior Scheduler attempts to meet all policies (**reserve**, **min**, and **share**) to release reserved resources and direct available resources to other containers that should obtain resources under different tenants.

- **Dynamic queue status control (Open/Closed/Active/Inactive)**  
Multiple queue statuses are supported, helping you operate and maintain multiple tenants.
  - **Open status (Open/Closed):** If the status is **Open** by default, applications submitted to the queue are accepted. If the status is **Closed**, no application is accepted.
  - **Active status (Active/Inactive):** If the status is **Active** by default, resources can be scheduled and allocated to applications in the tenant. Resources will not be scheduled to queues in **Inactive** status.
- **Application pending reason**  
If the application is not started, provide the job pending reasons.

**Table 1-27** describes the comparison result of Superior Scheduler and Yarn open source schedulers.

**Table 1-27** Comparative analysis

Scheduling	Yarn Open Source Scheduler	Superior Scheduler
Multi-tenant scheduling	In homogeneous clusters, either Capacity Scheduler or Fair Scheduler can be selected and the cluster does not support Fair Scheduler. Capacity Scheduler supports the scheduling by percentage and Fair Scheduler supports the scheduling by absolute value.	<ul style="list-style-type: none"> <li>• Supports heterogeneous clusters and multiple resource pools.</li> <li>• Supports <b>reservation</b> to ensure direct access to resources.</li> </ul>
Data locality aware scheduling	The node-to-job scheduling policy reduces the success rate of data localization and potentially affects application execution performance.	The <b>job-to-node scheduling policy</b> can aware data location more accurately, and the job hit rate of data localization scheduling is higher.
Balanced scheduling based on load of hosts	Not supported	<b>Balanced scheduling can be achieved when Superior Scheduler considers the host load and resource allocation during scheduling.</b>
Fair scheduling of multiple users in a tenant	Not supported	Supports keywords <b>default</b> and <b>others</b> .

Scheduling	Yarn Open Source Scheduler	Superior Scheduler
Job waiting reason	Not supported	Job waiting reasons illustrate why a job needs to wait.

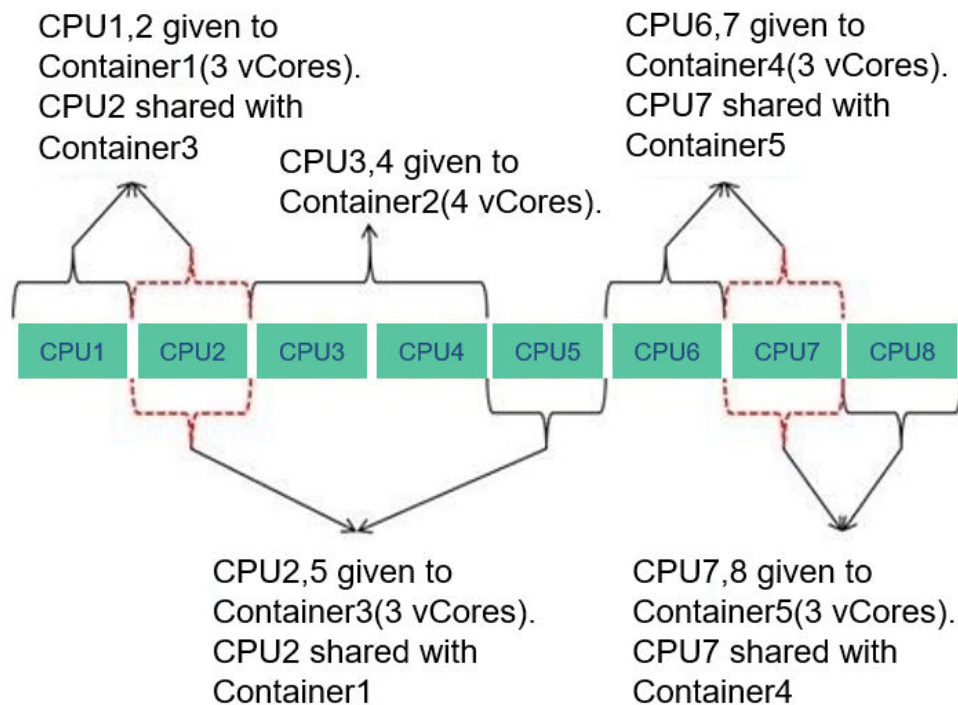

In conclusion, Superior Scheduler is a high-performance scheduler with various scheduling policies and is better than Capacity Scheduler in terms of functionality, performance, resource usage, and scalability.

### CPU Hard Isolation

Yarn cannot strictly control the CPU resources used by each container. When the CPU subsystem is used, a container may occupy excessive resources. Therefore, CPUset is used to control resource allocation.

To solve this problem, the CPU resources are allocated to each container based on the ratio of virtual cores (vCores) to physical cores. If a container requires an entire physical core, the container has it. If a container needs only some physical cores, several containers may share the same physical core. The following figure shows an example of the CPU quota. The given ratio of vCores to physical cores is 2:1.

Figure 1-137 CPU quota

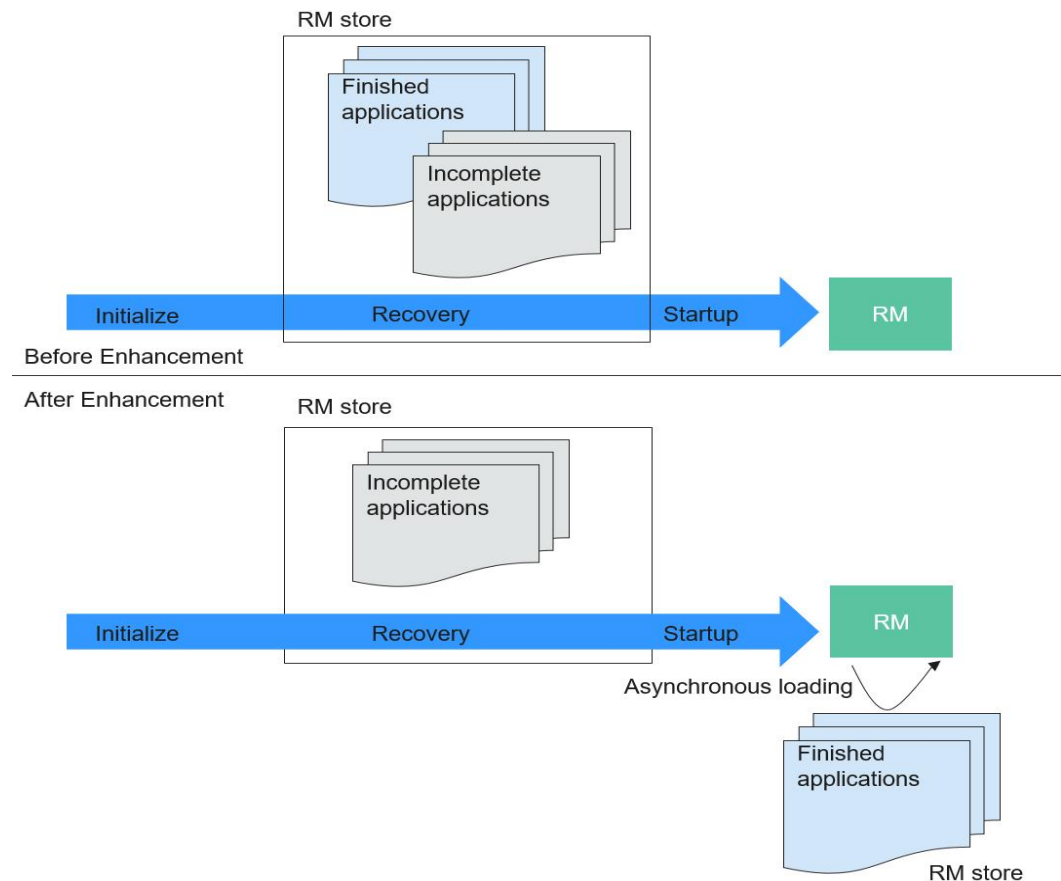

### Enhanced Open Source Feature: Optimizing Restart Performance

Generally, the recovered ResourceManager can obtain running and completed applications. However, a large number of completed applications may cause

problems such as slow startup and long HA switchover/restart time of ResourceManagers.

To speed up the startup, obtain the list of unfinished applications before starting the ResourceManagers. In this case, the completed application continues to be recovered in the background asynchronous thread. The following figure shows how the ResourceManager recovery starts.

**Figure 1-138** Starting the ResourceManager recovery

## 1.3.27 ZooKeeper

### 1.3.27.1 ZooKeeper Basic Principle

#### ZooKeeper Overview

ZooKeeper is a distributed, highly available coordination service. ZooKeeper provides two functions:

- Prevents the system from single point of failures (SPOFs) and provides reliable services for applications.
- Provides distributed coordination services and manages configuration information.

## ZooKeeper Architecture

Nodes in a ZooKeeper cluster have three roles: Leader, Follower, and Observer. [Figure 1-139](#) shows the ZooKeeper architecture. Generally, an odd number (2N+1) of ZooKeeper servers are configured. At least (N+1) vote majority is required to successfully perform write operation.

**Figure 1-139** ZooKeeper architecture

[Table 1-28](#) describes the functions of each module shown in [Figure 1-139](#).

**Table 1-28** ZooKeeper modules

Module	Description
Leader	Only one node serves as the Leader in a ZooKeeper cluster. The Leader, elected by Followers using the ZooKeeper Atomic Broadcast (ZAB) protocol, receives and coordinates all write requests and synchronizes written information to Followers and Observers.
Follower	Follower has two functions: <ul style="list-style-type: none"> <li>Prevents SPOF. A new Leader is elected from Followers when the Leader is faulty.</li> <li>Processes read requests and interacts with the Leader to process write requests.</li> </ul>
Observer	The Observer does not take part in voting for election and write requests. It only processes read requests and forwards write requests to the Leader, increasing system processing efficiency.

Module	Description
Client	Reads and writes data from or to the ZooKeeper cluster. For example, HBase can serve as a ZooKeeper client and use the arbitration function of the ZooKeeper cluster to control the active/standby status of the HMaster.

If security services are enabled in the cluster, authentication is required during the connection to ZooKeeper. The authentication modes are as follows:

- **keytab mode:** Obtain a human-machine user from the MRS cluster administrator for login to the platform and authentication, and obtain the keytab file of the user.
- **Ticket mode:** Obtain a human-machine user from the MRS cluster administrator for subsequent secure login, enable the renewable and forwardable functions of the Kerberos service, set the ticket update interval, and restart Kerberos and related components.

 **NOTE**

- For details about how to obtain a human-machine user and the keytab file of the user, see the *Administrator Guide*.
- The default validity period of a user password is 90 days. Therefore, the validity period of the obtained keytab file is 90 days. To prolong the validity period of the keytab file, modify the user password policy and obtain the keytab file again. For details, see the *Administrator Guide*.
- The parameters for enabling the renewable and forwardable functions and setting the ticket update interval are on the **System** tab of the Kerberos service configuration page. The ticket update interval can be set to `kdc_renew_lifetime` or `kdc_max_renewable_life` based on the actual situation.

## ZooKeeper Principle

- **Write Request**
  - a. After the Follower or Observer receives a write request, the Follower or Observer sends the request to the Leader.
  - b. The Leader coordinates Followers to determine whether to accept the write request by voting.
  - c. If more than half of voters return a write success message, the Leader submits the write request and returns a success message. Otherwise, a failure message is returned.
  - d. The Follower or Observer returns the processing results.
- **Read Request**

The client directly reads data from the Leader, Follower, or Observer.

### 1.3.27.2 Relationship Between ZooKeeper and Other Components

#### Relationship Between ZooKeeper and HDFS

[Figure 1-140](#) shows the relationship between ZooKeeper and HDFS.

**Figure 1-140** Relationship between ZooKeeper and HDFS

As the client of a ZooKeeper cluster, ZKFailoverController (ZKFC) monitors the status of NameNode. ZKFC is deployed only in the node where NameNode resides, and in both the active and standby HDFS NameNodes.

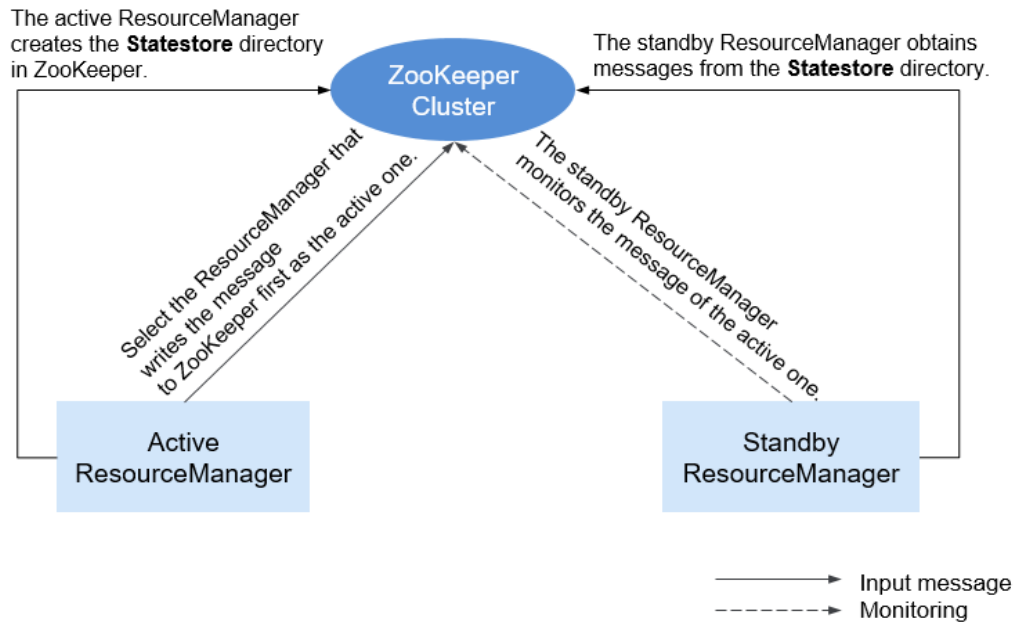

1. The ZKFC connects to ZooKeeper and saves information such as host names to ZooKeeper under the znode directory **/hadoop-ha**. NameNode that creates the directory first is considered as the active node, and the other is the standby node. NameNodes read the NameNode information periodically through ZooKeeper.
2. When the process of the active node ends abnormally, the standby NameNode detects changes in the **/hadoop-ha** directory through ZooKeeper, and then takes over the service of the active NameNode.

## Relationship Between ZooKeeper and Yarn

**Figure 1-141** shows the relationship between ZooKeeper and Yarn.

**Figure 1-141** Relationship Between ZooKeeper and Yarn

1. When the system is started, ResourceManager attempts to write state information to ZooKeeper. ResourceManager that first writes state information to ZooKeeper is selected as the active ResourceManager, and others are standby ResourceManagers. The standby ResourceManagers periodically monitor active ResourceManager election information in ZooKeeper.
2. The active ResourceManager creates the **Statestore** directory in ZooKeeper to store application information. If the active ResourceManager is faulty, the standby ResourceManager obtains application information from the **Statestore** directory and restores the data.

## Relationship Between ZooKeeper and HBase

**Figure 1-142** shows the relationship between ZooKeeper and HBase.

**Figure 1-142** Relationship between ZooKeeper and HBase

1. HRegionServer registers itself to ZooKeeper on Ephemeral node. ZooKeeper stores the HBase information, including the HBase metadata and HMaster addresses.
2. HMaster detects the health status of each HRegionServer using ZooKeeper, and monitors them.
3. HBase supports multiple HMaster nodes (like HDFS NameNodes). When the active HMaster is faulty, the standby HMaster obtains the state information about the entire cluster using ZooKeeper. That is, using ZooKeeper can avoid HBase SPOFs.

## Relationship Between ZooKeeper and Kafka

**Figure 1-143** shows the relationship between ZooKeeper and Kafka.

**Figure 1-143** Relationship between ZooKeeper and Kafka

1. Broker uses ZooKeeper to register broker information and elect a partition leader.
2. The consumer uses ZooKeeper to register consumer information, including the partition list of consumer. In addition, ZooKeeper is used to discover the broker list, establish a socket connection with the partition leader, and obtain messages.

### 1.3.27.3 ZooKeeper Enhanced Open Source Features

#### Enhanced Log

In security mode, an ephemeral node is deleted as long as the session that created the node expires. Ephemeral node deletion is recorded in audit logs so that ephemeral node status can be obtained.

Username must be added to audit logs for all operations performed on ZooKeeper clients.

On the ZooKeeper client, create a znode, of which the Kerberos principal is **zkcli/hadoop.<System domain name>@<System domain name>**.

For example, open the **<ZOO\_LOG\_DIR>/zookeeper\_audit.log** file. The file content is as follows:

```
2016-12-28 14:17:10,505 | INFO | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test1?result=success
2016-12-28 14:17:10,530 | INFO | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test2?result=success
2016-12-28 14:17:10,550 | INFO | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test3?result=success
2016-12-28 14:17:10,570 | INFO | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test4?result=success
2016-12-28 14:17:10,592 | INFO | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test5?result=success
2016-12-28 14:17:10,613 | INFO | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
```

```
target=ZooKeeperServer?znode=/test6?result=success
2016-12-28 14:17:10,633 | INFO | CommitProcWorkThread-4 | session=0x12000007553b4903?
user=10.177.223.78,zkcli/hadoop.hadoop.com@HADOOP.COM?ip=10.177.223.78?operation=create znode?
target=ZooKeeperServer?znode=/test7?result=success
```

The content shows that logs of the ZooKeeper client user **zkcli/hadoop.hadoop.com@HADOOP.COM** are added to the audit log.

### User details in ZooKeeper

In ZooKeeper, different authentication schemes use different credentials as users. Based on the authentication provider requirement, any parameter can be considered as users.

Example:

- **SAMLAAuthenticationProvider** uses the client principal as a user.
- **X509AuthenticationProvider** uses the user client certificate as a user.
- **IAAuthenticationProvider** uses the client IP address as a user.
- A username can be obtained from the custom authentication provider by implementing the **org.apache.zookeeper.server.auth.ExtAuthenticationProvider.getUserName(String)** method. If the method is not implemented, getting the username from the authentication provider instance will be skipped.

## Enhanced Open Source Feature: ZooKeeper SSL Communication (Netty Connection)

The ZooKeeper design contains the Nio package and does not support SSL later than version 3.5. To solve this problem, Netty is added to ZooKeeper. Therefore, if you need to use SSL, enable Netty and set the following parameters on the server and client:

The open source server supports only plain text passwords, which may cause security problems. Therefore, such text passwords are no longer used on the server.

- Client
  - Set **-Dzookeeper.client.secure** in the **zkCli.sh/zkEnv.sh** file to **true** to use secure communication on the client. Then, the client can connect to the **secureClientPort** on the server.
  - Set the following parameters in the **zkCli.sh/zkEnv.sh** file to configure the client environment:

Parameter	Description
-Dzookeeper.clientCnxnSocket	Used for Netty communication between clients. Default value: <b>org.apache.zookeeper.ClientCnxnSocketNetty</b>
-Dzookeeper.ssl.keyStore.location	Indicates the path for storing the keystore file.

Parameter	Description
-Dzookeeper.ssl.keyStore.password	Encrypts a password.
-Dzookeeper.ssl.trustStore.location	Indicates the path for storing the truststore file.
-Dzookeeper.ssl.trustStore.password	Encrypts a password.
-Dzookeeper.config.crypt.class	Decrypts an encrypted password.
-Dzookeeper.ssl.password.encrypted	Default value: <b>false</b> If the keystore and truststore passwords are encrypted, set this parameter to <b>true</b> .
-Dzookeeper.ssl.enabled.protocols	Defines the SSL protocols to be enabled for the SSL context.
-Dzookeeper.ssl.exclude.cipher.ext	Defines the list of passwords separated by a comma which should be excluded from the SSL context.

 NOTE

The preceding parameters must be set in the **zkCli.sh/zk.Env.sh** file.

- Server
  - a. Set **secureClientPort** to **3381** in the **zoo.cfg** file.
  - b. Set **zookeeper.serverCnxnFactory** to **org.apache.zookeeper.server.NettyServerCnxnFactory** in the **zoo.cfg** file on the server.
  - c. Set the following parameters in the **zoo.cfg** file (in the **zookeeper/conf/zoo.cfg** path) to configure the server environment:

Parameter	Description
ssl.keyStore.location	Path for storing the <b>keystore.jks</b> file
ssl.keyStore.password	Encrypts a password.
ssl.trustStore.location	Indicates the path for storing the truststore file.
ssl.trustStore.password	Encrypts a password.
config.crypt.class	Decrypts an encrypted password.

Parameter	Description
ssl.keyStore.password.encrypted	Default value: <b>false</b> If this parameter is set to <b>true</b> , the encrypted password can be used.
ssl.trustStore.password.encrypted	Default value: <b>false</b> If this parameter is set to <b>true</b> , the encrypted password can be used.
ssl.enabled.protocols	Defines the SSL protocols to be enabled for the SSL context.
ssl.exclude.cipher.ext	Defines the list of passwords separated by a comma which should be excluded from the SSL context.

- d. Start ZKserver and connect the security client to the security port.
- Credential  
The credential used between client and server in ZooKeeper is **X509AuthenticationProvider**. This credential is initialized using the server certificates specified and trusted by the following parameters:
  - zookeeper.ssl.keyStore.location
  - zookeeper.ssl.keyStore.password
  - zookeeper.ssl.trustStore.location
  - zookeeper.ssl.trustStore.password

 **NOTE**

If you do not want to use default mechanism of ZooKeeper, then it can be configured with different trust mechanisms as needed.

## 1.4 Functions

### 1.4.1 Multi-tenant

#### Feature Introduction

Modern enterprises' data clusters are developing towards centralization and cloudification. Enterprise-class big data clusters must meet the following requirements:

- Carry data of different types and formats and run jobs and applications of different types (analysis, query, and stream processing).
- Isolate data of a user from that of another user who has demanding requirements on data security, such as a bank or government institute.

The preceding requirements bring the following challenges to the big data cluster:

- Proper allocation and scheduling of resources to ensure stable operating of applications and jobs
- Strict access control to ensure data and service security

Multi-tenant isolates the resources of a big data cluster into resource sets. Users can lease desired resource sets to run applications and jobs and store data. In a big data cluster, multiple resource sets can be deployed to meet diverse requirements of multiple users.

The MRS big data cluster provides a complete enterprise-class big data multi-tenant solution. Multi-tenant is a collection of multiple resources (each resource set is a tenant) in an MRS big data cluster. It can allocate and schedule resources, including computing and storage resources.

## Advantages

- Proper resource configuration and isolation  
The resources of a tenant are isolated from those of another tenant. The resource use of a tenant does not affect other tenants. This mechanism ensures that each tenant can configure resources based on service requirements, improving resource utilization.
- Resource consumption measurement and statistics  
Tenants are system resource applicants and consumers. System resources are planned and allocated based on tenants. Resource consumption by tenants can be measured and recorded.
- Ensured data security and access security  
In multi-tenant scenarios, the data of each tenant is stored separately to ensure data security. The access to tenants' resources is controlled to ensure access security.

## Enhanced Schedulers

Schedulers are divided into the open source Capacity scheduler and proprietary Superior scheduler.

To meet enterprise requirements and tackle challenges facing the Yarn community in scheduling, develops the Superior scheduler. In addition to inheriting the advantages of the Capacity scheduler and Fair scheduler, this scheduler is enhanced in the following aspects:

- Enhanced resource sharing policy  
The Superior scheduler supports queue hierarchy. It integrates the functions of open source schedulers and shares resources based on configurable policies. In terms of instances, MRS cluster administrators can use the Superior scheduler to configure an absolute value or percentage policy for queue resources. The resource sharing policy of the Superior scheduler enhances the label scheduling policy of Yarn as a resource pool feature. The nodes in the Yarn cluster can be grouped based on the capacity or service type to ensure that queues can more efficiently utilize resources.
- Tenant-based resource reservation policy  
Resources required by tenants must be ensured for running critical tasks. The Superior scheduler builds a mechanism to support the resource reservation

policy. By doing so, reserved resources can be allocated to the tasks run by the tenant queues in a timely manner to ensure proper task execution.

- Fair sharing among tenants and resource pool users  
The Superior scheduler allows shared resources to be configured for users in a queue. Each tenant may have users with different weights. Heavily weighted users may require more shared resources.
- Ensured scheduling performance in a big cluster  
The Superior scheduler receives heartbeats from each NodeManager and saves resource information in memory, which enables the scheduler to control cluster resource usage globally. The Superior scheduler uses the push scheduling model, which makes the scheduling more precise and efficient and remarkably improves cluster resource utilization. Additionally, the Superior scheduler delivers excellent performance when the interval between NodeManager heartbeats is long and prevents heartbeat storms in big clusters.
- Priority policy  
If the minimum resource requirement of a service cannot be met after the service obtains all available resources, a preemption occurs. The preemption function is disabled by default.

## 1.4.2 Security Hardening

MRS is a platform for massive data management and analysis and has high security. MRS protects user data and service running from the following aspects:

- Network isolation  
The entire system is deployed in a VPC on the cloud to provide an isolated network environment and ensure service and management security of the cluster. By combining the subnet division, route control, and security group functions of VPC, MRS provides a secure and reliable isolated network environment.
- Resource isolation  
MRS supports resource deployment and isolation of physical resources in dedicated zones. You can flexibly combine computing and storage resources, such as dedicated computing resources + shared storage resources, shared computing resources + dedicated storage resources, and dedicated computing resources + dedicated storage resources.
- Host security  
MRS can be integrated with security services, including Vulnerability Scan Service (VSS), Host Security Service (HSS), Web Application Firewall (WAF), Cloud Bastion Host (CBH), and Web Tamper Protection (WTP). The following measures are provided to improve security of the OS and ports:
  - Security hardening of OS kernels
  - OS patch update
  - OS permission control
  - OS port management
  - OS protocol and port attack defense
- Application security

The following measures are used to ensure normal running of big data services:

- Identification and authentication
- Web application security
- Access control
- Audit security
- Password security
- Data security

The following measures are provided to ensure the confidentiality, integrity, and availability of massive amounts of user data:

  - Disaster recovery: MRS supports data backup to OBS and cross-region high reliability.
  - Backup: MRS supports backup of DBService, NameNode, and LDAP metadata and backup of HDFS and HBase service data.
- Data integrity

Data is verified to ensure its integrity during storage and transmission.

  - CRC32C is used by default to verify the correctness of user data stored in HDFS.
  - DataNodes of HDFS store the verified data. If the data transmitted from a client is abnormal (incomplete), DataNodes report the abnormality to the client, and the client rewrites the data.
  - The client checks data integrity when reading data from a DataNode. If the data is incomplete, the client will read data from another DataNode.
- Data confidentiality

Based on Apache Hadoop, the distributed file system of MRS supports encrypted storage of files to prevent sensitive data from being stored in plaintext, improving data security. Applications need only to encrypt specified sensitive data. Services are not affected during the encryption process. Based on file system data encryption, Hive provides table-level encryption and HBase provides column family-level encryption. Sensitive data can be encrypted and stored after you specify an encryption algorithm during table creation.

Encrypted storage and access control of data are used to ensure user data security.

  - HBase stores service data to the HDFS after compression. Users can configure the AES and SMS4 encryption algorithm to encrypt data.
  - All the components allow access permissions to be set for local data directories. Unauthorized users are not allowed to access data.
  - All cluster user information is stored in ciphertext.
- Security authentication
  - Uses a unified user- and role-based authentication system as well as an account- and role-based access control (RBAC) model to centrally control user permissions and batch manage user authorization.
  - Employs Lightweight Directory Access Protocol (LDAP) as an account management system and performs the Kerberos authentication on accounts.

- Provides the single sign-on (SSO) function that centrally manages and authenticates MRS system and component users.
- Audits users who have logged in to Manager.

### 1.4.3 Easy Access to Web UIs of Components

Big data components have their own web UIs to manage their own systems. However, you cannot easily access the web UIs due to network isolation. For example, to access the HDFS web UI, you need to create an ECS to remotely log in to the web UI. This makes the UI access complex and unfriendly.

MRS provides an EIP-based secure channel for you to easily access the web UIs of components. This is more convenient than binding an EIP by yourself, and you can access the web UIs with a few clicks, avoiding the steps for logging in to a VPC, adding security group rules, and obtaining a public IP address. For the Hadoop, Spark, HBase, and Hue components in analysis clusters and the Storm component in streaming clusters, you can quickly access their web UIs from the entries on Manager.

### 1.4.4 Reliability Enhancement

Based on Apache Hadoop open source software, MRS optimizes and improves the reliability and performance of main service components.

#### System Reliability

- HA for all management nodes

In the Hadoop open source version, data and compute nodes are managed in a distributed system, in which a single point of failure (SPOF) does not affect the operation of the entire system. However, a SPOF may occur on management nodes running in centralized mode, which becomes the weakness of the overall system reliability.

MRS provides similar double-node mechanisms for all management nodes of the service components, such as Manager, HDFS NameNodes, HiveServers, HBase HMasters, Yarn ResourceManagers, KerberosServers, and LdapServers. All of them are deployed in active/standby mode or configured with load sharing, effectively preventing SPOFs from affecting system reliability.

- Reliability guarantee in case of exceptions

By reliability analysis, the following measures to handle software and hardware exceptions are provided to improve the system reliability:

- After power supply is restored, services are running properly regardless of a power failure of a single node or the whole cluster, ensuring data reliability in case of unexpected power failures. Key data will not be lost unless the hard disk is damaged.
- Health status checks and fault handling of the hard disk do not affect services.
- The file system faults can be automatically handled, and affected services can be automatically restored.
- The process and node faults can be automatically handled, and affected services can be automatically restored.

- The network faults can be automatically handled, and affected services can be automatically restored.
- Data backup and restoration

MRS provides full backup, incremental backup, and restoration functions based on service requirements, preventing the impact of data loss and damages on services and ensuring fast system restoration in case of exceptions.

  - Automatic backup

MRS provides automatic backup for data on Manager. Based on the customized backup policy, data on clusters, including LdapServer and DBService data, can be automatically backed up.
  - Manual backup

You can also manually back up data of the cluster management system before the capacity expansion and patch installation to recover the cluster management system functions upon faults.

To improve the system reliability, data on Manager and HBase is backed up to a third-party server manually.

## Node Reliability

- OS health status monitoring

MRS periodically collects OS hardware resource usage data, including usage of CPUs, memory, hard disks, and network resources.
- Process health status monitoring

MRS checks the status of service instances and health indicators of service instance processes, enabling you to know the health status of processes in a timely manner.
- Automatic disk troubleshooting

MRS is enhanced based on the open source version. It can monitor the status of hardware and file systems on all nodes. If an exception occurs, the corresponding partitions will be removed from the storage pool. If a disk is faulty and replaced, a new hard disk will be added for running services. In this case, maintenance operations are simplified. Replacement of faulty disks can be completed online. In addition, users can set hot backup disks to reduce the faulty disk restoration time and improve the system reliability.
- LVM configuration for node disks

MRS allows you to configure Logic Volume Management (LVM) to plan multiple disks as a logical volume group. Configuring LVM can avoid uneven usage of disks. It is especially important to ensure even usage of disks on components that can use multiple disk capabilities, such as HDFS and Kafka. In addition, LVM supports disk capacity expansion without re-attaching, preventing service interruption.

## Data Reliability

MRS can use the anti-affinity node groups and placement group capabilities provided by ECS and the rack awareness capability of Hadoop to redundantly distribute data to multiple physical host machines, preventing data loss caused by physical hardware failures.

## 1.4.5 Job Management

The job management function provides an entry for you to submit jobs in a cluster, including MapReduce, Spark, HiveQL, and SparkSQL jobs. MRS works with Data Lake Factory (DLF) to provide a one-stop big data collaboration development environment and fully-managed big data scheduling capabilities, helping you effortlessly build big data processing centers.

DLF allows you to develop and debug MRS HiveQL/SparkSQL scripts online and develop MRS jobs by performing drag-and-drop operations to migrate and integrate data between MRS and more than 20 heterogeneous data sources. Powerful job scheduling and flexible monitoring and alarming help you easily manage data and job O&M.

## 1.4.6 Bootstrap Actions

### Feature Introduction

MRS provides standard elastic big data clusters on the cloud. Nine big data components, such as Hadoop and Spark, can be installed and deployed. Currently, standard cloud big data clusters cannot meet all user requirements, for example, in the following scenarios:

- Common operating system configurations cannot meet data processing requirements, for example, increasing the maximum number of system connections.
- Software tools or running environments need to be installed, for example, Gradle and dependency R language package.
- Big data component packages need to be modified based on service requirements, for example, modifying the Hadoop or Spark installation package.
- Other big data components that are not supported by MRS need to be installed.

To meet the preceding customization requirements, you can manually perform operations on the existing and newly added nodes. The overall process is complex and error-prone. In addition, manual operations cannot be traced, and data cannot be processed immediately after creating a cluster based on your demand.

Therefore, MRS supports custom bootstrap actions that enable you to run scripts on a specified node before or after a cluster component is started. You can run bootstrap actions to install third-party software that is not supported by MRS, modify the cluster running environment, and perform other customizations. If you choose to run bootstrap actions when expanding a cluster, the bootstrap actions will be run on the newly added nodes in the same way. MRS runs the script you specify as user **root**. You can run the **su - xxx** command in the script to switch the user.

### Customer Benefits

You can use the custom bootstrap actions to flexibly and easily configure your dedicated clusters and customize software installation.

## 1.4.7 Metadata

MRS provides multiple metadata storage methods. When deploying Hive and Ranger during MRS cluster creation, select one of the following storage modes as required:

- **Local:** Metadata is stored in the local GaussDB of a cluster. When the cluster is deleted, the metadata is also deleted. To retain the metadata, manually back up the metadata in the database in advance.
- **Data Connection:** Metadata is stored in the associated PostgreSQL or MySQL database of the RDS service in the same VPC and subnet as the current cluster. When the cluster is terminated, the metadata is not deleted. Multiple MRS clusters can share the metadata.

### NOTE

Hive in MRS 1.9.x or later allows you to specify a metadata storage method.

Ranger in MRS 1.9.x allows metadata to be stored only in the associated MySQL database of the RDS service.

## 1.4.8 Cluster Management

### 1.4.8.1 Cluster Lifecycle Management

MRS supports cluster lifecycle management, including creating and terminating clusters.

- **Creating a cluster:** After you specify a cluster type, components, number of nodes of each type, VM specifications, AZ, VPC, and authentication information, MRS automatically creates a cluster that meets the configuration requirements. You can run customized scripts in the cluster. In addition, you can create clusters of different types for multiple application scenarios, such as Hadoop analysis clusters, HBase clusters, and Kafka clusters. The big data platform supports heterogeneous cluster deployment. That is, VMs of different specifications can be combined in a cluster based on CPU types, disk capacities, disk types, and memory sizes. Various VM specifications can be mixed in a cluster.
- **Terminating a cluster:** You can terminate a cluster that is no longer needed (including data and configurations in the cluster). MRS will delete all resources related to the cluster.

## Creating a Cluster

On the MRS management console, you can create an MRS cluster. You can select a region and cloud resource specifications to create an MRS cluster that is suitable for enterprise services in one click. MRS automatically installs and deploys the enterprise-level big data platform and optimizes parameters based on the selected cluster type, version, and node specifications.

MRS provides you with fully managed big data clusters. When creating a cluster, you can set a VM login mode (password or key pair). You can use all resources of the created MRS cluster. In addition, MRS allows you to deploy a big data cluster on only two ECSs with 4 vCPUs and 8 GB memory, providing more flexible choices for testing and development.

MRS clusters are classified into analysis, streaming, and hybrid clusters.

- **Analysis cluster:** is used for offline data analysis and provides Hadoop components.
- **Streaming cluster:** is used for streaming tasks and provides stream processing components.
- **Hybrid cluster:** is used for not only offline data analysis but also streaming processing, and provides Hadoop components and stream processing components.
- **Custom:** You can flexibly combine required components (MRS 3.x and later versions) based on service requirements.

MRS cluster nodes are classified into Master, Core, and Task nodes.

- **Master node:** management node in a cluster. Master processes of a distributed system, Manager, and databases are deployed on Master nodes. Master nodes cannot be scaled out. The processing capability of Master nodes determines the upper limit of the management capability of the entire cluster. MRS supports scale-up of Master node specifications to provide support for management of a larger cluster.
- **Core node:** used for both storage and computing and can be scaled in or out. Since Core nodes bear data storage, there are many restrictions on scale-in to prevent data loss and auto scaling cannot be performed.
- **Task node:** used only for computing only and can be scaled in or out. Task nodes bear only computing tasks. Therefore, auto scaling can be performed.

You can create a cluster in two modes: custom create a cluster and quick create a cluster.

- **Custom config:** On the **Custom Config** page, you can flexibly configure cluster parameters based on application scenarios, such as ECS specifications to better suit your service requirements.
- **Quick config:** On the **Quick Config** page, you can quickly create a cluster based on application scenarios, improving cluster configuration efficiency. Currently, Hadoop analysis clusters, HBase clusters, and Kafka clusters are available for your quick creation.
  - **Hadoop analysis cluster:** uses components in the open-source Hadoop ecosystem to analyze and query vast amounts of data. For example, use Yarn to manage cluster resources, Hive and Spark to provide offline storage and computing of large-scale distributed data, Spark Streaming and Flink to offer streaming data computing, and Presto to enable interactive queries, and Tez to provide a distributed computing framework of directed acyclic graphs (DAGs).
  - **HBase cluster:** uses Hadoop and HBase components to provide a column-oriented distributed cloud storage system featuring enhanced reliability, excellent performance, and elastic scalability. It applies to the storage and distributed computing of massive amounts of data. You can use HBase to build a storage system capable of storing TB- or even PB-level data. With HBase, you can filter and analyze data with ease and get responses in milliseconds, rapidly mining data value.
  - **Kafka cluster:** uses Kafka and Storm to provide an open source message system with high throughput and scalability. It is widely used in scenarios

such as log collection and monitoring data aggregation to implement efficient streaming data collection and real-time data processing and storage.

## Terminating a Cluster

MRS allows you to terminate a cluster when it is no longer needed. After the cluster is terminated, all cloud resources used by the cluster will be released. Before terminating a cluster, you are advised to migrate or back up data. Terminate the cluster only when no service is running in the cluster or the cluster is abnormal and cannot provide services based on O&M analysis. If data is stored on EVS disks or pass-through disks in a big data cluster, the data will be deleted after the cluster is terminated. Therefore, exercise caution when terminating a cluster.

### 1.4.8.2 Manually Scale Out/In a Cluster

The processing capability of a big data cluster can be horizontally expanded by adding nodes. If the cluster scale does not meet service requirements, you can manually scale out or scale in the cluster. MRS intelligently selects the node with the least load or the minimum amount of data to be migrated for scale-in. The node to be scaled in will not receive new tasks, and continues to execute the existing tasks. At the same time, MRS copies its data to other nodes and the node is decommissioned. If the tasks on the node cannot be completed after a long time, MRS migrates the tasks to other nodes, minimizing the impact on cluster services.

## Scaling Out a Cluster

Currently, you can add Core or Task nodes to scale out a cluster to handle peak service loads. The capacity expansion of an MRS cluster node does not affect the services of the existing cluster.

## Scaling In a Cluster

You can reduce the number of Core or Task nodes to scale in a cluster so that MRS delivers better storage and computing capabilities at lower O&M costs based on service requirements. After you scale in an MRS cluster, MRS automatically selects nodes that can be scaled in based on the type of services installed on the nodes.

During the scale-in of Core nodes, data on the original nodes is migrated. If the data location is cached, the client automatically updates the location information, which may affect the latency. Node scale-in may affect the response duration of the first access to some HBase on HDFS data. You can restart HBase or disable or enable related tables to avoid this problem.

Task nodes do not store cluster data. They are compute nodes and do not involve migration of data on the nodes.

### 1.4.8.3 Auto Scaling

## Feature Introduction

More and more enterprises use technologies such as Spark and Hive to analyze data. Processing a large amount of data consumes huge resources and costs

much. Typically, enterprises regularly analyze data in a fixed period of time every day rather than all day long. To meet enterprises' requirements, MRS provides the auto scaling function to apply for extra resources during peak hours and release resources during off-peak hours. This enables users to use resources on demand and focus on core business at lower costs.

In big data applications, especially in periodic data analysis and processing scenarios, cluster computing resources need to be dynamically adjusted based on service data changes to meet service requirements. The auto scaling function of MRS enables clusters to be elastically scaled out or in based on cluster loads. In addition, if the data volume changes regularly and you want to scale out or in a cluster before the data volume changes, you can use the MRS resource plan feature.

MRS supports two types of auto scaling policies: auto scaling rules and resource plans

- Auto scaling rules: You can increase or decrease Task nodes based on real-time cluster loads. Auto scaling will be triggered when the data volume changes but there may be some delay.
- Resource plans: If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding a delay in increasing or decreasing resources.

Both auto scaling rules and resource plans can trigger auto scaling. You can configure both of them or configure one of them. Configuring both resource plans and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

In some service scenarios, resources need to be reallocated or service logic needs to be modified after cluster scale-out or scale-in. If you manually scale out or scale in a cluster, you can log in to cluster nodes to reallocate resources or modify service logic. If you use auto scaling, MRS enables you to customize automation scripts for resource reallocation and service logic modification. Automation scripts can be executed before and after auto scaling and automatically adapt to service load changes, all of which eliminates manual operations. In addition, automation scripts can be fully customized and executed at various moments, which can meet your personalized requirements and improve auto scaling flexibility.

## Customer Benefits

MRS auto scaling provides the following benefits:

- Reducing costs  
Enterprises do not analyze data all the time but perform a batch data analysis in a specified period of time, for example, 03:00 a.m. The batch analysis may take only two hours.  
The auto scaling function enables enterprises to add nodes for batch analysis and automatically releases the nodes after completion of the analysis, minimizing costs.
- Meeting instant query requirements  
Enterprises usually encounter instant analysis tasks, for example, data reports for supporting enterprise decision-making. As a result, resource consumption increases sharply in a short period of time. With the auto scaling function,

computing nodes can be added for emergent big data analysis, avoiding a service breakdown due to insufficient computing resources. You do not need to create extra resources. After the emergency event ends, MRS can automatically release the nodes.

- Focusing on core business

It is difficult for developers to determine resource consumption on the big data secondary development platform because of complex query analysis conditions (such as global sorting, filtering, and merging) and data complexity, for example, uncertainty of incremental data. As a result, estimating the computing volume is difficult. MRS's auto scaling function enable developers to focus on service development without the need for resource estimation.

#### 1.4.8.4 Task Node Creation

##### Feature Introduction

Task nodes can be created and used for computing only. They do not store persistent data and are the basis for implementing auto scaling.

##### Customer Benefits

When MRS is used only as a computing resource, Task nodes can be used to reduce costs and facilitate cluster node scaling, flexibly meeting users' requirements for increasing or decreasing cluster computing capabilities.

##### Application Scenarios

When the data volume change is small in a cluster but the cluster's service processing capabilities need to be remarkably and temporarily improved, add Task nodes to address the following situations:

- The number of temporary services is increased, for example, report processing at the end of the year.
- Long-term tasks need to be completed in a short time, for example, some urgent analysis tasks.

#### 1.4.8.5 Isolating a Host

When detecting that a host is abnormal or faulty and cannot provide services or affects cluster performance, you can exclude the host from the available nodes in the cluster temporarily so that the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation. Only non-management nodes can be isolated.

After a host is isolated, all role instances on the host will be stopped, and you cannot start, stop, or configure the host and all instances on the host. In addition, after a host is isolated, statistics about the monitoring status and metric data of hardware and instances on the host cannot be collected or displayed.

### 1.4.8.6 Managing Tags

Tags are cluster identifiers. Adding tags to clusters can help you identify and manage your cluster resources. By associating with Tag Management Service (TMS), MRS allows users with a large number of cloud resources to tag cloud resources, quickly search for cloud resources with the same tag attribute, and perform unified management operations such as review, modification, and deletion, facilitating unified management of big data clusters and other cloud resources.

You can add a maximum of 10 tags to a cluster when creating the cluster or add them on the details page of the created cluster.

## 1.4.9 Cluster O&M

### Alarm Management

MRS can monitor big data clusters in real time and identify system health status based on alarms and events. In addition, MRS allows you to customize monitoring and alarm thresholds to focus on the health status of each metric. When monitoring data reaches the alarm threshold, the system triggers an alarm.

MRS can also interconnect with the message service system of the Simple Message Notification (SMN) service to push alarm information to users by SMS message or email. For details, see [Message Notification](#).

### Patch Management

MRS supports cluster patching operations and will release patches for open source big data components in a timely manner. On the MRS cluster management page, you can view patch release information related to running clusters, including the detailed description of the resolved issues and impacts. You can determine whether to install a patch based on the service running status. One-click patch installation involves no manual intervention, and will not cause service interruption through rolling installation, ensuring long-term availability of the clusters.

MRS can display the detailed patch installation process. Patch management also supports patch uninstallation and rollback.

#### NOTE

MRS 3.x or later does not support patch management on the management console.

### O&M Support

Cluster resources provided by MRS belong to users. Generally, when O&M personnel's support is required for troubleshooting of a cluster, O&M personnel cannot directly access the cluster. To better serve customers, MRS provides the following two methods to improve communication efficiency during fault locating:

- **Log sharing:** You can initiate log sharing on the MRS management console to share a specified log scope with O&M personnel, so that O&M personnel can locate faults without accessing the cluster.

- O&M authorization: If a problem occurs when you use an MRS cluster, you can initiate O&M authorization on the MRS management console. O&M personnel can help you quickly locate the problem, and you can revoke the authorization at any time.

## Health Check

MRS provides automatic inspection on system running environments for you to check and audit system running health status in one click, ensuring proper system running and lowering system operation and maintenance costs. After viewing inspection results, you can export reports for archiving and fault analysis.

## 1.4.10 Message Notification

### Feature Introduction

The following operations are often performed during the running of a big data cluster:

- Big data clusters often change, for example, cluster scale-out and scale-in.
- When a service data volume changes abruptly, auto scaling will be triggered.
- After related services are stopped, a big data cluster needs to be stopped.

To immediately notify you of successful operations, cluster unavailability, and node faults, MRS uses Simple Message Notification (SMN) to send notifications to you through SMS and emails, facilitating maintenance.

### Customer Benefits

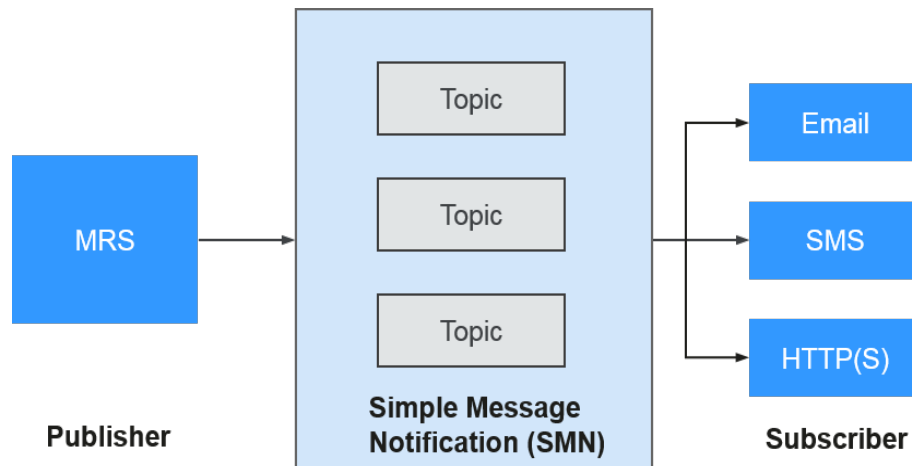

After configuring SMN, you can receive MRS cluster health status, updates, and component alarms through SMS or emails in real time. MRS sends real-time monitoring and alarm notification to help you easily perform O&M and efficiently deploy big data services.

### Feature Description

MRS uses SMN to provide one-to-multiple message subscription and notification over a variety of protocols.

You can create a topic and configure topic policies to control publisher and subscriber permissions on the topic. MRS sends cluster messages to the topic to which you have permission to publish messages. Then, all subscribers who subscribe to the topic can receive cluster updates and component alarms through SMS and emails.

**Figure 1-144** Implementation process

## 1.5 Constraints

Before using MRS, ensure that you have read and understand the following restrictions.

- MRS clusters must be created in VPC subnets.
- You are advised to use any of the following browsers to access MRS:
  - Google Chrome: 36.0 or later
  - Internet Explorer: 9.0 or later
- When you create an MRS cluster, you can select **Auto create** from the drop-down list of **Security Group** to create a security group or select an existing security group. After the MRS cluster is created, do not delete or modify the used security group. Otherwise, a cluster exception may occur.
- To prevent illegal access, only assign access permission for security groups used by MRS where necessary.
- Do not perform the following operations because they will cause cluster exceptions:
  - Shutting down, restarting, or deleting MRS cluster nodes displayed in ECS, changing or reinstalling their OS, or modifying their specifications.
  - Deleting the existing processes, applications or files on cluster nodes.
- If a cluster exception occurs when no incorrect operations have been performed, contact technical support engineers. They will ask you for your password and then perform troubleshooting.
- Plan disks of cluster nodes based on service requirements. If you want to store a large volume of service data, add EVS disks or storage space to prevent insufficient storage space from affecting node running.
- The cluster nodes store only users' service data. Non-service data can be stored in the OBS or other ECS nodes.
- The cluster nodes only run MRS cluster programs. Other client applications or user service programs are deployed on separate ECS nodes.
- The storage capacity of MRS cluster nodes (including master, core, and task nodes) can be expanded only by attaching new disks instead of expanding capacity of the existing disks.

- If the cluster is still used to execute tasks or modify configurations after a master node in the cluster has been stopped, and other master nodes in the cluster are stopped before the stopped master node is started after the task execution or configuration modification, data may be lost due to an active/standby switchover. In this scenario, after the task is executed or the configuration is modified, start the master node that has been stopped and then stop all nodes. If all nodes in the cluster have been stopped, start them in the reverse order of node shutdown.
- The Capacity and Superior scheduler switchover is complete when the MRS cluster is used, while configuration synchronization is not complete. Configure synchronization again based on the new scheduler if necessary.

## 1.6 Permissions Management

If you need to assign different permissions to employees in your enterprise to access your MRS resources in the cloud, IAM is a good choice for fine-grained permissions management. IAM provides identity authentication, permissions management, and access control, helping you secure access to your cloud resources.

With IAM, you can create IAM users under your cloud account, and assign permissions to these users to control their access to specific resources. For example, some software developers in your enterprise need to use MRS resources but must not delete MRS clusters or perform any high-risk operations. To achieve this goal, you can create IAM users for the software developers and grant them only the permissions required for using MRS cluster resources.

If your cloud account does not require individual IAM users for permissions management, skip this section.

### MRS Permissions

By default, new IAM users do not have any permissions. To assign permissions to a user, add the user to one or more groups and assign permissions policies or roles to these groups. The user then inherits permissions from the groups it is a member of and can perform specified operations on cloud services based on the permissions.

MRS is a project-level service deployed and accessed in specific physical regions. To assign permissions to a user group, specify **Scope** as **Region-specific projects** and select projects in the corresponding region for the permissions to take effect. If **All projects** is selected, the permissions will take effect for the user group in all region-specific projects. When accessing MRS, the users need to switch to a region where they have been authorized to use the MRS service.

You can grant users permissions by using roles and policies.

- **Roles:** A type of coarse-grained authorization mechanism that defines permissions related to user responsibilities. This mechanism provides only a limited number of service-level roles for authorization. When using roles to grant permissions, you need to also assign other roles on which the permissions depend to take effect. However, roles are not an ideal choice for fine-grained authorization and secure access control.

- **Policies:** A type of fine-grained authorization mechanism that defines permissions required to perform operations on specific cloud resources under certain conditions. This mechanism allows for more flexible policy-based authorization, meeting requirements for secure access control. For example, you can grant MRS users only the permissions for performing specified operations on MRS clusters, such as creating a cluster and querying a cluster list rather than deleting a cluster. Most policies define permissions based on APIs.

**Table 1-29** lists all the system policies supported by MRS.

**Table 1-29** MRS system policies

Policy	Description	Type
MRS FullAccess	Administrator permissions for MRS. Users granted these permissions can operate and use all MRS resources.	Fine-grained policy
MRS CommonOperations	Common user permissions for MRS. Users granted these permissions can use MRS but cannot add or delete resources.	Fine-grained policy
MRS ReadOnlyAccess	Read-only permission for MRS. Users granted these permissions can only view MRS resources.	Fine-grained policy
MRS Administrator	Permissions: <ul style="list-style-type: none"> <li>• All operations on MRS</li> <li>• Users with permissions of this policy must also be granted permissions of the <b>Tenant Guest</b>, <b>Server Administrator</b>, and <b>BSS Administrator</b> policies.</li> </ul>	RBAC policy

**Table 1-30** lists the common operations supported by each system-defined policy or role of MRS. Select the policies or roles as required.

**Table 1-30** Common operations supported by each system-defined policy

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Creating a cluster	√	x	x	√
Resizing a cluster	√	x	x	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Upgrading node specifications	√	x	x	√
Deleting a cluster	√	x	x	√
Querying cluster details	√	√	√	√
Querying a cluster list	√	√	√	√
Configuring an auto scaling rule	√	x	x	√
Querying a host list	√	√	√	√
Querying operation logs	√	√	√	√
Creating and executing a job	√	√	x	√
Stopping a job	√	√	x	√
Deleting a single job	√	√	x	√
Deleting jobs in batches	√	√	x	√
Querying job details	√	√	√	√
Querying a job list	√	√	√	√
Creating a folder	√	√	x	√
Deleting a file	√	√	x	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Querying a file list	√	√	√	√
Operating cluster tags in batches	√	√	x	√
Creating a single cluster tag	√	√	x	√
Deleting a single cluster tag	√	√	x	√
Querying a resource list by tag	√	√	√	√
Querying cluster tags	√	√	√	√
Accessing Manager	√	√	x	√
Querying a patch list	√	√	√	√
Installing a patch	√	√	x	√
Uninstalling a patch	√	√	x	√
Authorizing O&M channels	√	√	x	√
Sharing O&M channel logs	√	√	x	√

Operation	MRS FullAccess	MRS CommonOperations	MRS ReadOnlyAccess	MRS Administrator
Subscribing to alarm notification	√	√	x	√
Submitting an SQL statement	√	√	x	√
Querying SQL results	√	√	x	√
Canceling an SQL execution task	√	√	x	√

## 1.7 Related Services

### Relationships with Other Services

**Table 1-31** Relationships with other services

Service	Relationships
Virtual Private Cloud (VPC)	MRS clusters are created in the subnets of a VPC. VPCs provide a secure, isolated, and logical network environment for your MRS clusters.
Object Storage Service (OBS)	<p>OBS stores the following user data:</p> <ul style="list-style-type: none"> <li>• MRS job input data, such as user programs and data files</li> <li>• MRS job output data, such as result files and log files of jobs</li> </ul> <p>In MRS clusters, HDFS, Hive, MapReduce, Yarn, Spark, Flume, and Loader can import or export data from OBS.</p> <p>MRS uses the parallel file system of OBS to provide services.</p>
Elastic Cloud Server (ECS)	MRS uses elastic cloud servers (ECSs) as cluster nodes.
Relational Database Service (RDS)	RDS stores MRS system running data, including MRS cluster metadata.
Identity and Access Management (IAM)	IAM provides authentication for MRS.
Simple Message Notification (SMN)	MRS uses SMN to provide one-to-multiple message subscription and notification over a variety of protocols.

Service	Relationships
Cloud Trace Service (CTS)	CTS provides you with operation records of MRS resource operation requests and request results for querying, auditing, and backtracking.

**Table 1-32** MRS operations recorded by CTS

Operation	Resource Type	Trace Name
Creating a cluster	cluster_mrs	createCluster
Deleting a cluster	cluster_mrs	deleteCluster
Expanding a cluster	cluster_mrs	scaleOutCluster
Shrinking a cluster	cluster_mrs	scaleInCluster

After you enable CTS, the system starts recording operations on cloud resources. You can view operation records of the last 7 days on the CTS management console. For details, see **Cloud Trace Service > Getting Started > Querying Real-Time Traces**.

# 2 IAM Permissions Management

---

## 2.1 Creating a User and Granting Permissions

Use [IAM](#) to implement fine-grained permission control over your MapReduce Service (MRS). With IAM, you can:

- Create IAM users for employees based on your enterprise's organizational structure. Each IAM user will have their own security credentials for accessing MRS resources.
- Grant only the permissions required for users to perform a specific task.
- Entrust a cloud account or cloud service to perform efficient O&M on your MRS resources.

If your cloud account does not require individual IAM users, skip this chapter.

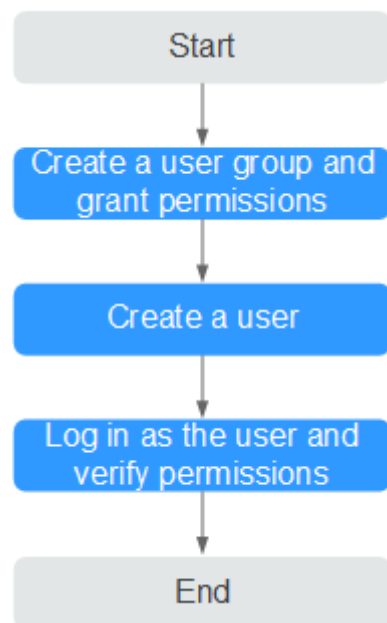

This section describes the procedure for granting permissions (see [Figure 2-1](#)).

### Prerequisites

Learn about the permissions.

## Process Flow

Figure 2-1 Process for granting MRS permissions

1. **Create a user group and assign permissions to it.**  
Create a user group on the IAM console, and assign MRS permissions to the group.
2. **Create a user and add it to a user group.**  
Create a user on the IAM console and add the user to the group created in **1. Create a user group and assign permissions to it.**
3. Log in and verify permissions.  
Log in to the console by using the user created, and verify that the user has the granted permissions.
  - Choose **Service List > MapReduce Service**. Then click **Create Cluster** on the MRS console. If a message appears indicating that you have insufficient permissions to perform the operation, the **MRS ReadOnlyAccess** policy has already taken effect.
  - Choose any other service in **Service List**. If a message appears indicating that you have insufficient permissions to access the service, the **MRS ReadOnlyAccess** policy has already taken effect.

## 2.2 Creating MRS Custom Policies

Custom policies can be created to supplement the system-defined policies of MRS. For the actions that can be added to custom policies, see [Permissions Policies and Supported Actions](#).

You can create custom policies in either of the following ways:

- Visual editor: Select cloud services, actions, resources, and request conditions. This does not require knowledge of policy syntax.

- JSON: Edit JSON policies from scratch or based on an existing policy.

For details, see [Creating a Custom Policy](#).

## Example Custom Policies

- Example 1: Allowing users to create MRS clusters only

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create",
        "ecs:*:*",
        "bms:*:*",
        "evs:*:*",
        "vpc:*:*"
      ]
    }
  ]
}
```

- Example 2: Allowing users to resize an MRS cluster

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:resize"
      ]
    }
  ]
}
```

- Example 3: Allowing users to create a cluster, create and execute a job, and delete a single job, but denying cluster deletion

```
{
  "Version": "1.1",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "mrs:cluster:create",
        "mrs:job:submit",
        "mrs:job:delete"
      ]
    },
    {
      "Effect": "Deny",
      "Action": [
        "mrs:cluster:delete"
      ]
    }
  ]
}
```

## 2.3 Synchronizing IAM Users to MRS

IAM user synchronization is to synchronize IAM users bound with MRS policies to the MRS system and create accounts sharing same names with the IAM users but different passwords. Then, you can use an IAM username (the password needs to be reset by user **admin** of Manager) to log in to Manager for cluster

management, and submit jobs on the GUI in a cluster with Kerberos authentication enabled.

**Table 2-1** compares IAM users' permission policies and the synchronized users' permissions on MRS. For details about the default permissions on Manager, see [Users and Permissions of MRS Clusters](#).

**Table 2-1** Policy and permission mapping after synchronization

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
Fine-grained	MRS ReadOnlyAccess	Manager_viewer	No	No
	MRS CommonOperations	<ul style="list-style-type: none"> <li>• Manager_viewer</li> <li>• default</li> <li>• launcher-job</li> </ul>	No	Yes
	MRS FullAccess	<ul style="list-style-type: none"> <li>• Manager_administrator</li> <li>• Manager_auditor</li> <li>• Manager_operator</li> <li>• Manager_tenant</li> <li>• Manager_viewer</li> <li>• System_administrator</li> <li>• default</li> <li>• launcher-job</li> </ul>	Yes	Yes

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
RBAC	MRS Administrator	<ul style="list-style-type: none"> <li>• Manager_administrator</li> <li>• Manager_auditor</li> <li>• Manager_operator</li> <li>• Manager_tenant</li> <li>• Manager_viewer</li> <li>• System_administrator</li> <li>• default</li> <li>• launcher-job</li> </ul>	No	Yes
	Server Administrator, Tenant Guest, and MRS Administrator	<ul style="list-style-type: none"> <li>• Manager_administrator</li> <li>• Manager_auditor</li> <li>• Manager_operator</li> <li>• Manager_tenant</li> <li>• Manager_viewer</li> <li>• System_administrator</li> <li>• default</li> <li>• launcher-job</li> </ul>	Yes	Yes

Policy Type	IAM Policy	User's Default Permissions on MRS After Synchronization	Have Permission to Perform the Synchronization	Have Permission to Submit Jobs
	Tenant Administrator	<ul style="list-style-type: none"> <li>• Manager_administrator</li> <li>• Manager_auditor</li> <li>• Manager_operator</li> <li>• Manager_tenant</li> <li>• Manager_viewer</li> <li>• System_administrator</li> <li>• default</li> <li>• launcher-job</li> </ul>	Yes	Yes
Custom	Custom policy	<ul style="list-style-type: none"> <li>• Manager_viewer</li> <li>• default</li> <li>• launcher-job</li> </ul>	<ul style="list-style-type: none"> <li>• If custom policies use RBAC policies as a template, refer to the RBAC policies.</li> <li>• If custom policies use fine-grained policies as a template, refer to the fine-grained policies. The fine-grained policies are recommended.</li> </ul>	Yes

 NOTE

To facilitate user permission management, use fine-grained policies rather than RBAC policies. In fine-grained policies, the Deny action takes precedence over other actions.

- A user has permission to synchronize IAM users only when the user has the Tenant Administrator role or has the Server Administrator, Tenant Guest, and MRS Administrator roles at the same time.
- A user with the **action:mrs:cluster:syncUser** policy has permission to synchronize IAM users.

## Procedure

- Step 1** Create a user and authorize the user to use MRS. For details, see [Creating a User and Granting Permissions](#).
- Step 2** Log in to the MRS management console and create a cluster. For details, see [Creating a Custom Cluster](#).
- Step 3** In the left navigation pane, choose **Clusters > Active Clusters**. Click the cluster name to go to the cluster details page.
- Step 4** In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users.
- Step 5** After a synchronization request is sent, choose **Operation Logs** in the left navigation pane on the MRS console to check whether the synchronization is successful. For details about the logs, see [Viewing Operation Logs](#).
- Step 6** After the synchronization is successful, use the user synchronized with IAM to perform subsequent operations.

 NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.
- After you click **Click to synchronize** on the right side of **IAM User Sync**, the cluster details page is blank for a short time, because user data is being synchronized. The page will be properly displayed after the data synchronization is complete.
- Submitting jobs in a security cluster: Users can submit jobs using the job management function on the GUI in the security cluster. For details, see [Running a MapReduce Job](#).
- All tabs are displayed on the cluster details page, including **Components**, **Tenants**, and **Backups & Restorations**.
- Logging in to Manager
  - a. Log in to Manager as user **admin**. For details, see [Accessing Manager](#).
  - b. Initialize the password of the user synchronized with IAM. For details, see [Initializing the Password of a System User](#).

- c. Modify the role bound to the user group to which the user belongs to control user permissions on Manager. For details, see [Related Tasks](#). For details about how to create and modify a role, see [Creating a Role](#). After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.
- d. Log in to Manager using the user synchronized with IAM and the password after the initialization in [Step 6.b](#).

 **NOTE**

If the IAM user's permission changes, go to [Step 4](#) to perform second synchronization. After the second synchronization, a system user's permissions are the union of the permissions defined in the IAM system policy and the permissions of roles added by the system user on Manager. After the second synchronization, a custom user's permissions are subject to the permissions configured on Manager.

- System user: If all user groups to which an IAM user belongs are bound to system policies (RABC policies and fine-grained policies belong to system policies), the IAM user is a system user.
- Custom user: If the user group to which an IAM user belongs is bound to any custom policy, the IAM user is a custom user.

----End

# 3 MRS Quick Start

---

## 3.1 How to Use MRS

MapReduce Service (MRS) is a cloud service that is used to deploy and manage the Hadoop system and enables one-click Hadoop cluster deployment. MRS provides enterprise-level big data clusters on the cloud. Tenants can fully control the clusters and easily run big data components such as Hadoop, Spark, HBase, Kafka, and Storm in the clusters.

MRS is easy to use. You can execute various tasks and process or store PB-level data using computers connected in a cluster. The procedure of using MRS is as follows:

1. Upload local programs and data files to OBS.
2. Create a cluster by following instructions in [Creating a Custom Cluster](#). You can choose a cluster type for offline data analysis or stream processing or both, and set ECS instance specifications, instance count, data disk type (common I/O, high I/O, and ultra-high I/O), and components to be installed such as Hadoop, Spark, HBase, Hive, Kafka, and Storm in a cluster. You can use a [bootstrap action](#) to execute a script on a specified node before or after the cluster is started to install additional third-party software, modify the cluster running environment, and perform other customizations.
3. [Manage jobs](#). MRS provides a platform for executing programs you develop. You can submit, execute, and monitor such programs on MRS.
4. [Manage clusters](#). MRS provides you with MRS Manager, an enterprise-level unified management platform of big data clusters, helping you quickly know health status of services and hosts. Through graphical metric monitoring and customization, you can obtain critical system information in a timely manner. In addition, you can modify service attribute configurations based on service performance requirements, and start or stop clusters, services, and role instances in one click.
5. [Terminate a cluster](#). You can terminate an MRS cluster that is no longer use after job execution is complete.

## 3.2 Creating a Cluster

The first step of using MRS is to create a cluster. This section describes how to create a cluster on the MRS management console.

### Procedure

**Step 1** Log in to the MRS management console.

**Step 2**

 **NOTE**

When creating a cluster, pay attention to quota notification. If a resource quota is insufficient, increase the resource quota as prompted and create a cluster.

**Step 3** On the page for creating a cluster, select **Custom Config**.

**Step 4** Configure cluster software information.

- **Region:** Use the default value.
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs\_20180321**.
- **Cluster Version:** Select the latest version, which is the default value.
- **Cluster Type:** Use the default **Analysis Cluster**.
- **Component:** Select components such as Spark2x, HBase, and Hive for the analysis cluster. For a streaming cluster, select components such as Kafka and Storm. For a hybrid cluster, you can select the components of the analysis cluster and streaming cluster based on service requirements.
- **Metadata:** Retain the default value.

 **NOTE**

For versions earlier than MRS 3.x, select components such as Spark, HBase, and Hive for the analysis cluster.

**Step 5** Click **Next**.

- **AZ:** Use the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **Security Group:** Select **Auto create**.
- **EIP:** Select **Bind later**.
- **Enterprise Project:** Use the default value.
- **Instance Specifications:** Select General Computing S3 -> 8 vCPUs | 16 GB (s3.2xlarge.2) for both Master and Core nodes.
- **System Disk:** Select **Common I/O** and retain the default settings.
- **Data Disk:** Select **Common I/O** and retain the default settings.
- **Instance Count:** The default number of Master nodes is 2, and that of Core nodes is 3.

**Step 6** Click **Next**. The **Set Advanced Options** tab page is displayed. Configure the following parameters. Retain the default settings for the other parameters.

- **Kerberos authentication:**
  - **Kerberos Authentication:** Disable Kerberos authentication.
  - **Username:** name of the Manager administrator. **admin** is used by default.
  - **Password:** password of the Manager administrator.
- **Login Mode:** Select a mode for logging in to an ECS.
  - **Password:** Set a password for logging in to an ECS.
  - **Key Pair:** Select a key pair from the drop-down list. Select "**I acknowledge that I have obtained private key file *SSHkey-xxx* and that without this file I will not be able to log in to my ECS.**" If you have never created a key pair, click **View Key Pair** to create or import a key pair. And then, obtain a private key file.
- **Secure Communications:** Select **Enable**.

**Step 7** Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 8** Click **Back to Cluster List** to view the cluster status.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

----End

## 3.3 Uploading Data and Programs

Through the **Files** tab page, you can create, delete, import, export, delete files in the analysis cluster.

### Background

MRS clusters process data from OBS or HDFS. OBS provides customers with the data storage capabilities that are massive, secure, reliable, and cost-effective. MRS can directly process data in OBS. You can browse, manage, and use data on the web page of the management console and OBS Client.

### Importing Data

Currently, MRS can only import data from OBS to HDFS. The file upload rate decreases with the increase of the file size. This mode applies to scenarios where the data volume is small.

You can perform the following steps to import files and directories:

1. Log in to the MRS management console.

2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's information.
3. Click the **Files** tab to go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd\_app1**.  
The **bd\_app1** directory is only an example. You can use any directory on the page or create a new one.  
The requirements for creating a folder are as follows:
  - The folder name contains a maximum of 255 characters
  - The folder name cannot be empty.
  - The folder name cannot contain the following special characters: `/:*?"<>| \;&,'!{}[]$%+`
  - The value cannot start or end with a period (.).
  - The spaces at the beginning and end are ignored.
6. Click **Import Data** and configure the HDFS and OBS paths correctly. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
  - OBS path
    - The path must start with **obs://**.
    - Files or programs encrypted by KMS cannot be imported.
    - An empty folder cannot be imported.
    - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters: `;&>,<'$*?\`
    - The directory and file name cannot start or end with a space, but can contain spaces between them.
    - The OBS full path contains a maximum of 255 characters.
  - HDFS path
    - The path starts with **/user** by default.
    - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters: `;&>,<'$*?\:`
    - The directory and file name cannot start or end with a space, but can contain spaces between them.
    - The HDFS full path contains a maximum of 255 characters.
7. Click **OK**.  
You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data import operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

## Exporting Data

After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS.

You can perform the following steps to export files and directories:

1. Log in to the MRS management console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
3. Click the **Files** tab to go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd\_app1**.
6. Click **Export Data** and configure the OBS and HDFS paths. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
  - OBS path
    - The path must start with **obs://**.
    - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters ;|&><'\$\*?\
    - The directory and file name cannot start or end with a space, but can contain spaces between them.
    - The OBS full path contains a maximum of 255 characters.
  - HDFS path
    - The path starts with **/user** by default.
    - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters: ;|&><'\$\*?\":
    - The directory and file name cannot start or end with a space, but can contain spaces between them.
    - The HDFS full path contains a maximum of 255 characters.

### NOTE

When a folder is exported to OBS, a label file named **folder name\_ \$folder\$** is added to the OBS path. Ensure that the exported folder is not empty. If the exported folder is empty, OBS cannot display the folder and only generates a file named **folder name\_ \$folder\$**.

7. Click **OK**.

You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data export operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

## 3.4 Creating a Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results.

This section describes how to submit a job (take a MapReduce job as an example) on the MRS management console. MapReduce jobs are used to submit JAR programs to quickly process massive amounts of data in parallel and create a distributed data processing and execution environment.

If the job and file management functions are not supported on the cluster details page, submit the jobs in the background.

Before creating a job, you need to upload local data to OBS for data computing and analyzing. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the analyzing and computing are complete, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

### Submitting a Job on the GUI

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

#### NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

**Step 4** Click the **Jobs** tab.

**Step 5** Click **Create**. The **Create Job** page is displayed.

**Step 6** In **Type**, select **MapReduce**. Configure other job information.

**Table 3-1** Job configuration information

Parameter	Description
Name	<p>Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p><b>NOTE</b> You are advised to set different names for different jobs.</p>
Program Path	<p>Path of the program package to be executed. The following requirements must be met:</p> <ul style="list-style-type: none"> <li>• Contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;&lt;'\$. The parameter value cannot be empty or full of spaces.</li> <li>• The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> <li>– OBS: The path must start with <b>obs://</b>. Example: <b>obs://wordcount/program/xxx.jar</b></li> <li>– HDFS: The path must start with <b>/user</b>. For details about how to import data to HDFS, see <a href="#">Importing Data</a>.</li> </ul> </li> <li>• For SparkScript and HiveScript, the path must end with <b>.sql</b>. For MapReduce, the path must end with <b>.jar</b>. For Flink and SparkSubmit, the path must end with <b>.jar</b> or <b>.py</b>. The <b>.sql</b>, <b>.jar</b>, and <b>.py</b> are case-insensitive.</li> </ul>
Parameters	<p>(Optional) It is the key parameter for program execution. Multiple parameters are separated by space.</p> <p>Configuration method: <i>Program class name Data input path Data output path</i></p> <ul style="list-style-type: none"> <li>• Program class name: It is specified by a function in your program. MRS is responsible for transferring parameters only.</li> <li>• Data input path: Click <b>HDFS</b> or <b>OBS</b> to select a path or manually enter a correct path.</li> <li>• Data output path: Enter a directory that does not exist. The parameter contains a maximum of 2,047 characters, excluding special characters such as ; &amp;&gt;&lt;'\$, and can be left blank.</li> </ul> <p><b>CAUTION</b> If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.</p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in <a href="#">Configuring Service Parameters</a>.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click <b>Delete</b> on the right.</p> <p><a href="#">Table 3-2</a> lists the common service configuration parameters.</p>

Parameter	Description
Command Reference	Command submitted to the background for execution when a job is submitted.

**Table 3-2 Service Parameter** parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

**Step 7** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

**Step 4** Click **Remote Login** in the upper right corner of the page.

**Step 5** Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

**Step 6** Run the following command to initialize environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

**Step 7** If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

**Step 8** Run the following command to copy the program in the OBS file system to the Master node in the cluster:

```
hadoop fs -Dfs.obs.access.key=AK -Dfs.obs.secret.key=SK -copyToLocal  
source_path.jar target_path.jar
```

Example: `hadoop fs -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX -  
copyToLocal "obs://mrs-word/program/hadoop-mapreduce-examples-XXX.jar"  
"/home/omm/hadoop-mapreduce-examples-XXX.jar"`

You can log in to OBS Console using AK/SK. To obtain AK/SK information, click the username in the upper right corner of the management console and choose **My Credentials > Access Keys**.

**Step 9** Run the following command to submit a wordcount job. If data needs to be read from OBS or outputted to OBS, the AK/SK parameters need to be added.

```
source /opt/Bigdata/client/bigdata_env;hadoop jar execute.jar wordcount  
input_path output_path
```

Example: `source /opt/Bigdata/client/bigdata_env;hadoop jar /home/omm/  
hadoop-mapreduce-examples-XXX.jar wordcount -Dfs.obs.access.key=XXXX -  
Dfs.obs.secret.key=XXXX "obs://mrs-word/input/*" "obs://mrs-word/output/"`

In the preceding command, **input\_path** indicates a path for storing job input files on OBS. **output\_path** indicates a path for storing job output files on OBS and needs to be set to a directory that does not exist

----End

## 3.5 Terminating a Cluster

You can terminate an MRS cluster that is no longer use after job execution is complete.

### Background

You can manually terminate a cluster after data analysis is complete or when the cluster encounters an exception. A cluster failed to be deployed will be automatically terminated.

### Procedure

- Step 1** Log in to the MRS console.
- Step 2** In the navigation tree of the MRS console, choose **Clusters > Active Clusters**.
- Step 3** Locate the cluster to be terminated, and click **Terminate** in the **Operation** column.

The cluster status changes from **Running** to **Terminating**, and finally to **Terminated**. You can view the clusters in **Terminated** state in **Cluster History**.

----End

# 4 Configuring a Cluster

## 4.1 Overview

You can quickly view the status of all clusters and jobs by viewing the dashboard information, and obtain relevant MRS documents from **Help** in the left navigation pane on the MRS console.

MRS is used to manage and analyze massive data. It is easy to use. You can create a cluster and add MapReduce, Spark, and Hive jobs to the cluster to analyze and process user data. After being processed, you can transmit the data in SSL encryption mode to OBS to ensure data integrity and confidentiality.

### Cluster Status

**Table 4-1** lists the statuses of all MRS clusters after you log in to the MRS management console.

**Table 4-1** Cluster status

Status	Description
Starting	If a cluster is being created, the cluster is in the <b>Starting</b> state.
Running	If a cluster is created successfully and all components in the cluster are normal, the cluster is in the <b>Running</b> state.
Scaling out	If the Core or Task node in a cluster is being added, the cluster is in the <b>Scaling out</b> state. <b>NOTE</b> If the cluster scale-out fails, you can add node to the cluster again.
Scaling in	If you stop, delete, change or reinstall the OSs of cluster nodes, and modify the specifications of the cluster node, the cluster nodes are being terminated. Then, the cluster is in the <b>Scaling in</b> state.

Status	Description
Abnormal	If some components in a cluster are abnormal, the cluster is <b>Abnormal</b> .
Terminating	If a cluster node is being terminated, the cluster is in the <b>Terminating</b> state.
Terminated	The cluster has been terminated. This parameter is displayed only in <b>Cluster History</b> .

## Job Status

**Table 4-2** describes the status of jobs that you execute after logging in to the MRS management console.

**Table 4-2** Job status

Status	Description
Accepted	Initial status of a job after it is successfully submitted.
Running	A job is being executed.
Completed	A job has been executed and completed successfully.
Terminated	A job is stopped during execution.
Abnormal	An error occurs during job execution or job execution fails.

## 4.2 Cluster List

The cluster list contains all clusters in MRS. You can view clusters in various states. If a large number of clusters are involved, navigate through multiple pages to view all of the clusters.

MRS, as a platform managing and analyzing massive data, provides a PB-level data processing capability. MRS allows you to create multiple clusters. The cluster quantity is subject to that of ECSs.

Clusters are listed in chronological order by default in the cluster list, with the most recent cluster displayed at the top. **Table 4-3** describes the cluster list parameters.

- **Active Clusters:** contain all clusters except the clusters in the **Failed** and **Terminated** states.
- **Cluster History:** contains the tasks in the **Terminated** states. Only clusters terminated within the last six months are displayed. If you want to view clusters terminated six months ago, contact technical support engineers.
- **Failed Tasks:** only contain the tasks in the **Failed** state. Task failures include:

- Cluster creation failure
- Cluster termination failure
- Cluster scale-out failure
- Cluster scale-in failure
- Cluster patch installation failure (supported only by versions earlier than MRS 3.x)
- Cluster patch uninstallation failure (supported only by versions earlier than MRS 3.x)
- Cluster specifications upgrade failure

**Table 4-3** Parameters in the active cluster list

Parameter	Description
Name/ID	<p>Cluster name, which is set when a cluster is created. Unique identifier of a cluster, which is automatically assigned when a cluster is created.</p> <ul style="list-style-type: none"> <li>•  : Change the cluster name.</li> <li>•  : Copy the cluster ID.</li> </ul>
Cluster Version	Cluster version.
Nodes	Number of nodes that can be deployed in a cluster. This parameter is set when a cluster is created.

Parameter	Description
Status	<p>Status and operation progress description of a cluster.</p> <p>The cluster creation progress includes:</p> <ul style="list-style-type: none"> <li>• Verifying cluster parameters</li> <li>• Applying for cluster resources</li> <li>• Creating VMs</li> <li>• Initializing VMs</li> <li>• Installing MRS Manager</li> <li>• Deploying the cluster</li> <li>• Cluster installation failed</li> </ul> <p>The cluster scale-out progress includes:</p> <ul style="list-style-type: none"> <li>• Preparing for scale-out</li> <li>• Creating VMs</li> <li>• Initializing VMs</li> <li>• Adding nodes to the cluster</li> <li>• Scale-out failed</li> </ul> <p>The cluster scale-in progress includes:</p> <ul style="list-style-type: none"> <li>• Preparing for scale-in</li> <li>• Decommissioning instance</li> <li>• Deleting VMs</li> <li>• Deleting nodes from the cluster</li> <li>• Scale-in failed</li> </ul> <p>The system will display causes of cluster installation, scale-out, and scale-in failures. For details, see <a href="#">Table 4-9</a>.</p>
Created	The cluster node is successfully created.
Terminated	Time when a cluster node stops and the cluster node begins to be terminated. This parameter is valid only for historical clusters displayed on the <b>Cluster History</b> page.
AZ	Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.
Enterprise Project	Enterprise project to which a cluster belongs.

Parameter	Description
Operation	<p><b>Terminate:</b> If you want to terminate a cluster after jobs are complete, click <b>Terminate</b>. The cluster status changes from <b>Running</b> to <b>Terminating</b>. After the cluster is terminated, the cluster status will change to <b>Terminated</b> and will be displayed in <b>Cluster History</b>. If the MRS cluster fails to be deployed, the cluster is automatically terminated.</p> <p>This parameter is displayed in <b>Active Clusters</b> only.</p> <p><b>NOTE</b> Typically after data is analyzed and stored, or when the cluster encounters an exception and cannot work, you can terminate a cluster. If a cluster is terminated before data processing and analysis are completed, data loss may occur. Therefore, exercise caution when terminating a cluster.</p>

**Table 4-4** Button description

Button	Description
	Select an enterprise project from the drop-down list to filter the corresponding cluster.
	<p>In the drop-down list, select a status to filter clusters:</p> <ul style="list-style-type: none"> <li>• Active Clusters <ul style="list-style-type: none"> <li>- All statuses: displays all existing clusters.</li> <li>- Starting: displays existing clusters in the <b>Starting</b> state.</li> <li>- Running: displays existing clusters in the <b>Running</b> state.</li> <li>- Scaling out: displays existing clusters in the <b>Scaling out</b> state.</li> <li>- Scaling in: displays existing clusters in the <b>Scaling in</b> state.</li> <li>- Abnormal: displays existing clusters in the <b>Abnormal</b> state.</li> <li>- Terminating: displays existing clusters in the <b>Terminating</b> state.</li> </ul> </li> </ul>
	<p>Choose <b>Clusters &gt; Active Clusters</b> and click  to go to the page for managing failed tasks.</p> <p> <i>Num.</i> displays the failed tasks in the <b>failed</b> state.</p>
	Enter a cluster name in the search bar and click  to search for a cluster.

Button	Description
Search by Tag	Click <b>Search by Tag</b> , enter the tag of the cluster to be queried, and click <b>Search</b> to search for the clusters. You can select a tag key or tag value from their drop-down lists. When the tag key or tag value is exactly matched, the system can automatically locate the target cluster. If you enter multiple tags, their intersections are used to search for the cluster.
	Click  to manually refresh the cluster list.

## 4.3 Methods of Creating MRS Clusters

This section describes how to create MRS clusters.

- **Quick Creation of a Hadoop Analysis Cluster:** On the **Quick Config** tab page, you can quickly configure parameters to create Hadoop analysis clusters within a few minutes, facilitating analysis and queries of vast amounts of data.
- **Quick Creation of an HBase Analysis Cluster:** On the **Quick Config** tab page, you can quickly configure parameters to create HBase query clusters within a few minutes, facilitating storage and distributed computing of vast amounts of data.
- **Quick Creation of a Kafka Streaming Cluster:** On the **Quick Config** tab page, you can quickly configure parameters to create Kafka streaming clusters within a few minutes, facilitating streaming data ingestion as well as real-time data processing and storage.
- **Quick Creation of a ClickHouse Cluster:** You can quickly create a ClickHouse cluster. ClickHouse is a columnar database management system used for online analysis. It features the ultimate compression rate and fast query performance.
- **Quick Creation of a Real-time Analysis Cluster:** You can create a real-time analysis cluster within a few minutes to quickly collect, analyze, and query a large amount of data.
- **Creating a Custom Cluster:** On the **Custom Config** tab page, you can flexibly configure parameters to create clusters based on application scenarios, such as ECS specifications to better suit your service requirements.

## 4.4 Quick Creation of a Hadoop Analysis Cluster

This section describes how to quickly create a Hadoop analysis cluster for analyzing and querying vast amounts of data. In the open-source Hadoop ecosystem, Hadoop uses Yarn to manage cluster resources, Hive and Spark to provide offline storage and computing of large-scale distributed data, Spark Streaming and Flink to offer streaming data computing, and Presto to enable interactive queries, Tez to provide a distributed computing framework of directed acyclic graphs (DAGs).

## Quick Creation of a Hadoop Analysis Cluster

**Step 1** Log in to the MRS management console.

**Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.

**Step 3** Click the **Quick Config** tab.

**Step 4** Configure basic cluster information. For details about the parameters, see [Creating a Custom Cluster](#).

- **Region:** Use the default value.
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs\_20180321**.
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **Hadoop analysis cluster**.
- **AZ:** Use the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **Enterprise Project:** Use the default value.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements.
- **Cluster HA:** Use the default value. This parameter is not available in MRS 3.x.
- **Kerberos Authentication:** Specifies whether to enable Kerberos authentication.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password:** Set a password for user **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

**Step 5** Select **Enable** to enable secure communications. For details, see [Communication Security Authorization](#).

**Step 6** Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 7** Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 4-3](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

## 4.5 Quick Creation of an HBase Analysis Cluster

This section describes how to quickly create an HBase query cluster. The HBase cluster uses Hadoop and HBase components to provide a column-oriented distributed cloud storage system featuring enhanced reliability, excellent performance, and elastic scalability. It applies to the storage and distributed computing of massive amounts of data. You can use HBase to build a storage system capable of storing TB- or even PB-level data. With HBase, you can filter and analyze data with ease and get responses in milliseconds, rapidly mining data value.

### Quick Creation of an HBase Analysis Cluster

- Step 1** Log in to the MRS management console.
- Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.
- Step 3** Click the **Quick Config** tab.
- Step 4** Configure basic cluster information. For details about the parameters, see [Creating a Custom Cluster](#).
  - **Region:** Use the default value.
  - **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs\_20180321**.
  - **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
  - **Component:** Select **HBase Query Cluster**.
  - **AZ:** Use the default value.
  - **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
  - **Subnet:** Use the default value.
  - **Enterprise Project:** Use the default value.
  - **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements.
  - **Cluster HA:** Use the default value. This parameter is not available in MRS 3.x.
  - **Kerberos Authentication:** Specifies whether to enable Kerberos authentication.
  - **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
  - **Password:** Set a password for user **root/admin**.
  - **Confirm Password:** Enter the password of user **root/admin** again.

**Step 5** Select **Enable** to enable secure communications. For details, see [Communication Security Authorization](#).

**Step 6** Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 7** Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 4-3](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

## 4.6 Quick Creation of a Kafka Streaming Cluster

This section describes how to quickly create a Kafka streaming cluster. The Kafka cluster uses the Kafka and Storm components to provide an open-source messaging system with high throughput and scalability. It is widely used in scenarios such as log collection and monitoring data aggregation to implement efficient streaming data collection and real-time data processing and storage.

### Quick Creation of a Kafka Streaming Cluster

**Step 1** Log in to the MRS management console.

**Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.

**Step 3** Click the **Quick Config** tab.

**Step 4** Configure basic cluster information. For details about the parameters, see [Creating a Custom Cluster](#).

- **Region:** Use the default value.
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs\_20200321**.
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **Kafka streaming cluster**.
- **AZ:** Use the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.

- **Subnet:** Use the default value.
- **Enterprise Project:** Use the default value.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements.
- **Cluster HA:** Use the default value. This parameter is not available in MRS 3.x.
- **LVM:** Use the default value. This parameter is not available in MRS 3.x.
- **Kerberos Authentication:** Specifies whether to enable Kerberos authentication.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password:** Set a password for user **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

**Step 5** Select **Enable** to enable secure communications. For details, see [Communication Security Authorization](#).

**Step 6** Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 7** Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 4-3](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

## 4.7 Quick Creation of a ClickHouse Cluster

This section describes how to quickly create a ClickHouse cluster. ClickHouse is a columnar database management system used for online analysis. It features the ultimate compression rate and fast query performance. It is widely used in Internet advertisement, app and web traffic analysis, telecom, finance, and IoT fields.

The ClickHouse cluster table engine that uses Kunpeng as the CPU architecture does not support HDFS and Kafka.

### Quick Creation of a ClickHouse Cluster

**Step 1** Log in to the MRS management console.

**Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.

**Step 3** Click the **Quick Config** tab.

**Step 4** Configure basic cluster information. For details about the parameters, see [Creating a Custom Cluster](#).

- **Region:** Use the default value.
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, Example: **mrs\_20201121**.
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **ClickHouse cluster**.
- **AZ:** Use the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **Enterprise Project:** Use the default value.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements.
- **Kerberos Authentication:** Select whether to enable Kerberos authentication.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password:** Set a password for users **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

**Step 5** Select **Enable** to enable secure communications. For details, see [Communication Security Authorization](#).

**Step 6** Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 7** Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 4-3](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

## 4.8 Quick Creation of a Real-time Analysis Cluster

This section describes how to quickly create a real-time analysis cluster. The real-time analysis cluster uses Hadoop, Kafka, Flink, and ClickHouse to collect, analyze, and query a large amount of data in real time.

The real-time analysis cluster consists of the following components:

- MRS 3.0.5: Hadoop 3.1.1, Kafka 2.11-2.4.0, Flink 1.10.0, ClickHouse 20.8.7.15, ZooKeeper 3.5.6, and Ranger 2.0.0.

### Quick Creation of a Real-time Analysis Cluster

**Step 1** Log in to the MRS management console.

**Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.

**Step 3** Click the **Quick Config** tab.

**Step 4** Configure basic cluster information. For details about the parameters, see [Creating a Custom Cluster](#).

- **Region:** Use the default value.
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, Example: **mrs\_20201130**.
- **Cluster Version:** Select the latest version, which is the default value. (The components provided by a cluster vary according to the cluster version. Select a cluster version based on site requirements.)
- **Component:** Select **Real-time Analysis Cluster**.
- **AZ:** Use the default value.
- **VPC:** Use the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Use the default value.
- **Enterprise Project:** Use the default value.
- **Cluster Node:** Select the number of cluster nodes and node specifications based on site requirements.
- **Kerberos Authentication:** Select whether to enable Kerberos authentication.
- **Username:** The default value is **root/admin**. User **root** is used to remotely log in to ECSs, and user **admin** is used to access the cluster management page.
- **Password:** Set a password for users **root/admin**.
- **Confirm Password:** Enter the password of user **root/admin** again.

**Step 5** Select **Enable** to enable secure communications. For details, see [Communication Security Authorization](#).

**Step 6** Click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 7** Click **Back to Cluster List** to view the cluster status. Click **Access Cluster** to view cluster details.

For details about cluster status during creation, see the description of the status parameters in [Table 4-3](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

## 4.9 Creating a Custom Cluster

The first step of using MRS is to create a cluster. This section describes how to create a cluster on the **Custom Config** tab of the MRS management console.

You can create an IAM user or user group on the IAM management console and grant it specific operation permissions, to perform refined resource management after registering an account. For details, see [Creating a User and Granting Permissions](#).

**Step 1** Log in to the MRS console.

**Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.

### NOTE

When creating a cluster, pay attention to quota notification. If a resource quota is insufficient, increase the resource quota as prompted and create a cluster.

**Step 3** Click the **Custom Config** tab.

**Step 4** Configure cluster information by referring to [Software Configurations](#) and click **Next**.

**Step 5** Configure cluster information by referring to [Hardware Configurations](#) and click **Next**.

**Step 6** Set advanced options by referring to [\(Optional\) Advanced Configuration](#) and click **Apply Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 7** Click **Back to Cluster List** to view the cluster status.

For details about cluster status during creation, see the description of the status parameters in [Table 4-3](#).

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

On the MRS management console, a maximum of 10 clusters can be concurrently created, and a maximum of 100 clusters can be managed.

----End

## Software Configurations

**Table 4-5** MRS cluster software configuration

Parameter	Description
Region	Select a region. Cloud service products in different regions cannot communicate with each other over an intranet. For low network latency and quick access, select the nearest region.
Cluster Name	The cluster name must be unique. A cluster name can contain 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. The default name is <b>mrs_</b> xxxx. xxxx is a random collection of letters and digits.
Cluster Version	Currently, MRS 2.1.1, MRS 3.0.5, MRS 3.1.0, and MRS 3.2.0-LTS.1 are supported.
Cluster Type	The cluster types are as follows: <ul style="list-style-type: none"> <li>• <b>Analysis cluster:</b> is used for offline data analysis and provides Hadoop components.</li> <li>• <b>Streaming cluster:</b> is used for streaming tasks and provides stream processing components.</li> <li>• <b>Hybrid cluster:</b> is used for both offline data analysis and streaming processing and provides Hadoop components and streaming processing components. You are advised to use a hybrid cluster to perform offline data analysis and streaming processing tasks at the same time.</li> <li>• <b>Custom:</b> You can adjust the cluster service deployment mode based on service requirements. For details, see <a href="#">Customizing a Topology Cluster</a>. (<b>Custom</b> is supported in MRS 3.x only.)</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• MRS streaming clusters do not support job and file management functions.</li> <li>• To install all components in a cluster, select <b>Custom</b>.</li> </ul>

Parameter	Description
Components	<p>MRS components are as follows..</p> <p>Components of an analysis cluster:</p> <ul style="list-style-type: none"> <li>● Presto: open source and distributed SQL query engine</li> <li>● Hadoop: distributed system architecture</li> <li>● Spark: in-memory distributed computing framework (not supported in MRS 3.x)</li> <li>● Spark2x: A fast general-purpose engine for large-scale data processing. It is developed based on the open-source Spark2.x version. (supported only by MRS 3.x)</li> <li>● Hive: data warehouse framework built on Hadoop</li> <li>● HBase: distributed column-oriented database</li> <li>● Tez: an application framework which allows for a complex directed-acyclic-graph of tasks for processing data</li> <li>● Hue: provides the Hadoop UI capability, which enables users to analyze and process Hadoop cluster data on browsers</li> <li>● Loader: a tool based on source Sqoop 1.99.7, designed for efficiently transferring bulk data between Apache Hadoop and structured datastores such as relational databases Hadoop is mandatory, and Spark and Hive must be used together. Select components based on service requirements.</li> <li>● Flink: a distributed big data processing engine that can perform stateful computations over both finite and infinite data streams</li> <li>● Oozie: a Hadoop job scheduling system (supported only by MRS 3.x)</li> <li>● Alluxio: a memory speed virtual distributed storage system</li> <li>● Ranger: a framework to enable, monitor, and manage data security across the Hadoop platform (Currently, Ranger does not support Kerberos authentication.)</li> <li>● Impala: an SQL query engine for processing huge volumes of data</li> <li>● ClickHouse: A column database management system (DBMS) for on-line analytical processing (OLAP). The ClickHouse cluster table engine that uses Kunpeng as the CPU architecture does not support HDFS and Kafka.</li> <li>● Kudu: a column-oriented data store</li> </ul>

Parameter	Description
	<p>Components of a streaming cluster:</p> <ul style="list-style-type: none"> <li>• Kafka: distributed messaging system</li> <li>• Flume: distributed, reliable, and available service for efficiently collecting, aggregating, and moving large amounts of log data</li> </ul>
Metadata	<p>Whether to use external data sources to store metadata.</p> <ul style="list-style-type: none"> <li>• <b>Local:</b> Metadata is stored in the local cluster.</li> <li>• <b>Data connections:</b> Metadata of external data sources is used. If the cluster is abnormal or deleted, metadata is not affected. This mode applies to scenarios where storage and compute are decoupled.</li> </ul> <p>Clusters that support the Hive or Ranger component support this function.</p>
Component	<p>This parameter is valid only when <b>Metadata</b> is set to <b>Data connections</b>. It indicates the type of an external data source. This function is not available in MRS 3.x.</p> <ul style="list-style-type: none"> <li>• Hive</li> <li>• Ranger</li> </ul>
Data Connection Type	<p>This parameter is valid only when <b>Metadata</b> is set to <b>Data connections</b>. It indicates the type of an external data source.</p> <ul style="list-style-type: none"> <li>• Hive supports the following data connection types: <ul style="list-style-type: none"> <li>- RDS PostgreSQL database</li> <li>- RDS MySQL database</li> <li>- Local database</li> </ul> </li> <li>• Ranger supports the following data connection types: <ul style="list-style-type: none"> <li>- RDS MySQL database</li> <li>- Local database</li> </ul> </li> </ul>
Data Connection Instance	<p>This parameter is valid only when <b>Data Connection Type</b> is set to <b>RDS PostgreSQL database</b> or <b>RDS MySQL database</b>. This parameter indicates the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click <b>Create Data Connection</b> to create a data connection. For details, see <a href="#">Configuring Data Connections</a>.</p>

## Hardware Configurations

**Table 4-6** MRS cluster hardware configuration

Parameter	Description
AZ	<p>Select the AZ associated with the region of the cluster. An AZ is a physical area that uses independent power and network resources. AZs are physically isolated but interconnected through the internal network. This improves the availability of applications. You are advised to create clusters in different AZs.</p>
VPC	<p>A VPC is a secure, isolated, and logical network environment. Select the VPC for which you want to create a cluster and click <b>View VPC</b> to view the name and ID of the VPC. If no VPC is available, create one.</p>
Subnet	<p>A subnet provides dedicated network resources that are isolated from other networks, improving network security. Select the subnet for which you want to create a cluster. Click <b>View Subnet</b> to view details about the selected subnet. If no subnet is created in the VPC, go to the VPC console and choose <b>Subnets &gt; Create Subnet</b> to create one.</p> <p><b>NOTE</b></p> <p>The number of IP addresses required by creating an MRS cluster depends on the number of cluster nodes and selected components, but not the cluster type.</p> <p>In MRS, IP addresses are automatically assigned to clusters during cluster creation basically based on the following formula: Quantity of IP addresses = Number of cluster nodes + 2 (one for Manager; one for the DB). In addition, if the Hadoop, Hue, Sqoop, and Presto or Loader and Presto components are selected during cluster deployment, one IP address is added for each component. If a ClickHouse cluster is created independently, its required IP addresses are calculated as follows: Quantity of IP addresses = Number of cluster nodes + 1 (for Manager).</p>

Parameter	Description
Security Group	<p>A security group is a set of ECS access rules. It provides access policies for ECSs that have the same security protection requirements and are mutually trusted in a VPC.</p> <p>When you create a cluster, you can select <b>Auto create</b> from the drop-down list of <b>Security Group</b> to create a security group or select an existing security group.</p> <p><b>NOTE</b> When you select a security group created by yourself, ensure that the inbound rule contains a rule in which <b>Protocol</b> is set to <b>All</b>, <b>Port</b> is set to <b>All</b>, and <b>Source</b> is set to a trusted accessible IP address range. Do not use <b>0.0.0.0/0</b> as a source address. Otherwise, security risks may occur. If you do not know the trusted accessible IP address range, select <b>Auto create</b>.</p>
EIP	<p>After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster.</p> <p>When creating a cluster, you can select an available EIP from the drop-down list and bind it. If no EIP is available in the drop-down list, click <b>Manage EIP</b> to access the <b>EIPs</b> service page to create one.</p> <p><b>NOTE</b> The EIP must be in the same region as the cluster.</p>
Enterprise Project	<p>Select the enterprise project to which a cluster belongs. To use an enterprise project, create one on the <b>Enterprise Project Management</b> page of the <b>Enterprise Management</b> console.</p> <p>The <b>Enterprise Management</b> console of the enterprise project is designed for resource management. It helps enterprises manage cloud-based personnel, resources, permissions, and finance in a hierarchical manner, such as management of companies, departments, and projects.</p>

**Table 4-7** Cluster node information

Parameter	Description
Common Template	<p>This parameter is valid only when <b>Cluster Type</b> is set to <b>Custom</b>. For details, see <a href="#">Custom Cluster Template Description</a>.</p>

Parameter	Description
Node Type	<p>MRS provides three types of nodes:</p> <ul style="list-style-type: none"> <li>● <b>Master:</b> A Master node in an MRS cluster manages the cluster, assigns executable cluster files to Core nodes, traces the execution status of each job, and monitors the DataNode running status.</li> <li>● <b>Core:</b> A Core node in a cluster processes data and stores process data in HDFS. Analysis Core nodes are created in an analysis cluster. Streaming Core nodes are created in a streaming cluster. Both analysis and streaming Core nodes are created in a hybrid cluster.</li> <li>● <b>Task:</b> A Task node in a cluster is used for computing and does not store persistent data. Yarn and Storm are mainly installed on Task nodes. Task nodes are optional, and the number of Task nodes can be zero. Analysis Task nodes are created in an analysis cluster. Streaming Task nodes are created in a streaming cluster. Both analysis and streaming Task nodes are created in a hybrid cluster. When the data volume change is small in a cluster but the cluster's service processing capabilities need to be remarkably and temporarily improved, add Task nodes to address the following situations: <ul style="list-style-type: none"> <li>- Service volumes temporarily increase, for example, report processing at the end of the year.</li> <li>- Long-term tasks must be completed in a short time, for example, some urgent analysis tasks.</li> </ul> </li> </ul>
Instance Specifications	<p>Instance specifications of Master or Core nodes. MRS supports host specifications determined by CPU, memory, and disk space. Click  to configure the instance specifications, system disk, and data disk parameters of the cluster node.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>● More advanced instance specifications provide better data processing.</li> <li>● If you select non-HDD disks for Core nodes, the disk types of Master and Core nodes are determined by <b>Data Disk</b>.</li> <li>● If <b>Sold out</b> appears next to an instance specification of a node, the node of this specification cannot be . You can only nodes of other specifications.</li> <li>● If the cluster version is set to MRS 3.x and all components are deployed, the memory of the Master node must be at least 64 GB.</li> </ul>

Parameter	Description
System Disk	<p>Storage type can be any of the following:</p> <ul style="list-style-type: none"> <li>● SATA: common I/O</li> <li>● SAS: high I/O</li> <li>● SSD: ultra-high I/O</li> <li>● GPSSD: general-purpose SSD</li> </ul>
Data Disk	<p>Data disk storage space of a node. To increase data storage capacity, you can add disks at the same time when creating a cluster. The following two application scenarios are involved.</p> <ul style="list-style-type: none"> <li>● Data storage and computing are separated. Data is stored in OBS, which features low cost and unlimited storage capacity. The clusters can be terminated at any time in OBS. The computing performance is determined by OBS access performance and is lower than that of HDFS. This configuration is recommended if data computing is infrequent.</li> <li>● Data storage and computing are not separated. Data is stored in HDFS, which features high cost, high computing performance, and limited storage capacity. Before terminating clusters, you must export and store the data. This configuration is recommended if data computing is frequent.</li> </ul> <p>The storage type can be any of the following:</p> <ul style="list-style-type: none"> <li>● SATA: common I/O</li> <li>● SAS: high I/O</li> <li>● SSD: ultra-high I/O</li> <li>● GPSSD: general-purpose SSD</li> </ul> <p><b>NOTE</b> More nodes in a cluster require higher disk capacity of Master nodes. To ensure stable cluster running, set the disk capacity of the Master node to over 600 GB if the number of nodes is 300 and increase it to over 1 TB if the number of nodes reaches 500.</p>

Parameter	Description
Instance Count	<p>Number of Master and Core nodes.</p> <p>For Master nodes:</p> <ul style="list-style-type: none"> <li>• If <b>Cluster HA</b> is enabled, the number of Master nodes is fixed to <b>2</b>.</li> <li>• If <b>Cluster HA</b> is disabled, the number of Master nodes is fixed to <b>1</b>.</li> </ul> <p>At least one Core node must exist and the total number of Core and Task nodes cannot exceed 500.</p> <p>Task: Click  to add a Task node. Click  to modify the instance specifications and disk configuration of a Task node. Click  to delete the added Task node.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• A maximum of 500 Core nodes are supported by default. If more than 500 Core nodes are required, contact technical support.</li> <li>• A small number of nodes may cause clusters to run slowly while a large number of nodes may be unnecessarily costly. Set an appropriate value based on data to be processed.</li> </ul>
Cluster HA	<p>Whether to enable high availability for a cluster. This parameter is enabled by default. This parameter is not available in MRS 3.x.</p> <p>If you enable this option, the management processes of all components will be deployed on both Master nodes to achieve hot standby and prevent single-node failure, improving reliability. If you disable this option, they will be deployed on only one Master node. As a result, if a process of a component becomes abnormal, the component will fail to provide services.</p> <ul style="list-style-type: none"> <li>•  : Disabled. When <b>Cluster HA</b> is disabled, there is only one Master node and the number of Core nodes is three by default. However, you can decrease the number of Core nodes to 1.</li> <li>•  : Enabled. When <b>Cluster HA</b> is enabled, there are two Master nodes and the number of Core nodes is three by default. However, you can decrease the number of Core nodes to 1.</li> </ul>
LVM	<p>This parameter is valid when a streaming Core node is created only. Click this parameter to enable or disable the disk LVM management function.</p> <p>If LVM is enabled, all disks on a node are mounted as logical volumes. This delivers more proper disk planning to avoid data skew, thereby improving system stability.</p>

Parameter	Description
Topology Adjustment	If the deployment mode in the <b>Common Node</b> does not meet the requirements, set <b>Topology Adjustment</b> to <b>Enable</b> and adjust the instance deployment mode based on service requirements. For details, see <a href="#">Topology Adjustment for a Custom Cluster</a> . This parameter is valid only when <b>Cluster Type</b> is set to <b>Custom</b> .

## (Optional) Advanced Configuration

Table 4-8 MRS cluster advanced configuration topology

Parameter	Description
Tag	For details, see <a href="#">Adding a Tag to a Cluster</a> .
Hostname Prefix	Enter the prefix for the computer hostname of an ECS in the cluster.
Auto Scaling	Auto scaling can be configured only after you specify Task node specifications in the <b>Configure Hardware</b> step. For details about how to configure Task node specifications, see <a href="#">Configuring Auto Scaling Rules When Creating a Cluster</a> .
Bootstrap Action	For details, see <a href="#">Adding a Bootstrap Action</a> . This parameter is not available in MRS 3.x.
Agency	By binding an agency, ECSs or BMSs can manage some of your resources. Determine whether to configure an agency based on the actual service scenario. For example, you can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see <a href="#">Configuring a Storage-Compute Decoupled Cluster (Agency)</a> . The <b>MRS_ECS_DEFAULT_AGENCY</b> agency has the OBS OperateAccess permission of OBS and the CES FullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.
Metric Sharing	Monitoring metrics of big data components are collected. If a fault occurs when you use a cluster, share the monitoring metrics with technical support personnel for troubleshooting. This parameter is not available in MRS 3.x.

Parameter	Description
OBS Permission Control	Users who have enabled fine-grained permission control can use this function to grant permissions on different directories in OBS file systems to different MRS users. For details, see <a href="#">Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS</a> . This parameter is not available in MRS 3.x.
Data Disk Encryption	<p>Whether to encrypt data in the data disk mounted to the cluster. This function is disabled by default. To use this function, you must have the Security Administrator and KMS Administrator permissions. This parameter is not available in MRS 3.x.</p> <p>Keys used by encrypted data disks are provided by the Key Management Service (KMS) of the Data Encryption Workshop (DEW), secure and convenient. Therefore, you do not need to establish and maintain the key management infrastructure.</p> <p>Click <b>Data Disk Encryption</b> to enable or disable the data disk encryption function.</p>
Key ID	This parameter is displayed only when the <b>Data Disk Encryption</b> function is enabled. This parameter indicates the key ID corresponding to the selected key name. This parameter is not available in MRS 3.x.
Key Name	<p>This parameter is mandatory when the <b>Data Disk Encryption</b> function is enabled. Select the name of the key used to encrypt the data disk. By default, the default master key named <b>evs/default</b> is selected. You can select another master key from the drop-down list. This parameter is not available in MRS 3.x.</p> <p>If disks are encrypted using a CMK, which is then disabled or scheduled for deletion, the disks can no longer be read from or written to, and data on these disks may never be restored. Exercise caution when performing this operation.</p> <p>Click <b>View Key List</b> to enter a page where you can create and manage keys.</p>
Alarm	If the alarm function is enabled, the cluster maintenance personnel can be notified in a timely manner to locate faults when the cluster runs abnormally or the system is faulty.
Rule Name	Name of the rule for sending alarm messages. The value can contain only digits, letters, hyphens (-), and underscores (_).

Parameter	Description
Topic Name	<p>Select an existing topic or click <b>Create Topic</b> to create a topic. To deliver messages published to a topic, you need to add a subscriber to the topic. For details, see <a href="#">Adding Subscriptions to a Topic</a>.</p> <p>A topic serves as a message sending channel, where publishers and subscribers can interact with each other.</p>
Kerberos Authentication	<p>Whether to enable Kerberos authentication when logging in to Manager.</p> <ul style="list-style-type: none"> <li>•  : If <b>Kerberos Authentication</b> is disabled, common users can use all functions of an MRS cluster. You are advised to disable Kerberos authentication in single-user scenarios.</li> <li>•  : If <b>Kerberos Authentication</b> is enabled, common users cannot use the file and job management functions of an MRS cluster and cannot view cluster resource usage or the job records for Hadoop and Spark. To use more cluster functions, the users must contact the Manager administrator to assign more permissions. You are advised to enable Kerberos authentication in multi-user scenarios.</li> </ul> <p>If the Ranger component is selected, Kerberos authentication cannot be enabled.</p>
Username	Name of the administrator of Manager. <b>admin</b> is used by default.
Password	<p>Password of the Manager administrator</p> <p>The following requirements must be met:</p> <ul style="list-style-type: none"> <li>• Must contain 8 to 26 characters.</li> <li>• Must contain at least four of the following: <ul style="list-style-type: none"> <li>- Lowercase letters</li> <li>- Uppercase letters</li> <li>- Digits</li> <li>- Have at least one of the following special characters: !?,: -_{} [ ]@ \$% ^ + = /</li> </ul> </li> <li>• Cannot be the same as the username or the username spelled backwards.</li> </ul> <p>Password Strength: The colorbar in red, orange, and green indicates weak, medium, and strong password, respectively.</p>
Confirm Password	Enter the password of the Manager administrator again.

Parameter	Description
Login Mode	<ul style="list-style-type: none"> <li>● Password You can log in to ECS nodes using a password. A password must meet the following requirements:               <ol style="list-style-type: none"> <li>1. Must be a string and 8 to 26 characters long.</li> <li>2. The password must contain at least four types of the following characters: uppercase letters, lowercase letters, digits, and special characters (! ?,,: -_{} [ ]@ \$% ^ + = /).</li> <li>3. The password cannot be the username or the reverse username.</li> </ol> </li> <li>● Key Pair Key pairs are used to log in to ECS nodes of the cluster. Select a key pair from the drop-down list. Select "I acknowledge that I have obtained private key file <i>SSHkey-xxx</i> and that without this file I will not be able to log in to my ECS." If you have never created a key pair, click <b>View Key Pair</b> to create or import a key pair. And then, obtain a private key file. A key pair, also called an SSH key, consists of a public key and a private key. You can create an SSH key and download the private key for authenticating remote login. For security, a private key can only be downloaded once. Keep it secure. Use an SSH key in either of the following two methods:               <ol style="list-style-type: none"> <li>1. Creating an SSH key: After you create an SSH key, a public key and a private key are generated. The public key is stored in the system, and the private key is stored in the local ECS. When you log in to an ECS, the public and private keys are used for authentication.</li> <li>2. Importing an SSH key: If you have obtained the public and private keys, import the public key into the system. When you log in to an ECS, the public and private keys are used for authentication.</li> </ol> </li> </ul>

Parameter	Description
Secure Communications	<p>MRS clusters provision, manage, and use big data components through the management console. Big data components are deployed in a user's VPC. If the MRS management console needs to directly access big data components deployed in the user's VPC, you need to enable the corresponding security group rules after you have obtained user authorization. This authorization process is called secure communications. For details, see <a href="#">Communication Security Authorization</a>.</p> <p>If the secure communications function is not enabled, MRS clusters cannot be created.</p>

## Failed to Create a Cluster

If a cluster fails to be created, the failed task will be managed on the **Manage Failed Tasks** page. Choose **Clusters > Active Clusters**. Click  to go to the **Manage Failed Tasks** page. In the **Status** column, hover the cursor over  to view the failure cause. You can delete failed tasks by referring to [Deleting a Failed Task](#).

[Table 4-9](#) lists the error codes of MRS cluster creation failures.

**Table 4-9** Error codes

Error Code	Description
MRS.101	Insufficient quota to meet your request. Contact customer service to increase the quota.
MRS.102	The token cannot be null or invalid. Try again later or contact customer service.
MRS.103	Invalid request. Try again later or contact customer service.
MRS.104	Insufficient resources. Try again later or contact customer service.
MRS.105	Insufficient IP addresses in the existing subnet. Try again later or contact customer service.
MRS.201	Failed due to an ECS error. Try again later or contact customer service.
MRS.202	Failed due to an IAM error. Try again later or contact customer service.
MRS.203	Failed due to a VPC error. Try again later or contact customer service.

Error Code	Description
MRS.400	MRS system error. Try again later or contact customer service.

## 4.10 Customizing a Topology Cluster

The analysis cluster, streaming cluster, and hybrid cluster provided by MRS use fixed templates to deploy cluster processes. Therefore, you cannot customize service processes on management nodes and control nodes. If you want to customize the cluster deployment, set **Cluster Type** to **Custom** when creating a cluster. In this way, you can customize the deployment mode of process instances on the management nodes and control nodes in the cluster. Only MRS 3.x and later versions support the creation of clusters in a custom topology.

A custom cluster provides the following functions:

- Separated deployment of the management and control roles: The management role and control role are deployed on different Master nodes.
- Co-deployment of the management and control roles: The management and control roles are co-deployed on the Master node.
- ZooKeeper is deployed on an independent node to improve reliability.
- Components are deployed separately to avoid resource contention.

Roles in an MRS cluster:

- **Management Node (MN):** is the node to install Manager (the management system of the MRS cluster). It provides a unified access entry. Manager centrally manages nodes and services deployed in the cluster.
- **Control Node (CN):** controls and monitors how data nodes store and receive data, and send process status, and provides other public functions. Control nodes of MRS include HMaster, HiveServer, ResourceManager, NameNode, JournalNode, and SlapdServer.
- **Data Node (DN):** A data node executes the instructions sent by the management node, reports task status, stores data, and provides other public functions. Data nodes of MRS include DataNode, RegionServer, and NodeManager.

### Customizing a Cluster

**Step 1** Log in to the MRS management console.

**Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.

**Step 3** Click the **Custom Config** tab.

**Step 4** Configure basic cluster information. For details about the parameters, see [Software Configurations](#).

- **Region:** Retain the default value.
- **Cluster Name:** You can use the default name. However, you are advised to include a project name abbreviation or date for consolidated memory and easy distinguishing, for example, **mrs\_20180321**.

- **Cluster Version:** Currently, only MRS 3.x are supported.
- **Cluster Type:** Select **Custom** and select components as required.

**Step 5** Click **Next**. Configure hardware information.

- **AZ:** Retain the default value.
- **VPC:** Retain the default value. If there is no available VPC, click **View VPC** to access the VPC console and create a new VPC.
- **Subnet:** Retain the default value.
- **Security Group:** Select **Auto create**.
- **EIP:** Select **Bind later**.
- **Enterprise Project:** Retain the default value.
- **Common Node:** For details, see [Custom Cluster Template Description](#).
- **Instance Specifications:** Click  to configure the instance specifications, system disk and data disk storage types, and storage space.
- **Instance Count:** Adjust the number of cluster instances based on the service volume. For details, see [Table 4-11](#).
- **Topology Adjustment:** If the deployment mode in the **Common Node** does not meet the requirements, set **Topology Adjustment** to **Enable** and adjust the instance deployment mode based on service requirements. For details, see [Topology Adjustment for a Custom Cluster](#).

**Step 6** Click **Next** and set advanced options.

For details about the parameters, see [\(Optional\) Advanced Configuration](#).

**Step 7** Click **Create Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

**Step 8** Click **Back to Cluster List** to view the cluster status.

It takes some time to create a cluster. The initial status of the cluster is **Starting**. After the cluster has been created successfully, the cluster status becomes **Running**.

----End

## Custom Cluster Template Description

**Table 4-10** Common templates for custom clusters

Common Node	Description	Node Range
Compact	The management role and control role are deployed on the Master node, and data instances are deployed in the same node group. This deployment mode applies to scenarios where the number of control nodes is less than 100, reducing costs.	<ul style="list-style-type: none"> <li>• The number of Master nodes is greater than or equal to 3 and less than or equal to 11.</li> <li>• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.</li> </ul>
OMS-separate	The management role and control role are deployed on different Master nodes, and data instances are deployed in the same node group. This deployment mode is applicable to a cluster with 100 to 500 nodes and delivers better performance in high-concurrency load scenarios.	<ul style="list-style-type: none"> <li>• The number of Master nodes is greater than or equal to 5 and less than or equal to 11.</li> <li>• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.</li> </ul>
Full-size	The management role and control role are deployed on different Master nodes, and data instances are deployed in different node groups. This deployment mode is applicable to a cluster with more than 500 nodes. Components can be deployed separately, which can be used for a larger cluster scale.	<ul style="list-style-type: none"> <li>• The number of Master nodes is greater than or equal to 9 and less than or equal to 11.</li> <li>• The total number of node groups is less than or equal to 10, and the total number of nodes in non-Master node groups is less than or equal to 10,000.</li> </ul>

**Table 4-11** Node deployment scheme of a customized MRS cluster

Node Deployment Principle		Applicable Scenario	Networking Rule
Management nodes, control nodes, and data nodes are deployed separately. (This scheme requires at least eight nodes.)	$MN \times 2 + CN \times 9 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 500–2000.	<ul style="list-style-type: none"> <li>If the number of nodes in a cluster exceeds 200, the nodes are distributed to different subnets and the subnets are interconnected with each other in Layer 3 using core switches. Each subnet can contain a maximum of 200 nodes and the allocation of nodes to different subnets must be balanced.</li> <li>If the number of nodes is less than 200, the nodes in the cluster are deployed in the same subnet and the nodes are interconnected with each other in Layer 2 using aggregation switches.</li> </ul>
	$MN \times 2 + CN \times 5 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 100–500.	
	$MN \times 2 + CN \times 3 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 30–100.	
The management nodes and control nodes are deployed together, and the data nodes are deployed separately.	$(MN+CN) \times 3 + DN \times n$	(Recommended) This scheme is used when the number of data nodes is 3–30.	Nodes in the cluster are deployed in the same subnet and are interconnected with each other at Layer 2 through aggregation switches.

Node Deployment Principle	Applicable Scenario	Networking Rule
<p>The management nodes, control nodes, and data nodes are deployed together.</p>	<ul style="list-style-type: none"> <li>This scheme is applicable to a cluster having fewer than 6 nodes.</li> <li>This scheme requires at least three nodes.</li> </ul> <p><b>NOTE</b> This template is not recommended in the production environment or commercial environment.</p> <ul style="list-style-type: none"> <li>If management, control, and data nodes are co-deployed, cluster performance and reliability are greatly affected.</li> <li>If the number of nodes meet the requirements, deploy data nodes separately.</li> <li>If the number of nodes is insufficient to support separately deployed data nodes, use the dual-plane networking mode for this scenario. The traffic of the management network is isolated from that of the service network to prevent excessive data volumes on the service plane, ensuring correct delivery of management operations.</li> </ul>	<p>Nodes in the cluster are deployed in the same subnet and are interconnected with each other at Layer 2 through aggregation switches.</p>

## Topology Adjustment for a Custom Cluster

Table 4-12 Topology adjustment

Service	Dependency	Role	Role Deployment Suggestions	Description
OMSServer	-	OMSServer	This role can be deployed it on the Master node and cannot be modified.	-

Service	Dependency	Role	Role Deployment Suggestions	Description
ClickHouse	Depends on ZooKeeper.	ClickHouse	This role can be deployed on all nodes. The number of role instances to be deployed must be an even number. The maximum number is 24.	A non-Master node group with this role assigned is considered as a Core node.
DBService	-	DBServer	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
ZooKeeper	-	QP(quorumpeer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1, 3, or 5	-
Hadoop	Depends on ZooKeeper.	NN(NameNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	The NameNode and ZKFC processes are deployed on the same server for cluster HA.
		JN(JournalNode)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 or 3	-
		DN(DataNode)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all node instances	A non-Master node group with this role assigned is considered as a Core node.

Service	Dependence	Role	Role Deployment Suggestions	Description
		RM(Resource Manager)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		NM(Node Manager)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all node instances	-
		JHS(JobHistoryServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		TLS(TimelineServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1	-
Presto	Depends on Hive.	PCD(Coordinator)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		PWK(Worker)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all node instances	-

Service	Dependency	Role	Role Deployment Suggestions	Description
Spark2x	<ul style="list-style-type: none"> <li>• Depends on Hadoop.</li> <li>• Depends on Hive.</li> </ul>	JS2x(JDBC Server)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to number of all Master nodes	-
		JH2x(Job History)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		SR2x(SparkResource)	This role can be deployed on the Master node only. Number of role instances to be deployed: 2 to number of all Master nodes	-
		IS2X(IndexServer2x)	(Optional) This role can be deployed on the Master node only. Number of role instances to be deployed: 0 to 2	-
HBase	Depends on Hadoop.	HM(HMaster)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		TS (ThriftServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to number of all Master nodes	-

Service	Dependence	Role	Role Deployment Suggestions	Description
		RT(RESTServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to number of all Master nodes	-
		RS(RegionServer)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all nodes	-
Hive	<ul style="list-style-type: none"> <li>• Depends on Hadoop.</li> <li>• Depends on DBService.</li> </ul>	MS(MetaStore)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		WebHCat	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		HS(HiveServer)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to number of all Master nodes	-
Hue	Depends on DBService	Hue	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-

Service	Dependency	Role	Role Deployment Suggestions	Description
Loader	<ul style="list-style-type: none"> <li>• Depends on Hadoop.</li> <li>• Depends on DBService.</li> </ul>	LS(Sqoop)	<p>This role can be deployed on all nodes.</p> <p>Number of role instances to be deployed: 1 to number of all nodes</p>	-
Sqoop	Depends on Hadoop.	SS(Sqoop Client)	<p>This role can be deployed on all nodes.</p> <p>Number of role instances to be deployed: 1 to number of all nodes</p>	-
Kafka	Depends on ZooKeeper.	Broker	<p>This role can be deployed on all nodes.</p> <p>Number of role instances to be deployed: 1 to number of all nodes</p>	-
		MirrorMaker	<p>This role can be deployed on all nodes.</p> <p>Number of role instances to be deployed: 1 to number of all nodes</p>	-
Storm	Depends on ZooKeeper.	Supervisor	<p>This role can be deployed on all nodes.</p> <p>Number of role instances to be deployed: 0 to number of all nodes</p>	Logviewer is deployed on the same node as this role.
		Nimbus	<p>This role can be deployed on the Master node only.</p> <p>Number of role instances to be deployed: 1 to 2</p>	Web UI is deployed on the same node as this role.

Service	Depende ncy	Role	Role Deployment Suggestions	Description
Flume	-	MonitorS erver	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		Flume	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all nodes	A non-Master node group with this role assigned is considered as a Core node.
Tez	Depends on Hive.	TezUI	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
Flink	-	FlinkReso urce	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all nodes	-
Alluxio	-	AMS(Allu xioMaster )	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 or 3	-
		AJMS(All uxioJobM aster)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 or 3	-

Service	Dependence	Role	Role Deployment Suggestions	Description
		AWK(AlluxioWorker)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all nodes	-
		AJWK(AlluxioJobWorker)	This role can be deployed on all nodes. Number of role instances to be deployed: 1 to number of all nodes	-
Ranger	-	admin(RangerAdmin)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1 to 2	-
		usersync(RangerUserSync)	This role can be deployed on the Master node only. Number of role instances to be deployed: 1	-

## 4.11 Adding a Tag to a Cluster

Tags are used to identify clusters. Adding tags to clusters can help you identify and manage your cluster resources.

You can add a maximum of 10 tags to a cluster when creating the cluster or add them on the details page of the created cluster.

A tag consists of a tag key and a tag value. [Table 4-13](#) provides tag key and value requirements.

**Table 4-13** Tag key and value requirements

Parameter	Requirement	Example
Key	<p>A tag key cannot be left blank.</p> <p>A tag key must be unique in a cluster.</p> <p>A tag key contains a maximum of 36 characters.</p> <p>A tag value cannot contain special characters (=*&lt;&gt;\,/ ) or start or end with spaces.</p>	Organization
Value	<p>A tag value contains a maximum of 43 characters.</p> <p>A tag value cannot contain special characters (=*&lt;&gt;\,/ ) or start or end with spaces.</p> <p>This parameter can be left blank.</p>	Apache

## Adding Tags to a Cluster

You can perform the following operations to add tags to a cluster when creating the cluster.

1. Log in to the MRS management console.
2. Click **Create Cluster**. The corresponding page is displayed.
3. Click the **Custom Config** tab.
4. Configure the cluster software and hardware by referring to [Creating a Custom Cluster](#).
5. On the **Set Advanced Options** tab page, add a tag.

Enter the key and value of a tag to be added.

You can add a maximum of 10 tags to a cluster and use intersections of tags to search for the target cluster.

### NOTE

You can also add tags to existing clusters. For details, see [Managing Tags](#).

## Searching for the Target Cluster

On the **Active Clusters** page, search for the target cluster by tag key or tag value.

1. Log in to the MRS management console.

2. In the upper right corner of the **Active Clusters** page, click **Search by Tag** to access the search page.
3. Enter the tag of the cluster to be searched.  
You can select a tag key or tag value from their drop-down lists. When the tag key or tag value is exactly matched, the system can automatically locate the target cluster. If you enter multiple tags, their intersections are used to search for the cluster.
4. Click **Search**.  
The system searches for the target cluster by tag key or value.

## Managing Tags

You can view, add, modify, and delete tags on the **Tags** tab page of the cluster.

1. Log in to the MRS management console.
2. On the **Active Clusters** page, click the name of a cluster for which you want to manage tags.  
The cluster details page is displayed.
3. Click the **Tags** tab and view, add, modify, and delete tags on the tab page.
  - View  
On the **Tags** tab page, you can view details about tags of the cluster, including the number of tags and the key and value of each tag.
  - Add  
Click **Add Tag** in the upper left corner. In the displayed **Add Tag** dialog box, enter the key and value of the tag to be added, and click **OK**.
  - Modify  
In the **Operation** column of the tag, click **Edit**. In the displayed **Edit Tag** page, enter new tag key and value and click **OK**.
  - Delete  
In the **Operation** column of the tag, click **Delete**. After confirmation, click **OK** in the displayed page for deleting a tag.

### NOTE

MRS cluster tag updates will be synchronized to every ECS in the cluster. You are advised not to modify ECS tags on the ECS console to prevent inconsistency between ECS tags and MRS cluster tags. If the number of tags of an ECS in the MRS cluster reaches the upper limit, you cannot create any tag for the MRS cluster.

## 4.12 Communication Security Authorization

MRS clusters provision, manage, and use big data components through the management console. Big data components are deployed in a user's VPC. If the MRS management console needs to directly access big data components deployed in the user's VPC, you need to enable the corresponding security group rules after you have obtained user authorization. This authorization process is called secure communications.

If the secure communications function is not enabled, MRS clusters cannot be created. If you disable the communication after a cluster is created, the cluster

status will be **Network channel is not authorized** and the following functions will be affected:

- Functions, such as big data component installation, cluster scale-out/scale-in, and Master node specification upgrade, are unavailable.
- The cluster running status, alarms, and events cannot be monitored.
- The node management, component management, alarm management, file management, job management, patch management, and tenant management functions on the cluster details page are unavailable.
- The Manager page and the website of each component cannot be accessed.

After the secure communications function is enabled again, the cluster status is restored to **Running**, and the preceding functions become available. For details, see [Enabling Secure Communications for Clusters with This Function Disabled](#).

If the security group rules authorized in the cluster are insufficient for you to provision, manage, and use big data components,  is displayed on the right of **Secure Communications**. In this case, click **Update** to update the security group rules. For details, see [Update](#).

## Enabling Secure Communications During Cluster Creation

**Step 1** Log in to the MRS management console.

**Step 2** Click **Create Cluster**. The corresponding page is displayed.

**Step 3** Click **Quick Config** or **Custom Config**.

**Step 4** Configure cluster information by referring to [Creating a Custom Cluster](#).

**Step 5** In the **Secure Communications** area of the **Advanced Settings** tab page, select **Enable**.

**Step 6** Click **Create Now**.

If Kerberos authentication is enabled for a cluster, check whether Kerberos authentication is required. If yes, click **Continue**. If no, click **Back** to disable Kerberos authentication and then create a cluster.

----End

## Disabling Secure Communications After a Cluster Is Created

**Step 1** Log in to the MRS management console.

**Step 2** In the active cluster list, click the name of the cluster for which you want to disable secure communications.

The cluster details page is displayed.

**Step 3** Click the switch on the right of **Secure Communications** to disable authorization. In the dialog box that is displayed, click **OK**.

After the authorization is disabled, the cluster status changes to **Network channel unauthorized**, and some functions of the cluster are unavailable. Exercise caution when performing this operation.

----End

## Enabling Secure Communications for Clusters with This Function Disabled

**Step 1** Log in to the MRS management console.

**Step 2** In the active cluster list, click the name of the cluster for which you want to enable secure communications.

The cluster details page is displayed.

**Step 3** Click the switch on the right of **Secure Communications** to enable the function.

After the function is enabled, the cluster status changes to **Running**.

----End

## Update

If the security group rules authorized in the cluster are insufficient for you to provision, manage, and use big data components,  is displayed on the right of **Secure Communications**. In this case, click **Update** to update the security group rules.

**Step 1** Log in to the MRS console.

**Step 2** In the active cluster list, click the name of the cluster for which you want to update secure communications.

The cluster details page is displayed.

**Step 3** Click **Update** on the right of **Secure Communications**.

**Figure 4-1** Update

**Step 4** Click **OK**.

**Figure 4-2** Updating access control rules

✕

### Update Access Control Rules

The update operation will enable the following access control rules, which will allow you to deploy big data components and use, maintain, and manage clusters on the MRS console. [Learn more](#)

Protocol & Port	Type	Source Address	Description
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule
TCP : 9022	IPv4		MRS default access control rule

## 4.13 Installing the Third-Party Software Using Bootstrap Actions

### 4.13.1 Introduction to Bootstrap Actions

Bootstrap actions indicate that you can run your scripts on a specified cluster node before or after starting big data components. You can run bootstrap actions to install additional third-party software, modify the cluster running environment, and perform other customizations.

If you choose to run bootstrap actions when scaling out a cluster, the bootstrap actions will be run on the newly added nodes in the same way. If auto scaling is enabled in a cluster, you can add an automation script in addition to configuring a resource plan. Then the automation script executes the corresponding script on the nodes that are scaled out or in to implement custom operations.

MRS runs the script you specify as user **root**. You can run the **su - XXX** command in the script to switch the user.

**NOTE**

The bootstrap action scripts must be executed as user **root**. Improper use of the script may affect the cluster availability. Therefore, exercise caution when performing this operation.

MRS determines the result based on the return code after the execution of the bootstrap action script. If the return code is **0**, the script is executed successfully. If the return code is not **0**, the execution fails. If a bootstrap action script fails to be executed on a node, the corresponding boot script will fail to be executed. In this case, you can set **Action upon Failure** to choose whether to continue to execute the subsequent scripts. Example 1: If a script fails to be executed and **Action upon Failure** is set to **Stop**, subsequent scripts will not be executed and cluster creation or scale-out will fail. Example 2: If you set **Action upon Failure** to **Continue** for all scripts during cluster creation, all the scripts will be executed regardless of whether the scripts are successfully executed or fail to be executed, and the startup process is complete.

You can add a maximum of 18 bootstrap actions, which will be executed before or after the cluster component is started in the order you specified. The bootstrap actions performed before or after the component startup must be completed within 60 minutes. Otherwise, the cluster creation or scale-out will fail.

### 4.13.2 Preparing the Bootstrap Action Script

Currently, bootstrap actions support Linux shell scripts only. Script files must end with **.sh**.

#### Uploading the Installation Packages and Files to an OBS File System

Before compiling a script, you need to upload all required installation packages, configuration packages, and relevant files to the OBS file system in the same region. Because networks of different regions are isolated from each other, MRS VMs cannot download OBS files from other regions.

#### Compiling a Script for Downloading Files from the OBS File System

You can specify the file to be downloaded from OBS in the script. If you upload files to a private file system, you need to run the **hadoop fs** command to download the files. The following example shows that the **obs://yourbucket/myfile.tar.gz** file will be downloaded to the local host and decompressed to the **your-dir** directory.

```
#!/bin/bash
source /opt/Bigdata/client/bigdata_env;hadoop fs -D fs.obs.endpoint=<obs-endpoint> -D
fs.obs.access.key=<your-ak> -D fs.obs.secret.key=<your-sk> -copyToLocal obs://yourbucket/
myfile.tar.gz ./
mkdir -p /<your-dir>
tar -zxvf myfile.tar.gz -C /<your-dir>
```

#### NOTE

- In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.
- The Hadoop client has been preinstalled on the MRS node. You can run the **hadoop fs** command to download or upload data from or to OBS.
- Obtain the `obs-endpoint` of each region. For details, see [Regions and Endpoints](#).

## Uploading the Script to the OBS File System

After script compilation, upload the script to the OBS file system in the same region. At the time you specify, each node in the cluster downloads the script from OBS and executes the script as user **root**.

### 4.13.3 View Execution Records

You can view the execution result of the bootstrap operation on the **Bootstrap Action** tab page of the cluster details page.

#### Viewing the Execution Result

1. Log in to the MRS management console.
2. In the left navigation pane, choose **Clusters > Active Clusters**. Click a cluster you want to query.  
The cluster details page is displayed.
3. On the cluster details page, click the **Bootstrap Action** tab. Information about the bootstrap actions added during cluster creation is displayed.

#### NOTE

- You select **Before initial component start** or **After initial component start** in the upper right corner to query information about the related bootstrap actions.
- The last execution result is listed here. For a newly created cluster, the records of bootstrap actions executed during cluster creation are listed. If a cluster is expanded, the records of bootstrap actions executed on the newly added nodes are listed.

#### Viewing Execution Logs

If you want to view the run logs of a bootstrap action, set **Action upon Failure** to **Continue** when adding the bootstrap action. And then, log in to each node to view the run logs in the **/var/log/Bootstrap** directory. If you add bootstrap actions before and after component start, you can distinguish bootstrap action logs of the two phases based on the timestamps.

You are advised to print logs in detail in the script so that you can view the detailed run result. MRS redirects the standard output and error output of the script to the log directory of the bootstrap action.

### 4.13.4 Adding a Bootstrap Action

This operation applies to clusters of MRS 3.x or earlier.

In MRS 3.x, bootstrap actions cannot be added during cluster creation.

#### Adding a Bootstrap Action When Creating a Cluster

- Step 1** Log in to the MRS management console.
- Step 2** Click **Create Cluster**. The page for creating a cluster is displayed.
- Step 3** Click the **Custom Config** tab.

**Step 4** Configure the cluster software and hardware by referring to [Creating a Custom Cluster](#).

**Step 5** On the **Set Advanced Options** tab page, click **Add** in the **Bootstrap Action** area.

**Table 4-14** Parameters

Parameter	Description
Name	Name of a bootstrap action script The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space. The value can contain 1 to 64 characters. <b>NOTE</b> A name must be unique in the same cluster. You can set the same name for different clusters.
Script Path	Script path. The value can be an OBS file system path or a local VM path. <ul style="list-style-type: none"> <li>An OBS file system path must start with <b>s3a://</b> and end with <b>.sh</b>, for example, <b>s3a://mrs-samples/xxx.sh</b>.</li> <li>A local VM path must start with a slash (/) and end with <b>.sh</b>.</li> </ul>
Parameters	Bootstrap action script parameters
Execution Node	Select a type of the node where the bootstrap action script is executed.
Executed	Select the time when the bootstrap action script is executed. <ul style="list-style-type: none"> <li>Before initial component start</li> <li>After initial component start</li> </ul>
Action upon Failure	Whether to continue to execute subsequent scripts and create a cluster after the script fails to be executed. <b>NOTE</b> You are advised to set this parameter to <b>Continue</b> in the debugging phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.

**Step 6** Click **OK**.

After the bootstrap action is successfully added, you can edit, clone, or delete it in the **Operation** column.

----End

## Adding an Automation Script on the Auto Scaling Page

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name. The cluster details page is displayed.

**Step 3** On the **Nodes** tab page, click **Auto Scaling** in the **Operation** column of the Task node group. The **Auto Scaling** page is displayed.

If no Task node exists in the cluster, click **Configure Task Node** to add a Task node and then perform this step.

 **NOTE**

For MRS 3.x or later, **Configure Task Node** applies only to analysis clusters, streaming clusters, and hybrid clusters.

**Step 4** Configure a resource plan.

You can configure the resource plan to adjust the number of nodes, which affects the actual price. Therefore, exercise caution when performing this operation.

Configuration procedure:

1. On the **Auto Scaling** page, enable **Auto Scaling**.
2. For example, the **Default Range** of node quantity is set to **2-2**, indicating that the number of Task nodes is fixed to 2 except the time range specified in the resource plan.
3. Click **Configure Node Range for Specific Time Range** under **Default Range**.
4. Configure the **Time Range** and **Node Range** parameters. For example, set **Time Range** to **07:00-13:00**, and **Node Range** to **5-5**. This indicates that the number of Task nodes is fixed to 5 in the time range specified in the resource plan. For details about the parameters, see [Table 5-14](#).

You can click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

**Step 5** (Optional) Configure automation scripts.

1. Set **Advanced Settings** to **Configure**.
2. Click **Create**. The **Automation Script** page is displayed.
3. Set the following parameters: **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see [Table 5-15](#).
4. Click **OK** to save the automation script configurations.

**Step 6** Select **I agree to authorize MRS to scale out or scale in nodes based on the above rule**.

**Step 7** Click **OK**.

----End

# 5 Managing an Existing Cluster

## 5.1 Managing and Monitoring a Cluster

### 5.1.1 Viewing Basic Cluster Information

You can monitor and manage the clusters you have created. Choose **Clusters > Active Clusters**. Select a cluster and click its name to go to the cluster details page. On the displayed page, view the basic configuration and node information of the cluster.

On the cluster details page, click **Dashboard**. [Table 5-1](#) describes the parameters on the **Dashboard** tab page.

**Table 5-1** Basic cluster information

Parameter	Description
Cluster Name	Name of a cluster. Set this parameter when creating a cluster. Click  to change the cluster name. For versions earlier than MRS 3.x, only the cluster name displayed on the MRS management console is changed, while the cluster name on MRS Manager is not changed synchronously.
Cluster Status	Cluster status. For details, see <a href="#">Table 4-1</a> .
MRS Manager	Portal for the Manager page. <ul style="list-style-type: none"> <li>For MRS 3.x or later, see <a href="#">Accessing FusionInsight Manager (MRS 3.x or Later)</a>.</li> <li>For versions earlier than MRS 3.x, you need to bind an EIP and add a security group rule as prompted before accessing the MRS Manager page. For details, see <a href="#">Accessing Manager</a>.</li> </ul>

Parameter	Description
Cluster Version	MRS version information.
Cluster Type	<p>There are three types of clusters:</p> <ul style="list-style-type: none"> <li>• <b>Analysis cluster:</b> is used for offline data analysis and provides Hadoop components.</li> <li>• <b>Streaming cluster:</b> is used for streaming tasks and provides stream processing components.</li> <li>• <b>Hybrid cluster:</b> is used for both offline data analysis and streaming processing and provides Hadoop components and streaming processing components.</li> <li>• Custom: An MRS cluster with all custom components. MRS 3.x and later versions support this type.</li> </ul>
Cluster ID	Unique identifier of a cluster, which is automatically assigned when a cluster is created.
Created	Time when a cluster is created.
AZ	Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.
Default Subnet	<p>Subnet selected during cluster creation.</p> <p>If the subnet IP addresses are insufficient, click <b>Change Subnet</b> to switch to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Adding a subnet does not affect the IP addresses and subnets of existing nodes. Adding a subnet does not affect the IP addresses and subnets of existing nodes.</p> <p>A subnet provides dedicated network resources that are isolated from other networks, improving network security.</p>
VPC	<p>VPC selected during cluster creation.</p> <p>A VPC is a secure, isolated, and logical network environment.</p>
Elastic IP (EIP)	After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster.
OBS Permission Control	Click <b>Manage</b> and modify the mapping between MRS users and OBS permissions. For details, see <a href="#">Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS</a> .
Data Connection	Click <b>Manage</b> to view the data connection type associated with the cluster. For details, see <a href="#">Configuring Data Connections</a> .

Parameter	Description
Agency	<p>Click <b>Manage Agency</b> to bind or modify an agency for the cluster.</p> <p>An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see <a href="#">Configuring a Storage-Compute Decoupled Cluster (Agency)</a>.</p> <p>The <b>MRS_ECS_DEFAULT_AGENCY</b> agency has the OBS OperateAccess permission of OBS and the CES FullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.</p>
Key Pair	<p>Name of a key pair. Set this parameter when creating a cluster. If the login mode is set to password during cluster creation, this parameter is not displayed.</p>
Kerberos Authentication	<p>Whether to enable Kerberos authentication when logging in to Manager.</p>
Logging	<p>Used to collect logs about cluster creation and scaling failures.</p>
Enterprise Project	<p>Enterprise project to which a cluster belongs. Only on the <b>Active Clusters</b> page, you can click the name of an enterprise project to go to its <b>Enterprise Project Management</b> page.</p>
Security Group	<p>Security group name of the cluster.</p>
Streaming Core Node LVM	<p>Indicates whether to enable the Logical Volume Manager (LVM) function of streaming Core nodes.</p>
Data Disk Key Name	<p>Name of the key used to encrypt data disks. To manage the used keys, log in to the key management console.</p>
Data Disk Key ID	<p>ID of the key used to encrypt data disks.</p>
IAM User Synchronization	<p>IAM user information can be synchronized to an MRS cluster for cluster management. For details, see <a href="#">Synchronizing IAM Users to MRS</a>.</p> <p><b>NOTE</b> The <b>Components</b>, <b>Tenants</b>, and <b>Backups &amp; Restorations</b> tab pages on the cluster details page can be used only after users are synchronized. After clusters of MRS 3.x are synchronized, you can use the <b>Component Management</b> function.</p>
Secure Communications	<p>Used to display the security authorization status. You can click  to enable or disable security authorization. Disabling security authorization brings high risks. Exercise caution when performing this operation. For details, see <a href="#">Communication Security Authorization</a>.</p>

**Table 5-2** Component versions

Parameter	Description
Hadoop Version	Displays the Hadoop version information.
Spark Version	Version of the Spark component. Only clusters of versions earlier than MRS 3.x support this parameter.
HBase Version	Displays the HBase version information.
Hive Version	Displays the Hive version information.
Hue Version	Displays the Hue version information.
Loader Version	Displays the Loader version information.
Kafka Version	Displays the Kafka version information.
Storm Version	Displays the Storm version information.
Flume Version	Displays the Flume version information.
Tez Version	Displays the Tez version information.
Presto Version	Displays the Presto version information.
KafkaManager Version	Displays the KafkaManager version information.
Flink Version	Displays the Flink version information.
Alluxio Version	Displays the Alluxio version information.
Ranger Version	Displays the Ranger version information.
Impala Version	Displays the Impala version information.
Kudu Version	Displays the Kudu version information.
Spark2x Version	Displays the version information about the Spark2x component. Only clusters of MRS 3.x or later support this function.
Oozie Version	Displays the Oozie version information. Only clusters of MRS 3.x or later support this function.
ClickHouse Version	Displays ClickHouse version information. Only clusters of MRS 3.x or later support this function.

On the cluster details page, click **Nodes**. For details about the node parameters, see [Table 5-3](#).

**Table 5-3** Node information

Parameter	Description
Configure Task Node	Used to add a Task node. For details, see <a href="#">Configure Task Node</a> . For 3.x and later versions, this operation applies only to the analysis cluster, streaming cluster, and hybrid cluster.
Add Node Group	This parameter applies only to 3.x and later versions. It applies to customized clusters only and is used to add node groups. For details, see <a href="#">Adding a Node Group</a> .
Node Group	Node group name.
Node Type	<p>Node type:</p> <ul style="list-style-type: none"> <li>• <b>Master:</b> A Master node in an MRS cluster manages the cluster, assigns MapReduce executable files to Core nodes, traces the execution status of each job, and monitors the DataNode running status.</li> <li>• A Task node group is a group of nodes where only data roles that do not store data are deployed. The roles include NodeManager, ThriftServer, ThriftServer1, RESTServer, Supervisor, Logviewer, HBaseIndexer, EsClient and TagSync.</li> <li>• If other roles are deployed in the node group in addition to the preceding roles, the node group is the Core node group.</li> </ul> <p>On the <b>Nodes</b> tab page, click  next to a node group name to unfold the nodes contained in the node group. Click a node name to remotely log in to the ECS using the password or key pair configured during cluster creation. For details about the parameters, see <a href="#">Managing Components and Monitoring Hosts</a>.</p>
Node Count	Number of nodes in a node group.
Operation	<ul style="list-style-type: none"> <li>• <b>Scale Out:</b> For details, see <a href="#">Manually Scaling Out a Cluster</a>.</li> <li>• <b>Scale In:</b> For details, see <a href="#">Manually Scaling In a Cluster</a>.</li> <li>• <b>Auto Scaling:</b> For details, see <a href="#">Configuring an Auto Scaling Rule</a>.</li> <li>• <b>View Roles:</b> You can view information about roles deployed on the node group. This function applies only to custom clusters of 3.x and later.</li> </ul>

## 5.1.2 Viewing Cluster Patch Information

To view patch information about cluster components, you can download the required patch if the cluster component, such as Hadoop or Spark, is faulty. On the MRS console, choose **Clusters > Active Clusters**, select a cluster, and click the

cluster name. On the cluster details page that is displayed, upgrade the component and rectify the fault.

 **NOTE**

MRS 3.x does not have patch version information. Therefore, this section is not involved.

- Patch Name: name of the patch package
- Published: time when the patch package is released
- Status: patch status
- Patch Description: patch version description
- Operation: patch installation or uninstallation

### 5.1.3 Viewing and Customizing Cluster Monitoring Metrics

MRS cluster nodes are classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics on each type of node can be calculated and displayed as curve charts in reports based on the customized periods. If a host belongs to multiple node types, the metric statistics will be repeatedly collected.

This section provides overview of MRS clusters and describes how to view, customize, and export node monitoring metrics on MRS Manager.

**Method 1 (applicable to clusters of versions earlier than MRS 3.x):**

- Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.
- Step 2** Click the **Dashboard** tab, you can view the cluster host health status statistics on the lower part of the displayed tab page.
- Step 3** To view or export reports of other metrics, click **Access Manager** next to **MRS Manager** in the **Basic Information** area to access the Manager page. For details, see [Accessing Manager](#).
- Step 4** On the Manager page, view, customize, and export the node monitoring metric report. For details, see [Dashboard](#).

----End

**Method 2**

- Step 1** Log in to the MRS console.
- Step 2** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.
- Step 3** In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users.
- Step 4** After the synchronization is complete, you can view the cluster monitoring metric report on the right of the page.
- Step 5** In time range area, specify a period to view monitoring data. The options are as follows:
  - Last 1 hour

- Last 3 hours
- Last 12 hours
- Last 24 hours
- Recent 7 days
- Recent 30 days
- Customize: You can customize the period for viewing monitoring data.

**Step 6** Customize a monitoring metric report.

1. Click **Customize** and select monitoring metrics to be displayed.  
MRS supports a maximum of 14 monitoring metrics, but at most 12 customized monitoring metrics can be displayed on the page.
  - Cluster Host Health Status
  - Cluster Network Read Speed Statistics
  - Host Network Read Speed Distribution
  - Host Network Write Speed Distribution
  - Cluster Disk Write Speed Statistics
  - Cluster Disk Usage Statistics
  - Cluster Disk Information
  - Host Disk Usage Statistics
  - Cluster Disk Read Speed Statistics
  - Cluster Memory Usage Statistics
  - Host Memory Usage Distribution
  - Cluster Network Write Speed Statistics
  - Host CPU Usage Distribution
  - Cluster CPU Usage Statistics
2. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

**Step 7** Export a monitoring report.

1. Select a period. The options are as follows:
  - Last 1 hour
  - Last 3 hours
  - Last 12 hours
  - Last 24 hours
  - Recent 7 days
  - Recent 30 days
  - Customize: You can customize the period for viewing monitoring data.
2. Click **Export**. MRS will generate a report about the selected monitoring metrics in a specified time of period. Save the report.

----**End**

**Method 3: (applicable to MRS 3.x clusters)**

- Step 1** Log in to the MRS console.
- Step 2** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.
- Step 3** In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users.
- Step 4** After the synchronization is complete, you can view the cluster monitoring metric report on the right of the page.
- Step 5** In time range area, specify a period to view monitoring data. The options are as follows:
- Last 1 hour
  - Last 3 hours
  - Last 12 hours
  - Last 24 hours
  - Recent 7 days
  - Recent 30 days
  - Customize: You can customize the period for viewing monitoring data.
- Step 6** Customize a monitoring metric report.
1. Click **Customize** and select monitoring metrics to be displayed.  
At most 12 customized monitoring metrics can be displayed on the page.
  2. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

----End

## 5.1.4 Managing Components and Monitoring Hosts

You can manage the following status and metrics of all components (including role instances) and hosts on the MRS console:

- Status information: includes operation, health, configuration, and role instance status.
- Indicator information: includes key monitoring indicators for each component.
- Export monitoring metrics. (This function is not supported in MRS 3.x or later.)

 **NOTE**

- For , see [Managing Services and Monitoring Hosts](#).
- For MRS 3.x or later, see [Procedure](#).
- You can set the interval for automatically refreshing the page or click  to refresh the page immediately.
- Component management supports the following parameter values:
  - Refresh every 30 seconds
  - Refresh every 60 seconds
  - Stop refreshing

## Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

### Managing Components

 **NOTE**

For details about how to perform operations on MRS Manager, see [Managing Service Monitoring](#).

**Step 1** On the MRS cluster details page, click **Components**.

On the **Components** tab page, **Service**, **Operating Status**, **Health Status**, **Configuration Status**, **Role**, and **Operation** are displayed in the component list.

- [Table 5-4](#) describes the service operating status.

**Table 5-4** Service operating status

Status	Description
Started	The service is started.
Stopped	The service is stopped.
Failed to start	Failed to start the role instance.
Failed to stop	Failed to stop the service.
Unknown	Indicates initial service status after the background system restarts.

- [Table 5-5](#) describes the service health status.

**Table 5-5** Service health status

Status	Description
Good	Indicates that all role instances in the service are running properly.
Faulty	Indicates that the running status of at least one role instance is <b>Faulty</b> or the status of the service on which the current service depends is abnormal.
Unknown	Indicates that all role instances in the service are in the <b>Unknown</b> state.
Restoring	Indicates that the background system is restarting the service.
Partially Healthy	Indicates that the status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be invoked by external systems.

- [Table 5-6](#) describes the service health status.

**Table 5-6** Service configuration status

Status	Description
Synchronized	The latest configuration takes effect.
Configuration expired	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
Configuration failed	The communication is incorrect or data cannot be read or written during the parameter configuration. Use <b>Synchronize Configuration</b> to rectify the fault.
Configuring	Parameters are being configured.
Unknown	Indicates that configuration status cannot be obtained.

By default, the **Service** column is sorted in ascending order. You can click the icon next to **Service**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

**Step 2** Click a specified service in the list to view its status and metric information.

**Step 3** Customize and view monitoring graphs.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.

----End

## Managing Role Instances

### NOTE

For versions earlier than MRS 3.x, see [Managing Role Instances](#).

**Step 1** On the MRS cluster details page, click **Components**. In the component list, click the specified service name.

**Step 2** Click **Instances** to view the role status.

The role instance list contains the Role, Host Name, Management IP Address, Service IP Address, Rack, Running Status, and Configuration Status of each instance.

- [Table 5-7](#) shows the running status of a role instance.

**Table 5-7** Role instance running status

Status	Description
<b>Good</b>	Indicates that the instance is running properly.
<b>Bad</b>	Indicates that the instance cannot run properly.
<b>Decommissioned</b>	Indicates that the instance is out of service.
<b>Not started</b>	Indicates that the instance is stopped.
<b>Unknown</b>	Indicates that the initial status of the instance cannot be detected.
<b>Starting</b>	Indicates that the instance is being started.
<b>Stopping</b>	Indicates that the instance is being stopped.
<b>Restoring</b>	Indicates that an exception may occur in the instance and the instance is being automatically rectified.
<b>Decommissioning</b>	Indicates that the instance is being decommissioned.
<b>Recommissioning</b>	Indicates that the instance is being recommissioned.
<b>Failed to start</b>	Indicates that the service fails to be started.
<b>Failed to stop</b>	Indicates that the service fails to be stopped.

- [Table 5-8](#) shows the configuration status of a role instance.

**Table 5-8** Role instance configuration status

Status	Description
<b>Synchronized</b>	The latest configuration takes effect.

Status	Description
<b>Configuration expired</b>	The latest configuration does not take effect after the parameter modification. Related services need to be restarted.
<b>Configuration failed</b>	The communication is incorrect or data cannot be read or written during the parameter configuration. Use <b>Synchronize Configuration</b> to rectify the fault.
<b>Configuring</b>	Parameters are being configured.
<b>Unknown</b>	Current configuration status cannot be obtained.

By default, the **Role** column is sorted in ascending order. You can click the sorting icon next to **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Running Status**, or **Configuration Status** to change the sorting mode.

You can filter out all instances of the same role in the **Role** column.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. You can click **Reset** to reset the search criteria. Fuzzy search is supported.

**Step 3** Click the target role instance to view its status and metric information.

**Step 4** Customize and view monitoring graphs.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.

----End

### Managing Hosts

#### NOTE

For versions earlier than MRS 3.x, see [Managing Hosts](#).

**Step 1** On the MRS cluster details page, click the **Nodes** tab and expand a node group to view the host status.

The host list contains the **Node Name**, **IP Address**, **Rack**, **Operating Status**, **Health Status**, **CPU Usage**, **Memory Usage**, **Disk Usage**, **Network Speed**, **Specification Name**, **Specifications** and **AZ**.

- [Table 5-9](#) shows the host operating status.

**Table 5-9** Host operating status

Status	Description
Normal	The host and service roles on the host are running properly.

Status	Description
Isolated	The host is isolated, and the service roles on the host stop running.

- [Table 5-10](#) describes the host health status.

**Table 5-10** Host health status

Status	Description
Good	The host can properly send heartbeats.
Bad	The host fails to send heartbeats due to timeout.
Unknown	The host initial status is unknown during the operation of adding or deleting a host.

The nodes are sorted in ascending order by default. You can click **Node Name**, **IP Address**, **Rack**, **Operating Status**, **Health Status**, **CPU Usage**, **Memory Usage**, **Disk Usage**, **Network Speed**, **Specification Name**, or **Specifications** to change the sorting mode.

- Step 2** Click the target node in the list to view its status and metric information.

----End

## 5.2 Manually Scaling Out a Cluster

The storage and computing capabilities of MRS can be improved by simply adding Core nodes or Task nodes instead of modifying system architecture, reducing O&M costs. Core nodes can process and store data. You can add Core nodes to expand the node quantities and handle peak loads. Task nodes are used for computing and do not store persistent data.

### Background

The MRS cluster supports a maximum of 500 Core and Task nodes. If more than 500 Core/Task nodes are required, contact technical support engineers or invoke a background interface to modify the database.

Core nodes and Task nodes can be added, excluding the Master node. Here, the maximum number of Core/Task nodes to be added is 500 minus the number of Core/Task nodes. For example, the current number of Core nodes is 3, the number of Core nodes to be added must be less than or equal to 497. If the cluster scale-out fails, you can add node to the cluster again.

If no node is added during cluster creation, you can specify the number of nodes to be added during scale-out. However, you cannot specify the nodes to be added.

The operations for scaling out a cluster vary depending on the selected version.

## Procedure

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale Out**. The **Scale Out** page is displayed.

The scale-out operation can only be performed on the running clusters.

**Step 4** Set **Scaled Out Nodes**, **Enable Component**, and **Run Bootstrap Action**, and click **OK**

### NOTE

- If the Task node group does not exist in the cluster, configure the Task node by referring to [Configure Task Node](#).
- If a bootstrap action is added during cluster creation, the **Run Bootstrap Action** parameter is valid. If this function is enabled, the bootstrap actions added during cluster creation will be run on all the scaled out nodes.
- If the **New Specifications** parameter is available, the specifications that are the same as those of the original nodes have been sold out or discontinued. Nodes with new specifications will be added.
- Before scaling out the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.

**Step 5** In the **Scale Out Node** dialog box, click **OK**.

**Step 6** A dialog box is displayed, indicating that the scale-out task is submitted successfully.

The following parameters explain the cluster scale-out process:

- Expanding: If a cluster is being expanded, its status is **Scaling out**. The submitted jobs will be executed and you can submit new jobs. You are not allowed to continue to scale out, or delete the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Expansion succeeded: If a cluster is expanded successfully, its status is **Running**.
- Failed scale-out: The cluster status is **Running** when the cluster scale-out failed. You can execute jobs and scale out the cluster again.

After the cluster is scaled out, you can view the node information of the cluster on the **Nodes** tab page of the cluster details page.

----End

## Configure Task Node

To add a Task node, perform the following steps:

1. On the cluster details page, click the **Nodes** tab and click **Configure Task Node**. The **Configure Task Node** page is displayed.
2. On the **Configure Task Node** page, set **Node Type**, **Instance Specifications**, **Nodes**, **System Disk**. In addition, if **Add Data Disk** is enabled, configure the storage type, size, and number of data disks.

3. Click **OK**.

## Adding a Node Group

### NOTE

Used to add node groups and applies to customized clusters of MRS 3.x

1. On the cluster details page, click the **Nodes** tab and click **Add Node Group**. The **Add Node Group** page is displayed.
2. Set the parameters as needed.

**Table 5-11** Parameters for adding a node group

Parameter	Description
Instance Specifications	Select the flavor type of the hosts in the node group.
Nodes	Set the number of nodes in the node group.
System Disk	Set the specifications and capacity of the system disk on the new node.
Data Disk (GB)	Set the specifications, capacity, and number of data disks of the new node.
Deploy Roles	Deploy the instances of each node in the new node group. The setting can be manually adjusted.

3. Click **OK**.

## 5.3 Manually Scaling In a Cluster

You can reduce the number of core or task nodes to scale in a cluster based on service requirements so that MRS delivers better storage and computing capabilities at lower O&M costs.

The scale-in operation is not allowed for a cluster that is performing active/standby synchronization.

### Background

A cluster can have three types of nodes, master, core, and task nodes. Currently, only core and task nodes can be removed. To scale in a cluster, you only need to adjust the number of nodes on the MRS console. MRS then automatically selects the nodes to be removed.

The policies for MRS to automatically select nodes are as follows:

- MRS does not select the nodes with basic components installed, such as ZooKeeper, DBService, KrbServer, and LdapServer, because these basic components are the basis for the cluster to run.

- Core nodes store cluster service data. When scaling in a cluster, ensure that all data on the core nodes to be removed has been migrated to other nodes. You can perform follow-up scale-in operations only after all component services are decommissioned, for example, removing nodes from Manager and deleting ECSs. When selecting core nodes, MRS preferentially selects the nodes with a small amount of data and healthy instances to be decommissioned to prevent decommissioning failures. For example, if DataNodes are installed on core nodes in an analysis cluster, MRS preferentially selects the nodes with small data volume and good health status during scale-in.

When core nodes are removed, their data is migrated to other nodes. If the user business has cached the data storage path, the client will automatically update the path, which may increase the service processing latency temporarily. Cluster scale-in may slow the response of the first access to some HBase on HDFS data. You can restart HBase or disable or enable related tables to resolve this issue.

- Task nodes are computing nodes and do not store cluster data. Data migration is not involved in removing task nodes. Therefore, when selecting task nodes, MRS preferentially selects nodes whose health status is faulty, unknown, or subhealthy. On the **Components** tab of the MRS console, click a service and then the **Instances** tab to view the health status of the node instances.

## Scale-In Verification Policy

To prevent component decommissioning failures, components provide different decommissioning constraints. Scale-in is allowed only when the constraints of all installed components are met. [Table 5-12](#) describes the scale-in verification policies.

**Table 5-12** Decommissioning constraints

Component	Constraint
HDFS/DataNode	<p>The number of available nodes after scale-in is greater than or equal to the number of HDFS copies and the total HDFS data volume does not exceed 80% of the total HDFS cluster capacity.</p> <p>This ensures that the remaining space is sufficient for storing existing data after the scale-in and reserves some space for future use.</p> <p><b>NOTE</b> To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total.</p>
HBase/RegionServer	<p>The total available memory of RegionServers on all nodes except the nodes to be removed is greater than 1.2 times of the memory which is currently used by RegionServers on these nodes.</p> <p>This ensures that the node to which the region on a decommissioned node is migrated has sufficient memory to bear the region of the decommissioned node.</p>

Component	Constraint
Storm/ Supervisor	After the scale-in, ensure that the number of slots in the cluster is sufficient for running the submitted tasks. This prevents no sufficient resources being available for running the stream processing tasks after the scale-in.
Flume/ FlumeServer	If FlumeServer is installed on a node and Flume tasks have been configured for the node, the node cannot be deleted. This prevents the deployed service program from being deleted by mistake.

## Scaling In a Cluster by Specifying the Node Quantity

**Step 1** Log in to the MRS console.

**Step 2** In the navigation pane on the left, choose **Clusters > Active Clusters**, select a running cluster, and click its name to go to the cluster details page.

**Step 3** Click the **Nodes** tab. In the **Operation** column of the node group, click **Scale In** to go to the **Scale In** page.

This operation can be performed only when the cluster and all nodes in it are running.

**Step 4** Set **Scale-In Nodes** and click **OK**.

### NOTE

- Before scaling in the cluster, check whether its security group configuration is correct. Ensure that an inbound security group rule contains a rule in which **Protocol & Port** is set to **All**, and **Source** is set to a trusted accessible IP address range.
- If damaged data blocks exist in HDFS, the cluster may fail to be scaled in. Contact technical support.

**Step 5** A dialog box displayed in the upper right corner of the page indicates that the task of removing the node is submitted successfully.

The cluster scale-in process is explained as follows:

- During scale-in: The cluster status is **Scaling In**. The submitted jobs will be executed, and you can submit new jobs. You are not allowed to continue to scale in or terminate the cluster. You are advised not to restart the cluster or modify the cluster configuration.
- Successful scale-in: The cluster status is **Running**.
- Failed scale-in: The cluster status is **Running**. You can execute jobs or scale-in the cluster again.

After the cluster is scaled in, you can view the node information of the cluster on the **Nodes** tab of the cluster details page.

----End

## 5.4 Configuring an Auto Scaling Rule

In big data application scenarios, especially real-time data analysis and processing, the number of cluster nodes needs to be dynamically increased or decreased according to data volume changes to add or reduce resources. The auto scaling function of MRS enables clusters to be automatically scaled out or in based on cluster loads. In addition, if the data volume changes in a cycle by day and you want to scale out or in a cluster before the data volume changes, you can use the MRS resource plan feature (setting the Task node quantity based on the time range).

- Auto scaling rules: You can increase or decrease Task nodes based on real-time cluster loads. Auto scaling will be triggered when the data volume changes but there may be some delays.
- Resource plan (setting the Task node quantity based on the time range): If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding delays in increasing or decreasing resources.

You can configure either auto scaling rules or resource plans or both of them to trigger the auto scaling. Configuring both resource plans and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

In some service scenarios, resources need to be reallocated or service logic needs to be modified after cluster scale-out or scale-in. If you manually scale out or scale in a cluster, you can log in to cluster nodes to reallocate resources or modify service logic. If you use auto scaling, MRS enables you to customize automation scripts for resource reallocation and service logic modification. Automation scripts can be executed before and after auto scaling and automatically adapt to service load changes, all of which eliminates manual operations. In addition, automation scripts can be fully customized and executed at various moments, which can meet your personalized requirements and improve auto scaling flexibility.

### NOTE

You can configure auto scaling rules when creating a cluster or after a cluster has been created. This section describes how to configure auto scaling rules after cluster creation. For details about how to configure auto scaling rules during cluster creation, see [Configuring Auto Scaling Rules When Creating a Cluster](#).

## Background

You can configure either auto scaling rules or resource plans or both of them to trigger the auto scaling.

- Auto scaling rules:
  - You can set a maximum of five rules for scaling out or in a cluster, respectively.
  - The system determines the scale-out and then scale-in based on your configuration sequence. Important policies take precedence over other policies to prevent repeated triggering when the expected effect cannot be achieved after a scale-out or scale-in.

- Comparison factors include greater than, greater than or equal to, less than, and less than or equal to.
- Cluster scale-out or scale-in can be triggered only after the configured metric threshold is reached for consecutive  $5n$  (the default value of  $n$  is 1) minutes.
- After each scale-out or scale-in, there is a cooling duration is greater than 0, and lasts 20 minutes by defaults.
- In each cluster scale-out or scale-in, at least one node and at most 100 nodes can be added or reduced.
- Resource plans (setting the number of Task nodes by time range):
  - You can specify a Task node range (minimum number to maximum number) in a time range. If the number of Task nodes is beyond the Task node range in a resource plan, the system triggers cluster scale-out or scale-in.
  - You can set a maximum of five resource plans for a cluster.
  - A resource plan cycle is by day. The start time and end time can be set to any time point between 00:00 and 23:59. The start time must be at least 30 minutes earlier than the end time. Time ranges configured for different resource plans cannot overlap.
  - After a resource plan triggers cluster scale-out or scale-in, there is 10-minute cooling duration. Auto scaling will not be triggered again within the cooling time.
  - When a resource plan is enabled, the number of Task nodes in the cluster is limited to the default node range configured by you in other time periods except the time period configured in the resource plan.
  - If the resource plan is not enabled, the number of Task nodes is not limited to the default node range.
- Automation scripts:
  - You can set an automation script so that it can automatically run on cluster nodes when auto scaling is triggered.
  - You can set a maximum number of 10 automation scripts for a cluster.
  - You can specify an automation script to be executed on one or more types of nodes.
  - Automation scripts can be executed before or after scale-out or scale-in.
  - Before using automation scripts, upload them to a cluster VM or OBS file system in the same region as the cluster. The automation scripts uploaded to the cluster VM can be executed only on the existing nodes. If you want to make the automation scripts run on the new nodes, upload them to the OBS file system.

## Using Auto Scaling Rules Alone

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to The cluster details page is displayed.

**Step 3** On the **Nodes** tab page, click **Auto Scaling** in the **Operation** column of the Task node group. The **Auto Scaling** page is displayed.

If no Task node exists in the cluster, click **Configure Task Node** to add a Task node and then perform this step.

**Step 4** Configure an auto scaling rule.

You can configure the auto scaling rule to adjust the number of nodes, which affects the actual price. Therefore, exercise caution when performing this operation.

- **Auto Scaling:** indicates whether to enable auto scaling. Auto scaling is disabled by default. After you enable it, you can configure the following parameters.
- **Node Range**
  - **Default Range:** Enter a Task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules. The value ranges from 0 to 500.
  - **Configure Node Range for Specific Time Range:** This parameter is used to configure an auto scaling resource plan.
    - i. Click **Configure Node Range for Specific Time Range** under **Default Range**.
    - ii. Configure the **Time Range** and **Node Range** parameters. **Time Range** and **Node Range** indicate the number of Task nodes within the time range. The value of **Node Range** ranges from 0 to 500.  
You can click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

 **NOTE**

- If the node range in a specified period is not configured, the default node range is used.
- If the number of nodes in a specified time range is configured, the node range is used. If the time is not within the configured time range, the default range is used.
- **Auto Scaling Rule:** To enable the auto scaling, the scale-out and scale-in rules need to be configured.

Configuration procedure:

- a. Select **Scale-out** or **Scale-in**.
- b. Click **Add Rule**. The **Add Rule** page is displayed.
- c. Configure the **Rule Name**, **If**, **Last for**, **Add**, and **Cooldown Period** parameters.
- d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page. You can click **Add Rule** to configure multiple rules.

**Step 5** Select **I agree to authorize MRS to scale out or scale in nodes based on the above rule**.

**Step 6** Click **OK**.

----End

## Using Resource Plans Alone

If the data volume changes regularly every day and you want to scale out or in a cluster before the data volume changes, you can create resource plans to adjust the number of Task nodes as planned in the specified time range.

For example, the service data volume for real-time processing peaks between 7:00 and 13:00 every day and is stable and low for other time. Assume that an MRS streaming cluster is used to process the service data. Between 7:00 and 13:00, five Task nodes are required for processing the peak data volume, and only two task nodes are required for other time periods. You can perform the following steps to configure a resource plan.

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to The cluster details page is displayed.

**Step 3** On the **Nodes** tab page, click **Auto Scaling** in the **Operation** column of the Task node group. The **Auto Scaling** page is displayed.

If no Task node exists in the cluster, click **Configure Task Node** to add a Task node and then perform this step.

**Step 4** Configure a resource plan.

You can configure the resource plan to adjust the number of nodes, which affects the actual price. Therefore, exercise caution when performing this operation.

Configuration procedure:

1. On the **Auto Scaling** page, enable **Auto Scaling**.
2. For example, the **Default Range** is set to **2-2**, indicating that the number of Task nodes is fixed to 2 except the time range specified in the resource plan.
3. Click **Configure Node Range for Specific Time Range** under **Default Range**.
4. Configure the **Time Range** and **Node Range** parameters. For example, set **Time Range** to **07:00-13:00**, and **Node Range** to **5-5**. This indicates that the number of Task nodes is fixed to 5 in the time range specified in the resource plan. For details about the parameters, see [Table 5-14](#).

You can click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

**Step 5** (Optional) Configure automation scripts. MRS 3.x does not support this operation.

1. Set **Advanced Settings** to **Configure**.
2. Click **Create**. The **Automation Script** page is displayed.
3. Set the following parameters: **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see [Table 5-15](#).
4. Click **OK** to save the automation script configurations.

**Step 6** Select **I agree to authorize MRS to scale out or scale in nodes based on the above rule**.

**Step 7** Click **OK**.

----End

## Using Auto Scaling Rules and Resource Plans Together

If the data volume is not stable and the expected fluctuation may occur, the fixed Task node range cannot guarantee that the requirements in some service scenarios are met. In this case, it is necessary to adjust the number of Task nodes based on the real-time loads and resource plans.

For example, even though the service data volume for real-time processing changes regularly from 7:00 to 13:00 every day, it is still unstable. Assume that during 7:00 to 13:00, the number of required Task nodes ranges from 5 to 8, and the number of Task nodes required at other time ranges from 2 to 4. Therefore, you can set an auto scaling rule based on a resource plan. When the data volume exceeds the expected value, the number of Task nodes can be adjusted if resource loads change, without exceeding the node range specified in the resource plan. When a resource plan is triggered, the number of nodes is adjusted within the specified node range with minimum affect. That is, increase nodes to the upper limit and decrease nodes to the lower limit. Perform the following steps to configure both the auto scaling rule and the resource plan:

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to The cluster details page is displayed.

**Step 3** On the **Nodes** tab page, click **Auto Scaling** in the **Operation** column of the Task node group. The **Auto Scaling** page is displayed.

**Step 4** Configure an auto scaling rule.

You can configure the auto scaling rule to adjust the number of nodes, which affects the actual price. Therefore, exercise caution when performing this operation.

- **Auto Scaling:** indicates whether to enable auto scaling. Auto scaling is disabled by default. After you enable it, you can configure the following parameters.
- **Default Range:** Enter a Task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules. Set this parameter to **2 to 4**.
- **Auto Scaling Rule:** To enable the auto scaling, the scale-out and scale-in rules need to be configured.

Configuration procedure:

- a. Select **Scale-out** or **Scale-in**.
- b. Click **Add Rule**. The **Add Rule** page is displayed.
- c. Configure the **Rule Name**, **If**, **Last for**, **Add**, and **Cooldown Period** parameters.
- d. Click **OK**.

You can view, edit, or delete the rules you configured in the **Scale-out** or **Scale-in** area on the **Auto Scaling** page.

**Step 5** Configure a resource plan.

You can configure the resource plan to adjust the number of nodes, which affects the actual price. Therefore, exercise caution when performing this operation.

Configuration procedure:

1. Click **Configure Node Range for Specific Time Range** under **Default Range**.
2. Configure the **Time Range** and **Node Range** parameters. Set **Time Range** to **07:00-13:00** and **Node Range** to **5-8**. For details about the parameters, see [Table 5-14](#).
3. You can click **Configure Node Range for Specific Time Range** to configure multiple resource plans.

**Step 6** Configure the automation script. MRS 3.x does not support this operation.

1. In **Automation Script** in the **Advanced Settings**, click **Create**. The **Automation Script** page is displayed.
2. Set the following parameters: **Name**, **Script Path**, **Execution Node**, **Parameter**, **Executed**, and **Action upon Failure**. For details about the parameters, see [Table 5-15](#).
3. Click **OK** to save the automation script configurations.

**Step 7** Select **I agree to authorize MRS to scale out or scale in nodes based on the above rule**.

**Step 8** Click **OK**.

----End

## Related Information

When adding a rule, you can refer to [Table 5-13](#) to configure the corresponding metrics.

**Table 5-13** Auto scaling metrics

Cluster Type	Metric	Value Type	Description
Streaming cluster	StormSlotAvailable	Integer	Number of available Storm slots Value range: 0 to 2147483646
	StormSlotAvailablePercentage	Percentage	Percentage of available Storm slots, that is, the proportion of the available slots to total slots Value range: 0 to 100
	StormSlotUsed	Integer	Number of the used Storm slots Value range: 0 to 2147483646
	StormSlotUsedPercentage	Percentage	Percentage of the used Storm slots, that is, the proportion of the used slots to total slots Value range: 0 to 100

Cluster Type	Metric	Value Type	Description
	StormSupervisorMemAverageUsage	Integer	Average memory usage of the Supervisor process of Storm Value range: 0 to 2147483646
	StormSupervisorMemAverageUsagePercentage	Percentage	Average percentage of the used memory of the Supervisor process of Storm to the total memory of the system Value range: 0 to 100
	StormSupervisorCPUAverageUsagePercentage	Percentage	Average percentage of the used CPUs of the Supervisor process of Storm to the total CPUs Value range: 0 to 6000
Analysis cluster	YARNAppPending	Integer	Number of pending tasks on YARN Value range: 0 to 2147483646
	YARNAppPendingRatio	Ratio	Ratio of pending tasks on Yarn, that is, the ratio of pending tasks to running tasks on Yarn Value range: 0 to 2147483646
	YARNAppRunning	Integer	Number of running tasks on Yarn Value range: 0 to 2147483646
	YARNContainerAllocated	Integer	Number of containers allocated to Yarn Value range: 0 to 2147483646
	YARNContainerPending	Integer	Number of pending containers on Yarn Value range: 0 to 2147483646
	YARNContainerPendingRatio	Ratio	Ratio of pending containers on Yarn, that is, the ratio of pending containers to running containers on Yarn. Value range: 0 to 2147483646
	YARNCPUAllocated	Integer	Number of virtual CPUs (vCPUs) allocated to Yarn Value range: 0 to 2147483646
	YARNCPUAvailable	Integer	Number of available vCPUs on Yarn Value range: 0 to 2147483646

Cluster Type	Metric	Value Type	Description
	YARNCPUsAvailablePercentage	Percentage	Percentage of available vCPUs on Yarn, that is, the proportion of available vCPUs to total vCPUs Value range: 0 to 100
	YARNCPUPending	Integer	Number of pending vCPUs on Yarn Value range: 0 to 2147483646
	YARNMemoryAllocated	Integer	Memory allocated to Yarn. The unit is MB. Value range: 0 to 2147483646
	YARNMemoryAvailable	Integer	Available memory on Yarn. The unit is MB. Value range: 0 to 2147483646
	YARNMemoryAvailablePercentage	Percentage	Percentage of available memory on Yarn, that is, the proportion of available memory to total memory on Yarn Value range: 0 to 100
	YARNMemoryPending	Integer	Pending memory on Yarn Value range: 0 to 2147483646

 **NOTE**

- When the value type is percentage or ratio in [Table 5-13](#), the valid value can be accurate to percentile. The percentage metric value is a decimal value with a percent sign (%) removed. For example, 16.80 represents 16.80%.
- Hybrid clusters support all metrics of analysis and streaming clusters.

When adding a resource plan, you can set parameters by referring to [Table 5-14](#).

**Table 5-14** Configuration items of a resource plan

Configuration Item	Description
Time Range	Start time and End time of a resource plan are accurate to minutes, with the value ranging from <b>00:00</b> to <b>23:59</b> . For example, if a resource plan starts at 8:00 and ends at 10:00, set this parameter to 8:00-10:00. The end time must be at least 30 minutes later than the start time.

Configuration Item	Description
Node Range	The number of nodes in a resource plan ranges from <b>0</b> to <b>500</b> . In the time range specified in the resource plan, if the number of Task nodes is less than the specified minimum number of nodes, it will be increased to the specified minimum value of the node range at a time. If the number of Task nodes is greater than the maximum number of nodes specified in the resource plan, the auto scaling function reduces the number of Task nodes to the maximum value of the node range at a time. The minimum number of nodes must be less than or equal to the maximum number of nodes.

 **NOTE**

- When a resource plan is enabled, the **Default Range** value on the auto scaling page forcibly takes effect beyond the time range specified in the resource plan. For example, if **Default Range** is set to **1-2**, **Time Range** is between **08:00-10:00**, and **Node Range** is **4-5** in a resource plan, the number of Task nodes in other periods (0:00-8:00 and 10:00-23:59) of a day is forcibly limited to the default node range (1 to 2). If the number of nodes is greater than 2, auto scale-in is triggered; if the number of nodes is less than 1, auto scale-out is triggered.
- When a resource plan is not enabled, the **Default Range** takes effect in all time ranges. If the number of nodes is not within the default node range, the number of Task nodes is automatically increased or decreased to the default node range.
- Time ranges of resource plans cannot be overlapped. The overlapped time range indicates that two effective resource plans exist at a time point. For example, if resource plan 1 takes effect from **08:00** to **10:00** and resource plan 2 takes effect from **09:00** to **11:00**, the time range between **09:00** to **10:00** is overlapped.
- The time range of a resource plan must be on the same day. For example, if you want to configure a resource plan from **23:00** to **01:00** in the next day, configure two resource plans whose time ranges are **23:00-00:00** and **00:00-01:00**, respectively.

When adding an automation script, you can set related parameters by referring to [Table 5-15](#).

**Table 5-15** Configuration items of an automation script

Configuration Item	Description
Name	Automation script name. The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space. The value can contain 1 to 64 characters. <b>NOTE</b> A name must be unique in the same cluster. You can set the same name for different clusters.

Configuration Item	Description
Script Path	<p>Script path. The value can be an OBS file system path or a local VM path.</p> <ul style="list-style-type: none"> <li>• An OBS file system path must start with <b>s3a://</b> and end with <b>.sh</b>, for example, <b>s3a://mrs-samples/xxx.sh</b>.</li> <li>• A local VM path must start with a slash (/) and end with <b>.sh</b>. For example, the path of the example script for installing the Zepelin is <b>/opt/bootstrap/zepelin/zepelin_install.sh</b>.</li> </ul>
Execution Node	<p>Select a type of the node where an automation script is executed.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If you select <b>Master</b> nodes, you can choose whether to run the script only on the active Master nodes by enabling or disabling the <b>Active Master</b> switch.</li> <li>• If you enable it, the script runs only on the active Master nodes. If you disable it, the script runs on all Master nodes. This switch is disabled by default.</li> </ul>
Parameter	<p>Automation script parameter. The following predefined variables can be imported to obtain auto scaling information:</p> <ul style="list-style-type: none"> <li>• <b>\${mrs_scale_node_num}</b>: Number of auto scaling nodes. The value is always positive.</li> <li>• <b>\${mrs_scale_type}</b>: Scale-out/in type. The value can be <b>scale_out</b> or <b>scale_in</b>.</li> <li>• <b>\${mrs_scale_node_hostnames}</b>: Host names of the auto scaling nodes. Use commas (,) to separate multiple host names.</li> <li>• <b>\${mrs_scale_node_ips}</b>: IP address of the auto scaling nodes. Use commas (,) to separate multiple IP addresses.</li> <li>• <b>\${mrs_scale_rule_name}</b>: Name of the triggered auto scaling rule. For a resource plan, this parameter is set to <b>resource_plan</b>.</li> </ul>
Executed	<p>Time for executing an automation script. The following four options are supported: <b>Before scale-out</b>, <b>After scale-out</b>, <b>Before scale-in</b>, and <b>After scale-in</b>.</p> <p><b>NOTE</b></p> <p>Assume that the execution nodes include Task nodes.</p> <ul style="list-style-type: none"> <li>• The automation script executed before scale-out cannot run on the Task nodes to be added.</li> <li>• The automation script executed after scale-out can run on the added Task nodes.</li> <li>• The automation script executed before scale-in can run on Task nodes to be deleted.</li> <li>• The automation script executed after scale-in cannot run on the deleted Task nodes.</li> </ul>

Configuration Item	Description
Action upon Failure	<p>Whether to continue to execute subsequent scripts and scale-out/in after the script fails to be executed.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>You are advised to set this parameter to <b>Continue</b> in the commissioning phase so that the cluster can continue the scale-out/in operation no matter whether the script is executed successfully.</li> <li>If the script fails to be executed, view the log in <code>/var/log/Bootstrap</code> on the cluster VM.</li> <li>The scale-in operation cannot be rolled back. Therefore, the <b>Action upon Failure</b> can only be set to <b>Continue</b> after scale-in.</li> </ul>

 **NOTE**

The automation script is triggered only during auto scaling. It is not triggered when the cluster node is manually scaled out or in.

## 5.5 Configuring Auto Scaling Rules When Creating a Cluster

In big data application scenarios, especially real-time data analysis and processing, the number of cluster nodes needs to be dynamically increased or decreased according to data volume changes to add or reduce resources. The auto scaling function of MRS enables clusters to be automatically scaled out or in based on cluster loads. In addition, if the data volume changes in a cycle by day and you want to scale out or in a cluster before the data volume changes, you can use the MRS resource plan feature (setting the Task node quantity based on the time range).

- Auto scaling rules: You can increase or decrease Task nodes based on real-time cluster loads. Auto scaling will be triggered when the data volume changes but there may be some delays.
- Resource plan (setting the Task node quantity based on the time range): If the data volume changes periodically, you can create resource plans to resize the cluster before the data volume changes, thereby avoiding delays in increasing or decreasing resources.

You can configure either auto scaling rules or resource plans or both of them to trigger the auto scaling. Configuring both resource plans and auto scaling rules improves the cluster node scalability to cope with occasionally unexpected data volume peaks.

In some service scenarios, resources need to be reallocated or service logic needs to be modified after cluster scale-out or scale-in. If you manually scale out or scale in a cluster, you can log in to cluster nodes to reallocate resources or modify service logic. If you use auto scaling, MRS enables you to customize automation scripts for resource reallocation and service logic modification. Automation scripts can be executed before and after auto scaling and automatically adapt to service

load changes, all of which eliminates manual operations. In addition, automation scripts can be fully customized and executed at various moments, which can meet your personalized requirements and improve auto scaling flexibility.

#### NOTE

You can configure auto scaling rules when creating a cluster or after a cluster has been created. This section describes how to configure auto scaling rules during cluster creation. For details about how to configure auto scaling rules after cluster creation, see [Configuring an Auto Scaling Rule](#).

## Background

You can configure either auto scaling rules or resource plans or both of them to trigger the auto scaling.

- Auto scaling rules:
  - You can set a maximum of five rules for scaling out or in a cluster, respectively.
  - The system determines the scale-out and then scale-in based on your configuration sequence. Important policies take precedence over other policies to prevent repeated triggering when the expected effect cannot be achieved after a scale-out or scale-in.
  - Comparison factors include greater than, greater than or equal to, less than, and less than or equal to.
  - Cluster scale-out or scale-in can be triggered only after the configured metric threshold is reached for consecutive 5n (the default value of n is 1) minutes.
  - After each scale-out or scale-in, there is a cooling duration that is greater than 0 and lasts 20 minutes by defaults.
  - In each cluster scale-out or scale-in, at least one node and at most 100 nodes can be added or reduced.
- Resource plans (setting the number of Task nodes by time range):
  - You can specify a Task node range (minimum number to maximum number) in a time range. If the number of Task nodes is beyond the Task node range in a resource plan, the system triggers cluster scale-out or scale-in.
  - You can set a maximum of five resource plans for a cluster.
  - A resource plan cycle is by day. The start time and end time can be set to any time point between 00:00 and 23:59. The start time must be at least 30 minutes earlier than the end time. Time ranges configured for different resource plans cannot overlap.
  - After a resource plan triggers cluster scale-out or scale-in, there is 10-minute cooling duration. Auto scaling will not be triggered again within the cooling time.
  - When a resource plan is enabled, the number of Task nodes in the cluster is limited to the default node range configured by you in other time periods except the time period configured in the resource plan.
  - If the resource plan is not enabled, the number of Task nodes is not limited to the default node range.

- Automation scripts:
  - You can set an automation script so that it can automatically run on cluster nodes when auto scaling is triggered.
  - You can set a maximum number of 10 automation scripts for a cluster.
  - You can specify an automation script to be executed on one or more types of nodes.
  - Automation scripts can be executed before or after scale-out or scale-in.
  - Before using automation scripts, upload them to a cluster VM or OBS file system in the same region as the cluster. The automation scripts uploaded to the cluster VM can be executed only on the existing nodes. If you want to make the automation scripts run on the new nodes, upload them to the OBS file system.

## Adding an Auto Scaling Rule

**Step 1** Log in to the MRS management console.

**Step 2** Click **Create Cluster**, the **Create Cluster** page is displayed.

**Step 3** Configure the cluster software and hardware by referring to [Creating a Custom Cluster](#).

**Step 4** On the **Set Advanced Options** tab page, click **Add** in the **Auto Scaling** area.

**Step 5** Add an auto scaling rule.

You can configure the auto scaling rule to adjust the number of nodes, which affects the actual price. Therefore, exercise caution when performing this operation.

- Node type: Select the type of Task nodes for which an auto scaling rule is to be added. For an analysis cluster, the option is **Analysis Task**. For a streaming cluster, the option is **Streaming Task**. For a hybrid cluster, the options are **Analysis Task** and **Streaming Task**.
- Default node range: Enter a Task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules. The value ranges from 0 to 500.
- To add the auto scaling rule, perform the following operations:
  - a. In **Type**, select **Scale-out** or **Scale-in**.
  - b. Configure the **Rule Name**, **If**, **Last for**, **Add**, and **Cooldown Period** parameters. For details about monitoring metrics that trigger auto scaling, see [Table 5-13](#).
  - c. Click **OK**.

You can view the added scaling rules in the **Add Auto Scaling Rule** area and edit or delete the rule in the **Operation** column.
  - d. Add more rules by clicking **Add Auto Scaling Rule**.

**Step 6** Click **OK**.

You can view the added scaling rules in the **Add Auto Scaling Rule** area and edit or delete the rule in the **Operation** column.

----End

## Adding a Resource Plan

If the data volume changes regularly every day and you want to scale out or in a cluster before the data volume changes, you can create resource plans to adjust the number of Task nodes as planned in the specified time range.

For example, the service data volume for real-time processing peaks between 7:00 and 13:00 every day and is stable and low for other time. Assume that an MRS streaming cluster is used to process the service data. Between 7:00 and 13:00, five Task nodes are required for processing the peak data volume, and only two task nodes are required for other time. You can perform the following steps to configure a resource plan.

- Step 1** Log in to the MRS management console.
- Step 2** Click **Create Cluster**, the **Create Cluster** page is displayed.
- Step 3** Configure the cluster software and hardware by referring to [Creating a Custom Cluster](#).
- Step 4** On the **Set Advanced Options** tab page, click **Add** in the **Auto Scaling** area.
- Step 5** Add a resource plan.

You can configure the resource plan to adjust the number of nodes, which affects the actual price. Therefore, exercise caution when performing this operation.

- **Node type:** Select the type of Task nodes for which an auto scaling rule is to be added. For an analysis cluster, the option is **Analysis Task**. For a streaming cluster, the option is **Streaming Task**. For a hybrid cluster, the options are **Analysis Task** and **Streaming Task**.
- **Default node range:** Enter a Task node range, in which auto scaling is performed. This constraint applies to all scale-in and scale-out rules. The value ranges from 0 to 500. For example, the default node range **2-2** indicates that the number of Task nodes is fixed to 2 except the time range specified in the resource plan.
- To add the resource plan, perform the following operations:
  - a. Configure the **Time Range** and **Node Range** parameters. For example, set **Time Range** to **07:00-13:00**, and **Node Range** to **5-5**. This indicates that the number of Task nodes is fixed to 5 in the time range specified in the resource plan. For details about the parameters, see [Table 5-14](#).
  - b. Add more resource plans by clicking **Add Resource Plan**.
  - c. Click **OK**.

You can view or modify the added the auto scaling plans in the **Auto Scaling** area, and delete the plan in the **Operation** column.

- Step 6** (Optional) Add an automation script. Currently, MRS 3.x does not support the Bootstrap action.
  1. Click **Create**.
  2. Configure the **Name**, **Script Path**, **Parameter**, **Execution Node**, **Execution Time**, and **Action upon Failure** parameter. For details about the parameters, see [Table 5-16](#).

**Table 5-16** Parameter description

Parameter	Description
Name	<p>Name of a bootstrap action script</p> <p>The value can contain only digits, letters, spaces, hyphens (-), and underscores (_) and must not start with a space.</p> <p>The value can contain 1 to 64 characters.</p> <p><b>NOTE</b> A name must be unique in the same cluster. You can set the same name for different clusters.</p>
Script Path	<p>Script path. The value can be an OBS file system path or a local VM path.</p> <ul style="list-style-type: none"> <li>- An OBS file system path must start with <b>s3a://</b> and end with <b>.sh</b>, for example, <b>s3a://mrs-samples/xxx.sh</b>.</li> <li>- A local VM path must start with a slash (/) and end with <b>.sh</b>.</li> </ul>
Parameter	Automatic script parameter.
Execution Node	Select a type of the node where the bootstrap action script is executed.
Executed	<p>Select the time when the bootstrap action script is executed.</p> <ul style="list-style-type: none"> <li>- Before</li> <li>- After</li> <li>- Before scale-in</li> <li>- After scale-in</li> </ul>
Action upon Failure	<p>Whether to continue to execute subsequent scripts and create a cluster after the script fails to be executed.</p> <p><b>NOTE</b> You are advised to set this parameter to <b>Continue</b> in the debugging phase so that the cluster can continue to be installed and started no matter whether the bootstrap action is successful.</p>

3. Click **OK** to save the bootstrap action.

----End

## 5.6 Changing the Subnet of a Cluster

If the current subnet does not have sufficient IP addresses, you can change to another subnet in the same VPC of the current cluster to obtain more available subnet IP addresses. Changing a subnet does not affect the IP addresses or subnets of existing nodes.

For details about how to configure network ACL outbound rules, see [How Do I Configure a Network ACL Outbound Rule?](#)

## Changing a Subnet When No Network ACL Is Associated

- Step 1** Log in to the MRS console.
- Step 2** Click the target cluster name to go to its details page.
- Step 3** Click **Change Subnet** on the right of **Default Subnet**.
- Step 4** Select the target subnet and click **OK**.

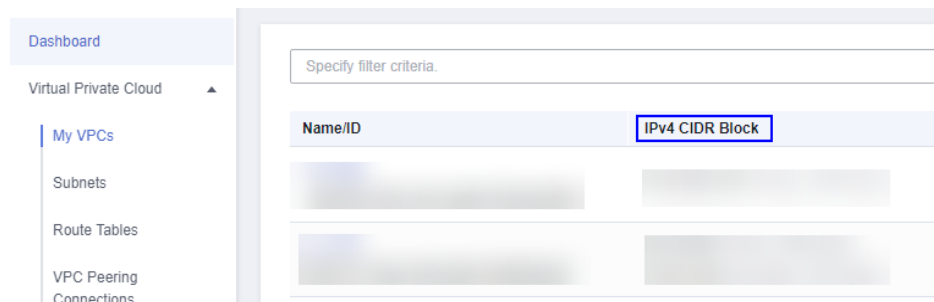

If no subnet is available, click **Create Subnet** to create a subnet first.

----End

## Changing a Subnet When a Network ACL Is Associated

- Step 1** Log in to the MRS console and click the target cluster to go to its details page.
- Step 2** In the **Basic Information** area, view **VPC**.
- Step 3** Log in to the VPC console. In the navigation pane on the left, choose **Virtual Private Cloud** and obtain the IPv4 CIDR block corresponding to the VPC obtained in [Step 2](#).

**Figure 5-1** Obtaining the IPv4 CIDR block

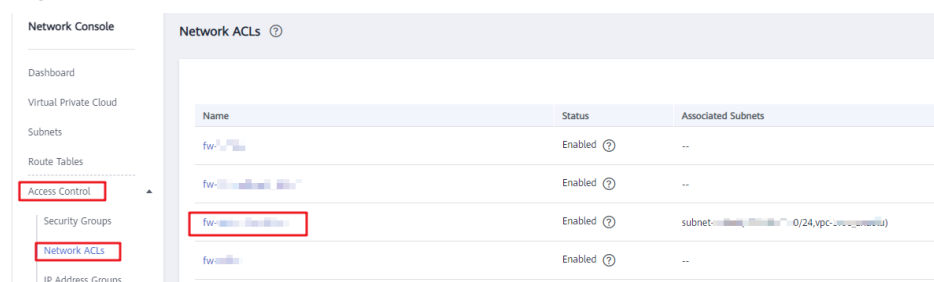

- Step 4** Choose **Access Control > Network ACLs** and click the name of the network ACL that is associated with the default and new subnets.

**NOTE**

If both the default and new subnets are associated with a network ACL, add inbound rules to the network ACL by referring to [Step 5](#) to [Step 7](#).

**Figure 5-2** Network ACLs

**Step 5** On the **Inbound Rules** page, choose **More > Insert Rule Above** in the **Operation** column.

**Step 6** Add a network ACL rule. Set **Action** to **Allow**, **Source** to the VPC IPv4 CIDR block obtained in [Step 3](#), and retain the default values for other parameters.

**Step 7** Click **OK**.

 **NOTE**

If you do not want to allow access from all IPv4 CIDR blocks of the VPC, add the IPv4 CIDR blocks of the default and new subnets by performing [Step 8](#) to [Step 12](#). If the rules for VPC IPv4 CIDR blocks have been added, skip [Step 8](#) to [Step 12](#).

**Step 8** Log in to the MRS console.

**Step 9** Click the target cluster to go to its details page.

**Step 10** Click **Change Subnet** on the right of **Default Subnet**.

**Step 11** Obtain the IPv4 CIDR blocks of the default and new subnets.

---

**NOTICE**

In this case, you do not need to click **OK** displayed in the **Change Subnet** dialog box. Otherwise, the default subnet will be updated to the new subnet, thereby making it difficult to query the IPv4 CIDR block of the default subnet. Exercise caution when performing this operation.

---

**Step 12** Add the IPv4 CIDR blocks of the default and target subnets to the inbound rules of the network ACL bound to the two subnets by referring to [Step 4](#) to [Step 7](#).

**Step 13** Log in to the MRS console.

**Step 14** Click the target cluster to go to its details page.

**Step 15** Click **Change Subnet** on the right of **Default Subnet**.

**Step 16** Select the target subnet and click **OK**.

----End

## How Do I Configure a Network ACL Outbound Rule?

- Method 1

Allow all outbound traffic. This method ensures that clusters can be created and used properly.

- Method 2

Allow the mandatory outbound rules that can ensure the successful creation of clusters. You are not advised to use this method because created clusters may not run properly due to absent outbound rules. If the preceding problem occurs, contact O&M personnel.

Similar to the example provided in method 1, set **Action** to **Allow** and add the outbound rules whose destinations are the address with **Secure Communications** enabled, NTP server address, OBS server address, OpenStack address, and DNS server address, respectively.

## 5.7 Configuring Message Notification

MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications in a variety of message types (SMSs and emails).

### Scenario

On the MRS management console, you can enable or disable the notification service on the **Alarms** tab page of the cluster details page. The functions in the following scenarios can be implemented only after the required cluster function is enabled:

- After a user subscribes to the notification service, the MRS management plane notifies the user of success or failure of manual cluster scale-out and scale-in, cluster termination, and auto scaling by emails or SMS messages.
- The management plane checks the alarms about the MRS cluster and sends a notification to the tenant if the alarms critical.
- If either of the operations such as deletion, shutdown, specifications modification, restart, and OS update is performed on an ECS in a cluster, the MRS cluster works abnormally. The management plane notifies a user when detecting that the VM of the user is in either of the preceding operations.

### Creating a Topic

A topic is a specified event for message publication and notification subscription. It serves as a message sending channel, where publishers and subscribers can interact with each other.

1. Log in to the management console.
2. Click **Service List**, and choose **Application > Simple Message Notification**. The **SMN** page is displayed.
3. In the navigation pane, choose **Topic Management > Topics**. The **Topics** page is displayed.
4. Click **Create Topic**. The **Create Topic** dialog box is displayed.
5. In **Topic Name**, enter a topic name. In **Display Name**, enter a display name.
6. Select an existing project from the **Enterprise Project** drop-down list, or click **Create Enterprise Project** to create an enterprise project on the **Enterprise Project Management** page and then select it.
7. Set tag keys and tag values. Tags consist of keys and values. They identify cloud resources so that you can easily categorize and search for your resources.

### Adding Subscriptions to a Topic

To deliver messages published to a topic to subscribers, you must add subscription endpoints to the topic. SMN automatically sends a confirmation message to the

subscription endpoint. The confirmation message is valid only within 48 hours. The subscribers must confirm the subscription within 48 hours so that they can receive notification messages. Otherwise, the confirmation message becomes invalid, and you need to send it again.

1. Log in to the management console.
2. Choose **Application > Simple Message Notification**.  
The **SMN** page is displayed.
3. In the navigation pane, choose **Topic Management > Topics**.  
The **Topics** page is displayed.

4. Locate the topic to which you want to add a subscription, click **More** in the **Operation** column, and select **Add Subscription**.

The **Add Subscription** box is displayed.

Protocol can be set to **SMS**, FunctionGraph (function), **HTTP**, **HTTPS**, and **Email**.

**Endpoint** indicates the address of the subscription endpoint. SMS and email, endpoints can be entered in batches. When adding endpoints in batches, each endpoint address occupies a line. You can enter a maximum of 10 endpoints.

5. Click **OK**.

The subscription you added is displayed in the subscription list.

## Send information to subscribers.

1. Log in to the MRS management console.
2. Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
3. Click **Alarms**.
4. Choose **Notification Rules > Add Notification Rule**. The **Add Notification Rule** page is displayed.
5. Set the notification rule parameters.

**Table 5-17** Parameters of a notification rule

Parameter	Description
Rule Name	User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.
Message Notification	<ul style="list-style-type: none"> <li>• If you enable this function, the system sends notifications to subscribers based on the notification rule.</li> <li>• If you disable this function, the rule does not take effect, that is, notifications are not sent to subscribers.</li> </ul>

Parameter	Description
Topic Name	Select an existing topic or click <b>Create Topic</b> to create a topic.
Notification Type	Select the type of the notification to be subscribed to. <ul style="list-style-type: none"> <li>Alarm</li> </ul>
Subscription Items	Select the items to be subscribed to. You can select all or some items as required. Subscription rules in MRS 3.x or later: Alarm severity: critical, major, and minor Subscription rules in versions earlier than MRS 3.x: <ul style="list-style-type: none"> <li>Critical</li> <li>Major</li> <li>Minor</li> <li>Suggestion</li> </ul>

6. Click **OK**.

## 5.8 O&M

### 5.8.1 Authorizing O&M

If you need technical support personnel to help you with troubleshooting, you can use the O&M authorization function to authorize technical support personnel to access your local host for fault location.

#### Procedure

- Step 1** Log in to the MRS management console.
- Step 2** In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** In the upper right corner of the page, click **O&M**, choose **Authorize O&M**, and select the deadline for the support personnel to access the local host. Before the deadline, the support personnel have the temporary permission to access the local host.

**Step 4** After the fault is rectified, click **O&M** in the upper right corner of the page and select **Cancel Authorization** to cancel the access permission for the support personnel.

----End

## 5.8.2 Sharing Logs

If you need technical support personnel to help you with troubleshooting, you can use the log sharing function to provide logs in a specific time to technical support personnel for fault location.

### Procedure

**Step 1** Log in to the MRS management console.

**Step 2** In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a cluster, and click its name to switch to the cluster details page.

**Step 3** In the upper right corner of the displayed page, choose **O&M > Share Log** to open the **Share Log** dialog box.

**Step 4** Select the start time and end time in **Time Range**.

#### NOTE

- Select **Time Range** based on the suggestions of support personnel.
- **End Date** must be later than **Start Date**. Otherwise, logs cannot be filtered by time.

----End

## 5.9 Terminating a Cluster

You can terminate an MRS cluster after job execution is complete.

### Background

You can manually terminate a cluster after data analysis is complete or when the cluster encounters an exception. A cluster failed to be deployed will be automatically terminated.

### Procedure

**Step 1** Log in to the MRS console.

**Step 2** In the navigation tree of the MRS console, choose **Clusters > Active Clusters**.

**Step 3** Locate the cluster to be terminated, and click **Terminate** in the **Operation** column.

The cluster status changes from **Running** to **Terminating**, and finally to **Terminated**. You can view the clusters in **Terminated** state in **Cluster History**.

----End

## 5.10 Deleting a Failed Task

This section describes how to delete a failed MRS task.

### Background

If a cluster fails to be created, terminated, scaled out, or scaled in, the **Manage Failed Tasks** page is displayed. Only the tasks that fail to be deleted are displayed on the **Cluster History** page. You can delete a failed task that is not required.

### Procedure

- Step 1** Log in to the MRS management console.
- Step 2** In the left navigation pane, choose **Clusters > Active Clusters**.
- Step 3** Click  or the number on the right of **Failed Tasks**. The **Manage Failed Tasks** page is displayed.
- Step 4** In the **Operation** column of the cluster that you want to start, click **Delete**.  
In this step, only one job can be deleted.
- Step 5** You can click **Delete All** in the upper left corner of the task list to delete all failed tasks.

----End

## 5.11 Job Management

### 5.11.1 Introduction to MRS Jobs

An MRS job is the program execution platform of MRS. It is used to process and analyze user data. After a job is created, all job information is displayed on the **Jobs** tab page. You can view a list of all jobs and create and manage jobs. If the **Jobs** tab is not displayed on the cluster details page, submit a job in the background.

Data sources processed by MRS are from OBS or HDFS. OBS is an object-based storage service that provides you with massive, secure, reliable, and cost-effective data storage capabilities. MRS can process data in OBS directly. You can view, manage, and use data by using the web page of the management control platform or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

Before creating jobs, upload the local data to OBS for MRS to compute and analyze. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the analyzing and computing are complete, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

## Category

An MRS cluster allows creating and managing the following jobs: If a cluster in the **Running** state fails to create a job, check the health status of related components on the cluster management page. For details, see [Viewing and Customizing Cluster Monitoring Metrics](#).

- MapReduce: provides the capability of processing massive data quickly and in parallel. It is a distributed data processing mode and execution environment. MRS supports the submission of MapReduce JAR programs.
- Spark: a distributed in-memory computing framework. MRS supports SparkSubmit, Spark Script, and Spark SQL jobs.
  - SparkSubmit: You can submit the Spark JAR and Spark Python programs, execute the Spark Application, and compute and process user data.
  - SparkScript: You can submit the SparkScript scripts and batch execute Spark SQL statements.
  - Spark SQL: You can use Spark SQL statements (similar to SQL statements) to query and analyze user data in real time.
- Hive: an open-source data warehouse based on Hadoop. MRS allows you to submit HiveScript scripts and execute Hive SQL statements.
- Flink: provides a distributed big data processing engine that can perform stateful computations over both finite and infinite data streams.

## Job List

Tasks are listed in chronological order by default in the task list, with the most recent jobs displayed at the top. [Table 5-18](#) describes the parameters in the job list.

**Table 5-18** Job list parameters

Parameter	Description
Name/ID	Job name, which is set when a job is created. ID is the unique identifier of a job. After a job is added, the system automatically assigns a value to ID.
Username	Name of the user who submits a job.

Parameter	Description
Type	<p>The following data types are supported:</p> <ul style="list-style-type: none"> <li>• DistCp: importing and exporting data</li> <li>• MapReduce</li> <li>• Spark</li> <li>• SparkSubmit</li> <li>• SparkScript</li> <li>• Spark SQL</li> <li>• Hive SQL</li> <li>• HiveScript</li> <li>• Flink</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• After importing and exporting files on the <b>Files</b> tab page, you can view the DistCp job on the <b>Jobs</b> tab page.</li> <li>• Spark, Hive, and Flink jobs can be added only when the Spark, Hive, and Flink components are selected during cluster creation and the cluster is running.</li> </ul>
Status	<p>Job status.</p> <ul style="list-style-type: none"> <li>• Submitted</li> <li>• Accepted</li> <li>• Running</li> <li>• Completed</li> <li>• Terminated</li> <li>• Abnormal</li> </ul>
Result	<p>Execution result of a job.</p> <ul style="list-style-type: none"> <li>• <b>Undefined</b>: indicates that the job is being executed.</li> <li>• <b>Successful</b>: indicates that the job has been successfully executed.</li> <li>• <b>Killed</b>: indicates that the job is manually terminated during execution.</li> <li>• <b>Failed</b>: indicates that the job fails to be executed.</li> </ul> <p><b>NOTE</b></p> <p>Once a job has succeeded or failed, you cannot execute it again. However, you can add a job, and set job parameters to submit a job again.</p>
Submitted	Time when a job is submitted.
Ended	Time when a job is completed or manually stopped.

Parameter	Description
Operation	<ul style="list-style-type: none"> <li>Viewing Log: Click <b>View Log</b> to view the real-time logs of running jobs. For details, see <a href="#">Viewing Job Configuration and Logs</a>.</li> <li>View Details: Click <b>View Details</b> to view the detailed configuration information about jobs. For details, see <a href="#">Viewing Job Configuration and Logs</a>.</li> <li>More <ul style="list-style-type: none"> <li>Stop: You can click <b>Stop</b> to stop a running job. For details, see <a href="#">Stopping a Job</a>.</li> <li>Delete: Click <b>Delete</b> to delete a job. For details, see <a href="#">Deleting a Job</a>.</li> <li>View Result: Click <b>View Result</b> to view the execution results of SparkSQL and SparkScript jobs whose status is <b>Completed</b> and result is <b>Successful</b>.</li> </ul> </li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>You cannot stop Spark SQL jobs.</li> <li>A deleted job cannot be restored. Therefore, exercise caution when deleting a job.</li> <li>If you choose to save job logs to OBS or HDFS, the system compresses and saves the logs to the corresponding path after the job execution is completed. Therefore, after a job execution of this type is completed, the job status is still <b>Running</b>. After the log is successfully stored, the job status changes to <b>Completed</b>. The log storage duration depends on the log size and takes several minutes.</li> </ul>

**Table 5-19** Icon description

Icon	Description
	Select a time range for job submission to filter jobs submitted in the time range.
	Select a certain job execution result from the drop-down list to display jobs of the status. <ul style="list-style-type: none"> <li>All statuses: Filter all jobs.</li> <li>Successful: Filter jobs that are successfully executed.</li> <li>Undefined: Filter jobs that are being executed.</li> <li>Killed: Filter jobs that are manually stopped.</li> <li>Failed: Filter jobs that fail to be executed.</li> </ul>

Icon	Description
	Select a certain job type from the drop-down list to display jobs of the type. <ul style="list-style-type: none"> <li>• All types</li> <li>• MapReduce</li> <li>• HiveScript</li> <li>• Distcp</li> <li>• SparkScript</li> <li>• Spark SQL</li> <li>• Hive SQL</li> <li>• SparkSubmit</li> <li>• Flink</li> </ul>
	In the search box, search for a job by setting the corresponding search condition and click  . <ul style="list-style-type: none"> <li>• Job name.</li> <li>• Job ID.</li> <li>• Username.</li> <li>• Queue name.</li> </ul>
	Click  to manually refresh the job list.

## Job Execution Permission Description

For a security cluster with Kerberos authentication enabled, a user needs to synchronize an IAM user before submitting a job on the MRS web UI. After the synchronization is completed, the MRS system generates a user with the same IAM username. Whether a user has the permission to submit jobs depends on the IAM policy bound to the user during IAM synchronization. For details about the job submission policy, see [Table 2-1](#) in [Synchronizing IAM Users to MRS](#).

When a user submits a job that involves the resource usage of a specific component, such as accessing HDFS directories and Hive tables, user **admin** (Manager administrator) must grant the relevant permission to the user. Detailed operations are as follows:

- Step 1** Log in to Manager as user **admin**.
- Step 2** Add the role of the component whose permission is required by the user. For details, see [Creating a Role](#).
- Step 3** Change the user group to which the user who submits the job belongs and add the new component role to the user group. For details, see [Related Tasks](#).

 NOTE

After the component role bound to the user group to which the user belongs is modified, it takes some time for the role permissions to take effect.

----End

## 5.11.2 Running a MapReduce Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a MapReduce job on the MRS management console. MapReduce jobs are used to submit JAR programs to quickly process massive amounts of data in parallel and create a distributed data processing and execution environment.

If the job and file management functions are not supported on the cluster details page, submit the jobs in the background.

### Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

### Submitting a Job on the GUI

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 NOTE

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

- Step 4** Click the **Jobs** tab.
- Step 5** Click **Create**. The **Create Job** page is displayed.
- Step 6** In **Type**, select **MapReduce**. Configure other job information.

**Table 5-20** Job configuration information

Parameter	Description
Name	<p>Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed.</p> <p><b>NOTE</b> You are advised to set different names for different jobs.</p>
Program Path	<p>Path of the program package to be executed. The following requirements must be met:</p> <ul style="list-style-type: none"> <li>• Contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;&lt;'\$. The parameter value cannot be empty or full of spaces.</li> <li>• The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> <li>– OBS: The path must start with <b>obs://</b>. Example: <b>obs://wordcount/program/xxx.jar</b></li> <li>– HDFS: The path must start with <b>/user</b>. For details about how to import data to HDFS, see <a href="#">Importing Data</a>.</li> </ul> </li> <li>• For SparkScript and HiveScript, the path must end with <b>.sql</b>. For MapReduce, the path must end with <b>.jar</b>. For Flink and SparkSubmit, the path must end with <b>.jar</b> or <b>.py</b>. The <b>.sql</b>, <b>.jar</b>, and <b>.py</b> are case-insensitive.</li> </ul>
Parameters	<p>(Optional) It is the key parameter for program execution. Multiple parameters are separated by space.</p> <p>Configuration method: <i>Program class name Data input path Data output path</i></p> <ul style="list-style-type: none"> <li>• Program class name: It is specified by a function in your program. MRS is responsible for transferring parameters only.</li> <li>• Data input path: Click <b>HDFS</b> or <b>OBS</b> to select a path or manually enter a correct path.</li> <li>• Data output path: Enter a directory that does not exist. The parameter contains a maximum of 2,047 characters, excluding special characters such as ; &amp;&gt;&lt;'\$, and can be left blank.</li> </ul> <p><b>CAUTION</b> If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.</p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in <a href="#">Configuring Service Parameters</a>.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click <b>Delete</b> on the right.</p> <p><a href="#">Table 5-21</a> lists the common service configuration parameters.</p>

Parameter	Description
Command Reference	Command submitted to the background for execution when a job is submitted.

**Table 5-21 Service Parameter** parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

**Step 7** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

**Step 4** Click **Remote Login** in the upper right corner of the page.

**Step 5** Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

**Step 6** Run the following command to initialize environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

**Step 7** If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

**Step 8** Run the following command to copy the program in the OBS file system to the Master node in the cluster:

```
hadoop fs -Dfs.obs.access.key=AK -Dfs.obs.secret.key=SK -copyToLocal  
source_path.jar target_path.jar
```

```
Example: hadoop fs -Dfs.obs.access.key=XXXX -Dfs.obs.secret.key=XXXX -  
copyToLocal "obs://mrs-word/program/hadoop-mapreduce-examples-XXX.jar"  
"/home/omm/hadoop-mapreduce-examples-XXX.jar"
```

You can log in to OBS Console using AK/SK. To obtain AK/SK information, click the username in the upper right corner of the management console and choose **My Credentials > Access Keys**.

- Step 9** Run the following command to submit a wordcount job. If data needs to be read from OBS or outputted to OBS, the AK/SK parameters need to be added.

```
source /opt/Bigdata/client/bigdata_env;hadoop jar execute_jar wordcount  
input_path output_path
```

```
Example: source /opt/Bigdata/client/bigdata_env;hadoop jar /home/omm/  
hadoop-mapreduce-examples-XXX.jar wordcount -Dfs.obs.access.key=XXXX -  
Dfs.obs.secret.key=XXXX "obs://mrs-word/input/*" "obs://mrs-word/output/"
```

In the preceding command, **input\_path** indicates a path for storing job input files on OBS. **output\_path** indicates a path for storing job output files on OBS and needs to be set to a directory that does not exist

----End

### 5.11.3 Running a SparkSubmit Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a Spark job on the MRS console.

#### Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

#### Submitting a Job on the GUI

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

**Step 4** Click the **Jobs** tab.

**Step 5** Click **Create**. The **Create Job** page is displayed.

**Step 6** Configure job information.

- Set **Type** to **SparkSubmit**. Configure other parameters of the SparkSubmit job by referring to [Table 5-22](#).

**Table 5-22** Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. <b>NOTE</b> You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: <ul style="list-style-type: none"> <li>• Contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;&lt;'\$. The parameter value cannot be empty or full of spaces.</li> <li>• The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> <li>– OBS: The path must start with <b>obs://</b>. Example: <b>obs://wordcount/program/xxx.jar</b></li> <li>– HDFS: The path must start with <b>/user</b>. For details about how to import data to HDFS, see <a href="#">Importing Data</a>.</li> </ul> </li> <li>• For SparkScript and HiveScript, the path must end with <b>.sql</b>. For MapReduce, the path must end with <b>.jar</b>. For Flink and SparkSubmit, the path must end with <b>.jar</b> or <b>.py</b>. The <b>.sql</b>, <b>.jar</b>, and <b>.py</b> are case-insensitive.</li> </ul>
Program Parameter	(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance. <a href="#">Table 5-23</a> describes the common parameters of a running program.

Parameter	Description
Parameters	<p>(Optional) Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space.</p> <p>The parameter contains a maximum of 2,047 characters, excluding special characters such as ; &amp;&gt;&lt;'\$, and can be left blank.</p> <p><b>CAUTION</b> If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.</p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in <a href="#">Configuring Service Parameters</a>.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click <b>Delete</b> on the right.</p> <p><a href="#">Table 5-24</a> lists the common service configuration parameters.</p> <p><b>NOTE</b> If you need to run a long-term job, such as SparkStreaming, and access OBS, you need to use <b>Service Parameter</b> to import the AK/SK for accessing OBS.</p>
Command Reference	Command submitted to the background for execution when a job is submitted.

**Table 5-23** Program parameters

Parameter	Description	Example Value
--conf	Add the task configuration items.	spark.executor.me mory=2G
--driver-memory	Set the running memory of driver.	2G
--num-executors	Set the number of executors to be started.	5
--executor-cores	Set the number of executor cores.	2
--class	Set the main class of a task.	org.apache.spark. examples.SparkPi
--files	Upload files to a task. The files can be custom configuration files or some data files from OBS or HDFS.	-

Parameter	Description	Example Value
--jars	Upload additional dependency packages of a task to add the external dependency packages to the task.	-
--executor-memory	Set executor memory.	2G
--conf spark-yarn.maxAppAttempts	Control the number of AM retries.	If this parameter is set to <b>0</b> , retry is not allowed. If this parameter is set to <b>1</b> , one retry is allowed.

**Table 5-24 Service Parameter** parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

**Step 7** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.

**Step 1** Create a user for submitting jobs. For details, see [Creating a User](#).

In this example, a machine-machine user used in the user development scenario has been created, and user groups (**hadoop** and **supergroup**), the primary group (**supergroup**), and role permissions (**System\_administrator** and **default**) have been correctly assigned to the user.

**Step 2** On MRS Manager, choose **System > Manage User**. In the **Operation** column of the new user, choose **More > Download Authentication Credential**.

**Step 3** Upload JAR files related to the job to the cluster. In this example, the sample JAR file built in Spark is used. It is stored in `$SPARK_HOME/examples/jars/`.

**Step 4** Upload the authentication credential of the user created in [Step 2](#) to the `/opt/` directory of the cluster and run the following command to decompress the credential:

```
tar -xvf MRSTest_XXXXXX_keytab.tar
```

You will obtain two files: **user.keytab** and **krb5.conf**.

**Step 5** Before performing operations on the cluster, run the following commands:

```
source /opt/Bigdata/client/bigdata_env
```

```
cd $SPARK_HOME
```

**Step 6** Run the following command to submit the Spark job:

```
./bin/spark-submit --master yarn --deploy-mode client --conf  
spark.yarn.principal=MRSTest --conf spark.yarn.keytab=/opt/user.keytab --  
class org.apache.spark.examples.SparkPi examples/jars/spark-  
examples_2.11-2.3.2-mrs-2.0.jar 10
```

Parameter description:

1. Computing capability of Yarn, which specifies that the job is submitted in client mode.
2. Configuration item of the Spark job. The authentication file and username are transferred here.
3. **spark.yarn.principal**: user created in step 1
4. **spark.yarn.keytab**: keytab file used for authentication
5. **xx.jar**: JAR file used by the job

----End

## 5.11.4 Running a HiveSQL Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a HiveSQL job on the MRS management console. HiveSQL jobs are used to submit SQL statements and script files for data query and analysis. Both SQL statements and scripts are supported. If SQL statements contain sensitive information, use Script to submit them.

### Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

### Submitting a Job on the GUI

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

**Step 4** Click the **Jobs** tab.

**Step 5** Click **Create**. The **Create Job** page is displayed.

**Step 6** Configure job information.

**Table 5-25** Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. <b>NOTE</b> You are advised to set different names for different jobs.
SQL Type	Submission type of the SQL statement <ul style="list-style-type: none"> <li>• SQL</li> <li>• Script</li> </ul>
SQL Statement	This parameter is valid only when <b>SQL Type</b> is set to <b>SQL</b> . Enter the SQL statement to be executed, and then click <b>Check</b> to check whether the SQL statement is correct. If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.

Parameter	Description
SQL File	<p>This parameter is valid only when <b>SQL Type</b> is set to <b>Script</b>. The path of the SQL file to be executed must meet the following requirements:</p> <ul style="list-style-type: none"> <li>• Contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;&lt;'\$. The parameter value cannot be empty or full of spaces.</li> <li>• The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> <li>– OBS: The path must start with <b>obs://</b>. Example: <b>obs://wordcount/program/xxx.jar</b></li> <li>– HDFS: The path must start with <b>/user</b>. For details about how to import data to HDFS, see <a href="#">Importing Data</a>.</li> </ul> </li> <li>• For SparkScript and HiveScript, the path must end with <b>.sql</b>. For MapReduce, the path must end with <b>.jar</b>. For Flink and SparkSubmit, the path must end with <b>.jar</b> or <b>.py</b>. The <b>.sql</b>, <b>.jar</b>, and <b>.py</b> are case-insensitive.</li> </ul> <p><b>NOTE</b> A file path on OBS can start with <b>obs://</b>. To submit jobs in this format, you need to configure permissions for accessing OBS.</p> <ul style="list-style-type: none"> <li>• If the OBS permission control function is enabled during cluster creation, you can use the <b>obs://</b> directory without extra configuration.</li> <li>• If the OBS permission control function is not enabled or is not supported when you create a cluster, configure the function by following instructions in <a href="#">Accessing OBS</a>.</li> </ul>
Program Parameter	<p>(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance.</p> <p><a href="#">Table 5-26</a> describes the common parameters of a running program.</p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in <a href="#">Configuring Service Parameters</a>.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click <b>Delete</b> on the right.</p> <p><a href="#">Table 5-27</a> lists the common service configuration parameters.</p>
Command Reference	<p>Command submitted to the background for execution when a job is submitted.</p>

**Table 5-26** Program parameters

Parameter	Description	Example Value
--hiveconf	Hive service configuration, for example, set the execution engine to MapReduce.	Setting the execution engine to MR: <b>--hiveconf "hive.execution.engine=mr"</b>
--hivevar	Custom variable, for example, variable ID.	Setting the variable ID: <b>--hivevar id="123" select * from test where id = \${hivevar:id}</b>

**Table 5-27** Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-
hive.execution.engine	Engine for running a job.	<ul style="list-style-type: none"> <li>• mr</li> <li>• tez</li> </ul>

**Step 7** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## Submitting a Job in the Background

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** On the **Nodes** tab page, click the name of a Master node to go to the ECS management console.

**Step 4** Click **Remote Login** in the upper right corner of the page.

**Step 5** Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.

**Step 6** Run the following command to initialize environment variables:

```
source /opt/BigData/client/bigdata_env
```

 NOTE

- In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.
- If you use the client to connect to a specific Hive multi-instance in a scenario where multiple Hive instances are installed, run the following command to load the environment variables of the instance. Otherwise, skip this step. For example, load the environment variables of the Hive2 instance.

```
source /opt/BigData/client/Hive2/component_env
```

**Step 7** If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster(normal mode), skip this step.

```
kinit MRS cluster user (The user must be in the hive user group.)
```

**Step 8** Run the **beeline** command to connect to HiveServer and run tasks.

```
beeline
```

For clusters in normal mode, run the following commands. If no component service user is specified, the current OS user is used to log in to the HiveServer.

```
beeline -n Component service user
```

```
beeline -f SQL files (SQLs in the execution files)
```

```
----End
```

## 5.11.5 Running a SparkSql Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a SparkSQL job on the MRS console. SparkSQL jobs are used for data query and analysis. Both SQL statements and scripts are supported. If SQL statements contain sensitive information, use Spark Script to submit them.

### Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

### Submitting a Job on the GUI

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

**Step 4** Click the **Jobs** tab.

**Step 5** Click **Create**. On the displayed **Create Job** page, set **Type** to **SparkSql** and configure SparkSql job information by referring to [Table 5-28](#).

**Table 5-28** Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. <b>NOTE</b> You are advised to set different names for different jobs.
SQL Type	Submission type of the SQL statement <ul style="list-style-type: none"> <li>• SQL</li> <li>• Script</li> </ul>
SQL Statement	This parameter is valid only when <b>SQL Type</b> is set to <b>SQL</b> . Enter the SQL statement to be executed, and then click <b>Check</b> to check whether the SQL statement is correct. If you want to submit and execute multiple statements at the same time, use semicolons (;) to separate them.

Parameter	Description

Command Reference	<p>Command submitted to the background for execution when a job is submitted.</p>

**Table 5-29** Program parameters

Parameter	Description	Example Value
--conf	Task configuration items to be added.	spark.executor.memory=2G
--driver-memory	Running memory of a driver.	2G
--num-executors	Number of executors to be started.	5
--executor-cores	Number of executor cores.	2
--jars	Additional dependency packages of a task, which is used to add the external dependency packages to the task.	-
--executor-memory	Executor memory.	2G

**Table 5-30** Service parameters

Parameter	Description	Example Value
fs.obs.access.key	Key ID for accessing OBS.	-
fs.obs.secret.key	Key corresponding to the key ID for accessing OBS.	-

**Step 6** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is /opt/Bigdata/client. In MRS 3.x and earlier versions, the default installation path is /opt/client. For details, see the actual situation.

**Step 1** Create a user for submitting jobs. For details, see [Creating a User](#).

In this example, a machine-machine user used in the user development scenario has been created, and user groups (**hadoop** and **supergroup**), the primary group (**supergroup**), and role permissions (**System\_administrator** and **default**) have been correctly assigned to the user.

**Step 2** Download the authentication credential.

- For clusters of MRS 3.x or later, log in to FusionInsight Manager and choose **System > Permission > User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.

- For clusters whose version is earlier than MRS 3.x, log in to MRS Manager and choose **System > Manage User**. In the **Operation** column of the newly created user, choose **More > Download Authentication Credential**.

**Step 3** Log in to the node where the Spark client is located, upload the user authentication credential created in 2 to the **/opt/** directory of the cluster, and run the following command to decompress the package:

```
tar -xvf MRSTest_XXXXXX_keytab.tar
```

After the decompression, you obtain the **user.keytab** and **krb5.conf** files.

**Step 4** Before performing operations on the cluster, run the following commands:

```
source /opt/Bigdata/client/bigdata_env
```

```
cd $SPARK_HOME
```

**Step 5** Open the **spark-sql** CLI and run the following SQL statement:

```
./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf  
spark.yarn.keytab=/opt/user.keytab
```

To execute the SQL file, you need to upload the SQL file (for example, to the **/opt/** directory). After the file is uploaded, run the following command:

```
./bin/spark-sql --conf spark.yarn.principal=MRSTest --conf  
spark.yarn.keytab=/opt/user.keytab -f /opt/script.sql
```

----End

## 5.11.6 Running a Flink Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This section describes how to submit a Flink job on the MRS management console. Flink jobs are used to submit JAR programs to process streaming data.

### Prerequisites

You have uploaded the program packages and data files required for running jobs to OBS or HDFS.

### Submitting a Job on the GUI

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

In the **Basic Information** area on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users. For details, see [Synchronizing IAM Users to MRS](#).

 **NOTE**

- When the policy of the user group to which the IAM user belongs changes from MRS ReadOnlyAccess to MRS CommonOperations, MRS FullAccess, or MRS Administrator, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** (System Security Services Daemon) cache of cluster nodes needs time to be updated. Then, submit a job. Otherwise, the job may fail to be submitted.
- When the policy of the user group to which the IAM user belongs changes from MRS CommonOperations, MRS FullAccess, or MRS Administrator to MRS ReadOnlyAccess, wait for 5 minutes until the new policy takes effect after the synchronization is complete because the **SSSD** cache of cluster nodes needs time to be updated.

**Step 4** Click the **Jobs** tab.

**Step 5** Click **Create**. The **Create Job** page is displayed.

**Step 6** Set **Type** to **Flink**. Configure Flink job information by referring to [Table 5-31](#).

**Table 5-31** Job configuration information

Parameter	Description
Name	Job name. It contains 1 to 64 characters. Only letters, digits, hyphens (-), and underscores (_) are allowed. <b>NOTE</b> You are advised to set different names for different jobs.
Program Path	Path of the program package to be executed. The following requirements must be met: <ul style="list-style-type: none"> <li>• Contains a maximum of 1,023 characters, excluding special characters such as ; &amp;&gt;&lt;'\$. The parameter value cannot be empty or full of spaces.</li> <li>• The path of the program to be executed can be stored in HDFS or OBS. The path varies depending on the file system. <ul style="list-style-type: none"> <li>– OBS: The path must start with <b>obs://</b>. Example: <b>obs://wordcount/program/xxx.jar</b></li> <li>– HDFS: The path must start with <b>/user</b>. For details about how to import data to HDFS, see <a href="#">Importing Data</a>.</li> </ul> </li> </ul>
Program Parameter	(Optional) Used to configure optimization parameters such as threads, memory, and vCPUs for the job to optimize resource usage and improve job execution performance. <a href="#">Table 5-32</a> describes the common parameters of a running program.

Parameter	Description
Parameters	<p>(Optional) Key parameter for program execution. The parameter is specified by the function of the user's program. MRS is only responsible for loading the parameter. Multiple parameters are separated by space.</p> <p>The parameter contains a maximum of 2,047 characters, excluding special characters such as ; &amp;&gt;&lt;'\$, and can be left blank.</p> <p><b>CAUTION</b> If you enter a parameter with sensitive information (such as the login password), the parameter may be exposed in the job details display and log printing. Exercise caution when performing this operation.</p>
Service Parameter	<p>(Optional) It is used to modify service parameters for the job. The parameter modification applies only to the current job. To make the modification take effect permanently for the cluster, follow instructions in <a href="#">Configuring Service Parameters</a>.</p> <p>To add multiple parameters, click  on the right. To delete a parameter, click <b>Delete</b> on the right.</p> <p><a href="#">Table 5-33</a> describes the common parameters of a service.</p>
Command Reference	Command submitted to the background for execution when a job is submitted.

**Table 5-32** Program parameters

Parameter	Description	Example Value
-ytm	Memory size of each TaskManager container. (Optional unit. The unit is MB by default.)	1024
-yjm	Memory size of JobManager container. (Optional unit. The unit is MB by default.)	1024
-yn	Number of Yarn containers allocated to applications. The value is the same as the number of TaskManagers.	2
-ys	Number of TaskManager cores.	2
-ynm	Custom name of an application on Yarn.	test
-c	Class of the program entry point (for example, the <b>main</b> or <b>getPlan()</b> method). This parameter is required only when the JAR file does not specify the class of its manifest.	com.bigdata.mrs.test

 NOTE

For MRS 3.x or later, the `-yn` parameter is not supported.

**Table 5-33** Service parameters

Parameter	Description	Example Value
<code>fs.obs.access.key</code>	Key ID for accessing OBS.	-
<code>fs.obs.secret.key</code>	Key corresponding to the key ID for accessing OBS.	-

**Step 7** Confirm job configuration information and click **OK**.

After the job is created, you can manage it.

----End

## Submitting a Job in the Background

In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.

**Step 1** Log in to the MRS client.

**Step 2** Run the following command to initialize environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

**Step 3** If Kerberos authentication is enabled for the cluster, perform the following steps. If Kerberos authentication is not enabled for the cluster, skip this step.

1. Prepare a user for submitting Flink jobs.
2. Log in to Manager as the newly created user.
  - For MRS 3.x earlier: Log in to Manager of the cluster. Choose **System > Manage User**. In the **Operation** column of the row that contains the added user, choose **More > Download authentication credential** to locate the row that contains the user.
  - For MRS 3.x or later: Log in to Manager of the cluster. Choose **System > Permission > Manage User**. On the displayed page, locate the row that contains the added user, click **More** in the **Operation** column, and select **Download authentication credential**.
3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the `/opt/Bigdata/client/Flink/flink/conf` directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the `/etc/` directory on this node.
4. For MRS 3.x or later: In security mode, add the service IP address of the node where the client is installed and floating IP address of Manager to the **jobmanager.web.allow-access-address** configuration item in the `/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml` file.

- Run the following commands to configure security authentication by adding the **keytab** path and username to the **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml** configuration file.

**security.kerberos.login.keytab:** *<user.keytab file path>*

**security.kerberos.login.principal:** *<Username>*

Example:

security.kerberos.login.keytab: /opt/Bigdata/client/Flink/flink/conf/user.keytab

security.kerberos.login.principal: test

- Run the following command to perform security hardening in the **bin** directory of the Flink client. Set password to a new password for submitting jobs.

sh generate\_keystore.sh *<password>*

This script automatically replaces the SSL value in the **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml** file. For MRS 3.x or earlier, external SSL is disabled by default in security clusters. To enable external SSL, run this script again after configuration. The configuration parameters do not exist in the default Flink configuration of MRS, if you enable SSL for external connections, you need to add the parameters listed in [Table 5-34](#).

**Table 5-34** Parameter description

Parameter	Example Value	Description
security.ssl.rest.enabled	true	Switch to enable external SSL.
security.ssl.rest.keystore	\${path}/flink.keystore	Path for storing <b>keystore</b> .
security.ssl.rest.keystore-password	123456	Password of the <b>keystore</b> . <b>123456</b> indicates a user-defined password is required.
security.ssl.rest.key-password	123456	Password of the SSL key. <b>123456</b> indicates a user-defined password is required.
security.ssl.rest.truststore	\${path}/flink.truststore	Path for storing the <b>truststore</b> .
security.ssl.rest.truststore-password	123456	Password of the <b>truststore</b> . <b>123456</b> indicates a user-defined password is required.

 NOTE

- For MRS 3.x or earlier: The **generate\_keystore.sh** script is automatically generated.
  - Perform **authentication and encryption**. The generated **flink.keystore**, **flink.truststore**, and **security.cookie** files are automatically filled in the corresponding configuration items in **flink-conf.yaml**.
  - For MRS 3.x or later: You can obtain the values of **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password** using the Manager plaintext encryption API by running the following command:  

```
curl -k -i -u <user name>:<password> -X POST -HContent-type:application/json -d '{"plainText":"<password>"}' 'https://x.x.x.x:28443/web/api/v2/tools/encrypt';
```

In the preceding command, **<password>** must be the same as the password used for issuing the certificate, and **x.x.x.x** indicates the floating IP address of Manager in the cluster.
7. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
- Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **opt/Bigdata/client/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
  - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
    - i. In the **/opt/Bigdata/client/Flink/flink/conf/** directory, create a new directory, for example, **ssl**.
    - ii. Move the **flink.keystore** and **flink.truststore** file to the **/opt/Bigdata/client/Flink/flink/conf/ssl/** directory.
    - iii. For MRS 3.x or later: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```
    - iv. For MRS 3.x or earlier: Change the values of the following parameters in the **flink-conf.yaml** file to relative paths:

```
security.ssl.internal.keystore: ssl/flink.keystore
security.ssl.internal.truststore: ssl/flink.truststore
```
8. If the client is installed on a node outside the cluster, add the following configuration to the configuration file (for example, **/opt/Bigdata/client/Flink/flink/conf/flink-conf.yaml**). Replace **xx.xx.xxx.xxx** with the IP address of the node where the client resides.
- ```
web.access-control-allow-origin: xx.xx.xxx.xxx
jobmanager.web.allow-access-address: xx.xx.xxx.xxx
```

**Step 4** Run a wordcount job.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name"
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
  - Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```

- Security cluster (Kerberos authentication enabled)
    - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
      - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name"  
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
      - Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
    - If the **flink.keystore** and **flink.truststore** file are stored in the relative path:
      - In the same directory of SSL, run the following command to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/Bigdata/client/Flink/flink/conf/**, then run the following command in this directory:

```
yarn-session.sh -t ssl/ -nm "session-name"  
flink run /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
      - Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster -yt ssl/ /opt/Bigdata/client/Flink/flink/examples/streaming/WordCount.jar
```
- End

## 5.11.7 Running a Kafka Job

You can submit programs developed by yourself to MRS to execute them, and obtain the results. This topic describes how to generate and consume messages in a Kafka topic.

Currently, Kafka jobs cannot be submitted on the GUI. You can submit them in the background.

### Submitting a Job in the Background

Query the instance addresses of ZooKeeper and Kafka, and then run the Kafka job.

#### Querying the Instance Address (3.x)

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** Go to the FusionInsight Manager page. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). On MRS Manager, choose **Services > ZooKeeper > Instance** to query the IP addresses of ZooKeeper instances. Record any IP address of a ZooKeeper instance.
- Step 4** Choose **Services > Kafka > Instance** to query the IP addresses of Kafka instances. Record any IP address of a Kafka instance.

----End

Querying the Instance Address (Versions Earlier Than 3.x)

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** On the MRS cluster details page, choose **Components > ZooKeeper > Instance** to query the IP addresses of ZooKeeper instances. Record any IP address of a ZooKeeper instance.
- Step 4** Choose **Components > Kafka > Instance** to query the IP addresses of Kafka instances. Record any IP address of a Kafka instance.

----End

### Running a Kafka Job

In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.

- Step 1** On the **Nodes** tab page of the cluster detail page, click the name of the Master2 node to go to the ECS management console.
- Step 2** Click **Remote Login** in the upper right corner of the page.
- Step 3** Enter the username and password of the Master node as prompted. The username is **root** and the password is the one set during cluster creation.
- Step 4** Run the following command to initialize environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

- Step 5** If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

- Step 6** Run the following command to create a Kafka topic:

```
kafka-topics.sh --create --zookeeper <IP address of the ZooKeeper role instance:2181/kafka> --partitions 2 --replication-factor 2 --topic <Topic name>
```

- Step 7** Produce messages in a topic test.

Run the following command: **kafka-console-producer.sh --broker-list <IP address of the Kafka role instance:9092> --topic <Topic name> --producer.config /opt/Bigdata/client/Kafka/kafka/config/producer.properties.**

Input specified information as the messages produced by the producer and then press **Enter** to send the messages. To end message production, press **Ctrl+C** to exit.

- Step 8** Consume messages in the topic test.

```
kafka-console-consumer.sh --topic <Topic name> --bootstrap-server <Kafka role instance IP:210079092> --consumer.config /opt/Bigdata/client/Kafka/kafka/config/consumer.properties
```

 NOTE

If Kerberos authentication is enabled in the cluster, change the port number 9092 to 21007 when running the preceding two commands. For details, see [List of Open Source Component Ports](#).

----End

## 5.11.8 Viewing Job Configuration and Logs

This section describes how to view job configuration and logs.

### Background

- You can view configuration information of all jobs.
- You can only view logs of running jobs.

Because logs of Spark SQL and DistCp jobs are not in the background, you cannot view logs of running Spark SQL and DistCp jobs.

### Procedure

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

**Step 3** Click **Jobs**.

**Step 4** In the **Operation** column of the job to be viewed, click **View Details**.

In the **View Details** window that is displayed, configuration of the selected job is displayed.

**Step 5** Select a running job, and click **View Log** in the **Operation** column.

In the new page that is displayed, real-time log information of the job is displayed.

Each tenant can submit and view 10 jobs concurrently.

----End

## 5.11.9 Stopping a Job

This section describes how to stop running MRS jobs.

### Background

You cannot stop Spark SQL jobs. After a job is stopped, its status changes to **Terminated** and the job cannot be executed again.

### Procedure

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name.

The cluster details page is displayed.

**Step 3** Click **Jobs**.

**Step 4** Select a running job, and choose **More > Stop** in the **Operation** column.

The job status changes from **Running** to **Terminated**.

----End

## 5.11.10 Deleting a Job

This section describes how to delete an MRS job. After a job is executed, you can delete it if you do not need to view its information.

### Background

Jobs can be deleted one after another or in a batch. A deleted job cannot be restored. Therefore, exercise caution when deleting a job.

### Procedure

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name.

The cluster details page is displayed.

**Step 3** Click **Jobs**.

**Step 4** Choose **More > Delete** from the **Operation** in the row of the target job to be deleted.

In this step, you can only delete one job only.

**Step 5** If you select multiple jobs and click **Delete** on the upper left of the job list.

You can delete one, multiple, or all jobs.

----End

## 5.11.11 Using Encrypted OBS Data for Job Running

In versions earlier than MRS 3.x, encrypted data in OBS file systems can be used to run jobs, and the encrypted job running results can be stored in OBS file systems. Currently, data can be accessed only through an OBS protocol.

OBS supports data encryption and decryption using KMS keys. All encryption and decryption operations are performed on OBS, and keys are managed by DEW.

To use the OBS encryption function in MRS, you must have the KMS Administrator permissions and configure the following settings for the corresponding component:

 NOTE

If the **OBS permission control** function is enabled in a cluster, the default agency **MRS\_ECS\_DEFAULT\_AGENCY** configured on the ECS or the AK/SK of the custom agency is used for accessing OBS. OBS uses the received AK/SK to access DEW to obtain the KMS key status. Therefore, you need to bind the KMS Administrator policy to the used agency. Otherwise, OBS returns the "403 Forbidden" error when processing encrypted data. Currently, the KMS Administrator policy is bound to the agency **MRS\_ECS\_DEFAULT\_AGENCY** by default. If you use a custom agency, you need to manually bind the policy to your custom agency.

## Prerequisites

You have configured the function of accessing OBS from MRS first to use the OBS encryption function. For details, see [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#).

## Hive Configuration

**Step 1** Log in to the MRS management console. In the navigation tree on the left, choose **Clusters > Active Clusters** and click the cluster name.

**Step 2** Choose **Components > Hive > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 5-35** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                    |
|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li><b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li><b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                   |
| fs.obs.server-side-encryption-key  | -       | (Optional) This parameter indicates an ID of the KMS key used for encryption. If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.                                                                |
| fs.obs.connection.ssl.enabled      | true    | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"> <li><b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li><b>false</b>: The secure connection is disabled.</li> </ul> |

**Step 4** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

----End

## Hadoop Configuration

### Method 1: Configuration on the GUI

**Step 1** Log in to the MRS management console. In the navigation tree on the left, choose **Clusters > Active Clusters** and click the cluster name.

**Step 2** Choose **Components > HDFS > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 5-36** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                           |
|------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li><b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li><b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                          |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p>                                                                    |
| fs.obs.connection.ssl.enabled      | true    | <p>Whether to establish a secure connection with OBS.</p> <ul style="list-style-type: none"> <li><b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li><b>false</b>: The secure connection is disabled.</li> </ul> |

**Step 4** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

**Step 5** Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

**Step 6** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 7** Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

```
./ autoRefreshConfig.sh
```

----End

### Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, `/opt/Bigdata/client/HDFS/hadoop/etc/hadoop/core-site.xml`, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

**Table 5-37** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                           |
|------------------------------------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li><b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li><b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                          |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p>                                                                    |
| fs.obs.connection.ssl.enabled      | true    | <p>Whether to establish a secure connection with OBS.</p> <ul style="list-style-type: none"> <li><b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li><b>false</b>: The secure connection is disabled.</li> </ul> |

## HBase Configuration

### Method 1: Configuration on the GUI

**Step 1** Log in to the MRS management console. In the navigation tree on the left, choose **Clusters > Active Clusters** and click the cluster name.

**Step 2** Choose **Components > HBase > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 5-38** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li>• <b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                          |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p>                                                                        |
| fs.obs.connection.ssl.enabled      | true    | <p>Whether to establish a secure connection with OBS.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li>• <b>false</b>: The secure connection is disabled.</li> </ul> |

**Step 4** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

**Step 5** Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

**Step 6** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 7** Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

```
./ autoRefreshConfig.sh
```

```
----End
```

#### Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, **/opt/Bigdata/client/HBase/hbase/conf/core-site.xml**, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

**Table 5-39** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                               |
|------------------------------------|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li>• <b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                          |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p>                                                                        |
| fs.obs.connection.ssl.enabled      | true    | <p>Whether to establish a secure connection with OBS.</p> <ul style="list-style-type: none"> <li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li>• <b>false</b>: The secure connection is disabled.</li> </ul> |

## Spark Configuration

### Method 1: Configuration on the GUI

- Step 1** Log in to the MRS management console. In the navigation tree on the left, choose **Clusters > Active Clusters** and click the cluster name.
- Step 2** Choose **Components > Spark > Service Configuration**.
- Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 5-40** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                        |
|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li>• <b>NONE</b>: The encryption function is disabled.</li> </ul>                                                   |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p> |

| Parameter                     | Value | Description                                                                                                                                                                                                                                                                                        |
|-------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.connection.ssl.enabled | true  | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"> <li>• <b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li>• <b>false</b>: The secure connection is disabled.</li> </ul> |

**Step 4** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

**Step 5** Log in to the Master node as user **root**. The password is the password of user **root** you set when you create the cluster. If the cluster has multiple Master nodes, log in to each Master node and repeat **Step 5** to **Step 7**.

**Step 6** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 7** Run the following command to update client configurations, and enter the username and password. The username is **admin**, and the password is the password of user **admin** you set when you create the cluster.

```
./autoRefreshConfig.sh
```

----End

### Method 2: Configuration Through the Client Configuration File

Add the following parameter settings to the client configuration file, for example, **/opt/Bigdata/client/Spark/spark/conf/core-site.xml**, on the Master node. If the cluster has multiple Master nodes, log in to each Master node and perform this operation.

**Table 5-41** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                        |
|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li>• <b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li>• <b>NONE</b>: The encryption function is disabled.</li> </ul>                                                   |
| fs.obs.server-side-encryption-key  | -       | <p>ID of the KMS key used for encryption. This parameter is optional.</p> <p>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.</p> |

| Parameter                     | Value | Description                                                                                                                                                                                                                                                                                    |
|-------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.connection.ssl.enabled | true  | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"> <li><b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li><b>false</b>: The secure connection is disabled.</li> </ul> |

## Presto Configuration

**Step 1** Log in to the MRS management console. In the navigation tree on the left, choose **Clusters > Active Clusters** and click the cluster name.

**Step 2** Choose **Components > Presto > Service Configuration**.

**Step 3** Switch **Basic** to **All**, and search for and set the following parameters:

**Table 5-42** Data encryption parameters

| Parameter                          | Value   | Description                                                                                                                                                                                                                                                                                    |
|------------------------------------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| fs.obs.server-side-encryption-type | SSE-KMS | <ul style="list-style-type: none"> <li><b>SSE-KMS</b>: KMS keys are used for encryption and decryption</li> <li><b>NONE</b>: The encryption function is disabled.</li> </ul>                                                                                                                   |
| fs.obs.server-side-encryption-key  | -       | ID of the KMS key used for encryption. This parameter is optional.<br>If <b>fs.obs.server-side-encryption-type</b> is set to <b>SSE-KMS</b> and this parameter is not set, OBS uses the default KMS key for encryption.                                                                        |
| fs.obs.connection.ssl.enabled      | true    | Whether to establish a secure connection with OBS. <ul style="list-style-type: none"> <li><b>true</b>: The secure connection is enabled. To use OBS encryption and decryption, this parameter must be set to <b>true</b>.</li> <li><b>false</b>: The secure connection is disabled.</li> </ul> |

**Step 4** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

----End

## 5.11.12 Configuring Job Notification Rules

MRS uses SMN to offer a publish/subscribe model to achieve one-to-multiple message subscriptions and notifications in a variety of message types (SMSs and emails). You can configure job notification rules to receive notifications immediately upon a job execution success or failure.

### Procedure

- Step 1** Log in to the management console.
- Step 2** Click **Service List**, and choose **Simple Message Notification** under **Application**.
- Step 3** Create a topic and add subscriptions to the topic. For details, see [Configuring Message Notification](#).
- Step 4** Go to the MRS management console, and click the cluster name to go to the cluster details page.
- Step 5** Click the **Alarms** tab, and choose **Notification Rules > Add Notification Rule**.
- Step 6** Configure a notification rule for sending job execution results to subscribers.

**Table 5-43** Parameters of adding a notification rule

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rule Name            | User-defined notification rule name. Only digits, letters, hyphens (-), and underscores (_) are allowed.                                                                                                                                                                                                                                                                                   |
| Message Notification | If you enable this function, subscription messages will be sent to subscribers.                                                                                                                                                                                                                                                                                                            |
| Topic Name           | Select an existing topic or click <b>Create Topic</b> to create a topic.                                                                                                                                                                                                                                                                                                                   |
| Notification Type    | Select <b>Event</b> .                                                                                                                                                                                                                                                                                                                                                                      |
| Subscription Items   | <ol style="list-style-type: none"> <li>1. Click  next to <b>Suggestion</b>.</li> <li>2. Click  next to <b>Manager</b>.</li> <li>3. Select <b>Job Running Succeeded</b> and <b>Job Running Failed</b>.</li> </ol> |

----End

## 5.12 Importing and Exporting Data

Through the **Files** tab page, you can create, delete, import, export, delete files in the analysis cluster. Currently, file creation is not supported. Streaming clusters do not support the file management function on the MRS GUI. In a cluster with Kerberos authentication enabled, to read or write the folders in the root directory,

add a role that has the required permissions on the folders by referring to [Creating a Role](#). Then, add the new role to the user group to which the user who submits the job belongs by referring to [Related Tasks](#).

## Background

Data sources processed by MRS are from OBS or HDFS. OBS is an object-based storage service that provides you with massive, secure, reliable, and cost-effective data storage capabilities. MRS can process data in OBS directly. You can view, manage, and use data by using the web page of the management control platform or OBS client. In addition, you can use REST APIs independently or integrate APIs to service applications to manage and access data.

Before creating jobs, upload the local data to OBS for MRS to compute and analyze. MRS allows exporting data from OBS to HDFS for computing and analyzing. After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS. HDFS and OBS can also store the compressed data in the format of **bz2** or **gz**.

## Importing Data

Currently, MRS can only import data from OBS to HDFS. The file upload rate decreases with the increase of the file size. This mode applies to scenarios where the data volume is small.

You can perform the following steps to import files and directories:

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's information.
3. Click the **Files** tab, and go to the file management page.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd\_app1**.

The **bd\_app1** directory is only an example. You can use any directory on the page or create a new one.

The requirements for creating a folder are as follows:

- The folder name contains a maximum of 255 characters
  - The folder name cannot be empty.
  - The folder name cannot contain the following special characters: `/*? "<>| \;&,'!{}[]$%+`
  - The value cannot start or end with a period (`.`).
  - The spaces at the beginning and end are ignored.
6. Click **Import Data** and configure the HDFS and OBS paths correctly. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
    - OBS path
      - The path must start with **obs://**.
      - Files or programs encrypted by KMS cannot be imported.

- An empty folder cannot be imported.
  - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters: ;|&>,<'\$\*?\
  - The directory and file name cannot start or end with a space, but can contain spaces between them.
  - The OBS full path contains a maximum of 255 characters.
- HDFS path
- The path starts with **/user** by default.
  - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters: ;|&>,<'\$\*?\
  - The directory and file name cannot start or end with a space, but can contain spaces between them.
  - The HDFS full path contains a maximum of 255 characters.
7. Click **OK**.
- You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data import operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

## Exporting Data

After the data analysis and computing are completed, you can store the data in HDFS or export them to OBS.

You can perform the following steps to export files and directories:

1. Log in to the MRS console.
2. Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
3. Click the **Files** tab, and the file management page is displayed.
4. Select **HDFS File List**.
5. Go to the data storage directory, for example, **bd\_app1**.
6. Click **Export Data** and configure the OBS and HDFS paths. When configuring the OBS or HDFS path, click **Browse**, select a file directory, and click **Yes**.
  - OBS path
    - The path must start with **obs://**.
    - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters: ;|&>,<'\$\*?\
    - The directory and file name cannot start or end with a space, but can contain spaces between them.

- The OBS full path contains a maximum of 255 characters.
- HDFS path
  - The path starts with **/user** by default.
  - The directory and file name can contain letters, digits, hyphens (-), and underscores (\_), but cannot contain the following special characters: ;|&>,<'\$\*?\
  - The directory and file name cannot start or end with a space, but can contain spaces between them.
  - The HDFS full path contains a maximum of 255 characters.

 **NOTE**

When a folder is exported to OBS, a label file named **folder name \$folder\$** is added to the OBS path. Ensure that the exported folder is not empty. If the exported folder is empty, OBS cannot display the folder and only generates a file named **folder name\_ \$folder\$**.

7. Click **OK**.

You can view the file upload progress on the **File Operation Records** tab page. MRS processes the data export operation as a DistCp job. You can also check whether the DistCp job is successfully executed on the **Jobs** tab page.

## Viewing Operation Logs

When importing and exporting data on the MRS management console, you can choose **Files > File Operation Records** to view the data import and export progress.

[Table 5-44](#) describes the parameters of the file operation record.

**Table 5-44** File operation record parameters

| Parameter   | Description                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Submitted   | Start time of data import or export.                                                                                                           |
| Source Path | Source path of data. <ul style="list-style-type: none"> <li>• OBS path during data import.</li> <li>• HDFS path during data export.</li> </ul> |
| Target Path | Target path of data. <ul style="list-style-type: none"> <li>• HDFS path during data import.</li> <li>• OBS path during data import.</li> </ul> |

| Parameter      | Description                                                                                                                                                                                  |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Status         | Status during data import or export. <ul style="list-style-type: none"> <li>Submitted</li> <li>Accepted</li> <li>Running</li> <li>Completed</li> <li>Terminated</li> <li>Abnormal</li> </ul> |
| Duration (min) | Time of data import or export.<br>The unit is minute.                                                                                                                                        |
| Result         | Result of data import or export. <ul style="list-style-type: none"> <li>Successful</li> <li>Failed</li> <li>Killed</li> <li>Undefined</li> </ul>                                             |
| Operation      | View Log: allows you to view file operation logs.                                                                                                                                            |

## 5.13 Component Management

### 5.13.1 Object Management

MRS contains different types of basic objects. [Table 5-45](#) describes these objects.

**Table 5-45** MRS basic object overview

| Object           | Description                                                         | Example                                                                            |
|------------------|---------------------------------------------------------------------|------------------------------------------------------------------------------------|
| Service          | Function set that can complete specific business.                   | KrbServer service and LdapServer service                                           |
| Service instance | Specific instance of a service, usually called service.             | KrbServer service                                                                  |
| Service role     | Function entity that forms a complete service, usually called role. | KrbServer is composed of the KerberosAdmin role and KerberosServer role.           |
| Role instance    | Specific instance of a service role running on a host.              | KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3 |
| Host             | An ECS running Linux OS.                                            | Host1 to Host5                                                                     |

| Object  | Description                                                                   | Example                                                                                                          |
|---------|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Rack    | Physical entity that contains multiple hosts connecting to the same switch.   | Rack1 contains Host1 to Host5.                                                                                   |
| Cluster | Logical entity that consists of multiple hosts and provides various services. | Cluster1 cluster consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer. |

## 5.13.2 Viewing Configuration

On MRS, you can view the configuration of services (including roles) and role instances.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

- Query service configuration.
  - a. On the MRS cluster details page, click **Components**.
  - b. Select the target service from the service list.
  - c. Click **Service Configuration**.
  - d. Switch **Basic** to **All**. All configuration parameters of the service are displayed in the navigation tree. The service name and role names are displayed from upper to lower in the navigation tree.
  - e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

The parameters under the service nodes and role nodes are service configuration parameters and role configuration parameters respectively.
  - f. Select **Non-default** from the **--Select--** drop-down list. The parameters whose values are not default values are displayed.
- Query role instance configurations.
  - a. On the MRS cluster details page, click **Components**.
  - b. Select the target service from the service list.
  - c. Click the **Instances** tab.
  - d. Click the target role instance from the role instance list.
  - e. Click **Instance Configuration**.
  - f. Switch **Basic** to **All** on the right of the page. All configuration parameters of the role instance are displayed in the navigation tree.
  - g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

- h. Select **Non-default** from the **--Select--** drop-down list. The parameters whose values are not default values are displayed.

### 5.13.3 Managing Services

You can perform the following operations on MRS:

- Add or delete services. This is available only for custom clusters of MRS 3.1.2 and later versions.
- Start the service in the **Stopped**, **Stop Failed**, or **Failed to Start** state to use the service.
- Stop the services or stop abnormal services.
- Restart abnormal services or configure expired services to restore or enable the services.

#### Prerequisites

- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)
- When adding a service, ensure that the role instances of the underlying services on which the service depends are running properly. Otherwise, the service may fail to be added or fail to be started after being added.

#### Procedure

**Step 1** On the MRS cluster details page, click **Components**.

**Step 2** Locate the row that contains the target service, **Start**, **Stop**, and **Restart** to start, stop, or restart the service.

Services are interrelated. If a service is started, stopped, and restarted, services dependent on it will be affected.

The services will be affected in the following ways:

- If a service is to be started, the lower-layer services dependent on it must be started first.
- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

----End

### 5.13.4 Configuring Service Parameters

On the MRS console, you can view and modify the default service configurations based on site requirements and export or import the configurations.

#### Impact on the System

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

## Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Modifying Service Parameters

1. On the MRS cluster details page, click **Components**.
2. Select the target service from the service list.
3. Click **Service Configuration**.
4. Switch **Basic** to **All**. All configuration parameters of the service are displayed in the navigation tree. The service name and role names are displayed from upper to lower in the navigation tree.
5. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.

6. Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

### NOTE

To update the queue configuration of Yarn without restarting service, choose **More > Refresh Queue** on the **Service Status** tab page to update the queue for the configuration to take effect.

## 5.13.5 Configuring Customized Service Parameters

Each component of MRS supports all open-source parameters. MRS supports the modification of some parameters for key application scenarios. Some component clients may not include all parameters with open-source features. To modify the component parameters that are not directly supported by MRS, you can add new parameters for components by using the configuration customization function on MRS. Newly added parameters are saved in component configuration files and take effect after restart.

## Impact on the System

- After the service attributes are configured, the service needs to be restarted. The service cannot be accessed during restart.
- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

## Prerequisites

- You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.

- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

**Step 1** On the MRS cluster details page, click **Components**.

**Step 2** Select the target service from the service list.

**Step 3** Click **Service Configuration**.

**Step 4** In the configuration type drop-down box on the right side, switch **Basic** to **All**.

**Step 5** In the navigation tree, select **Customization**. The customized parameters of the current component are displayed on MRS.

The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Different configuration files may have same open-source parameters. After the parameters in different files are set to different values, whether the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

**Step 6** Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Parameter** column and enter the parameter value in the **Value** column.

- You can click  or  to add or delete a customized parameter. You can delete a customized parameter only after you click  for the first time.
- If you want to cancel the modification of a parameter value, click  to restore it.

**Step 7** Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

----End

## Task Example

### Configuring Customized Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

**Step 1** On the MRS cluster details page, click **Components**.

**Step 2** Choose **Hive > Service Configuration**.

- Step 3** In the configuration type drop-down box on the right side, switch **Basic** to **All**.
- Step 4** In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.
- Step 5** In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Parameter** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.
- Step 6** Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

**Operation successful** is displayed. Click **Finish**. The service is started successfully.

----End

## 5.13.6 Synchronizing Service Configuration

### Scenario

If **Configuration Status** of some services is **Configuration expired** or **Configuration failed**, synchronize configuration for the cluster or service to restore its configuration status. If all services in the cluster are in the **Configuration failed** state, synchronize the cluster configuration with the background configuration.

### Impact on the System

After synchronizing service configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

- Step 1** On the MRS cluster details page, click **Components**.
- Step 2** Select the target service from the service list.
- Step 3** On the Service Status tab page, choose **More > Synchronize Configuration**.
- Step 4** In the dialog box that is displayed, select **Restart the service or instances whose configurations have expired** and click **Yes** to restart the service.

----End

## 5.13.7 Managing Role Instances

### Scenario

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

## Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

- Step 1** On the MRS cluster details page, click **Components**.
- Step 2** Select the target service from the service list.
- Step 3** Click the **Instances** tab.
- Step 4** Select the check box on the left of the target role instance.
- Step 5** Click **More**, select operations such as **Start Instance**, **Stop Instance**, **Restart Instance**, **Rolling-restart Instance**, or **Delete Instance** based on site requirements.

----End

## 5.13.8 Configuring Role Instance Parameters

### Scenario

You can view and modify default role instance configuration on MRS based on site requirements. The configurations can be imported and exported.

### Impact on the System

You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

## Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Modifying Role Instance Parameters

1. On the MRS cluster details page, click **Components**.
2. Select the target service from the service list.
3. Click the **Instances** tab.
4. Click the target role instance from the role instance list.
5. Click the **Instance Configuration** tab.
6. Switch **Basic** to **All** from the drop-down list on the right of the page. All configuration parameters of the role instance are displayed in the navigation tree.
7. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.

8. Click **Save Configuration**, select **Restart the affected services or instances**, and click **OK**.

## 5.13.9 Synchronizing Role Instance Configuration

### Scenario

When **Configuration Status** of a role instance is **Configuration expired** or **Configuration failed**, you can synchronize the configuration data of the role instance with the background configuration.

### Impact on the System

After synchronizing a role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during restart.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

- Step 1** On the MRS cluster details page, click **Components**.
- Step 2** Select a service name.
- Step 3** Click the **Instances** tab.
- Step 4** Click the target role instance from the role instance list.
- Step 5** Choose **More > Synchronize Configuration** above the role instance status and indicator information.
- Step 6** In the dialog box that is displayed, select **Restart the service or instances whose configurations have expired** and click **Yes** to restart the role instance.

----End

## 5.13.10 Decommissioning and Recommissioning a Role Instance

### Scenario

If a Core or Task node is faulty, the cluster status may be displayed as **Abnormal**. In an MRS cluster, data can be stored on different Core nodes. You can decommission the specified role instance on MRS to stop the role instance from providing services. After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned or recommissioned:

- DataNode role instance on HDFS
- NodeManager role instance on Yarn
- RegionServer role instance on HBase
- ClickHouseServer role instance on ClickHouse
- Broker role instance on Kafka

Restrictions:

- If the number of the DataNodes is less than or equal to that of HDFS copies, decommissioning cannot be performed. If the number of HDFS copies is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and force MRS to exit the decommissioning 30 minutes after MRS attempts to perform the decommissioning.
- If the number of Kafka Broker instances is less than or equal to that of Kafka copies, decommissioning cannot be performed. For example, if the number of Kafka copies is two and the number of nodes is less than three in the system, decommissioning cannot be performed. Instance decommissioning will fail and exit.
- If a role instance is out of service, you must recommission the instance to start it before using it again.

## Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

- Step 1** On the MRS cluster details page, click **Components**.
- Step 2** Click a service in the service list.
- Step 3** Click the **Instances** tab.
- Step 4** Select an instance.
- Step 5** Choose **More > Decommission** or **Recommission** to perform the corresponding operation.

### NOTE

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

## 5.13.11 Managing a Host (Node)

### Scenario

To check an abnormal or faulty host (node), you need to stop all host roles on MRS. To recover host services after the host fault is rectified, restart all roles.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

- Step 1** On the MRS details page, click **Nodes**.
- Step 2** Unfold the node group information and select the check box of the target node.
- Step 3** Choose **Node Operation** > **Start All Roles** or **Stop All Roles** to perform the required operation.

----End

## 5.13.12 Isolating a Host

### Scenario

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

You can isolate a host manually on MRS based on the actual service requirements or O&M plan. Only non-management nodes can be isolated.

### Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics of the monitoring status and indicator data of the host hardware and instances cannot be collected or displayed.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

- Step 1** On the MRS details page, click **Nodes**.
- Step 2** Unfold the node group information and select the check box of the target host.

**Step 3** Choose **Node Operation > Isolate Host**.

**Step 4** Confirm the information about the host to be isolated and click **OK**.

When **Operation successful** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

 **NOTE**

For isolated hosts, you can cancel the isolation and add them to the cluster again. For details, see [Canceling Host Isolation](#).

----End

## 5.13.13 Canceling Host Isolation

### Scenario

After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

You can cancel the isolation of a host on MRS.

### Prerequisites

- The host is in the **Isolated** state.
- The exception or fault of the host has been rectified.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Nodes**.

**Step 2** Unfold the node group information and select the check box of the target host that you want to cancel its isolation.

**Step 3** Choose **Node Operation > Cancel Host Isolation**.

**Step 4** Confirm the information about the host for which the isolation is to be cancelled and click **OK**.

When **Operation successful** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.

**Step 5** Select the host that has been de-isolated and choose **Node Operation > Start All Roles**.

----End

## 5.13.14 Starting and Stopping a Cluster

A cluster is a collection of service components. You can start or stop all services in a cluster.

## Procedure

On the cluster details page, choose **Management Operations > Start All Components** or **Stop All Components** in the upper right corner to perform the required operation.

## 5.13.15 Synchronizing Cluster Configuration

### Scenario

If **Configuration Status** of all services or some services is **Configuration expired** or **Configuration failed**, synchronize configuration for the cluster or service to restore its configuration status.

- If all services in the cluster are in the **Configuration failed** status, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Configuration failed** status, synchronize the service configuration with the background configuration.

#### NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

### Impact on the System

After synchronizing cluster configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

### Procedure

- Step 1** On the cluster details page, choose **Configuration > Synchronize Configuration** in the upper right corner.
- Step 2** In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The cluster is started successfully.

----End

## 5.13.16 Exporting Cluster Configuration

### Scenario

You can export all configuration data of a cluster using MRS to meet site requirements. The exported configuration data is used to rapidly update service configuration.

#### NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

## Procedure

On the cluster details page, choose **Configuration > Export Cluster Configuration** in the upper right corner.

The exported file is used to update service configurations. For details, see **Importing Service Configuration Parameters** in [Configuring Service Parameters](#).

### 5.13.17 Performing Rolling Restart

After modifying the configuration items of a big data component, you need to restart the corresponding service to make new configurations take effect. If you use a normal restart mode, all services or instances are restarted concurrently, which may cause service interruption. To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted. Rolling restart takes longer than normal restart.

[Table 5-46](#) provides services and instances that support or do not support rolling restart in the MRS cluster.

**Table 5-46** Services and instances that support or do not support rolling restart

| Service   | Instance         | Whether to Support Rolling Restart |
|-----------|------------------|------------------------------------|
| HDFS      | NameNode         | Yes                                |
|           | Zkfc             |                                    |
|           | JournalNode      |                                    |
|           | HttpFS           |                                    |
|           | DataNode         |                                    |
| Yarn      | ResourceManager  | Yes                                |
|           | NodeManager      |                                    |
| Hive      | MetaStore        | Yes                                |
|           | WebHCat          |                                    |
|           | HiveServer       |                                    |
| Mapreduce | JobHistoryServer | Yes                                |
| HBase     | HMaster          | Yes                                |
|           | RegionServer     |                                    |
|           | ThriftServer     |                                    |
|           | RETSerVer        |                                    |

| Service   | Instance      | Whether to Support Rolling Restart |
|-----------|---------------|------------------------------------|
| Spark     | JobHistory    | Yes                                |
|           | JDBCServer    |                                    |
|           | SparkResource | No                                 |
| Hue       | Hue           | No                                 |

## Restrictions

- Perform a rolling restart during off-peak hours.
  - Otherwise, a rolling restart failure may occur. For example, if the throughput of Kafka is high (over 100 MB/s) during the Kafka rolling restart, the Kafka rolling restart may fail.
  - For example, if the requests per second of each RegionServer on the native interface exceed 10,000 during the HBase rolling restart, you need to increase the number of handles to prevent a RegionServer restart failure caused by heavy loads during the restart.
- Before the restart, check the number of current requests of HBase. If the number of requests of each RegionServer on the native interface exceeds 10,000, increase the number of handles to prevent a failure.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.
- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

## Performing a Rolling Service Restart

**Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

- Step 2** Click **Components** and select a service for which you want to perform a rolling restart.
  - Step 3** On the **Service Status** tab page, click **More** and select **Rolling-restart Service**.
  - Step 4** The **Rolling-restart Service** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.
  - Step 5** After the rolling restart task is complete, click **Finish**.
- End

## Performing a Rolling Instance Restart

- Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.
  - Step 2** Click **Components** and select a service for which you want to perform a rolling restart.
  - Step 3** On the **Instance** tab page, select the instance to be restarted. Click **More** and select **Rolling-restart Instance**.
  - Step 4** After you enter the administrator password, the **Rolling-restart Instance** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the instance.
  - Step 5** After the rolling restart task is complete, click **Finish**.
- End

## Perform a Rolling Cluster Restart

- Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.
  - Step 2** In the upper right corner of the page, choose **Management Operations > Perform Rolling Cluster Restart**.
  - Step 3** The **Rolling-restart Cluster** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the cluster.
  - Step 4** After the rolling restart task is complete, click **Finish**.
- End

## Rolling Restart Parameter Description

[Table 5-47](#) describes rolling restart parameters.

**Table 5-47** Rolling restart parameter description

| Parameter                                                | Description                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Only restart instances whose configurations have expired | Specifies whether to restart only the modified instances in a cluster.                                                                                                                                                                                                                                                                                                                            |
| Data Node Instances to Be Batch Restarted                | Specifies the number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is <b>1</b> . The value ranges from 1 to 20. This parameter is valid only for data nodes.                                                                                                                                                                   |
| Batch Interval                                           | Specifies the interval between two batches of instances for rolling restart. The default value is <b>0</b> . The value ranges from 0 to 2147483647. The unit is second.<br><br>Note: Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart. You are advised to set this parameter to a non-default value, for example, 10. |
| Batch Fault Tolerance Threshold                          | Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is <b>0</b> , which indicates that the rolling restart task ends after any batch of instances fails to be restarted. The value ranges from 0 to 2147483647.                                                                                                                |

## Procedure in a Typical Scenario

**Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

**Step 2** Click **Components** and select **HBase**. The **HBase** service page is displayed.

**Step 3** Click the **Service Configuration** tab, and modify an HBase parameter. After the following dialog box is displayed, click **OK** to save the configurations.

 **NOTE**

Do not select **Restart the affected services or instances**. This option indicates a normal restart. If you select this option, all services or instances will be restarted, which may cause service interruption.

**Step 4** After saving the configurations, click **Finish**.

**Step 5** Click the **Service Status** tab.

**Step 6** On the **Service Status** tab page, click **More** and select **Rolling-restart Service**.

**Step 7** After you enter the administrator password, the **Rolling-restart Service** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart.

**Step 8** After the rolling restart task is complete, click **Finish**.

----End

## 5.14 Alarm Management

### 5.14.1 Viewing the Alarm List

The alarm list displays all alarms in the MRS cluster. The MRS page displays the alarms that need to be handled in a timely manner and the events.

On the MRS management console, you can only query basic information about uncleared MRS alarms on the **Alarms** tab page. For details about how to view alarm details or manage alarms, see [Viewing and Manually Clearing an Alarm](#).

Alarms are listed in chronological order by default in the alarm list, with the most recent alarms displayed at the top.

[Table 5-48](#) describes various fields in an alarm.

**Table 5-48** Alarm description

| Parameter  | Description       |
|------------|-------------------|
| Alarm ID   | ID of an alarm.   |
| Alarm Name | Name of an alarm. |

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Severity  | <p>Alarm severity.</p> <p>In versions earlier than MRS 3.x, the cluster alarm severity is as follows:</p> <ul style="list-style-type: none"> <li>● <b>Critical</b><br/>Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. You need to check the cluster status based on the alarms and rectify the faults in a timely manner.</li> <li>● <b>Major</b><br/>Indicates alarms reporting errors that affect some cluster functions, including process faults, periodic backup task failures, and abnormal key file permissions. Check the objects for which the alarms are generated based on the alarms and clear the alarms in a timely manner.</li> <li>● <b>Minor</b><br/>Indicates alarms reporting errors that do not affect major functions of the current cluster, including alarms indicating that the certificate file is about to expire, audit logs fail to be dumped, and the license file is about to expire.</li> <li>● <b>Warning</b><br/>Indicates an alarm of the lowest severity. It is used for information display or prompt and indicates that an event occurs in the scenarios when you stop a service, delete a service, stop an instance, delete an instance, delete a node, restart a service, restart an instance, perform an active/standby switchover for MRS Manager, scale in a host, or restore an instance. Additionally, this type of alarms also occurs when an instance is faulty, a job executed successfully, or a job failed to be executed.</li> </ul> <p>In MRS 3.x or later, the alarm severity of a cluster is as follows:</p> <ul style="list-style-type: none"> <li>● <b>Critical</b><br/>Indicates alarms reporting errors that affect cluster running, such as unavailable cluster services, node faults, data inconsistency between the active and standby GaussDB databases, and abnormal LdapServer data synchronization. ## 5.14.2 Viewing the Event List

The event list displays information about all events in a cluster, such as service restart and service termination.

Events are listed in chronological order by default in the event list, with the most recent events displayed at the top.

**Table 5-50** describes various fields for an event.

**Table 5-50** Event description

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event ID       | Specifies the ID of an event.                                                                                                                                                                                                                                                                                                                                                                                                          |
| Event Severity | <p>Specifies the event severity.</p> <p>In versions earlier than MRS 3.x, the cluster event level is as follows:</p> <ul style="list-style-type: none"> <li>• Critical</li> <li>• Major</li> <li>• Minor</li> <li>• Suggestion</li> </ul> <p>In MRS 3.x or later, the event level of a cluster is as follows:</p> <ul style="list-style-type: none"> <li>• Critical</li> <li>• Major</li> <li>• Minor</li> <li>• Suggestion</li> </ul> |
| Event Name     | Name of the generated event.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Generated      | Time when the event is generated.                                                                                                                                                                                                                                                                                                                                                                                                      |
| Location       | Specifies the detailed information for locating the event,                                                                                                                                                                                                                                                                                                                                                                             |

**Table 5-51** Icon description

|  | <p>Select an interval for refreshing the event list from the drop-down list.</p> <ul style="list-style-type: none"> <li>• Refresh every 30s</li> <li>• Refresh every 60s</li> <li>• Stop refreshing</li> </ul>  |
|  | Click  to manually refresh the event list.                                                                                   |
| Advanced Search                                                                     | Click <b>Advanced Search</b> . In the displayed event search area, set search criteria and click <b>Search</b> to view the information about specified events. Click <b>Reset</b> to clear the search criteria. |

## Exporting events

- Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.
  - Step 2** Click **Alarm Management > Events**.
  - Step 3** Click **Export All**.
  - Step 4** In the displayed dialog box, select the type and click **OK**.
- End

## Common Events

**Table 5-52** Common events

| Event ID | Event Name                                                 |
|----------|------------------------------------------------------------|
| 12019    | Stop Service                                               |
| 12020    | Delete Service                                             |

| 43026    | ZooKeeper Connection Succeeded        |
| 43027    | Zookeeper Connection Failed           |

### 5.14.3 Viewing and Manually Clearing an Alarm

#### Scenario

You can view and clear alarms on MRS.

Generally, the system automatically clears an alarm when the fault is rectified. If the fault has been rectified and the alarm cannot be automatically cleared, you can manually clear the alarm.

You can view the latest 100,000 alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS. If the number of cleared alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to the dump path.

3. In versions earlier than x, the value is the same as that of `#{BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data` for the active management node.

(For 3.x and later versions) The path is `#{BIGDATA_HOME}/om-server/OMS/workspace/data` of the active management node.

A directory is automatically generated when alarms are dumped for the first time.

 NOTE

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

## Procedure

**Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.

**Step 2** Click **Alarms** and view the alarm information in the alarm list.

- By default, the alarm list page displays the latest 10 alarms.
- By default, data is sorted in descending order based on the generation time. For MRS 3.x or earlier, you can click the alarm ID, severity, and generation time to modify the sorting mode. For clusters of MRS 3.x or later, you can click the severity and generation time to modify the sorting mode.
- You can filter all alarms of the same severity. The results include cleared and uncleared alarms.
- For clusters of MRS 3.x and earlier versions, you can click , ,  or  in the upper right corner of the page to quickly filter **Critical**, **Major**, **Minor**, or **Suggestion** alarms that are uncleared.
- For clusters of MRS 3.x or later: You can click , ,  or  in the upper right corner of the page to quickly filter uncleared **Critical**, **Major**, **Minor** or **Warning** alarms.

**Step 3** Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. You can click **Reset** to clear the search criteria.

 NOTE

The start time and end time are specified in **Time Range**. You can search for alarms generated within the time range.

Handle the alarm by referring to **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

**Step 4** If the alarm needs to be manually cleared after errors are rectified, click **Clear Alarm**.

 NOTE

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

## Exporting Alarms

- Step 1** Choose **Clusters > Active Clusters** and click a cluster name to go to the cluster details page.
  - Step 2** Click **Alarm Management > Alarms**.
  - Step 3** Click **Export All**.
  - Step 4** In the displayed dialog box, select the type and click **OK**.
- End

## 5.15 Patch Management

### 5.15.1 Patch Operation Guide for Versions Earlier Than MRS 3.x

If you obtain patch information from the following sources, upgrade the patch according to actual requirements.

- You obtain information about the patch released by MRS from a message pushed by the message center service.
- You obtain information about the patch by accessing the cluster and viewing patch information.

#### Preparing for Patch Installation

- Follow instructions in [Performing a Health Check](#) to check cluster status. If the cluster health status is normal, install a patch.
- You need to confirm the target patch to be installed according to the patch information in the patch content.

#### Installing a Patch

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
- Step 3** On the **Patches** tab page, click **Install** in the **Operation** column to install the target patch.

#### NOTE

- For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

#### Uninstalling a Patch

- Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

**Step 3** On the **Patches** page, click **Uninstall** in the **Operation** column to uninstall the target patch.

 **NOTE**

- For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## 5.15.2 Rolling Patches

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

 **NOTE**

In **MRS 3.x**, you cannot perform operations in this section on the management console.

**Table 5-53** provides services and instances that support or do not support rolling restart in the MRS cluster.

**Table 5-53** Services and instances that support or do not support rolling restart

| Service | Instance        | Whether to Support Rolling Restart |
|---------|-----------------|------------------------------------|
| HDFS    | NameNode        | Yes                                |
|         | Zkfc            |                                    |
|         | JournalNode     |                                    |
|         | HttpFS          |                                    |
|         | DataNode        |                                    |
| Yarn    | ResourceManager | Yes                                |
|         | NodeManager     |                                    |
| Hive    | MetaStore       | Yes                                |

| Service   | Instance         | Whether to Support Rolling Restart |
|-----------|------------------|------------------------------------|
|           | WebHCat          |                                    |
|           | HiveServer       |                                    |
| MapReduce | JobHistoryServer | Yes                                |
| HBase     | HMaster          | Yes                                |
|           | RegionServer     |                                    |
|           | ThriftServer     |                                    |
|           | RETSerVer        |                                    |
| Spark     | JobHistory       | Yes                                |
|           | JDBCServer       | No                                 |
|           | SparkResource    |                                    |
| Hue       | Hue              | No                                 |
| Tez       | TezUI            | No                                 |
| Loader    | Sqoop            | No                                 |
| Zookeeper | Quorumpeer       | Yes                                |
| Kafka     | Broker           | Yes                                |
|           | MirrorMaker      | No                                 |
| Flume     | Flume            | Yes                                |
|           | MonitorServer    |                                    |
| Storm     | Nimbus           | Yes                                |
|           | UI               |                                    |
|           | Supervisor       |                                    |
|           | Logviewer        |                                    |

## Installing a Patch

- Step 1** Log in to the MRS console.
- Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
- Step 3** On the **Patches** page, click **Install** in the **Operation** column.
- Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

 **NOTE**

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

**Step 5** Click **Yes** to install the target patch.

**Step 6** View the patch installation progress.

1. Access MRS Manager. For details, see [Accessing Manager](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

 **NOTE**

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## Uninstalling a Patch

**Step 1** Log in to the MRS console.

**Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

**Step 3** On the **Patches** page, click **Uninstall** in the **Operation** column.

**Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

 **NOTE**

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- Only patches that are installed in rolling mode can be uninstalled in the same mode.

**Step 5** Click **Yes** to uninstall the target patch.

**Step 6** View the patch uninstallation progress.

1. Access MRS Manager. For details, see [Accessing Manager](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

 NOTE

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## 5.15.3 Restoring Patches for the Isolated Hosts

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

 NOTE

In **MRS 3.x**, you cannot perform operations in this section on the management console.

- Step 1** Access MRS Manager. For details, see [Accessing Manager](#).
- Step 2** Choose **System > Manage Patch**. The **Manage Patch** page is displayed.
- Step 3** In the **Operation** column, click **View Details**.
- Step 4** On the patch details page, select host nodes whose **Status** is **Isolated**.
- Step 5** Click **Select and Restore** to restore the isolated host nodes.

----End

## 5.16 Health Check Management

### 5.16.1 Before You Start

This section describes how to manage health checks on the MRS console.

Health check management operations on the MRS console apply only to clusters of **MRS 1.9.2 to MRS 2.1.x**.

Health check management on Manager applies to all versions. For MRS 3.x and later versions, see [Viewing a Health Check Task](#). For versions earlier than MRS 3.x, see [Performing a Health Check](#).

### 5.16.2 Performing a Health Check

#### Scenario

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

 **NOTE**

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

## Procedure

- Manually perform the health check for all services.

On the MRS details page, choose **Management Operations > Start Cluster Health Check**.

 **NOTE**

For the operations on MRS Manager, see [Performing a Health Check](#); for the operations on FusionInsight Manager of MRS 3.x or later, see [Overview](#).

- The cluster health check includes Manager, service, and host status checks.
- To perform cluster health checks, you can also choose **System > Check Health Status > Start Cluster Health Check** on MRS Manager.
- To export the health check result, click **Export Report** in the upper left corner.
- Manually perform the health check for a service.
  - a. On the MRS cluster details page, click **Components**.
  - b. Select the target service from the service list.
  - c. Choose **More > Start Service Health Check** to start the health check for the service.
- Manually perform the health check for a host.
  - a. On the MRS details page, click **Nodes**.
  - b. Expand the node group information and select the check box of the host to be checked.
  - c. Choose **Node > Start Host Health Check** to start the health check for the host.

## 5.16.3 Viewing and Exporting a Health Check Report

### Scenario

You can view the health check result on MRS and export it for further analysis.

 NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

## Prerequisites

You have performed a health check.

## Procedure

**Step 1** On the MRS details page, choose **Management Operations > View Cluster Health Check Report**.

**Step 2** Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

 NOTE

For details about how to rectify the faults of the check items, see [DBService Health Check Indicators](#) to [ZooKeeper Health Check Indicators](#).

----End

## 5.16.4 DBService Health Check Indicators

### Performing Service Health Checks

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether the DBService service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to ALM-27001.

### Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.5 Flume Health Check Indicators

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether Flume service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to ALM-24000.

### Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.6 HBase Health Check Indicators

### Normal RegionServer Count

**Indicator:** Normal RegionServer Count

**Description:** This indicator is used to check the number of RegionServers that are running properly in an HBase cluster.

**Recovery Guide:** If the indicator is abnormal, check whether the status of RegionServer is normal. If the status is abnormal, resolve the problem and check that the network is normal.

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether HBase service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the status of HMaster and RegionServer is normal. If the status is abnormal, resolve the problem. Then, check whether the status of the Zookeeper service is faulty. On the HBase client, check whether the data in the HBase table can be correctly read and locate the data reading failure cause. Handle the alarm following instructions in the alarm processing document.

### Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.7 Host Health Check Indicators

### Swap Usage

**Indicator:** Swap Usage

**Description:** Swap usage of the system. The value is calculated using the following formula:  $\text{Swap usage} = \text{Used swap size} / \text{Total swap size}$ . Assume that the current threshold is set to 75.0%. If the usage of the file handles in the system exceeds the threshold, the system is unhealthy.

**Recovery Guide:**

1. Check the swap usage of the node.  
Log in to the unhealthy node and run the **free -m** command to check the total swap space and used swap space. If the swap space usage exceeds the threshold, go to [2](#).
2. If the swap usage exceeds the threshold, you are advised to expand the system capacity, for example, add nodes.

### Host File Handle Usage

**Indicator:** Host File Handle Usage

**Description:** This indicator indicates the file handle usage in the system.  $\text{Host file handle usage} = \text{Number of used handles} / \text{Total number of handles}$ . If the usage exceeds the threshold, the system is unhealthy.

**Recovery Guide:**

1. Check the file handle usage of the host.  
Log in to the unhealthy node and run the **cat /proc/sys/fs/file-nr** command. In the command output, the first and third columns indicate the number of used handles and the total number of handles, respectively. If the usage exceeds the threshold, go to [2](#).
2. If the file handle usage of the host exceeds the threshold, you are advised to check the system and analyze the file handle usage.

### NTP Offset

**Indicator:** NTP Offset

**Description:** This indicator indicates the NTP time offset. If the time deviation exceeds the threshold, the system is unhealthy.

**Recovery Guide:**

1. Check the NTP time offset.  
Log in to the unhealthy node and run the **/usr/sbin/ntpq -np** command to view the information. In the command output, the **Offset** column indicates the time offset. If the time offset is greater than the threshold, go to [2](#).

2. If the indicator is abnormal, check whether the clock source configuration is correct. Contact O&M personnel.

## average load

**Indicator:** Average Load

**Description:** Average system load, indicating the average number of processes in the running queue in a specified period. The system average load is calculated using the load value obtained by the uptime command. Calculation method: (Load of 1 minute + Load of 5 minutes + Load of 15 minutes)/(3 x Number of CPUs). Assume that the current threshold is set to 2. If the average load exceeds 2, the system is unhealthy.

**Recovery Guide:**

1. Log in to the unhealthy node and run the **uptime** command. The last three columns in the command output indicate the load in 1 minute, 5 minutes, and 15 minutes, respectively. If the average system load exceeds the threshold, go to [2](#).
2. If the system average load exceeds the threshold, you are advised to perform system capacity expansion, such as adding nodes.

## D State Process

**Indicator:** D State Process

**Description:** This indicator indicates the unstopable sleep process, that is, the process in the D state. A process that is in the D state is waiting for I/O, such as disk I/O and network I/O, and experiences an I/O exception. If any process in the D state exists in the system, the system is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12028.

## Hardware Status

**Indicator:** Hardware Status

**Description:** This indicator is used to check the system hardware status, including the CPU, memory, disk, power supply, and fan. This indicator obtains related hardware information using ipmitool sdr elist. If the hardware status is abnormal, the hardware is abnormal.

**Recovery Guide:**

1. Log in to the node where the check result is unhealthy. Run the ipmitool sdr elist command to check system hardware status. The last column in the command output indicates the hardware status. If the status is included in the following fault description table, the check result is unhealthy.

| Module       | Symptom                                                                                                                                                                                                                                                                                                                                 |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Battery    | Low<br>Failed                                                                                                                                   |

2. If the indicator is abnormal, contact O&M personnel.

## Host Name

**Indicator:** Host Name

**Description:** This indicator is used to check whether the host name is set. If the host name is not set, the system is unhealthy. If the indicator is abnormal, you are advised to set the host name properly.

**Recovery Guide:**

1. Log in to the node where the check result is unhealthy.
2. Run the `hostname host name` command to change the host name to ensure that the host name is consistent with the planned host name.

**hostname** *host name* For example, to change the host name to Bigdata-OM-01, run the `hostname Bigdata-OM-01` command.

3. Modify the host name configuration file.

Run the `vi /etc/HOSTNAME` command to edit the file. Change the file content to **Bigdata-OM-01**. Save the file, and exit.

## Umask

**Indicator:** Umask

**Description:** This indicator is used to check whether the umask setting of user **omm** is correct. If Umask is not 0077, the system is unhealthy.

**Recovery Guide:**

1. If the indicator is abnormal, you are advised to set umask of user **omm** to 0077. Log in to the unhealthy node and run the `su - omm` command to switch to user **omm**.
2. Run the `vi ${BIGDATA_HOME}/.om_profile` command and change the value of **umask** to **0077**. Save and exit.

## OMS HA Status

**Indicator:** OMS HA Status

**Description:** This indicator is used to check whether the OMS two-node cluster resources are normal. You can run the `${CONTROLLER_HOME}/sbin/status-oms.sh` command to view the detailed information about the status of the OMS two-node cluster resources. If any module is abnormal, the OMS is unhealthy.

**Recovery Guide:**

1. Log in to the active management node and run the `su - omm` command to switch to user `omm`. Run the `${CONTROLLER_HOME}/sbin/status-oms.sh` command to check the OMS status.
2. If `floatip`, `okerberos`, and `oldap` are abnormal, see ALM-12002, ALM-12004, and ALM-12005 respectively to resolve the problems.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

If controller resources are abnormal, view `/var/log/Bigdata/controller/controller.log` of the faulty node.

If the CEP resource is abnormal, check the `/var/log/Bigdata/omm/oms/cep/cep.log` of the abnormal node.

If aos resources are abnormal, view `/var/log/Bigdata/controller/aos/aos.log` of the faulty node.

If the `feed_watchdog` resource is abnormal, view the `/var/log/Bigdata/watchdog/watchdog.log` file on the abnormal node.

If the `httpd` resource is abnormal, view `/var/log/Bigdata/httpd/error_log` of the abnormal node.

If the `fms` resource is abnormal, check `/var/log/Bigdata/omm/oms/fms/fms.log` of the abnormal node.

If the `pms` resource is abnormal, check the `/var/log/Bigdata/omm/oms/pms/pms.log` of the abnormal node.

If the `IAM` resource is abnormal, view the `/var/log/Bigdata/omm/oms/iam/iam.log` of the abnormal node.

If the `gaussDB` resource is abnormal, check the `/var/log/Bigdata/omm/oms/db/omm_gaussdba.log` of the abnormal node.

If the `NTP` resource is abnormal, check the `/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log` of the abnormal node.

If the `Tomcat` resource is abnormal, check the `/var/log/Bigdata/tomcat/catalina.log` of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## Checking the Installation Directory and Data Directory

**Indicator:** Checking the Installation Directory and Data Directory

**Description:** This indicator checks the `lost+found` directory in the root directory of the disk partition where the installation directory (`/opt/Bigdata` by default) is located. If the directory contains the files of user `omm`, there are exceptions.

When a node is abnormal, related files are stored in the **lost+found** directory. This indicator is used to check whether files are lost in such scenarios. Check the installation directory (for example, **/opt/Bigdata**) and data directory (for example, **/srv/BigData**). If any files of non-omm users exist in the two directories, the system is unhealthy.

**Recovery Guide:**

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**. Check whether files or folders of user **omm** exist in the **lost+found** directory.

If the **omm** user file exists, you are advised to restore it and check again. If the **omm** user file does not exist, go to [2](#).

2. Check the installation directory and data directory. Check whether the files or folders of non-omm users exist in the installation directory and data directory. If the files and folders are manually generated temporary files, you are advised to delete them and check again.

## CPU Usage

**Indicator:** CPU Usage

**Description:** This indicator is used to check whether the CPU usage exceeds the threshold. If the usage exceeds the threshold, it is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12016.

## Memory Usage

**Indicator:** Memory Usage

**Description:** This indicator is used to check whether the memory usage exceeds the threshold. If the usage exceeds the threshold, it is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12018.

## Host Disk Usage

**Indicator:** Host Disk Usage

**Description:** This indicator is used to check whether the host disk usage exceeds the threshold. If the usage exceeds the threshold, it is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12017.

## Host Disk Write Rate

**Indicator:** Host Disk Write Rate

**Description:** This indicator is used to check the disk write rate of a host. The write rate of the host disk may vary according to the service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

**Recovery Guide:** Determine whether the current disk write rate is normal based on the service scenario.

## Host Disk Read Rate

**Indicator:** Host Disk Read Rate

**Description:** This indicator is used to check the disk read rate of a host. The read rate of the host disk may vary by service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

**Recovery Guide:** Determine whether the current disk read rate is normal based on the service scenario.

## Host Service Plane Network Status

**Indicator:** Host Service Plane Network Status

**Description:** This indicator is used to check the connectivity of the service plane network of the cluster host. If the hosts are disconnected, the cluster is unhealthy.

**Recovery Guide:** If the single-plane networking is used, check the IP address of the single plane. For a dual-plane network, the operation procedure is as follows:

1. Check the network connectivity between the service plane IP addresses of the active and standby management nodes.  
If the network is abnormal, go to **3**.  
If the network is normal, go to **2**.
2. Check the network connectivity between the IP address of the active management node and the IP address of the abnormal node in the cluster.
3. If the network is disconnected, contact O&M personnel to rectify the network fault to ensure that the network meets service requirements.

## Host Status

**Indicator:** host status

**Description:** This indicator is used to check whether the host status is normal. If a node is faulty, the HDFS service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to ALM-12006.

## Checking Alarms

**Indicator:** Checking Alarms

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.8 HDFS Health Check Indicators

### Average Packet Sending Time

**Indicator:** Average Packet Sending Time

**Description:** This indicator is used to collect statistics on the average time for the DataNode in the HDFS to execute SendPacket each time. If the average time is greater than 2,000,000 ns, the DataNode is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high. Check whether the HDFS load in the cluster is high.

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether HDFS service status is normal. If a node is faulty, the HDFS service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the health status of theKrbServer, LdapServer and ZooKeeper services are faulty. If yes, rectify the fault. Then, check whether the file writing failure is caused by HDFS SafeMode ON. Use the client to check whether data cannot be written into HDFS and locate the cause of the HDFS data writing failure. Handle the alarm following instructions in the alarm processing document.

### Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether HDFS alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.9 Hive Health Check Indicators

### Maximum Number of Sessions Allowed by HiveServer

**Indicator:** Maximum number of sessions that can be connected to Hive

**Description:** This indicator is used to check the maximum number of sessions that can be connected to Hive.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

### Number of sessions connected to the HiveServer

**Indicator:** Number of Sessions Connected to HiveServer

**Description:** This indicator is used to check the number of Hive connections.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether Hive service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.10 Kafka Health Check Indicators

### Number of Available Broker Nodes

**Indicator:** Number of Brokers

**Description:** This indicator is used to check the number of available Broker nodes in a cluster. If the number of available Broker nodes in a cluster is less than 2, the cluster is unhealthy.

**Recovery Guide:** If the indicator is abnormal, go to the Kafka service instance page and click the host name of the unavailable Broker instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to the alarm handling suggestions in **Process Fault**. If the status is not **Good**, rectify the fault by referring to the handling procedure of the **Node Fault** alarm.

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether Kafka service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to the alarm "Kafka Service Unavailable".

## Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.11 KrbServer Health Check Indicators

### KerberosAdmin Service Availability

**Indicator:** KerberosAdmin Service Availability

**Description:** The system checks the KerberosAdmin service status. If the check result is abnormal, the KerberosAdmin service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the KerberosAdmin service is located is faulty or the SlapdServer service is unavailable. During the KerberosAdmin service recovery, try the following operations:

1. Check whether the node where the KerberosAdmin service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

### KerberosServer Service Availability

**Indicator:** KerberosServer Service Availability

**Description:** The system checks the KerberosServer service status. If the check result is abnormal, the KerberosServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the KerberosServer service is located is faulty or the SlapdServer service is unavailable. During the KerberosServer service recovery, try the following operations:

1. Check whether the node where the KerberosServer service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

### Service Health Status

**Indicator:** Service Health Status

**Description:** The system checks the KrbServer service status. If the check result is abnormal, the KrbServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the KrbServer service resides is faulty or the LdapServer service is unavailable. For details, see the handling procedure of ALM-25500.

### Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check the alarm information about the KrbServer service. If any alarms exist, the KrbServer service may be abnormal.

**Recovery Guide:** If this indicator check result is abnormal, see the related alarm document to handle the alarms.

## 5.16.12 LdapServer Health Check Indicators

### SlapdServer Service Availability

**Indicator:** SlapdServer Service Availability

**Description:** The system checks the SlapdServer service status. If the status is abnormal, the SlapdServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the SlapdServer service is located is faulty or the SlapdServer process is faulty. During the SlapdServer service recovery, try the following operations:

1. Check whether the node where the SlapdServer service locates is faulty. For details, see ALM-12006.
2. Check whether the SlapdServer process is normal. For details, see ALM-12007.

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check the alarm information about the LdapServer service. If the status is abnormal, the LdapServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the active LdapServer service resides is faulty or the active LdapServer process is faulty. For details, see ALM-25000.

### Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check the alarm information about the LdapServer service. If any alarms exist, the LdapServer service may be abnormal.

**Recovery Guide:** If this indicator check result is abnormal, see the related alarm document to handle the alarms.

## 5.16.13 Loader Health Check Indicators

### ZooKeeper Health Status

**Indicator:** ZooKeeper health status

**Description:** This indicator is used to check whether the ZooKeeper health status is normal. If the status is abnormal, the ZooKeeper service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

### HDFS Health Status

**Indicator:** HDFS health status

**Description:** This indicator is used to check whether the HDFS health status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## DBService Health Status

**Indicator:** DBService Health Status

**Description:** This indicator is used to check whether the DBService health status is normal. If the status is abnormal, the DBService service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Yarn Health Status

**Indicator:** Yarn health status

**Description:** This indicator is used to check whether the Yarn health status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## MapReduce Health Status

**Indicator:** MapReduce Health Status

**Description:** This indicator is used to check whether the MapReduce health status is normal. If the status is abnormal, the MapReduce service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Loader Process Status

**Indicator:** Loader Process Status

**Description:** This indicator is used to check whether the Loader process is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether the Loader service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist for loader. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

### 5.16.14 MapReduce Health Check Indicators

#### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether the MapReduce service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

### 5.16.15 OMS Health Check Indicators

#### OMS Status Check

**Indicator:** OMS Status Check

**Description:** The OMS status check includes the HA status check and resource status check. The HA status includes **active**, **standby**, and **NULL**, indicating the active node, standby node, and unknown, respectively. The resource status includes normal, abnormal, and NULL. If the HA status is NULL, the HA status is unhealthy. If the resource status is NULL or abnormal, the resource status is unhealthy.

**Table 5-54** OMS status description

| Item     | Description                                                                                                                   |
|----------|-------------------------------------------------------------------------------------------------------------------------------|
| HA state | <p><b>active</b> indicates the active node.</p> <p><b>standby</b> indicates the standby node.</p> <p><b>NULL:</b> unknown</p> |

| Item            | Description                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Resource status | <p><b>normal:</b> All resources are normal.</p> <p><b>abnormal:</b> indicates that abnormal resources exist.</p> <p><b>NULL:</b> unknown</p> |

**Recovery Guide:**

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the `/${CONTROLLER_HOME}/sbin/status-oms.sh` command to check the status of OMS.
2. If the HA status is NULL, the system may be restarting. NULL is an intermediate state, and the HA status will automatically change to a normal state.
3. If the resource status is abnormal, certain component resources of FusionInsight Manager are abnormal. Check whether the status of components such as acs, aos cep, controller, feed\_watchdog, fms, gaussDB, httpd, iam, ntp, okerberos, oldap, pms, and tomcat component is normal.
4. If any Manager component resource is abnormal, see Manager component status check to rectify the fault.

**Manager Component Status Check**

**Indicator:** Manager Component Status Check

**Description:** This indicator is used to check the running status and HA status of Manager components. The resource running status includes **Normal** and **Abnormal**, and the resource HA status includes **Normal** and **Exception**. Manager components include Acs, Aos, Cep, Controller, feed\_watchdog, Floatip, Fms, GaussDB, HeartBeatCheck, httpd, IAM, NTP, Okerberos, OLDAP, PMS, and Tomcat. If the running status and HA status is not Normal, the check result is unhealthy.

**Table 5-55** Manager status description

| Item                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Resource running status: | <p><b>Normal:</b> The system is running properly.</p> <p><b>Abnormal:</b> The running is abnormal.</p> <p><b>Stopped:</b> The task is stopped.</p> <p><b>Unknown:</b> The status is unknown.</p> <p><b>Starting:</b> The process is being started.</p> <p><b>Stopping:</b> The task is being stopped.</p> <p><b>Active_normal:</b> The active node is running properly.</p> <p><b>Standby_normal:</b> The standby node is running properly.</p> <p><b>Raising_active:</b> The node is being promoted to be the active node.</p> <p><b>Lowning_standby:</b> The node is being set to be the standby node.</p> <p><b>No_action:</b> the action does not exist.</p> <p><b>Repairing:</b> The disk is being repaired.</p> <p><b>NULL:</b> unknown</p> |
| Resource HA status       | <p><b>Normal</b> the status is normal.</p> <p><b>Exception:</b> indicates a fault.</p> <p><b>Non_steady:</b> indicates the non-steady state.</p> <p><b>Unknown:</b> unknown</p> <p><b>NULL:</b> unknown</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Recovery Guide:**

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **`\${CONTROLLER\_HOME}/sbin/status-oms.sh** command to check the status of OMS.
2. If floatip, okerberos, and oldap are abnormal, see ALM-12002, ALM-12004, and ALM-12005 respectively to resolve the problems.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

If controller resources are abnormal, view **`/var/log/Bigdata/controller/controller.log`** of the faulty node.

If the CEP resource is abnormal, check the **`/var/log/Bigdata/omm/oms/cep/cep.log`** of the abnormal node.

If aos resources are abnormal, view **`/var/log/Bigdata/controller/aos/aos.log`** of the faulty node.

If the feed\_watchdog resource is abnormal, view the **`/var/log/Bigdata/watchdog/watchdog.log`** file on the abnormal node.

If the httpd resource is abnormal, view `/var/log/Bigdata/httpd/error_log` of the abnormal node.

If the fms resource is abnormal, check `/var/log/Bigdata/omm/oms/fms/fms.log` of the abnormal node.

If the pms resource is abnormal, check the `/var/log/Bigdata/omm/oms/pms/pms.log` of the abnormal node.

If the IAM resource is abnormal, view the `/var/log/Bigdata/omm/oms/iam/iam.log` of the abnormal node.

If the gaussDB resource is abnormal, check the `/var/log/Bigdata/omm/oms/db/omm_gaussdba.log` of the abnormal node.

If the NTP resource is abnormal, check the `/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log` of the abnormal node.

If the Tomcat resource is abnormal, check the `/var/log/Bigdata/tomcat/catalina.log` of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## OMA Running Status

**Indicator:** OMA running status

**Description:** This indicator is used to check the running status of the OMA. The status can be **Running** or **Stopped**. If the OMA is **Stopped**, the OMA is unhealthy.

**Recovery Guide:**

1. Log in to the unhealthy node and run the `su - omm` command to switch to user `omm`.
2. Run `${OMA_PATH}/restart_oma_app` to manually start the OMA and check again. If the check result is still unhealthy, go to [3](#).
3. If manually starting the OMA cannot resolve the problem, you are advised to check the OMA logs in `/var/log/Bigdata/omm/oma/omm_agent.log`.
4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## SSH Trust Between Each Node and the Active Management Node

**Indicator:** SSH Trust Between Each Node and the Active Management Node

**Description:** This indicator is used to check whether the SSH mutual trust is normal. If you can switch to another node through SSH from the active OMS node as user `omm` without the need of entering the password, SSH communication is normal. Otherwise, SSH communication is abnormal. In addition, if you can switch to another node through SSH from the active OMS node but fail to switch to the active OMS node from the other nodes, SSH communication is abnormal.

**Recovery Guide:**

1. If the indicator check result is abnormal, the SSH trust relationships between the nodes and the active management node are abnormal. In this case, check whether the permission of the `/home/omm` directory is `omm`. If non-omm users have the directory permission, the SSH trust relationship may be

abnormal. You are advised to run **chown omm:wheel** to modify the permission and check again. If the permission on the **/home/omm** directory is normal, go to [2](#).

2. The SSH trust relationship exception may cause heartbeat exceptions between Controller and NodeAgent, resulting in node fault alarms. In this case, rectify the fault by referring to the handling procedure of ALM-12006.

## Process Running Time

**Indicator:** NodeAgent running time, Controller running time, and Tomcat running time

**Description:** This indicator is used to check the running time of the NodeAgent, Controller, and Tomcat processes. If the time is less than half an hour (1800s), the process may have been restarted. You are advised to check the process after half an hour. If multiple check results indicate that the process runs for less than half an hour, the process is abnormal.

### Recovery Guide:

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the following command to check the PID based on the process name:  
**ps -ef | grep NodeAgent**
3. Run the following command to check the process startup time based on the PID:  
**ps -p pid -o lstart**
4. Check whether the process start time is normal. If the process restarts repeatedly, go to [5](#).
5. View the related logs and analyze restart causes.

If the runtime of NodeAgent is abnormal, check **/var/log/Bigdata/nodeagent/agentlog/agent.log**.

If the Controller running time is abnormal, check the **/var/log/Bigdata/controller/controller.log** file.

If the Tomcat running time is abnormal, check the **/var/log/Bigdata/tomcat/web.log** file.

6. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## Account and Password Expiration Check

**Indicator:** Account and Password Expiration Check

**Description:** This indicator checks the two operating system users **omm** and **ommdba** of MRS. For OS users, both the account and password expiration time must be checked. If the validity period of the account or password is not greater than 15 days, the account is abnormal.

**Recovery Guide:** If the validity period of the account or password is less than or equal to 15 days, contact O&M personnel.

## 5.16.16 Spark Health Check Indicators

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether Spark service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to ALM-28001.

### Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.17 Storm Health Check Indicators

### Number of Working Nodes

**Indicator:** Number of Supervisors

**Description:** This indicator is used to check the number of available Supervisors in a cluster. If the number of available Supervisors in a cluster is less than 1, the cluster is unhealthy.

**Recovery Guide:** If the indicator is abnormal, go to the Streaming service instance page and click the host name of the unavailable Supervisor instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to ALM-12007 Process Faults. If the status is not **Good**, rectify the fault by referring to the handling procedure of the ALM-12006 Node Faults.

### Number of Idle Slots

**Indicator:** Number of Idle Slots

**Description:** This indicator is used to check the number of idle slots in a cluster. If the number of idle slots in a cluster is less than 1, the cluster is unhealthy.

**Recovery Guide:** If the indicator is abnormal, go to the Storm service instance page and check the health status of the Supervisor instance. If the health status of all Supervisor instances is **Good**, you need to expand the capacity of the Core node in the cluster. If not, rectify the fault by referring to ALM-12007 Process Faults.

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether Storm service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to the alarm "ALM-26051 Storm Service Unavailable".

## Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.18 Yarn Health Check Indicators

### Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether Yarn service status is normal. If the number of NodeManager nodes cannot be obtained, the system is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can handle the alarm by referring to the alarm handling guide and make sure that the network is normal.

## Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 5.16.19 ZooKeeper Health Check Indicators

### Average ZooKeeper Request Processing Latency

**Indicator:** Average ZooKeeper Service Request Processing Latency

**Description:** This indicator is used to check the average delay for the ZooKeeper service to process requests. If the average delay is greater than 300 ms, the ZooKeeper service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high.

### ZooKeeper Connections Usage

**Indicator:** ZooKeeper Connection Usage

**Description:** This indicator is used to check whether the ZooKeeper memory usage exceeds 80%. If the usage exceeds the threshold, it is unhealthy.

**Recovery Guide:** If the indicator is abnormal, you are advised to increase the memory available for the ZooKeeper service. The method of increasing the memory is as follows: Increase the value of **-Xmx** in the **GC\_OPTS** configuration item in the ZooKeeper service. After the modification, restart the ZooKeeper service for the configuration to take effect.

## Service Health Status

**Indicator:** Service Health Status

**Description:** This indicator is used to check whether ZooKeeper service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the health status of the KrbServer and LdapServer services is faulty. If yes, rectify the fault. Log in to the ZooKeeper client, check whether the ZooKeeper data writing fails. If yes, find the failure cause based on the error message and handle the fault according to error message. Rectify the fault by following the procedure for handling ALM-13000.

## Checking Alarms

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

# 5.17 Tenant Management

## 5.17.1 Before You Start

This section describes how to manage tenants on the MRS console.

Tenant management operations on the console apply only to clusters of versions earlier than MRS 3.x.

Tenant management operations on FusionInsight Manager apply to all versions. For MRS 3.x and later versions, see [Overview](#). For versions earlier than MRS 3.x, see [Overview](#).

## 5.17.2 Overview

### Definition

An MRS cluster provides various resources and services for multiple organizations, departments, or applications to share. The cluster provides tenants as a logical entity to use these resources and services. A mode involving different tenants is

called multi-tenant mode. Currently, only the analysis cluster supports tenant management.

## Principles

The MRS cluster provides the multi-tenant function. It supports a layered tenant model and allows dynamic adding or deleting of tenants to isolate resources. It dynamically manages and configures tenants' computing and storage resources.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS supports a maximum of 512 tenants. The default tenants created by the system include **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

## Resource Pools

Yarn task queues support only the label-based scheduling policy. This policy enables Yarn task queues to associate NodeManagers that have specific node labels. In this way, Yarn tasks run on specified nodes so that tasks are scheduled and certain hardware resources are utilized. For example, Yarn tasks requiring a large memory capacity can run on nodes with a large memory capacity by means of label association, preventing poor service performance.

In an MRS cluster, the tenant logically divides Yarn cluster nodes to combine multiple NodeManagers into a resource pool. Yarn task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS supports a maximum of 50 resource pools. By default, the system contains a **default** resource pool.

### 5.17.3 Creating a Tenant

#### Scenario

You can create a tenant on MRS Manager to specify the resource usage.

## Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** Click **Create Tenant**. On the page that is displayed, configure tenant properties.

**Table 5-56** Tenant parameters

| Parameter                               | Description                                                                                                                                                                                                                                              |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                                    | Specifies the name of the current tenant. The value consists of 3 to 50 characters, and can contain letters, digits, and underscores (_).                                                                                                                |
| Tenant Type                             | The options include <b>Leaf</b> and <b>Non-leaf</b> . If <b>Leaf</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If <b>Non-leaf</b> is selected, sub-tenants can be added to the current tenant.                    |
| Dynamic Resource                        | Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the tenant name in Yarn. When dynamic resources are not <b>Yarn</b> , the system does not automatically create a task queue. |
| Default Resource Pool Capacity (%)      | Specifies the percentage of the computing resources used by the current tenant in the <b>default</b> resource pool.                                                                                                                                      |
| Default Resource Pool Max. Capacity (%) | Specifies the maximum percentage of the computing resources used by the current tenant in the <b>default</b> resource pool.                                                                                                                              |

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Storage Resource | Specifies storage resources for the current tenant. The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. If storage resources are not <b>HDFS</b> , the system does not create a storage directory under the root directory of HDFS.                                                                                                                                                                                                                                                                                                                                                               |
| Space Quota (MB) | Specifies the quota for HDFS storage space used by the current tenant. The value ranges from <b>1</b> to <b>8796093022208</b> . The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk.<br><b>NOTE</b><br>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b> , the actual space for storing files is about 250 MB (500/2 = 250). |
| Storage Path     | Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for <b>ta1</b> is <b>tenant/ta1</b> . When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.                                                                                                                                                                                                                                                                                                                                                             |
| Service          | Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click <b>Associate Services</b> . In the dialog box that is displayed, set <b>Service</b> to <b>HBase</b> . If <b>Association Mode</b> is set to <b>Exclusive</b> , service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.                                                                                                                                                                                                                                                                                                                                                                                                |
| Description      | Specifies the description of the current tenant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the `Manager_tenant` role and the role corresponding to the tenant to the user. For details, see [Creating a User](#).

----End

## Related Tasks

Viewing an added tenant

**Step 1** On the MRS details page, click **Tenants**.

**Step 2** In the tenant list on the left, click the name of the added tenant.

The **Summary** tab is displayed on the right by default.

**Step 3** View **Basic Information**, **Resource Quota**, and **Statistics** of the tenant.

If HDFS is in the **Stopped** state, **Available** and **Used of Space** in **Resource Quota** are **unknown**.

----End

## 5.17.4 Creating a Sub-tenant

### Scenario

You can create a sub-tenant on MRS if the resources of the current tenant need to be further allocated.

### Prerequisites

- A parent tenant has been added.
- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

**Table 5-57** Sub-tenant parameters

| Parameter                               | Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parent tenant                           | Specifies the name of the parent tenant.                                                                                                                                                                                                                                                                                                                                                                                  |
| Name                                    | Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).                                                                                                                                                                                                                                                                                 |
| Tenant Type                             | The options include <b>Leaf</b> and <b>Non-leaf</b> . If <b>Leaf</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If <b>Non-leaf</b> is selected, sub-tenants can be added to the current tenant.                                                                                                                                                                                     |
| Dynamic Resource                        | Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the sub-tenant name in the Yarn parent queue. When dynamic resources are not <b>Yarn</b> , the system does not automatically create a task queue. If the parent tenant does not have dynamic resources, the sub-tenant cannot use dynamic resources.                                          |
| Default Resource Pool Capacity (%)      | Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant.                                                                                                                                                                                                                                                                                         |
| Default Resource Pool Max. Capacity (%) | Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant.                                                                                                                                                                                                                                                                       |
| Storage Resource                        | Specifies storage resources for the current tenant. The system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. If storage resources are not <b>HDFS</b> , the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources. |

| Parameter        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Space Quota (MB) | <p>Specifies the quota for HDFS storage space used by the current tenant. The minimum value is 1, and the maximum value is the total storage quota of the parent tenant. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the HDFS physical disk. If the quota is greater than the quota of the parent tenant, the actual storage capacity is subject to the quota of the parent tenant.</p> <p><b>NOTE</b><br/>To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b>, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p> |
| Storage Path     | <p>Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>tenant/ta1</b>, the system sets this parameter for the sub-tenant to <b>tenant/ta1/ta1s</b>. The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Service          | <p>Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click <b>Associate Services</b>. In the dialog box that is displayed, set <b>Service</b> to <b>HBase</b>. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Description      | <p>Specifies the description of the current tenant.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- When using this tenant, create a system user and assign the user a related tenant role. For details, see [Creating a User](#).

----End

## 5.17.5 Deleting a Tenant

### Scenario

You can delete a tenant that is not required on MRS.

### Prerequisites

- A tenant has been added.
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.
- The role of the tenant to be deleted cannot be associated with any user or user group. For details about how to cancel the binding between a role and a user, see [Modifying User Information](#).
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

**Step 3** Click **OK**.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

 **NOTE**

- After the tenant is deleted, the task queue of the tenant still exists in Yarn.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

## 5.17.6 Managing a Tenant Directory

### Scenario

You can manage the HDFS storage directory used by a specific tenant on MRS. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

### Prerequisites

- A tenant associated with HDFS storage resources has been added.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

- View a tenant directory.
  - a. On the MRS details page, click **Tenants**.
    - 📖 **NOTE**

For MRS 3.x or later, see [Overview](#).
  - b. In the tenant list on the left, click the target tenant.
  - c. Click the **Resources** tab.
  - d. View the **HDFS Storage** table.
    - The **Maximum Number of Files/Directories** column indicates the quotas for the file and directory quantity of the tenant directory.
    - The **Space Quota** column indicates storage space size of tenant directories.

- Add a tenant directory.
  - a. On the MRS details page, click **Tenants**.
    - 📖 **NOTE**

For MRS 3.x or later, see [Overview](#).
  - b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be added.
  - c. Click the **Resources** tab.
  - d. In the **HDFS Storage** table, click **Create Directory**.

- Set **Path** to a tenant directory path.

#### 📖 NOTE

- If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
- If the current tenant is a sub-tenant, the new path is created in the specified directory.

A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (\_). The name cannot start or end with a space.

- Set **Maximum Number of Files/Directories** to the quotas of file and directory quantity.

**Maximum Number of Files/Directories** is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 **NOTE**

To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ( $500/2 = 250$ ).

- e. Click **OK**. The system creates tenant directories in the HDFS root directory.
- Modify a tenant directory.
    - a. On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

- b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be modified.
- c. Click the **Resources** tab.
- d. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

- Set **Maximum Number of Files/Directories** to the quotas of file and directory quantity.

**Maximum Number of Files/Directories** is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 **NOTE**

To ensure data reliability, one backup is automatically generated for each file saved in HDFS, that is, two copies are generated in total. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ( $500/2 = 250$ ).

- e. Click **OK**.
- Delete a tenant directory.
    - a. On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

- b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be deleted.
- c. Click the **Resources** tab.
- d. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.  
The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.
- e. Click **OK**. The tenant directory is deleted.

## 5.17.7 Restoring Tenant Data

### Scenario

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** In the tenant list on the left, click a tenant node.

**Step 3** Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the left of **Basic Information**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.
4. If any check result is abnormal, go to [Step 4](#) to restore tenant data.

**Step 4** Click **Restore Tenant Data**.

**Step 5** In the **Restore Tenant Data** window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

## 5.17.8 Creating a Resource Pool

### Scenario

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS and add hosts that have not been added to other customized resource pools to it.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Pools** tab.

**Step 3** Click **Create Resource Pool**.

**Step 4** In **Create Resource Pool**, set the properties of the resource pool.

- **Name:** Enter a name for the resource pool. The name of the newly created resource pool cannot be **default**.  
The name consists of 1 to 20 characters and can contain digits, letters, and underscores (\_) but cannot start with an underscore (\_).
- **Available Hosts:** In the host list on the left, select a specified host name and add it to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

**Step 5** Click **OK**.

**Step 6** After a resource pool is created, users can view the **Name**, **Members**, **Type**, **vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **default** resource pool.

----End

## 5.17.9 Modifying a Resource Pool

### Scenario

You can modify members of an existing resource pool on MRS.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Pools** tab.

**Step 3** Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

**Step 4** In **Modify Resource Pool**, modify **Added Hosts**.

- Adding a host: In the host list on the left, select the specified host name and add it to the resource pool.
- Deleting a host: In the host list on the right, click  next to a host to remove the host from the resource pool. The host list of a resource pool can be left blank.

**Step 5** Click **OK**.

----End

## 5.17.10 Deleting a Resource Pool

### Scenario

You can delete an existing resource pool on MRS.

### Prerequisites

- Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see [Configuring a Queue](#).
- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see [Clearing Configuration of a Queue](#).
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

**Step 1** On the MRS details page, click **Tenant**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Pools** tab.

**Step 3** Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

In the displayed dialog box, click **OK**.

----End

## 5.17.11 Configuring a Queue

### Scenario

You can modify the queue configuration of a specified tenant on MRS based on service requirements.

### Prerequisites

- A tenant associated with Yarn and allocated dynamic resources has been added.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Queue Configuration** tab.

**Step 3** In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

 **NOTE**

- In the tenant list on the left of the **Tenant Management** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click  to open the queue modification page.
- A queue can be bound to only one non-default resource pool.

Versions earlier than MRS 3.x:

**Table 5-58** Queue configuration parameters

| Parameter                                             | Description                                                                                                                                                                                                                                                         |
|-------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maximum Applications                                  | Specifies the maximum number of applications. The value ranges from 1 to 2147483647.                                                                                                                                                                                |
| Maximum AM Resource Percent                           | Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. The value ranges from 0 to 1.                                                                                                                             |
| Minimum User Limit Percent (%)                        | Specifies the minimum percentage of resources consumed by a user. The value ranges from 0 to 100.                                                                                                                                                                   |
| User Limit Factor                                     | Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster. The minimum value is <b>0</b> . |
| Status                                                | Specifies the current status of a resource plan. The values are <b>Running</b> and <b>Stopped</b> .                                                                                                                                                                 |
| Default Resource Pool (Default Node Label Expression) | Specifies the resource pool used by a queue. The default value is <b>Default</b> . If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a> .         |

MRS 3.x or later:

**Table 5-59** Queue configuration parameters

| Parameter                 | Description                                                                                                                                                                                                              |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Master Shares (%)     | Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.                                                                                                                   |
| Max Allocated vCores      | Indicates the maximum number of cores that can be allocated to a single YARN container in the current queue. The default value is <b>-1</b> , indicating that the number of cores is not limited within the value range. |
| Max Allocated Memory (MB) | Indicates the maximum memory that can be allocated to a single Yarn container in the current queue. The default value is <b>-1</b> , indicating that the memory is not limited within the value range.                   |

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max Running Apps          | Maximum number of tasks that can be executed at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value 0 indicates that the task cannot be executed. The value ranges from -1 to 2147483647.       |
| Max Running Apps per User | Maximum number of tasks that can be executed by each user in the current queue at the same time. The default value is <b>-1</b> , indicating that the number is not limited within the value range. If the value is <b>0</b> , the task cannot be executed. The value ranges from -1 to 2147483647.                                          |
| Max Pending Apps          | Maximum number of tasks that can be suspended at the same time in the current queue. The default value is <b>-1</b> , indicating that the number is not limited within the value range (the meaning is the same if the value is empty). The value <b>0</b> indicates that tasks cannot be suspended. The value ranges from -1 to 2147483647. |
| Resource Allocation Rule  | Indicates the rule for allocating resources to different tasks of a user. The rule can be FIFO or FAIR.<br>If a user submits multiple tasks in the current queue and the rule is FIFO, the tasks are executed one by one in sequential order. If the rule is FAIR, resources are evenly allocated to all tasks.                              |
| Default Resource Label    | Indicates that tasks are executed on a node with a specified resource label.<br><b>NOTE</b><br>If you need to use a new resource pool, change the default label to the new resource pool label.                                                                                                                                              |
| Active                    | <ul style="list-style-type: none"> <li>● <b>ACTIVE</b>: indicates that the current queue can receive and execute tasks.</li> <li>● <b>INACTIVE</b>: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.</li> </ul>                                                            |
| Open                      | <ul style="list-style-type: none"> <li>● <b>OPEN</b>: indicates that the current queue is opened.</li> <li>● <b>CLOSED</b>: indicates that the current queue is closed. Tasks submitted to the queue are rejected.</li> </ul>                                                                                                                |

----End

## 5.17.12 Configuring the Queue Capacity Policy of a Resource Pool

### Scenario

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS.

### Prerequisites

- A resource pool has been added.
- The task queues are not associated with other resource pools. By default, all queues are associated with the **Default** resource pool.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Distribution Policies** tab.

**Step 3** In **Resource Pools**, select a specified resource pool.

**Available Resource Quota:** indicates that all resources in each resource pool are available for queues by default.

**Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

**Step 5** In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

**Step 6** Click **OK** to save the settings.

----End

## 5.17.13 Clearing Configuration of a Queue

### Scenario

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

### Prerequisites

- If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see [Configuring a Queue](#).
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the MRS details page, click **Tenants**.

 **NOTE**

For MRS 3.x or later, see [Overview](#).

**Step 2** Click the **Resource Distribution Policies** tab.

**Step 3** In **Resource Pools**, select a specified resource pool.

**Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column

In the **Clear Queue Configuration** dialog box, click **OK** to clear the queue configuration in the current resource pool.

 **NOTE**

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

## 5.18 Backup and Restoration

### 5.18.1 Before You Start

This section describes how to back up and restore data on the MRS console.

Backup and restoration operations on the console apply only to clusters of **MRS 3.x** or earlier.

Backup and restore operations on Manager apply to all versions. For MRS 3.x and later versions, see [Introduction](#). For versions earlier than MRS 3.x, see [Introduction](#).

## 5.18.2 Introduction

### Overview

MRS provides backup and restoration for user data and system data. The backup function is provided based on components to back up Manager data (including OMS data and LdapServer data), Hive user data, component metadata saved in DBService, and HDFS metadata.

Backup is used in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- If the system is faulty, the data backup can be used to recover the system.
- If the active cluster is completely faulty, an image cluster identical to the active cluster needs to be created. You can use the backup data to restore the active cluster.

**Table 5-60** Backing up metadata

| Backup Type | Backup Content                                                                                            |
|-------------|-----------------------------------------------------------------------------------------------------------|
| OMS         | Database data (excluding alarm data) and configuration data in the cluster management system (by default) |
| LdapServer  | User information (about usernames, passwords, keys, password policies, and user groups)                   |
| DBService   | Metadata of the components (Hive) managed by DBService                                                    |
| NameNode    | HDFS metadata                                                                                             |

### Principles

#### Task

Before backup or restoration, you need to create a backup or restoration task and set task parameters, such as the task name, backup data source, and type of backup file save path. Data backup and restoration can be performed by executing backup and restoration tasks. When MRS is used to recover the data of HDFS, HBase, Hive, and NameNode, no cluster can be accessed.

Each backup task can back up data of different data sources and generates an independent backup file for each data source. All the backup files generated in each backup task form a backup file set, which can be used in restoration tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS. The backup task provides the full backup or incremental backup policies. HDFS and Hive backup tasks support the incremental backup policy, while OMS, LdapServer, DBService, and NameNode backup tasks support only the full backup policy.

 **NOTE**

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started, either.
- The interval at which a periodical task is automatically executed must be greater than 120s; otherwise, the task is postponed and executed in the next period. Manual tasks can be executed at any interval.
- When a period task is to be automatically executed, the current time cannot be 120s later than the task start time; otherwise, the task is postponed and executed in the next period.
- When a periodical task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, LdapServer, DBService, or NameNode backup task starts, ensure that the LocalBackup partition on the active management node has more than 20 GB available space. Otherwise, the backup task cannot be started.
- When you are planning backup and restoration tasks, select the data to be backed up or restored strictly based on the service logic, data store structure, and database or table association. The system creates a default periodic backup task **default** whose execution interval is 24 hours to perform full backup of OMS, LdapServer, DBService, and NameNode data to the Linux local disk.

## Specifications

**Table 5-61** Backup and restoration feature specifications

| Item                                                    | Specifications |
|---------------------------------------------------------|----------------|
| Maximum number of backup or restoration tasks           | 100            |
| Number of concurrent running tasks                      | 1              |
| Maximum number of waiting tasks                         | 199            |
| Maximum size of backup files on a Linux local disk (GB) | 600            |

**Table 5-62** Specifications of the **default** task

| Item                          | OMS    | LdapServer | DBService | NameNode |
|-------------------------------|--------|------------|-----------|----------|
| Backup period                 | 1 hour |            |           |          |
| Maximum number of copies      | 2      |            |           |          |
| Maximum size of a backup file | 10 MB  | 20 MB      | 100 MB    | 1.5 GB   |

| Item                            | OMS                                                                      | LdapServer | DBService | NameNode |
|---------------------------------|--------------------------------------------------------------------------|------------|-----------|----------|
| Maximum size of disk space used | 20 MB                                                                    | 40 MB      | 200 MB    | 3 GB     |
| Save path of backup data        | <i>Save path/LocalBackup/</i> of the active and standby management nodes |            |           |          |

 NOTE

The backup data of the **default** task must be periodically transferred and saved outside the cluster based on the enterprise O&M requirements.

## 5.18.3 Backing Up Metadata

### Scenario

To ensure metadata security or before and after a critical operation (such as scale-out/scale-in, patch installation, upgrade, or migration) on the metadata, you need to back up the metadata. The backup data can be used to recover the system in time if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services. Metadata includes data of OMS, LdapServer, DBService, and NameNode. MRS Manager data to be backed up includes OMS data and LdapServer data.

By default, metadata backup is supported by the **default** task. This section describes how to create a backup task and back up metadata on MRS. You can back up data both automatically or manually.

### Prerequisites

- A standby cluster for backing up data has been created, and the network is normal. For the security group of each cluster, you need to add inbound rules of the security group of the peer cluster to allow access requests from all ECSs in the security group using all protocols and ports.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

#### Step 1 Create a backup task.

1. On the cluster details page, click **Backups & Restorations**.

 NOTE

For MRS 3.x, see [Backing Up Data](#).

2. On the **Backups** tab page, click **Create Backup Task**.

**Step 2** Configure a backup policy.

1. Set **Task Name** to the name of the backup task.
2. Set **Backup Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started**: indicates the time when the task is started for the first time.
- **Period**: indicates the task execution interval. The options include **By hour** and **By day**.
- **Backup Policy**: indicates the volume of data to be backed up in each task execution. Supports **Full backup at the first time and incremental backup later**, **Full backup every time**, and **Full backup once every n times**. If you select **Full backup once every n times**, you need to specify the value of **n**.

**Step 3** Select backup sources.

In the **Configuration** area, select the metadata type, such as **OMS** and **LdapServer**.

**Step 4** Set backup parameters.

1. Set **Path Type** of **OMS** and **LdapServer** to the backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*. If you select **LocalDir**, you need to set the maximum number of copies to specify the number of backup files that can be retained in the backup directory.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **LocalHDFS**, set the following parameters:
  - **Target Path**: indicates the HDFS directory for storing the backup files. The save path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory.
  - **Max Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Target Instance Name**: indicates the NameService name of the backup directory. The default value is **hacluster**.

2. Click **OK**.

**Step 5** Execute a backup task. In the **Operation** column of the created task in the backup task list, perform the following operations:

- If **Backup Type** is set to **Periodic**, click **Back Up Now**.
- If **Backup Type** is set to **Manual**, click **Start** to start the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name

is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 5.18.4 Restoring Metadata

### Scenario

Metadata needs to be recovered in the following scenarios:

- Data is modified or deleted unexpectedly and needs to be restored.
- After a critical operation (such as an upgrade or critical data adjustment) is performed on metadata components, an exception occurs or the operation does not achieve the expected result. All modules are faulty and become unavailable.
- Data is migrated to a new cluster.

You can create a metadata restoration task on MRS. The restoration tasks can be created manually only.

---

#### NOTICE

- Data restoration can be performed only when the system version during data backup is consistent with the current system version.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the data that is generated after the data backup and before the data restoration will be lost.
  - Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail.
  - By default, MRS clusters use DBService to store Hive metadata.
- 

### Impact on the System

- Data generated between the backup time and restoration time is lost after data restoration.
- After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.

### Prerequisites

- You have checked whether the data in the OMS and LdapServer backup files is backed up at the same time.
- You have checked whether the status of the OMS resource and the LdapServer instance is normal. If the status is abnormal, data restoration cannot be performed.
- You have checked whether the status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.

- You have checked whether the cluster host topologies during data restoration and data backup are the same. If they are different, data restoration cannot be performed and you need to back up data again.
- You have checked the services added to the cluster during data restoration and data backup are the same. If they are different, data restoration cannot be performed and you need to back up data again.
- You have checked whether the status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- You have stopped the upper-layer applications depending on the cluster.
- On MRS console, you have stopped all the NameNode role instances whose data is to be recovered. Other HDFS role instances must be running properly. After data is recovered, the NameNode role instances need to be restarted. The NameNode role instances cannot be accessed before the restart.
- Check whether NameNode backup files are stored in *Data storage path/LocalBackup/* on the active management node.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

## Procedure

### Step 1 Check the location of backup data.

1. On the cluster details page, choose **Backups & Restorations > Backups**.

#### NOTE

For MRS 3.x, see [Recovering Data](#).

2. In the row where the specified backup task resides, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task. In the displayed window, locate a specified success backup record. In the **Operation** column, click **View Backup Path** to open the task execution logs. Find the following information and view the path:
  - **Backup Object**: indicates a backup data source.
  - **Backup Path**: indicates the full path where the backup files are stored.
3. Select the correct path, and manually copy the full path of backup files in **Backup Path**.

### Step 2 Create a restoration task.

1. On the cluster details page, choose **Backups & Restorations > Restorations**.

#### NOTE

For MRS 3.x, see [Recovering Data](#).

2. On the page that is displayed, click **Create Restoration Task**.
3. Set **Task Name** to the name of the restoration task.

### Step 3 Select restoration sources.

In the **Configuration** area, select the metadata component whose data is to be restored.

**Step 4** Set the restoration parameters.

1. Set **Path Type** to a backup directory type.
2. The settings vary according to backup directory types:
  - **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select **LocalDir**, you need to set **Source Path** to specify the full path of the backup file. For example, *Data storage path/LocalBackup/Backup task name\_Task creation time/Data source\_Task execution time/Version number\_Data source\_Task execution time.tar.gz*.
  - **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **LocalHDFS**, set the following parameters:
    - **Source Path**: indicates the full HDFS path of a backup file, for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
    - **Source Instance Name**: indicates the name of NameService corresponding to the backup directory when a restoration task is being executed. The default value is **hacluster**.
3. Click **OK**.

**Step 5** Execute the restoration task.

In the restoration task list, locate the row where the created task resides, and click **Start** in the **Operation** column.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and try to execute the task again by clicking **Start**.

**Step 6** If the following metadata type is restored, perform the corresponding operations:

- If the OMS and LdapServer metadata is restored, go to [Step 7](#).
- If DBService data is restored, no further action is required.
- If NameNode data is restored, choose **Components > HDFS > More > Restart Service** on the MRS cluster details page. No further action is required.

**Step 7** Restart the service for the recovered data to take effect

1. On the MRS cluster details page, click **Components**.
2. Choose **LdapServer > More > Restart Service** and click **OK**. Wait until the LdapServer service is restarted successfully.
3. Log in to the active management node. For details, see [Determining Active and Standby Management Nodes of Manager](#).
4. Run the following command to restart the OMS:

```
sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh
```

The command has been executed successfully if the following information is displayed:

```
start HA successfully.
```

5. On the cluster details page, click **Components**, choose **KrbServer > More > Synchronize Configuration**. Deselect **Restart the services and instances whose configurations have expired**. Click **Yes** and wait until the KrbServer service configuration is synchronized and restarted successfully.
6. On the cluster details page, choose **Configuration > Synchronize Configuration** in the upper right corner, deselect **Restart the service or instance whose configurations have expired**, and click **Yes**. Wait until the cluster configuration is synchronized successfully.
7. On the cluster details page, choose **Management Operations > Stop All Components** in the upper right corner. After the cluster is stopped, choose **Management Operations > Start All Components**, and wait for the cluster to start.

----End

## 5.18.5 Modifying Backup Tasks

### Scenario

You can modify the parameters of a created backup task on MRS to meet changing service requirements. The parameters of restoration tasks can only be viewed but cannot be modified.

### Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

### Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.
- You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the cluster details page, choose **Backups & Restorations > Backups**.

 **NOTE**

For MRS 3.x, see [Modifying a Backup Task](#).

**Step 2** In the task list, locate a specified task, click **Modify** in the **Operation** column to go to the configuration modification page.

**Step 3** Modify task parameters on the page that is displayed.

- The following parameters can be modified for manual backup:
  - Target Path
  - Max Number of Backup Copies
- The following parameters can be modified for periodic backup:

- Started
- Period
- Target Path
- Max Number of Backup Copies

 **NOTE**

- When **Path Type** is set to **LocalHDFS**, **Target Path** is valid for modifying a backup task.
- After you change the value of **Target Path** for a backup task, full backup is performed by default when the task is executed for the first time.

**Step 4** Click **OK**.

----End

## 5.18.6 Viewing Backup and Restoration Tasks

### Scenario

You can view created backup and restoration tasks and check their running status on the MRS console.

### Prerequisites

You have synchronized IAM users (on the **Dashboard** tab page, click **Click to synchronize** on the right side of **IAM User Sync** to synchronize IAM users).

### Procedure

**Step 1** On the cluster details page, click **Backups & Restorations**.

 **NOTE**

For MRS 3.x, see [Viewing Backup and Recovery Tasks](#).

**Step 2** Click **Backups** or **Restorations**.

**Step 3** In the task list, obtain the previous execution result in the **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

**Step 4** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical record of backup and restoration execution.

In the displayed window, click **View Details** in the **Operation** column. The task execution logs and paths are displayed.

----End

### Related Tasks

- Modifying Backup Tasks  
For details, see [Modifying Backup Tasks](#).
- Viewing Restoration Tasks

In the **Operation** column of the specified task in the task list, click **View Details** to view the restoration task. You can only view but cannot modify the parameters of a restoration task.

- Executing Backup and Restoration Tasks

In the task list, locate a specified task and click **Start** in the **Operation** column to start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.

- Stopping a Backup Task

In the task list, locate a specified task and click **More > Stop** in the **Operation** column to stop a backup task that is running.

- Deleting Backup and Restoration Tasks

In the **Operation** column of the specified task in the task list, choose **More > Delete** to delete the backup and restoration tasks. After a task is deleted, the backup data is retained by default.

- Suspending a Backup Task

In the **Operation** column of the specified task in the task list, choose **More > Suspend** to suspend the backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To cancel the suspension status of a task, click **More > Resume**.

## 5.19 MRS Multi-User Permission Management

### 5.19.1 Users and Permissions of MRS Clusters

#### Overview

- **MRS Cluster Users**

Indicate the security accounts of Manager, including usernames and passwords. These accounts are used to access resources in MRS clusters. Each MRS cluster in which Kerberos authentication is enabled can have multiple users.

- **MRS Cluster Roles**

Before using resources in an MRS cluster, users must obtain the access permission which is defined by MRS cluster objects. A cluster role is a set of one or more permissions. For example, the permission to access a directory in HDFS needs to be configured in the specified directory and saved in a role.

Manager provides the user permission management function for MRS clusters, facilitating permission and user management.

- Permission management: adopts the role-based access control (RBAC) mode. In this mode, permissions are granted by role to form a permission set. After one or more roles are allocated to a user, the user can obtain the permissions of the roles.
- User management: uses MRS Manager to uniformly manage users, adopts the Kerberos protocol for user identity verification, and employs Lightweight Directory Access Protocol (LDAP) to store user information.

## Permission Management

Permissions provided by MRS clusters include the O&M permissions of Manager and components (such as HDFS, HBase, Hive, and Yarn). In actual application, permissions must be assigned to each user based on service scenarios. To facilitate permission management, Manager introduces the role function to allow administrators to select and assign specified permissions. Permissions are centrally viewed and managed in permission sets, enhancing user experience.

A role is a logical entity that contains one or more permissions. Permissions are assigned to roles, and users can be granted the permissions by obtaining the roles.

A role can have multiple permissions, and a user can be bound to multiple roles.

- Role 1: is assigned operation permissions A and B. After role 1 is allocated to users a and b, users a and b can obtain operation permissions A and B.
- Role 2: is assigned operation permission C. After role 2 is allocated to users c and d, users c and d can obtain operation permission C.
- Role 3: is assigned operation permissions D and F. After role 3 is allocated to user a, user a can obtain operation permissions D and F.

For example, if an MRS user is bound to the cluster administrator role, the user becomes an administrator of the MRS cluster.

**Table 5-63** lists the roles that are created by default on Manager.

**Table 5-63** Default roles and description

| Default Role          | Description                                                                                                                     |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------|
| default               | Tenant role                                                                                                                     |
| Manager_administrator | Manager administrator: This role has the permission to manage MRS Manager.                                                      |
| Manager_auditor       | Manager auditor: This role has the permission to view and manage auditing information.                                          |
| Manager_operator      | Manager operator: This role has all permissions except tenant, configuration, and cluster management permissions.               |
| Manager_viewer        | Manager viewer: This role has the permission to view the information about systems, services, hosts, alarms, and auditing logs. |
| System_administrator  | System administrator: This role has the permissions of Manager administrators and all service administrators.                   |
| Manager_tenant        | Manager tenant viewer: This role has the permission to view information on the <b>Tenant</b> page on MRS Manager.               |

When creating a role on Manager, you can perform rights management for Manager and components, as shown in **Table 5-64**.

**Table 5-64** Manager and component permission management

| Permission | Description                                                                                                                                                                                                                               |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Manager    | Manager access and login permission.                                                                                                                                                                                                      |
| HBase      | HBase administrator permission and permission for accessing HBase tables and column families.                                                                                                                                             |
| HDFS       | HDFS directory and file permission.                                                                                                                                                                                                       |
| Hive       | <ul style="list-style-type: none"> <li>• Hive Admin Privilege<br/>Hive administrator permission.</li> <li>• Hive Read Write Privileges<br/>Hive data table management permission to set and manage the data of created tables.</li> </ul> |
| Hue        | Storage policy administrator permissions.                                                                                                                                                                                                 |
| Yarn       | <ul style="list-style-type: none"> <li>• Cluster Admin Operations<br/>Yarn administrator permission.</li> <li>• Scheduler Queue<br/>Queue resource management permission.</li> </ul>                                                      |

## User Management

MRS clusters that support Kerberos authentication use the Kerberos protocol and LDAP for user management.

- Kerberos verifies the identity of the user when a user logs in to Manager or uses a component client. Identity verification is not required for clusters with Kerberos authentication disabled.
- LDAP is used to store user information, including user records, user group information, and permission information.

MRS clusters can automatically update Kerberos and LDAP user data when users are created or modified on Manager. They can also automatically perform user identity verification and authentication and obtain user information when a user logs in to Manager or uses a component client. This ensures the security of user management and simplifies the user management tasks. Manager also provides the user group function for managing one or multiple users by type:

- A user group is a set of users, which can be used to manage users by type. Users in the system can exist independently or in a user group.
- After a user is added to a user group to which roles are allocated, the role permission of the user group is assigned to the user.

**Table 5-65** lists the user groups that are created by default on MRS Manager in MRS 3.x or earlier.

For details about the default user groups displayed on FusionInsight Manager of MRS 3.x or later, see [User group](#).

**Table 5-65** Default user groups and description

| User Group     | Description                                                                                                                                                                       |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hadoop         | Users added to this user group have the permission to submit tasks to all Yarn queues.                                                                                            |
| hbase          | Common user group. Users added to this user group will not have any additional permission.                                                                                        |
| hive           | Users added to this user group can use Hive.                                                                                                                                      |
| spark          | Common user group. Users added to this user group will not have any additional permission.                                                                                        |
| supergroup     | Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.                                                                   |
| flume          | Common user group. Users added to this user group will not have any additional permission.                                                                                        |
| kafka          | Kafka common user group. Users added to this group need to be granted with read and write permission by users in the <b>kafkaadmin</b> group before accessing the desired topics. |
| kafkasuperuser | Users added to this group have permissions to read data from and write data to all topics.                                                                                        |
| kafkaadmin     | Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.                        |
| storm          | Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.                                                     |
| stormadmin     | Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.                                              |

User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

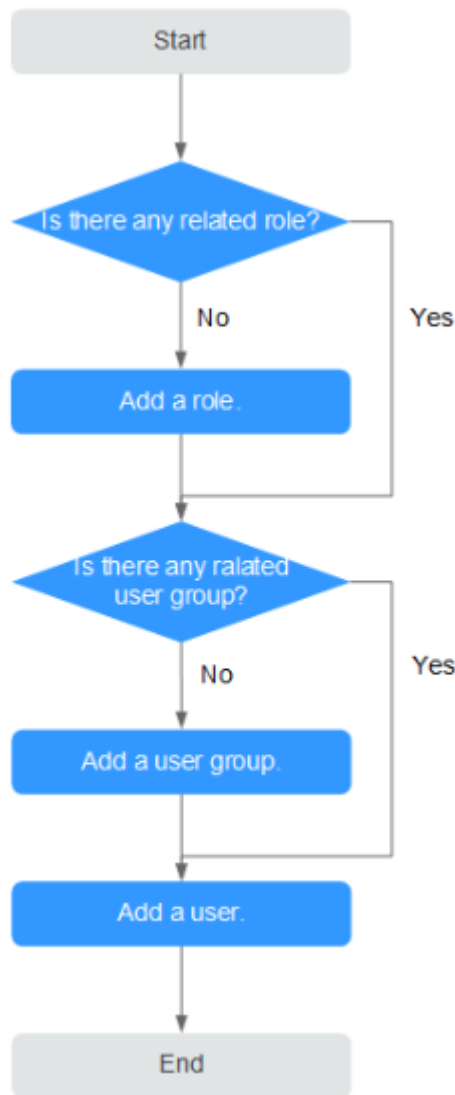

## Process Overview

In practice, MRS cluster users must understand the service scenarios of big data and plan user permissions. Then, create roles and assign permissions to the roles on MRS Manager to meet service requirements. Manager provides the user group function for MRS cluster administrators to create user groups for managing users of one or multiple service scenarios of the same type.

**NOTE**

If a role has the permission of HDFS, HBase, Hive, or Yarn respectively, the role can only use the corresponding functions of the component. To use Manager, the corresponding Manager permission must be added to the role.

**Figure 5-3** Process of creating a user

## 5.19.2 Default Users of Clusters with Kerberos Authentication Enabled

### User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

| User Type            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System user          | <ul style="list-style-type: none"> <li>• User created on Manager for MRS cluster O&amp;M and service scenarios. There are two types of users:                             <ul style="list-style-type: none"> <li>– <b>Human-machine</b> user: used for Manager O&amp;M scenarios and component client operation scenarios.</li> <li>– <b>Machine-machine</b> user: used for MRS cluster application development scenarios.</li> </ul> </li> <li>• User who runs OMS processes.</li> </ul> |
| Internal system user | Internal user who performs process communications, saves user group information, and associates user permissions.                                                                                                                                                                                                                                                                                                                                                                         |
| Database user        | <ul style="list-style-type: none"> <li>• User who manages OMS database and accesses data.</li> <li>• User who runs the database of service components (Hive, Hue, Loader, and DBService)</li> </ul>                                                                                                                                                                                                                                                                                       |

## System User

 NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

| Type                                    | Username | Initial Password                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------|----------|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System administrator of the MRS cluster | admin    | Specified by the user during the cluster creation. | <p>Manager administrator with the following permissions:</p> <ul style="list-style-type: none"> <li>• Common HDFS and ZooKeeper user permissions.</li> <li>• Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI.</li> <li>• Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service.</li> <li>• Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.</li> </ul> |
| MRS cluster node OS user                | omm      | Randomly generated by the system.                  | Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password.                                                                                                                                                                                                                                                                                                                                                                                                             |
| MRS cluster node OS user                | root     | Set by the user.                                   | User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Internal System Users

### NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

| Type                   | Default User | Initial Password | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|      | hbase        | Hbase@123        | <p>This user is the HBase system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Cluster management permission: <b>Enable</b> and <b>Disable</b> operations on tables to trigger MajorCompact and ACL operations.</li> <li>• Grants and revokes permissions, and shuts down the cluster.</li> <li>• Table management permission: Creates, modifies, and deletes tables.</li> <li>• Data management permission: Reads and writes data in tables, column families, and columns.</li> <li>• Accesses the HBase web UI.</li> </ul> |
|      | mapred       | Mapred@123       | <p>This user is the MapReduce system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Submits, stops, and views the MapReduce tasks.</li> <li>• Modifies the Yarn configuration parameters.</li> <li>• Accesses the Yarn and MapReduce web UI.</li> </ul>                                                                                                                                                                                                                                                                       |
|      | spark        | Spark@123        | <p>This user is the Spark system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Accesses the Spark web UI.</li> <li>• Submits Spark tasks.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |

## User Group Information

| Default User Group    | Description                                                                                                                                                                                                                    |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hadoop                | Users added to this user group have the permission to submit tasks to all Yarn queues.                                                                                                                                         |
| hbase                 | Common user group. Users added to this user group will not have any additional permission.                                                                                                                                     |
| hive                  | Users added to this user group can use Hive.                                                                                                                                                                                   |
| spark                 | Common user group. Users added to this user group will not have any additional permission.                                                                                                                                     |
| supergroup            | Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.                                                                                                                |
| check_sec_ldap        | Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components. |
| Manager_tenant        | Tenant system user group, which is an internal system user group used only between components.                                                                                                                                 |
| System_administrator  | MRS cluster system administrator group, which is an internal system user group used only between components.                                                                                                                   |
| Manager_viewer        | MRS Manager system viewer group, which is an internal system user group used only between components.                                                                                                                          |
| Manager_operator      | MRS Manager system operator group, which is an internal system user group used only between components.                                                                                                                        |
| Manager_auditor       | MRS Manager system auditor group, which is an internal system user group used only between components.                                                                                                                         |
| Manager_administrator | MRS Manager system administrator group, which is an internal system user group used only between components.                                                                                                                   |
| compcommon            | Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default.                                                                          |
| default_1000          | User group created for tenants, which is an internal system user group used only between components.                                                                                                                           |

| Default User Group | Description                                                                                                                                                                       |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| kafka              | Kafka common user group. Users added to this group need to be granted with read and write permission by users in the <b>kafkaadmin</b> group before accessing the desired topics. |
| kafkasuperuser     | Users added to this group have permissions to read data from and write data to all topics.                                                                                        |
| kafkaadmin         | Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.                        |
| storm              | Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.                                                     |
| stormadmin         | Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.                                              |
| opentsdb           | Common user group. Users added to this user group will not have any additional permission.                                                                                        |
| presto             | Common user group. Users added to this user group will not have any additional permission.                                                                                        |
| flume              | Common user group. Users added to this user group will not have any additional permission.                                                                                        |
| launcher-job       | MRS internal group, which is used to submit jobs using V2 APIs.                                                                                                                   |

| OS User Group | Description                                                                                                                         |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------|
| wheel         | Primary group of MRS internal running user <b>omm</b> .                                                                             |
| ficommon      | MRS cluster common group that corresponds to <b>compcommon</b> for accessing public resource files stored in the OS of the cluster. |

## Database User

MRS cluster system database users include OMS database users and DBService database users.

### NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

| Type               | Default User | Initial Password  | Description                                                                                                            |
|--------------------|--------------|-------------------|------------------------------------------------------------------------------------------------------------------------|
| OMS database       | ommdba       | dbChangeMe@123456 | OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications. |
|                    | omm          | ChangeMe@123456   | User for accessing OMS database data.                                                                                  |
| DBService database | omm          | dbserverAdmin@123 | Administrator of the GaussDB database in the DBService component.                                                      |
|                    | hive         | HiveUser@         | User for Hive to connect to the DBService database.                                                                    |
|                    | hue          | HueUser@123       | User for Hue to connect to the DBService database.                                                                     |
|                    | sqoop        | SqoopUser@        | User for Loader to connect to the DBService database.                                                                  |
|                    | ranger       | RangerUser@       | User for Ranger to connect to the DBService database.                                                                  |

## 5.19.3 Creating a Role

### Scenario

This section describes how to create a role on Manager and authorize and manage Manager and components.

Up to 1000 roles can be created on Manager.

#### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Managing Roles](#).

### Prerequisites

- You have learned service requirements.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

### Procedure

**Step 1** Access MRS Manager. For details, see [Accessing Manager](#).

**Step 2** On MRS Manager, choose **System > Manage Role**.

**Step 3** Click **Create Role** and fill in **Role Name** and **Description**.

**Role Name** is mandatory and contains 3 to 30 characters. Only digits, letters, and underscores (\_) are allowed. **Description** is optional.

**Step 4** In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

 **NOTE**

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click . The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

**Table 5-66** Manager permission description

| Resource Supporting Permission Management | Permission Setting                                                                                                                           |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Alarm</b>                              | Authorizes the Manager alarm function. You can select <b>View</b> to view alarms and <b>Management</b> to manage alarms.                     |
| <b>Audit</b>                              | Authorizes the Manager audit log function. You can select <b>View</b> to view audit logs and <b>Management</b> to manage audit logs.         |
| <b>Dashboard</b>                          | Authorizes the Manager overview function. You can select <b>View</b> to view the cluster overview.                                           |
| <b>Hosts</b>                              | Authorizes the node management function. You can select <b>View</b> to view node information and <b>Management</b> to manage nodes.          |
| <b>Services</b>                           | Authorizes the service management function. You can select <b>View</b> to view service information and <b>Management</b> to manage services. |
| <b>System_cluster_management</b>          | Authorizes the MRS cluster management function. You can select <b>Management</b> to use the MRS patch management function.                   |
| <b>System_configuration</b>               | Authorizes the MRS cluster configuration function. You can select <b>Management</b> to configure MRS clusters on Manager.                    |
| <b>System_task</b>                        | Authorizes the MRS cluster task function. You can select <b>Management</b> to manage periodic tasks of MRS clusters on Manager.              |

| Resource Supporting Permission Management | Permission Setting                                                                                                 |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------|
| <b>Tenant</b>                             | Authorizes the Manager multi-tenant management function. You can select <b>Management</b> to manage multi-tenants. |

**Table 5-67** HBase permission description

| Resource Supporting Permission Management | Permission Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>SUPER_USER_GROUP</b>                   | Grants you HBase administrator permissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Global</b>                             | HBase resource type, indicating the whole HBase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Namespace</b>                          | HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Admin</b> permission to manage the namespace</li> <li>• <b>Create</b>: permission to create HBase tables in the namespace</li> <li>• <b>Read</b>: permission to access the namespace</li> <li>• <b>Write</b>: permission to write data to the namespace</li> <li>• <b>Execute</b>: permission to execute the coprocessor (Endpoint)</li> </ul>      |
| <b>Table</b>                              | HBase resource type, indicating a data table, which is used to store data. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Admin</b>: permission to manage a data table</li> <li>• <b>Create</b>: permission to create column families and columns in a data table</li> <li>• <b>Read</b>: permission to read a data table</li> <li>• <b>Write</b>: permission to write data to a data table</li> <li>• <b>Execute</b>: permission to execute the coprocessor (Endpoint)</li> </ul> |
| <b>ColumnFamily</b>                       | HBase resource type, indicating a column family, which is used to store data. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Create</b>: permission to create columns in a column family</li> <li>• <b>Read</b>: permission to read a column family</li> <li>• <b>Write</b>: permission to write data to a column family</li> </ul>                                                                                                                                                |

| Resource Supporting Permission Management | Permission Setting                                                                                                                                                                                                                                                         |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Qualifier                                 | <p>HBase resource type, indicating a column, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Read:</b> permission to read a column</li> <li>• <b>Write:</b> permission to write data to a column</li> </ul> |

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

**Table 5-68** HDFS permission description

| Resource Supporting Permission Management | Permission Setting                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Folder                                    | <p>HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Read:</b> permission to access the HDFS directory</li> <li>• <b>Write:</b> permission to write data to the HDFS directory</li> <li>• <b>Execute:</b> permission to perform an operation. It must be selected when you add access or write permission.</li> </ul> |
| Files                                     | <p>HDFS resource type, indicating a file in HDFS. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Read:</b> permission to access the file</li> <li>• <b>Write:</b> permission to write data to the file</li> <li>• <b>Execute:</b> permission to perform an operation. It must be selected when you add access or write permission.</li> </ul>                                                                        |

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** for permissions to be added to subdirectories.

**Table 5-69** Hive permission description

| Resource Supporting Permission Management | Permission Setting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hive Admin Privilege</b>               | Grants you Hive administrator permissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Database</b>                           | <p>Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Select:</b> permission to query the Hive database</li> <li>• <b>Delete:</b> permission to perform the deletion operation in the Hive database</li> <li>• <b>Insert:</b> permission to perform the insertion operation in the Hive database</li> <li>• <b>Create:</b> permission to perform the creation operation in the Hive database</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Table</b>                              | <p>Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Select:</b> permission to query the Hive table</li> <li>• <b>Delete:</b> permission to perform the deletion operation in the Hive table</li> <li>• <b>Update:</b> permission to perform the update operation in the Hive table</li> <li>• <b>Insert:</b> permission to perform the insertion operation in the Hive table</li> <li>• <b>Grant of Select:</b> permission to grant the <b>Select</b> permission to other users using Hive statements</li> <li>• <b>Grant of Delete:</b> permission to grant the <b>Delete</b> permission to other users using Hive statements</li> <li>• <b>Grant of Update:</b> permission to grant the <b>Update</b> permission to other users using Hive statements</li> <li>• <b>Grant of Insert:</b> permission to grant the <b>Insert</b> permission to other users using Hive statements</li> </ul> |

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

**Table 5-70** Yarn permission description

| Resource Supporting Permission Management | Permission Setting                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cluster Admin Operations</b>           | Grants you Yarn administrator permissions.                                                                                                                                                                                                                                                                                                |
| <b>root</b>                               | Root queue of Yarn. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Submit</b>: permission to submit jobs in the queue</li> <li>• <b>Admin</b>: permission to manage permissions of the current queue</li> </ul>                                                                                            |
| <b>Parent Queue</b>                       | Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Submit</b>: permission to submit jobs in the queue</li> <li>• <b>Admin</b>: permission to manage permissions of the current queue</li> </ul> |
| <b>Leaf Queue</b>                         | Yarn resource type, indicating a leaf queue. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Submit</b>: permission to submit jobs in the queue</li> <li>• <b>Admin</b>: permission to manage permissions of the current queue</li> </ul>                                                                   |

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

**Table 5-71** Hue permission description

| Resource Supporting Permission Management | Permission Setting                                   |
|-------------------------------------------|------------------------------------------------------|
| <b>Storage Policy Admin</b>               | Grants you storage policy administrator permissions. |

**Step 5** Click **OK**. Return to **Manage Role**.

----End

## Related Tasks

### Modifying a role

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be modified, click **Modify** to modify role information.

 **NOTE**

If you modify permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

- Step 4** Click **OK**. The modification is complete.

----End

### Deleting a role

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be deleted, click **Delete**.
- Step 4** Click **OK**. The role is deleted.

----End

## 5.19.4 Creating a User Group

### Scenario

This section describes how to create user groups and specify their operation permissions on Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Manager supports a maximum of 100 user groups.

 **NOTE**

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Managing User Groups](#).

### Prerequisites

- MRS cluster administrators have learned service requirements and created roles required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

### Procedure

- Step 1** Access MRS Manager. For details, see [Accessing Manager](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User Group**.

**Step 4** Above the user group list, click **Create User Group**.

**Step 5** Input **Group Name** and **Description**.

**Group Name** is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (\_) are allowed. **Description** is optional.

**Step 6** In **Role**, click **Select and Add Role** to select and add specified roles.

If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

**Step 7** Click **OK**.

----End

## Related Tasks

### Modifying a user group

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User Group**.

**Step 3** In the row of a user group to be modified, click **Modify**.

#### NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

**Step 4** Click **OK**. The modification is complete.

----End

### Deleting a user group

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User Group**.

**Step 3** In the row of the user group to be deleted, click **Delete**.

**Step 4** Click **OK**. The user group is deleted.

----End

## 5.19.5 Creating a User

### Scenario

This section describes how to create users on Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1000 users can be created on Manager.

If a new password policy needs to be used for a new user's password, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to create a user.

 **NOTE**

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Creating a User](#).

## Prerequisites

- You have learned service requirements and created roles and role groups required by service scenarios.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

## Procedure

**Step 1** Access MRS Manager. For details, see [Accessing Manager](#).

**Step 2** On MRS Manager, click **System**.

**Step 3** In the **Permission** area, click **Manage User**.

**Step 4** Above the user list, click **Create User**.

**Step 5** Configure parameters as prompted and enter a username in **Username**.

 **NOTE**

- A username that differs only in alphabetic case from an existing username is not allowed. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the exactly correct username, which is case-sensitive.
- **Username** is mandatory and contains 3 to 20 characters. Only digits, letters, and underscores (\_) are allowed.
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

**Step 6** Set **User Type** to either **Human-machine** or **Machine-machine**.

- **Human-machine** user: used for MRS Manager O&M scenarios and component client operation scenarios. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-machine** users: used for MRS application development scenarios. If you select this user type, you do not need to enter a password, because the password is randomly generated.

**Step 7** In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

 **NOTE**

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager\_tenant** role and the role corresponding to the tenant.
- Users created on Manager cannot be added to the user group synchronized using the IAM user synchronization function.

**Step 8** In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

**Step 9** In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on onsite service requirements.

 **NOTE**

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access web UIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

**Step 10** In **Description**, provide description based on onsite service requirements.

**Description** is optional.

**Step 11** Click **OK**.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see [Changing the Password of an Operation User](#).

----End

## 5.19.6 Modifying User Information

### Scenario

This section describes how to modify user information on Manager, including information about the user group, primary group, role, and description.

This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

 **NOTE**

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Modifying User Information](#).

### Procedure

**Step 1** Access MRS Manager. For details, see [Accessing Manager](#).

**Step 2** On MRS Manager, click **System**.

**Step 3** In the **Permission** area, click **Manage User**.

**Step 4** In the row of a user to be modified, click **Modify**.

 **NOTE**

If you change user groups for a user or assign role permissions to a user, it takes 3 minutes to make new configurations take effect.

**Step 5** Click **OK**. The modification is complete.

----End

## 5.19.7 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to Manager or perform security authentication in the cluster. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

A locked user can be used only after being manually unlocked or after the lockout period expires. You can lock a user by using either of the following methods:

- **Automatic lock:** Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see [Modifying a Password Policy](#).
- **Manual lock:** The MRS cluster administrator manually locks a user.

### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Locking a User](#).

The following describes how to manually lock a user. **Machine-machine** users cannot be locked.

## Procedure

**Step 1** Access MRS Manager. For details, see [Accessing Manager](#).

**Step 2** On MRS Manager, click **System**.

**Step 3** In the **Permission** area, click **Manage User**.

**Step 4** In the row of a user you want to lock, click **Lock User**.

**Step 5** In the window that is displayed, click **OK** to lock the user.

----End

## 5.19.8 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked by the MRS cluster administrator, the MRS cluster administrator can unlock the user on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Unlocking a User](#).

## Procedure

- Step 1** Access MRS Manager. For details, see [Accessing Manager](#).
  - Step 2** On MRS Manager, click **System**.
  - Step 3** In the **Permission** area, click **Manage User**.
  - Step 4** In the row of a user to be unlocked, click **Unlock User**.
  - Step 5** In the window that is displayed, click **OK** to unlock the user.
- End

### 5.19.9 Deleting a User

You can delete an MRS cluster user that is not required on MRS Manager. Deleting a user is allowed only in clusters with Kerberos authentication enabled or normal clusters with the EIP function enabled.

#### NOTE

If you want to create a new user with the same name as user A after deleting user A who has submitted a job on the client or MRS console, you need to delete user A's residual folders when deleting user A. Otherwise, the newly created user A may fail to submit a job.

To delete residual folders, log in to each Core node in the MRS cluster and run the following commands. In the following commands, **\$user** indicates the folder named after the username.

```
cd /srv/BigData/hadoop/data1/nm/localdir/usercache/  
rm -rf $user
```

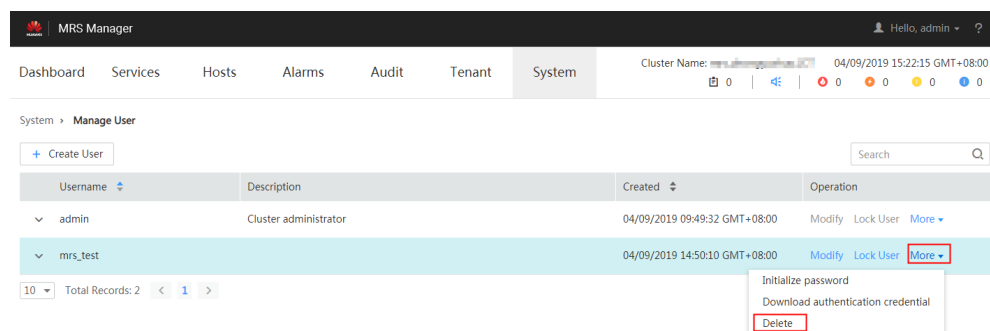

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Deleting a User](#).

## Procedure

- Step 1** Access MRS Manager. For details, see [Accessing Manager](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User**.
- Step 4** In the row that contains the user to be deleted, choose **More > Delete**.

Figure 5-4 Deleting a user

**Step 5** Click **OK**.

----End

## 5.19.10 Changing the Password of an Operation User

### Scenario

Passwords of **Human-machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to modify the password.

#### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Changing a User Password](#).

### Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after modifying the password of the MRS cluster user.

### Prerequisites

- You have obtained the current password policies from the MRS cluster administrator.
- You have obtained the MRS Manager access address from the MRS cluster administrator.
- You have obtained a cluster with Kerberos authentication enabled or a common cluster with the EIP function enabled.

### Procedure

**Step 1** Access MRS Manager. For details, see [Accessing Manager](#).

**Step 2** On MRS Manager, move the mouse cursor to in the upper right corner.

On the menu that is displayed, select **Change Password**.

**Step 3** Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:'",<.>/?').
- The password cannot be the username or the reverse username.

----End

## 5.19.11 Initializing the Password of a System User

### Scenario

This section describes how to initialize a password on Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

#### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Initializing a Password](#).

### Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

### Initializing the Password of a Human-Machine User

**Step 1** Access MRS Manager. For details, see [Accessing Manager](#).

**Step 2** On MRS Manager, click **System**.

**Step 3** In the **Permission** area, click **Manage User**.

**Step 4** Locate the row that contains the user whose password is to be initialized, choose **More > Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current MRS cluster administrator account and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:":',.<.>/?).
- The password cannot be the username or the reverse username.

----End

### Initializing the Password of a Machine-Machine User

**Step 1** Prepare a client based on service conditions and log in to the node with the client installed.

**Step 2** Run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Run the following command to log in to the console as user **kadmin/admin**:

 **NOTE**

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

```
kadmin -p kadmin/admin
```

**Step 6** Run the following command to reset the password of a component running user. This operation takes effect on all servers:

```
cpw Component running user name
```

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|{[];:~",<.>/?').
- The password cannot be the username or the reverse username.

----End

## 5.19.12 Downloading a User Authentication File

### Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a **Machine-machine** user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a **Machine-machine** user authentication file and export the keytab file on Manager. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

 **NOTE**

Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password set. Otherwise, the exported keytab file cannot be used. For details, see [Changing the Password of an Operation User](#).

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Exporting an Authentication Credential File](#).

## Procedure

- Step 1** Access MRS Manager. For details, see [Accessing Manager](#).
- Step 2** On MRS Manager, click **System**.
- Step 3** In the **Permission** area, click **Manage User**.
- Step 4** In the row of a user for whom you want to export the keytab file, choose **More > Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it secure.
- Step 5** Open the authentication file with a decompression program.
  - **user.keytab** indicates a user keytab file used for user authentication.
  - **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to this configuration file information when authenticating users.

----End

## 5.19.13 Modifying a Password Policy

### Scenario

---

#### NOTICE

Because password policies are critical to the user management security, modify them based on service security requirements. Otherwise, security risks may be incurred.

---

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated. This operation is supported only in clusters with Kerberos authentication enabled or common clusters with the EIP function enabled.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the password policy first, and then follow instructions in [Creating a User](#) or [Changing the Password of an Operation User](#).

#### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Configuring Password Policies](#).

## Procedure

- Step 1** Access MRS Manager. For details, see [Accessing Manager](#).
- Step 2** On MRS Manager, click **System**.

**Step 3** Click **Configure Password Policy**.

**Step 4** Modify password policies as prompted. For parameter details, see [Table 5-72](#).

**Table 5-72** Password policy parameter description

| Parameter                                                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Minimum Password Length</b>                                  | Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is <b>8</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Number of Character Types</b>                                | Indicates the minimum number of character types a password contains. The character types include uppercase letters, lowercase letters, digits, spaces, and special characters (~!?,,;:_'(){}[]/<>@#\$%^&*+ \=). The value can be <b>3</b> or <b>4</b> . The default value <b>3</b> indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces.                                                                                                                                                                               |
| <b>Password Validity Period (days)</b>                          | Indicates the validity period (days) of a password. The value ranges from 0 to 90. Value <b>0</b> means that the password is permanently valid. The default value is <b>90</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Password Expiration Notification Days</b>                    | Indicates the number of days to notify password expiration in advance. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from <b>0</b> to $X$ ( $X$ must be set to the half of the password validity period and rounded down). Value <b>0</b> indicates that no notification is sent. The default value is <b>5</b> . |
| <b>Interval of Resetting Authentication Failure Count (min)</b> | Indicates the interval (minutes) of retaining incorrect password attempts. The value ranges from 0 to 1440. Value <b>0</b> indicates that the number of incorrect password attempts are permanently retained and value <b>1440</b> indicates that the number of incorrect password attempts are retained for one day. The default value is <b>5</b> .                                                                                                                                                                                                                                                                                     |

| Parameter                          | Description                                                                                                                                            |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Number of Password Retries</b>  | Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is 5.   |
| <b>Account Lock Duration (min)</b> | Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is 5. |

----End

## 5.19.14 Configuring Cross-Cluster Mutual Trust Relationships

### Scenario

If cluster A needs to access the resources of cluster B, the mutual trust relationship must be configured between these two clusters.

If no trust relationship is configured, resources of a cluster are available only for users in this cluster. MRS automatically assigns a unique **domain name** for each cluster to define the scope of resources for users.

#### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#).

### Impact on the System

- After cross-cluster mutual trust is configured, resources of a cluster become available for users in other cluster. User permission in the clusters must be regularly checked based on service and security requirements.
- After cross-cluster mutual trust is configured, the KrbServer service needs to be restarted and the cluster becomes unavailable during the restart.
- After cross-cluster mutual trust is configured, internal users **krbtgt/Local cluster domain name@External cluster domain name** and **krbtgt/External cluster domain name@Local cluster domain name** are added to the two clusters. The internal users cannot be deleted.

### Prerequisites

Both clusters are in the same VPC and subnet.

### Procedure

- Step 1** On the MRS management console, query all security groups of the two clusters.

- If the security groups of the two clusters are the same, go to [Step 3](#).
- If the security groups of the two clusters are different, go to [Step 2](#).

**Step 2** On the VPC management console, add rules for each security group.

Set **Protocol** to **ANY**, **Transfer Direction** to **Inbound**,

and **Source** to **Security Group**. The source is the security group of the peer cluster.

- For cluster A, add inbound rules to the security group, set **Source** to the security groups of cluster B (the peer cluster of cluster A).
- For cluster B, add inbound rules to the security group, set **Source** to the security groups of cluster A (the peer cluster of cluster B).

 **NOTE**

For a common cluster with Kerberos authentication disabled, perform step [Step 1](#) to [Step 2](#) to configure cross-cluster mutual trust. For a security cluster with Kerberos authentication enabled, after completing the preceding steps, proceed to the following steps for configuration.

**Step 3** Log in to MRS Manager of the two clusters separately. For details, see [Accessing Manager](#). Click **Service** and check whether the **Health Status** of all components is **Good**.

- If yes, go to [Step 4](#).
- If no, contact technical support personnel for troubleshooting.

**Step 4** Query configuration information.

1. On MRS Manager of the two clusters, choose **Services > KrbServer > Instance**. Query the **OM IP Address** of the two KerberosServer hosts.
2. Click **Service Configuration**. Set **Type** to **All**. Choose **KerberosServer > Port** in the navigation tree on the left. Query the value of **kdc\_ports**. The default value is **21732**.
3. Click **Realm** and query the value of **default\_realm**.

**Step 5** On MRS Manager of either cluster, modify the **peer\_realms** parameter.

**Table 5-73** Parameter description

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| realm_name | Domain name of the mutual-trust cluster, that is, the value of <b>default_realm</b> obtained in step <a href="#">4</a> .                                                                                                                                                                                                                                               |
| ip_port    | KDC address of the peer cluster. Format: <i>IP address of a KerberosServer node in the peer cluster:kdc_port</i><br>The addresses of the two KerberosServer nodes are separated by a comma. For example, if the IP addresses of the KerberosServer nodes are 10.0.0.1 and 10.0.0.2 respectively, the value of this parameter is <b>10.0.0.1:21732,10.0.0.2:21732</b> . |

 NOTE

- To deploy trust relationships with multiple clusters, click  to add items and specify relevant parameters. To delete an item, click .
- A cluster can have trust relationships with a maximum of 16 clusters. By default, no trust relationship exists between different clusters that are trusted by a local cluster.

**Step 6** Click **Save Configuration**. In the dialog box that is displayed, select **Restart the affected services or instances** and click **OK**. If you do not select **Restart the affected services or instances**, manually restart the affected services or instances.

After **Operation successful** is displayed, click **Finish**.

**Step 7** Exit MRS Manager and log in to it again. If the login is successful, the configurations are valid.

**Step 8** Log in to MRS Manager of the other cluster and repeat step [Step 5](#) to [Step 7](#).

----End

## Follow-up Operations

After cross-cluster mutual trust is configured, the service configuration parameters are modified on MRS Manager and the service is restarted. Therefore, you need to prepare the client configuration file again and update the client.

Scenario 1:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the same type, for example, analysis cluster or streaming cluster. Follow instructions in [Updating a Client \(Versions Earlier Than 3.x\)](#) to update the client configuration files of cluster A and B respectively.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

Scenario 2:

Cluster A and cluster B (peer cluster and mutually trusted cluster) are the different type. Perform the following steps to update the configuration files.

- Update the client configuration file of cluster A to cluster B.
- Update the client configuration file of cluster B to cluster A.
- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

**Step 1** Log in to MRS Manager of cluster A.

**Step 2** Click **Services**, and then **Download Client**.

**Step 3** Set **Client Type** to **Only configuration files**.

**Step 4** Set **Download to** to **Remote host**.

**Step 5** Set **Host IP Address** to the IP address of the active Master node of cluster B, **Host Port** to 22, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to cluster B using SSH is changed, set **Host Port** to a new port.
- The value of **Save Path** contains a maximum of 256 characters.

**Step 6** Set **Login User** to **root**.

If another user is used, ensure that the user has permissions to read, write, and execute the save path.

**Step 7** Click **OK** to generate a client file.

If the following information is displayed, the client file is saved. Click **Close**.

Client files downloaded to the remote host successfully.

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to [Step 2](#) to download the client again.

Failed to connect to the server. Please check the network connection or parameter settings.

**Step 8** Log in to the ECS of cluster B using VNC. For details, see in the *Elastic Cloud Server User Guide*.**Step 9** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 10** Run the following command to update the client configuration of cluster A to cluster B:

```
sh refreshConfig.sh Client installation directory Full path of the client configuration file package
```

For example, run the following command:

```
sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS_Services_Client.tar
```

If the following information is displayed, the configurations have been updated successfully.

ReFresh components client config is complete.  
Succeed to refresh components client config.

**NOTE**

You can also refer to method 2 in [Updating a Client \(Versions Earlier Than 3.x\)](#) to perform operations in [Step 1](#) to [Step 10](#).

**Step 11** Repeat step [Step 1](#) to [Step 10](#) to update the client configuration file of cluster B to cluster A.**Step 12** Follow instructions in [Updating a Client \(Versions Earlier Than 3.x\)](#) to update the client configuration file of the local cluster.

- Update the client configuration file of cluster A.
- Update the client configuration file of cluster B.

----End

## 5.19.15 Configuring Users to Access Resources of a Trusted Cluster

### Scenario

After cross-cluster mutual trust is configured, permission must be configured for users in the local cluster, so that the users can access the same resources in the peer cluster as the users in the peer cluster.

#### NOTE

The operations described in this section apply only to clusters of versions earlier than MRS 3.x.

For clusters of **MRS 3.x** or later, see [Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured](#).

### Prerequisites

The mutual trust relationship has been configured between two clusters (clusters A and B). The clients of the clusters have been updated.

### Procedure

- Step 1** Log in to MRS Manager of cluster A and choose **System > Manage User**. Check whether cluster A has accounts that are the same as those of cluster B.
  - If yes, go to [Step 2](#).
  - If no, go to [Step 3](#).
- Step 2** Click  on the left side of the username to unfold the detailed user information. Check whether the user group and role to which the user belongs meet the service requirements.

For example, user **admin** of cluster A has the permission to access and create files in the **/tmp** directory of cluster A. Then go to [Step 4](#).
- Step 3** Create the accounts in cluster A and bind the accounts to the user group and roles required by the services. Then go to [Step 4](#).
- Step 4** Choose **Service > HDFS > Instance**. Query the **OM IP Address of NameNode (Active)**.
- Step 5** Log in to the client of cluster B.

For example, if you have updated the client on the Master2 node, log in to the Master2 node to use the client. For details, see [Using an MRS Client](#).
- Step 6** Run the following command to access the **/tmp** directory of cluster A.

```
hdfs dfs -ls hdfs://192.168.6.159:9820/tmp
```

In the preceding command, **192.168.6.159** is the IP address of the active NameNode of cluster A; **9820** is the default port for communication between the client and the NameNode.
- Step 7** Run the following command to create a file in the **/tmp** directory of cluster A:

```
hdfs dfs -touchz hdfs://192.168.6.159:9820/tmp/mrstest.txt
```

If you can query the `mrstest.txt` file in the `/tmp` directory of cluster A, the cross-cluster mutual trust is configured successfully.

----End

## 5.19.16 Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS

When fine-grained permission control is enabled, you can configure OBS access permissions to implement access control on directories in OBS file systems.

This function enables you to control MRS users' access to OBS resources. For example, if you allow user group A to only access log files in a specified OBS file system, perform the following operations:

1. Configure an agency with OBS access permissions for an MRS cluster so that OBS can be accessed using the temporary AK/SK automatically obtained by the ECS. This prevents the AK/SK from being exposed in the configuration file.
2. Create a policy on the IAM console to allow access to log files in a specified OBS file system, and create an agency bound to the policy permission.
3. In the MRS cluster, bind the new agency to user group A so that user group A only has the permission to access log files in the specified OBS file system.

In the following scenarios, the username used for submitting jobs is an internal username so that MRS multi-user access to OBS is not supported.

- For spark-beeline, the internal username used for submitting jobs is **spark** in a security cluster and **omm** in a normal cluster.
- For the HBase shell, the internal username used for submitting jobs is **hbase** in a security cluster and **omm** in a normal cluster.
- For Presto, the internal username used for submitting jobs in the security cluster is **omm** or **hive**, and that in the normal cluster is **omm**. (Choose **Components > Presto > Service Configuration**. Change **Basic** to **All** in the parameter type drop-down box.) Then, search for and change the value of **hive.hdfs.impersonation.enabled** to **true** to enable MRS multi-user to access OBS with fine-grained permissions.

### Prerequisites

- Fine-grained permission control has been enabled. For details about permissions management, see [Creating a User and Granting Permissions](#).
- You have a basic knowledge of IAM Agencies and OBS fine-grained policies.

### Step 1: Configuring an Agency with OBS Access Permission for a Cluster

- Step 1** Follow instructions in [Configuring a Storage-Compute Decoupled Cluster \(Agency\)](#) to configure an agency with OBS access permissions.

The agency takes effect for all users (including internal users) and user groups in the cluster. To control the permissions of users and user groups in the cluster to access OBS, perform the following operations.

----End

## Step 2: Creating a Policy and an Agency on IAM

Create policies with different access permissions and bind the policies to the agency. For details, see [Creating a Policy and an Agency on IAM](#).

## Step 3: Configuring OBS Permission Control Mappings on the MRS Cluster Details Page

- Step 1** On the MRS management console, choose **Clusters > Active Clusters** and click the cluster name.
- Step 2** In the **Basic Information** area on the **Dashboard** tab page, click **Manage** next to **OBS Permission Control**.
- Step 3** Click **Add Mapping** and set parameters according to [Table 5-74](#).

**Table 5-74** OBS permission control parameters

| Parameter  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IAM Agency | Select the agency created in <a href="#">Step 2</a> .                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Type       | <ul style="list-style-type: none"> <li>• <b>User</b>: User-level mapping</li> <li>• <b>Group</b>: User group-level mapping</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• User-level mapping takes priority over user group-level mapping. If you select <b>Group</b>, you are advised to enter the primary group name in <b>MRS User (User Group)</b>.</li> <li>• Do not use the same username (user group) for multiple mapping records.</li> </ul> |

| Parameter             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MRS User (User Group) | <p>Use commas (,) to separate multiple names of users or user groups.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If OBS permission control is not configured for a user and no AK and SK are configured, the permission in <b>MRS_ECS_DEFAULT_AGENCY</b> will be used for accessing OBS. You are advised not to bind the internal user of a component to an agency.</li> <li>• If you need to configure an agency for the internal user of a component when submitting a job in the following scenarios, the requirements are as follows: <ul style="list-style-type: none"> <li>- To control permissions on spark-beeline operations, set the username to <b>spark</b> for a security cluster and <b>omm</b> for a normal cluster.</li> <li>- To control permissions on HBase shell operations, set the username to <b>hbase</b> for a security cluster and <b>omm</b> for a normal cluster.</li> <li>- To control permissions on Presto, set the username to <b>omm</b>, <b>hive</b>, and the username used for logging in to the client for a security cluster and <b>omm</b> and the username used for logging in to the client for a normal cluster.</li> <li>- If you want to use Hive to create tables in beeline mode, set the username to the internal user <b>hive</b>.</li> </ul> </li> </ul> |

**Step 4** Click **OK**.

**Step 5** Select **I agree to authorize the trust relationships between MRS Users (Groups) and IAM agencies**, and click **OK**. The mapping between the MRS user and OBS permission is added.

If  appears next to **OBS Permission Control** on the **Dashboard** tab page or the mapping table has been updated for OBS permission control, the mapping takes effect. It takes about 1 minute to for the mapping to take effect.

In the **Operation** column of the mapping list, you can edit or delete the added mapping.

 **NOTE**

- If OBS permission control is not configured for a user and no AK and SK are configured, the permissions owned by the agency configured for the cluster in the **Object Storage Service (OBS)** project will be used to access OBS.
- Regardless of whether OBS permission control is configured, AK/SK permission is used for accessing OBS once it is configured.
- Security Administrator permission is required to modify, create, or delete a mapping.
- To enable mapping changes to take effect in spark-line, hive beeline and Presto respectively, you need to restart Spark, exit beeline and enter again, and restart Presto respectively.

----End

## Component Access to OBS When OBS Permission Control Is Enabled

**Step 1** Log in to any node in a cluster as user **root** using the password set during cluster creation.

**Step 2** Set environment variables (In MRS 3.x and later versions, the default installation path of the client is `/opt/Bigdata/client`. In MRS 3.x and earlier versions, the default installation path is `/opt/client`. For details, see the actual situation.).

**source** `/opt/Bigdata/client/bigdata_env`

**Step 3** If the Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If the Kerberos authentication is disabled for the current cluster, skip this step:

**kinit** *MRS cluster user*

Example: **kinit** `admin`

**Step 4** If the Kerberos authentication is disabled for the current cluster, run the following commands to log in. Note that you should create a user that belongs to the **supergroup** group by referring to [Creating a User](#) and replace `XXXX` with the username:

**mkdir** `/home/XXXX`

**chown** `XXXX /home/XXXX`

**su** - `XXXX`

**Step 5** Access OBS. You do not need to configure the AK, SK, and endpoint. The OBS path format is **obs://buck\_name/XXX**.

Example: **hadoop fs -ls "obs://obs-example/job/hadoop-mapreduce-examples-3.1.2.jar"**

 **NOTE**

- If you want to use **hadoop fs** to delete files on OBS, use **hadoop fs -rm -skipTrash** to delete the files.
- If data import is not involved when a table is created using spark-sql and spark-beeline, OBS will not be accessed. That is, if you create a table in an OBS directory on which you do not have permission, the **CREATE TABLE** operation will still be successful, but the error message "**403 AccessDeniedException**" is displayed when you insert data.

----End

## Creating a Policy and an Agency on IAM

**Step 1** Create a policy on IAM.

1. Log in to the IAM console.
2. Choose **Permissions**. On the displayed page, click **Create Custom Policy**.
3. Set parameters according to [Table 5-75](#).

**Table 5-75** Policy parameters

| Parameter   | Description                                                              |
|-------------|--------------------------------------------------------------------------|
| Policy Name | Only letters, digits, spaces, and special characters (-_.,) are allowed. |
| Scope       | Select <b>Global services</b> , because OBS is a global service.         |
| Policy View | Select <b>Visual editor</b> .                                            |

| Parameter      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Policy Content | <ol style="list-style-type: none"> <li>1. <b>Allow:</b> Select <b>Allow</b>.</li> <li>2. <b>Select service:</b> Select <b>Object Storage Service (OBS)</b>.</li> <li>3. <b>Select action:</b> Select <b>WriteOnly, ReadOnly, and ListOnly</b>.</li> <li>4. <b>Specific resources:</b> <ol style="list-style-type: none"> <li>a. Set <b>object</b> to <b>Specify resource path</b>, click <b>Add Resource Path</b>, and enter <i>obs_bucket_name/tmp/</i> and <i>obs_bucket_name/tmp/*</i>. The <b>/tmp</b> directory is used as an example. If you need to add permissions for other directories, perform the following steps to add the directories and resource paths of all objects in the directories.</li> <li>b. Set <b>bucket</b> to <b>Specify resource path</b>, click <b>Add Resource Path</b>, and enter <i>obs_bucket_name</i>.</li> </ol> </li> <li>5. (Optional) Add request condition, which does not need to be added currently.</li> </ol> |
| Description    | (Optional) Brief description about the policy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

 **NOTE**

If the data write operation of each component is implemented in **rename** mode, the permission to delete objects must be configured when data is written.

4. Click **OK** to save the policy.

**Step 2** Create an agency on IAM.

1. Log in to the IAM console.
2. Choose **Agencies**. On the displayed page, click **Create Agency**.
3. Set parameters according to [Table 5-76](#).

**Table 5-76** Agency parameters

| Parameter   | Description                                                              |
|-------------|--------------------------------------------------------------------------|
| Agency Name | Only letters, digits, spaces, and special characters (-_.,) are allowed. |

| Parameter         | Description                                                                                                                                                                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Agency Type       | Select <b>Common account</b> .                                                                                                                                                                                                                                                             |
| Delegated Account | Enter your cloud account, that is, the account you register using your mobile phone number. It cannot be a federated user or an IAM user created using your cloud account.                                                                                                                 |
| Validity Period   | Select <b>1 day</b> or <b>Unlimited</b> .                                                                                                                                                                                                                                                  |
| Description       | (Optional) Brief description about the agency.                                                                                                                                                                                                                                             |
| Permissions       | <ol style="list-style-type: none"> <li>1. In the <b>Project [Region]</b> column, locate the row where <b>OBS</b> is, click <b>Attach Policy</b>.</li> <li>2. Select the policy created in <b>Step 1</b> to display it in <b>Selected Policies</b>.</li> <li>3. Click <b>OK</b>.</li> </ol> |

4. Click **OK** to save the agency.

 **NOTE**

If you modify an agency and policies bound to it after using the agency to access OBS, the modification will take effect within 15 minutes.

----End

# 6 Managing Historical Clusters

## 6.1 Viewing Basic Information of a Historical Cluster

Choose **Clusters > Cluster History** and click the name of a target cluster. You can view the cluster configuration and deployed node information.

The following table describes the parameters for the historical cluster information.

**Table 6-1** Basic cluster information

| Parameter              | Description                                                                                                                                                  |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cluster Name           | Name of a cluster. The cluster name is set when the cluster is created.                                                                                      |
| Cluster Status         | Status of a cluster.                                                                                                                                         |
| Cluster Version        | Cluster version                                                                                                                                              |
| Cluster Type           | Type of the cluster to be created.                                                                                                                           |
| Obtaining a cluster ID | Unique identifier of a cluster, which is automatically assigned when a cluster is created                                                                    |
| Created                | Time when a cluster is created.                                                                                                                              |
| AZ                     | Availability zone (AZ) in the region of a cluster, which is set when a cluster is created.                                                                   |
| Default Subnet         | Subnet selected during cluster creation.<br>A subnet provides dedicated network resources that are isolated from other networks, improving network security. |
| VPC                    | VPC selected during cluster creation.<br>A VPC is a secure, isolated, and logical network environment.                                                       |

| Parameter                  | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBS Permission Control     | Click <b>Manage</b> and modify the mapping between MRS users and OBS permissions. For details, see <a href="#">Configuring Fine-Grained Permissions for MRS Multi-User Access to OBS</a> .                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Creating a data connection | Click <b>Manage</b> to view the data connection type associated with the cluster. For details, see <a href="#">Configuring Data Connections</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Agency                     | <p>Click <b>Manage Agency</b> to bind or modify an agency for the cluster.</p> <p>An agency allows ECS or BMS to manage MRS resources. You can configure an agency of the ECS type to automatically obtain the AK/SK to access OBS. For details, see <a href="#">Configuring a Storage-Compute Decoupled Cluster (Agency)</a>.</p> <p>The <code>MRS_ECS_DEFAULT_AGENCY</code> agency has the OBS OperateAccess permission of OBS and the CES FullAccess (for users who have enabled fine-grained policies), CES Administrator, and KMS Administrator permissions in the region where the cluster is located.</p> |
| Elastic IP (EIP)           | After binding an EIP to an MRS cluster, you can use the EIP to access the Manager web UI of the cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Key Pair                   | Name of a key pair. Set this parameter when creating a cluster. If the login mode is set to password during cluster creation, this parameter is not displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Kerberos Authentication    | Whether to enable Kerberos authentication when logging in to Manager.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Logging                    | Indicates whether the tenant has enabled the log collection function.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enterprise project         | Enterprise project to which a cluster belongs. Only on the <b>Active Clusters</b> page, you can click the name of an enterprise project to go to its <b>Enterprise Project Management</b> page.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Security Group             | Security group name of the cluster.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Streaming Core Node LVM    | Indicates whether to enable the Logical Volume Manager (LVM) function of streaming Core nodes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Data Disk Key Name         | Name of the key used to encrypt data disks. To manage the used keys, log in to the key management console.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Data Disk Key ID           | ID of the key used to encrypt data disks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Component Version          | Version of each component installed in the cluster                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Go back to the historical clusters page. You can use the following buttons to perform operations. For details about the buttons, see the following table.

**Table 6-2** Icon description

| Icon                                                                              | Description                                                                                                                                                   |
|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Click  to manually refresh the node information.                             |
|  | Enter a cluster name in the search bar and click  to search for a cluster. |

# 7 Viewing Operation Logs

You can view operation logs of clusters and jobs on the **Operation Logs** page. Log information is typically used for quickly locating faults in case of cluster exceptions, helping users resolve problems.

## Operation Type

Currently, the following operation logs are provided by MRS. You can filter the logs in the search box.

- Cluster operations
  - Creating, deleting, scaling out, and scaling in a cluster
  - Creating and deleting a directory, deleting a file
- Job operations: Creating, stopping, and deleting a job
- Data operations: IAM user tasks, adding user, and adding user group

## Log Fields

Logs are listed in chronological order by default in the log list, with the most recent logs displayed at the top.

**Table 7-1** describes various fields in a log.

**Table 7-1** Log description

| Parameter      | Description                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operation Type | Various types of operations, including: <ul style="list-style-type: none"> <li>• Cluster operations</li> <li>• Job operations</li> <li>• Data operations</li> </ul>                                                                                         |
| Operation IP   | IP address where an operation is performed.<br><b>NOTE</b><br>If an MRS cluster fails to be deployed, the cluster is automatically deleted, and the operation logs of the automatically deleted cluster do not contain the <b>Operation IP</b> of the user. |

| Parameter          | Description                                                                                                                                                            |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operation          | Operation details. The value can contain a maximum of 2048 characters.                                                                                                 |
| Time               | Operation time. For a deleted cluster, only logs generated within the last six months are displayed. To view logs generated six months ago, contact technical support. |
| Enterprise Project | Enterprise project to which the cluster belongs                                                                                                                        |

**Table 7-2** Icon description

| Icon                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    | Select an enterprise project from the drop-down list box to filter logs.                                                                                                                                                                                                                                                                                                    |
|    | Select an operation type from the drop-down list box to filter logs. <ul style="list-style-type: none"> <li>● <b>All Operation Types:</b> Filter all logs.</li> <li>● <b>Cluster:</b> Filter logs for <b>Cluster</b>.</li> <li>● <b>Job:</b> Filter logs for <b>Job</b>.</li> <li>● <b>Data:</b> Filter logs for <b>Data</b>.</li> </ul>                                    |
|  | Filter logs by time. <ol style="list-style-type: none"> <li>1. Click the input box.</li> <li>2. Specify the date and time.</li> <li>3. Click <b>OK</b>.</li> </ol> <p>The left-side input box indicates the start time and the right-side one indicates the end time. The start time must be earlier than or equal to the end time. Otherwise, logs cannot be filtered.</p> |
|  | Enter a keyword of the <b>Operation Details</b> in the search box and click  to search for logs.                                                                                                                                                                                         |
|  | Click  to manually refresh the log list.                                                                                                                                                                                                                                                 |

# 8 Metadata

---

## 8.1 Configuring Data Connections

MRS data connections are used to manage external source connections used by components in a cluster. For example, if Hive metadata uses an external relational database, a data connection can be used to associate the external relational database with the Hive component.

- **Local:** Metadata is stored in the local GaussDB of a cluster. When the cluster is deleted, the metadata is also deleted. To retain the metadata, manually back up the metadata in the database in advance.
- **Data Connection:** Metadata is stored in the associated PostgreSQL or MySQL database of the RDS service in the same VPC and subnet as the current cluster. When the cluster is terminated, the metadata is not deleted. Multiple MRS clusters can share the metadata.

### NOTE

When Hive metadata is switched between different clusters, MRS synchronizes only the permissions in the metadata database of the Hive component. The permission model on MRS is maintained on MRS Manager. Therefore, when Hive metadata is switched between clusters, the permissions of users or user groups cannot be automatically synchronized to MRS Manager of another cluster.

### Performing Operations Before Data Connection

- Step 1** Log in to the RDS console.
- Step 2** Click the **Instance Management** tab and click the name of the RDS DB instance used by the MRS data connection.
- Step 3** Click **Log In** in the upper right corner to log in to the instance as user **root**.
- Step 4** On the home page of the instance, click **Create Database** to create a database.
- Step 5** On the top of the page, choose **Account Management > User Management**.

 **NOTE**

If the selected data connection is **RDS MySQL database**, ensure that the database user is user **root**. If the user is not **root**, perform [Step 5](#) to [Step 7](#).

**Step 6** Click **Create User** to create a non-root user.

**Step 7** On the top of the page, choose **SQL Operations > SQL Query**, switch to the target database by database name, and run the following SQL statements to grant permissions to the database user. In the following statements, *db\_name* and *db\_user* indicate the name of the database to be connected to MRS and the name of the new user, respectively.

```
grant SELECT, INSERT on mysql.* to '${db_user}'@'%' with grant option;
grant all privileges on ${db_name}.* to '${db_user}'@'%' with grant option;
grant reload on *.* to '${db_user}'@'%' with grant option;
flush privileges;
```

**Step 8** Create a data connection by referring to [Creating a Data Connection](#).

----End

## Creating a Data Connection

**Step 1** Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.

**Step 2** Click **Create Data Connection**.

**Step 3** Set parameters according to [Table 8-1](#).

**Table 8-1** Data connection parameters

| Parameter | Description                                                                                                                                                                                                                                                                                               |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type      | Type of an external source connection. <ul style="list-style-type: none"> <li>RDS for PostgreSQL database. Clusters of that support Hive can connect to this type of database.</li> <li>RDS for MySQL database. Clusters of that supports Hive or Ranger can connect to this type of database.</li> </ul> |
| Name      | Name of a data connection.                                                                                                                                                                                                                                                                                |

| Parameter    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RDS Instance | <p>RDS database instance. This instance must be created in RDS before being referenced here, and the database must have been created. For details, see <a href="#">Performing Operations Before Data Connection</a>. Click <b>View RDS Instance</b> to view the created instances.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>To ensure network communications between the cluster and the PostgreSQL database, you are advised to create the instance in the same VPC and subnet as the cluster.</li> <li>The inbound rule of the security group of the RDS instance must allow access of the instance to port 3306. To configure that, click the instance name on the RDS console to go to the instance management page. In <b>Connection Information</b> area, click the name of <b>Security Group</b>. On the page that is displayed, click the <b>Inbound Rules</b> tab, and click <b>Add Rule</b>. On the displayed dialog box, in <b>Protocol &amp; Port</b> area, select <b>TCP</b> and enter port number <b>3306</b>. In <b>Source</b> area, enter the IP address of all nodes where the MetaStore instance of Hive resides.</li> <li>Currently, MRS supports <b>PostgreSQL9.5/PostgreSQL9.6</b> on RDS.</li> <li>Currently, MRS supports only <b>MySQL 5.7.x</b> on RDS.</li> </ul> |
| Database     | Name of the database to be connected to.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Username     | Username for logging in to the database to be connected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Password     | Password for logging in to the database to be connected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

 **NOTE**

If the selected data connection is an **RDS MySQL database**, ensure that the database user is a **root** user. If the user is not **root**, perform operations by referring to [Performing Operations Before Data Connection](#).

**Step 4** Click **OK**.

----End

## Editing a Data Connection

- Step 1** Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.
- Step 2** In the **Operation** column of the data connection list, click **Edit** in the row where the data connection to be edited is located.
- Step 3** Modify parameters according to [Table 8-1](#).

If the selected data connection has been associated with a cluster, the configuration changes will be synchronized to the cluster.

----End

## Deleting a Data Connection

- Step 1** Log in to the MRS management console, and choose **Data Connections** in the left navigation pane.
- Step 2** In the **Operation** column of the data connection list, click **Delete** in the row where the data connection to be deleted is located.

If the selected data connection has been associated with a cluster, the deletion does not affect the cluster.

----End

## Configuring a data connection during cluster creation

- Step 1** Log in to the MRS management console.
- Step 2** Click **Create Cluster**. The **Create Cluster** page is displayed.
- Step 3** Click the **Custom Config** tab.
- Step 4** In the software configuration area, set **Metadata** by referring to [Table 8-2](#). For other parameters, see [Creating a Custom Cluster](#) for configuration and cluster creation.

**Table 8-2** Data connection parameters

| Parameter | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Metadata  | <p>Whether to use external data sources to store metadata.</p> <ul style="list-style-type: none"> <li>• <b>Local:</b> Metadata is stored in the local cluster.</li> <li>• <b>Data connections:</b> Metadata of external data sources is used. If the cluster is abnormal or deleted, metadata is not affected. This mode applies to scenarios where storage and compute are decoupled.</li> </ul> <p>Clusters that support the Hive or Ranger component support this function.</p> |

| Parameter                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Component                | <p>This parameter is valid only when <b>Use External Data Sources to Store Metadata</b> is enabled. It indicates the type of an external data source.</p> <ul style="list-style-type: none"> <li>• Hive</li> <li>• Ranger</li> </ul>                                                                                                                                                                                                                                                                                                                                                                          |
| Data Connection Type     | <p>This parameter is valid only when <b>Use External Data Sources to Store Metadata</b> is enabled. It indicates the type of an external data source.</p> <ul style="list-style-type: none"> <li>• Hive supports the following data connection types: <ul style="list-style-type: none"> <li>- RDS PostgreSQL database (supported for clusters of MRS 1.9.x)</li> <li>- RDS MySQL database</li> <li>- Local database</li> </ul> </li> <li>• Ranger supports the following data connection types: <ul style="list-style-type: none"> <li>- RDS MySQL database</li> <li>- Local database</li> </ul> </li> </ul> |
| Data Connection Instance | <p>This parameter is valid only when <b>Data Connection Type</b> is set to <b>RDS PostgreSQL database</b> or <b>RDS MySQL database</b>. This parameter indicates the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click <b>Create Data Connection</b> to create a data connection. For details, see <a href="#">Performing Operations Before Data Connection</a> and <a href="#">Creating a Data Connection</a>.</p>                                                                                              |

----End

## Managing Data Connections in an Existing Cluster

This function is not supported in MRS 3.0.5.

- Step 1** Log in to the MRS management console. In the left navigation pane, choose **Clusters > Active Clusters**.
- Step 2** Click the name of the cluster to enter its details page.
- Step 3** On the **Dashboard** tab page of the cluster details page, click **Manage** next to **Data Connection**.
- Step 4** On the **Data Connection** dialog box, the data connections associated with the cluster are displayed. You can click **Edit** or **Delete** to edit or delete the data connections.
- Step 5** If there is no associated data connection on the **Data Connection** page, click **Configure Data Connection** to add a connection.

 **NOTE**

Only one data connection can be configured for a module type. For example, after a data connection is configured for Hive metadata, no other data connection can be configured for it. If no module type is available, the **Configure Data Connection** button is unavailable.

**Table 8-3** Parameters for configuring a data connection

| Parameter            | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Component Name       | <ul style="list-style-type: none"> <li>• Hive</li> <li>• Ranger</li> </ul>                                                                                                                                                                                                                                                                                                                                                    |
| Module Type          | <p>If <b>Component Name</b> is set to <b>Hive</b>, <b>Hive metadata</b> is supported.</p> <p>When the <b>Component Name</b> is <b>Ranger</b>, <b>Ranger metadata</b> is supported.</p>                                                                                                                                                                                                                                        |
| Data Connection Type | <ul style="list-style-type: none"> <li>• Hive supports the following data connection types: <ul style="list-style-type: none"> <li>- RDS PostgreSQL database</li> <li>- RDS MySQL database</li> <li>- Local database</li> </ul> </li> <li>• Ranger supports the following data connection types: <ul style="list-style-type: none"> <li>- RDS MySQL database</li> <li>- Local database</li> </ul> </li> </ul>                 |
| Instance             | <p>This parameter is valid only when <b>Data Connection Type</b> is set to <b>RDS PostgreSQL database</b> or <b>RDS MySQL database</b>. Select the name of the connection between the MRS cluster and the RDS database. This instance must be created before being referenced here. You can click <b>Create Data Connection</b> to create a data connection. For details, see <a href="#">Creating a Data Connection</a>.</p> |

**Step 6** Click **Test** to test connectivity of the data connection.

**Step 7** After the data connection is successful, click **OK**.

 **NOTE**

After Hive/Ranger metadata is configured, restart Hive/Ranger. Hive/Ranger will create necessary database tables in the specified database. (If tables exist, they will not be created.)

----End

## 8.2 Configuring Ranger Data Connections

Switch the Ranger metadata of the existing cluster to the metadata stored in the RDS database. This operation enables multiple MRS clusters to share the same metadata, and the metadata will not be deleted when the clusters are deleted. In this way, Ranger metadata migration is not required during cluster migration.

### Prerequisites

You have created an RDS MySQL database instance. For details, see [Creating a Data Connection](#).

#### NOTE

- For versions earlier than MRS 3.x, if the selected data connection is an **RDS MySQL database**, ensure that the database user is a **root** user. If the user is not **root**, create a user and grant permissions to the user by referring to [Performing Operations Before Data Connection](#).
- In MRS 3.x or later, if the selected data connection is **RDS MySQL database**, the database user cannot be user **root**. In this case, create a user and grant permissions to the user by following the instructions provided in [Performing Operations Before Data Connection](#).

### Preparing for MySQL Database Ranger Metadata Configuration

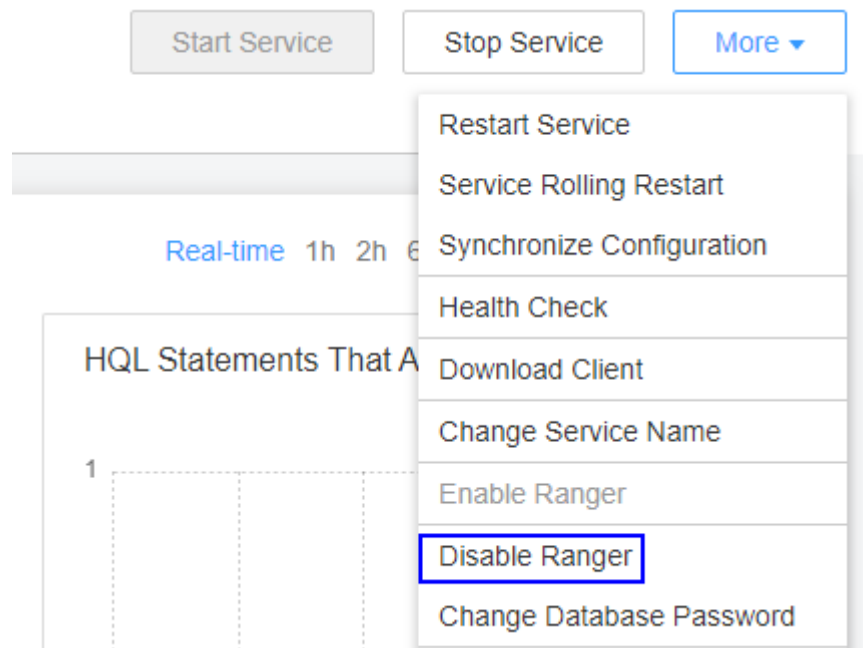

This operation is required only for **MRS 3.1.0 or later**.

**Step 1** Log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Choose **Clusters** > **Services** > *Service name*.

Currently, the following components in an MRS 3.1.0 cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

**Step 2** In the upper right corner of the **Dashboard** page, click **More** and select **Disable Ranger**. If **Disable Ranger** is dimmed, Ranger authentication is disabled, as shown in [Figure 8-1](#).

**Figure 8-1** Disabling Ranger authentication

**Step 3** (Optional) To use an existing authentication policy, perform this step to export the authentication policy on the Ranger web page. After the Ranger metadata is switched, you can import the existing authentication policy again. The following uses Hive as an example. After the export, a policy file in JSON format is generated in a local directory.

1. Log in to FusionInsight Manager.
2. Choose **Cluster > Services > Ranger** to go to the Ranger service overview page.
3. Click **RangerAdmin** in the **Basic Information** area to go to the Ranger web UI.

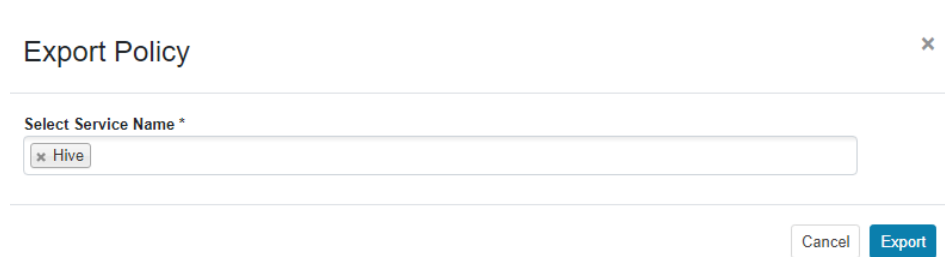

The **admin** user in Ranger belongs to the **User** type. To view all management pages, click the username in the upper right corner, select **Log Out**, log out of the system, and log in to the system as the **rangeradmin** user or another user.

4. Click the export button  in the row where the Hive component is located to export the authentication policy.

**Figure 8-2** Exporting authentication policies

5. Click **Export**. After the export is complete, a policy file in JSON format is generated in a local directory.

**Figure 8-3** Exporting Hive authentication policies

----End

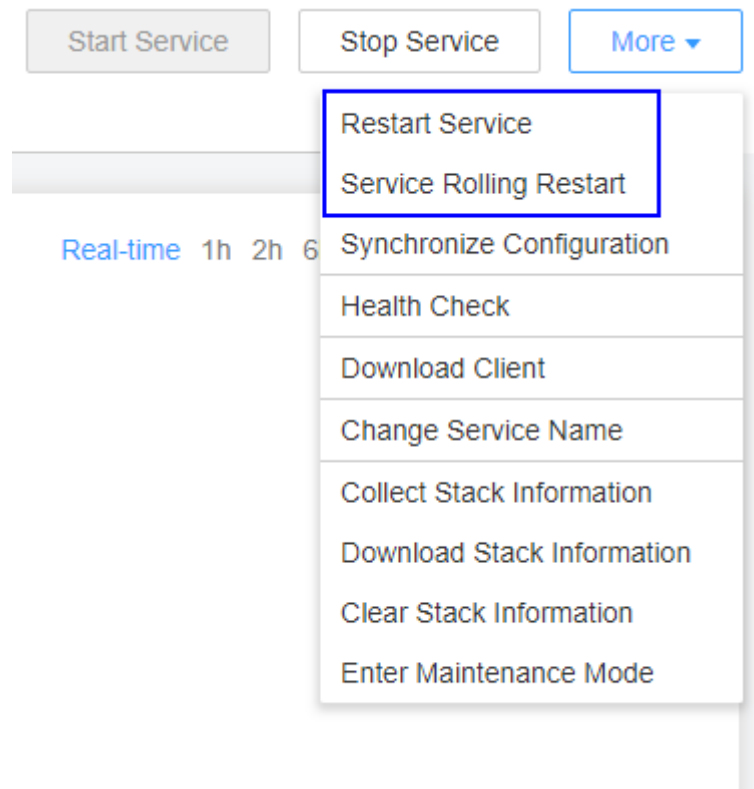

## Configuring a Data Connection for an MRS Cluster

- Step 1** Log in to the MRS console.
- Step 2** Click the name of the cluster to view its details.
- Step 3** Click **Manage** on the right of **Data Connection** to go to the data connection configuration page.
- Step 4** Click **Configure Data Connection** and set related parameters.
  - **Component Name:** Ranger
  - **Module Type:** Ranger metadata
  - **Connection Type:** RDS MySQL database
  - **Connection Instance:** Select a created RDS MySQL DB instance. To create a new data connection, see [Creating a Data Connection](#).
- Step 5** Select **I understand the consequences of performing the scale-in operation** and click **Test**.
- Step 6** After the test is successful, click **OK** to complete the data connection configuration.
- Step 7** Log in to FusionInsight Manager.
- Step 8** Choose **Cluster > Services > Ranger** to go to the Ranger service overview page.
- Step 9** Choose **More > Restart Service** or **More > Service Rolling Restart**.

If you choose **Restart Service**, services will be interrupted during the restart. If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

Restarting Ranger will affect the permissions of all components controlled by Ranger and may affect the normal running of services. Therefore, restart Ranger when the cluster is idle or during off-peak hours. Before the Ranger component is restarted, the policies in the Ranger component still take effect.

**Figure 8-4** Restarting a service

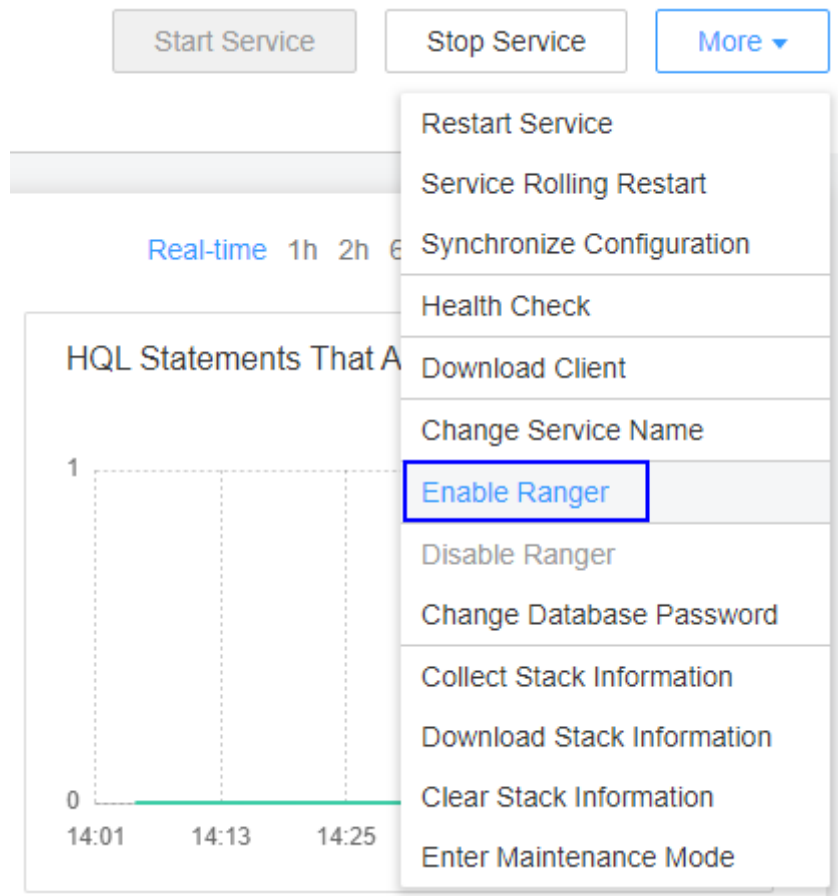

**Step 10** Enable Ranger authentication for the component to be authenticated. The Hive component is used as an example.

Currently, the following components in an MRS 3.1.0 cluster support Ranger authentication: HDFS, HBase, Hive, Spark, Impala, Storm, and Kafka.

1. Log in to FusionInsight Manager and choose **Cluster** > **Services** > *Service Name*.
2. In the upper right corner of the **Dashboard** page, click **More** and select **Enable Ranger**.

**Figure 8-5** Enabling Ranger authentication

**Step 11** Log in to the Ranger web UI and click the import button  in the row of the Hive component.

**Step 12** Import parameters.

- Click **Select file** and select the authentication policy file downloaded in [Step 3.5](#).
- Select **Merge If Exist Policy**.

**Figure 8-6** Importing authentication policies

Import Policy
✕

**i** 'Override Policy' has higher priority than 'Merge If Exist Policy', if user selects both of them, then only 'Override Policy' take effect.

**Select File :**

Select file 📎

|        | To | No zone selected ▼ |

**Specify Service Mapping:**

| Source   |    | Destination |
|----------|----|-------------|
| Hive ✕ ▼ | To | Hive ▼ ✕    |

+

Cancel
Import

**Step 13** Restart the component for which Ranger authentication is enabled.

1. Log in to FusionInsight Manager.
2. Choose **Cluster > Services > Hive** to go to the Hive service overview page.
3. Choose **More > Restart Service** or **More > Service Rolling Restart**.  
 If you choose **Restart Service**, services will be interrupted during the restart.  
 If you select **Service Rolling Restart**, rolling restart can minimize the impact or do not affect service running.

----End

# 9 Connecting to Clusters

---

## 9.1 Logging In to a Cluster

### 9.1.1 Cluster Node Overview

This section describes remote login, MRS cluster node types, and node functions.

MRS cluster nodes support remote login. The following remote login methods are available:

- GUI login: Use the remote login function provided by the ECS management console to log in to the Linux interface of the Master node in the cluster.
- SSH login: Applies to Linux ECSs only. You can use a remote login tool (such as PuTTY) to log in to an ECS. The ECS must have a bound EIP.

For details about how to apply for and bind EIP for the Master node, see **Virtual Private Cloud > User Guide > Elastic IP > Assigning an EIP and Binding It to an ECS**.

You can log in to a Linux ECS using either a key pair or password.

---

#### NOTICE

If you use a key pair to access a node in a cluster, you need to log in to the node as user **root**. For details, see [Logging In to an ECS Using a Key Pair \(SSH\)](#).

For details about how to access a cluster node using a password, see [Logging In to an ECS Using a Password \(SSH\)](#).

---

In an MRS cluster, a node is an ECS. [Table 9-1](#) describes the node types and node functions.

**Table 9-1** Cluster node types

| Node Type   | Functions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Master node | <p>Management node of an MRS cluster. It manages and monitors the cluster. In the navigation tree of the MRS management console, choose <b>Clusters &gt; Active Clusters</b>, select a running cluster, and click its name to switch to the cluster details page. On the <b>Nodes</b> tab page, view the <b>Name</b>. The node that contains <b>master1</b> in its name is the Master1 node. The node that contains <b>master2</b> in its name is the Master2 node.</p> <p>You can log in to a Master node either using VNC on the ECS management console or using SSH. After logging in to the Master node, you can access Core nodes without entering passwords.</p> <p>The system automatically deploys the Master nodes in active/standby mode and supports the high availability (HA) feature for MRS cluster management. If the active management node fails, the standby management node switches to the active state and takes over services.</p> <p>To determine whether the Master1 node is the active management node, see <a href="#">Determining Active and Standby Management Nodes of Manager</a>.</p> |
| Core node   | Work node of an MRS cluster. It processes and analyzes data and stores process data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Task node   | Compute node. It is used for auto scaling when the computing resources in a cluster are insufficient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 9.1.2 Logging In to an ECS

This section describes how to remotely log in to an ECS in an MRS cluster using the remote login (VNC mode) function provided on the ECS management console or a key or password (SSH mode). Remote login (VNC mode) is mainly used for emergency O&M. In other scenarios, it is recommended that you log in to the ECS using SSH.

### NOTE

To log in to a cluster node using SSH, you need to manually add an inbound rule in the security group of the cluster. The source address is **Client IPv4 address/32** (or **Client IPv6 address/128**) and the port number is **22**. For details, see [Virtual Private Cloud > User Guide > Security > Security Group > Adding a Security Group Rule](#).

## Logging In to an ECS Using VNC

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.

- Step 3** On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
- Step 4** In the upper right corner, click **Remote Login**.
- Step 5** Enter the username and password for logging in to the Master node as prompted.
1. If you select **Password** for **Login Mode**, you need to enter **root** in **Username** and the password you set during cluster creation in **Password**.
  2. If you select **Key Pair** for **Login Mode** when creating a cluster, perform the following operations to log in to the cluster:
    - a. After the cluster is created, assign an EIP and bind it to the Master node of the cluster. For details, see **Virtual Private Cloud > User Guide > Elastic IP Address > Assigning an EIP and Binding It to an ECS**.
    - b. Remotely log in to the Master node in SSH mode as user **root** using the key file.
    - c. Run the **passwd root** command to set a password for user **root**.
    - d. Go back to the login interface, and enter **root** and the password set in **Step 5.2.c** to log in to the node.

----End

## Logging In to an ECS Using a Key Pair (SSH)

### Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

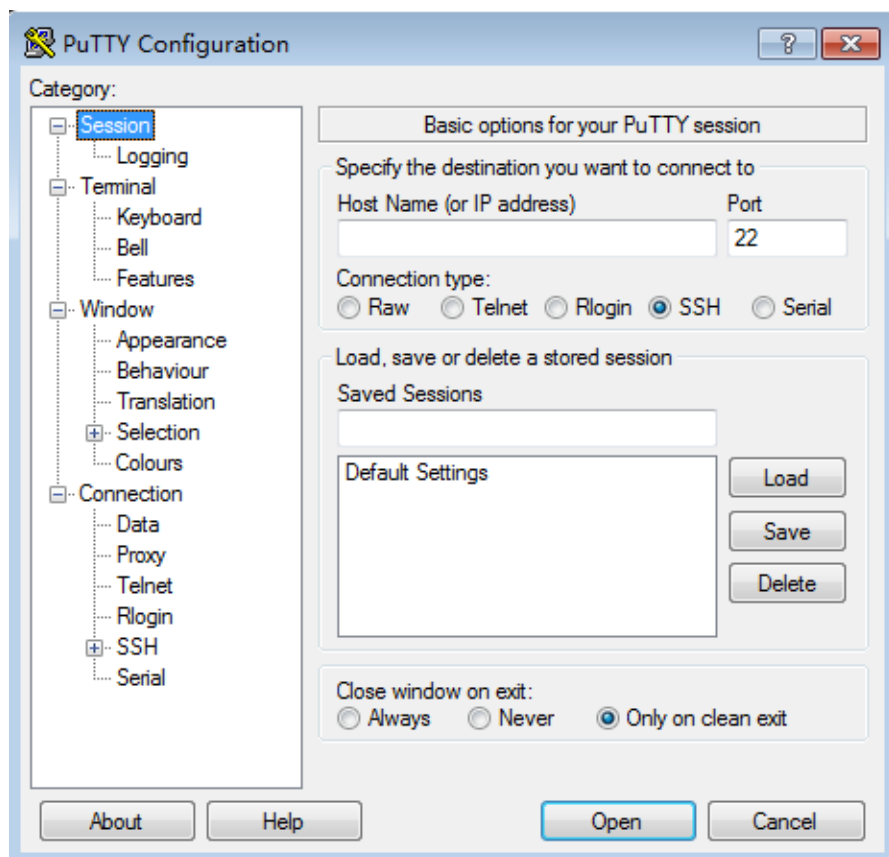

1. Log in to the MRS management console.
2. Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
3. On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
4. Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.
5. Check whether the private key file has been converted to **.ppk** format.
  - If yes, go to **10**.
  - If no, go to **6**.
6. Run PuTTY.
7. In the **Actions** area, click **Load** and import the private key file you used during ECS creation.  
Ensure that the private key file is in the format of **All files (\*.\*)**.
8. Click **Save private key**.
9. Save the converted private key, for example, **kp-123.ppk**, to a local directory.
10. Run PuTTY.
11. Choose **Connection > Data**. Enter the image username in **Auto-login username**.

**NOTE**

The image username for cluster nodes is **root**.

12. Choose **Connection > SSH > Auth**. In the last configuration item **Private key file for authentication**, click **Browse** and select the private key converted in [9](#).
13. Click **Session**.
  - a. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
  - b. **Port**: Enter **22**.
  - c. **Connection Type**: Select **SSH**.
  - d. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

**Figure 9-1** Clicking **Session**

14. Click **Open** to log in to the ECS.

If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

**Logging In to the ECS from Local Linux**

To log in to the Linux ECS from local Linux, perform the operations described in this section. The following procedure uses private key file **kp-123.pem** as an example to log in to the ECS. The name of your private key file may differ.

1. On the Linux CLI, run the following command to change operation permissions:

```
chmod 400 /path/kp-123.pem
```

 NOTE

In the preceding command, *path* refers to the path where the key file is saved.

2. Run the following command to log in to the ECS:

```
ssh -i /path/kp-123.pem Default username@EIP
```

For example, if the default username is **root** and the EIP is **123.123.123.123**, run the following command:

```
ssh -i /path/kp-123.pem root@123.123.123.123
```

 NOTE

- *path* indicates the path where the key file is saved.
- *EIP* indicates the EIP bound to the ECS.
- The image username is **root** for cluster nodes.

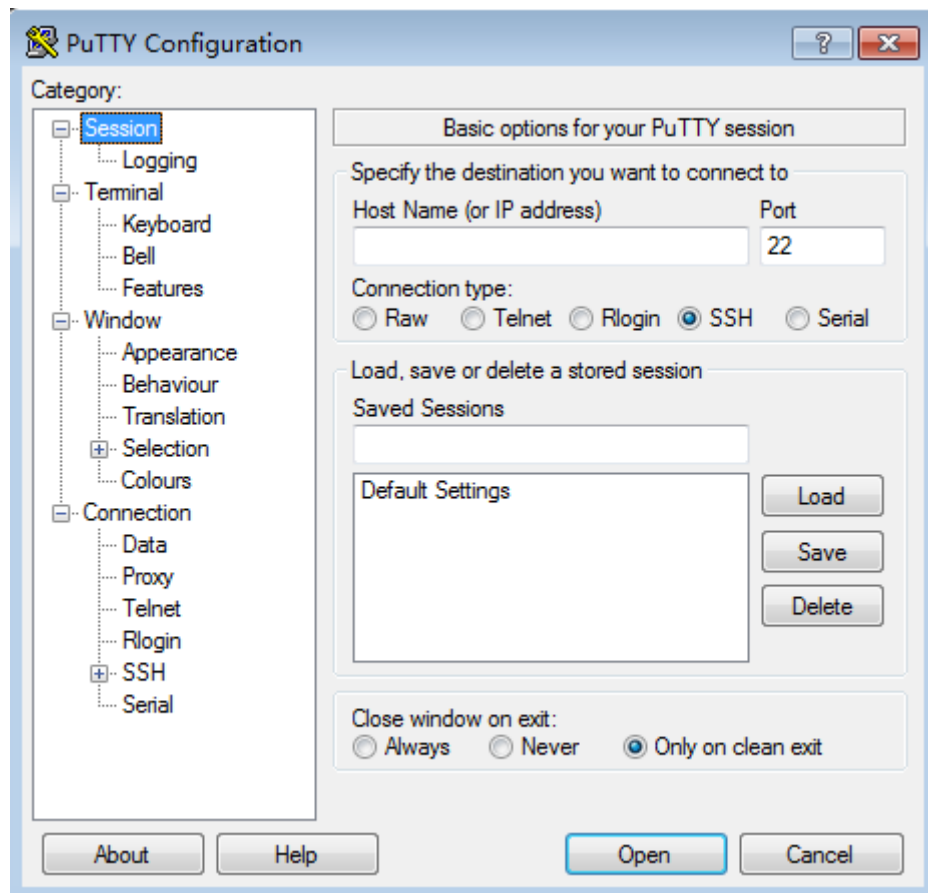

## Logging In to an ECS Using a Password (SSH)

### Logging In to the ECS from Local Windows

To log in to the Linux ECS from local Windows, perform the operations described in this section. The following procedure uses PuTTY as an example to log in to the ECS.

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page.
- Step 3** On the **Nodes** tab page, click the name of a Master node in the Master node group to log in to the ECS management console.
- Step 4** Click the **EIPs** tab, click **Bind EIP** to bind an EIP to the ECS, and record the EIP. If an EIP has been bound to the ECS, skip this step.
- Step 5** Run PuTTY.
- Step 6** Click **Session**.
  1. **Host Name (or IP address)**: Enter the EIP bound to the ECS.
  2. **Port**: Enter **22**.
  3. **Connection Type**: Select **SSH**.
  4. **Saved Sessions**: Task name, which can be clicked for remote connection when you use PuTTY next time

Figure 9-2 Clicking Session

**Step 7** Click **Window** and select **UTF-8** for **Remote character set:** in **Translation**.

**Step 8** Click **Open** to log in to the ECS.

If you log in to the ECS for the first time, PuTTY displays a security warning dialog box, asking you whether to accept the ECS security certificate. Click **Yes** to save the certificate to your local registry.

**Step 9** After the SSH connection to the ECS is set up, enter the username and password as prompted to log in to the ECS.

**NOTE**

The username is **root** and the password is the one you set during cluster creation.

----End

**Logging In to the ECS from Local Linux**

If the local host runs Linux, perform steps **Step 1** to **Step 4** to bind an EIP to the ECS, and run the following command on the CLI to log in to the ECS: **ssh EIP bound by the ECS**

### 9.1.3 Determining Active and Standby Management Nodes of Manager

This section describes how to determine the active and standby management nodes of Manager on the Master1 node.

## Background

You can log in to other nodes in the cluster from the Master node. After logging in to the Master node, you can determine the active and standby management nodes of Manager and run commands on corresponding management nodes.

In active/standby mode, a switchover can be implemented between Master1 and Master2. For this reason, Master1 may not be the active management node for Manager.

## Procedure

**Step 1** Confirm the Master nodes of an MRS cluster.

1. In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a running cluster, and click its name to switch to the cluster details page. View basic information of the specified cluster.
2. On the **Nodes** tab page, view the node name. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.

**Step 2** Determine the active and standby Manager management nodes.

1. Remotely log in to the Master1 node. For details, see [Logging In to an ECS](#). Master nodes support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation.

2. Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

3. Run the following command to identify the active and standby management nodes:

For versions earlier than MRS 3.x, run the **sh \${BIGDATA\_HOME}/om-0.0.1/sbin/status-oms.sh** command.

For MRS 3.x or later: Run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command.

In the command output, the node whose **HActive** is **active** is the active management node (mgtomsdat-sh-3-01-1 in the following example), and the node whose **HActive** is **standby** is the standby management node (mgtomsdat-sh-3-01-2 in the following example).

```
Ha mode
double
NodeName      HostName      HAVersion     StartTime     HActive
HAAllResOK    HARunPhase
192-168-0-30  mgtomsdat-sh-3-01-1  V100R001C01  2014-11-18 23:43:02
active        normal        Activated
192-168-0-24  mgtomsdat-sh-3-01-2  V100R001C01  2014-11-21 07:14:02
standby      normal        Deactivated
```

### NOTE

If the Master1 node to which you have logged in is the standby management node and you need to log in to the active management node, run the following command:

```
ssh IP address of Master2 node
```

----End

## 9.2 Accessing Manager

### 9.2.1 Accessing Manager

#### Scenario

MRS uses Manager to monitor, configure, and manage clusters. You can go to the Manager management page on the MRS console and use the admin account and password configured during cluster creation to log in to Manager.

#### Accessing MRS Manager Using an EIP

**Step 1** Log in to the MRS management console.

**Step 2** In the navigation pane, choose **Clusters > Active Clusters**. Click the target cluster name to access the cluster details page.

**Step 3** Click **Access Manager** next to **MRS Manager**. In the displayed dialog box, set **Access Mode** to **EIP**. For details about **Direct Connect**, see [Access Through Direct Connect](#).

1. If no EIP is bound during cluster creation, select an available EIP from the EIP drop-down list or click **Manage EIP** to create an EIP. If you have bound an EIP when creating a cluster, go to [Step 3.2](#).
2. Select the security group to which the security group rule to be added belongs. The security group is configured when the cluster is created.
3. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. To enable multiple IP address segments to access MRS Manager, see [Step 6](#) to [Step 9](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

#### NOTE

- It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
  - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS Manager.
4. Select the checkbox stating that **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address**.

**Step 4** Click **OK**. The MRS Manager login page is displayed.

**Step 5** Enter the default username **admin** and the password set during cluster creation, and click **Log In**. The MRS Manager page is displayed.

**Step 6** On the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.

#### NOTE

To assign MRS Manager access permissions to other users, follow instructions from [Step 6](#) to [Step 9](#) to add the users' public IP addresses to the trusted range.

**Step 7** Click **Add Security Group Rule** on the right of **EIP**.

**Step 8** On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that the authorized object is a trusted public IP address range. Do not use 0.0.0.0/0. Otherwise, security risks may arise.**

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps [Step 6](#) to [Step 9](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

**Step 9** Click **OK**.

----End

## Accessing MRS Manager Using an ECS

**Step 1** On the MRS management console, click **Clusters**.

**Step 2** On the **Active Clusters** page, click the name of the specified cluster.

Record the **AZ**, **VPC**, and **Security Group** of the cluster.

**Step 3** On the ECS management console, create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, select the standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see **Elastic Cloud Server > User Guide > Getting Started > Creating and Logging In to a Windows ECS**.

### NOTE

If the security group of the ECS is different from **Default Security Group** of the MRS cluster, you can modify the configuration using either of the following methods:

- Change the default security group of the ECS to the security group of the MRS cluster. For details, see **Elastic Cloud Server > User Guide > Security Group > Changing a Security Group**.
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP** and **ports** of the two security group rules to **28443** and **20009**, respectively. For details, see **Virtual Private Cloud > User Guide > Security > Security Group > Adding a Security Group Rule**.

**Step 4** On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see **Virtual Private Cloud > User Guide > Elastic IP > Assigning an EIP and Binding It to an ECS**.

**Step 5** Log in to the ECS.

The Windows system account, password, EIP, and the security group rules are required for logging in to the ECS. For details, see **Elastic Cloud Server > User Guide > Instances > Logging In to a Windows ECS**.

**Step 6** On the Windows remote desktop, use your browser to access Manager.

For example, you can use Internet Explorer 11 in the Windows 2012 OS.

The Manager access address is in the format of **https://Cluster Manager IP Address:28443/web**. Enter the name and password of the MRS cluster user, for example, user **admin**.

 **NOTE**

- To obtain the cluster manager IP address, remotely log in to the Master2 node, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the cluster manager IP address. Record the value of **inet**. If the cluster manager IP address cannot be queried on the Master2 node, switch to the Master1 node to query and record the cluster manager IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- If you access MRS Manager with other MRS cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

**Step 7** Log out of FusionInsight Manager. To log out of Manager, move the cursor to  in the upper right corner and click **Log Out**.

----End

## Changing an EIP for a Cluster

**Step 1** On the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.

**Step 2** View EIPs

**Step 3** Log in to the VPC management console.

**Step 4** Choose **Elastic IP and Bandwidth > EIPs**.

**Step 5** Search for the EIP bound to the MRS cluster and click **Unbind** in the **Operation** column to unbind the EIP from the MRS cluster.

**Step 6** Log in to the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.

EIP on the cluster details page is displayed as **Unbound**.

**Step 7** Click **Access Manager** next to **MRS Manager**. In the displayed dialog box, set **Access Mode** to **EIP**.

**Step 8** Select a new EIP from the EIP drop-down list and configure other parameters. For details, see [Accessing MRS Manager Using an EIP](#).

----End

## Granting the Permission to Access MRS Manager to Other Users

**Step 1** On the MRS management console, choose **Clusters > Active Clusters**, and click the target cluster name to access the cluster details page.

**Step 2** Click **Add Security Group Rule** on the right of **EIP**.

**Step 3** On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that the authorized object is a trusted public IP address range. Do not use 0.0.0.0/0. Otherwise, security risks may arise.**

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps [Step 1](#) to [Step 4](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

**Step 4** Click **OK**.

----End

## 9.2.2 Accessing FusionInsight Manager (MRS 3.x or Later)

### Scenario

In MRS 3.x or later, FusionInsight Manager is used to monitor, configure, and manage clusters. After the cluster is installed, you can use the account to log in to FusionInsight Manager.

#### NOTE

If you cannot log in to the WebUI of the component, access FusionInsight Manager by referring to [Accessing FusionInsight Manager Through an ECS](#).

### Accessing FusionInsight Manager Using an Elastic IP Address

**Step 1** Log in to the MRS management console.

**Step 2** In the navigation pane, choose **Clusters > Active Clusters**. Click the target cluster name to access the cluster details page.

**Step 3** Click **Manage** next to **MRS Manager**. In the displayed dialog box, configure the EIP information.

1. If no EIP is bound during MRS cluster creation, select an available EIP from the EIP drop-down list or click **Manage EIP** to create an EIP. If you have bound an EIP when creating a cluster, go to [Step 3.2](#).
2. Select the security group to which the security group rule to be added belongs. The security group is configured when the cluster is created.
3. Add a security group rule. By default, the filled-in rule is used to access the EIP. To enable multiple IP address segments to access Manager, see steps [Step 6](#) to [Step 9](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.
4. Select the information to be confirmed and click **OK**.

**Step 4** Click **OK**. The Manager login page is displayed.

**Step 5** Enter the default username **admin** and the password set during cluster creation, and click **Log In**. The Manager page is displayed.

**Step 6** On the MRS management console, choose **Clusters > Active Clusters**. Click the target cluster name to access the cluster details page.

 NOTE

To grant other users the permission to access Manager, perform [Step 6](#) to [Step 9](#) to add the users' public IP addresses to the trusted IP address range.

**Step 7** Click **Add Security Group Rule** on the right of **EIP**.

**Step 8** On the **Add Security Group Rule** page, add the IP address segment for users to access the public network and select **I confirm that the authorized object is a trusted public IP address range. Do not use 0.0.0.0/0. Otherwise, security risks may arise.**

By default, the IP address used for accessing the public network is filled. You can change the IP address segment as required. To enable multiple IP address segments, repeat steps [Step 6](#) to [Step 9](#). If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

**Step 9** Click **OK**.

----End

## Accessing FusionInsight Manager Through an ECS

**Step 1** On the MRS management console, click **Clusters**.

**Step 2** On the **Active Clusters** page, click the name of the specified cluster.

Record the **AZ**, **VPC**, **MRS ManagerSecurity Group** of the cluster.

**Step 3** On the homepage of the management console, choose **Service List > Elastic Cloud Server** to switch to the ECS management console and create an ECS.

- The **AZ**, **VPC**, and **Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, a standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see **Elastic Cloud Server > User Guide > Getting Started > Creating and Logging In to a Windows ECS**.

 NOTE

If the security group of the ECS is different from **Default Security Group** of the Master node, you can modify the configuration using either of the following methods:

- Change the security group of the ECS to the default security group of the Master node. For details, see **Elastic Cloud Server > User Guide > Security Group > Changing a Security Group**.
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP**, **Ports** of the two security group rules to **28443** and **20009**, respectively. For details, see **Virtual Private Cloud > User Guide > Security > Security Group > Adding a Security Group Rule**.

**Step 4** On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see **Virtual Private Cloud > User Guide > Elastic IP > Assigning an EIP and Binding It to an ECS**.

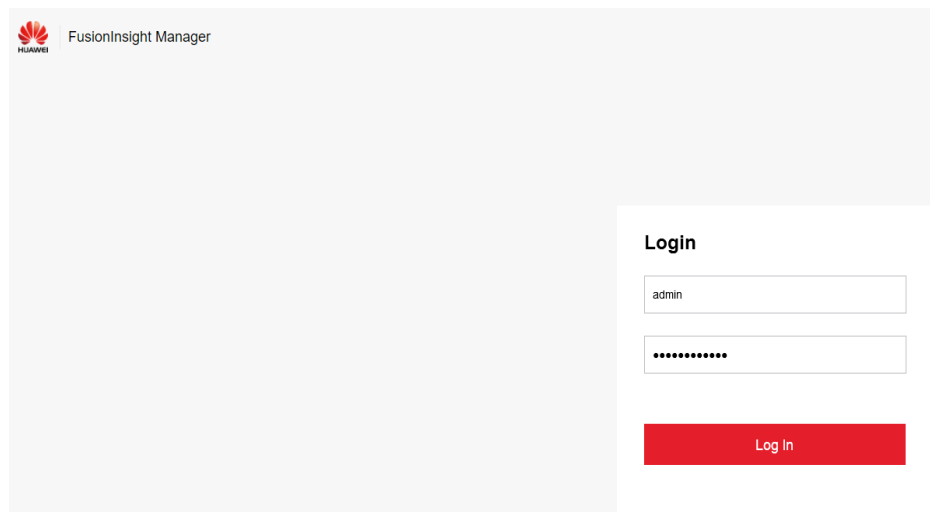

**Step 5** Log in to the ECS.

The Windows system account, password, EIP, and the security group rules are required for logging in to the ECS. For details, see **Elastic Cloud Server > User Guide > Instances > Logging In to a Windows ECS**.

**Step 6** On the Windows remote desktop, use your browser to access Manager.

For example, you can use Internet Explorer 11 in the Windows 2012 OS.

The address for accessing Manager is the address of the **MRS Manager** page. Enter the name and password of the cluster user, for example, user **admin**.

**NOTE**

- If you access Manager with other cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

**Step 7** Log out of FusionInsight Manager. To log out of Manager, move the cursor to  in the upper right corner and click **Log Out**.

----End

## 9.3 Accessing Web Pages of Open Source Components Managed in MRS Clusters

### 9.3.1 Web UIs of Open Source Components

#### Scenario

Web UIs of different components are created and hosted on the Master or Core nodes in the MRS cluster by default. You can view information about the components on these web UIs.

Procedure for accessing the web UIs of open-source component:

1. Select an access method.  
MRS provides the following methods for accessing the web UIs of open-source components:
  - **EIP-based Access:** This method is recommended because it is easy to bind an EIP to a cluster.
  - **Access Using a Windows ECS:** Independent ECSs need to be created and configured.
  - **Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser:** Use this method when the user and the MRS cluster are on different networks.
2. Access the web UIs. For details, see [Table 9-2](#).

## Web UIs

**Table 9-2** Web UI addresses of open-source components

| Cluster Type | Web UI Type | Web UI Address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 9.3.2 List of Open Source Component Ports

### Common HBase Ports

| Parameter              | Default Port | Port Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hbase.master.port      | 16000        | <p>HMaster RPC port. This port is used to connect the HBase client to HMaster.</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>                  |
| hbase.master.info.port | 16010        | <p>HMaster HTTPS port. This port is used by the remote web client to connect to the HMaster UI.</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul> |

| Parameter                          | Default Port | Port Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hbase.region<br>server.port        | 16020        | <p>RegionServer (RS) RPC port. This port is used to connect the HBase client to RegionServer.</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>                                          |
| hbase.region<br>server.info.port   | 16030        | <p>HTTPS port of the Region server. This port is used by the remote web client to connect to the RegionServer UI.</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>                      |
| hbase.thrift.info.port             | 9095         | <p>Thrift Server listening port of Thrift Server. This port is used for:<br/>Listening when the client is connected</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>                    |
| hbase.region<br>server.thrift.port | 9090         | <p>Thrift Server listening port of RegionServer. This port is used for:<br/>Listening when the client is connected to the RegionServer</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul> |

| Parameter            | Default Port | Port Description                                    |
|----------------------|--------------|-----------------------------------------------------|
| hbase.rest.info.port | 8085         | Port of the RegionServer RESTServer native web page |
| -                    | 21309        | REST port of RegionServer RESTServer                |

## Common HDFS Ports

| Parameter              | Default Port                                                                   | Port Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dfs.namenode.rpc.port  | 9820 (For open-source versions earlier than 3.0.0, the default value is 8020.) | <p>NameNode RPC port.</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Communication between the HDFS client and NameNode</li> <li>2. Connection between the DataNode and NameNode</li> </ol> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>          |
| dfs.namenode.http.port | 9870 (The default value is 50070 in versions earlier than open-source 3.0.0.)  | <p>HDFS HTTP port (NameNode).</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Point-to-point NameNode checkpoint operations.</li> <li>2. Connect the remote web client to the NameNode UI.</li> </ol> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul> |

| Parameter               | Default Port                                                                  | Port Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dfs.namenode.https.port | 9871 (50470 is the default value in versions earlier than open-source 3.0.0.) | <p>HDFS HTTPS port (NameNode).</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Point-to-point NameNode checkpoint operations</li> <li>2. Connecting the remote web client to the NameNode UI</li> </ol> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>         |
| dfs.datanode.ipc.port   | 9867 (50020 is the default value in versions earlier than open-source 3.0.0.) | <p>IPC server port of DataNode.</p> <p>This port is used for:</p> <p>Connection between the client and DataNode to perform RPC operations.</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>                                                                                              |
| dfs.datanode.port       | 9866 (50010 is the default value in versions earlier than open-source 3.0.0.) | <p>DataNode data transmission port.</p> <p>This port is used for:</p> <ol style="list-style-type: none"> <li>1. Transmitting data from HDFS client from or to the DataNode</li> <li>2. Point-to-point DataNode data transmission</li> </ol> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul> |

| Parameter                | Default Port                                                                  | Port Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| dfs.datanode.http.port   | 9864 (50075 is the default value in versions earlier than open-source 3.0.0.) | <p>DataNode HTTP port.</p> <p>This port is used for:</p> <p>Connecting to the DataNode from the remote web client in security mode</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul>     |
| dfs.datanode.https.port  | 9865 (50475 is the default value in versions earlier than open-source 3.0.0.) | <p>HTTPS port of DataNode.</p> <p>This port is used for:</p> <p>Connecting to the DataNode from the remote web client in security mode</p> <p><b>NOTE</b></p> <p>The port ID is a recommended value and is specified based on the product. ## Common Hue Ports

| Parameter | Default Port | Port Description                                                                                                                                                                                                                                                                                                |
|-----------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HTTP_PORT | 8888         | <p>Port for Hue to provide HTTPS services. This port is used for: providing web services in HTTPS mode (The port can be modified.)</p> <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul> |

## Common Kafka Ports

| Parameter     | Default Port | Port Description                                                                                |
|---------------|--------------|-------------------------------------------------------------------------------------------------|
| port          | 9092         | Port for a broker to receive data and obtain services                                           |
| ssl.port      | 9093         | SSL port used by a broker to receive data and obtain services                                   |
| sasl.port     | 21007        | SASL security authentication port provided by a broker, which provides the secure Kafka service |
| sasl-ssl.port | 21009        | Port used by a broker to provide encrypted service based on the SASL and SSL protocols          |

## Common Loader Ports

| Parameter         | Default Port | Port Description                                                                                                                                                                                                                                                        |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOADER_HTTPS_PORT | 21351        | <p>This port is used for: providing REST APIs for configuration and running of Loader jobs</p> <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul> |

## Common Manager Ports

| Parameter | Default Port | Port Description                                                                                                                                                                                                                                                                    |
|-----------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -         | 8080         | <p>Port provided by WebService for user access.<br/>This port is used to access the web UI over HTTP.</p> <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul>  |
| -         | 28443        | <p>Port provided by WebService for user access.<br/>This port is used to access the web UI over HTTPS.</p> <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul> |

## Common MapReduce Ports

| Parameter                        | Default Port | Port Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| mapreduce.jobhistory.webapp.port | 19888        | <p>Web HTTP port of the JobHistory server.<br/>This port is used for: viewing the web page of the JobHistory server</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul>                                                                                           |
| mapreduce.jobhistory.port        | 10020        | <p>Port of the JobHistory server.<br/>This port is used for:</p> <ol style="list-style-type: none"> <li>Task data restoration in the MapReduce client</li> <li>Obtaining task report in the Job client</li> </ol> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>Is the port enabled by default during the installation: Yes</li> <li>Is the port enabled after security hardening: Yes</li> </ul> |

| Parameter                              | Default Port | Port Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| kdc_ports | 21732        | <p>Kerberos server port.</p> <p>This port is used for:<br/>Performing Kerberos authentication for components This parameter may be used during the configuration of mutual trust between clusters.</p> <p><b>NOTE</b><br/>The port ID is a recommended value and is specified based on the product. The port range is not restricted in the code.</p> <ul style="list-style-type: none"> <li>• Is the port enabled by default during the installation: Yes</li> <li>• Is the port enabled after security hardening: Yes</li> </ul> |

## Common OpenTSDB Ports

| Parameter        | Default Port | Port Description                                                                                                            |
|------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------|
| tsd.network.port | 4242         | Web UI port of OpenTSDB.<br>This port is used for: HTTPS/HTTP communication between web requests and the OpenTSDB UI server |

## Common Tez Ports

| Parameter   | Default Port | Port Description   |
|-------------|--------------|--------------------|
| tez.ui.port | 28888        | Web UI port of Tez |

## Common KafkaManager Ports

| Parameter          | Default Port | Port Description             |
|--------------------|--------------|------------------------------|
| kafka_manager_port | 9099         | Web UI port of KafkaManager. |

## Common Presto Ports

| Parameter              | Default Port | Port Description                                                           |
|------------------------|--------------|----------------------------------------------------------------------------|
| http-server.http.port  | 7520         | HTTP port of Presto coordinator to provide services for external entities  |
| http-server.https.port | 7521         | HTTPS port of Presto coordinator to provide services for external entities |

| Parameter              | Default Port | Port Description                                                           |
|------------------------|--------------|----------------------------------------------------------------------------|
| http-server.http.port  | 7530         | HTTP port used by Presto worker to provide services for external entities  |
| http-server.https.port | 7531         | HTTPS port used by Presto worker to provide services for external entities |

### Common Flink Ports

| Parameter           | Default Port | Port Description                                                                                                          |
|---------------------|--------------|---------------------------------------------------------------------------------------------------------------------------|
| jobmanager.web.port | 32261-32325  | Web UI port of Flink.<br>This port is used for: HTTP/HTTPS communication between the client web requests and Flink server |

### 9.3.3 Access Through Direct Connect

MRS allows you to access MRS clusters using Direct Connect. Direct Connect is a high-speed, low-latency, stable, and secure dedicated network connection that connects your local data center to an online cloud VPC. It extends online cloud services and existing IT facilities to build a flexible, scalable hybrid cloud computing environment.

#### Prerequisites

Direct Connect is available, and the connection between the local data center and the online VPC has been established.

#### Accessing an MRS Cluster Using Direct Connect

- Step 1** Log in to the MRS console.
- Step 2** Click the name of the cluster to enter its details page.
- Step 3** On the **Dashboard** tab page of the cluster details page, click **Access Manager** next to **MRS Manager**.
- Step 4** Set **Access Mode** to **Direct Connect** and select **I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection**.

The floating IP address is automatically allocated by MRS to access MRS Manager. Before using Direct Connect to access MRS Manager, ensure that the connection between the local data center and the online VPC has been established.

- Step 5** Click **OK**. The MRS Manager login page is displayed. Enter the username **admin** and the password set during cluster creation.

----End

## Switching the MRS Manager Access Mode

To facilitate user operations, the browser cache records the selected Manager access mode. To change the access mode, perform the following steps:

- Step 1** Log in to the MRS console.

- Step 2** Click the name of the cluster to enter its details page.

- Step 3** On the **Dashboard** tab page of the cluster details page, click  next to **MRS Manager**.

- Step 4** On the displayed page, set **Access Mode**.

- To change **EIP** to **Direct Connect**, ensure that the network for direct connections is available, set **Access Mode** to **Direct Connect**, and select **I confirm that the network between the local PC and the floating IP address is connected and that MRS Manager is accessible using the Direct Connect connection**. Click **OK**.
- To change **Direct Connect** to **EIP**, set **Access Mode** to **EIP** and configure the EIP by referring to [Accessing MRS Manager Using an EIP](#). If a public IP address has been configured for the cluster, click **OK** to access MRS Manager using an EIP.

----End

### 9.3.4 EIP-based Access

You can bind an EIP to a cluster to access the web UIs of the open-source components managed in the MRS cluster. This method is simple and easy to use and is recommended for accessing the web UIs of the open-source components.

#### Binding an EIP to a Cluster and Adding a Security Group Rule

1. On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users. After the IAM users are synchronized, the **Components** tab is available.
2. Click **Access Manager** on the right of **MRS Manager**.
3. The page for accessing MRS Manager is displayed. Bind an EIP and add a security group rule. Perform the following operations only when you access the web UIs of the open-source components of the cluster for the first time.
  - a. Select an available EIP from the EIP drop-down list to bind it. If there is no available EIP, click **Manage EIP** to create an EIP. If an EIP has been bound during cluster creation, skip this step.

- b. Select the security group to which the security group rule to be added belongs. The security group is configured when the group is created.
- c. Add a security group rule. By default, your public IP address used for accessing port 9022 is filled in the rule. If you want to view, modify, or delete a security group rule, click **Manage Security Group Rule**.

 NOTE

- It is normal that the automatically generated public IP address is different from the local IP address and no action is required.
  - If port 9022 is a Knox port, you need to enable the permission of port 9022 to access Knox for accessing MRS components.
- d. Select the checkbox stating that **I confirm that xx.xx.xx.xx is a trusted public IP address and MRS Manager can be accessed using this IP address**.
  - e. Click **OK**. The component login page is displayed. Enter the username **admin** and the password set during cluster creation.
4. Log in to FusionInsight Manager and choose **Cluster > Services > HDFS**. On the displayed page, click **NameNode(Host name, active)** to access the HDFS web UI. The HDFS NameNode is used as an example. For details about the web UIs of other components, see [Web UIs of Open Source Components](#).

### 9.3.5 Access Using a Windows ECS

MRS allows you to access the web UIs of open-source components through a Windows ECS. This method is complex and is recommended for MRS clusters that do not support the EIP function.

**Step 1** On the MRS management console, click **Clusters**.

**Step 2** On the **Active Clusters** page, click the name of the specified cluster.

On the cluster details page, record the **AZ, VPC, Cluster Manager IP Address, and Security Group** of the cluster.

 NOTE

To obtain the cluster manager IP address, remotely log in to the Master2 node, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the cluster manager IP address. Record the value of **inet**. If the cluster manager IP address cannot be queried on the Master2 node, switch to the Master1 node to query and record the cluster manager IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.

**Step 3** On the ECS management console, create an ECS.

- The **AZ, VPC, and Security Group** of the ECS must be the same as those of the cluster to be accessed.
- Select a Windows public image. For example, select the standard image **Windows Server 2012 R2 Standard 64bit(40GB)**.
- For details about other configuration parameters, see **Elastic Cloud Server > User Guide > Getting Started > Creating and Logging In to a Windows ECS**.

 NOTE

If the security group of the ECS is different from **Security Group** of the MRS cluster, you can modify the configuration using either of the following methods:

- Change the security group of the ECS to the security group of the MRS cluster. For details, see **Elastic Cloud Server > User Guide > Security Group > Changing a Security Group**.
- Add two security group rules to the security groups of the Master and Core nodes to enable the ECS to access the cluster. Set **Protocol** to **TCP** and **ports** of the two security group rules to **28443** and **20009**, respectively. For details, see **Cloud > User Guide > Security > Security Group > Adding a Security Group Rule**.

**Step 4** On the VPC management console, apply for an EIP and bind it to the ECS.

For details, see **Virtual Private Cloud > User Guide > Elastic IP > Assigning an EIP and Binding It to an ECS**.

**Step 5** Log in to the ECS.

The Windows system account, password, EIP, and the security group rules are required for logging in to the ECS. For details, see **Elastic Cloud Server > User Guide > Instances > Logging In to a Windows ECS**.

**Step 6** On the Windows remote desktop, use your browser to access Manager.

For example, you can use Internet Explorer 11 in the Windows 2012 OS.

The MRS Manager access address is in the format of **https://Cluster Manager IP Address:28443/web**. Enter the name and password of the MRS cluster user, for example, user **admin**.

 NOTE

- To obtain the cluster manager IP address, remotely log in to the Master2 node, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the cluster manager IP address. Record the value of **inet**. If the cluster manager IP address cannot be queried on the Master2 node, switch to the Master1 node to query and record the cluster manager IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
- If you access MRS Manager with other MRS cluster usernames, change the password upon your first access. The new password must meet the requirements of the current password complexity policies.
- By default, a user is locked after inputting an incorrect password five consecutive times. The user is automatically unlocked after 5 minutes.

**Step 7** Visit the web UIs of the open-source components by referring to the addresses listed in [Web UIs of Open Source Components](#).

----End

## Related Tasks

### Configuring the Mapping Between Cluster Node Names and IP Addresses

**Step 1** Log in to MRS Manager, and choose **Host Management**.

Record the host names and management IP addresses of all nodes in the cluster.

**Step 2** In the work environment, use Notepad to open the **hosts** file and add the mapping between node names and IP addresses to the file.

Fill in one row for each mapping relationship, as shown in the following figure.

```
192.168.4.127 node-core-Jh3ER
192.168.4.225 node-master2-PaWVE
192.168.4.19 node-core-mtZ81
192.168.4.33 node-master1-zbYN8
192.168.4.233 node-core-7KoGY
```

Save the modifications.

----End

## 9.3.6 Creating an SSH Channel for Connecting to an MRS Cluster and Configuring the Browser

### Scenario

Users and an MRS cluster are in different networks. As a result, an SSH channel needs to be created to send users' requests for accessing websites to the MRS cluster and dynamically forward them to the target websites.

The MAC system does not support this function. For details about how to access MRS, see [EIP-based Access](#).

### Prerequisites

- You have prepared an SSH client for creating the SSH channel, for example, the Git open-source SSH client. You have downloaded and installed the client.
- You have created a cluster and prepared a key file in PEM format or obtained the password used during cluster creation.
- Users can access the Internet on the local PC.

### Procedure

**Step 1** Log in to the MRS management console and choose **Clusters > Active Clusters**.

**Step 2** Click the specified MRS cluster name.

Record the security group of the cluster.

**Step 3** Add an inbound rule to the security group of the Master node to allow data access to the IP address of the MRS cluster through port 22.

For details, see **Virtual Private Cloud > User Guide > Security > Security Group > Adding a Security Group Rule**.

**Step 4** Query the primary management node of the cluster. For details, see [Determining Active and Standby Management Nodes of Manager](#).

**Step 5** Bind an elastic IP address to the primary management node.

For details, see **Virtual Private Cloud > User Guide > Elastic IP > Assigning an EIP and Binding It to an ECS**.

**Step 6** Start Git Bash locally and run the following command to log in to the active management node of the cluster: **ssh root@Elastic IP address** or **ssh -i Path of the key file root@Elastic IP address**.

**Step 7** Run the following command to view data forwarding configurations:

```
cat /etc/sysctl.conf | grep net.ipv4.ip_forward
```

- If **net.ipv4.ip\_forward=1** is displayed, the forwarding function has been configured. Go to [Step 9](#).
- If **net.ipv4.ip\_forward=0** is displayed, the forwarding function has not been configured. Go to [Step 8](#).
- If **net.ipv4.ip\_forward** fails to be queried, this parameter has not been configured. Run the following command and then go to [Step 9](#):  

```
echo "net.ipv4.ip_forward = 1" >> /etc/sysctl.conf
```

**Step 8** Modify forwarding configurations on the node.

1. Run the following command to switch to user **root**:

```
sudo su - root
```

2. Run the following commands to modify forwarding configurations:

```
echo 1 > /proc/sys/net/ipv4/ip_forward
```

```
sed -i "s/net.ipv4.ip_forward=0/net.ipv4.ip_forward = 1/g" /etc/sysctl.conf  
sysctl -w net.ipv4.ip_forward=1
```

3. Run the following command to modify the **sshd** configuration file:

```
vi /etc/ssh/sshd_config
```

Press **I** to enter the edit mode. Locate **AllowTcpForwarding** and **GatewayPorts** and delete comment tags. Modify them as follows. Save the changes and exit.

```
AllowTcpForwarding yes  
GatewayPorts yes
```

4. Run the following command to restart the **sshd** service:

```
service sshd restart
```

**Step 9** Run the following command to view the floating IP address:

```
ifconfig
```

In the command output, **eth0:FI\_HUE** indicates the floating IP address of Hue and **eth0:wsom** specifies the floating IP address of Manager. Record the value of **inet**.

Run the **exit** command to exit.

**Step 10** Run the following command on the local PC to create an SSH channel supporting dynamic port forwarding:

```
ssh -i Path of the key file -v -ND Local port root@Elastic IP address or ssh -v -ND Local port root@Elastic IP address. After running the command, enter the password you set when you create the cluster.
```

In the command, set **Local port** to the user's local port that is not occupied. Port **8157** is recommended.

After the SSH channel is created, add **-D** to the command and run the command to start the dynamic port forwarding function. By default, the dynamic port forwarding function enables a SOCKS proxy process and monitors the user's local port. Port data will be forwarded to the primary management node using the SSH channel.

**Step 11** Run the following command to configure the browser proxy.

1. Go to the Google Chrome client installation directory on the local PC.
2. Press **Shift** and right-click the blank area, choose **Open Command Window Here** and enter the following command:

```
chrome --proxy-server="socks5://localhost:8157" --host-resolver-rules="MAP * 0.0.0.0 , EXCLUDE localhost" --user-data-dir=c:/tmp/path --proxy-bypass-list="*google*.com,*gstatic.com,*gvt*.com,*:80"
```

 **NOTE**

- In the preceding command, **8157** is the local proxy port configured in [Step 10](#).
- If the local OS is Windows 10, start the Windows OS, click **Start** and enter **cmd**. In the displayed CLI, run the command in [Step 11.2](#). If this method fails, click **Start**, enter the command in the search box, and run the command in [Step 11.2](#).

**Step 12** In the address box of the browser, enter the address for accessing Manager.

Address format: **https://Floating IP address of FusionInsight Manager:28443/web**

The username and password of the MRS cluster need to be entered for accessing clusters with Kerberos authentication enabled, for example, user **admin**. They are not required for accessing clusters with Kerberos authentication disabled.

When accessing Manager for the first time, you must add the address to the trusted site list.

**Step 13** Prepare the website access address.

1. Obtain the website address format and the role instance according to [Web UIs](#).
2. Click **Services**.
3. Click the specified service name, for example, HDFS.
4. Click **Instance** and view **Service IP Address of NameNode(Active)**.

**Step 14** In the address bar of the browser, enter the website address to access it.

**Step 15** When logging out of the website, terminate and close the SSH tunnel.

----End

# 10 Using an MRS Client

---

## 10.1 Installing a Client

### 10.1.1 Installing a Client (Version 3.x or Later)

#### Scenario

This section describes how to install clients of all services (excluding Flume) in an MRS cluster. For details about how to install the Flume client, see [Installing the Flume Client](#).

A client can be installed on a node inside or outside the cluster. This section uses the installation directory `/opt/hadoopclient` as an example. Replace it to the actual one.

#### Prerequisites

- An installation directory will be automatically created if it does not exist. If the directory exists, it must be empty. The directory path cannot contain any space.
- If a server outside the cluster is used as the client node, ensure that the node can communicate with the cluster service plane. Otherwise, client installation will fail.

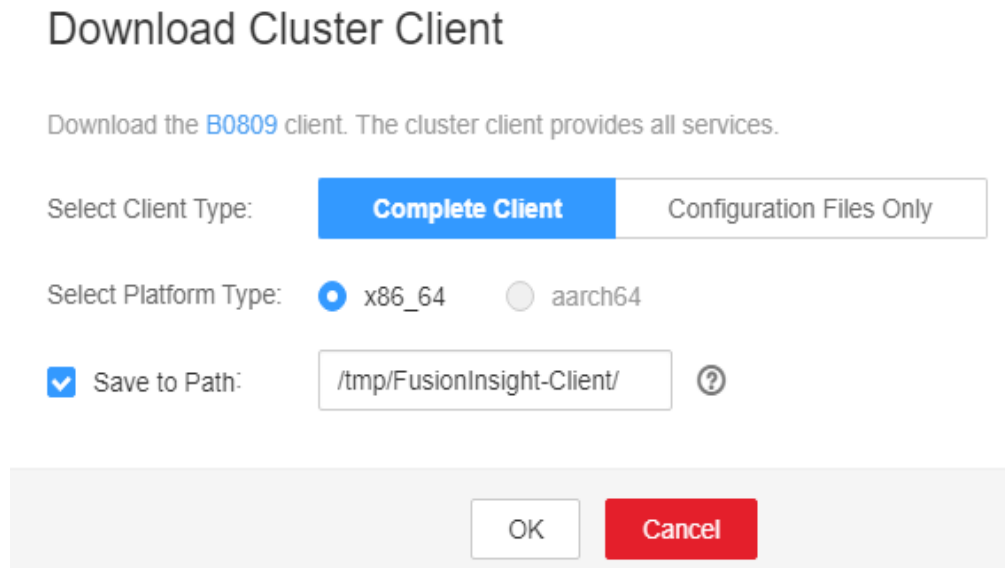

#### Installing a Client

1. Obtain the software package.

Log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Click the name of the cluster to be operated in the **Cluster** drop-down list.

Choose **More > Download Client**. The **Download Cluster Client** dialog box is displayed.

**Figure 10-1** Downloading a client

**NOTE**

In the scenario where only one client is to be installed, choose **Cluster > Service > Service name > More > Download Client**. The **Download Client** dialog box is displayed.

2. Set the client type to **Complete Client**.

**Configuration Files Only** is to download client configuration files in the following scenario: After a complete client is downloaded and installed and MRS cluster administrators modify server configurations on Manager, developers need to update the configuration files during application development.

The platform type can be set to **x86\_64** or **aarch64**.

- **x86\_64**: indicates the client software package that can be deployed on the x86 platform.
- **aarch64**: indicates the client software package that can be deployed on the TaiShan server.

**NOTE**

The cluster supports two types of clients: **x86\_64** and **aarch64**. The client type must match the architecture of the node to be installed. Otherwise, client installation will fail.

3. Determine whether to generate a client file on the cluster node.
  - If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directories. Click **OK** and copy the software package to the file directory, for example, **/opt/Bigdata/client**, on the server where the client is to be installed as user **omm** or **root**. Then go to 5.

 NOTE

If you cannot obtain permissions of user **root**, use user **omm**.

- If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete and go to 4.
4. Upload the software package.

Use WinSCP to upload the obtained software package as the user (such as **user\_client**) who prepares for the installation, to the directory (such as **/opt/Bigdata/client**) of the server where the client is to be installed.

The format of the client software package name is as follows:  
**FusionInsight\_Cluster\_<Cluster ID>\_Services\_Client.tar**.

The following steps and sections use **FusionInsight\_Cluster\_1\_Services\_Client.tar** as an example.

 NOTE

The host where the client is to be installed can be a node inside or outside the cluster. If the node is a server outside the cluster, it must be able to communicate with the cluster, and the NTP service must be enabled to ensure that the time is the same as that on the server.

For example, you can configure the same NTP clock source for external servers as that of the cluster. After the configuration, you can run the **ntpq -np** command to check whether the time is synchronized.

- If there is an asterisk (\*) before the IP address of the NTP clock source in the command output, the synchronization is normal. For example:

```
remote refid st t when poll reach delay offset jitter
=====
=====
*10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
```

- If there is no asterisk (\*) before the IP address of the NTP clock source and the value of **refid** is **.INIT.**, or if the command output is abnormal, the synchronization is abnormal. Contact technical support.

```
remote refid st t when poll reach delay offset jitter
=====
=====
10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
```

You can also configure the same chrony clock source for external servers as that for the cluster. After the configuration, run the **chronyc sources** command to check whether the time is synchronized.

- In the command output, if there is an asterisk (\*) before the IP address of the chrony service on the active OMS node, the synchronization is normal. For example:

```
MS Name/IP address      Stratum Poll Reach LastRx Last sample
=====
=====
^* 10.10.10.162          10 10 377 626 +16us[ +15us] +/- 308us
```

- In the command output, if there is no asterisk (\*) before the IP address of the NTP service on the active OMS node, and the value of **Reach** is **0**, the synchronization is abnormal.

```
MS Name/IP address      Stratum Poll Reach LastRx Last sample
=====
=====
^? 10.1.1.1              0 10 0 - +0ns[ +0ns] +/- 0ns
```

- 5. Log in to the server where the client software package is located as user **user\_client**.
- 6. Decompress the software package.

Go to the directory where the installation package is stored, such as **/opt/Bigdata/client**. Run the following command to decompress the installation package to a local directory:

```
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```

7. Verify the software package.

Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file.

```
sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Services_Client.tar: OK
```

8. Decompress the obtained installation file.

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar
```

9. Configure network connections for the client.

- a. Ensure that the host where the client is installed can communicate with the hosts listed in the **hosts** file (for example, **/opt/Bigdata/client/FusionInsight\_Cluster\_<Cluster ID>\_Services\_ClientConfig/hosts**).
- b. If the host where the client is installed is not a host in the cluster, you need to set the mapping between the host name and the service plane IP address for each cluster node in **/etc/hosts**, user **root** rights are required to modify the file. Each host name uniquely maps an IP address. You can perform the following steps to import the domain name mapping of the cluster to the **hosts** file:
  - i. Switch to user **root** or a user who has the permission to modify the **hosts** file.

```
su - root
```
  - ii. Go to the directory where the client package is decompressed.

```
cd /opt/Bigdata/client/  
FusionInsight_Cluster_1_Services_ClientConfig
```
  - iii. Run the **cat realm.ini >> /etc/hosts** command to import the domain name mapping to the **hosts** file.

#### NOTE

- If the host where the client is installed is not a node in the cluster, configure network connections for the client to prevent errors when you run commands on the client.
  - If Spark tasks are executed in yarn-client mode, add the **spark.driver.host** parameter to the file *Client installation directory/Spark/spark/conf/spark-defaults.conf* and set the parameter to the client IP address.
  - If the yarn-client mode is used, you need to configure the mapping between the IP address and host name of the client in the **hosts** file on the active and standby Yarn nodes (ResourceManager nodes in the cluster) to make sure that the Spark web UI is properly displayed.
10. Go to the directory where the installation package is stored, and run the following command to install the client to a specified directory (an absolute path), for example, **/opt/hadoopclient**:

```
cd /opt/Bigdata/client/FusionInsight_Cluster_1_Services_ClientConfig
```

Run the `./install.sh /opt/hadoopclient` command to install the client. The client is successfully installed if information similar to the following is displayed:

```
The component client is installed successfully
```

#### NOTE

- If the clients of all or some services use the `/opt/hadoopclient` directory, other directories must be used when you install other service clients.
- You must delete the client installation directory when uninstalling a client.
- To ensure that an installed client can only be used by the installation user (for example, `user_client`), add parameter `-o` during the installation. That is, run the `./install.sh /opt/hadoopclient -o` command to install the client.
- If the NTP server is to be installed in `chrony` mode, ensure that the parameter `chrony` is added during the installation, that is, run the `command ./install.sh /opt/hadoopclient -o chrony` to install the client.
- If an HBase client is installed, it is recommended that the client installation directory contain only uppercase and lowercase letters, digits, and characters (`[-?.@+=]`) due to the limitation of the Ruby syntax used by HBase.
- If the client node is a server outside the cluster and cannot communicate with the service plane IP address of the active OMS node or cannot access port 20029 of the active OMS node, the client can be successfully installed but cannot be registered with the cluster or displayed on the GUI.

## Using a Client

1. On the node where the client is installed, run the `sudo su - omm` command to switch the user. Run the following command to go to the client directory:  
`cd /opt/hadoopclient`
2. Run the following command to configure environment variables:  
`source bigdata_env`
3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: `kinit admin`

#### NOTE

User `admin` is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

4. Run the client command of a component directly.  
For example, run the `hdfs dfs -ls /` command to view files in the HDFS root directory.

## 10.1.2 Installing a Client (Versions Earlier Than 3.x)

### Scenario

An MRS client is required. The MRS cluster client can be installed on the Master or Core node in the cluster or on a node outside the cluster.

After a cluster of versions earlier than MRS 3.x is created, a client is installed on the active Master node by default. You can directly use the client. The installation directory is `/opt/client`.

For details about how to install a client of MRS 3.x or later, see [Installing a Client \(Version 3.x or Later\)](#).

#### NOTE

If a client has been installed on the node outside the MRS cluster and the client only needs to be updated, update the client using the user who installed the client, for example, user `root`.

## Prerequisites

- An ECS has been prepared. For details about the OS and its version of the ECS, see [Table 10-1](#).

**Table 10-1** Reference list

| OS      | Supported Version                                                                                                                          |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------|
| EulerOS | <ul style="list-style-type: none"><li>• Available: EulerOS 2.2</li><li>• Available: EulerOS 2.3</li><li>• Available: EulerOS 2.5</li></ul> |

For example, a user can select an ECS running the EulerOS.

In addition, sufficient disk space is allocated for the ECS, for example, **40GB**.

- The ECS and the MRS cluster are in the same VPC.
- The security group of the ECS is the same as that of the Master node of the MRS cluster.

If this requirement is not met, modify the ECS security group or configure the inbound and outbound rules of the ECS security group to allow the ECS security group to be accessed by all security groups of MRS cluster nodes.

- To enable users to log in to a Linux ECS using a password (SSH), see [Instances > Logging In to a Linux ECS > Login Using an SSH Password](#) in the *Elastic Cloud Server User Guide*.

## Installing a Client on the Core Node

1. Log in to MRS Manager and choose **Services > Download Client** to download the client installation package to the active management node.

#### NOTE

If only the client configuration file needs to be updated, see method 2 in [Updating a Client \(Versions Earlier Than 3.x\)](#).

2. Use the IP address to search for the active management node, and log in to the active management node using VNC.
3. Log in to the active management node, and run the following command to switch the user:

**sudo su - omm**

4. On the MRS management console, view the IP address on the **Nodes** tab page of the specified cluster.

Record the IP address of the Core node where the client is to be used.

5. On the active management node, run the following command to copy the client installation package to the Core node:

```
scp -p /tmp/MRS-client/MRS_Services_Client.tar IP address of the Core node:///opt/client
```

6. Log in to the Core node as user **root**.

Master nodes support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation.

7. Run the following commands to install the client:

```
cd /opt/client
```

```
tar -xvf MRS_Services_Client.tar
```

```
tar -xvf MRS_Services_ClientConfig.tar
```

```
cd /opt/client/MRS_Services_ClientConfig
```

```
./install.sh Client installation directory
```

For example, run the following command:

```
./install.sh /opt/client
```

8. For details about how to use the client, see [Using an MRS Client](#).

## Using an MRS Client

1. On the node where the client is installed, run the **sudo su - omm** command to switch the user. Run the following command to go to the client directory:

```
cd /opt/client
```

2. Run the following command to configure environment variables:

```
source bigdata_env
```

3. If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

 **NOTE**

User **admin** is created by default for MRS clusters with Kerberos authentication enabled and is used for administrators to maintain the clusters.

4. Run the client command of a component directly.

For example, run the **hdfs dfs -ls /** command to view files in the HDFS root directory.

## Installing a Client on a Node Outside the Cluster

**Step 1** Create an ECS that meets the requirements in the prerequisites.

**Step 2** Log in to MRS Manager. For details, see [Accessing Manager](#). Then, choose **Services**.

**Step 3** Click **Download Client**.

**Step 4** In **Client Type**, select **All client files**.

**Step 5** In **Download To**, select **Remote host**.

**Step 6** Set **Host IP Address** to the IP address of the ECS, **Host Port** to **22**, and **Save Path** to **/tmp**.

- If the default port **22** for logging in to an ECS using SSH has been changed, set **Host Port** to the new port.
- **Save Path** contains a maximum of 256 characters.

**Step 7** Set **Login User** to **root**.

If other users are used, ensure that the users have read, write, and execute permission on the save path.

**Step 8** Select **Password** or **SSH Private Key** for **Login Mode**.

- **Password**: Enter the password of user **root** set during cluster creation.
- **SSH Private Key**: Select and upload the key file used for creating the cluster.

**Step 9** Click **OK** to generate a client file.

If the following information is displayed, the client package is saved. Click **Close**. Obtain the client file from the save path on the remote host that is set when the client is downloaded.

Client files downloaded to the remote host successfully.

If the following information is displayed, check the username, password, and security group configurations of the remote host. Ensure that the username and password are correct and an inbound rule of the SSH (22) port has been added to the security group of the remote host. And then, go to [Step 2](#) to download the client again.

Failed to connect to the server. Please check the network connection or parameter settings.

 **NOTE**

Generating a client will occupy a large number of disk I/Os. You are advised not to download a client when the cluster is being installed, started, and patched, or in other unstable states.

**Step 10** Log in to the ECS using VNC. For details, see **Instances > Logging In to a Linux > Login Using VNC** in the *Elastic Cloud Server User Guide*.

All images support Cloud-Init. The preset username for Cloud-Init is **root** and the password is the one you set during cluster creation. It is recommended that you change the password upon the first login.

**Step 11** Perform NTP time synchronization to synchronize the time of nodes outside the cluster with the time of the MRS cluster.

1. Check whether the NTP service is installed. If it is not installed, run the **yum install ntp -y** command to install it.
2. Run the **vim /etc/ntp.conf** command to edit the NTP client configuration file, add the IP address of the Master node in the MRS cluster, and comment out the IP addresses of other servers.

```
server master1_ip prefer
server master2_ip
```

**Figure 10-2** Adding the Master node IP addresses

```
# For more information about this file, see the man pages
# ntp.conf(5), ntp_acc(5), ntp_auth(5), ntp_clock(5), ntp_misc(5), ntp_mon(5).

driftfile /var/lib/ntp/drift

# Permit time synchronization with our time source, but do not
# permit the source to query or modify the service on this system.
restrict default nomodify notrap nopeer noquery

# Permit all access over the loopback interface. This could
# be tightened as well, but to do so would effect some of
# the administrative functions.
restrict 127.0.0.1
restrict ::1

# Hosts on local network are less restricted.
#restrict 192.168.1.0 mask 255.255.255.0 nomodify notrap

# Use public servers from the pool.ntp.org project.
# Please consider joining the pool (http://www.pool.ntp.org/join.html).
#server 0.centos.pool.ntp.org iburst
#server 1.centos.pool.ntp.org iburst
#server 2.centos.pool.ntp.org iburst
#server 3.centos.pool.ntp.org iburst

#broadcast 192.168.1.255 autokey # broadcast server
#broadcastclient # broadcast client
#broadcast [redacted] autokey # multicast server
#multicastclient [redacted] # multicast client
#manycastserver # manycast server
#manycastclient [redacted] autokey # manycast client
#
# Enable public key cryptography.
#crypto
```

3. Run the **service ntpd stop** command to stop the NTP service.
4. Run the **/usr/sbin/ntpdate IP address of the active Master node** command to manually synchronize the time.
5. Run the **service ntpd start** or **systemctl restart ntpd** command to start the NTP service.
6. Run the **ntpstat** command to check the time synchronization result:

**Step 12** On the ECS, switch to user **root** and copy the installation package in **Save Path** in **Step 6** to the **/opt** directory. For example, if **Save Path** is set to **/tmp**, run the following commands:

```
sudo su - root
```

```
cp /tmp/MRS_Services_Client.tar /opt
```

**Step 13** Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

```
tar -xvf MRS_Services_Client.tar
```

**Step 14** Run the following command to verify the configuration file package of the client:

```
sha256sum -c MRS_Services_ClientConfig.tar.sha256
```

The command output is as follows:

```
MRS_Services_ClientConfig.tar: OK
```

**Step 15** Run the following command to decompress **MRS\_Services\_ClientConfig.tar**:

```
tar -xvf MRS_Services_ClientConfig.tar
```

**Step 16** Run the following command to install the client to a new directory, for example, **/opt/Bigdata/client**. A directory is automatically generated during the client installation.

```
sh /opt/MRS_Services_ClientConfig/install.sh /opt/Bigdata/client
```

If the following information is displayed, the client has been successfully installed:

```
Components client installation is complete.
```

**Step 17** Check whether the IP address of the ECS node is connected to the IP address of the cluster Master node.

For example, run the following command: **ping** *Master node IP address*.

- If yes, go to **Step 18**.
- If no, check whether the VPC and security group are correct and whether the ECS and the MRS cluster are in the same VPC and security group, and go to **Step 18**.

**Step 18** Run the following command to configure environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

**Step 19** If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

**Step 20** Run the client command of a component.

For example, run the following command to query the HDFS directory:

```
hdfs dfs -ls /
```

```
----End
```

## 10.2 Updating a Client

### 10.2.1 Updating a Client (Version 3.x or Later)

A cluster provides a client for you to connect to a server, view task results, or manage data. If you modify service configuration parameters on Manager and restart the service, you need to download and install the client again or use the configuration file to update the client.

#### Updating the Client Configuration

**Method 1:**

- Step 1** Log in to FusionInsight Manager. For details, see [Accessing FusionInsight Manager \(MRS 3.x or Later\)](#). Click the name of the cluster to be operated in the **Cluster** drop-down list.
- Step 2** Choose **More > Download Client > Configuration Files Only**.
- The generated compressed file contains the configuration files of all services.
- Step 3** Determine whether to generate a configuration file on the cluster node.
- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directories. Then go to [Step 4](#).
  - If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete and go to [Step 4](#).
- Step 4** Use WinSCP to save the compressed file to the client installation directory, for example, **/opt/hadoopclient**, as the client installation user.
- Step 5** Decompress the software package.
- Run the following commands to go to the directory where the client is installed, and decompress the file to a local directory. For example, the downloaded client file is **FusionInsight\_Cluster\_1\_Services\_Client.tar**.
- ```
cd /opt/hadoopclient
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```
- Step 6** Verify the software package.
- Run the following command to verify the decompressed file and check whether the command output is consistent with the information in the **sha256** file.
- ```
sha256sum -c
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar.sha256
```
- ```
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar: OK
```
- Step 7** Decompress the package to obtain the configuration file.
- ```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar
```
- Step 8** Run the following command in the client installation directory to update the client using the configuration file:
- ```
sh refreshConfig.sh Client installation directory Directory where the configuration file is located
```
- For example, run the following command:
- ```
sh refreshConfig.sh /opt/hadoopclient /opt/hadoopclient/
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles
```
- If the following information is displayed, the configurations have been updated successfully.
- ```
Succeed to refresh components client config.
```
- End

**Method 2:**

- Step 1** Log in to the client installation node as user **root**.
- Step 2** Go to the client installation directory, for example, **/opt/hadoopclient** and run the following commands to update the configuration file:

```
cd /opt/hadoopclient
```

```
sh autoRefreshConfig.sh
```

- Step 3** Enter the username and password of the FusionInsight Manager administrator and the floating IP address of FusionInsight Manager.
- Step 4** Enter the names of the components whose configuration needs to be updated. Use commas (,) to separate the component names. Press **Enter** to update the configurations of all components if necessary.

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

```
----End
```

## 10.2.2 Updating a Client (Versions Earlier Than 3.x)

 **NOTE**

This section applies to clusters of versions earlier than MRS 3.x. For MRS 3.x or later, see [Updating a Client \(Version 3.x or Later\)](#).

### Updating a Client Configuration File

**Scenario**

An MRS cluster provides a client for you to connect to a server, view task results, or manage data. Before using an MRS client, you need to download and update the client configuration file if service configuration parameters are modified and a service is restarted or the service is merely restarted on MRS Manager.

During cluster creation, the original client is stored in the **/opt/client** directory on all nodes in the cluster by default. After the cluster is created, only the client of a Master node can be directly used. To use the client of a Core node, you need to update the client configuration file first.

**Procedure****Method 1:**

- Step 1** Log in to MRS Manager. For details, see [Accessing Manager](#). Then, choose **Services**.
- Step 2** Click **Download Client**.

Set **Client Type to Only configuration files**, **Download To to Server**, and click **OK** to generate the client configuration file. The generated file is saved in the **/tmp/MRS-client** directory on the active management node by default. You can customize the file path.

**Step 3** Query and log in to the active Master node.

**Step 4** If you use the client in the cluster, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

```
sudo su - omm
```

**Step 5** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 6** Run the following command to update client configurations:

```
sh refreshConfig.sh Client installation directory Full path of the client configuration file package
```

For example, run the following command:

```
sh refreshConfig.sh /opt/Bigdata/client /tmp/MRS-client/  
MRS_Services_Client.tar
```

If the following information is displayed, the configurations have been updated successfully.

```
ReFresh components client config is complete.  
Succeed to refresh components client config.
```

```
----End
```

#### Method 2:

**Step 1** After the cluster is installed, run the following command to switch to user **omm**. If you use the client outside the cluster, switch to user **root**.

```
sudo su - omm
```

**Step 2** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 3** Run the following command and enter the name of an MRS Manager user with the download permission and its password (for example, the username is **admin** and the password is the one set during cluster creation) as prompted to update client configurations.

```
sh autoRefreshConfig.sh
```

**Step 4** After the command is executed, the following information is displayed, where *XXX* indicates the name of the component installed in the cluster. To update client configurations of all components, press **Enter**. To update client configurations of some components, enter the component names and separate them with commas (,).

```
Components "xxx" have been installed in the cluster. Please input the comma-separated names of the components for which you want to update client configurations. If you press Enter without inputting any component name, the client configurations of all components will be updated:
```

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

If the following information is displayed, the username or password is incorrect.

```
login manager failed,Incorrect username or password.
```

 **NOTE**

- This script automatically connects to the cluster and invokes the **refreshConfig.sh** script to download and update the client configuration file.
- By default, the client uses the floating IP address specified by **wsom=xxx** in the **Version** file in the installation directory to update the client configurations. To update the configuration file of another cluster, modify the value of **wsom=xxx** in the **Version** file to the floating IP address of the corresponding cluster before performing this step.

----End

## Fully Updating the Original Client of the Active Master Node

### Scenario

During cluster creation, the original client is stored in the **/opt/client** directory on all nodes in the cluster by default. The following uses **/opt/Bigdata/client** as an example.

- For a normal MRS cluster, you will use the pre-installed client on a Master node to submit a job on the management console page.
- You can also use the pre-installed client on the Master node to connect to a server, view task results, and manage data.

After installing the patch on the cluster, you need to update the client on the Master node to ensure that the functions of the built-in client are available.

### Procedure

**Step 1** Log in to MRS Manager. For details, see [Accessing Manager](#). Then, choose **Services**.

**Step 2** Click **Download Client**.

Set **Client Type** to **All client files**, **Download To** to **Server**, and click **OK** to generate the client configuration file. The generated file is saved in the **/tmp/MRS-client** directory on the active management node by default. You can customize the file path.

**Step 3** Query and log in to the active Master node.

**Step 4** On the ECS, switch to user **root** and copy the installation package to the **/opt** directory.

```
sudo su - root
```

```
cp /tmp/MRS-client/MRS_Services_Client.tar /opt
```

**Step 5** Run the following command in the **/opt** directory to decompress the package and obtain the verification file and the configuration package of the client:

```
tar -xvf MRS_Services_Client.tar
```

**Step 6** Run the following command to verify the configuration file package of the client:

```
sha256sum -c MRS_Services_ClientConfig.tar.sha256
```

The command output is as follows:

```
MRS_Services_ClientConfig.tar: OK
```

**Step 7** Run the following command to decompress **MRS\_Services\_ClientConfig.tar**:

```
tar -xvf MRS_Services_ClientConfig.tar
```

**Step 8** Run the following command to move the original client to the **/opt/Bigdata/client\_bak** directory:

```
mv /opt/Bigdata/client /opt/Bigdata/client_bak
```

**Step 9** Run the following command to install the client in a new directory. The client path must be **/opt/Bigdata/client**.

```
sh /opt/MRS_Services_ClientConfig/install.sh /opt/Bigdata/client
```

If the following information is displayed, the client has been successfully installed:

```
Components client installation is complete.
```

**Step 10** Run the following command to modify the user and user group of the **/opt/Bigdata/client** directory:

```
chown omm:wheel /opt/Bigdata/client -R
```

**Step 11** Run the following command to configure environment variables:

```
source /opt/Bigdata/client/bigdata_env
```

**Step 12** If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled for the current cluster, skip this step.

```
kinit MRS cluster user
```

Example: **kinit admin**

**Step 13** Run the client command of a component.

For example, run the following command to query the HDFS directory:

```
hdfs dfs -ls /
```

```
----End
```

## Fully Updating the Original Client of the Standby Master Node

**Step 1** Repeat **Step 1** to **Step 3** to log in to the standby Master node, and run the following command to switch to user **omm**:

```
sudo su - omm
```

**Step 2** Run the following command on the standby Master node to copy the downloaded client package from the active Master node (**master1** is used as an example):

```
scp omm@master1_host_name:/tmp/MRS-client/  
MRS_Services_Client.tar /tmp/MRS-client/
```

**Step 3** Repeat **Step 4** to **Step 13** to update the client of the standby Master node.

```
----End
```

## 10.3 Using the Client of Each Component

### 10.3.1 Using a ClickHouse Client

ClickHouse is a column-based database oriented to online analysis and processing. It supports SQL query and provides good query performance. The aggregation analysis and query performance based on large and wide tables is excellent, which is one order of magnitude faster than other analytical databases.

#### Prerequisites

You have installed the client, for example, in the `/opt/hadoopclient` directory. The client directory used in the following operations is only an example. Change it to the actual installation directory. Before using the client, download and update the client configuration file, and ensure that the active management node of Manager is available.

#### Procedure

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the current user. The current user must have the permission to create ClickHouse tables. Therefore, you need to bind the user to the corresponding role.

```
kinit Component service user
```

Example: **kinit clickhouseuser**

**Step 5** Run the client command of the ClickHouse component.

Run the **clickhouse -h** command to view the command help of ClickHouse.

The command output is as follows:

```
Use one of the following commands:
clickhouse local [args]
clickhouse client [args]
clickhouse benchmark [args]
clickhouse server [args]
clickhouse performance-test [args]
clickhouse extract-from-config [args]
clickhouse compressor [args]
clickhouse format [args]
clickhouse copier [args]
clickhouse obfuscator [args]
...
```

For details about how to use the command, see <https://clickhouse.tech/docs/en/operations/>.

The following table describes the parameters when the **clickhouse client** command is used to connect to the ClickHouse server.

**Table 10-2** Parameters of the clickhouse client command

Parameter	Description
--host	Host name of the server. The default value is <b>localhost</b> . You can use the host name or IP address of the node where the ClickHouse instance is located.
--port	Port for connection. <ul style="list-style-type: none"> <li>• If the SSL security connection is used, the default port number is <b>9440</b>, the parameter <b>--secure</b> must be carried. For details about the port number, search for the <b>tcp_port_secure</b> parameter in the ClickHouseServer instance configuration.</li> <li>• If non-SSL security connection is used, the default port number is <b>9000</b>, the parameter <b>--secure</b> does not need to be carried. For details about the port number, search for the <b>tcp_port</b> parameter in the ClickHouseServer instance configuration.</li> </ul>
--user	Username. Create a user with this name on Manager and bind the user to the corresponding role. <ul style="list-style-type: none"> <li>• If Kerberos authentication is enabled for the current cluster and the user authentication is successful, you do not need to carry the <b>--user</b> and <b>--password</b> parameters when logging in to the client as the authenticated user. You must create a user with this name on Manager because there is no default user in the Kerberos cluster scenario.</li> <li>• If Kerberos authentication is not enabled for the current cluster, you can specify a user and its password created on Manager when logging in to the client. If the user is used for the first time, you need to log in to Manager to change the password. If the user and password parameters are not carried, user <b>default</b> is used for login by default.</li> </ul>
--password	Password. The default password is an empty string. This parameter is used together with the <b>--user</b> parameter. You can set a password when creating a user on Manager.
--query	Query to process when using non-interactive mode.
--database	Current default database. The default value is <b>default</b> , which is the default configuration on the server.
--multiline	If this parameter is specified, multiline queries are allowed. ( <b>Enter</b> only indicates line feed and does not indicate that the query statement is complete.)

Parameter	Description
--multiquery	If this parameter is specified, multiple queries separated with semicolons (;) can be processed. This parameter is valid only in non-interactive mode.
--format	Specified default format used to output the result.
--vertical	If this parameter is specified, the result is output in vertical format by default. In this format, each value is printed on a separate line, which helps to display a wide table.
--time	If this parameter is specified, the query execution time is printed to <b>stderr</b> in non-interactive mode.
--stacktrace	If this parameter is specified, stack trace information will be printed when an exception occurs.
--config-file	Name of the configuration file.
--secure	If this parameter is specified, the server will be connected in SSL mode.
--history_file	Path of files that record command history.
--param_<name>	Query with parameters. Pass values from the client to the server. For details, see <a href="https://clickhouse.tech/docs/en/interfaces/cli/#cli-queries-with-parameters">https://clickhouse.tech/docs/en/interfaces/cli/#cli-queries-with-parameters</a> .

- Using SSL for login when Kerberos authentication is disabled for the current cluster:

```
clickhouse client --host IP address of the ClickHouse instance --user Username --password Password --port 9440 --secure
```

- Using SSL for login when Kerberos authentication is enabled for the current cluster:

You must create a user on Manager because there is no default user in the Kerberos cluster scenario.

After the user authentication is successful, you do not need to carry the **--user** and **--password** parameters when logging in to the client as the authenticated user.

```
clickhouse client --host IP address of the ClickHouse instance --port 9440 --secure
```

 **NOTE**

You can log in to FusionInsight Manager and choose **Cluster > Services > ClickHouse > Instance** to obtain the service IP address of the ClickHouseServer instance.

----End

## 10.3.2 Using a Flink Client

This section describes how to use Flink to run wordcount jobs.

## Prerequisites

- Flink has been installed in an MRS cluster.
- The cluster runs properly and the client has been correctly installed, for example, in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

## Using the Flink Client (Versions Earlier Than MRS 3.x)

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to initialize environment variables:

```
source /opt/hadoopclient/bigdata_env
```

**Step 4** If Kerberos authentication is enabled for the cluster, perform the following steps. If not, skip this whole step.

1. Prepare a user for submitting Flink jobs..
2. Log in to Manager as the newly created user.

Log in to Manager of the cluster. For details, see [Accessing Manager](#). Choose **System Settings > User Management**. In the **Operation** column of the row that contains the added user, choose **More > Download Authentication Credential**.

3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the **/opt/hadoopclient/Flink/flink/conf** directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the **/etc/** directory on this node.
4. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.

```
security.kerberos.login.keytab: <user.keytab file path>
```

```
security.kerberos.login.principal: <Username>
```

Example:

```
security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab
```

```
security.kerberos.login.principal: test
```

5. Generate the **generate\_keystore.sh** script and save it to the **bin** directory of the Flink client. In the **bin** directory of the Flink client, run the following command to harden the security. Set **password** to a new password for submitting jobs.

```
sh generate_keystore.sh <password>
```

The script automatically replaces the SSL value in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file.

6. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.

- Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **/opt/**

- hadoopclient/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
- Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
    - i. Create a directory, for example, **ssl**, in **/opt/hadoopclient/Flink/flink/conf/**.
    - ii. Move the **flink.keystore** and **flink.truststore** files to the **/opt/hadoopclient/Flink/flink/conf/ssl/** directory.
    - iii. Change the values of the following parameters to relative paths in the **flink-conf.yaml** file:

```
security.ssl.internal.keystore: ssl/flink.keystore
security.ssl.internal.truststore: ssl/flink.truststore
```
7. Add the IP addresses of the nodes where the client is located to the following configuration items in the configuration file (for example, **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml**). Use commas (,) to separate IP addresses.

```
web.access-control-allow-origin: xx.xx.xxx.xxx
jobmanager.web.allow-access-address: xx.xx.xxx.xxx
```

#### Step 5 Run a wordcount job.

#### NOTICE

To submit or run jobs on Flink, the user must have the following permissions:

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the **/flink** read and write permissions in Ranger.
  - If Ranger authentication is disabled, the current user must belong to the **hadoop** group.
- 
- Normal cluster (Kerberos authentication disabled)
    - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name"
flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
    - Run the following command to submit a single job on Yarn:

```
flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
  - Security cluster (Kerberos authentication enabled)
    - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
      - Run the following commands to start a session and submit a job in the session:

```
yarn-session.sh -nm "session-name"
```

**flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar**

- Run the following command to submit a single job on Yarn:
 

**flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar**
- If the **flink.keystore** and **flink.truststore** file are stored in the relative path:
  - In the same directory of SSL, run the following commands to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/hadoopclient/Flink/flink/conf/**, then run the following commands in this directory:
 

**yarn-session.sh -t ssl/ -nm "session-name"**

**flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar**
  - Run the following command to submit a single job on Yarn:
 

**flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar**

**Step 6** After the job has been successfully submitted, the following information is displayed on the client:

**Figure 10-3** Job submitted successfully on Yarn

```
[root@node-master1ks2P ~]# flink run -m yarn-cluster /opt/client/Flink/flink/examples/streaming/WordCount.jar
2019-07-10 16:30:11,090 | WARN | [main] | The short-circuit local reads feature cannot be used because libhadoop cannot be loaded. | org.apache.hadoop.hdfs.shortcircuit.DomainSocketFactory (DomainSocketFactory.java:118)
2019-07-10 16:30:11,090 | WARN | [main] | The short-circuit local reads feature cannot be used because libhadoop cannot be loaded. | org.apache.hadoop.hdfs.shortcircuit.DomainSocketFactory (DomainSocketFactory.java:118)

Program execution finished
Job with JobID 5b0bc1806563f3d792a19163c2e7c3c3 has finished.
Job Runtime: 5099 ms
[root@node-master1ks2P Hive]#
```

**Step 7** Go to the native page of the Yarn service, find the application of the job, and click the application name to go to the job details page. For details, see .

- If the job is not completed, click **Tracking URL** to go to the native Flink page and view the job running information.
- If the job submitted in a session has been completed, you can click **Tracking URL** to log in to the native Flink service page to view job information.

Figure 10-6 Application

The screenshot shows the Hadoop Application Overview page for application\_1561367690309\_0044. The page is titled "Application application\_1561367690309\_0044" and is logged in as admin. The main content area displays the following details:

- User:** test
- Name:** testjob
- Application Type:** Apache Flink
- Application Tags:** (empty)
- Application Priority:** 0 (Higher Integer value indicates higher priority)
- YarnApplicationState:** RUNNING: AM has registered with RM and started running.
- Queue:** default
- FinalStatus Reported by AM:** Application has not completed yet.
- Started:** Thu Jul 4 15:33:40 +0800 2019
- Elapsed:** 145hrs, 1mins, 6sec
- Tracking URL:** [ApplicationMaster](#)
- Log Aggregation Status:** NOT\_START
- Diagnostics:** (empty)
- Unmanaged Application:** false
- Application Node Label expression:** <Not set>
- AM container Node Label expression:** <DEFAULT\_PARTITION>

Below the details, the **Application Metrics** section shows:

- Total Resource Preempted:** <memory0, vCores0>
- Total Number of Non-AM Containers Preempted:** 0
- Total Number of AM Containers Preempted:** 0
- Resource Preempted from Current Attempt:** <memory0, vCores0>
- Number of Non-AM Containers Preempted from Current Attempt:** 0
- Aggregate Resource Allocation:** 534592479 MB-seconds, 522062 vcore-seconds
- Aggregate Preempted Resource Allocation:** 0 MB-seconds, 0 vcore-seconds

At the bottom, there is a table of application attempts:

Attempt ID	Started	Node	Logs	Nodes blacklisted by the app.	Nodes blacklisted by the system
appattempt_1561367690309_0044_000001	Thu Jul 4 15:33:40 +0800 2019	https://node-ana-cos3z-DP:8044	0	0	0

----End

## Using the Flink Client (MRS 3.x or Later)

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to initialize environment variables:

```
source /opt/hadoopclient/bigdata_env
```

**Step 4** If Kerberos authentication is enabled for the cluster, perform the following steps. If not, skip this whole step.

1. Prepare a user for submitting Flink jobs.
2. Log in to Manager as the newly created user.

Log in to Manager. For details, see [Accessing Manager](#). Choose **System > Permission > Manage User**. On the displayed page, locate the row that contains the added user, click **More** in the **Operation** column, and select **Download authentication credential**.

3. Decompress the downloaded authentication credential package and copy the **user.keytab** file to the client node, for example, to the **/opt/hadoopclient/Flink/flink/conf** directory on the client node. If the client is installed on a node outside the cluster, copy the **krb5.conf** file to the **/etc/** directory on this node.
4. In security mode, append the service IP address of the node where the client is installed and floating IP address of Manager to the **jobmanager.web.allow-access-address** configuration item in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file. Use commas (,) to separate IP addresses.

 NOTE

- To obtain the service IP address of the node where the client is installed, perform the following operations:
    - Node inside the cluster:

In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a cluster, and click its name to switch to the cluster details page.

On the **Nodes** tab page, view the IP address of the node where the client is installed.
    - Node outside the cluster: IP address of the ECS where the client is installed.
  - To obtain the floating IP address of Manager, perform the following operations:
    - In the navigation tree of the MRS management console, choose **Clusters > Active Clusters**, select a cluster, and click its name to switch to the cluster details page.
    - On the **Nodes** tab page, view the **Name**. The node that contains **master1** in its name is the Master1 node. The node that contains **master2** in its name is the Master2 node.
    - Log in to the Master2 node remotely, and run the **ifconfig** command. In the command output, **eth0:wsom** indicates the floating IP address of MRS Manager. Record the value of **inet**. If the floating IP address of MRS Manager cannot be queried on the Master2 node, switch to the Master1 node to query and record the floating IP address. If there is only one Master node, query and record the cluster manager IP address of the Master node.
5. Configure security authentication by adding the **keytab** path and username in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** configuration file.
- ```
security.kerberos.login.keytab: <user.keytab file path>  
security.kerberos.login.principal: <Username>
```
- Example:
- ```
security.kerberos.login.keytab: /opt/hadoopclient/Flink/flink/conf/user.keytab  
security.kerberos.login.principal: test
```
6. Generate the **generate\_keystore.sh** script and save it to the **bin** directory of the Flink client. For details, see . In the **bin** directory of the Flink client, run the following command to harden the security. For details see . Set **password** to a new password for submitting jobs.
- ```
sh generate_keystore.sh <password>
```
- The script automatically replaces the SSL value in the **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml** file.

 NOTE

After operations in are performed, the **flink.keystore** and **flink.truststore** files are generated in the **conf** directory of the Flink client and the following configuration items in the **flink-conf.yaml** client configuration file are set by default:

- Set **security.ssl.keystore** to the absolute path of the **flink.keystore** file.
- Set **security.ssl.truststore** to the absolute path of the **flink.truststore** file.
- Set **security.cookie** to a random password automatically generated by the **generate\_keystore.sh** script.
- By default, **security.ssl.encrypt.enabled** is set to **false** in the **flink-conf.yaml** file by default. The **generate\_keystore.sh** script sets **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password** to the password entered when the **generate\_keystore.sh** script is called.
- If ciphertext is required and **security.ssl.encrypt.enabled** is set to **true** in the **flink-conf.yaml** file, the **generate\_keystore.sh** script does not set **security.ssl.key-password**, **security.ssl.keystore-password**, and **security.ssl.truststore-password**. To obtain the values, use the Manager plaintext encryption API by running the following command: **curl -k -i -u Username:Password -X POST -HContent-type:application/json -d '{"plainText":"Password"}' 'https://x.x.x.x:28443/web/api/v2/tools/encrypt'**  
In the preceding command, *Username:Password* indicates the user name and password for logging in to the system. The password of "plainText" indicates the one used to call the **generate\_keystore.sh** script. *x.x.x.x* indicates the floating IP address of Manager.

7. Configure paths for the client to access the **flink.keystore** and **flink.truststore** files.
  - Absolute path: After the script is executed, the file path of **flink.keystore** and **flink.truststore** is automatically set to the absolute path **/opt/hadoopclient/Flink/flink/conf/** in the **flink-conf.yaml** file. In this case, you need to move the **flink.keystore** and **flink.truststore** files from the **conf** directory to this absolute path on the Flink client and Yarn nodes.
  - Relative path: Perform the following steps to set the file path of **flink.keystore** and **flink.truststore** to the relative path and ensure that the directory where the Flink client command is executed can directly access the relative paths.
    - i. Create a directory, for example, **ssl**, in **/opt/hadoopclient/Flink/flink/conf/**.
    - ii. Move the **flink.keystore** and **flink.truststore** files to the **/opt/hadoopclient/Flink/flink/conf/ssl/** directory.
    - iii. Change the values of the following parameters to relative paths in the **flink-conf.yaml** file:

```
security.ssl.keystore: ssl/flink.keystore
security.ssl.truststore: ssl/flink.truststore
```
8. Add the IP addresses of the nodes where the client is located to the following configuration items in the configuration file (for example, **/opt/hadoopclient/Flink/flink/conf/flink-conf.yaml**). Use commas (,) to separate IP addresses.

```
web.access-control-allow-origin: xx.xx.xxx.xxx
jobmanager.web.allow-access-address: xx.xx.xxx.xxx
```

**Step 5** Run a wordcount job.

**NOTICE**

To submit or run jobs on Flink, the user must have the following permissions:

- If Ranger authentication is enabled, the current user must belong to the **hadoop** group or the user has been granted the **/flink** read and write permissions in Ranger.
- If Ranger authentication is disabled, the current user must belong to the **hadoop** group.

- Normal cluster (Kerberos authentication disabled)
  - Run the following commands to start a session and submit a job in the session:  

```
yarn-session.sh -nm "session-name"
flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
  - Run the following command to submit a single job on Yarn:  

```
flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
- Security cluster (Kerberos authentication enabled)
  - If the **flink.keystore** and **flink.truststore** file are stored in the absolute path:
    - Run the following commands to start a session and submit a job in the session:  

```
yarn-session.sh -nm "session-name"
flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
    - Run the following command to submit a single job on Yarn:  

```
flink run -m yarn-cluster /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
  - If the **flink.keystore** and **flink.truststore** file are stored in the relative path:
    - In the same directory of SSL, run the following commands to start a session and submit jobs in the session. The SSL directory is a relative path. For example, if the SSL directory is **opt/hadoopclient/Flink/flink/conf/**, then run the following commands in this directory:  

```
yarn-session.sh -t ssl/ -nm "session-name"
flink run /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```
    - Run the following command to submit a single job on Yarn:  

```
flink run -m yarn-cluster -yt ssl/ /opt/hadoopclient/Flink/flink/examples/streaming/WordCount.jar
```

**Step 6** After the job has been successfully submitted, the following information is displayed on the client:

Figure 10-7 Job submitted successfully on Yarn

```
[root@node-master1kszp ~]# flink run -m yarn-cluster /opt/client/flink/flink/examples/streaming/WordCount.jar
2019-07-10 16:30:11,099 | WARN | [main] | The short-circuit local reads feature cannot be used because libhadoop cannot be loaded. | org.apache.hadoop.hdfs.shortcircuit.DomainSocketFactory (DomainSocketFactory.java:118)

- If the job is not completed, click **Tracking URL** to go to the native Flink page and view the job running information.
- If the job submitted in a session has been completed, you can click **Tracking URL** to log in to the native Flink service page to view job information.

Figure 10-10 Application

The screenshot shows the Hadoop Application Overview page for application\_1561367690309\_0044. The page includes a navigation menu on the left with options like Cluster, About, Nodes, Node Labels, Applications, Scheduler, and Tools. The main content area displays application details such as User (test), Name (testsql), Application Type (Apache Flink), and Application Tags. It also shows Application Metrics including Total Resource Preempted, Total Number of Non-AM Containers Preempted, and Aggregate Preempted Resource Allocation. A table at the bottom shows the attempt details for the application.

----End

## 10.3.3 Using a Flume Client

### Scenario

You can use Flume to import collected log information to Kafka.

### Prerequisites

- A streaming cluster with Kerberos authentication enabled has been created.

- The Flume client has been installed on the node where logs are generated, for example, in the **/opt/Flumeclient** directory. For details about how to install the Flume client, see . The client directory in the following operations is only an example. Change it to the actual installation directory.
- The streaming cluster can properly communicate with the node where logs are generated.

## Using the Flume Client (Versions Earlier Than MRS 3.x)

### NOTE

You do not need to perform [Step 2](#) to [Step 5](#) for a normal cluster.

#### **Step 1** Install the client.

For details, see .

#### **Step 2** Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory*/**fusioninsight-flume-Flume component version number/conf** directory on the node where the Flume client resides.

The full file path is **`${BIGDATA_HOME}/MRS_Current/1_X_KerberosClient/etc/kdc.conf`**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

#### **Step 3** Copy the user authentication file from this node to the *Flume client installation directory*/**fusioninsight-flume-Flume component version number/conf** directory on the Flume client node.

The full file path is **`${BIGDATA_HOME}/MRS_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab`**.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

#### **Step 4** Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

The full file path is **`${BIGDATA_HOME}/MRS_Current/1_X_Flume/etc/jaas.conf`**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

#### **Step 5** Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

```
vi conf/jaas.conf
```

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory**/**fusioninsight-flume-Flume component version number/conf** saved in [Step 3](#), and save the modification and exit.

#### **Step 6** Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

**vi *Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/flume-env.sh**

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -
Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -
Dzookeeper.request.timeout=120000
```

For example, "**-XX:+UseCMSCompactAtFullCollection -  
Djava.security.krb5.conf=*Flume client installation directory*/fusioninsight-  
flume-*Flume component version number*/conf/kdc.conf -  
Djava.security.auth.login.config=*Flume client installation directory*/  
fusioninsight-flume-*Flume component version number*/conf/jaas.conf -  
Dzookeeper.request.timeout=120000**"

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

**Step 7** Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to restart the Flume client:

```
cd /opt/FlumeClient/fusioninsight-flume-Flume component version number/bin  
./flume-manage.sh restart
```

**Step 8** Run the following command to modify the **properties.properties** configuration file of the Flume client:

**vi *Flume client installation directory*/fusioninsight-flume-*Flume component version number*/conf/properties.properties**

Add the following information to the file:

```
#####  
#####  
client.sources = static_log_source  
client.channels = static_log_channel  
client.sinks = kafka_sink  
#####  
#####  
#LOG_TO_HDFS_ONLINE_1  
  
client.sources.static_log_source.type = spooldir  
client.sources.static_log_source.spoolDir = PATH  
client.sources.static_log_source.fileSuffix = .COMPLETED  
client.sources.static_log_source.ignorePattern = ^$  
client.sources.static_log_source.trackerDir = PATH  
client.sources.static_log_source.maxBlobLength = 16384  
client.sources.static_log_source.batchSize = 51200  
client.sources.static_log_source.inputCharset = UTF-8  
client.sources.static_log_source.deserializer = LINE  
client.sources.static_log_source.selector.type = replicating  
client.sources.static_log_source.fileHeaderKey = file  
client.sources.static_log_source.fileHeader = false  
client.sources.static_log_source.basenameHeader = true  
client.sources.static_log_source.basenameHeaderKey = basename  
client.sources.static_log_source.deletePolicy = never  
  
client.channels.static_log_channel.type = file  
client.channels.static_log_channel.dataDirs = PATH  
client.channels.static_log_channel.checkpointDir = PATH  
client.channels.static_log_channel.maxFileSize = 2146435071  
client.channels.static_log_channel.capacity = 1000000  
client.channels.static_log_channel.transactionCapacity = 612000  
client.channels.static_log_channel.minimumRequiredSpace = 524288000
```

```
client.sinks.kafka_sink.type = org.apache.flume.sink.kafka.KafkaSink
client.sinks.kafka_sink.kafka.topic = flume_test
client.sinks.kafka_sink.kafka.bootstrap.servers =
XXX.XXX.XXX.XXX:210079092,XXX.XXX.XXX.XXX:21007,XXX.XXX.XXX.XXX:21007
client.sinks.kafka_sink.flumeBatchSize = 1000
client.sinks.kafka_sink.kafka.producer.type = sync
client.sinks.kafka_sink.kafka.security.protocol = SASL_PLAINTEXT
client.sinks.kafka_sink.kafka.kerberos.domain.name = hadoop.XXX.com
client.sinks.kafka_sink.requiredAcks = 0

client.sources.static_log_source.channels = static_log_channel
client.sinks.kafka_sink.channel = static_log_channel
```

Modify the following parameters as required. Then save and exit the file.

- `spoolDir`
- `trackerDir`
- `dataDirs`
- `checkpointDir`
- `topic`  
If the topic does not exist in Kafka, the topic is automatically created by default.
- `kafka.bootstrap.servers`  
By default, the port for a security cluster is port 21007 and that for a normal cluster is port 9092.
- `kafka.security.protocol`  
Set this parameter to **SASL\_PLAINTEXT** for a security cluster and **PLAINTEXT** for a normal cluster.
- **`kafka.kerberos.domain.name`**  
You do not need to set this parameter for a normal cluster. For a security cluster, the value of this parameter is the value of **`kerberos.domain.name`** in the Kafka cluster.  
You can check **`${BIGDATA_HOME}/MRS_Current/1_X_Broker/etc/server.properties`** on the node where the broker instance resides.  
In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

**Step 9** The Flume client automatically loads the information in the **`properties.properties`** file.

After new log files are generated in the directory specified by **`spoolDir`**, the logs will be sent to Kafka producers and can be consumed by Kafka consumers.

----End

## Using the Flume Client (MRS 3.x or Later)

### NOTE

You do not need to perform [Step 2](#) to [Step 5](#) for a normal cluster.

**Step 1** Install the client.

For details, see .

- Step 2** Copy the configuration file of the authentication server from the Master1 node to the *Flume client installation directory/fusioninsight-flume-Flume component version number/conf* directory on the node where the Flume client resides.

The full file path is **`${BIGDATA_HOME}/FusionInsight_Current/1_X_KerberosClient/etc/kdc.conf`**. In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

- Step 3** Copy the user authentication file from this node to the *Flume client installation directory/fusioninsight-flume-Flume component version number/conf* directory on the Flume client node.

The full file path is **`${BIGDATA_HOME}/FusionInsight_Porter_XXX/install/FusionInsight-Flume-Flume component version number/flume/conf/flume.keytab`**.

In the preceding paths, **XXX** indicates the product version number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

- Step 4** Copy the **jaas.conf** file from this node to the **conf** directory on the Flume client node.

The full file path is **`${BIGDATA_HOME}/FusionInsight_Current/1_X_Flume/etc/jaas.conf`**.

In the preceding path, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

- Step 5** Log in to the Flume client node and go to the client installation directory. Run the following command to modify the file:

```
vi conf/jaas.conf
```

Change the full path of the user authentication file defined by **keyTab** to the **Flume client installation directory/fusioninsight-flume-Flume component version number/conf** saved in **Step 3**, and save the modification and exit.

- Step 6** Run the following command to modify the **flume-env.sh** configuration file of the Flume client:

```
vi Flume client installation directory/fusioninsight-flume-Flume component version number/conf/flume-env.sh
```

Add the following information after **-XX:+UseCMSCompactAtFullCollection**:

```
-Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-1.9.0/conf/kdc.conf -
Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-1.9.0/conf/jaas.conf -
Dzookeeper.request.timeout=120000
```

For example, **"-XX:+UseCMSCompactAtFullCollection -Djava.security.krb5.conf=Flume client installation directory/fusioninsight-flume-Flume component version number/conf/kdc.conf -Djava.security.auth.login.config=Flume client installation directory/fusioninsight-flume-Flume component version number/conf/jaas.conf -Dzookeeper.request.timeout=120000"**

Change *Flume client installation directory* to the actual installation directory. Then save and exit.

**Step 7** Assume that the Flume client installation path is **/opt/FlumeClient**. Run the following command to restart the Flume client:

```
cd /opt/FlumeClient/fusioninsight-flume-Flume component version number/bin  
./flume-manage.sh restart
```

**Step 8** Run the following command to modify the **properties.properties** configuration file of the Flume client:

```
vi Flume client installation directory/fusioninsight-flume-Flume component version number/conf/properties.properties
```

Add the following information to the file:

```
#####  
#####  
client.sources = static_log_source  
client.channels = static_log_channel  
client.sinks = kafka_sink  
#####  
#####  
#LOG_TO_HDFS_ONLINE_1  
  
client.sources.static_log_source.type = spoolDir  
client.sources.static_log_source.spoolDir = PATH  
client.sources.static_log_source.fileSuffix = .COMPLETED  
client.sources.static_log_source.ignorePattern = ^$  
client.sources.static_log_source.trackerDir = PATH  
client.sources.static_log_source.maxBlobLength = 16384  
client.sources.static_log_source.batchSize = 51200  
client.sources.static_log_source.inputCharset = UTF-8  
client.sources.static_log_source.deserializer = LINE  
client.sources.static_log_source.selector.type = replicating  
client.sources.static_log_source.fileHeaderKey = file  
client.sources.static_log_source.fileHeader = false  
client.sources.static_log_source.basenameHeader = true  
client.sources.static_log_source.basenameHeaderKey = basename  
client.sources.static_log_source.deletePolicy = never  
  
client.channels.static_log_channel.type = file  
client.channels.static_log_channel.dataDirs = PATH  
client.channels.static_log_channel.checkpointDir = PATH  
client.channels.static_log_channel.maxFileSize = 2146435071  
client.channels.static_log_channel.capacity = 1000000  
client.channels.static_log_channel.transactionCapacity = 612000  
client.channels.static_log_channel.minimumRequiredSpace = 524288000  
  
client.sinks.kafka_sink.type = org.apache.flume.sink.kafka.KafkaSink  
client.sinks.kafka_sink.kafka.topic = flume_test  
client.sinks.kafka_sink.kafka.bootstrap.servers =  
XXX.XXX.XXX.XXX:210079092,XXX.XXX.XXX.XXX:21007,XXX.XXX.XXX.XXX:21007  
client.sinks.kafka_sink.flumeBatchSize = 1000  
client.sinks.kafka_sink.kafka.producer.type = sync  
client.sinks.kafka_sink.kafka.security.protocol = SASL_PLAINTEXT  
client.sinks.kafka_sink.kafka.kerberos.domain.name = hadoop.XXX.com  
client.sinks.kafka_sink.requiredAcks = 0  
  
client.sources.static_log_source.channels = static_log_channel  
client.sinks.kafka_sink.channel = static_log_channel
```

Modify the following parameters as required. Then save and exit the file.

- spoolDir

- trackerDir
- dataDirs
- checkpointDir
- topic  
If the topic does not exist in Kafka, the topic is automatically created by default.
- kafka.bootstrap.servers  
By default, the port for a security cluster is port 21007 and that for a normal cluster is port 9092.
- kafka.security.protocol  
Set this parameter to **SASL\_PLAINTEXT** for a security cluster and **PLAINTEXT** for a normal cluster.
- **kafka.kerberos.domain.name**  
You do not need to set this parameter for a normal cluster. For a security cluster, the value of this parameter is the value of **kerberos.domain.name** in the Kafka cluster.  
For details, check **`\${BIGDATA\_HOME}/FusionInsight\_Current/1\_X\_Broker/etc/server.properties** on the node where the broker instance resides.  
In the preceding paths, **X** indicates a random number. Change it based on the site requirements. The file must be saved by the user who installs the Flume client, for example, user **root**.

**Step 9** The Flume client automatically loads the information in the **properties.properties** file.

After new log files are generated in the directory specified by **spoolDir**, the logs will be sent to Kafka producers and can be consumed by Kafka consumers.

----End

## 10.3.4 Using an HBase Client

### Scenario

This section describes how to use the HBase client in an O&M scenario or a service scenario.

### Prerequisites

- The client has been installed. For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the MRS cluster administrator as required.  
A machine-machine user needs to download the **keytab** file and a human-machine user needs to change the password upon the first login.
- If a non-**root** user uses the HBase client, ensure that the owner of the HBase client directory is this user. Otherwise, run the following command to change the owner.

```
chown user:group -R Client installation directory/HBase
```

## Using the HBase Client (Versions Earlier Than MRS 3.x)

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** If Kerberos authentication has been enabled for the current cluster, run the following command to authenticate the current user (the current user must have the permission to create HBase tables). See to configure the roles with corresponding permissions. See to bind a role to a user.. If Kerberos authentication is disabled, skip this step.

```
kinit Component service user
```

For example, **kinit hbaseuser**.

**Step 5** Run the following HBase client command:

```
hbase shell
```

```
----End
```

## Using the HBase Client (MRS 3.x or Later)

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** If you use the client to connect to a specific HBase instance in a scenario where multiple HBase instances are installed, run the following command to load the environment variables of the instance. Otherwise, skip this step. For example, to load the environment variables of the HBase2 instance, run the following command:

```
source HBase2/component_env
```

**Step 5** If Kerberos authentication has been enabled for the current cluster, run the following command to authenticate the current user (the current user must have the permission to create HBase tables). See to configure the roles with corresponding permissions. See to bind a role to a user.. If Kerberos authentication is disabled, skip this step.

```
kinit Component service user
```

For example, **kinit hbaseuser**.

**Step 6** Run the following HBase client command:

```
hbase shell
```

```
----End
```

## Common HBase client commands

The following table lists common HBase client commands. For more commands, see <http://hbase.apache.org/2.2/book.html>.

**Table 10-3** HBase client commands

| Command  | Description                                                                                                                                                                                                                                  |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| create   | Used to create a table, for example, <b>create 'test', 'f1', 'f2', 'f3'</b> .                                                                                                                                                                |
| disable  | Used to disable a specified table, for example, <b>disable 'test'</b> .                                                                                                                                                                      |
| enable   | Used to enable a specified table, for example, <b>enable 'test'</b> .                                                                                                                                                                        |
| alter    | Used to alter the table structure. You can run the <b>alter</b> command to add, modify, or delete column family information and table-related parameter values, for example, <b>alter 'test', {NAME =&gt; 'f3', METHOD =&gt; 'delete'}</b> . |
| describe | Used to obtain the table description, for example, <b>describe 'test'</b> .                                                                                                                                                                  |
| drop     | Used to delete a specified table, for example, <b>drop 'test'</b> . Before deleting a table, you must stop it.                                                                                                                               |
| put      | Used to write the value of a specified cell, for example, <b>put 'test','r1','f1:c1','myvalue1'</b> . The cell location is unique and determined by the table, row, and column.                                                              |
| get      | Used to get the value of a row or the value of a specified cell in a row, for example, <b>get 'test','r1'</b> .                                                                                                                              |
| scan     | Used to query table data, for example, <b>scan 'test'</b> . The table name and scanner must be specified in the command.                                                                                                                     |

## 10.3.5 Using an HDFS Client

### Scenario

This section describes how to use the HDFS client in an O&M scenario or service scenario.

### Prerequisites

- The client has been installed.

For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.

- Service component users are created by the MRS cluster administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user needs to change the password upon the first login. (This operation is not required in normal mode.)

## Using the HDFS Client

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** If the cluster is in security mode, run the following command to authenticate the user. In normal mode, user authentication is not required.

```
kinit Component service user
```

**Step 5** Run the HDFS Shell command. Example:

```
hdfs dfs -ls /
```

```
----End
```

## Common HDFS Client Commands

The following table lists common HDFS client commands.

For more commands, see [https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/CommandsManual.html#User\\_Commands](https://hadoop.apache.org/docs/stable/hadoop-project-dist/hadoop-common/CommandsManual.html#User_Commands).

**Table 10-4** Common HDFS client commands

| Command                                                   | Description                                           | Example                                                                                                                                  |
|-----------------------------------------------------------|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>hdfs dfs -mkdir</b> <i>Folder name</i>                 | Used to create a folder.                              | <b>hdfs dfs -mkdir /tmp/mydir</b>                                                                                                        |
| <b>hdfs dfs -ls</b> <i>Folder name</i>                    | Used to view a folder.                                | <b>hdfs dfs -ls /tmp</b>                                                                                                                 |
| <b>hdfs dfs -put</b> <i>Local file on the client node</i> | Used to upload a local file to a specified HDFS path. | <b>hdfs dfs -put /opt/test.txt /tmp</b><br>Upload the <b>/opt/test.txt</b> file on the client node to the <b>/tmp</b> directory of HDFS. |

| Command                                                                              | Description                                                 | Example                                                                                                                                |
|--------------------------------------------------------------------------------------|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>hdfs dfs -get</b> <i>Specified file on HDFS Specified path on the client node</i> | Used to download the HDFS file to the specified local path. | <b>hdfs dfs -get /tmp/test.txt /opt/</b><br>Download the <b>/tmp/test.txt</b> file on HDFS to the <b>/opt</b> path on the client node. |
| <b>hdfs dfs -rm -r -f</b> <i>Specified folder on HDFS</i>                            | Used to delete a folder.                                    | <b>hdfs dfs -rm -r -f /tmp/mydir</b>                                                                                                   |

## Client-related FAQs

1. What do I do when the HDFS client exits abnormally and error message "java.lang.OutOfMemoryError" is displayed after the HDFS client command is running?

This problem occurs because the memory required for running the HDFS client exceeds the preset upper limit (128 MB by default). You can change the memory upper limit of the client by modifying **CLIENT\_GC\_OPTS** in *<Client installation path>/HDFS/component\_env*. For example, if you want to set the upper limit to 1 GB, run the following command:

```
CLIENT_GC_OPTS="-Xmx1G"
```

After the modification, run the following command to make the modification take effect:

```
source <Client installation path>/bigdata_env
```

2. How can i set the log level when the HDFS client is running?

By default, the logs generated during the running of the HDFS client are printed to the console. The default log level is INFO. To enable the DEBUG log level for fault locating, run the following command to export an environment variable:

```
export HADOOP_ROOT_LOGGER=DEBUG,console
```

Then run the HDFS Shell command to generate the DEBUG logs.

If you want to print INFO logs again, run the following command:

```
export HADOOP_ROOT_LOGGER=INFO,console
```

## 10.3.6 Using a Hive Client

### Scenario

This section guides users to use a Hive client in an O&M or service scenario.

### Prerequisites

- The client has been installed. For example, the client is installed in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the MRS cluster administrator as required. In security mode, machine-machine users need to download the

keytab file. A human-machine user must change the password upon the first login.

## Using the Hive Client (Versions Earlier Than MRS 3.x)

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Log in to the Hive client based on the cluster authentication mode.

- In security mode, run the following command to complete user authentication and log in to the Hive client:  

```
kinit Component service user
```

```
beeline
```
- In common mode, run the following command to log in to the Hive client. If no component service user is specified, the current OS user is used to log in to the Hive client.

```
beeline -n component service user
```

### NOTE

After a beeline connection is established, you can compile and submit HQL statements to execute related tasks. To run the Catalog client command, you need to run the **!q** command first to exit the beeline environment.

**Step 5** Run the following command to execute the HCatalog client command:

```
hcat -e "cmd"
```

*cmd* must be a Hive DDL statement, for example, **hcat -e "show tables"**.

 NOTE

- To use the HCatalog client, choose **More > Download Client** on the service page to download the clients of all services. This restriction does not apply to the beeline client.
- Due to permission model incompatibility, tables created using the HCatalog client cannot be accessed on the HiveServer client. However, the tables can be accessed on the WebHCat client.
- If you use the HCatalog client in Normal mode, the system performs DDL commands using the current user who has logged in to the operating system.
- Exit the beeline client by running the **!q** command instead of by pressing **Ctrl + c**. Otherwise, the temporary files generated by the connection cannot be deleted and a large number of junk files will be generated as a result.
- If multiple statements need to be entered during the use of beeline clients, separate the statements from each other using semicolons (;) and set the value of **entireLineAsCommand** to **false**.

Setting method: If beeline has not been started, run the **beeline --entireLineAsCommand=false** command. If the beeline has been started, run the **!set entireLineAsCommand false** command.

After the setting, if a statement contains semicolons (;) that do not indicate the end of the statement, escape characters must be added, for example, **select concat\_ws('\n', collect\_set(col1)) from tbl**.

----End

## Using the Hive Client (MRS 3.x or Later)

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** MRS 3.X supports multiple Hive instances. If you use the client to connect to a specific Hive instance in a scenario when multiple Hive instances are installed, run the following command to load the environment variables of the instance. Otherwise, skip this step. For example, load the environment variables of the Hive2 instance.

```
source Hive2/component_env
```

**Step 5** Log in to the Hive client based on the cluster authentication mode.

- In security mode, run the following command to complete user authentication and log in to the Hive client:

```
kinit Component service user
```

```
beeline
```

- In common mode, run the following command to log in to the Hive client. If no component service user is specified, the current OS user is used to log in to the Hive client.

```
beeline -n component service user
```

**Step 6** Run the following command to execute the HCatalog client command:

**hcat -e "cmd"**

*cmd* must be a Hive DDL statement, for example, **hcat -e "show tables"**.

 **NOTE**

- To use the HCatalog client, choose **More > Download Client** on the service page to download the clients of all services. This restriction does not apply to the beeline client.
- Due to permission model incompatibility, tables created using the HCatalog client cannot be accessed on the HiveServer client. However, the tables can be accessed on the WebHCat client.
- If you use the HCatalog client in Normal mode, the system performs DDL commands using the current user who has logged in to the operating system.
- Exit the beeline client by running the **!q** command instead of by pressing **Ctrl + C**. Otherwise, the temporary files generated by the connection cannot be deleted and a large number of junk files will be generated as a result.
- If multiple statements need to be entered during the use of beeline clients, separate the statements from each other using semicolons (;) and set the value of **entireLineAsCommand** to **false**.

Setting method: If beeline has not been started, run the **beeline --entireLineAsCommand=false** command. If the beeline has been started, run the **!set entireLineAsCommand false** command.

After the setting, if a statement contains semicolons (;) that do not indicate the end of the statement, escape characters must be added, for example, **select concat\_ws('\;', collect\_set(col1)) from tbl**.

----End

## Common Hive Client Commands

The following table lists common Hive Beeline commands.

For more commands, see <https://cwiki.apache.org/confluence/display/Hive/HiveServer2+Clients#HiveServer2Clients-BeelineCommands>.

**Table 10-5** Common Hive Beeline commands

| Command                                                                                                              | Description                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| set <key>=<value>                                                                                                    | Sets the value of a specific configuration variable (key).<br><b>NOTE</b><br>If the variable name is incorrectly spelled, the Beeline does not display an error. |
| set                                                                                                                  | Prints the list of configuration variables overwritten by users or Hive.                                                                                         |
| set -v                                                                                                               | Prints all configuration variables of Hadoop and Hive.                                                                                                           |
| add FILE[S] <filepath><br><filepath>*add JAR[S]<br><filepath> <filepath>*add<br>ARCHIVE[S] <filepath><br><filepath>* | Adds one or more files, JAR files, or ARCHIVE files to the resource list of the distributed cache.                                                               |

| Command                                                                                                                | Description                                                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| add FILE[S] <ivyurl><br><ivyurl>*<br>add JAR[S] <ivyurl><br><ivyurl>*<br>add ARCHIVE[S] <ivyurl><br><ivyurl>*          | Adds one or more files, JAR files, or ARCHIVE files to the resource list of the distributed cache using the lvy URL in the <b>ivy://goup:module:version?query_string</b> format.                                                |
| list FILE[S]list JAR[S]list<br>ARCHIVE[S]                                                                              | Lists the resources that have been added to the distributed cache.                                                                                                                                                              |
| list FILE[S] <filepath>*list<br>JAR[S] <filepath>*list<br>ARCHIVE[S] <filepath>*                                       | Checks whether given resources have been added to the distributed cache.                                                                                                                                                        |
| delete FILE[S]<br><filepath>*delete JAR[S]<br><filepath>*delete<br>ARCHIVE[S] <filepath>*                              | Deletes resources from the distributed cache.                                                                                                                                                                                   |
| delete FILE[S] <ivyurl><br><ivyurl>*<br>delete JAR[S] <ivyurl><br><ivyurl>*<br>delete ARCHIVE[S]<br><ivyurl> <ivyurl>* | Delete the resource added using <ivyurl> from the distributed cache.                                                                                                                                                            |
| reload                                                                                                                 | Enable HiveServer2 to discover the change of the JAR file <b>hive.reloadable.aux.jars.path</b> in the specified path. (You do not need to restart HiveServer2.) Change actions include adding, deleting, or updating JAR files. |
| dfs <dfs command>                                                                                                      | Runs the <b>dfs</b> command.                                                                                                                                                                                                    |
| <query string>                                                                                                         | Executes the Hive query and prints the result to the standard output.                                                                                                                                                           |

### 10.3.7 Using an Impala Client

Impala is a massively parallel processing (MPP) SQL query engine for processing vast amounts of data stored in Hadoop clusters. It is an open source software written in C++ and Java. It provides high performance and low latency compared with other SQL engines for Hadoop.

#### Background

Suppose a user develops an application to manage users who use service A in an enterprise. The procedure of operating service A on the Impala client is as follows:

#### Operations on common tables:

- Create the **user\_info** table.
- Add users' educational backgrounds and titles to the table.
- Query user names and addresses by user ID.
- Delete the user information table after service A ends.

**Table 10-6** User information

| No.         | Name | Gender | Age | Address |
|-------------|------|--------|-----|---------|
| 12005000201 | A    | Male   | 19  | City A  |
| 12005000202 | B    | Female | 23  | City B  |
| 12005000203 | C    | Male   | 26  | City C  |
| 12005000204 | D    | Male   | 18  | City D  |
| 12005000205 | E    | Female | 21  | City E  |
| 12005000206 | F    | Male   | 32  | City F  |
| 12005000207 | G    | Female | 29  | City G  |
| 12005000208 | H    | Female | 30  | City H  |
| 12005000209 | I    | Male   | 26  | City I  |
| 12005000210 | J    | Female | 25  | City J  |

## Prerequisites

The client has been installed. For example, the client is installed in the **/opt/hadoopclient** directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

## Procedure

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Run the Impala client command to implement service A.

Run the client command of the Impala component directly.

```
impala-shell.sh
```

 NOTE

By default, **impala-shell** attempts to connect to the Impala daemon on port 21000 of **localhost**. To connect to another host, use the **-i <host:port>** option. To automatically connect to a specific Impala database, use the **-d <database>** option. For example, if all your Kudu tables are in the **impala\_kudu** database, **-d impala\_kudu** can use this database. To exit the Impala shell, run the **quit** command.

**Operations on internal tables:**

1. Create the **user\_info** user information table according to [Table 10-6](#) and add data to it.

```
create table user_info(id string,name string,gender string,age int,addr string);
insert into table user_info(id,name,gender,age,addr) values("12005000201", "A", "Male", 19, "City A");
```

... (Other statements are the same.)

2. Add users' educational backgrounds and titles to the **user\_info** table.

For example, to add educational background and title information about user 12005000201, run the following commands.

```
alter table user_info add columns(education string,technical string);
```

3. Query user names and addresses by user ID.

For example, to query the name and address of user 12005000201, run the following command:

```
select name,addr from user_info where id='12005000201';
```

4. Delete the user information table:

```
drop table user_info;
```

**Operations on external partition tables:**

Create an external partition table and import data.

1. Create a path for storing external table data.

```
hdfs dfs -mkdir /hive/user_info
```

2. Create a table.

```
create external table user_info(id string,name string,gender string,age int,addr string) partitioned
by(year string) row format delimited fields terminated by ' ' lines terminated by '\n' stored as textfile
location '/hive/user_info';
```

 NOTE

**fields terminated** indicates delimiters, for example, spaces.

**lines terminated** indicates line breaks, for example, **\n**.

**/hive/user\_info** indicates the path of the data file.

3. Import data.

- a. Execute the **insert** statement to insert data.

```
insert into user_info partition(year="2018") values ("12005000201", "A", "Male", 19, "City A");
```

- b. Run the **load data** command to import file data.

- i. Create a file based on the data in [Table 10-6](#). For example, the file name is **txt.log**. Fields are separated by space, and the line feed characters are used as the line breaks.

- ii. Upload the file to HDFS.

```
hdfs dfs -put txt.log /tmp
```

- iii. Load data to the table.

```
load data inpath '/tmp/txt.log' into table user_info partition
(year='2011');
```

4. Query the imported data:  

```
select * from user_info;
```
5. Delete the user information table:  

```
drop table user_info;
```

----End

## 10.3.8 Using a Kafka Client

### Scenario

You can create, query, and delete topics on a cluster client.

### Prerequisites

The client has been installed. For example, the client is installed in the `/opt/hadoopclient` directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

### Using the Kafka Client (Versions Earlier Than MRS 3.x)

- Step 1** View the IP addresses of the ZooKeeper role instance.

Record any IP address of the ZooKeeper instance.

- Step 2** Log in to the node where the client is installed.

- Step 3** Run the following command to switch to the client directory, for example, `/opt/hadoopclient/Kafka/kafka/bin`.

```
cd /opt/hadoopclient/Kafka/kafka/bin
```

- Step 4** Run the following command to configure environment variables:

```
source /opt/hadoopclient/bigdata_env
```

- Step 5** If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled, skip this step.

```
kinit Kafka user
```

- Step 6** Create a topic.

```
sh kafka-topics.sh --create --topic Topic name --partitions Number of partitions
occupied by the topic --replication-factor Number of replicas of the topic --
zookeeper IP address of the node where the ZooKeeper instance
resides:clientPort/kafka
```

- Step 7** Run the following command to view the topic information in the cluster:

```
sh kafka-topics.sh --list --zookeeper IP address of the node where the ZooKeeper
instance resides:clientPort/kafka
```

- Step 8** Delete the topic created in [Step 6](#).

```
sh kafka-topics.sh --delete --topic Topic name --zookeeper IP address of the node where the ZooKeeper instance resides:clientPort/kafka
```

Type **y** and press **Enter**.

----End

## Using the Kafka Client (MRS 3.x or Later)

**Step 1** View the IP addresses of the ZooKeeper role instance.

Record any IP address of the ZooKeeper instance.

**Step 2** Log in to the node where the client is installed.

**Step 3** Run the following command to switch to the client directory, for example, **/opt/hadoopclient/Kafka/kafka/bin**.

```
cd /opt/hadoopclient/Kafka/kafka/bin
```

**Step 4** Run the following command to configure environment variables:

```
source /opt/hadoopclient/bigdata_env
```

**Step 5** If Kerberos authentication is enabled for the current cluster, run the following command to authenticate the user. If Kerberos authentication is disabled, skip this step.

```
kinit Kafka user
```

**Step 6** Create a topic.

```
sh kafka-topics.sh --create --topic Topic name --partitions Number of partitions occupied by the topic --replication-factor Number of replicas of the topic --zookeeper IP address of the node where the ZooKeeper instance resides:clientPort/kafka
```

**Step 7** Run the following command to view the topic information in the cluster:

```
sh kafka-topics.sh --list --zookeeper IP address of the node where the ZooKeeper instance resides:clientPort/kafka
```

**Step 8** Delete the topic created in [Step 6](#).

```
sh kafka-topics.sh --delete --topic Topic name --zookeeper IP address of the node where the ZooKeeper instance resides:clientPort/kafka
```

Type **y** and press **Enter**.

----End

### 10.3.9 Using a Kudu Client

Kudu is a columnar storage manager developed for the Apache Hadoop platform. Kudu shares the common technical properties of Hadoop ecosystem applications. It is horizontally scalable and supports highly available operations.

## Prerequisites

The cluster client has been installed. For example, the client is installed in the `/opt/hadoopclient` directory. The client directory in the following operations is only an example. Change it to the actual installation directory.

## Procedure

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Run the Kudu command line tool.

Run the command line tool of the Kudu component to view help information.

```
kudu -h
```

The command output is as follows:

```
Usage: ./kudu <command> [<args>]

<command> can be one of the following:
  cluster  Operate on a Kudu cluster
  diagnose Diagnostic tools for Kudu servers and clusters
    fs     Operate on a local Kudu filesystem
    hms    Operate on remote Hive Metastores
  local_replica Operate on local tablet replicas via the local filesystem
  master   Operate on a Kudu Master
    pbc   Operate on PBC (protobuf container) files
    perf  Measure the performance of a Kudu cluster
  remote_replica Operate on remote tablet replicas on a Kudu Tablet Server
  table    Operate on Kudu tables
  tablet   Operate on remote Kudu tablets
  test     Various test actions
  tserver  Operate on a Kudu Tablet Server
  wal     Operate on WAL (write-ahead log) files
```

### NOTE

The Kudu command line tool does not support DDL and DML operations, but provides the refined query function for the **cluster**, **master**, **tserver**, **fs**, and **table** parameters.

### Common operations:

- Check the tables in the current cluster.  
`./kudu table list KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051`
- Query the configurations of the KuduMaster instance of the Kudu service.  
`./kudu master get_flags KuduMaster instance IP:7051`
- Query the schema of a table.  
`./kudu table describe KuduMaster instance IP1:7051, KuduMaster instance IP2:7051, KuduMaster instance IP3:7051 table name`
- Delete a table.

```
./kudu table delete KuduMaster instance IP1:7051, KuduMaster instance  
IP2:7051, KuduMaster instance IP3:7051 table name
```

 NOTE

To obtain the IP address of the KuduMaster instance, choose **Components > Kudu > Instances** on the cluster details page.

----End

## 10.3.10 Using the Oozie Client

### Scenario

This section describes how to use the Oozie client in an O&M scenario or service scenario.

### Prerequisites

- The client has been installed. For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the MRS cluster administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login.

### Using the Oozie Client

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory.

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Check the cluster authentication mode.

- If the cluster is in security mode, run the following command to authenticate the user: *exampleUser* indicates the name of the user who submits tasks.

```
kinit exampleUser
```

- If the cluster is in normal mode, go to [Step 5](#).

**Step 5** Perform the following operations to configure Hue:

1. Configure the Spark2x environment (skip this step if the Spark2x task is not involved):

```
hdfs dfs -put /opt/hadoopclient/Spark2x/spark/jars/*.jar /user/oozie/  
share/lib/spark2x/
```

2. Upload the Oozie configuration file and JAR package to HDFS.

```
hdfs dfs -mkdir /user/exampleUser
```

```
hdfs dfs -put -f /opt/hadoopclient/Oozie/oozie-client-*/examples /user/  
exampleUser/
```

 NOTE

- *exampleUser* indicates the name of the user who submits tasks.
- If the user who submits the task and other files except **job.properties** are not changed, client installation directory **/Oozie/oozie-client-\*/examples** can be repeatedly used after being uploaded to HDFS.
- When the JAR package in the HDFS directory **/user/oozie/share** changes, you need to restart the Oozie service.
- Resolve the JAR file conflict between Spark and Yarn about Jetty.

```
hdfs dfs -rm -f -skipTrash /user/oozie/share/lib/spark/jetty-  
all-9.2.22.v20170606.jar
```

- In normal mode, if **Permission denied** is displayed during the upload, run the following commands:

```
su - omm  
source /opt/hadoopclient/bigdata_env  
hdfs dfs -chmod -R 777 /user/oozie  
exit
```

----End

## 10.3.11 Using a Storm Client

### Scenario

This section describes how to use the Storm client in an O&M scenario or service scenario.

### Prerequisites

- The client has been installed. For example, the installation directory is **/opt/hadoopclient**.
- Service component users are created by the MRS cluster administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login. (Not involved in normal mode)

### Procedure

**Step 1** Prepare the client based on service requirements. Log in to the node where the client is installed.

Log in to the node where the client is installed. For details, see .

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** If multiple Storm instances are installed, run the following command to load the environment variables of a specific instance when running the Storm command to submit the topology. Otherwise, skip this step. The following command uses the instance Storm-2 as an example.

**source Storm-2/component\_env**

**Step 5** Run the following command to perform user authentication (skip this step in normal mode):

**kinit** *Component service user*

**Step 6** Run the following command to perform operations on the client:

For example, run the following command:

- **cql**
- **storm**

 **NOTE**

A Storm client cannot be connected to secure and non-secure ZooKeepers at the same time.

----End

## 10.3.12 Using a Yarn Client

### Scenario

This section guides users to use a Yarn client in an O&M or service scenario.

### Prerequisites

- The client has been installed.  
For example, the installation directory is **/opt/hadoopclient**. The client directory in the following operations is only an example. Change it to the actual installation directory.
- Service component users are created by the MRS cluster administrator as required. In security mode, machine-machine users need to download the keytab file. A human-machine user must change the password upon the first login. In common mode, you do not need to download the keytab file or change the password.

### Using the Yarn Client

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

**cd /opt/hadoopclient**

**Step 3** Run the following command to configure environment variables:

**source bigdata\_env**

**Step 4** If the cluster is in security mode, run the following command to authenticate the user. In normal mode, user authentication is not required.

**kinit** *Component service user*

**Step 5** Run the Yarn command. The following provides an example:

```
yarn application -list
```

```
----End
```

## Client-related FAQs

1. What Do I Do When the Yarn Client Exits Abnormally and Error Message "java.lang.OutOfMemoryError" Is Displayed After the Yarn Client Command Is Run?

This problem occurs because the memory required for running the Yarn client exceeds the upper limit (128 MB by default) set on the Yarn client. For clusters of MRS 3.x or later: You can modify **CLIENT\_GC\_OPTS** in *<Client installation path>/HDFS/component\_env* to change the memory upper limit of the Yarn client. For example, if you want to set the maximum memory to 1 GB, run the following command:

```
export CLIENT_GC_OPTS="-Xmx1G"
```

For clusters earlier than MRS 3.x: You can modify **GC\_OPTS\_YARN** in *<Client installation path >/HDFS/component\_env* to change the memory upper limit of the Yarn client. For example, if you want to set the maximum memory to 1 GB, run the following command:

```
export GC_OPTS_YARN="-Xmx1G"
```

After the modification, run the following command to make the modification take effect:

```
source <Client installation path>/bigdata_env
```

2. How Can I Set the Log Level When the Yarn Client Is Running?

By default, the logs generated during the running of the Yarn client are printed to the console. The default log level is INFO. To enable the DEBUG log level for fault locating, run the following command to export an environment variable:

```
export YARN_ROOT_LOGGER=DEBUG,console
```

Then run the Yarn Shell command to print DEBUG logs.

If you want to print INFO logs again, run the following command:

```
export YARN_ROOT_LOGGER=INFO,console
```

# 11 MRS Manager Operation Guide (Applicable to 2.x and Earlier Versions)

---

## 11.1 Introduction to MRS Manager

### Overview

MRS manages and analyzes massive data and helps you rapidly obtain desired data from structured and unstructured data. The structure of open-source components is complex. The installation, configuration, and management processes are time- and labor-consuming. MRS Manager is a unified enterprise-level cluster management platform and provides the following functions:

- Cluster monitoring enables you to quickly view the health status of hosts and services.
- Graphical metric monitoring and customization enable you to quickly obtain key information about the system.
- Service property configurations can meet service performance requirements.
- With cluster, service, and role instance functions, you can start or stop services and clusters in one click.

### Introduction to the MRS Manager GUI

MRS Manager provides a unified cluster management platform, facilitating rapid and easy O&M for clusters. For details about how to access MRS Manager, see [Accessing Manager](#).

[Table 11-1](#) describes the functions of each operation entry.

**Table 11-1** Functions of each entry on the operation bar

| Parameter | Function                                                                                                                                                                                                                                                                                                                         |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dashboard | Displays the status of all services, main monitoring indicators of each service, and host status in charts, such as bar charts, line charts, and tables. You can customize a dashboard for the key monitoring indicators and drag it to any position on the interface. The system dashboard page supports automatic data update. |
| Services  | Provides the service monitoring, operation, and configuration guidance, which helps you manage services in a unified manner.                                                                                                                                                                                                     |
| Hosts     | Provides guidance on how to monitor, operate, and configure hosts, helping you manage hosts in a unified manner.                                                                                                                                                                                                                 |
| Alarms    | Supports alarm query and provides guidance on alarm handling, helping you identify and rectify product faults and potential risks in a timely manner to ensure normal system operation.                                                                                                                                          |
| Audit     | Allows authorized users to query and export audit logs, helping you to view all user activities and operations.                                                                                                                                                                                                                  |
| Tenant    | Provides a unified tenant management platform.                                                                                                                                                                                                                                                                                   |
| System    | Provides monitoring, alarm configuration management, and backup management.                                                                                                                                                                                                                                                      |

Go to the **System** tab page, and switch to another function pages through shortcuts. See [Table 11-2](#).

The following is an example of quick redirection through shortcuts:

- Step 1** On MRS Manager, click **System**.
- Step 2** On the **System** tab page, click a function link. The function page is displayed.  
For example, in the **Backup and Restoration** area, click **Back Up Data**. The page for backing up data is displayed.
- Step 3** Move the cursor to the left border of the browser window. The **System** black shortcut menu is displayed. After you move the cursor out of the menu, the menu is collapsed.
- Step 4** In the shortcut menu that is displayed, you can click a function link to go to the corresponding function page.  
For example, choose **Maintenance > Export Log**. The page for exporting logs is displayed.

----End

**Table 11-2** Shortcut menus on the **System** tab page

| Menu                   | Function Link                           |
|------------------------|-----------------------------------------|
| Backup and Restoration | Back Up Data                            |
|                        | Restore Data                            |
| Maintenance            | Export Log                              |
|                        | Export Audit Log                        |
|                        | Check Health Status                     |
| Monitoring and Alarm   | Configure Syslog                        |
|                        | Configure Alarm Threshold               |
|                        | Configure SNMP                          |
|                        | Configure Monitoring Metric Dump        |
|                        | Configure Resource Contribution Ranking |
| Permission             | Manage User                             |
|                        | Manage User Group                       |
|                        | Manage Role                             |
|                        | Configure Password Policy               |
|                        | Change OMS Database Password            |
| Patch                  | Manage Patch                            |

## Reference

MapReduce Service (MRS) is a data analysis service. It is used to manage and analyze massive sets of data.

MRS uses MRS Manager to manage big data components, such as components in the Hadoop ecosystem. Therefore, some concepts on the MRS Console must be different from those on MRS Manager. For details, see [Table 11-3](#).

**Table 11-3** Difference Comparison

| Concept           | MRS                                                                                                                                     | MRS Manager                                                                        |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|
| MapReduce Service | Indicates the data analysis cloud service, called MRS. This service includes components such as Hive, Spark, Yarn, HDFS, and ZooKeeper. | Provides a unified management platform for big data components in tenant clusters. |

## 11.2 Checking Running Tasks

### Scenario

When you perform operations on MRS Manager to trigger a task, the task execution process and progress are displayed. After the task window is closed, you need to open the task window by using the task management function.

MRS Manager reserves 10 latest tasks by default, for example, restarting services, synchronizing service configurations, and performing health check.

### Procedure

**Step 1** On MRS Manager, click  to open the task list.

You can view the following information in the task list: **Name**, **Status**, **Progress**, **Start Time** and **End Time**.

**Step 2** Click the target task name to view the detailed information about the running task.

----End

## 11.3 Monitoring Management

### 11.3.1 Dashboard

On MRS Manager, nodes in a cluster can be classified into management nodes, control nodes, and data nodes. The change trends of key host monitoring metrics on each type of node can be calculated and displayed as curve charts in reports based on the customized periods. If a host belongs to multiple node types, the metric statistics will be repeatedly collected.

This section provides overview of MRS clusters and describes how to view, customize, and export node monitoring metrics on MRS Manager.

### Procedure

**Step 1** Log in to MRS Manager. For details, see [Accessing Manager](#).

**Step 2** Choose **Dashboard** on MRS Manager.

**Step 3** In **Period**, you can specify a period to view monitoring data. The options are as follows:

- Real time
- Last 3 hours
- Last 6 hours
- Last 24 hours
- Last week

- Last month
- Last 3 months
- Last 6 months
- Customize. If you select this option, you can customize the period for viewing monitoring data.

**Step 4** Click **View** to view monitoring data in a period.

- You can view **Health Status** and **Roles** of each service on the **Service Summary** page of MRS Manager.
- Click  above the curve chart to view details about a metric.

**Step 5** Customize a monitoring report.

1. Click **Customize** and select monitoring metrics to be displayed on MRS Manager.

MRS Manager supports a maximum of 14 monitoring metrics, but at most 12 customized monitoring metrics can be displayed on the page.

- Cluster Host Health Status
- Cluster Network Read Speed Statistics
- Host Network Read Speed Distribution
- Host Network Write Speed Distribution
- Cluster Disk Write Speed Statistics
- Cluster Disk Usage Statistics
- Cluster Disk Information
- Host Disk Usage Statistics
- Cluster Disk Read Speed Statistics
- Cluster Memory Usage Statistics
- Host Memory Usage Distribution
- Cluster Network Write Speed Statistics
- Host CPU Usage Distribution
- Cluster CPU Usage Statistics

2. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

**Step 6** Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

 **NOTE**

If you select **Full Screen**, the **Dashboard** window will be maximized.

**Step 7** Export a monitoring report.

1. Select a period. The options are as follows:
  - Real time
  - Last 3 hours
  - Last 6 hours
  - Last 24 hours
  - Last week
  - Last month
  - Last 3 months
  - Last 6 months
  - Customize. If you select this option, you can customize a time of period to export a report.
2. Click **Export**. MRS Manager will generate a report about the selected monitoring metrics in a specified time of period. Save the report.

 **NOTE**

To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

## 11.3.2 Managing Services and Monitoring Hosts

You can manage the following status and indicators of all services (including role instances) and hosts on the MRS Manager:

- Status information: includes operation, health, configuration, and role instance status.
- Metric information: includes key monitoring metrics for services.
- Metric export: allows you to export monitoring reports.

 **NOTE**

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

## Managing Service Monitoring

**Step 1** On MRS Manager, click **Services**.

The service list includes **Service**, **Operating Status**, **Health Status**, **Configuration Status**, **Roles**, and **Operation** are displayed in the component list.

- [Table 11-4](#) describes the service operating status.

**Table 11-4** Service operating status

| Status          | Description                                                            |
|-----------------|------------------------------------------------------------------------|
| Started         | The service is started.                                                |
| Stopped         | The service is stopped.                                                |
| Failed to start | Failed to start the role instance.                                     |
| Failed to stop  | Failed to stop the role instance.                                      |
| Unknown         | Indicates initial service status after the background system restarts. |

- **Table 11-5** describes the service health status.

**Table 11-5** Service health status

| Status            | Description                                                                                                                                                        |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Good              | Indicates that all role instances in the service are running properly.                                                                                             |
| Bad               | Indicates that the running status of at least one role instance is <b>Faulty</b> or the status of the service on which the current service depends is abnormal.    |
| Unknown           | Indicates that all role instances in the service are in the <b>Unknown</b> state.                                                                                  |
| Concerning        | Indicates that the background system is restarting the service.                                                                                                    |
| Partially Healthy | Indicates that the status of the service on which the service depends is abnormal, and APIs related to the abnormal service cannot be invoked by external systems. |

- **Table 11-6** describes the service health status.

**Table 11-6** Service configuration status

| Status       | Description                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synchronized | The latest configuration takes effect.                                                                                                                          |
| Expired      | The latest configuration does not take effect after the parameter modification. Related services need to be restarted.                                          |
| Failed       | The communication is incorrect or data cannot be read or written during the parameter configuration. Use <b>Synchronize Configuration</b> to rectify the fault. |

| Status      | Description                                      |
|-------------|--------------------------------------------------|
| Configuring | Parameters are being configured.                 |
| Unknown     | Current configuration status cannot be obtained. |

By default, the **Service** column is sorted in ascending order. You can click the icon next to **Service**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

**Step 2** Click a specified service in the list to view its status and metric information.

**Step 3** Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

## Managing Role Instances

**Step 1** On MRS Manager, click **Services** and click the target service name in the service list.

**Step 2** Click **Instance** to view the role status.

The role instance list contains the **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operation Status**, **Health Status**, and **Configuration Status** of an instance.

- [Table 11-7](#) shows the configuration status of a role instance.

**Table 11-7** Role instance status

| Status          | Description                                                                  |
|-----------------|------------------------------------------------------------------------------|
| Started         | The role instance has been started.                                          |
| Stopped         | The role instance has been stopped.                                          |
| Failed to start | Failed to start the role instance.                                           |
| Failed to stop  | Failed to stop the role instance.                                            |
| Decommissioning | The role instance is being decommissioned.                                   |
| Decommissioned  | The role instance has been decommissioned.                                   |
| Recommissioning | The role instance is being recommissioned.                                   |
| Unknown         | Indicates initial role instance status after the background system restarts. |

- **Table 11-8** shows the health status of a role instance.

**Table 11-8** Role instance health status

| Status     | Description                                                                                    |
|------------|------------------------------------------------------------------------------------------------|
| Good       | The role instance is running properly.                                                         |
| Bad        | The role instance is abnormal. For example, the port cannot be accessed if PID does not exist. |
| Unknown    | The host where a role instance resides does not connect to the background system.              |
| Concerning | The background system is restarting a role instance.                                           |

- **Table 11-9** shows the configuration status of a role instance.

**Table 11-9** Role instance configuration status

| Status       | Description                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Synchronized | The latest configuration takes effect.                                                                                                                          |
| Expired      | The latest configuration does not take effect after the parameter modification. Related services need to be restarted.                                          |
| Failed       | The communication is incorrect or data cannot be read or written during the parameter configuration. Use <b>Synchronize Configuration</b> to rectify the fault. |
| Configuring  | Parameters are being configured.                                                                                                                                |
| Unknown      | Current configuration status cannot be obtained.                                                                                                                |

By default, the **Role** column is sorted in ascending order. You can click the sorting icon next to **Role**, **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Operating Status**, **Health Status**, or **Configuration Status** to change the sorting mode.

You can filter out all instances of the same role in the **Role** column.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

**Step 3** Click the target role instance to view its status and metric information.

**Step 4** Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

## Managing Hosts

**Step 1** On MRS Manager, click **Hosts** to view the status of all hosts.

The host list contains the host name, management IP address, service IP address, rack, network speed, operating status, health status, disk usage, memory usage, and CPU usage.

- **Table 11-10** shows the host operating status.

**Table 11-10** Host operating status

| Status   | Description                                                           |
|----------|-----------------------------------------------------------------------|
| Normal   | The host and service roles on the host are running properly.          |
| Isolated | The host is isolated, and the service roles on the host stop running. |

- **Table 11-11** describes the host health status.

**Table 11-11** Host health status

| Status  | Description                                                                           |
|---------|---------------------------------------------------------------------------------------|
| Good    | The host can properly send heartbeats.                                                |
| Bad     | The host fails to send heartbeats due to timeout.                                     |
| Unknown | The host initial status is unknown during the operation of adding or deleting a host. |

By default, the **Host Name** column is sorted by host name in ascending order. You can click the sorting icon next to **Host Name**, **OM IP Address**, **Business IP Address**, **Rack**, **Network Speed**, **Operating Status**, **Health Status**, **Disk Usage**, **Memory Usage**, or **CPU Usage** to change the sorting mode.

You can set search criteria in the role search area by clicking **Advanced Search**, and click **Search** to view specified role information. Click **Reset** to clear the search criteria. Fuzzy search is supported.

**Step 2** Click the target host in the host list to view its status and metric information.

**Step 3** Customize monitoring metrics and export customized monitoring information.

1. In the **Charts** area, click **Customize** to customize service monitoring metrics.
2. In **Period** area, select a time of period and click **View** to view the monitoring data within the time period.
3. Click **Export** to export the displayed metrics.

----End

### 11.3.3 Managing Resource Distribution

On MRS Manager, you can query the top value curves, bottom value curves, or average data curves of key service and host monitoring metrics, that is, the resource distribution information. MRS Manager allows you to view the monitoring data of the last hour.

You can also modify the resource distribution on MRS Manager to display both the top and bottom value curves in service and host resource distribution figures.

Resource distribution of some monitoring metrics is not recorded.

#### Procedure

- View the resource distribution of service monitoring metrics.
    - a. On MRS Manager, click **Services**.
    - b. Select the target service from the service list.
    - c. Click **Resource Distribution**.  
Select key metrics of the service from **Metric**. MRS Manager displays the resource distribution of the metrics in the last hour.
  - View the resource distribution of host monitoring metrics.
    - a. Click **Hosts**.
    - b. Click the name of the specified host in the host list.
    - c. Click **Resource Distribution**.  
Select key metrics of the host from **Metrics**. MRS Manager displays the resource distribution of the metrics in the last hour.
  - Configure resource distribution.
    - a. On MRS Manager, click **System**.
    - b. In **Configuration**, click **Configure Resource Contribution Ranking** under **Monitoring and Alarm**.
    - c. Change the number of resources to be displayed.
      - Set **Number of Top Resources** to the number of top values.
      - Set **Number of Bottom Resources** to the number of bottom values.
-  **NOTE**
- The sum of the maximum value and minimum value of resource distribution cannot be greater than 5.
- d. Click **OK** to save the configurations.  
The message "Number of top and bottom resources saved successfully" is displayed in the upper right corner of the page.

### 11.3.4 Configuring Monitoring Metric Dumping

You can configure interconnection parameters on MRS Manager to save monitoring metric data to a specified FTP server using the FTP or SFTP protocol. In this way, MRS clusters can interconnect with third-party systems. The FTP protocol does not encrypt data, which brings potential security risks. Therefore, the SFTP protocol is recommended.

MRS Manager supports the collection of all the monitoring metric data in the managed clusters. The collection period is 30 seconds, 60 seconds, or 300 seconds. The monitoring metric data is stored to different monitoring files on the FTP server by collection period. The monitoring file naming rule is in the "*Cluster name\_metric\_Monitoring metric data collection period\_File saving time.log*" format.

## Prerequisites

The ECS corresponding to the dump server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the dump server. The FTP service on the dump server is running properly.

## Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In **Configuration**, click **Configure Monitoring Metric Dump** under **Monitoring and Alarm**.
- Step 3** [Table 11-12](#) describes dump parameters.

**Table 11-12** Dump parameters

| Parameter         | Description                                                                                                                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FTP IP Address    | Mandatory. This parameter specifies the FTP server for storing monitoring files after the monitoring indicator data is interconnected.                                                                              |
| FTP Port          | Mandatory. This parameter specifies the port connected to the FTP server.                                                                                                                                           |
| FTP Username      | Mandatory. This parameter specifies the username for logging in to the FTP server.                                                                                                                                  |
| FTP Password      | Mandatory. This parameter specifies the password for logging in to the FTP server.                                                                                                                                  |
| Save Path         | Mandatory. This parameter specifies the path for storing monitoring files on the FTP server.                                                                                                                        |
| Dump Interval (s) | Mandatory. This parameter specifies the interval at which monitoring files are periodically stored on the FTP server, in seconds.                                                                                   |
| Dump Mode         | Mandatory. This parameter specifies the protocol used for sending monitoring files. This parameter is mandatory. The options are <b>FTP</b> and <b>SFTP</b> .                                                       |
| SFTP Public Key   | Optional. This parameter specifies the public key of the FTP server and is valid only when <b>Dump Mode</b> is set to <b>SFTP</b> . You are advised to configure a public key. Otherwise, security risks may arise. |

**Step 4** Click **OK** to complete the settings.

----End

## 11.4 Alarm Management

### 11.4.1 Viewing and Manually Clearing an Alarm

#### Scenario

You can view and clear alarms on MRS Manager.

Generally, the system automatically clears an alarm when the fault is rectified. If the fault has been rectified and the alarm cannot be automatically cleared, you can manually clear the alarm.

You can view the latest 100,000 alarms (including uncleared, manually cleared, and automatically cleared alarms) on MRS Manager. If the number of cleared alarms exceeds 100,000 and is about to reach 110,000, the system automatically dumps the earliest 10,000 cleared alarms to **`${BIGDATA_HOME}/OMSV100R001C00x8664/workspace/data`** on the active management node. A directory is automatically generated when alarms are dumped for the first time.

#### NOTE

Set an automatic refresh interval or click  for an immediate refresh.

The following refresh interval options are supported:

- Refresh every 30 seconds
- Refresh every 60 seconds
- Stop refreshing

#### Procedure

**Step 1** On MRS Manager, click **Alarms** to view the alarm information in the alarm list.

- By default, the alarm list page displays the latest 10 alarms.
- By default, alarms are displayed in descending order by **Generated**. You can click **Alarm ID**, **Alarm Name**, **Severity**, **Generated**, **Location**, **Operation** to change the display mode.
- You can filter all alarms of the same severity in **Severity**, including cleared and uncleared alarms.
- You can click , , , or  to filter out **Critical**, **Major**, **Minor**, or **Warning** alarms.

**Step 2** Click **Advanced Search**. In the displayed alarm search area, set search criteria and click **Search** to view the information about specified alarms. Click **Reset** to clear the search criteria.

#### NOTE

You can set the **Start Time** and **End Time** to specify the time range. You can search for alarms generated within the time range.

Handle the alarm by referring to **Alarm Reference**. If the alarms in some scenarios are generated due to other cloud services that MRS depends on, you need to contact maintenance personnel of the corresponding cloud services.

**Step 3** If the alarm needs to be manually cleared after errors are rectified, click **Clear Alarm**.

 **NOTE**

If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.

----End

## 11.4.2 Configuring an Alarm Threshold

### Scenario

You can configure an alarm threshold to learn the metric health status. After **Send Alarm** is selected, the system sends an alarm message when the monitored data reaches the alarm threshold. You can view the alarm information in **Alarms**.

### Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In **Configuration**, click **Configure Alarm Threshold** under **Monitoring and Alarm**, select monitoring metrics as planned, and set their baselines.
- Step 3** Click a metric, for example, **CPU Usage**, and click **Create Rule**.
- Step 4** Set the monitoring metric rule parameters on the displayed configuration page.

**Table 11-13** Monitoring metric rule parameters

| Parameter      | Value                   | Description                                                               |
|----------------|-------------------------|---------------------------------------------------------------------------|
| Rule Name      | CPU_MAX (example value) | Specifies the rule name.                                                  |
| Reference Date | 2014/11/06 (example)    | Specifies the date on which the reference indicator history is generated. |

| Parameter      | Value                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                           |
|----------------|----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Threshold Type | <ul style="list-style-type: none"> <li>• Max. value</li> <li>• Min. value</li> </ul>                                 | Specifies the maximum or minimum value of a metric. If this parameter is set to <b>Max. Value</b> , the system generates an alarm when the actual value of the metric is greater than the threshold. If this parameter is set to <b>Min. Value</b> , the system generates an alarm when the actual value of the metric is smaller than the threshold. |
| Alarm Severity | <ul style="list-style-type: none"> <li>• Critical</li> <li>• Major</li> <li>• Minor</li> <li>• Suggestion</li> </ul> | Alarm Severity                                                                                                                                                                                                                                                                                                                                        |
| Time Range     | From 00:00 to 23:59 (example)                                                                                        | Specifies the period in which the rule takes effect.                                                                                                                                                                                                                                                                                                  |
| Threshold      | 80 (example)                                                                                                         | Specifies the threshold of the rule monitoring metrics.                                                                                                                                                                                                                                                                                               |
| Date           | <ul style="list-style-type: none"> <li>• Workday</li> <li>• Weekend</li> <li>• Other</li> </ul>                      | Specifies the type of date when the rule takes effect.                                                                                                                                                                                                                                                                                                |
| Add Date       | 11/06 (example)                                                                                                      | This parameter is valid only when <b>Date</b> is set to <b>Other</b> . You can select multiple dates.                                                                                                                                                                                                                                                 |

**Step 5** Click **OK**. A message is displayed in the upper right corner of the page, indicating that the template is saved successfully.

**Send alarm** is selected by default. MRS Manager checks whether the value of each monitored metric reaches the threshold. If the number of consecutive check times is equal to the value of **Trigger Count**, and the threshold is not reached in these checks, the system sends an alarm. The value can be customized. **Check Period (s)** indicates the interval at which MRS Manager checks monitoring metrics.

**Step 6** Locate the row that contains the newly added rule, and click **Apply** in the **Operation** column. A message is displayed in the upper right corner, indicating that the rule xx is successfully added. Click **Cancel** in the **Operation** column. A

message is displayed in the upper right corner, indicating that the rule *xx* is successfully canceled.

----End

## 11.4.3 Configuring Syslog Northbound Interface Parameters

### Scenario

You can configure the northbound interface so that alarms generated on MRS Manager can be reported to your monitoring O&M system using Syslog.

#### NOTICE

If the Syslog protocol is not encrypted, data may be stolen.

### Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

### Procedure

**Step 1** On MRS Manager, click **System**.

**Step 2** In **Configuration**, click **Configure Syslog** under **Monitoring and Alarm**.

The **Syslog Service** is disabled by default. Click the switch to enable the Syslog service.

**Step 3** Set the interconnection parameters listed in [Table 11-14](#).

**Table 11-14** Syslog parameters

| Area            | Parameter          | Description                                                                                                                  |
|-----------------|--------------------|------------------------------------------------------------------------------------------------------------------------------|
| Syslog Protocol | Service IP Address | Specifies the IP address of the interconnection server.                                                                      |
|                 | Server Port        | Specifies the port number for interconnection.                                                                               |
|                 | Protocol           | Specifies the protocol type. The options are as follows: <ul style="list-style-type: none"><li>• TCP</li><li>• UDP</li></ul> |

| Area           | Parameter     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | Severity      | Specifies the severity of the reported message. The options are as follows: <ul style="list-style-type: none"> <li>• <b>Informational</b></li> <li>• <b>Emergency</b></li> <li>• <b>Alert</b></li> <li>• <b>Critical</b></li> <li>• <b>Error</b></li> <li>• <b>Warning</b></li> <li>• <b>Notice</b></li> <li>• <b>Debug</b></li> </ul>                                                                                                           |
|                | Facility      | Specifies the module where the log is generated.                                                                                                                                                                                                                                                                                                                                                                                                 |
|                | Identifier    | Specifies the product ID. The default value is <b>MRS Manager</b> .                                                                                                                                                                                                                                                                                                                                                                              |
| Report Message | Report Format | Specifies the message format of the alarm report. For details, see help information on the web page.                                                                                                                                                                                                                                                                                                                                             |
|                | Alarm Status  | Specifies the type of the alarm to be reported. <ul style="list-style-type: none"> <li>• <b>Fault</b>: indicates that the Syslog alarm message is reported when MRS Manager generates an alarm.</li> <li>• <b>Clear</b>: indicates that a Syslog alarm message is reported when an alarm on MRS Manager is cleared.</li> <li>• <b>Event</b>: indicates that the Syslog alarm message is reported when MRS Manager generates an event.</li> </ul> |

| Area                      | Parameter                       | Description                                                                                                                                                                                                                                                                                                      |
|---------------------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | Report Alarm Severity           | Specifies the level of the alarm to be reported. The value can be <b>Suggestion, Minor, Major, and Critical.</b>                                                                                                                                                                                                 |
| Uncleared Alarm Reporting | Periodic Uncleared Alarm Report | Specifies whether uncleared alarms are reported periodically. By default, the switch of <b>Periodic Uncleared Alarm Reporting</b> is disabled. You can click the switch to enable it.                                                                                                                            |
|                           | Report Interval (min)           | Specifies the interval for periodically reporting uncleared alarms to the remote Syslog service. This parameter is valid only when <b>Periodic Uncleared Alarm Reporting</b> switch is enabled. The unit is minute. The default value is <b>15</b> . The value ranges from 5 minutes to one day (1,440 minutes). |
| Heartbeat Settings        | Heartbeat Report                | Specifies whether to periodically report Syslog heartbeat messages. By default, the switch of <b>Periodic Uncleared Alarm Reporting</b> is disabled. You can click the switch to enable it.                                                                                                                      |
|                           | Heartbeat Period (min)          | Specifies the interval for periodically reporting heartbeat messages. This parameter is valid only when <b>Heartbeat Report</b> switch is enabled. The unit is minute. The default value is <b>15</b> . The value ranges from 1 to 60.                                                                           |

| Area | Parameter        | Description                                                                                                                                                                                                                                                                                    |
|------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|      | Heartbeat Packet | Specifies the content of the reported heartbeat message. This parameter is enabled when <b>Heartbeat Report</b> is enabled. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars ( ), colons (:), spaces, commas (,), and periods (.). |

 **NOTE**

After the periodic heartbeat packet function is enabled, packets may be interrupted during automatic recovery of some cluster error tolerance (for example, active/standby management node switchover). In this case, wait for automatic recovery.

**Step 4** Click **OK** to complete the settings.

----End

## 11.4.4 Configuring SNMP Northbound Interface Parameters

### Scenario

You can configure the northbound interface so that alarms and monitoring metrics on MRS Manager can be integrated to the network management platform using SNMP.

### Prerequisites

The ECS corresponding to the server must be in the same VPC as the Master node of the MRS cluster, and the Master node can access the IP address and specified port of the server.

### Procedure

**Step 1** On MRS Manager, click **System**.

**Step 2** In **Configuration**, click **Configure SNMP** under **Monitoring and Alarm**.

The **SNMP Service** is disabled by default. Click the switch to enable the SNMP service.

**Step 3** Set the interconnection parameters listed in [Table 11-15](#).

**Table 11-15** Syslog parameters

| Parameter               | Description                                                                                                                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Version                 | Specifies the version of the SNMP, which can be: <ul style="list-style-type: none"> <li>v2c: an earlier version with low security</li> <li>v3: the latest version of SNMP with higher security than SNMPv2c</li> </ul> The SNMP v3 version is recommended. |
| Local Port              | Specifies the local port. The default value is <b>20000</b> . The value ranges from <b>1025</b> to <b>65535</b> .                                                                                                                                          |
| Read Community Name     | Specifies the read-only community name. This parameter is valid only when <b>Version</b> is set to <b>v2c</b> .                                                                                                                                            |
| Write Community Name    | Specifies the write community name. This parameter is valid only when <b>Version</b> is set to <b>v2c</b> .                                                                                                                                                |
| Security Username       | Specifies the SNMP security username. This parameter is valid only when <b>Version</b> is set to <b>v3</b> .                                                                                                                                               |
| Authentication Protocol | Specifies the authentication protocol. You are advised to set this parameter to set this parameter to <b>SHA</b> . This parameter is valid only when <b>Version</b> is set to <b>v3</b> .                                                                  |
| Authentication Password | Specifies the authentication key. This parameter is valid only when <b>Version</b> is set to <b>v3</b> .                                                                                                                                                   |
| Confirm Password        | Used to confirm the authentication key. This parameter is valid only when <b>Version</b> is set to <b>v3</b> .                                                                                                                                             |
| Encryption Protocol     | Specifies the encryption protocol. You are advised to set this parameter to <b>AES256</b> . This parameter is valid only when <b>Version</b> is set to <b>v3</b> .                                                                                         |
| Encryption Password     | Specifies the encryption key. This parameter is valid only when <b>Version</b> is set to <b>v3</b> .                                                                                                                                                       |
| Confirm Password        | Used to confirm the encryption key. This parameter is valid only when <b>Version</b> is set to <b>v3</b> .                                                                                                                                                 |

 **NOTE**

- The **Authentication Password** and **Encryption Password** must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or the reverse of the security username.
- For security purposes, periodically change the authentication password and encryption password when the SNMP protocol is used.
- If SNMPv3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

- Step 4** Click **Create Trap Target** in the **Trap Target** area. In the displayed dialog box, set the following parameters:
- **Target Symbol** specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
  - **Target IP Address** specifies the IP address of the target trap. IP addresses of class A, B, and C can be used to communicate with the IP address of the management plane of the management node.
  - **Target Port** specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
  - **Trap Community Name** is valid only when **Version** is set to **v2c**.
- Click **OK**. The **Create Trap Target** dialog box is closed.
- Step 5** Click **OK** to complete the settings.
- End

## 11.5 Alarm Reference (Applicable to Versions Earlier Than MRS 3.x)

### 11.5.1 ALM-12001 Audit Log Dump Failure

#### Description

Cluster audit logs need to be dumped on a third-party server due to the local historical data backup policy. Audit logs can be successfully dumped if the dump server meets the configuration conditions. This alarm is generated when the audit log dump fails because the disk space of the dump directory on the third-party server is insufficient or a user changes the username, password, or dump directory of the dump server.

#### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12001    | Minor          | Yes        |

#### Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |

| Parameter | Description                                          |
|-----------|------------------------------------------------------|
| HostName  | Specifies the host for which the alarm is generated. |

## Impact on the System

The system can only store a maximum of 50 dump files locally. If the fault persists on the dump server, the local audit log may be lost.

## Possible Causes

- The network connection is abnormal.
- The username, password, or dump directory of the dump server does not meet the configuration conditions.
- The disk space of the dump directory is insufficient.

## Procedure

**Step 1** Check whether the username, password, and dump directory are correct.

1. Check on the dump configuration page of MRS Manager to see if they are correct.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 1.2](#).
2. Change the username, password, or dump directory, and click **OK**.
3. Wait 2 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Reset the dump rule.

1. On MRS Manager, choose **System > Dump Audit Log**.
2. Reset dump rules, set the parameters properly, and click **OK**.
3. Wait 2 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.2 ALM-12002 HA Resource Is Abnormal

### Description

The high availability (HA) software periodically checks the Webservice floating IP addresses and databases of Manager. This alarm is generated when the HA software detects that the Webservice floating IP addresses or databases are abnormal.

This alarm is cleared when the HA software detects that the floating IP addresses or databases are normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12002    | Major          | Yes        |

### Parameter

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated.  |
| RoleName    | Specifies the role for which the alarm is generated.     |
| HostName    | Specifies the host for which the alarm is generated.     |
| RESName     | Specifies the resource for which the alarm is generated. |

### Impact on the System

If the Webservice floating IP addresses of Manager are abnormal, users cannot log in to or use Manager. If databases of Manager are abnormal, all core services and related service processes, such as alarms and monitoring functions, are affected.

### Possible Causes

- The floating IP address is abnormal.
- The database is abnormal.

### Procedure

**Step 1** Check the floating IP address status of the active management node.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address and resource name of the alarm.
2. Log in to the active management node. Run the following commands to switch the user:  
**sudo su - root**  
**su - omm**
3. Go to the **`\${BIGDATA\_HOME}/om-0.0.1/sbin/`** directory, run the **status-oms.sh** script to check whether the floating IP address of the active Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

Example:

```
10-10-10-160 floatip Normal Normal Single_active
```

- If yes, go to [Step 2](#).
  - If no, go to [Step 1.4](#).
4. Contact the O&M personnel to check whether the floating IP NIC exists.
    - If yes, go to [Step 2](#).
    - If no, go to [Step 1.5](#).
  5. Contact O&M personnel to rectify the NIC fault.  
Wait 5 minutes and check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to [Step 2](#).

## Step 2 Check the database status of the active and standby management nodes.

1. Log in to the active and standby management nodes, run the **sudo su - root** and **su - ommdba** commands to switch to user **ommdba**, and run the **gs\_ctl query** command to check whether the following information is displayed in the command output.

Command output of the active management node:

```
Ha state:  
LOCAL_ROLE: Primary  
STATIC_CONNECTIONS: 1  
DB_STATE: Normal  
DETAIL_INFORMATION: user/password invalid  
Senders info:  
No information  
Receiver info:  
No information
```

Command output of the standby management node:

```
Ha state:  
LOCAL_ROLE: Standby  
STATIC_CONNECTIONS: 1  
DB_STATE : Normal  
DETAIL_INFORMATION: user/password invalid  
Senders info:  
No information  
Receiver info:  
No information
```

- If yes, go to [Step 2.3](#).
- If no, go to [Step 2.2](#).

2. Contact the O&M personnel to check whether a network fault occurs and rectify the fault.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3](#).
3. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.3 ALM-12004 OLdap Resource Is Abnormal

### Description

This alarm is generated when the Ldap resource in Manager is abnormal.

This alarm is cleared when the Ldap resource in Manager recovers and the alarm handling is complete.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12004    | Major          | Yes        |

### Parameter

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The Manager authentication services are unavailable and cannot provide security authentication and user management functions for web upper-layer services. Users may be unable to log in to Manager.

## Possible Causes

The LdapServer process in Manager is abnormal.

## Procedure

**Step 1** Check whether the LdapServer process in Manager is normal.

1. Log in to the active management node.
2. Run `ps -ef | grep slapd` to check whether the LdapServer resource process in the `/${BIGDATA_HOME}/om-0.0.1/` directory of the configuration file is running properly.

You can determine that the resource is normal as follows:

- a. Run `sh ${BIGDATA_HOME}/om-0.0.1/sbin/status-oms.sh` and find that **ResHASstatus** of the OLdap process is **Normal**.
  - b. Run `ps -ef | grep slapd` and find that the slapd process occupies port 21750.
- If yes, go to [Step 2](#).
  - If no, go to [Step 3](#).

**Step 2** Run `kill -2 PID of the LdapServer process` and wait 20 seconds. The HA starts the OLdap process automatically. Check whether the status of the OLdap resource is normal.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.4 ALM-12005 OKerberos Resource Is Abnormal

### Description

The alarm module monitors the status of the Kerberos resource in Manager. This alarm is generated when the Kerberos resource is abnormal.

This alarm is cleared when the alarm handling is complete and the Kerberos resource status recovers.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12005    | Major          | Yes        |

## Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The authentication services are unavailable and cannot provide security authentication functions for web upper-layer services. Users may be unable to log in to MRS Manager.

## Possible Causes

The OLdap resource on which OKerberos depends is abnormal.

## Procedure

**Step 1** Check whether the OLdap resource on which OKerberos depends is abnormal in Manager.

1. Log in to the active management node.
2. Run the following command to check whether the OLdap resource managed by HA is normal:

```
sh ${BIGDATA_HOME}/OMSV100R001C00x8664/workspace0/ha/module/hacom/script/status_ha.sh
```

The OLdap resource is normal when the OLdap resource is in the **Active\_normal** state on the active node and in the **Standby\_normal** state on the standby node.

- If yes, go to [Step 3](#).
- If no, go to [Step 2](#).

**Step 2** Resolve the problem by following the instructions in [ALM-12004 OLdap Resource Is Abnormal](#). After the OLdap resource status recovers, check whether the OKerberos resource is normal.

- If yes, no further action is required.

- If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.5 ALM-12006 Node Fault

### Description

Controller checks the NodeAgent status every 30 seconds. This alarm is generated when Controller fails to receive the status report of a NodeAgent for three consecutive times.

This alarm is cleared when Controller can properly receive the status report of the NodeAgent.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12006    | Critical       | Yes        |

### Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

### Impact on the System

Services on the node are unavailable.

### Possible Causes

The network is disconnected, or the hardware is faulty.

## Procedure

**Step 1** Check whether the network is disconnected or the hardware is faulty.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address of the alarm.
2. Log in to the active management node.
3. Run the following command to check whether the faulty node is reachable:  
**ping** *IP address of the faulty host*
  - a. If yes, go to **Step 2**.
  - b. If no, go to **Step 1.4**.
4. Contact the O&M personnel to check whether the network is faulty.
  - If yes, go to **Step 2**.
  - If no, go to **Step 1.6**.
5. Rectify the network fault and check whether the alarm is cleared from the alarm list.
  - If yes, no further action is required.
  - If no, go to **Step 1.6**.
6. Contact the O&M personnel to check whether a hardware fault (for example, a CPU or memory fault) occurs on the node.
  - If yes, go to **Step 1.7**.
  - If no, go to **Step 2**.
7. Repair the faulty components and restart the node. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

### 11.5.6 ALM-12007 Process Fault

#### Description

The process health check module checks the process status every 5 seconds. This alarm is generated when the process health check module detects that the process connection status is Bad for three consecutive times.

This alarm is cleared when the process can be connected.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12007    | Major          | Yes        |

## Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The service provided by the process is unavailable.

## Possible Causes

- The instance process is abnormal.
- The drive space is insufficient.

## Procedure

**Step 1** Check whether the instance process is abnormal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host name and service name of the alarm.
2. On the **Alarms** page, check whether the alarm [ALM-12006 Node Fault](#) is generated.  
If yes, go to [Step 1.3](#).  
If no, go to [Step 1.4](#).
3. Handle the alarm by following the instructions in [ALM-12006 Node Fault](#).
4. Check whether the installation directory user, user group, and permission of the alarm role are correct. The correct user, user group, and the permission are **omm**, **ficommon**, and **750**, respectively.
  - If yes, go to [Step 1.6](#).
  - If no, go to [Step 1.5](#).
5. Run the following commands to set the permission to **750** and **User:Group** to **omm:ficommon**:  
`chmod 750 <folder_name>`

**chown omm:ficommon** <folder\_name>

6. Wait 5 minutes and check whether the ALM-12007 Process Fault alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

**Step 2** Check whether the disk space is insufficient.

1. On the MRS cluster details page, click the alarm management tab and check whether ALM-12017 Insufficient Disk Capacity is generated in the alarm list.
  - If yes, go to [Step 2.2](#).
  - If no, go to [Step 3](#).
2. Handle the alarm by following the instructions in [ALM-12017 Insufficient Disk Capacity](#).
3. Wait 5 minutes and check whether the ALM-12017 Insufficient Disk Capacity alarm is cleared.
  - If yes, go to [Step 2.4](#).
  - If no, go to [Step 3](#).
4. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

## 11.5.7 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes

### Description

This alarm is generated when the active Manager does not receive any heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12010    | Major          | Yes        |

## Parameters

| Parameter             | Description                                             |
|-----------------------|---------------------------------------------------------|
| ServiceName           | Specifies the service for which the alarm is generated. |
| RoleName              | Specifies the role for which the alarm is generated.    |
| HostName              | Specifies the host for which the alarm is generated.    |
| Local Manager HA Name | Specifies a local Manager HA.                           |
| Peer Manager HA Name  | Specifies a peer Manager HA.                            |

## Impact on the System

When the active Manager process is abnormal, an active/standby failover cannot be performed, and services are affected.

## Possible Causes

The link between the active and standby Manager servers is abnormal.

## Procedure

**Step 1** Check whether the network between the active and standby Manager servers is normal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the standby Manager server.
2. Log in to the active management node.
3. Run the following command to check whether the standby Manager is reachable:  
**ping heartbeat IP address of the standby Manager**
  - If yes, go to [Step 2](#).
  - If no, go to [Step 1.4](#).
4. Contact the O&M personnel to check whether the network is faulty.
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Rectify the network fault and check whether the alarm is cleared from the alarm list.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.8 ALM-12011 Data Synchronization Exception Between the Active and Standby Manager Nodes

### Description

This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12011    | Critical       | Yes        |

### Parameters

| Parameter             | Description                                             |
|-----------------------|---------------------------------------------------------|
| ServiceName           | Specifies the service for which the alarm is generated. |
| RoleName              | Specifies the role for which the alarm is generated.    |
| HostName              | Specifies the host for which the alarm is generated.    |
| Local Manager HA Name | Specifies a local Manager HA.                           |
| Peer Manager HA Name  | Specifies a peer Manager HA.                            |

### Impact on the System

Because the configuration files on the standby Manager are not updated, some configurations will be lost after an active/standby switchover. Manager and some components may not run properly.

## Possible Causes

The link between the active and standby Manager nodes is interrupted.

## Procedure

**Step 1** Check whether the network between the active and standby Manager servers is normal.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the standby Manager server.
2. Log in to the active management node. Run the following command to check whether the standby Manager is reachable:

**ping** *IP address of the standby Manager*

- If yes, go to [Step 2](#).
  - If no, go to [Step 1.3](#).
3. Contact the O&M personnel to check whether the network is faulty.
    - If yes, go to [Step 1.4](#).
    - If no, go to [Step 2](#).
  4. Rectify the network fault and check whether the alarm is cleared from the alarm list.
    - If yes, no further action is required.
    - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.9 ALM-12012 NTP Service Is Abnormal

### Description

This alarm is generated when the NTP service on the current node fails to synchronize time with the NTP service on the active OMS node.

This alarm is cleared when the NTP service on the current node synchronizes time properly with the NTP service on the active OMS node.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12012    | Major          | Yes        |

## Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The time on the node is inconsistent with that on other nodes in the cluster. Therefore, some MRS applications on the node may not run properly.

## Possible Causes

- The NTP service on the current node cannot start properly.
- The current node fails to synchronize time with the NTP service on the active OMS node.
- The key value authenticated by the NTP service on the current node is inconsistent with that on the active OMS node.
- The time offset between the node and the NTP service on the active OMS node is large.

## Procedure

**Step 1** Check the NTP service on the current node.

1. Check whether the ntpd process is running on the node using the following method. Log in to the node for which the alarm is generated and run the **sudo su - root** command to switch to user **root**. Then run the following command to check whether the command output contains the ntpd process:

```
ps -ef | grep ntpd | grep -v grep
```

- If yes, go to [Step 2.1](#).
- If no, go to [Step 1.2](#).

2. Run **service ntp start** to start the NTP service.
3. Wait 10 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

**Step 2** Check whether the current node can synchronize time properly with the NTP service on the active OMS node.

1. Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

If yes, go to [Step 2.2](#).

If no, go to [Step 3](#).

2. Check whether the synchronization with the NTP service on the active OMS node is faulty.

Log in to the node for which the alarm is generated, run the `sudo su - root` command to switch to user `root`, and run the `ntpq -np` command.

If an asterisk (\*) exists before the IP address of the NTP service on the active OMS node in the command output, the synchronization is in normal state. The command output is as follows:

```
remote refid st t when poll reach delay offset jitter
=====
*10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
```

If there is no asterisk (\*) before the IP address of the NTP service on the active OMS node, as shown in the following command output, and the value of `refid` is `.INIT.`, the synchronization is abnormal.

```
remote refid st t when poll reach delay offset jitter
=====
10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
```

- If yes, go to [Step 2.3](#).

- If no, go to [Step 3](#).

3. Rectify the fault, wait 10 minutes, and then check whether the alarm is cleared.

An NTP synchronization failure is usually related to the system firewall. If the firewall can be disabled, disable it and then check whether the fault is rectified. If the firewall cannot be disabled, check the firewall configuration policies and ensure that port **UDP 123** is enabled (you need to follow specific firewall configuration policies of each system).

- If yes, no further action is required.

- If no, go to [Step 3](#).

**Step 3** Check whether the key value authenticated by the NTP service on the current node is consistent with that on the active OMS node.

Run `cat /etc/ntp.keys` to check whether the authentication code whose key value index is 1 is the same as the value of the NTP service on the active OMS node.

- If yes, go to [Step 4.1](#).

- If no, go to [Step 5](#).

**Step 4** Check whether the time offset between the node and the NTP service on the active OMS node is large.

1. Check whether the time offset is large in additional information of the alarm.

- If yes, go to [Step 4.2](#).

- If no, go to [Step 5](#).

2. On the **Hosts** page, select the host of the node, and choose **More > Stop All Roles** to stop all the services on the node.

If the time on the alarm node is later than that on the NTP service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More > Start All Roles** to start the services on the node.

If the time on the alarm node is earlier than that on the NTP service of the active OMS node, wait until the time offset is due and adjust the time of the alarm node. After adjusting the time, choose **More > Start All Roles** to start the services on the node.

 **NOTE**

If you do not wait, data loss may occur.

3. Wait 10 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.10 ALM-12016 CPU Usage Exceeds the Threshold

### Description

The system checks the CPU usage every 30 seconds and compares the check result with the default threshold. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

This alarm is cleared when the average CPU usage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12016    | Major          | Yes        |

### Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |

| Parameter         | Description                                                                         |
|-------------------|-------------------------------------------------------------------------------------|
| RoleName          | Specifies the role for which the alarm is generated.                                |
| HostName          | Specifies the host for which the alarm is generated.                                |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

## Impact on the System

Processes respond slowly or do not work.

## Possible Causes

- The alarm threshold or alarm hit number is improperly configured.
- The CPU configuration cannot meet service requirements. The CPU usage reaches the upper limit.

## Procedure

**Step 1** Check whether the alarm threshold or alarm hit number is properly configured.

1. Log in to MRS Manager and change the alarm threshold and alarm hit number based on CPU usage.
2. Choose **System > Threshold Configuration > Device > Host > CPU > CPU Usage > CPU Usage** and change the alarm threshold based on the actual CPU usage.
3. Choose **System > Threshold Configuration > Device > Host > CPU > CPU Usage > CPU Usage** and change **hit number** based on the actual CPU usage.

### NOTE

This option defines the alarm check phase. **Interval** indicates the alarm check period and **hit number** indicates the number of times when the CPU usage exceeds the threshold. An alarm is generated when the CPU usage exceeds the threshold for several times consecutively.

4. Wait 2 minutes and check whether the alarm is automatically cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Expand the system.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the node.
2. Log in to the node for which the alarm is generated.
3. Run `cat /proc/stat | awk 'NR==1|awk '{for(i=2;i<=NF;i++)j+=Si;print "" 100 - ($5+$6) * 100 / j;}'` to check the system CPU usage.

4. If the CPU usage exceeds the threshold, expand the CPU capacity.
5. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.11 ALM-12017 Insufficient Disk Capacity

### Description

The system checks the host disk usage every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated if the disk usage exceeds the threshold.

To change the threshold, choose **System > Threshold Configuration**.

This alarm is cleared when the host disk usage is less than or equal to the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12017    | Major          | Yes        |

### Parameters

| Parameter     | Description                                                    |
|---------------|----------------------------------------------------------------|
| ServiceName   | Specifies the service for which the alarm is generated.        |
| RoleName      | Specifies the role for which the alarm is generated.           |
| HostName      | Specifies the host for which the alarm is generated.           |
| PartitionName | Specifies the disk partition for which the alarm is generated. |

| Parameter         | Description                                                                         |
|-------------------|-------------------------------------------------------------------------------------|
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

## Impact on the System

Service processes become unavailable.

## Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

## Procedure

**Step 1** Log in to MRS Manager and check whether the threshold is appropriate.

1. The default threshold is 90%. You can change the threshold to meet service requirements.
  - If yes, go to [Step 2](#).
  - If no, go to [Step 1.2](#).
2. Choose **System > Threshold Configuration** and change the alarm threshold based on the actual disk usage.
3. Wait 2 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Check whether the disk is a system disk.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host name and disk partition information.
2. Log in to the node for which the alarm is generated.
3. Run the **df -h** command to check the system disk partition usage. Check whether the disk is mounted to any of the following directories by using the disk partition name obtained in [Step 2.1](#): **/**, **/boot**, **/home**, **/opt**, **/tmp**, **/var**, **/var/log**, **/boot**, and **/srv/BigData**.
  - If yes, the disk is a system disk. Then go to [Step 3.1](#).
  - If no, the disk is not a system disk. Then go to [Step 2.4](#).
4. Run the **df -h** command to check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in [Step 2.1](#).
5. Check whether the disk is used by HDFS or Yarn.
  - If yes, expand the disk capacity for the Core node. Then go to [Step 2.6](#).
  - If no, go to [Step 4](#).
6. Wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Step 3** Check whether large files are written to the disk.

1. Run the `find / -xdev -size +500M -exec ls -l {} \;` command to view files larger than 500 MB on the node. Check whether such files are written to the disk.
  - If yes, go to [Step 3.2](#).
  - If no, go to [Step 4](#).
2. Handle the large files and check whether the alarm is cleared 2 minutes later.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).
3. Expand the disk capacity.
4. Wait 2 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.12 ALM-12018 Memory Usage Exceeds the Threshold

### Description

The system checks the memory usage every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold. This alarm is generated when the detected memory usage exceeds the threshold.

This alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12018    | Major          | Yes        |

## Parameters

| Parameter         | Description                                                                         |
|-------------------|-------------------------------------------------------------------------------------|
| ServiceName       | Specifies the service for which the alarm is generated.                             |
| RoleName          | Specifies the role for which the alarm is generated.                                |
| HostName          | Specifies the host for which the alarm is generated.                                |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

## Impact on the System

Processes respond slowly or do not work.

## Possible Causes

Memory configuration cannot meet service requirements. The memory usage reaches the upper threshold.

## Procedure

### Step 1 Expand the system.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the host address of the alarm.
2. Log in to the node for which the alarm is generated.
3. Run **free -m | grep Mem\|: | awk '{printf("%s", (\$3-\$6-\$7) \* 100 / \$2)}'** to check the system memory usage.
4. If the memory usage exceeds the threshold, expand the memory capacity.
5. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

### Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.13 ALM-12027 Host PID Usage Exceeds the Threshold

### Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default threshold. This alarm is generated when the PID usage exceeds the threshold.

This alarm is cleared when the host PID usage is less than or equal to the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12027    | Major          | Yes        |

### Parameters

| Parameter         | Description                                                                         |
|-------------------|-------------------------------------------------------------------------------------|
| ServiceName       | Specifies the service for which the alarm is generated.                             |
| RoleName          | Specifies the role for which the alarm is generated.                                |
| HostName          | Specifies the host for which the alarm is generated.                                |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

### Impact on the System

No PID is available for new processes and service processes are unavailable.

### Possible Causes

Too many processes are running on the node. You need to increase the value of **pid\_max**. The system is abnormal.

### Procedure

#### Step 1 Increase the value of **pid\_max**.

1. On the MRS cluster details page, click the alarm from the real-time alarm list. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.

2. Log in to the node for which the alarm is generated.
3. Run the `cat /proc/sys/kernel/pid_max` command to check the value of `pid_max`.
4. If the PID usage exceeds the threshold, run the following command to double the value of `pid_max`:

```
echo New pid_max value > /proc/sys/kernel/pid_max
```

Example:

```
echo 65536 > /proc/sys/kernel/pid_max
```

5. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

#### Step 2 Check whether the system environment is abnormal.

1. Contact the O&M personnel to check whether the operating system is abnormal.
  - If yes, rectify the operating system fault and go to [Step 2.2](#).
  - If no, go to [Step 3](#).
2. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

#### Step 3 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.14 ALM-12028 Number of Processes in the D State on the Host Exceeds the Threshold

### Description

The system periodically checks the number of D state processes of user **omm** on the host every 30 seconds and compares the number with the threshold. The number of processes in the D state on the host has a default threshold. This alarm is generated when the number of processes in the D state exceeds the threshold.

This alarm is cleared when the number is less than or equal to the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12028    | Major          | Yes        |

## Parameters

| Parameter         | Description                                                                         |
|-------------------|-------------------------------------------------------------------------------------|
| ServiceName       | Specifies the service for which the alarm is generated.                             |
| RoleName          | Specifies the role for which the alarm is generated.                                |
| HostName          | Specifies the host for which the alarm is generated.                                |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

## Impact on the System

Excessive system resources are used and the service process responds slowly.

## Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and a process is in the D state.

## Procedure

**Step 1** Check the process that is in the D state.

1. Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the address of the host.
2. Log in to the node for which the alarm is generated.
3. Run the following commands to switch the user:  
**sudo su - root**  
**su - omm**
4. Run the following command as user **omm** to view the PID of the process that is in the D state:  
**ps -elf | grep -v "\[thread\_checkio\]" | awk 'NR!=1 {print \$2, \$3, \$4}' | grep omm | awk -F ' ' '{print \$1, \$3}' | grep D | awk '{print \$2}'**
5. Check whether the command output is empty.
  - If yes, the service process is running properly. Then go to [Step 1.7](#).
  - If no, go to [Step 1.6](#).
6. Switch to user **root** and run the **reboot** command to restart the alarm host. Restarting the host brings certain risks. Ensure that the service process runs properly after the restart.

7. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.15 ALM-12031 User omm or Password Is About to Expire

### Description

The system starts at 00:00 every day to check whether user **omm** and the password are about to expire every eight hours. This alarm is generated if the user or password is about to expire in 15 days.

The alarm is cleared when the validity period of user **omm** is changed or the password is reset and the alarm handling is complete.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12031    | Major          | Yes        |

### Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

### Impact on the System

The node trust relationship is unavailable and Manager cannot manage the services.

## Possible Causes

User **omm** or the password is about to expire.

## Procedure

**Step 1** Check whether user **omm** and the password in the system are valid.

1. Log in to the faulty node.
2. Run the following command to view the information about user **omm** and the password:  
**chage -l omm**
3. Check whether the user has expired based on the system message.
  - a. View the value of **Password expires** to check whether the password is about to expire.
  - b. View the value of **Account expires** to check whether the user is about to expire.

### NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If yes, go to [Step 1.4](#).
  - If no, go to [Step 2](#).
4. Run the following command to modify the validity period configuration:
    - Run the following command to set a validity period for user **omm**:  
**chage -E 'specified date' omm**
    - Run the following command to set the number of validity days for user **omm**:  
**chage -M 'number of days' omm**
  5. Check whether the alarm is cleared automatically in the next periodic check.
    - If yes, no further action is required.
    - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.16 ALM-12032 User **ommdba** or Password Is About to Expire

### Description

The system starts at 00:00 every day to check whether user **ommdba** and the password are about to expire every eight hours. This alarm is generated if the user or password is about to expire in 15 days.

The alarm is cleared when the validity period of user **ommdba** is changed or the password is reset and the alarm handling is complete.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12032    | Major          | Yes        |

### Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

### Impact on the System

The OMS database cannot be managed and data cannot be accessed.

### Possible Causes

User **ommdba** or the password is about to expire.

### Procedure

- Step 1** Check whether user **ommdba** and the password in the system are valid.
1. Log in to the faulty node.
  2. Run the following command to view the information about user **ommdba** and the password:  
**chage -l ommdba**
  3. Check whether the user has expired based on the system message.

- a. View the value of **Password expires** to check whether the password is about to expire.
- b. View the value of **Account expires** to check whether the user is about to expire.

 **NOTE**

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If yes, go to [Step 1.4](#).
  - If no, go to [Step 2](#).
4. Run the following command to modify the validity period configuration:
    - Run the following command to set a validity period for user **ommdba**:  
**chage -E 'specified date' ommdba**
    - Run the following command to set the number of validity days for user **ommdba**:  
**chage -M 'number of days' ommdba**
  5. Check whether the alarm is cleared automatically in the next periodic check.
    - If yes, no further action is required.
    - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.17 ALM-12033 Slow Disk Fault

### Description

The system runs the **iostat** command every second to monitor the disk I/O indicator. If there are more than 30 times that the **svctm** value is greater than 100 ms in 60 seconds, the disk is faulty and the alarm is generated.

This alarm is automatically cleared after the disk is replaced.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12033    | Major          | Yes        |

## Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |
| DiskName    | Specifies the disk for which the alarm is generated.    |

## Impact on the System

Service performance deteriorates and service processing capabilities become poor. For example, DBService active/standby synchronization is affected and even the service is unavailable.

## Possible Causes

The disk is aged or has bad sectors.

## Procedure

**Step 1** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.18 ALM-12034 Periodic Backup Failure

### Description

This alarm is generated when a periodic backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12034    | Major          | Yes        |

## Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |
| TaskName    | Specifies the task name.                                |

## Impact on the System

No backup package is available for a long time, so the system cannot be restored in case of exceptions.

## Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

## Procedure

**Step 1** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.19 ALM-12035 Unknown Data Status After Recovery Task Failure

### Description

If a recovery task fails, the system attempts to automatically roll back. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the recovery task is successfully executed later.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12035    | Critical       | Yes        |

## Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |
| TaskName    | Specifies the task name.                                |

## Impact on the System

The data may be lost or the data status may be unknown, which may affect services.

## Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

## Procedure

**Step 1** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.20 ALM-12037 NTP Server Is Abnormal

### Description

This alarm is generated when the NTP server is abnormal.

This alarm is cleared when the NTP server recovers.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12037    | Major          | Yes        |

## Parameters

| Parameter   | Description                                                                  |
|-------------|------------------------------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated.                      |
| RoleName    | Specifies the role for which the alarm is generated.                         |
| HostName    | Specifies the IP address of the NTP server for which the alarm is generated. |

## Impact on the System

The NTP server configured on the active OMS node is abnormal. In this case, the active OMS node cannot synchronize time with the NTP server and a time offset may be generated in the cluster.

## Possible Causes

- The NTP server network is faulty.
- The NTP server authentication fails.
- The time cannot be obtained from the NTP server.
- The time obtained from the NTP server is not continuously updated.

## Procedure

### Step 1 Check the NTP server network.

1. On the MRS cluster details page, click the alarm from the real-time alarm list.
2. In the **Alarm Details** area, view the additional information to check whether the NTP server fails to be pinged.
  - If yes, go to [Step 1.3](#).
  - If no, go to [Step 2](#).
3. Contact the O&M personnel to check the network configuration and ensure that the network between the NTP server and the active OMS node is in normal state. Then, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Check whether the NTP server authentication fails.

1. Log in to the active management node.
2. Run **ntpq -np** to check whether the NTP server authentication fails. If **refid** of the NTP server is **.AUTH.**, the authentication fails.
  - If yes, go to **Step 5**.
  - If no, go to **Step 3**.

**Step 3** Check whether the time can be obtained from the NTP server.

1. View the alarm additional information to check whether the time cannot be obtained from the NTP server.
  - If yes, go to **Step 3.2**.
  - If no, go to **Step 4**.
2. Contact the O&M personnel to rectify the NTP server fault. After the NTP server is in normal state, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 4**.

**Step 4** Check whether the time obtained from the NTP server fails to be updated.

1. View the alarm additional information to check whether the time obtained from the NTP server fails to be updated.
  - If yes, go to **Step 4.2**.
  - If no, go to **Step 5**.
2. Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is in normal state, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 5**.

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.21 ALM-12038 Monitoring Indicator Dump Failure

### Description

This alarm is generated when dumping fails after monitoring indicator dumping is configured on MRS Manager.

This alarm is cleared when dumping is successful.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12038    | Major          | Yes        |

## Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The upper-layer management system fails to obtain monitoring indicators from the MRS Manager system.

## Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

## Procedure

- Step 1** Contact the O&M personnel to check whether the network connection between the MRS Manager system and the server is normal.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 2](#).
- Step 2** Contact the O&M personnel to restore the network and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).
- Step 3** Choose **System > Monitor Dumping Configuration** and check whether the FTP username, password, port, dump mode, and public key configured on the monitoring indicator dumping configuration page are consistent with those on the server.
  - If yes, go to [Step 5](#).
  - If no, go to [Step 4](#).

- Step 4** Enter the correct configuration, click **OK**, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).
- Step 5** Choose **System > Monitor Dumping Configuration** and check the configuration items, including the FTP username, save path, and dumping mode.
- If the FTP mode is used, go to [Step 6](#).
  - If the SFTP mode is used, go to [Step 7](#).
- Step 6** Log in to the server. In the default path, check whether the save path (relative path) has the read and write permission on the FTP username.
- If yes, go to [Step 9](#).
  - If no, go to [Step 8](#).
- Step 7** Log in to the server. In the default path, check whether the save path (absolute path) has the read and write permission on the FTP username.
- If yes, go to [Step 9](#).
  - If no, go to [Step 8](#).
- Step 8** Add the read and write permission and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 9](#).
- Step 9** Log in to the server and check whether the save path has sufficient disk space.
- If yes, go to [Step 11](#).
  - If no, go to [Step 10](#).
- Step 10** Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 11](#).
- Step 11** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
  2. Contact the O&M personnel and send the collected logs.
- End

## Reference

## 11.5.22 ALM-12039 GaussDB Data Is Not Synchronized

### Description

The system checks the data synchronization status between the active and standby GaussDB nodes every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status is normal.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12039    | Critical       | Yes        |

## Parameter

| Parameter           | Description                               |
|---------------------|-------------------------------------------|
| ServiceName         | Service for which the alarm is generated. |
| RoleName            | Role for which the alarm is generated.    |
| HostName            | Host for which the alarm is generated.    |
| Local GaussDB HA IP | HA IP address of the local GaussDB.       |
| Peer GaussDB HA IP  | HA IP address of the peer GaussDB.        |
| SYNC_PERCENT        | Synchronization percentage.               |

## Impact on the System

When data is not synchronized between the active and standby GaussDBs, the data may be lost or abnormal if the active instance becomes abnormal.

## Possible Causes

- The network between the active and standby nodes is unstable.
- The standby GaussDB is abnormal.
- The disk space of the standby node is full.

## Procedure

**Step 1** Go to the MRS cluster details page. In the alarm list on the alarm management tab page, click the row that contains the alarm. In the alarm details, view the IP address of the standby GaussDB node.

**Step 2** Log in to the active management node.

**Step 3** Run the following command to check whether the standby GaussDB is reachable:

**ping** *heartbeat IP address of the standby GaussDB*

If yes, go to [Step 6](#).

If no, go to [Step 4](#).

**Step 4** Contact the O&M personnel to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Step 6** Log in to the standby GaussDB node.

**Step 7** Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

**Step 8** Go to the `${BIGDATA_HOME}/om-0.0.1/sbin/` directory.

Run the following command to check whether the resource status of the standby GaussDB is normal:

```
sh status-oms.sh
```

In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to [Step 9](#).
- If no, go to [Step 15](#).

**Step 9** Log in to the standby GaussDB node.

**Step 10** Run the following commands to switch the user:

```
sudo su - root
```

```
su - omm
```

**Step 11** Run the `echo ${BIGDATA_DATA_HOME}/dbdata_om` command to obtain the GaussDB data directory.

**Step 12** Run the `df -h` command to check the system disk partition usage.

**Step 13** Check whether the disk where the GaussDB data directory is mounted is full.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

**Step 14** Contact the O&M personnel to expand the disk capacity. After capacity expansion, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Step 15** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

### 11.5.23 ALM-12040 Insufficient System Entropy

#### Description

The system checks the entropy at 00:00:00 every day and performs five consecutive checks each time. First, the system checks whether the rng-tools tool is enabled and correctly configured. If not, the system checks the current entropy. This alarm is generated if the entropy is less than 500 in the five checks.

This alarm is cleared if the true random number mode is configured, random numbers are configured in pseudo-random number mode, or neither the true random number mode nor the pseudo-random number mode is configured but the entropy is greater than or equal to 500 in at least one check among the five checks.

#### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12040    | Major          | Yes        |

#### Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

#### Impact on the System

Decryption failures occur and functions related to decryption are affected, for example, DBService installation.

#### Possible Causes

The rngd service is abnormal.

#### Procedure

**Step 1** Go to the cluster details page and choose **Alarms**.

- Step 2** View the alarm details to obtain the value of the **HostName** field in **Location**.
- Step 3** Log in to the node for which the alarm is generated and run the **sudo su - root** command to switch to user **root**.
- Step 4** Run the **/bin/rpm -qa | grep -w "rng-tools"** command. If the command is executed successfully, run the **ps -ef | grep -v "grep" | grep rngd | tr -d " " | grep "\-o/dev/random" | grep "\-r/dev/urandom"** command and view the command output.
- If the command is executed successfully, the rngd service is installed, correctly configured, and is running properly. Go to **Step 8**.
  - If the command is not executed successfully, the rngd service is not running properly. Then go to **Step 5**.
- Step 5** Run the following command to start the rngd service:
- ```
echo 'EXTRAOPTIONS="-r /dev/urandom -o /dev/random"' >> /etc/sysconfig/rngd  
  
service rngd start
```
- Step 6** Run the **service rngd status** command to check whether the rngd service is in the running state.
- If yes, go to **Step 7**.
  - If no, go to **Step 8**.
- Step 7** Wait until 00:00:00 when the system checks the entropy again. Check whether the alarm is cleared automatically.
- If yes, no further action is required.
  - If no, go to **Step 8**.
- Step 8** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
  2. Contact the O&M personnel and send the collected logs.
- End

## Reference

None

## 11.5.24 ALM-13000 ZooKeeper Service Unavailable

### Description

The system checks the ZooKeeper service status every 30 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
13000	Critical	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

ZooKeeper fails to provide coordination services for upper-layer components and the components depending on ZooKeeper may not run properly.

## Possible Causes

- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.
- The network is faulty.
- The DNS is installed on the ZooKeeper node.

## Procedure

### Check the ZooKeeper service instance status.

- Step 1** On the MRS cluster details page, choose **Components > ZooKeeper > quorumpeer**.
- Step 2** Check whether the ZooKeeper instances are normal.
  - If yes, go to [Step 6](#).
  - If no, go to [Step 3](#).
- Step 3** Select instances whose status is not good and choose **More > Restart Instance**.
- Step 4** Check whether the instance status is good after restart.
  - If yes, go to [Step 5](#).
  - If no, go to [Step 19](#).
- Step 5** On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check disk status.**

**Step 6** On the MRS cluster details page, choose **Components > ZooKeeper > quorumpeer**, and check the host information of each node housing the ZooKeeper instance.

**Step 7** On the MRS cluster details page, click the **Nodes** tab and expand a node group.

**Step 8** In the **Disk Usage** column, check whether the disk space of each node housing ZooKeeper instances is insufficient (disk usage exceeds 80%).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

**Step 9** Expand the disk capacity. For details, see [ALM-12017 Insufficient Disk Capacity](#).

**Step 10** On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Check network communication status.**

**Step 11** On the Linux node housing the ZooKeeper instance, run the **ping** command to check whether the host names of other nodes housing the ZooKeeper instances can be pinged successfully.

- If yes, go to [Step 15](#).
- If no, go to [Step 12](#).

**Step 12** Modify the IP addresses in **/etc/hosts** and add the mapping between host names and IP addresses.

**Step 13** Run the **ping** command again to check whether the host names of other nodes housing the ZooKeeper instances can be pinged successfully.

- If yes, go to [Step 14](#).
- If no, go to [Step 19](#).

**Step 14** On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Check the DNS.**

**Step 15** Check whether the DNS is installed on the node housing the ZooKeeper instance. On the Linux node housing the ZooKeeper instance, run the **cat /etc/resolv.conf** command to check whether the file is empty.

- If yes, go to [Step 16](#).
- If no, go to [Step 19](#).

**Step 16** Run the **service named status** command to check whether the DNS is started.

- If yes, go to [Step 17](#).
- If no, go to [Step 19](#).

**Step 17** Run the **service named stop** command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in **/etc/resolv.conf**.

**Step 18** On the **Alarms** tab page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 19](#).

**Step 19** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.25 ALM-13001 Available ZooKeeper Connections Are Insufficient

### Description

The system checks ZooKeeper connections every 30 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

This alarm is cleared when the number of used ZooKeeper instance connections is less than the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
13001	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Parameter	Description
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, external connections cannot be handled.

## Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not meet the requirement of the actual scenario.

## Procedure

### Step 1 Check the connection status.

1. On the MRS cluster details page, choose **Alarms > ALM-13001 Available ZooKeeper Connections Are Insufficient > Location**. Check the IP address of the node for which the alarm is generated.
2. Obtain the PID of the ZooKeeper process. Log in to the node for which this alarm is generated and run the **pgrep -f proc\_zookeeper** command.
3. Check whether the PID can be successfully obtained.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 2](#).
4. Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the **lsof -i|grep \$pid | awk '{print \$9}' | cut -d : -f 2 | cut -d \> -f 2 | awk '{a[\$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10** command based on the obtained PID value. (**\$pid** is the PID obtained in the preceding step.)
5. Check whether the node IP addresses and the number of connections are successfully obtained.
  - If yes, go to [Step 1.6](#).
  - If no, go to [Step 2](#).
6. Obtain the ID of the port connected to the process. Run the **lsof -i|grep \$pid | awk '{print \$9}'|cut -d \> -f 2 |grep \$IP| cut -d : -f 2** command based on the obtained PID and IP address. (**\$pid** and **\$IP** are the PID and IP address obtained in the preceding step.)
7. Check whether the port ID is successfully obtained.
  - If yes, go to [Step 1.8](#).
  - If no, go to [Step 2](#).

8. Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: **lsof -i|grep \$port**. (**\$port** is the port ID obtained in the preceding step.)
9. Check whether the process ID is successfully obtained.
  - If yes, go to [Step 1.10](#).
  - If no, go to [Step 2](#).
10. Check whether connection leakage occurs on the process based on the obtained process ID.
  - If yes, go to [Step 1.11](#).
  - If no, go to [Step 1.12](#).
11. Close the process where connection leakage occurs and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 1.12](#).
12. On the MRS cluster details page, choose **Components > ZooKeeper > Service Configuration**. Set **Type** to **All**, choose **quorumpeer > Performance**, and change the value of **maxCnxns** to **20000** or more.
13. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.26 ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold

### Description

The system checks the ZooKeeper service status every 30 seconds. The alarm is generated when the memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
13002	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

If the available ZooKeeper memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The memory usage of the ZooKeeper instance is overused or the memory is inappropriately allocated.

## Procedure

### Step 1 Check the memory usage.

1. On the MRS cluster details page, choose **Alarms > ALM-13002 ZooKeeper Memory Usage Exceeds the Threshold > Location**. Check the IP address of the instance for which the alarm is generated.
2. On the MRS cluster details page, choose **Components > ZooKeeper > Instances > quorumpeer** (IP address of the instance for which the alarm is generated) **> Customize > ZooKeeper Heap And Direct Buffer Resource**. Check the heap memory usage.
3. Check whether the used heap memory of ZooKeeper reaches 80% of the maximum heap memory specified for ZooKeeper.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 1.6](#).
4. On MRS Manager, choose **Services > ZooKeeper > Configuration > All > quorumpeer > System**. Increase the value of **-Xmx** in **GC\_OPTS** as required.
5. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 1.6](#).
6. On the MRS cluster details page, choose **Components > ZooKeeper > Instances > quorumpeer** (IP address of the instance for which the alarm is

generated) > **Customize** > **ZooKeeper Heap And Direct Buffer Resource**.  
Check the direct buffer memory usage.

7. Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.
  - If yes, go to [Step 1.8](#).
  - If no, go to [Step 2](#).
8. On the MRS cluster details page, choose **Components** > **ZooKeeper** > **Service Configuration**. Set **Type** to **All** and choose **quorumpeer** > **System**.  
Increase the value of **-XX:MaxDirectMemorySize** in **GC\_OPTS** as required.
9. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.27 ALM-14000 HDFS Service Unavailable

### Description

The system checks the service status of NameService every 30 seconds. This alarm is generated when the system considers that the HDFS service is unavailable because all the NameService services are abnormal.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14000	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

## Possible Causes

- ZooKeeper is abnormal.
- All NameService services are abnormal.

## Procedure

### Step 1 Check the ZooKeeper status.

1. Go to the MRS cluster details page. On the **Components** tab page, check whether the health status of the ZooKeeper service is **Good**.
  - If yes, go to [Step 1.2](#).
  - If no, go to [Step 2.1](#).
2. Rectify the health status of the ZooKeeper service. For details, see [ALM-13000 ZooKeeper Service Unavailable](#). Then check whether the health status of the ZooKeeper service is **Good**.
  - If yes, go to [Step 1.3](#).
  - If no, go to [Step 3](#).
3. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

### Step 2 Handle the NameService service exception alarm.

1. Go to the MRS cluster details page. On the **Alarms** page, check whether all NameService services have abnormal alarms.
  - If yes, go to [Step 2.2](#).
  - If no, go to [Step 3](#).
2. Handle the abnormal NameService services following the instructions in [ALM-14010 NameService Service Is Abnormal](#) and check whether each NameService service exception alarm is cleared.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3](#).
3. Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.28 ALM-14001 HDFS Disk Usage Exceeds the Threshold

### Description

The system checks the disk usage of the HDFS cluster every 30 seconds and compares the actual disk usage with the threshold. The HDFS cluster disk usage indicator has a default threshold. This alarm is generated when the HDFS disk usage exceeds the threshold.

This alarm is cleared when the disk usage of the HDFS cluster is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14001	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

The performance of writing data to HDFS is affected.

## Possible Causes

The disk space configured for the HDFS cluster is insufficient.

## Procedure

**Step 1** Check the disk capacity and delete unnecessary files.

1. On the MRS cluster details page, choose **Components** > **HDFS**. The **Service Status** page is displayed.
2. In the **Charts** area, view the value of the monitoring indicator **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (80% by default).
  - If yes, go to **Step 1.3**.
  - If no, go to **Step 3**.
3. Use the client on the cluster node and run the **hdfs dfsadmin -report** command to check whether the value of **DFS Used%** is less than 100% minus the threshold.
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 3**.
4. Use the client on the cluster node and run the **hdfs dfs -rm -r file or directory path** command to delete unnecessary files.
5. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2.1**.

**Step 2** Expand the system.

1. Expand the disk capacity.
2. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 3**.

**Step 3** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.29 ALM-14002 DataNode Disk Usage Exceeds the Threshold

### Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. The **Percentage of DataNode Capacity** indicator has a default threshold. This alarm is generated when the value of the **Percentage of DataNode Capacity** indicator exceeds the threshold.

This alarm is cleared when the value of the **Percentage of DataNode Capacity** indicator is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14002	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

### Impact on the System

Insufficient disk space will impact read/write to HDFS.

### Possible Causes

- The disk space configured for the HDFS cluster is insufficient.
- Data skew occurs among DataNodes.

### Procedure

**Step 1** Check the cluster disk capacity.

1. Go to the MRS cluster details page. On the **Alarms** page, check whether the ALM-14001 HDFS Disk Usage Exceeds the Threshold alarm exists.

- If yes, go to [Step 1.2](#).
  - If no, go to [Step 2.1](#).
2. Handle the alarm by following the instructions in ALM-14001 HDFS Disk Usage Exceeds the Threshold and check whether the alarm is cleared.
    - If yes, go to [Step 1.3](#).
    - If no, go to [Step 3](#).
  3. Wait 5 minutes and check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to [Step 2.1](#).

**Step 2** Check the balance status of DataNodes.

1. Use the client on the cluster node, run the **hdfs dfsadmin -report** command to view the value of **DFS Used%** on the DataNode for which the alarm is generated, and compare the value with those on other DataNodes. Check whether the difference between the values is larger than 10.
  - If yes, go to [Step 2.2](#).
  - If no, go to [Step 3](#).
2. If data skew occurs, use the client on the cluster node and run the **hdfs balancer -threshold 10** command.
3. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.30 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold

### Description

The system checks the number of lost blocks every 30 seconds and compares the number of lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost blocks exceeds the threshold.

This alarm is cleared when the number of lost blocks is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
14003	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Data stored in HDFS is lost. HDFS may enter the safe mode and cannot provide write services. Lost block data cannot be restored.

## Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

## Procedure

**Step 1** Check the DataNode instance.

1. On the MRS cluster details page, choose **Components > HDFS > Instances**.
2. Check whether the status of all DataNode instances is **Good**.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 1.3](#).
3. Restart the DataNode instance and check whether the restart is successful.
  - If yes, go to [Step 2.2](#).
  - If no, go to [Step 2.1](#).

**Step 2** Delete the damaged file.

1. Use the client on the cluster node. Run the **hdfs fsck / -delete** command to delete the lost file. Then rewrite the file and recover the data.
2. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.31 ALM-14004 Number of Damaged HDFS Blocks Exceeds the Threshold

### Description

The system checks the number of damaged blocks every 30 seconds and compares the number of damaged blocks with the threshold. The damaged blocks indicator has a default threshold. This alarm is generated when the number of damaged blocks exceeds the threshold.

This alarm is cleared when the number of damaged blocks is less than or equal to the threshold. You are advised to run the **hdfs fsck /** command to check whether any file is completely damaged.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14004	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Parameter	Description
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Data is damaged and HDFS fails to read files.

## Possible Causes

- The DataNode instance is abnormal.
- Data verification information is damaged.

## Procedure

**Step 1** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.32 ALM-14006 Number of HDFS Files Exceeds the Threshold

### Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

This alarm is cleared when the number of HDFS files is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14006	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Disk storage space is insufficient, which may result in data import failure. The performance of the HDFS system is affected.

## Possible Causes

The number of HDFS files exceeds the threshold.

## Procedure

**Step 1** Check whether unnecessary files exist in the system.

1. Use the client on the cluster node and run the **hdfs dfs -ls *file or directory path*** command to check whether the file or directory can be deleted.
  - If yes, go to [Step 1.2](#).
  - If no, go to [Step 2.1](#).
2. Run the **hdfs dfs -rm -r *file or directory path*** command. Delete unnecessary files, wait 5 minutes, and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

**Step 2** Check the number of files in the system.

1. On MRS Manager, choose **System > Threshold Configuration**.
2. In the navigation tree on the left, choose **Services > HDFS > HDFS File > Total Number of Files**.
3. In the right pane, modify the threshold in the rule based on the number of current HDFS files.  
To check the number of HDFS files, choose **Services > HDFS**, click **Customize** in the **Real-Time Statistics** area on the right, and select the **HDFS File** monitoring item.

4. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.33 ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold

### Description

The system checks the HDFS NameNode memory usage every 30 seconds and compares the actual memory usage with the threshold. The HDFS NameNode memory usage has a default threshold. This alarm is generated when the HDFS NameNode memory usage exceeds the threshold.

This alarm is cleared when the HDFS NameNode memory usage is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14007	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

## Possible Causes

The HDFS NameNode memory is insufficient.

## Procedure

**Step 1** Delete unnecessary files.

1. Use the client on the cluster node and run the **hdfs dfs -rm -r *file or directory path*** command to delete unnecessary files.
2. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.34 ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold

### Description

The system checks the HDFS DataNode memory usage every 30 seconds and compares the actual memory usage with the threshold. The HDFS DataNode memory usage has a default threshold. This alarm is generated when the HDFS DataNode memory usage exceeds the threshold.

This alarm is cleared when the HDFS DataNode memory usage is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14007	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

The HDFS DataNode memory usage is too high, which affects the data read/write performance of the HDFS.

## Possible Causes

The HDFS DataNode memory is insufficient.

## Procedure

**Step 1** Delete unnecessary files.

1. Use the client on the cluster node and run the **hdfs dfs -rm -r file or directory path** command to delete unnecessary files.
2. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

## 11.5.35 ALM-14009 Number of Faulty DataNodes Exceeds the Threshold

### Description

The system periodically checks the number of faulty DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The number of faulty DataNodes has a default threshold. This alarm is generated when the number of faulty DataNodes in the HDFS cluster exceeds the threshold.

This alarm is cleared when the number of faulty DataNodes in the HDFS cluster is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14009	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

### Impact on the System

Faulty DataNodes cannot provide HDFS services.

### Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.

## Procedure

### Step 1 Check whether DataNodes are faulty.

1. Use the client on the cluster node and run the **hdfs dfsadmin -report** command to check whether DataNodes are faulty.
  - If yes, go to [Step 1.2](#).
  - If no, go to [Step 2.1](#).
2. On the MRS cluster details page, choose **Components > HDFS > Instances** to check whether the DataNode is stopped.
  - If yes, go to [Step 1.3](#).
  - If no, go to [Step 2.1](#).
3. Select the DataNode instance, and choose **More > Restart Instance** to restart it. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

### Step 2 Check the status of the network between the NameNode and the DataNode.

1. Log in to the service IP address of the node where the faulty DataNode is located, and run the **ping IP address of the NameNode** command to check whether the network between the DataNode and the NameNode is abnormal.
  - If yes, go to [Step 2.2](#).
  - If no, go to [Step 3.1](#).
2. Rectify the network fault. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3.1](#).

### Step 3 Check whether the DataNode is overloaded.

1. On the MRS cluster details page, click **Alarms** and check whether the alarm ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold exists.
  - If yes, go to [Step 3.2](#).
  - If no, go to [Step 4.1](#).
2. Follow procedures in [ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold](#) to handle the alarm and check whether the alarm is cleared.
  - If yes, go to [Step 3.3](#).
  - If no, go to [Step 4.1](#).
3. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4.1](#).

### Step 4 Check whether the NameNode is overloaded.

1. On the MRS cluster details page, click **Alarms** and check whether the alarm ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold exists.
  - If yes, go to [Step 4.2](#).

- If no, go to [Step 5](#).
- 2. Follow procedures in [ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold](#) to handle the alarm and check whether the alarm is cleared.
  - If yes, go to [Step 4.3](#).
  - If no, go to [Step 5](#).
- 3. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

**Reference**

None

**11.5.36 ALM-14010 NameService Service Is Abnormal**

**Description**

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
14010	Major	Yes

**Parameters**

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NSName	Specifies the NameService service for which the alarm is generated.

## Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

## Possible Causes

- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

## Procedure

**Step 1** Check the status of the JournalNode instance.

1. On the MRS Manager home page, click **Components**.
2. Click **HDFS**.
3. Click **Instance**.
4. Check whether the **Health Status** of the JournalNode is **Good**.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 1.5](#).
5. Select the faulty JournalNode, and choose **More > Restart Instance**. Check whether the JournalNode successfully restarts.
  - If yes, go to [Step 1.6](#).
  - If no, go to [Step 5](#).
6. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

**Step 2** Check the status of the DataNode instance.

1. On the MRS cluster details page, click **Components**.
2. Click **HDFS**.
3. In **Operation and Health Summary**, check whether the **Health Status** of all DataNodes is **Good**.
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 2.4](#).
4. Click **Instances**. On the DataNode management page, select the faulty DataNode, and choose **More > Restart Instance**. Check whether the DataNode successfully restarts.
  - If yes, go to [Step 2.5](#).
  - If no, go to [Step 3.1](#).
5. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4.1](#).

**Step 3** Check the disk status.

1. On the MRS cluster details page, click the **Nodes** tab and expand a node group.
2. In the **Disk Usage** column, check whether disk space is insufficient.
  - If yes, go to [Step 3.3](#).
  - If no, go to [Step 4.1](#).
3. Expand the disk capacity.
4. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4.1](#).

**Step 4** Check whether NameNode is in the safe mode.

1. Use the client on the cluster node, and run the **hdfs dfsadmin -safemode get** command to check whether **Safe mode is ON** is displayed.  
Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.
  - If yes, go to [Step 4.2](#).
  - If no, go to [Step 5](#).
2. Use the client on the cluster node and run the **hdfs dfsadmin -safemode leave** command.
3. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.37 ALM-14011 HDFS DataNode Data Directory Is Not Configured Properly

### Description

The DataNode parameter **dfs.datanode.data.dir** specifies the DataNode data directory. This alarm is generated in any of the following scenarios:

- A configured data directory cannot be created.
- A data directory uses the same disk as other critical directories in the system.
- Multiple directories use the same disk.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode is restarted.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
14011	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the DataNode data directory is mounted on critical directories such as the root directory, the disk space of the root directory will be used up after running for a long time. This causes a system fault.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

## Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk as critical directories, such as / or /boot.
- Multiple directories in the DataNode data directory use the same disk.

## Procedure

**Step 1** Check the alarm cause and information about the DataNode for which the alarm is generated.

1. On the MRS cluster details page, click **Alarms**. In the alarm list, click the alarm.
2. In the **Alarm Details** area, view **Alarm Cause** to obtain the cause of the alarm. In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

**Step 2** Delete directories that do not comply with the disk plan from the DataNode data directory.

1. Choose **Components > HDFS > Instances**. In the instance list, click the DataNode instance on the node for which the alarm is generated.

2. Click **Instance Configuration** and view the value of the DataNode parameter **dfs.datanode.data.dir**.
3. Check whether all DataNode data directories are consistent with the disk plan.
  - If yes, go to [Step 2.4](#).
  - If no, go to [Step 2.7](#).
4. Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.
5. Choose **Components > HDFS > Instances** to restart the DataNode instance.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.7](#).
7. Log in to the DataNode for which the alarm is generated.
  - If the alarm cause is "The DataNode data directory fails to be created", go to [Step 3.1](#).
  - If the alarm cause is "The DataNode data directory uses the same disk as critical directories, such / or /boot", go to [Step 4.1](#).
  - If the alarm cause is "Multiple directories in the DataNode data directory use the same disk", go to [Step 5.1](#).

**Step 3** Check whether the DataNode data directory fails to be created.

1. Run the following commands to switch the user:  
**sudo su - root**  
**su - omm**
2. Run the **ls** command to check whether the directories exist in the DataNode data directory.
  - If yes, go to [Step 7](#).
  - If no, go to [Step 3.3](#).
3. Run the **mkdir data directory** command to create a directory and check whether the directory is successfully created.
  - If yes, go to [Step 6.1](#).
  - If no, go to [Step 3.4](#).
4. Click **Alarms** to check whether alarm ALM-12017 Insufficient Disk Capacity exists.
  - If yes, go to [Step 3.5](#).
  - If no, go to [Step 3.6](#).
5. Adjust the disk capacity and check whether alarm ALM-12017 Insufficient Disk Capacity is cleared. For details, see [ALM-12017 Insufficient Disk Capacity](#).
  - If yes, go to [ALM-12017 Insufficient Disk Capacity](#).
  - If no, go to [Step 7](#).
6. Check whether user **omm** has the **rwX** or **X** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **X** permission for directory **tmp** and the **rwX** permission for directory **abc**.)

- If yes, go to [Step 6.1](#).
  - If no, go to [Step 3.7](#).
7. Run the **chmod u+rw***x path* or **chmod u+x** *path* command as the **root** user to add the **rw***x* or **x** permission to the paths. Then, go to [Step 3.3](#).
- Step 4** Check whether the DataNode data directory uses the same disk as other critical directories in the system.
1. Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory.
  2. Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.
    - If yes, go to [Step 4.3](#).
    - If no, go to [Step 6.1](#).
  3. Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.
  4. Go to [Step 6.1](#).
- Step 5** Check whether multiple directories in the DataNode data directory use the same disk.
1. Run the **df** command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.
  2. Modify the DataNode node parameter **dfs.datanode.data.dir** to reserve one of the directories mounted on the same disk directory.
  3. Go to [Step 6.1](#).
- Step 6** Restart the DataNode and check whether the alarm is cleared.
1. Choose **Components > HDFS > Instances** to restart the DataNode instance.
  2. Check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to [Step 7](#).
- Step 7** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
  2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.38 ALM-14012 HDFS JournalNode Data Is Not Synchronized

### Description

On the active NameNode, the system checks data synchronization on all JournalNodes in the cluster every 5 minutes. This alarm is generated when data on a JournalNode is not synchronized with that on other JournalNodes.

This alarm is cleared in 5 minutes after data on JournalNodes is synchronized.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
14012	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
IP	Specifies the service IP address of the JournalNode instance for which the alarm is generated.

### Impact on the System

When a JournalNode is working incorrectly, data on the node is not synchronized with that on other JournalNodes. If data on more than half of JournalNodes is not synchronized, the NameNode cannot work correctly, making the HDFS service unavailable.

### Possible Causes

- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

### Procedure

**Step 1** Check whether the JournalNode instance has been started.

1. On the MRS cluster details page, click **Alarms**. In the alarm list, click the alarm.

2. In the **Alarm Details** area, check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.
3. Choose **Components > HDFS > Instances**. In the instance list, click the JournalNode for which the alarm is generated and check whether **Operating Status** of the node is **Started**.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 1.4](#).
4. Select the JournalNode instance and choose **More > Start Instance** to start it.
5. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 2** Check whether the JournalNode instance is working correctly.

1. Check whether **Health Status** of the JournalNode instance is **Good**.
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 2.2](#).
2. Select the JournalNode instance and choose **More > Restart Instance** to restart it.
3. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 3** Check whether the network of the JournalNode is reachable.

1. On the MRS cluster details page, choose **Components > HDFS > Instances** to check the service IP address of the active NameNode.
2. Log in to the active NameNode.
3. Run the **ping** command to check whether a timeout occurs or the network between the active NameNode and the JournalNode is unreachable.  
**ping** *service IP address of the JournalNode*
  - If yes, go to [Step 3.4](#).
  - If no, go to [Step 4](#).
4. Contact O&M personnel to rectify the network fault. Wait 5 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.39 ALM-16000 Percentage of Sessions Connected to the HiveServer to the Maximum Number Allowed Exceeds the Threshold

### Description

The system checks the percentage of sessions connected to the HiveServer to the maximum number allowed every 30 seconds. This indicator can be viewed on the Hive service monitoring page. This alarm is generated when the the percentage of sessions connected to the HiveServer to the maximum number allowed exceeds the specified threshold (90% by default).

This alarm can be automatically cleared when the percentage is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
16000	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

### Impact on the System

If a connection alarm is generated, too many sessions are connected to the HiveServer and new connections cannot be created.

### Possible Causes

Too many clients are connected to the HiveServer.

## Procedure

**Step 1** Increase the maximum number of connections to Hive.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Hive > Service Configuration** and switch **Basic** to **All**.
3. Increase the value of the **hive.server.session.control.maxconnections** configuration item. Suppose the value of the configuration item is A, the threshold is B, and sessions connected to the HiveServer is C. Adjust the value of the configuration item according to  $A \times B > C$ . Sessions connected to the HiveServer can be viewed on the Hive monitoring page.
4. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.40 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold

### Description

The system checks the Hive warehouse space usage every 30 seconds. The indicator **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page. This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default).

This alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. You can reduce the warehouse space usage by expanding the warehouse capacity or releasing the used space.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
16001	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

The system fails to write data, which causes data loss.

## Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The system disk space is insufficient.
- Some data nodes break down.

## Procedure

### Step 1 Expand the system configuration.

1. Analyze the cluster HDFS capacity usage and increase the upper limit of the HDFS capacity available for Hive.

Go to the MRS cluster details page, choose **Components > Hive > Service Configuration**, set **Type** to **All**, search for **hive.metastore.warehouse.size.percent**, and increase the value of this parameter. Suppose that the value of the configuration item is A, total HDFS storage space is B, the threshold is C, and HDFS space used by Hive is D. Adjust the value of the configuration item according to  $A \times B \times C > D$ . The total HDFS storage space can be viewed on the HDFS monitoring page, and HDFS space used by Hive can be viewed on the Hive monitoring page.

2. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

### Step 2 Expand the system.

1. Add nodes.
2. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3.1](#).

**Step 3** Check whether the data node is normal.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12006 Node Fault, ALM-12007 Process Fault, or ALM-14002 DataNode Disk Usage Exceeds the Threshold exists.
  - If yes, go to **Step 3.3**.
  - If no, go to **Step 4**.
3. Clear the alarm by following the steps provided in ALM-12006 Node Fault, ALM-12007 Process Fault, or ALM-14002 DataNode Disk Usage Exceeds the Threshold.
4. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 4**.

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

**Reference**

## 11.5.41 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold

**Description**

The system checks the percentage of the HiveQL statements that are executed successfully every 30 seconds. Percentage of HiveQL statements that are executed successfully = Number of HiveQL statements that are executed successfully by Hive in a specified period/Total number of HiveQL statements that are executed by Hive. This indicator can be viewed on the Hive service monitoring page. This alarm is generated when the percentage of the HiveQL statements that are executed successfully exceeds the specified threshold (90% by default). The name of the host for which the alarm is generated can be obtained from the location information of the alarm. The host IP address is the IP address of the HiveServer node.

This alarm is cleared when the percentage of the HiveQL statements that are executed successfully in a test period is less than or equal to the threshold.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
16002	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The system configuration and performance cannot meet service processing requirements.

## Possible Causes

- A syntax error occurs in HiveQL commands.
- The HBase service is abnormal when a Hive on HBase task is being performed.
- Basic services that are depended on are abnormal, such as HDFS, Yarn, and ZooKeeper.

## Procedure

**Step 1** Check whether the HiveQL commands comply with syntax.

1. Use the Hive client to log in to the HiveServer node for which the alarm is generated. Query the HiveQL syntax standard provided by Apache, and check whether the HiveQL commands are correct. For details, see <https://cwiki.apache.org/confluence/display/hive/languagemanual>.
  - If yes, go to **Step 2.1**.
  - If no, go to **Step 1.2**.

### NOTE

To view the user who runs an incorrect statement, download HiveServerAudit logs of the HiveServer node for which this alarm is generated. Set **Start time** and **End time** to 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

2. Enter correct HiveQL statements, and check whether the command can be properly executed.
  - If yes, go to **Step 4.5**.
  - If no, go to **Step 2.1**.

**Step 2** Check whether the HBase service is abnormal.

1. Check whether a Hive on HBase task is performed.
  - If yes, go to [Step 2.2](#).
  - If no, go to [Step 3.1](#).
2. Check whether the HBase service is normal in the service list.
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 2.3](#).
3. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.
4. Enter correct HiveQL statements, and check whether the command can be properly executed.
  - If yes, go to [Step 4.5](#).
  - If no, go to [Step 3.1](#).

**Step 3** Check whether the Spark service is abnormal.

1. Check whether the Spark service is normal in the service list.
  - If yes, go to [Step 4.1](#).
  - If no, go to [Step 3.2](#).
2. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.
3. Enter correct HiveQL statements, and check whether the command can be properly executed.
  - If yes, go to [Step 4.5](#).
  - If no, go to [Step 4.1](#).

**Step 4** Check whether HDFS, Yarn, and ZooKeeper are normal.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.
  - If yes, go to [Step 4.5](#).
  - If no, go to [Step 4.3](#).
3. Check the alarms displayed on the alarm page and clear them according to **Alarm Help**.
4. Enter correct HiveQL statements, and check whether the command can be properly executed.
  - If yes, go to [Step 4.5](#).
  - If no, go to [Step 5](#).
5. Wait one minute and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.

2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.42 ALM-16004 Hive Service Unavailable

### Description

The system checks the Hive service status every 30 seconds. This alarm is generated when the Hive service is unavailable.

This alarm is cleared when the Hive service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
16004	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

The system cannot provide data loading, query, and extraction services.

### Possible Causes

- Basic services, such as ZooKeeper, HDFS, Yarn, and DBService work incorrectly, or the Hive process is faulty.
  - ZooKeeper is abnormal.
  - HDFS is abnormal.
  - Yarn is abnormal.
  - DBService is abnormal.
  - The Hive service process is faulty. If the alarm is caused by a Hive process fault, the alarm report has a delay of about 5 minutes.

- The network communication between the Hive service and basic services is interrupted.

## Procedure

**Step 1** Check the HiveServer/MetaStore process status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Hive > Instances**. In the Hive instance list, check whether the status of all HiveServer/MetaStore instances is **Unknown**.
  - If yes, go to [Step 1.3](#).
  - If no, go to [Step 2](#).
3. Above the Hive instance list, choose **More > Restart Instance** to restart the HiveServer/MetaStore process.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Check the ZooKeeper status.

1. Go to the cluster details page and choose **Alarms**.
2. On MRS Manager, check whether the ALM-12007 Process Fault alarm is reported.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3](#).
3. In the **Alarm Details** area of ALM-12007 Process Fault, check whether **ServiceName** is **ZooKeeper**.
  - If yes, go to [Step 2.4](#).
  - If no, go to [Step 3](#).
4. Rectify the fault by following steps provided in ALM-12007 Process Fault.
5. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Check the HDFS status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether the alarm ALM-14000 HDFS Service Unavailable exists.
  - If yes, go to [Step 3.3](#).
  - If no, go to [Step 4](#).
3. Rectify the fault by following the steps provided in ALM-14000 HDFS Service Unavailable.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
  - If yes, no further action is required.

- If no, go to [Step 4](#).

**Step 4** Check the Yarn status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether the alarm ALM-18000 Yarn Service Unavailable is generated.
  - If yes, go to [Step 4.3](#).
  - If no, go to [Step 4](#).
3. Rectify the fault by following the steps provided in ALM-18000 Yarn Service Unavailable.
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 5** Check the DBService status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether ALM-27001 DBService Unavailable is generated.
  - If yes, go to [Step 5.3](#).
  - If no, go to [Step 6](#).
3. Rectify the fault by following the handling procedure in [ALM-27001 DBService Is Unavailable](#).
4. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 6](#).

**Step 6** Check the network connection between Hive and ZooKeeper, HDFS, Yarn, and DBService.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Hive**.
3. Click **Instances**.  
The HiveServer instance list is displayed.
4. Click **Host Name** in the row of **HiveServer**.  
The HiveServer host status page is displayed.
5. Record the IP address under **Summary**.
6. Use the IP address obtained in [Step 6.5](#) to log in to the host where HiveServer is located.
7. Run the **ping** command to check whether the network connection between the host that runs HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. Methods of obtaining IP addresses of the hosts that run ZooKeeper, HDFS, Yarn, and DBService services as well as the HiveServer IP address are the same.
  - If yes, go to [Step 7](#).

- If no, go to [Step 6.8](#).
8. Contact the O&M personnel to restore the network.
  9. In the alarm list, check whether ALM-16004 Hive Service Unavailable is cleared.
    - If yes, no further action is required.
    - If no, go to [Step 7](#).

**Step 7** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.43 ALM-18000 Yarn Service Unavailable

### Description

The alarm module checks the Yarn service status every 30 seconds. This alarm is generated when the Yarn service is unavailable.

This alarm is cleared when the Yarn service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
18000	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

The cluster cannot provide the Yarn service. Users cannot run new applications. Submitted applications cannot be run.

## Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- There is no active ResourceManager node in the Yarn cluster.
- All NodeManager nodes in the Yarn cluster are abnormal.

## Procedure

### Step 1 Check the ZooKeeper status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether the alarm ALM-13000 ZooKeeper Service Unavailable exists.
  - If yes, go to [Step 1.3](#).
  - If no, go to [Step 2.2](#).
3. Rectify the fault by following the handling procedure in [ALM-13000 ZooKeeper Service Unavailable](#). Then, check whether this alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.2](#).

### Step 2 Check the HDFS status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, check whether an HDFS alarm is generated.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3.2](#).
3. Click **Alarms**, and handle HDFS alarms according to **Alarm Help**. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3.2](#).

### Step 3 Check the ResourceManager status in the Yarn cluster.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Yarn**.
3. In **Yarn Summary**, check whether there is an active ResourceManager node in the Yarn cluster.
  - If yes, go to [Step 4.2](#).
  - If no, go to [Step 5](#).

### Step 4 Check the NodeManager node status in the Yarn cluster.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Yarn > Instances**.
3. Check **Health Status** of NodeManager, and check whether there are unhealthy nodes.
  - If yes, go to [Step 4.4](#).
  - If no, go to [Step 5](#).

4. Rectify the fault by following the procedure provided in [ALM-18002 NodeManager Heartbeat Lost](#) or [ALM-18003 NodeManager Unhealthy](#). Then, check whether this alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.44 ALM-18002 NodeManager Heartbeat Lost

### Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number of lost nodes with the threshold. The **Lost Nodes** indicator has a default threshold. This alarm is generated when the value of the **Lost Nodes** indicator exceeds the threshold.

This alarm is cleared when the value of **Lost Nodes** is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
18002	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

## Possible Causes

- NodeManager is forcibly deleted without decommission.
- All NodeManager instances are stopped or the NodeManager process is faulty.
- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

## Procedure

**Step 1** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.45 ALM-18003 NodeManager Unhealthy

### Description

The system checks the number of abnormal NodeManager nodes every 30 seconds, and compares the number of abnormal nodes with the threshold. The **Unhealthy Nodes** indicator has a default threshold. This alarm is generated when the value of the **Unhealthy Nodes** indicator exceeds the threshold.

This alarm is cleared when the value of **Unhealthy Nodes** is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
18003	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

## Possible Causes

- The disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

## Procedure

**Step 1** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.46 ALM-18004 NodeManager Disk Usability Ratio Is Lower Than the Threshold

### Description

The system checks the available disk space of each NodeManager node every 30 seconds and compares the disk availability rate with the threshold. A default threshold range is provided for the **NodeManager Disk Usability Ratio**. This alarm is generated when the system detects that the actual **NodeManager Disk Usability Ratio** is lower than the threshold.

This alarm is automatically cleared when the value of **NodeManager Disk Usability Ratio** is greater than the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
18004	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

## Impact on the System

- The NodeManager node whose disk availability rate is lower than the threshold may fail to provide the Yarn service.
- The number of containers decreases, so the cluster performance may deteriorate.

## Possible Causes

- The disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

## Procedure

**Step 1** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

## 11.5.47 ALM-18006 MapReduce Job Execution Timeout

### Description

The alarm module checks the MapReduce job execution every 30 seconds. This alarm is generated when the execution of a submitted MapReduce job times out.

This alarm must be manually cleared.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
18006	Major	No

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

### Impact on the System

Execution of the submitted MapReduce job times out, so no execution result can be obtained. Execute the job again after rectifying the fault.

### Possible Causes

It takes a long time to execute a MapReduce job. However, the specified time is less than the required execution time.

### Procedure

**Step 1** Check whether time is improperly set.

Set **-Dapplication.timeout.interval** to a larger value, or do not set the parameter. Check whether the MapReduce job can be executed.

- If yes, go to [Step 2.5](#).

- If no, go to [Step 2.2](#).

**Step 2** Check the Yarn status.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list on MRS Manager, check whether the alarm ALM-18000 Yarn Service Unavailable is generated.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3](#).
3. Rectify the fault by following the handling procedure in [ALM-18000 Yarn Service Unavailable](#).
4. Run the MapReduce job command again to check whether the MapReduce job can be executed.
  - If yes, go to [Step 2.5](#).
  - If no, go to [Step 4](#).
5. In the alarm list, click  in the **Operation** column of the alarm to manually clear the alarm. No further action is required.

**Step 3** Adjust the timeout threshold.

On MRS Manager, choose **System > Threshold Configuration > Services > Yarn > Timed out Applications**, and increase the maximum number of timeout tasks allowed by the current threshold rule. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.48 ALM-19000 HBase Service Unavailable

### Description

The alarm module checks the HBase service status every 30 seconds. This alarm is generated when the HBase service is unavailable.

This alarm is cleared when the HBase service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
19000	Critical	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

Operations cannot be performed, such as reading or writing data and creating tables.

## Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- HBase is abnormal.
- The network is abnormal.

## Procedure

### Step 1 Check the ZooKeeper status.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list, check whether the health status of ZooKeeper is **Good**.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 1.3](#).
3. In the alarm list, check whether the alarm ALM-13000 ZooKeeper Service Unavailable exists.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 2.1](#).
4. Rectify the fault by following the steps provided in ALM-13000 ZooKeeper Service Unavailable.
5. Wait several minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

### Step 2 Check the HDFS status.

1. On MRS Manager, check whether the ALM-14000 HDFS Service Unavailable alarm is reported.
  - If yes, go to [Step 2.2](#).

- If no, go to **Step 3**.
- 2. Rectify the fault by following the steps provided in ALM-14000 HDFS Service Unavailable.
- 3. Wait several minutes and check whether the alarm is cleared.

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.49 ALM-19006 HBase Replication Sync Failed

### Description

This alarm is generated when disaster recovery (DR) data fails to be synchronized to a standby cluster.

This alarm is cleared when DR data synchronization succeeds.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
19006	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

HBase data in a cluster fails to be synchronized to the standby cluster, causing data inconsistency between active and standby clusters.

## Possible Causes

- The HBase service on the standby cluster is abnormal.
- The network is abnormal.

## Procedure

**Step 1** Observe whether the system automatically clears the alarm.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm to obtain alarm generation time from **Generated Time** in **Alarm Details**. Check whether the alarm has existed for over 5 minutes.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 1.3](#).
3. Wait 5 minutes and check whether the alarm is automatically cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

**Step 2** Check the HBase service status of the standby cluster.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm and obtain **HostName** from **Location** in **Alarm Details**.
3. Log in to the node where the HBase client of the active cluster is located. Run the following commands to switch the user:  
**sudo su - root**  
**su - omm**
4. Run the **status 'replication', 'source'** command to check the synchronization status of the faulty node.

The synchronization status of a node is as follows.

```
10-10-10-153:
SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0,
TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0,
FailedReplicationAttempts=0
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,
TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,
FailedReplicationAttempts=5
```

5. Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node **10-10-10-153** fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

6. Run the **list\_peers** command to find the cluster and the HBase instance corresponding to **PeerID**.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS
abc1 10.10.10.110,10.10.10.119,10.10.10.133:24002:/hbase2 ENABLED
abc 10.10.10.110,10.10.10.119,10.10.10.133:24002:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

7. In the service list of the standby cluster, check whether the health status of the HBase instance obtained in [Step 2.6](#) is **Good**.
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 2.8](#).
8. In the alarm list, check whether the alarm ALM-19000 HBase Service Unavailable exists.
  - If yes, go to [Step 2.9](#).
  - If no, go to [Step 3.1](#).
9. Rectify the fault by following the steps provided in ALM-19000 HBase Service Unavailable.
10. Wait several minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3.1](#).

**Step 3** Check the network connection between RegionServers on active and standby clusters.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, click the alarm and obtain **HostName** from **Location** in **Alarm Details**.
3. Log in to the faulty RegionServer node.
4. Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.
  - If yes, go to [Step 4](#).
  - If no, go to [Step 3.5](#).
5. Contact the O&M personnel to restore the network.
6. After the network recovers, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.50 ALM-25000 LdapServer Service Unavailable

### Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the active and standby LdapServer services are abnormal.

This alarm is cleared when either of the LdapServer services restores.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
25000	Critical	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

When this alarm is generated, no operation can be performed for the KrbServer users and LdapServer users in the cluster. For example, users, user groups, or roles cannot be added, deleted, or modified, and user passwords cannot be changed on MRS Manager. The authentication for existing users in the cluster is not affected.

## Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

## Procedure

- Step 1** Check whether the nodes where the two SlapdServer instances of the LdapServer service locate are faulty.
1. Go to the MRS cluster details page and click **Components**.
  2. Choose **LdapServer > Instances**. Go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances reside.
  3. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12006 Node Fault is generated.
    - If yes, go to [Step 1.4](#).
    - If no, go to [Step 2.1](#).
  4. Check whether the host name in the alarm information is the same as the actual host name in [Step 1.2](#).
    - If yes, go to [Step 1.5](#).
    - If no, go to [Step 2.1](#).
  5. Rectify the fault by following steps provided in ALM-12006 Node Fault.

6. In the alarm list, check whether the alarm ALM-25000 LdapServer Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 2** Check whether the LdapServer process is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12007 Process Fault is generated.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3](#).
3. Check whether the service name and host name in the alarm are consistent with the LdapServer service and host names.
  - If yes, go to [Step 2.4](#).
  - If no, go to [Step 3](#).
4. Rectify the fault by following steps provided in ALM-12007 Process Fault.
5. In the alarm list, check whether the alarm ALM-25000 LdapServer Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.51 ALM-25004 Abnormal LdapServer Data Synchronization

### Description

This alarm is generated when LdapServer data on Manager is inconsistent. This alarm is cleared when the data becomes consistent.

This alarm is generated when LdapServer data in the cluster is inconsistent with LdapServer data on Manager. This alarm is cleared when the data becomes consistent.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
25004	Critical	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Host for which the alarm is generated.

## Impact on the System

LdapServer data inconsistency occurs because LdapServer data on Manager or in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

## Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.

## Procedure

**Step 1** Check whether the network where the LdapServer nodes reside is faulty.

1. Go to the cluster details page and choose **Alarms**.
2. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).
3. Contact O&M personnel and use PuTTY to log in to the node corresponding to **IP1**. Run the **ping** command on the node to check whether the IP address of the management plane of the active OMS node can be pinged.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 2.1](#).
4. Contact O&M personnel to recover the network and check whether the alarm **ALM-25004 Abnormal LdapServer Data Synchronization** is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

**Step 2** Check whether the LdapServer process is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12004 OLdap Resource Is Abnormal is generated for LdapServer.
  - If yes, go to [Step 2.3](#).

- If no, go to [Step 2.5](#).
- 3. Rectify the fault by following steps provided in **ALM-12004 OLdap Resource Is Abnormal**.
- 4. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.5](#).
- 5. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12007 Process Fault of LdapServer is generated.
  - If yes, go to [Step 2.6](#).
  - If no, go to [Step 3.1](#).
- 6. Rectify the fault by following steps provided in ALM-12007 Process Fault.
- 7. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3.1](#).

**Step 3** Check whether the OS restart damages data on LdapServer.

1. Go to the cluster details page and choose **Alarms**.
2. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively). Choose **Services** > **LdapServer** > **Service Configuration** and record the LdapServer port number as **PORT**. (If the IP address in the alarm location information is the IP address of the standby OMS node, the default port number is 21750.)
3. Log in to node **IP1** as user **omm** and run the **ldapsearch -H ldaps://IP1:PORT -x -LLL -b dc=hadoop,dc=com** command (if the IP address is the IP address of the standby OMS node, run the **ldapsearch -H ldaps://IP1:PORT -x -LLL -b dc=hadoop,dc=com** command before running this command). Check whether error information is displayed in the command output.
  - If yes, go to [Step 3.4](#).
  - If no, go to [Step 4](#).
4. Recover the LdapServer and OMS nodes using backup data before the alarm is generated. For details, see section "Recovering Manager Data" in the *Administrator Guide*.

 **NOTE**

Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

5. Check whether the alarm ALM-25004 Abnormal LdapServer Data Synchronization is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.52 ALM-25500 KrbServer Service Unavailable

**Description**

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the KrbServer service is abnormal.

This alarm is cleared when the KrbServer service is in normal state.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
25500	Critical	Yes

**Parameters**

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

**Impact on the System**

When this alarm is generated, no operation can be performed for the KrbServer component in the cluster. The authentication of KrbServer in other components will be affected. The health status of components that depend on KrbServer in the cluster is **Bad**.

**Possible Causes**

- The node where the KrbServer service locates is faulty.
- The OLdap service is unavailable.

## Procedure

- Step 1** Check whether the node where the KrbServer service locates is faulty.
1. Go to the MRS cluster details page and click **Components**.
  2. Choose **KrbServer > Instances**. Go to the KrbServer instance page and view the host name of the node where the KrbServer service is deployed.
  3. On the **Alarms** page of MRS Manager, check whether the alarm ALM-12006 Node Fault is generated.
    - If yes, go to **Step 1.4**.
    - If no, go to **Step 2.1**.
  4. Check whether the host name in the alarm information is the same as the actual host name in **Step 1.2**.
    - If yes, go to **Step 1.5**.
    - If no, go to **Step 2.1**.
  5. Rectify the fault by following steps provided in ALM-12006 Node Fault.
  6. In the alarm list, check whether the alarm ALM-25500 KrbServer Service Unavailable is cleared.
    - If yes, no further action is required.
    - If no, go to **Step 3**.

- Step 2** Check whether the OLdap service is unavailable.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether ALM-12004 OLdap Resource Is Abnormal is generated.
  - If yes, go to **Step 2.3**.
  - If no, go to **Step 3**.
3. Rectify the fault by following steps provided in ALM-12004 OLdap Resource Is Abnormal.
4. In the alarm list, check whether the alarm ALM-25500 KrbServer Service Unavailable is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 3**.

- Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.53 ALM-27001 DBService Is Unavailable

### Description

The alarm module checks the DBService status every 30 seconds. This alarm is generated when the system detects that DBService is unavailable.

This alarm is cleared when DBService recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
27001	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in service exceptions.

### Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

### Procedure

**Step 1** Check whether the floating IP address exists in the cluster environment.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **DBService > Instances**.
3. Check whether the active instance exists.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 2.1](#).

4. Select the active DBServer instance and record the IP address.
5. Log in to the host with the preceding IP address and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.
  - If yes, go to [Step 1.6](#).
  - If no, go to [Step 2.1](#).
6. Run the **ping floating IP address** command to check whether the DBService floating IP address can be pinged.
  - If yes, go to [Step 1.7](#).
  - If no, go to [Step 2.1](#).
7. Log in to the host where the DBService floating IP address is located and run the **ifconfig interface down** command to delete the floating IP address.
8. Choose **Components > DBService > More > Restart Service** to restart DBService and check whether DBService is started successfully.
  - If yes, go to [Step 1.9](#).
  - If no, go to [Step 2.1](#).
9. Wait about 2 minutes and check whether the alarm is cleared in the alarm list.
  - If yes, no further action is required.
  - If no, go to [Step 13](#).

### Step 2 Check the status of the active DBServer instance.

1. Select the DBServer instance whose role status is abnormal and record the IP address.
2. On the **Alarms** page, check whether ALM-12007 Process Fault occurs in the DBServer instance on the host that corresponds to the IP address.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 4](#).
3. Rectify the fault by following steps provided in ALM-12007 Process Fault.
4. Wait about 5 minutes and check whether the alarm is cleared in the alarm list.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

### Step 3 Check the status of the active and standby DBServers.

1. Log in to the host where the DBService floating IP address is located, run the **sudo su - root** and **su - omm** commands to switch to user **omm**, and run the **cd \${BIGDATA\_HOME}/FusionInsight/dbservice/** command to go to the DBService installation directory.
2. Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.
  - If yes, go to [Step 3.3](#).
  - If no, go to [Step 4](#).
3. Check whether the active and standby HA processes are abnormal.

- If yes, go to [Step 3.4](#).
  - If no, go to [Step 4](#).
4. Choose **Components** > **DBService** > **More** > **Restart Service** to restart DBService and check whether DBService is started successfully.
    - If yes, go to [Step 3.5](#).
    - If no, go to [Step 4](#).
  5. Wait about 2 minutes and check whether the alarm is cleared in the alarm list.
    - If yes, no further action is required.
    - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

**Reference**

None

## 11.5.54 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes

**Description**

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node.

This alarm is cleared when the heartbeat recovers.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
27003	Major	Yes

**Parameters**

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.

## Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

## Possible Causes

The link between the active and standby DBService nodes is abnormal.

## Procedure

**Step 1** Check whether the network between the active and standby DBService servers is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, locate the row that contains the alarm and view the IP address of the standby DBService server in the alarm details.
3. Log in to the active DBService server.
4. Run the **ping heartbeat IP address of the standby DBService** command to check whether the standby DBService server is reachable.
  - If yes, go to [Step 2](#).
  - If no, go to [Step 1.5](#).
5. Contact the network administrator to check whether the network is faulty.
  - If yes, go to [Step 1.6](#).
  - If no, go to [Step 2](#).
6. Rectify the network fault and check whether the alarm is cleared from the alarm list.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.55 ALM-27004 Data Inconsistency Between Active and Standby DBServices

### Description

The system checks the data synchronization status between the active and standby DBServices every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization is in normal state.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
27004	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.
SYNC_PERSENT	Synchronization percentage.

### Impact on the System

When data is not synchronized between the active and standby DBServices, the data may be lost or abnormal if the active instance becomes abnormal.

### Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The disk space of the standby node is full.

## Procedure

**Step 1** Check whether the network between the active and standby nodes is in normal state.

1. Go to the cluster details page and choose **Alarms**.
2. In the alarm list, locate the row that contains the alarm and view the IP address of the standby DBService node in the alarm details.
3. Log in to the active DBService node.
4. Run the **ping heartbeat IP address of the standby DBService** command to check whether the standby DBService node is reachable.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 1.5](#).
5. Contact the O&M personnel to check whether the network is faulty.
  - If yes, go to [Step 1.6](#).
  - If no, go to [Step 2.1](#).
6. Rectify the network fault and check whether the alarm is cleared from the alarm list.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

**Step 2** Check whether the standby DBService is in normal state.

1. Log in to the standby DBService node.
2. Run the following commands to switch the user:  
**sudo su - root**  
**su - omm**
3. Go to the **`\${DBSERVER\_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is in normal state. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:  
Example:  
10\_10\_10\_231 gaussDB Standby\_normal Normal Active\_standby  
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 4](#).

**Step 3** Check whether the disk space of the standby node is insufficient.

1. Log in to the standby DBService node.
2. Run the following commands to switch the user:  
**sudo su - root**  
**su - omm**
3. Go to the **`\${DBSERVER\_HOME}** directory, and run the following commands to obtain the DBService data directory:  
**cd `\${DBSERVER\_HOME}**  
**source .dbservice\_profile**  
**echo `\${DBSERVICE\_DATA\_DIR}**

4. Run the **df -h** command to check the system disk partition usage.
5. Check whether the DBService data directory space is full.
  - If yes, go to **Step 3.6**.
  - If no, go to **Step 4**.
6. Perform upgrade and expand capacity.
7. After capacity expansion, wait 2 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 4**.

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

## 11.5.56 ALM-28001 Spark Service Unavailable

**Description**

The system checks the Spark service status every 30 seconds. This alarm is generated when the Spark service is unavailable.

This alarm is cleared when the Spark service recovers.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
28001	Critical	Yes

**Parameters**

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The Spark tasks submitted by users fail to be executed.

## Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.

## Procedure

**Step 1** Check whether service unavailability alarms exist in services that Spark depends on.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Check whether the following alarms exist in the alarm list:
  - a. ALM-25500 KrbServer Service Unavailable
  - b. ALM-25000 LdapServer Service Unavailable
  - c. ALM-13000 ZooKeeper Service Unavailable
  - d. ALM-14000 HDFS Service Unavailable
  - e. ALM-18000 Yarn Service Unavailable
  - f. ALM-16004 Hive Service Unavailable
  - If yes, go to **Step 1.3**.
  - If no, go to **Step 2**.
3. Handle the alarms based on the troubleshooting methods provided in the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.57 ALM-26051 Storm Service Unavailable

### Description

The system checks the Storm service availability every 30 seconds. This alarm is generated if the Storm service becomes unavailable after all Nimbus nodes in a cluster become abnormal.

This alarm is cleared after the Storm service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
26051	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

- The cluster cannot provide the Storm service.
- Users cannot run new Storm tasks.

### Possible Causes

- The Kerberos component is faulty.
- ZooKeeper is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal.

### Procedure

**Step 1** Check the Kerberos component status. For clusters without Kerberos authentication, skip this step and go to [Step 2](#).

1. Go to the MRS cluster details page and click **Components**.
2. Check whether the health status of the Kerberos service is **Good**.
  - If yes, go to [Step 2.1](#).

- If no, go to [Step 1.3](#).
- 3. Rectify the fault by following instructions in ALM-25500 KrbServer Service Unavailable.
- 4. Perform [Step 1.2](#) again.

**Step 2** Check the ZooKeeper component status.

1. Check whether the health status of the ZooKeeper service is **Good**.
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 2.2](#).
2. If the ZooKeeper service is stopped, start it. For other problems, follow the instructions in ALM-13000 ZooKeeper Service Unavailable.
3. Perform [Step 2.1](#) again.

**Step 3** Check the status of the active and standby Nimbus nodes.

1. Choose **Components > Storm > Nimbus**.
2. In **Role**, check whether only one active Nimbus node exists.
  - If yes, go to [Step 4](#).
  - If no, go to [Step 3.3](#).
3. Select the two Nimbus instances and choose **More > Restart Instance**. Check whether the restart is successful.
  - If yes, go to [Step 3.4](#).
  - If no, go to [Step 4](#).
4. Log in to MRS Manager again and choose **Components > Storm > Nimbus**. Check whether the health status of Nimbus is **Good**.
  - If yes, go to [Step 3.5](#).
  - If no, go to [Step 4](#).
5. Wait 30 seconds and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.58 ALM-26052 Number of Available Supervisors in Storm Is Lower Than the Threshold

### Description

The system checks the number of supervisors every 60 seconds and compares it with the threshold. This alarm is generated if the number of supervisors is lower than the threshold.

To modify the threshold, users can choose **System > Threshold Configuration** on MRS Manager.

This alarm is cleared if the number of supervisors is greater than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
26052	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

### Impact on the System

- Existing tasks in the cluster cannot be executed.
- The cluster can receive new Storm tasks but cannot execute them.

### Possible Causes

Supervisors are abnormal in the cluster.

## Procedure

**Step 1** Check the supervisor status.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm > Supervisor**.
3. In **Role**, check whether the cluster has supervisor instances that are in the **Faulty** or **Recovering** state.
  - If yes, go to **Step 1.4**.
  - If no, go to **Step 2**.
4. Select the supervisor instances that are in the **Faulty** or **Recovering** state and choose **More > Restart Instance**.
  - If yes, go to **Step 1.5**.
  - If the restart fails, go to **Step 2**.
5. Wait 30 seconds and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

# 11.5.59 ALM-26053 Slot Usage of Storm Exceeds the Threshold

## Description

The system checks the slot usage of Storm every 60 seconds and compares it with the threshold. This alarm is generated if the slot usage exceeds the threshold.

To modify the threshold, users can choose **System > Threshold Configuration** on MRS Manager.

This alarm is cleared if the slot usage is lower than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
26053	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Users cannot run new Storm tasks.

## Possible Causes

- Supervisors are abnormal in the cluster.
- Supervisors are normal but have poor processing capability.

## Procedure

### Step 1 Check the supervisor status.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm > Supervisor**.
3. In **Role**, check whether the cluster has supervisor instances that are in the **Faulty** or **Recovering** state.
  - If yes, go to **Step 1.4**.
  - If no, go to **Step 2.1** or **Step 3.1**.
4. Select the supervisor instances that are in the **Faulty** or **Recovering** state and choose **More > Restart Instance**.
  - If yes, go to **Step 1.5**.
  - If the restart fails, go to **Step 4**.
5. Wait a moment and then check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2.1** or **Step 3.1**.

### Step 2 Increase the number of slots for the supervisors.

1. Go to the cluster details page and click **Components**.
2. Choose **Storm > Supervisor > Service Configuration**, and set **Type** to **All**.
3. Increase the value of **supervisor.slots.ports** to increase the number of slots for each supervisor. Then restart the instances.

4. Wait a moment and then check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 3** Expand the capacity of the supervisors.

1. Add nodes.
2. Wait a moment and then check whether the alarm is cleared.
  - If yes, no further action is required.
  - If the restart fails, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.60 ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold

### Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares it with the threshold. This alarm is generated if the heap memory usage exceeds the threshold (80% by default).

To modify the threshold, users can choose **System > Threshold Configuration > Service > Storm** on MRS Manager.

This alarm is cleared if the heap memory usage is lower than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
26054	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Frequent memory garbage collection or memory overflow may occur, affecting submission of Storm services.

## Possible Causes

The heap memory usage is high or the heap memory is improperly allocated.

## Procedure

**Step 1** Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Choose **ALM-26054 Heap Memory Usage of Storm Nimbus Exceeds the Threshold > Location**. Query the **HostName** of the alarmed instance.
3. Choose **Components > Storm > Instances > Nimbus (corresponding to the HostName of the alarmed instance) > Customize > Heap Memory Usage of Nimbus**.
4. Check whether the heap memory usage of Nimbus has reached the threshold (80%).
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Adjust the heap memory.  
Choose **Components > Storm > Service Configuration**, and set **Type** to **All**. Choose **Nimbus > System**. Increase the value of **-Xmx** in **NIMBUS\_GC\_OPTS**. Click **Save Configuration**. Select **Restart the affected services or instances** and click **OK**.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.61 ALM-38000 Kafka Service Unavailable

### Description

The system checks the Kafka service availability every 30 seconds. This alarm is generated if the Kafka service becomes unavailable.

This alarm is cleared after the Kafka service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
38000	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

The cluster cannot provide the Kafka service and users cannot run new Kafka tasks.

### Possible Causes

- The KrbServer component is faulty.
- The ZooKeeper component is faulty or fails to respond.
- The Broker node in the Kafka cluster is abnormal.

### Procedure

**Step 1** Check the KrbServer component status. For clusters without Kerberos authentication, skip this step and go to [Step 2](#).

1. Go to the MRS cluster details page and click **Components**.

2. Check whether the health status of the KrbServer service is **Good**.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 1.3](#).
3. Rectify the fault by following instructions in ALM-25500 KrbServer Service Unavailable.
4. Perform [Step 1.2](#) again.

**Step 2** Check the ZooKeeper component status.

1. Check whether the health status of the ZooKeeper service is **Good**.
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 2.2](#).
2. If the ZooKeeper service is stopped, start it. For other problems, follow the instructions in ALM-13000 ZooKeeper Service Unavailable.
3. Perform [Step 2.1](#) again.

**Step 3** Check the Broker status.

1. Choose **Components > Kafka > Broker**.
2. In **Role**, check whether all instances are normal.
  - If yes, go to [Step 3.4](#).
  - If no, go to [Step 3.3](#).
3. Select all instances of Broker and choose **More > Restart Instance**.
  - If the restart is successful, go to [Step 3.4](#).
  - If the restart fails, go to [Step 4](#).
4. Choose **Components > Kafka**. Check whether the health status of Kafka is **Good**.
  - If yes, go to [Step 3.5](#).
  - If no, go to [Step 4](#).
5. Wait 30 seconds and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.62 ALM-38001 Insufficient Kafka Disk Space

### Description

The system checks the Kafka disk usage every 60 seconds and compares it with the threshold. This alarm is generated if the disk usage exceeds the threshold.

To modify the threshold, users can choose **System > Threshold Configuration** on MRS Manager.

This alarm is cleared if the Kafka disk usage is lower than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
38001	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Kafka fails to write data to the disks.

## Possible Causes

- The Kafka disk configurations (such as disk count and disk size) are insufficient for the data volume.
- The data retention period is long and historical data occupies large space.
- Services are improperly planned. As a result, data is unevenly distributed and some disks are full.

## Procedure

**Step 1** Go to the MRS cluster details page and choose **Alarms**.

**Step 2** In the alarm list, click the alarm and view the **HostName** and **PartitionName** of the alarm in **Location of Alarm Details**.

- Step 3** On the **Hosts** page, click the host name obtained in [Step 2](#).
- Step 4** Check whether the **Disk** area contains the **PartitionName** of the alarm.
- If yes, go to [Step 5](#).
  - If no, manually clear the alarm and no further action is required.
- Step 5** In the **Disk** area, check whether the usage of the alarmed partition has reached 100%.
- If yes, go to [Step 6](#).
  - If no, go to [Step 8](#).
- Step 6** In **Instance**, choose **Broker > Instance Configuration**. On the **Instance Configuration** page that is displayed, set **Type** to **All** and query the data directory parameter **log.dirs**.
- Step 7** Choose **Components > Kafka > Instances**. On the **Kafka Instance** page that is displayed, stop the Broker instance corresponding to [Step 2](#). Then log in to the alarmed node and manually delete the data directory in [Step 6](#). After all subsequent operations are complete, start the Broker instance.
- Step 8** Choose **Components > Kafka > Service Configuration**. The **Kafka Configuration** page is displayed.
- Step 9** Check whether **disk.adapter.enable** is **true**.
- If yes, go to [Step 11](#).
  - If no, change the value to **true** and go to [Step 10](#).
- Step 10** Check whether the **adapter.topic.min.retention.hours** parameter, indicating the minimum data retention period, is properly configured.
- If yes, go to [Step 12](#).
  - If no, set it to a proper value and go to [Step 12](#).

 **NOTE**

If the retention period cannot be adjusted for certain topics, the topics can be added to **disk.adapter.topic.blacklist**.

- Step 11** Wait 10 minutes and check whether the disk usage is reduced.
- If yes, wait until the alarm is cleared.
  - If no, go to [Step 12](#).
- Step 12** Go to the **Kafka Topic Monitor** page and query the data retention period configured for Kafka. Determine whether the retention period needs to be shortened based on service requirements and data volume.
- If yes, go to [Step 13](#).
  - If no, go to [Step 14](#).
- Step 13** Find the topics with great data volumes based on the disk partition obtained in [Step 2](#). Log in to the Kafka client and manually shorten the data retention period for these topics using the following command:

```
kafka-topics.sh --zookeeper ZooKeeper address:24002/kafka --alter --topic Topic name --config retention.ms=Retention period
```

**Step 14** Check whether partitions are properly configured for topics. For example, if the number of partitions for a topic with a large data volume is smaller than the number of disks, data may be unevenly distributed to the disks and the usage of some disks will reach the upper limit.

 **NOTE**

To identify topics with great data volumes, log in to the relevant nodes that are obtained in [Step 2](#), go to the data directory (the directory before `log.dirs` in [Step 6](#) is modified), and check the disk space occupied by the partitions of the topics.

- If the partitions are improperly configured, go to [Step 15](#).
- If the partitions are properly configured, go to [Step 16](#).

**Step 15** On the Kafka client, add partitions to the topics.

```
kafka-topics.sh --zookeeper ZooKeeper address:24002/kafka --alter --topic Topic  
name --partitions=Number of new partitions
```

 **NOTE**

It is advised to set the number of new partitions to a multiple of the number of Kafka disks. This operation may not quickly clear the alarm. Data will be gradually balanced among the disks.

**Step 16** Check whether the cluster capacity needs to be expanded.

- If yes, add nodes to the cluster and go to [Step 17](#).
- If no, go to [Step 17](#).

**Step 17** Wait a moment and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

**Step 18** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.63 ALM-38002 Heap Memory Usage of Kafka Exceeds the Threshold

### Description

The system checks the heap memory usage of Kafka every 30 seconds. This alarm is generated if the heap memory usage of Kafka exceeds the threshold (80%).

This alarm is cleared if the heap memory usage is lower than the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
38002	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Generates an alarm when the actual indicator value exceeds the specified threshold.

## Impact on the System

Memory overflow may occur, causing service crashes.

## Possible Causes

The heap memory usage is high or the heap memory is improperly allocated.

## Procedure

**Step 1** Check the heap memory usage.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Choose **ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold > Location**. Query the IP address of the alarmed instance.
3. Choose **Components > Kafka > Instance > Broker (corresponding to the IP address of the alarmed instance) > Customize > Kafka Heap Memory Resource Percentage** to check the heap memory usage.
4. Check whether the heap memory usage of Kafka has reached the threshold (80%).
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > Kafka > Service Configuration > All > Broker > Environment Variables**. Increase the value of **KAFKA\_HEAP\_OPTS** as required.

6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.64 ALM-24000 Flume Service Unavailable

### Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is cleared after the Flume service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
24000	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

Flume cannot work and data transmission is interrupted.

### Possible Causes

- HDFS is unavailable.

- LdapServer is unavailable.

## Procedure

**Step 1** Check the HDFS status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Check whether the ALM-14000 HDFS Service Unavailable alarm is generated.
  - If yes, clear the alarm according to the handling suggestions of "ALM-14000 HDFS Service Unavailable".
  - If no, go to [Step 2](#).

**Step 2** Check the LdapServer status.

Check whether the ALM-25000 LdapServer Service Unavailable alarm is generated.

- If yes, clear the alarm according to the handling suggestions of "ALM-25000 LdapServer Service Unavailable".
- If no, go to [Step 3.2](#).

**Step 3** Check whether the HDFS and LdapServer services are stopped.

1. Go to the MRS cluster details page and click **Components**.
2. In the service list on MRS Manager, check whether the HDFS and LdapServer services are stopped.
  - If yes, start the HDFS and LdapServer services and go to [Step 3.3](#).
  - If no, go to [Step 4](#).
3. Check whether the "ALM-24000 Flume Service Unavailable" alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

### 11.5.65 ALM-24001 Flume Agent Is Abnormal

#### Description

This alarm is generated if the Flume agent monitoring module detects that the Flume agent process is abnormal.

This alarm is cleared after the Flume agent process recovers.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
24001	Minor	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

Functions of the alarmed Flume agent instance are abnormal. Data transmission tasks of the instance are suspended. In real-time data transmission, data will be lost.

## Possible Causes

- The **JAVA\_HOME** directory does not exist or the Java permission is incorrect.
- The permission of the Flume agent directory is incorrect.

## Procedure

**Step 1** Check the Flume agent's configuration file.

1. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:  
**sudo su - root**
2. Run the **cd *Flume installation directory*/fusioninsight-flume-1.6.0/conf/** command to go to Flume's configuration directory.
3. Run the **cat ENV\_VARS** command. Check whether the **JAVA\_HOME** directory exists and whether the Flume agent user has execute permission of Java.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 1.4](#).
4. Specify the correct **JAVA\_HOME** directory and grant the Flume agent user with the execute permission of Java. Then go to [Step 2.4](#).

**Step 2** Check the permission of the Flume agent directory.

1. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:

**sudo su - root**

2. Run the following command to access the installation directory of the Flume agent:  
**cd *Flume agent installation directory***
3. Run the **ls -al \* -R** command. Check whether the owner of all files is the Flume agent user.
  - If yes, go to **Step 3**.
  - If no, run the **chown** command and change the owner of the files to the Flume agent user. Then go to **Step 2.4**.
4. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 3**.

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

**Related Information**

## 11.5.66 ALM-24003 Flume Client Connection Failure

**Description**

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in 3 consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
24003	Major	Yes

**Parameters**

Parameter	Description
ClientIP	Specifies the IP address of the Flume client.

Parameter	Description
ServerIP	Specifies the IP address of the Flume server.
ServerPort	Specifies the port on the Flume server.

## Impact on the System

The communication between the Flume client and server fails. The Flume client cannot send data to the Flume server.

## Possible Causes

- The network between the Flume client and server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

## Procedure

**Step 1** Check the network between the Flume client and server.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:  
**sudo su - root**
2. Run the **ping Flume server IP address** command to check whether the network between the Flume client and server is normal.
  - If yes, go to [Step 2.1](#).
  - If no, go to [Step 4](#).

**Step 2** Check whether the Flume client's process is normal.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:  
**sudo su - root**
2. Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.
  - If yes, go to [Step 3.1](#).
  - If no, go to [Step 4](#).

**Step 3** Check the Flume client configuration.

1. Log in to the host where the alarmed Flume client resides. Run the following command to switch to user **root**:  
**sudo su - root**
2. Run the **cd Flume installation directory/fusioninsight-flume-1.6.0/conf/** command to go to Flume's configuration directory.
3. Run the **cat properties.properties** command to query the current configuration file of the Flume client.

4. Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.
  - If yes, go to [Step 3.5](#).
  - If no, go to [Step 4](#).
5. Modify the **properties.properties** configuration file.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 4](#).

**Step 4** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.67 ALM-24004 Flume Fails to Read Data

### Description

The alarm module monitors the Flume source status. This alarm is generated if the duration that Flume source fails to read data exceeds the threshold.

Users can modify the threshold as required.

This alarm is cleared if the source reads data successfully.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
24004	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
ComponentType	Specifies the component type for which the alarm is generated.

Parameter	Description
ComponentName	Specifies the component name for which the alarm is generated.

## Impact on the System

Data collection is stopped.

## Possible Causes

- The Flume source is faulty.
- The network is faulty.

## Procedure

**Step 1** Check whether the Flume source is normal.

1. Check whether the Flume source is the spoolDir type.
  - If yes, go to [Step 1.2](#).
  - If no, go to [Step 1.3](#).
2. Query the **spoolDir** directory and check whether all files have been sent.
  - If yes, no further action is required.
  - If no, go to [Step 1.5](#).
3. Check whether the Flume source is the Kafka type.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 1.5](#).
4. Log in to the Kafka client and run the following commands to check whether all topic data configured for the Kafka source has been consumed.

```
cd /opt/client/Kafka/kafka/bin
./kafka-consumer-groups.sh --bootstrap-server Kafka cluster IP
address:21007 --new-consumer --describe --group example-group1 --
command-config
../config/consumer.properties
```

  - If yes, no further action is required.
  - If no, go to [Step 1.5](#).
5. Go to the cluster details page and click **Components**.
6. Choose **Flume > Instances**.
7. Click the Flume instance of the faulty node and check whether the value of the **Source Speed Metrics** is 0.
  - If yes, go to [Step 2.1](#).
  - If no, no further action is required.

**Step 2** Check the status of the network between the Flume source and faulty node.

1. Check whether the Flume source is the avro type.

- If yes, go to [Step 2.3](#).
  - If no, go to [Step 3](#).
2. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:  
**sudo su - root**
  3. Run the **ping *Flume source IP address*** command to check whether the Flume source can be pinged.
    - If yes, go to [Step 3](#).
    - If no, go to [Step 2.4](#).
  4. Contact the network administrator to repair the network.
  5. Wait for a while and check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.68 ALM-24005 Data Transmission by Flume Is Abnormal

### Description

The alarm module monitors the capacity of Flume channels. This alarm is generated if the duration that a channel is full or the number of times that a source fails to send data to the channel exceeds the threshold.

Users can set the threshold as required by modifying the **channelfullcount** parameter.

This alarm is cleared after the Flume channel space is released.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
24005	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
ComponentType	Specifies the component type for which the alarm is generated.
ComponentName	Specifies the component name for which the alarm is generated.

## Impact on the System

If the usage of the Flume channel continues to grow, the data transmission time increases. When the usage reaches 100%, the Flume agent process is suspended.

## Possible Causes

- The Flume sink is faulty.
- The network is faulty.

## Procedure

**Step 1** Check whether the Flume sink is normal.

1. Check whether the Flume sink is the HDFS type.
  - If yes, go to [Step 1.2](#).
  - If no, go to [Step 1.3](#).
2. On MRS Manager, check whether the ALM-14000 HDFS Service Unavailable alarm is reported and whether the HDFS service is stopped.
  - If the alarm is reported, clear it according to the handling suggestions of ALM-14000 HDFS Service Unavailable; if the HDFS service is stopped, start it. Then go to [Step 1.7](#).
  - If no, go to [Step 1.7](#).
3. Check whether the Flume sink is the HBase type.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 1.7](#).
4. On MRS Manager, check whether the ALM-19000 HBase Service Unavailable alarm is reported and whether the HBase service is stopped.
  - If the alarm is reported, clear it according to the handling suggestions of "ALM-19000 HBase Service Unavailable"; if the HBase service is stopped, start it. Then go to [Step 1.7](#).
  - If no, go to [Step 1.7](#).
5. Check whether the Flume sink is the Kafka type.

- If yes, go to [Step 1.6](#).
  - If no, go to [Step 1.7](#).
6. On MRS Manager, check whether the ALM-38000 Kafka Service Unavailable alarm is reported and whether the Kafka service is stopped.
    - If the alarm is reported, clear it according to the handling suggestions of "ALM-38000 Kafka Service Unavailable"; if the Kafka service is stopped, start it. Then go to [Step 1.7](#).
    - If no, go to [Step 1.7](#).
  7. Go to the MRS cluster details page and click **Components**.
  8. Choose **Flume > Instances**.
  9. Click the Flume instance of the faulty node and check whether the value of the **Sink Speed Metrics** is 0.
    - If yes, go to [Step 2.1](#).
    - If no, no further action is required.

**Step 2** Check the status of the network between the Flume sink and faulty node.

1. Check whether the Flume sink is the Avro type.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3](#).
2. Log in to the host where the faulty node resides. Run the following command to switch to user **root**:  
**sudo su - root**
3. Run the **ping *Flume sink IP address*** command to check whether the Flume sink can be pinged.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 2.4](#).
4. Contact the network administrator to repair the network.
5. Wait for a while and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3](#).

**Step 3** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.69 ALM-12041 Permission of Key Files Is Abnormal

### Description

The system checks the permission, users, and user groups of key directories or files every hour. This alarm is generated if any of these is abnormal.

This alarm is cleared after the problem that causes abnormal permission, users, or user groups is solved.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12041	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PathName	Specifies the file path or file name.

### Impact on the System

System functions are unavailable.

### Possible Causes

The user has manually modified the file permission, user information, or user groups, or the system has experienced an unexpected power-off.

### Procedure

**Step 1** Check the file permission.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the details of the alarm, query the **HostName** (name of the alarmed host) and **PathName** (path or name of the involved file).
3. Log in to the alarmed node.
4. Run the `ll PathName` command to query the current user, permission, and user group of the file or path.

5. Go to the ``${BIGDATA_HOME}/nodeagent/etc/agent/autocheck` directory and run the `vi keyfile` command. Search for the name of the involved file and query the correct permission of the file.
6. Compare the actual permission of the file with the permission obtained in [Step 1.5](#). If they are different, change the actual permission, user information, and user group to the correct values.
7. Wait until the next system check is complete and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.70 ALM-12042 Key File Configurations Are Abnormal

### Description

The system checks key file configurations every hour. This alarm is generated if any key configuration is abnormal.

This alarm is cleared after the configuration becomes normal.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12042	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PathName	Specifies the file path or file name.

## Impact on the System

Functions related to the file are abnormal.

## Possible Causes

The user has manually modified the file configurations or the system has experienced an unexpected power-off.

## Procedure

**Step 1** Check the file configurations.

1. Go to the MRS cluster details page and choose **Alarms**.
2. In the details of the alarm, query the **HostName** (name of the alarmed host) and **PathName** (path or name of the involved file).
3. Log in to the alarmed node.
4. Manually check and modify the file configurations according to the criteria in [Related Information](#).
5. Wait until the next system check is complete and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Related Information

- **Checking /etc/fstab**

Check whether partitions configured in **/etc/fstab** exist in **/proc/mounts** and whether swap partitions configured in **/etc/fstab** match those in **/proc/swaps**.

- **Checking /etc/hosts**

Run the **cat /etc/hosts** command. If any of the following situations exists, the file configurations are abnormal.

- The **/etc/hosts** file does not exist.
- The host name is not configured in the file.
- The IP address of the host is duplicate.
- The IP address of the host does not exist in the **ipconfig** list.
- An IP address in the file is used by multiple hosts.

## 11.5.71 ALM-23001 Loader Service Unavailable

### Description

The system checks the Loader service availability every 60 seconds. This alarm is generated if the Loader service is unavailable and is cleared after the Loader service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
23001	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

Data loading, import, and conversion are unavailable.

### Possible Causes

- The services that Loader depends on are abnormal.
  - ZooKeeper is abnormal.
  - HDFS is abnormal.
  - DBService is abnormal.
  - Yarn is abnormal.
  - MapReduce is abnormal.
- The network is faulty. Loader cannot communicate with its dependent services.
- Loader is running improperly.

### Procedure

- Step 1** Check the ZooKeeper status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **ZooKeeper** and check whether the health status of ZooKeeper is normal.
  - If yes, go to [Step 1.4](#).
  - If no, go to [Step 1.3](#).
3. Choose **More > Restart Service** to restart ZooKeeper. After ZooKeeper starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 1.4](#).
4. On MRS Manager, check whether the ALM-12007 Process Fault alarm is reported.
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2.1](#).
5. In **Alarm Details** of the "ALM-12007 Process Fault" alarm, check whether **ServiceName** is **ZooKeeper**.
  - If yes, go to [Step 1.6](#).
  - If no, go to [Step 2.1](#).
6. Clear the alarm according to the handling suggestions of "ALM-12007 Process Fault".
7. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2.1](#).

## Step 2 Check the HDFS status.

1. Go to the MRS cluster details page and choose **Alarms**.
2. On MRS Manager, check whether the "ALM-14000 HDFS Service Unavailable alarm" is reported.
  - If yes, go to [Step 2.3](#).
  - If no, go to [Step 3.1](#).
3. Clear the alarm according to the handling suggestions of "ALM-14000 HDFS Service Unavailable".
4. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 3.1](#).

## Step 3 Check the DBService status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **DBService** to check whether the health status of DBService is normal.
  - If yes, go to [Step 4.1](#).
  - If no, go to [Step 3.3](#).
3. Choose **More > Restart Service** to restart DBService. After DBService starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
  - If yes, no further action is required.

- If no, go to [Step 4.1](#).

**Step 4** Check the MapReduce status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **MapReduce** and check whether the health status of MapReduce is normal.
  - If yes, go to [Step 5.1](#).
  - If no, go to [Step 4.3](#).
3. Choose **More > Restart Service** to restart MapReduce. After MapReduce starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5.1](#).

**Step 5** Check the Yarn status.

1. Go to the MRS cluster details page and click **Components**.
2. Choose **Yarn** and check whether the health status of Yarn is normal.
  - If yes, go to [Step 5.4](#).
  - If no, go to [Step 5.3](#).
3. Choose **More > Restart Service** to restart Yarn. After Yarn starts, check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5.4](#).
4. On MRS Manager, check whether the "ALM-18000 Yarn Service Unavailable" alarm is reported.
  - If yes, go to [Step 5.5](#).
  - If no, go to [Step 6.1](#).
5. Clear the alarm according to the handling suggestions of "ALM-18000 Yarn Service Unavailable".
6. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 6.1](#).

**Step 6** Check the network connections between Loader and its dependent components.

1. Go to the MRS cluster details page and click **Components**.
2. Click **Loader**.
3. Click **Instance**. The Sqoop instance list is displayed.
4. Record the management IP addresses of all Sqoop instances.
5. Log in to the hosts using the IP addresses obtained in [Step 6.4](#). Run the following commands to switch the user:  
**sudo su - root**  
**su - omm**
6. Run the **ping** command to check whether the network connection between the hosts where the Sqoop instances reside and the dependent components is normal. (The dependent components include ZooKeeper, DBService, HDFS,

MapReduce, and Yarn. The method to obtain the IP addresses of the dependent components is the same as that used to obtain the IP addresses of the Sqoop instances.)

- If yes, go to [Step 7](#).
  - If no, go to [Step 6.7](#).
7. Contact the network administrator to repair the network.
  8. Check whether the "ALM-23001 Loader Service Unavailable" alarm is cleared.
    - If yes, no further action is required.
    - If no, go to [Step 7](#).

**Step 7** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.72 ALM-12357 Failed to Export Audit Logs to OBS

### Description

If the user has configured audit log export to the OBS on MRS Manager, the system regularly exports audit logs to the OBS. This alarm is reported if the system fails to access the OBS.

This alarm is cleared after the system exports audit logs to the OBS successfully.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12357	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

The local system saves a maximum of seven compressed service audit log files. If this alarm persists, local service audit logs may be lost.

The local system saves a maximum of 50 management audit log files (each file contains 100,000 records). If this alarm persists, local management audit logs may be lost.

## Possible Causes

- Connection to the OBS server fails.
- The specified OBS file system does not exist.
- The user AK/SK information is invalid.
- The local OBS configuration cannot be obtained.

## Procedure

**Step 1** Log in to the OBS server and check whether the OBS server can be properly accessed.

- If yes, go to [Step 3](#).
- If no, go to [Step 2](#).

**Step 2** Contact the maintenance personnel to repair OBS. Then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Step 3** On MRS Manager, choose **System > Export Audit Log**. Check whether the AK/SK information, file system name, and path are correct.

- If yes, go to [Step 5](#).
- If no, go to [Step 4](#).

**Step 4** Correct the information. Then check whether the alarm is cleared when the export task is executed again.

### NOTE

To check alarm clearance quickly, you can set the start time of audit log collection to 10 or 30 minutes later than the current time. After checking the result, restore the original start time.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Related Information

## 11.5.73 ALM-12014 Device Partition Lost

### Description

This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or goes offline, or the partition is deleted). The system checks the partition status periodically.

This alarm needs to be cleared manually.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12014	Major	No

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

### Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

### Possible Causes

- The disk is removed.
- The disk is offline, or a bad sector exists on the disk.

### Procedure

**Step 1** Go to the MRS cluster details page and choose **Alarms**.

**Step 2** In the real-time alarm list, click the row that contains the alarm.

- Step 3** In the **Alarm Details** area, obtain the values of **HostName**, **PartitionName**, and **DirName** from **Location**.
- Step 4** Check whether the disk corresponding to **PartitionName** on **HostName** is inserted to the correct server slot.
- If yes, go to **Step 5**.
  - If no, go to **Step 6**.
- Step 5** Contact hardware engineers to remove the faulty disk.
- Step 6** Use PuTTY to log in to the **HostName** node where an alarm is reported and check whether there is a line containing **DirName** in the **/etc/fstab** file.
- If yes, go to **Step 7**.
  - If no, go to **Step 8**.
- Step 7** Run the **vi /etc/fstab** command to edit the file and delete the line containing **DirName**.
- Step 8** Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.
- Step 9** Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the **DirName** directory.
- If yes, manually clear the alarm. No further operation is required.
  - If no, go to **Step 10**.
- Step 10** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
  2. Contact the O&M personnel and send the collected logs.
- End

## Reference

None

## 11.5.74 ALM-12015 Device Partition File System Read-Only

### Description

This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

## Attribute

Alarm ID	Alarm Severity	Auto Clear
12015	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

## Impact on the System

Service data fails to be written into the partition, and the service system runs abnormally.

## Possible Causes

The disk is faulty, for example, a bad sector exists.

## Procedure

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the row that contains the alarm.
- Step 3** In the **Alarm Details** area, obtain **HostName** and **PartitionName** from **Location**. **HostName** indicates the node for which the alarm is generated, and **PartitionName** indicates the partition of the faulty disk.
- Step 4** Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.
- Step 5** After the disk is removed, the system reports ALM-12014 Partition Lost. Handle the alarm by following the instructions in [ALM-12014 Device Partition Lost](#). After the handling, the alarm is automatically cleared.

----End

## Reference

### 11.5.75 ALM-12043 DNS Parsing Duration Exceeds the Threshold

#### Description

The system checks the DNS parsing duration every 30 seconds. This alarm is generated when the DNS parsing duration exceeds the threshold (the default threshold is 20,000 ms) for multiple times (the default value is 2).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Status > DNS Resolution Duration > DNS Resolution Duration**.

This alarm is cleared when **hit number** is **1** and the DNS resolution duration is less than or equal to the threshold. This alarm is cleared when **hit number** is not **1** and the DNS resolution duration is less than or equal to 90% of the threshold.

#### Attribute

Alarm ID	Alarm Severity	Auto Clear
12043	Major	Yes

#### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

#### Impact on the System

- Kerberos-based secondary authentication is slow.
- The ZooKeeper service is abnormal.
- The node is faulty.

#### Possible Causes

- The node is configured with the DNS client.

- The node is equipped with the DNS server and the DNS server is started.

## Procedure

### Check whether the node is configured with the DNS client.

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** View the alarm details to obtain the value of the **HostName** field in **Location**.
- Step 3** Use PuTTY to log in to the node for which the alarm is generated as user **root**.
- Step 4** Run the **cat /etc/resolv.conf** command to check whether the DNS client is installed.

If information similar to the following is displayed, the DNS client is installed and started:

```
nameserver 10.2.3.4  
nameserver 10.2.3.4
```

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

- Step 5** Run the **vi /etc/resolv.conf** command to comment out the following content using the number signs (#) and save the file:

```
# nameserver 10.2.3.4  
# nameserver 10.2.3.4
```

- Step 6** Check whether this alarm is cleared after 5 minutes.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

### Check whether the node is equipped with the DNS server and the DNS server is started.

- Step 7** Run the **service named status** command to check whether the DNS service is installed on the node.

If information similar to the following is displayed, the DNS server is installed and started:

```
Checking for nameserver BIND  
version: 9.6-ESV-R7-P4  
CPUs found: 8  
worker threads: 8  
number of zones: 17  
debug level: 0  
xfers running: 0  
xfers deferred: 0  
soa queries in progress: 0  
query logging is ON  
recursive clients: 4/0/1000  
tcp clients: 0/100  
server is up and running
```

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

- Step 8** Run the **service named stop** command to stop the DNS server.
- Step 9** Check whether this alarm is cleared after 5 minutes.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Step 10** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.76 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold

### Description

The system checks the read packet dropped rate every 30 seconds. This alarm is generated when the read packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Dropped Rate**.

This alarm is cleared when **hit number** is 1 and the read packet dropped rate is less than or equal to the threshold. This alarm is cleared when **hit number** is greater than 1 and the read packet dropped rate is less than or equal to 90% of the threshold.

The alarm detection is disabled by default. If you want to enable this function, check whether this function can be enabled based on Checking System Environments.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12045	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Parameter	Description
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The service performance deteriorates or some services time out.

Risk warning: In SUSE kernel 3.0 or later or Red Hat 7.2, the system kernel modifies the mechanism for counting the number of dropped read packets. In this case, this alarm may be generated even if the network is running properly, but services are not affected. You are advised to check the system environment first.

## Possible Causes

- An OS exception occurs.
- The NICs are bonded in active/standby mode.
- The alarm threshold is improperly configured.
- The network environment is abnormal.

## Procedure

### View the network packet dropped rate.

- Step 1** Use PuTTY to log in to any non-alarm node in the cluster as user **omm** and run the **ping IP address of the node for which the alarm is generated -c 100** command to check whether packet drop occurs on the network.

```
# ping 10.10.10.12 -c 5
PING 10.10.10.12 (10.10.10.12) 56(84) bytes of data:
64 bytes from 10.10.10.11: icmp_seq=1 ttl=64 time=0.033 ms
64 bytes from 10.10.10.11: icmp_seq=2 ttl=64 time=0.034 ms
64 bytes from 10.10.10.11: icmp_seq=3 ttl=64 time=0.021 ms
64 bytes from 10.10.10.11: icmp_seq=4 ttl=64 time=0.033 ms
64 bytes from 10.10.10.11: icmp_seq=5 ttl=64 time=0.030 ms
--- 10.10.10.12 ping statistics ---
5 packets transmitted, 5 received, 0% packet loss, time 4001ms   rtt min/avg/max/mdev =
0.021/0.030/0.034/0.006 ms
```

### NOTE

- *IP address of the node for which the alarm is generated.* Query the IP address of the node for which the alarm is generated on the node management page of the MRS cluster details page based on the value of **HostName** in the alarm location information. Check both the IP addresses of the management plane and service plane.
- **-c**: number of check times. The default value is **100**.
- If yes, go to [Step 11](#).
- If no, go to [Step 2](#).

**Check the system environment.**

**Step 2** Use PuTTY to log in to the active OMS node or the node for which the alarm is generated as user **omm**.

**Step 3** Run the **cat /etc/\*-release** command to check the OS type.

- If the OS is EulerOS, go to [Step 4](#).

```
# cat /etc/*-release EulerOS release 2.0 (SP2)
EulerOS release 2.0 (SP2)
```

- If the OS is SUSE, go to [Step 5](#).

```
# cat /etc/*-release
SUSE Linux Enterprise Server 11 (x86_64)
VERSION = 11
PATCHLEVEL = 3
```

- Otherwise, go to [Step 11](#).

**Step 4** Run the **cat /etc/euleros-release** command to check whether the OS version is EulerOS 2.2.

```
# cat/etc/euleros-release
EulerOS release 2.0 (SP2)
```

- If yes, the alarm sending function cannot be enabled. Go to [Step 6](#).
- If no, go to [Step 11](#).

**Step 5** Run the **cat /proc/version** command to check whether the SUSE kernel version is 3.0 or later.

```
# cat /proc/version
Linux version 3.0.101-63-default (geeko@buildhost) (gcc version 4.3.4 [gcc-4_3-branch revision 152973]
(SUSE Linux) ) #1 SMP Tue Jun 23 16:02:31 UTC 2015 (4b89d0c)
```

- If yes, the alarm sending function cannot be enabled. Go to [Step 6](#).
- If no, go to [Step 11](#).

**Step 6** Log in to MRS Manager and choose **System > Configuration > Threshold Configuration**.

**Step 7** In the navigation pane of the **Threshold Configuration** page, choose **Network Reading > Network Read Packet Rate Information > Read Packet Dropped Rate**. In the right pane, check whether **Send Alarm** is selected.

- If yes, the alarm sending function is enabled. Go to [Step 8](#).
- If no, the alarm sending function is disabled. Go to [Step 10](#).

**Step 8** In the right pane, deselect **Send Alarm** to shield alarm "Network Read Packet Dropped Rate Exceeds the Threshold."

**Step 9** Go to the MRS cluster details page and choose **Alarms**.

**Step 10** Search for alarm 12045 and manually clear the alarms that are not automatically cleared. No further action is required.

 **NOTE**

The ID of alarm Network Read Packet Dropped Rate Exceeds the Threshold is 12045.

**Check whether the NICs are bonded in active/standby mode.**

**Step 11** Use PuTTY to log in to the node for which the alarm is generated as user **omm** and run the **ls -l /proc/net/bonding** command to check whether the **/proc/net/bonding** directory exists on the node.

- If yes, as shown in the following figure, the bond mode is configured for the node. Go to [Step 12](#).

```
# ls -l /proc/net/bonding/  
total 0  
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the bond mode is not configured for the node. Go to [Step 14](#).

```
# ls -l /proc/net/bonding/  
ls: cannot access /proc/net/bonding/: No such file or directory
```

**Step 12** Run the `cat /proc/net/bonding/bond0` command to check whether the value of **Bonding Mode** in the configuration file is **fault-tolerance**.

 **NOTE**

In the preceding command, **bond0** is the name of the bond configuration file. Use the file name obtained in [Step 11](#).

```
# cat /proc/net/bonding/bond0  
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)
```

```
Bonding Mode: fault-tolerance (active-backup)  
Primary Slave: eth1 (primary_reselect always)  
Currently Active Slave: eth1  
MII Status: up  
MII Polling Interval (ms): 100  
Up Delay (ms): 0  
Down Delay (ms): 0
```

```
Slave Interface: eth0  
MII Status: up  
Speed: 1000 Mbps  
Duplex: full  
Link Failure Count: 1  
Slave queue ID: 0
```

```
Slave Interface: eth1  
MII Status: up  
Speed: 1000 Mbps  
Duplex: full  
Link Failure Count: 1  
Slave queue ID: 0
```

- If yes, the NICs are bonded in active/standby mode. Go to [Step 13](#).
- If no, go to [Step 14](#).

**Step 13** Check whether the NIC specified by **NetworkCardName** in the alarm details is the standby NIC.

- If yes, the alarm of the standby NIC cannot be automatically cleared. Manually clear the alarm on the alarm management page. No further action is required.
- If no, go to [Step 14](#).

 **NOTE**

To determine the standby NIC, check the `/proc/net/bonding/bond0` configuration file. If the NIC name corresponding to **NetworkCardName** is **Slave Interface** but not **Currently Active Slave** (the current active NIC), the NIC is the standby one.

**Check whether the threshold is set properly.**

**Step 14** Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to [Step 17](#).

- If no, go to [Step 15](#).

**Step 15** Choose **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Dropped Rate** and change the alarm threshold based on the actual service usage.

**Step 16** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

**Check whether the network is normal.**

**Step 17** Contact the network administrator to check whether the network is normal.

- If yes, rectify the network fault and go to [Step 18](#).
- If no, go to [Step 19](#).

**Step 18** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 19](#).

**Step 19** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.77 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold

### Description

The system checks the write packet dropped rate every 30 seconds. This alarm is generated when the write packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Writing > Network Write Packet Rate Information > Write Packet Dropped Rate**.

When the **hit number** is **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. When the **hit number** is greater than **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
12046	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The service performance deteriorates or some services time out.

## Possible Causes

- The alarm threshold is improperly configured.
- The network environment is abnormal.

## Procedure

### Check whether the threshold is set properly.

- Step 1** Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.
- If yes, go to [Step 4](#).
  - If no, go to [Step 2](#).
- Step 2** Choose **System > Threshold Configuration > Device > Host > Network Write Information > Network Write Packet Rate > Write Packet Dropped Rate** and change the alarm threshold based on the actual service usage.
- Step 3** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 4](#).

**Check whether the network is normal.**

**Step 4** Contact the network administrator to check whether the network is normal.

- If yes, rectify the network fault and go to **Step 5**.
- If no, go to **Step 6**.

**Step 5** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

**Step 6** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.78 ALM-12047 Read Packet Error Rate Exceeds the Threshold

**Description**

The system checks the read packet error rate every 30 seconds. This alarm is generated when the read packet error rate exceeds the threshold (the default threshold is **0.5%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Error Rate**.

If the **hit number** is **1**, this alarm is cleared when the read packet error rate is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the read packet error rate is less than or equal to 90% of the threshold.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
12047	Major	Yes

**Parameters**

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.

Parameter	Description
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The communication is intermittently interrupted, and services time out.

## Possible Causes

- The alarm threshold is improperly configured.
- The network environment is abnormal.

## Procedure

### Check whether the threshold is set properly.

**Step 1** Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **System > Threshold Configuration > Device > Host > Network Reading > Network Read Packet Rate Information > Read Packet Error Rate** and change the alarm threshold based on the actual service usage.

**Step 3** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check whether the network is normal.

**Step 4** Contact the network administrator to check whether the network is normal.

- If yes, rectify the network fault and go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Step 6** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.79 ALM-12048 Write Packet Error Rate Exceeds the Threshold

### Description

The system checks the write packet error rate every 30 seconds. This alarm is generated when the write packet error rate exceeds the threshold (the default threshold is **0.5%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Writing > Network Write Packet Rate Information > Write Packet Error Rate**.

If **hit number** is **1**, this alarm is cleared when the write packet error rate is less than or equal to the threshold. If **hit number** is greater than **1**, this alarm is cleared when the write packet error rate is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12048	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The communication is intermittently interrupted, and services time out.

## Possible Causes

- The alarm threshold is improperly configured.
- The network environment is abnormal.

## Procedure

**Check whether the threshold is set properly.**

**Step 1** Log in to MRS Manager and check whether the threshold (configurable, 0.5% by default) is appropriate.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **System > Threshold Configuration > Device > Host > Network Writing > Network Write Packet Rate Information > Write Packet Error Rate** and change the alarm threshold based on the actual service usage.

**Step 3** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the network is normal.**

**Step 4** Contact the network administrator to check whether the network is normal.

- If yes, rectify the network fault and go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Step 6** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

## 11.5.80 ALM-12049 Read Throughput Rate Exceeds the Threshold

### Description

The system checks the read throughput rate every 30 seconds. This alarm is generated when the read throughput rate exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Reading > Network Read Throughput Rate > Read Throughput Rate**.

If the **hit number** is **1**, this alarm is cleared when the read throughput rate is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the read throughput rate is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12049	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

The service system runs abnormally or is unavailable.

### Possible Causes

- The alarm threshold is improperly configured.

- The network port rate does not meet service requirements.

## Procedure

### Check whether the threshold is set properly.

**Step 1** Log in to MRS Manager and check whether the threshold (configurable, 80% by default) is appropriate.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** Choose **System > Threshold Configuration > Device > Host > Network Reading > Network Read Throughput Rate > Read Throughput Rate** to change the alarm threshold based on the actual service usage.

**Step 3** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check whether the network port rate meets the requirements.

**Step 4** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and network port name of the host for which the alarm is generated.

**Step 5** Use PuTTY to log in to the host for which the alarm is generated as user **root**.

**Step 6** Run the **ethtool network port name** command to check the maximum network port rate **Speed**.

#### NOTE

In a VM environment, you may fail to obtain the network port rate by running commands. You are advised to contact the system administrator to check whether the network port rate meets the requirements.

**Step 7** If the read throughput rate exceeds the threshold, contact the network administrator to increase the network port rate.

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Step 9** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.81 ALM-12050 Write Throughput Rate Exceeds the Threshold

### Description

The system checks the write throughput rate every 30 seconds. This alarm is generated when the write throughput rate exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Network Writing > Network Write Throughput Rate > Write Throughput Rate**.

If the **hit number** is **1**, this alarm is cleared when the write throughput rate is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the write throughput rate is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12050	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NetworkCardName	Specifies the network port for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

The service system runs abnormally or is unavailable.

### Possible Causes

- The alarm threshold is improperly configured.

- The network port rate does not meet service requirements.

## Procedure

### Check whether the threshold is set properly.

**Step 1** Log in to MRS Manager and check whether the threshold (configurable, 80% by default) is appropriate.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **System > Threshold Configuration > Device > Host > Network Writing > Network Write Throughput Rate > Write Throughput Rate** to change the alarm threshold based on the actual service usage.

**Step 3** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check whether the network port rate meets the requirements.

**Step 4** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and network port of the host for which the alarm is generated.

**Step 5** Use PuTTY to log in to the host for which the alarm is generated as user **root**.

**Step 6** Run the **ethtool network port name** command to check the maximum network port rate **Speed**.

#### NOTE

In a VM environment, you may fail to obtain the network port rate by running commands. You are advised to contact the system administrator to check whether the network port rate meets the requirements.

**Step 7** If the write throughput rate exceeds the threshold, contact the network administrator to increase the network port rate.

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Step 9** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.82 ALM-12051 Disk Inode Usage Exceeds the Threshold

### Description

The system checks the disk inode usage every 30 seconds. This alarm is generated when the disk inode usage exceeds the threshold (the default threshold is 80%) for multiple times (the default value is 5).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Disk > Disk Inode Usage > Disk Inode Usage**.

If the **hit number** is **1**, this alarm is cleared when the disk inode usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the disk inode usage is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12051	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Data cannot be written to the file system.

### Possible Causes

- There are too many small files on the disk.
- The system is abnormal.

## Procedure

### There are too many small files on the disk.

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address and disk partitions of the host for which the alarm is generated.
- Step 3** Use PuTTY to log in to the host for which the alarm is generated as user **root**.
- Step 4** Run the **df -i *partition name*** command to check the current inode usage of the disk.
- Step 5** If the inode usage exceeds the threshold, manually check whether the small files in the partition can be deleted.
- If yes, delete the files and go to **Step 6**.
  - If no, adjust the capacity. Then go to **Step 7**.
- Step 6** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 7**.
- Check whether the system environment is normal.**
- Step 7** Contact the operating system maintenance personnel to check whether the system environment is abnormal.
- If yes, rectify the operating system fault and go to **Step 8**.
  - If no, go to **Step 9**.
- Step 8** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 9**.
- Step 9** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
  2. Contact the O&M personnel and send the collected logs.
- End

## Reference

## 11.5.83 ALM-12052 Usage of Temporary TCP Ports Exceeds the Threshold

### Description

The system checks the usage of temporary TCP ports every 30 seconds. This alarm is generated when the usage of temporary TCP ports exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Host > Network Status > TCP Ephemeral Port Usage > TCP Ephemeral Port Usage**.

If the **hit number** is **1**, this alarm is cleared when the usage of temporary TCP ports is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the usage of temporary TCP ports is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
12052	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Services on the host fail to establish connections with the external and services are interrupted.

## Possible Causes

- The temporary ports do not meet service requirements.
- The system is abnormal.

## Procedure

### Expand the range of temporary ports.

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.
- Step 3** Use PuTTY to log in to the host for which the alarm is generated as user **omm**.

**Step 4** Run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1` command to obtain the start port number. Run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2` command to obtain the end port number. Subtract the start port number from the end port number to obtain the total number of temporary ports. If the total number of temporary ports is less than 28,232, the random port range of the OS is too small. In this case, contact the system administrator to expand the port range.

**Step 5** Run the `ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}'|cut -d ':' -f 2 | awk '$1 > "start port number" {print $1}' | sort -u | wc -l` command to calculate the number of used temporary ports.

**Step 6** Calculate the usage of temporary ports using the following formula: Usage of temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100. Check whether the usage exceeds the threshold.

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

**Step 7** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Check whether the system environment is normal.**

**Step 8** Run the following command to import the temporary file and view the frequently used ports in the `port_result.txt` file:

```
netstat -tnp > $BIGDATA_HOME/tmp/port_result.txt
```

```
netstat -tnp
Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp 0 0 10-120-85-154:45433
10-120-8:25009 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45434 10-120-8:25009 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45435 10-120-8:25009 CLOSE_WAIT 94237/java
...
```

**Step 9** Run the following command to check the processes that occupy a large number of ports:

```
ps -ef |grep PID
```

 **NOTE**

- `PID` indicates the process ID of the port queried in [Step 8](#).
- Run the following command to collect information about all processes in the system and check the processes that occupy a large number of ports:

```
ps -ef > $BIGDATA_HOME/tmp/ps_result.txt
```

**Step 10** Contact the system administrator to clear the processes that occupy a large number of ports. Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Step 11** Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.

2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.84 ALM-12053 File Handle Usage Exceeds the Threshold

### Description

The system checks the handler usage every 30 seconds. This alarm is generated when the handle usage exceeds the threshold (the default threshold is **80%**) for multiple times (the default value is **5**).

You can change the threshold by choosing **System > Threshold Configuration > Device > Host > Host Status > Host File Handle Usage > Host File Handle Usage**.

If the **hit number** is **1**, this alarm is cleared when the file handle usage is less than or equal to the threshold. If the **hit number** is greater than **1**, this alarm is cleared when the file handle usage is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12053	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

The system applications fail to open files, access networks, and perform other I/O operations. The applications are running improperly.

## Possible Causes

- The number of file handles does not meet service requirements.
- The system is abnormal.

## Procedure

### Increase the number of file handles.

- Step 1** Go to the MRS cluster details page and choose **Alarms**.
- Step 2** In the real-time alarm list, click the alarm. In the **Alarm Details** area, obtain the IP address of the host for which the alarm is generated.
- Step 3** Use PuTTY to log in to the host for which the alarm is generated as user **root**.
- Step 4** Run the **ulimit -n** command to check the maximum number of handles set in the system.
- Step 5** If the file handle usage exceeds the threshold, contact the system administrator to increase the number of system file handles.
- Step 6** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

### Check whether the system environment is normal.

- Step 7** Contact the system administrator to check whether the OS is abnormal.
- If yes, rectify the operating system fault and go to [Step 8](#).
  - If no, go to [Step 9](#).
- Step 8** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 9](#).
- Step 9** Collect fault information.
1. On MRS Manager, choose **System > Export Log**.
  2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.85 ALM-12054 The Certificate File Is Invalid

### Description

The system checks whether the certificate file is invalid (has expired or is not yet valid) on 23:00 every day. This alarm is generated when the certificate file is invalid.

This alarm is cleared when the status of the newly imported certificate is valid.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
12054	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The system reminds users that the certificate file is invalid. If the certificate file is invalid, some functions are restricted and cannot be used properly.

## Possible Causes

No certificate (HA root certificate or HA user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

## Procedure

**Check the alarm cause.**

**Step 1** Go to the MRS cluster details page and choose **Alarms**.

**Step 2** In the real-time alarm list, click the row that contains the alarm.

In the **Alarm Details** area, view the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, use PuTTY to log in to the active OMS management node as user **omm** and go to [Step 3](#).
- If **HA root Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 4](#).
- If **HA server Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 5](#).

**Check the validity period of the certificate files in the system.**

**Step 3** Check whether the current system time is in the validity period of the CA certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/cert/root/ca.crt** command to check the effective time and due time of the root certificate.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 4** Check whether the current system time is in the validity period of the HA root certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

**Step 5** Check whether the current system time is in the validity period of the HA user certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

The following is an example of the effective time and expiration time of a CA or HA certificate:

```
Certificate:
Data:
  Version: 3 (0x2)
  Serial Number:
    97:d5:0e:84:af:ec:34:d8
  Signature Algorithm: sha256WithRSAEncryption
  Issuer: C=CountryName, ST=State, L=Locality, O=Organization, OU=IT, CN=HADOOP.COM
  Validity
    Not Before: Dec 13 06:38:26 2016 GMT           // Effective time
    Not After : Dec 11 06:38:26 2026 GMT           // Expiration time
```

### Import certificate files.

**Step 6** Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 8](#).
- If no, no further action is required.

**Step 7** Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 8](#).

- If no, no further action is required.

**Step 8** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

**Reference**

None

## 11.5.86 ALM-12055 The Certificate File Is About to Expire

**Description**

The system checks the certificate file on 23:00 every day. This alarm is generated if the certificate file is about to expire with a validity period less than days set in the alarm threshold.

This alarm is generated if the status of the newly imported certificate is valid.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
12055	Minor	Yes

**Parameters**

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

**Impact on the System**

The system reminds users that the license is about to expire. If the license expires, some functions are restricted and cannot be used properly.

**Possible Causes**

The remaining validity period of the CA certificate, HA root certificate, or HA user certificate is smaller than the alarm threshold.

## Procedure

### Check the alarm cause.

**Step 1** Go to the MRS cluster details page and choose **Alarms**.

**Step 2** In the real-time alarm list, click the row that contains the alarm.

In the **Alarm Details** area, view the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, use PuTTY to log in to the active OMS management node as user **omm** and go to [Step 3](#).
- If **HA root Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 4](#).
- If **HA server Certificate** is displayed in the additional information, check **Location** to obtain the name of the host involved in this alarm. Then use PuTTY to log in to the host as user **omm** and go to [Step 5](#).

### Check the validity period of the certificate files in the system.

**Step 3** Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/cert/root/ca.crt** command to check the effective time and due time of the root certificate.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

**Step 4** Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 5** Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

The following is an example of the effective time and expiration time of a CA or HA certificate:

```
Certificate:
Data:
  Version: 3 (0x2)
  Serial Number:
```

```

97:d5:0e:84:af:ec:34:d8
Signature Algorithm: sha256WithRSAEncryption
Issuer: C=CountryName, ST=State, L=Locality, O=Organization, OU=IT, CN=HADOOP.COM
Validity
  Not Before: Dec 13 06:38:26 2016 GMT      // Effective time
  Not After : Dec 11 06:38:26 2026 GMT      // Expiration time
    
```

**Import certificate files.**

**Step 6** Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

**Step 7** Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to **Step 8**.
- If no, no further action is required.

**Step 8** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.87 ALM-18008 Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold

**Description**

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (80% of the maximum memory by default).

To change the threshold, choose **System > Threshold Configuration > Service > Yarn**. The alarm is cleared when the heap memory usage is less than or equal to the threshold.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
18008	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. What is more, a memory overflow occurs so that the Yarn service is unavailable.

## Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

**Step 1** Check the heap memory usage.

1. Go to the MRS cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **18008** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Yarn > Instances > ResourceManager** (IP address of the instance for which the alarm is generated) > **Customize > Percentage of Used Heap Memory of the ResourceManager**. Check the heap memory usage.
4. Check whether the heap memory usage of ResourceManager has reached the threshold (80% of the maximum memory).
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > Yarn > Service Configuration**. Set **Type** to **All** and choose **ResourceManager > System**. Change the values of **-Xmx** and **-Xms** in the **GC\_OPTS** parameter based on the site requirements to ensure that the value of **-Xms** is less than that of **-Xmx**. Click **Save Configuration** and select **Restart Role Instance**. Click **OK**.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.

- If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.88 ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold

### Description

The system checks the heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of MapReduce JobHistoryServer exceeds the threshold (80% of the maximum memory by default).

To change the threshold, choose **System > Threshold Configuration > Service > MapReduce**. The alarm is cleared when the heap memory usage is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18009	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

When the heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce log archiving is affected. What is more, a memory overflow occurs so that the Yarn service is unavailable.

## Possible Causes

The heap memory of the MapReduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

**Step 1** Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **18009** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > MapReduce > Instance > JobHistoryServer** (IP address of the instance for which the alarm is generated) > **Customize > JobHistoryServer Heap Memory Usage Statistics**. Check the heap memory usage.
4. Check whether the heap memory usage of JobHistoryServer has reached the threshold (80% of the maximum heap memory).
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > MapReduce > Service Configuration**. Set **Type** to **All** and choose **JobHistoryServer > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter as required, click **Save Configuration**, and select **Restart the affected services or instances**. Click **OK**.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

## 11.5.89 ALM-20002 Hue Service Unavailable

### Description

The system checks the Hue service status every 60 seconds. This alarm is generated if the Hue service is unavailable.

This alarm is cleared when the Hue service is normal.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
20002	Critical	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The system cannot provide data loading, query, and extraction services.

## Possible Causes

- The KrbServer service on which Hue depends is abnormal.
- The DBService service on which Hue depends is abnormal.
- The network connection to DBService is abnormal.

## Procedure

### Check whether the KrbServer service is normal.

**Step 1** Go to the MRS cluster details page and click **Components**.

**Step 2** In the service list, check whether **Health Status** of **KrbServer** is **Good**.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** Click **Restart** in the **Operation** column of the KrbServer service to restart the service.

**Step 4** Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check whether DBService is normal.

**Step 5** Go to the MRS cluster details page and click **Components**.

**Step 6** In the service list, check whether **Health Status** of **DBService** is **Good**.

- If yes, go to [Step 9](#).
- If no, go to [Step 7](#).

**Step 7** Click **Restart** in the **Operation** column of the DBService service to restart the service.

 **NOTE**

To restart the service, you need to enter the password of the MRS Manager administrator and select **Start or restart related services**.

**Step 8** Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Check whether the network connected to DBService is normal.**

**Step 9** Choose **Components > Hue > Instance** and record the IP address of the active Hue node.

**Step 10** Use PuTTY to log in to the active Hue.

**Step 11** Run the **ping** command to check whether the network connection between the host where the active Hue is located and the host where DBService is located is normal. (The method of obtaining the DBService service IP address is the same as that of obtaining the active Hue IP address.)

- If yes, go to [Step 17](#).
- If no, go to [Step 12](#).

**Step 12** Contact the network administrator to repair the network.

**Step 13** Wait for several minutes. Check whether ALM-20002 Hue Service Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

**Collect fault information.**

**Step 14** On MRS Manager, choose **System > Export Log**.

**Step 15** Select the following nodes from the **Services** drop-down list and click **OK**.

- Hue
- Controller

**Step 16** Set **Start Time** and **End Time** for log collection to 10 minutes before and after the alarm is generated, select an export type, and click **OK** to collect the corresponding fault log information.

**Restart Hue.**

**Step 17** Choose **Components > Hue**.

**Step 18** Choose **More > Restart Service** and click **OK**.

**Step 19** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 20](#).

**Step 20** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.90 ALM-43001 Spark Service Unavailable

### Description

The system checks the Spark service status every 60 seconds. This alarm is generated when the Spark service is unavailable.

This alarm is cleared when the Spark service recovers.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43001	Critical	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

The Spark tasks submitted by users fail to be executed.

## Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- ZooKeeper is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The corresponding Hive service is abnormal.

## Procedure

**Step 1** Check whether service unavailability alarms exist in services that Spark depends on.

1. Go to the cluster details page and choose **Alarms**.
2. Check whether the following alarms exist in the alarm list:
  - a. ALM-25500 KrbServer Service Unavailable
  - b. ALM-25000 LdapServer Service Unavailable
  - c. ALM-13000 ZooKeeper Service Unavailable
  - d. ALM-14000 HDFS Service Unavailable
  - e. ALM-18000 Yarn Service Unavailable
  - f. ALM-16004 Hive Service Unavailable
  - If yes, go to **Step 1.3**.
  - If no, go to **Step 2**.
3. Handle the alarm according to the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm HetuServer Service Unavailable is cleared.

  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.91 ALM-43006 Heap Memory Usage of the JobHistory Process Exceeds the Threshold

### Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the heap memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43006	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the available JobHistory process heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The heap memory of the JobHistory process is overused or the heap memory is inappropriately allocated.

## Procedure

**Step 1** Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43006** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) **> Customize > Heap Memory Statistics of the JobHistory Process**. Click **OK** to view the heap memory usage.
4. Check whether the used heap memory of JobHistory reaches 90% of the maximum heap memory specified for JobHistory.
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of **SPARK\_DAEMON\_MEMORY** as required.
6. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

7. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.92 ALM-43007 Non-Heap Memory Usage of the JobHistory Process Exceeds the Threshold

### Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the non-heap memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43007	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

If the available JobHistory process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The non-heap memory of the JobHistory process is overused or the non-heap memory is inappropriately allocated.

## Procedure

### Step 1 Check non-heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43007** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) **> Customize > Non-Heap Memory Statistics of the JobHistory Process**. Click **OK** to view the non-heap memory usage.
4. Check whether the non-heap memory usage of JobHistory has reached the threshold (90% of the maximum memory).
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of **-XX:MaxMetaspaceSize** in **SPARK\_DAEMON\_JAVA\_OPTS** as required.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

### Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.93 ALM-43008 Direct Memory Usage of the JobHistory Process Exceeds the Threshold

### Description

The system checks the JobHistory process status every 30 seconds. The alarm is generated when the direct memory usage of the JobHistory process exceeds the threshold (90% of the maximum memory).

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43008	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the available JobHistory process direct memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the JobHistory process is overused or the direct memory is inappropriately allocated.

## Procedure

**Step 1** Check the direct memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43008** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) **> Customize > Direct Memory Statistics of the JobHistory Process**. Click **OK** to view the direct memory usage.
4. Check whether the direct memory usage of the JobHistory process has reached the threshold (90% of the maximum direct memory).
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of - **XX:MaxDirectMemorySize** in **SPARK\_DAEMON\_JAVA\_OPTS** as required.
6. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.94 ALM-43009 JobHistory GC Time Exceeds the Threshold

### Description

The system checks the GC time of the JobHistory process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. You can change the threshold by choosing **System > Threshold Configuration > Service > Spark > JobHistory GC Time > Total JobHistory GC Time**. This alarm is cleared when the JobHistory GC time is shorter than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43009	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

If the GC time exceeds the threshold, JobHistory may run in low performance.

## Possible Causes

The heap memory of the JobHistory process is overused or inappropriately allocated, causing frequent GC.

## Procedure

### Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43009** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JobHistory** (IP address of the instance for which the alarm is generated) **> Customize > GC Time of the JobHistory Process**. Click **OK** to view the GC time.
4. Check whether the GC time of the JobHistory process is longer than 12 seconds.
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JobHistory > Default**. Increase the value of the **SPARK\_DAEMON\_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

### Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.95 ALM-43010 Heap Memory Usage of the JDBCServer Process Exceeds the Threshold

### Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the heap memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43010	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the available JDBCServer process heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The heap memory of the JDBCServer process is overused or the heap memory is inappropriately allocated.

## Procedure

**Step 1** Check the heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43010** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JDBCServer** (IP address of the instance for which the alarm is generated) **> Customize > Heap Memory Statistics of the JDBCServer Process**. Click **OK** to view the heap memory usage.
4. Check whether the heap memory usage of JDBCServer has reached the threshold (90% of the maximum heap memory).
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JDBCServer > Tuning**. Increase the value of the **SPARK\_DRIVER\_MEMORY** parameter as required.
6. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 11.5.96 ALM-43011 Non-Heap Memory Usage of the JDBCServer Process Exceeds the Threshold

### Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the non-heap memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43011	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

If the available JDBCServer process non-heap memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The non-heap memory of the JDBCServer process is overused or the non-heap memory is inappropriately allocated.

## Procedure

### Step 1 Check non-heap memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43011** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JDBCServer** (IP address of the instance for which the alarm is generated) **> Customize > Non-heap Memory Statistics of the JDBCServer Process**. Click **OK** to view the non-heap memory usage.
4. Check whether the non-heap memory usage of JDBCServer has reached the threshold (90% of the maximum non-heap memory).
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JDBCServer > Tuning**. Increase the value of **-XX:MaxMetaspaceSize** in **spark.driver.extraJavaOptions** as required.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 2](#).

### Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.97 ALM-43012 Direct Memory Usage of the JDBCServer Process Exceeds the Threshold

### Description

The system checks the JDBCServer process status every 30 seconds. The alarm is generated when the direct memory usage of the JDBCServer process exceeds the threshold (90% of the maximum memory).

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43012	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the available JDBCServer process direct memory is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the JDBCServer process is overused or the direct memory is inappropriately allocated.

## Procedure

**Step 1** Check the direct memory usage.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43012** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Spark > Instance > JDBCServer** (IP address of the instance for which the alarm is generated) **> Customize > Direct Memory Statistics of the JDBCServer Process**. Click **OK** to view the direct memory usage.
4. Check whether the direct memory usage of the JDBCServer process has reached the threshold (90% of the maximum direct memory).
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Spark > Service Configuration**. Set **Type** to **All** and choose **JDBCServer > Tuning**. Increase the value of - **XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** as required.
6. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.98 ALM-43013 JDBCServer GC Time Exceeds the Threshold

### Description

The system checks the GC time of the JDBCServer process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. You can change the threshold by choosing **System > Threshold Configuration > Service > Spark > JDBCServer GC Time > Total JDBCServer GC Time**. This alarm is cleared when the JDBCServer GC time is shorter than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
43013	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

If the GC time exceeds the threshold, JDBCServer may run in low performance.

## Possible Causes

The heap memory of the JDBCServer process is overused or inappropriately allocated, causing frequent GC.

## Procedure

### Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **43013** and view the IP address and role name of the instance in **Location**.
3. Choose **Components** > **Spark** > **Instance** > **JDBCServer** (IP address of the instance for which the alarm is generated) > **Customize** > **GC Time of the JDBCServer Process**. Click **OK** to view the GC time.
4. Check whether the GC time of the JDBCServer process is longer than 12 seconds.
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components** > **Spark** > **Service Configuration**. Set **Type** to **All** and choose **JDBCServer** > **Tuning**. Increase the value of the **SPARK\_DRIVER\_MEMORY** parameter as required.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

### Step 2 Collect fault information.

1. On MRS Manager, choose **System** > **Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.99 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold

### Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Presto** > **resource-groups** to configure a resource group. You can choose **Components** > **Presto** > **Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to configure the threshold of each resource group.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
44004	Major	Yes

## Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

## Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

## Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

## Procedure

- Step 1** Choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Presto > resource-groups** to adjust the resource group configuration.
- Step 2** You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Coordinator > Customize > resourceGroupAlarm** to modify the threshold of each resource group.
- Step 3** Collect fault information.
  1. Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks based on **Resource Group** in the additional information on the Presto client.
  2. Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and search for resource group information to view the monitoring collection information of the resource group.
  3. Contact the O&M personnel and send the collected logs.

----End

# 11.5.100 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold

## Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Presto > Coordinator > Presto Process Garbage Collection Time > Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
44005	Major	Yes

## Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

## Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

## Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Procedure

**Step 1** Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44005** and view the IP address and role name of the instance in **Location**.
3. Choose **Components > Presto > Instances > Coordinator** (business IP address of the instance for which the alarm is generated) > **Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**. Choose **Presto > Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA\_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

**Reference**

**11.5.101 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold**

**Description**

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Presto > Worker > Presto Garbage Collection Time > Garbage Collection Time of the Worker Process** on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

**Attribute**

Alarm ID	Alarm Severity	Auto Clear
44006	Major	Yes

## Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

## Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

## Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Procedure

### Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44006**. Then check the IP address and role name of the instance in **Location**.
3. Choose **Components > Presto > Instances > Worker** (business IP address of the instance for which the alarm is generated) **> Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**, and choose **Presto > Worker** Increase the value of **-Xmx** (maximum heap memory) in the **JAVA\_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

### Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.102 ALM-18010 Number of Pending Yarn Tasks Exceeds the Threshold

### Description

The system checks the number of pending Yarn tasks every 30 seconds and compares the number of tasks with the threshold. This alarm is generated when the number of pending tasks exceeds the threshold.

You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Yarn > Queue Root Pending Applications > Queue Root Pending Applications** on MRS Manager.

This alarm is cleared when the number of pending tasks is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18010	Major	Yes

### Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Tasks may be stacked and cannot be processed in a timely manner.

### Possible Causes

The computing capability of the cluster is lower than the task submission rate. As a result, the task cannot be processed in a timely manner after being submitted.

## Procedure

**Step 1** Check the usage of memory and vCores on the Yarn page.

Check whether the values of **Memory Used|Memory Total** and **VCores Used|VCores Total** on the native Yarn page reach or approach the maximum values.

- If yes, go to [Step 2](#).
- If no, go to [Step 5](#).

**Step 2** Check the number of submitted tasks.

Check whether the running tasks are submitted at a normal frequency.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Scale out the cluster.

The scale-out is based on the site requirements. For details, see [Manually Scaling Out a Cluster](#).

**Step 4** After the scale-out is completed, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

None

## 11.5.103 ALM-18011 Memory of Pending Yarn Tasks Exceeds the Threshold

### Description

The system checks the memory of pending Yarn tasks every 30 seconds and compares the memory with the threshold. This alarm is generated when the memory of pending tasks exceeds the threshold.

You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Yarn > Queue Root Pending Memory > Queue Root Pending Memory** on MRS Manager.

This alarm is cleared when the memory of pending tasks is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
18011	Major	Yes

## Parameters

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Tasks may be stacked and cannot be processed in a timely manner.

## Possible Causes

The computing capability of the cluster is lower than the task submission rate. As a result, the task cannot be processed in a timely manner after being submitted.

## Procedure

**Step 1** Check the usage of memory and vCores on the Yarn page.

Check whether the values of **Memory Used|Memory Total** and **VCores Used|VCores Total** on the native Yarn page reach or approach the maximum values.

- If yes, go to [Step 2](#).
- If no, go to [Step 5](#).

**Step 2** Check the number of submitted tasks.

Check whether the running tasks are submitted at a normal frequency.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Scale out the cluster.

The scale-out is based on the site requirements. For details, see [Manually Scaling Out a Cluster](#).

**Step 4** After the scale-out is completed, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 11.5.104 ALM-18012 Number of Terminated Yarn Tasks in the Last Period Exceeds the Threshold

### Description

The system checks the number of terminated Yarn tasks every 10 minutes. This alarm is generated when the number of terminated Yarn tasks in the last 10 minutes is greater than the threshold. This alarm is automatically cleared when the number of terminated Yarn tasks is less than the threshold in the next 10 minutes.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
18012	Major	Yes

### Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

### Impact on the System

None

### Possible Causes

A user manually stops a running Yarn task.

## Procedure

Check the task termination operator in the Yarn logs and audit logs, and determine the cause of the task termination.

## Reference

None

## 11.5.105 ALM-18013 Number of Failed Yarn Tasks in the Last Period Exceeds the Threshold

### Description

The system checks the number of failed Yarn tasks every 10 minutes. This alarm is generated when the number of failed Yarn tasks in the last 10 minutes is greater than the threshold. This alarm is automatically cleared when the number of failed Yarn tasks is less than the threshold in the next 10 minutes.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
18013	Major	Yes

### Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

### Impact on the System

None

### Possible Causes

The submitted Yarn job program is incorrect. For example, the parameter for Spark to submit a job is incorrect.

### Procedure

Check the log of the failed job, locate the failure cause, modify the job, and submit the job again.

## Reference

None

### 11.5.106 ALM-16005 Number of Failed Hive SQL Executions in the Last Period Exceeds the Threshold

#### Description

The system checks whether the number of Hive SQL statements that fail to be executed has exceeded the threshold in the last 10-minute period. This alarm is generated when the number of failed Hive SQL statement executions in the last 10 minutes is greater than the threshold. In the next 10 minutes, if the number of failed Hive SQL statement executions is less than the threshold, the alarm is automatically cleared.

#### Attribute

Alarm ID	Alarm Severity	Auto Clear
16005	Major	Yes

#### Parameter

Parameter	Description
ServiceName	Service for which the alarm is generated.
RoleName	Role for which the alarm is generated.
HostName	Host for which the alarm is generated.

#### Impact on the System

None

#### Possible Causes

The Hive SQL syntax is incorrect. As a result, the Hive SQL statements fail to be executed.

#### Procedure

Check the Hive SQL statements that fail to be executed, correct the syntax, and execute the SQL statements again.

#### Reference

None

## 11.6 Object Management

### 11.6.1 Managing Objects

MRS contains different types of basic objects as described in [Table 11-16](#).

**Table 11-16** MRS basic object overview

Object	Description	Example
Service	Function set that can complete specific business.	KrbServer service and LdapServer service
Service instance	Specific instance of a service, usually called service.	KrbServer service
Service role	Function entity that forms a complete service, usually called role.	KrbServer is composed of the KerberosAdmin role and KerberosServer role.
Role instance	Specific instance of a service role running on a host.	KerberosAdmin that is running on Host2 and KerberosServer that is running on Host3
Host	An ECS running Linux OS.	Host1 to Host5
Rack	Physical entity that contains multiple hosts connecting to the same switch.	Rack1 contains Host1 to Host5.
Cluster	Logical entity that consists of multiple hosts and provides various services.	Cluster names <b>Cluster1</b> consists of five hosts (Host1 to Host5) and provides services such as KrbServer and LdapServer.

### 11.6.2 Viewing Configurations

On MRS Manager, users can view the configurations of services (including roles) and role instances.

#### Procedure

- Query service configurations.
  - a. On MRS Manager page, click **Services**.
  - b. Select the target service from the service list.
  - c. Click **Service Configuration**.
  - d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.

- e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.  
The parameters under the service nodes and role nodes are service configuration parameters and role configuration parameters respectively.
- f. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.
- Query role instance configurations.
  - a. On MRS Manager page, click **Services**.
  - b. Select the target service from the service list.
  - c. Click the **Instances** tab.
  - d. Click the target role instance from the role instance list.
  - e. Click **Instance Configuration**.
  - f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
  - g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.
  - h. In the **Non-default** parameter, select **Non-default**. The parameters whose values are not default values will be displayed.

### 11.6.3 Managing Services

You can perform the following operations on MRS Manager:

- Start the service in the **Stopped**, **Stop Failed**, or **Start Failed** state to use the service.
- Stop the services or stop abnormal services.
- Restart abnormal services or configure expired services to restore or enable the services.

#### Procedure

**Step 1** On MRS Manager page, click **Services**.

**Step 2** Locate the row that contains the target service, **Start**, **Stop**, or **Restart** to start, stop, or restart the service.

Services are interrelated. If a service is started, stopped, and restarted, services dependent on it will be affected.

The services will be affected in the following ways:

- If a service is to be started, the lower-layer services dependent on it must be started first.
- If a service is stopped, the upper-layer services dependent on it are unavailable.
- If a service is restarted, the running upper-layer services dependent on it must be restarted.

----End

## 11.6.4 Configuring Service Parameters

On MRS Manager, you can view and modify the default service configurations based on site requirements and export or import the configurations.

### Impact on the System

- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.
- The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

### Procedure

- Modify a service.
  - a. Click **Services**.
  - b. Select the target service from the service list.
  - c. Click **Service Configuration**.
  - d. Set **Type** to **All**. All configuration parameters of the service are displayed in the navigation tree. The root nodes from top down in the navigation tree represent the service names and role names.
  - e. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.

#### NOTE

You can also use host groups to change role instance configurations in batches. Select a role name from the **Role** drop-down list and choose **< Select Host >** in the **Host** drop-down list. Enter a name in the **Host Group Name** text box, select the hosts to be modified from the **Host** list, add them to the **Selected hosts** area, and click **OK**. The added host group can be selected from **Host** and is only valid on the current page. The page cannot be saved after being refreshed.

- f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

#### NOTE

To update the queue configuration of the Yarn service without restarting service, choose **More > Refresh Queue** to update the queue for the configuration to take effect.

- Export service configuration parameters.
  - a. Click **Services**.
  - b. Select a service.
  - c. Click **Service Configuration**.

- d. Click **Export Service Configuration**. Select a path for saving the configuration files.
- Import service configuration parameters.
  - a. Click **Services**.
  - b. Select a service.
  - c. Click **Service Configuration**.
  - d. Click **Import Service Configuration**.
  - e. Select the target configuration file.
  - f. Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK**.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

## 11.6.5 Configuring Customized Service Parameters

Each component of MRS supports all open-source parameters. You can modify some parameters for key application scenarios on MRS Manager. Some component clients may not include all parameters with open-source features. For component parameters that cannot be directly modified on Manager, users can add new parameters for components by using the configuration customization function on Manager. Newly added parameters are saved in component configuration files and take effect after restart.

### Impact on the System

- After the service attributes are configured, the service needs to be restarted and cannot be accessed.
- You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

### Prerequisites

You have understood the meanings of parameters to be added, configuration files that have taken effect, and the impact on components.

### Procedure

- Step 1** On MRS Manager, click **Services**.
- Step 2** Select the target service from the service list.
- Step 3** Click **Service Configuration**.
- Step 4** Set **Type** to **All**.
- Step 5** In the navigation tree, select **Customization**. The customized parameters of the current component are displayed on Manager.

The configuration files that save the newly added customized parameters are displayed in the **Parameter File** column. Different configuration files may have same open source parameters. After the parameters in different files are set to

different values, whether the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.

**Step 6** Based on the configuration files and parameter functions, locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.

- You can click  or  to add or delete a user-defined parameter. You can delete a customized parameter only after you click  for the first time.
- If you want to cancel the modification of a parameter value, click  to restore it.

**Step 7** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the services.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

## Task Example

### Configuring Customized Hive Parameters

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters to take effect are controlled by HDFS in a unified manner. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout period for all clients to connect to the HDFS server. If you need to modify the timeout period for Hive to connect to HDFS, you can use the configuration customization function. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

**Step 1** On MRS Manager, choose **Services > Hive > Service Configuration**.

**Step 2** Set **Type** to **All**.

**Step 3** In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

**Step 4** In **core-site.xml**, locate the row that contains the **core.site.customized.configs** parameter, enter **ipc.client.rpc.timeout** in the **Name** column, and enter a new value in the **Value** column, for example, **150000**. The unit is millisecond.

**Step 5** Click **Save Configuration** and select **Restart the affected services or instances**. Click **OK** to restart the service.

After **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

## 11.6.6 Synchronizing Service Configurations

### Scenario

If **Configuration Status** of a service is **Expired** or **Failed**, synchronize configurations for the cluster or service to restore its configuration status. If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.

### Impact on the System

After synchronizing service configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

### Procedure

- Step 1** On MRS Manager page, click **Services**.
- Step 2** Select the target service from the service list.
- Step 3** In the upper part of the service status and metric information, choose **More > Synchronize Configuration**.
- Step 4** In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful** is displayed, click **Finish**. The service is started successfully.

----End

## 11.6.7 Managing Role Instances

### Scenario

You can start a role instance that is in the **Stopped**, **Failed to stop** or **Failed to start** status, stop an unused or abnormal role instance or restart an abnormal role instance to recover its functions.

### Procedure

- Step 1** On MRS Manager page, click **Services**.
- Step 2** Select the target service from the service list.
- Step 3** Click the **Instances** tab.
- Step 4** Select the check box on the left of the target role instance.
- Step 5** Choose **More > Start Instance**, **Stop Instance**, or **Restart Instance** accordingly.

----End

## 11.6.8 Configuring Role Instance Parameters

### Scenario

You can view and modify default role instance configurations on MRS Manager based on site requirements. The configurations can be imported and exported.

### Impact on the System

You need to download and update the client configuration files after configuring HBase, HDFS, Hive, Spark, Yarn, and MapReduce service properties.

### Procedure

- Modifying role instance configurations
  - a. Click **Services**.
  - b. Select the target service from the service list.
  - c. Click the **Instances** tab.
  - d. Click the target role instance from the role instance list.
  - e. Click **Instance Configuration**.
  - f. Set **Type** to **All**. The navigation tree of all configuration parameters of the role instance is displayed.
  - g. In the navigation tree, select a specified parameter and change its value. You can also enter the parameter name in the **Search** box to search for the parameter and view the result.

If you want to cancel the modification of a parameter value, click  to restore it.
  - h. Click **Save Configuration**, select **Restart the role instance**, and click **OK** to restart the role instance.

After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.
- Exporting Configuration Parameters of a Role Instance
  - a. Click **Services**.
  - b. Select a service.
  - c. Select a role instance or click the **Instances** tab.
  - d. Select a role instance on a specified host.
  - e. Click **Instance Configuration**.
  - f. Click **Export Instance Configuration** to export the configuration data of a specified role instance, and choose a path for saving the configuration file.
- Import configuration data of a role instance.
  - a. Click **Services**.
  - b. Select a service.
  - c. Select a role instance or click the **Instances** tab.

- d. Select a role instance on a specified host.
- e. Click **Instance Configuration**.
- f. Click **Import Instance Configuration** to import the configuration data of the specified role instance.
- g. Click **Save Configuration** and select **Restart the role instance**. Click **OK**. After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.

## 11.6.9 Synchronizing Role Instance Configuration

### Scenario

When **Configuration Status** of a role instance is **Expired** or **Failed**, you can synchronize the configuration data of the role instance with the background configuration.

### Impact on the System

After synchronizing a role instance configuration, you need to restart the role instance whose configuration has expired. The role instance is unavailable during restart.

### Procedure

- Step 1** On MRS Manager, click **Services** and select a service name.
- Step 2** Click the **Instances** tab.
- Step 3** Click the target role instance from the role instance list.
- Step 4** Choose **More > Synchronize Configuration** above the role instance status and indicator information.
- Step 5** In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the role instance.

After **Operation successful.** is displayed, click **Finish**. The role instance is started successfully.

----End

## 11.6.10 Decommissioning and Recommissioning a Role Instance

### Scenario

If a Core or Task node is faulty, the cluster status may be displayed as **Abnormal**. In an MRS cluster, data can be stored on different Core nodes. Users can decommission the specified role instance on MRS Manager to stop the role instance from providing services. After fault rectification, you can recommission the role instance.

The following role instances can be decommissioned and recommissioned.

- DataNode role instance on HDFS
- NodeManager role instance on Yarn
- RegionServer role instance on HBase
- Broker role instance on Kafka

Restrictions:

- If the number of the DataNodes is less than or equal to that of HDFS copies, decommissioning cannot be performed. If the number of HDFS copies is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and the decommissioning will be stopped 30 minutes after the decommissioning attempt is performed on Manager.
- If the number of Kafka Broker instances is less than or equal to that of copies, decommissioning cannot be performed. For example, if the number of Kafka copies is two and the number of nodes is less than three in the system, decommissioning cannot be performed. Instance decommissioning will fail on Manager and exit.
- If a role instance is out of service, you must recommission the instance to start it before using it again.

## Procedure

**Step 1** On MRS Manager page, click **Services**.

**Step 2** Click a service in the service list.

**Step 3** Click the **Instances** tab.

**Step 4** Select an instance.

**Step 5** Choose **More > Decommission** or **Recommission** to perform the corresponding operation.

### NOTE

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, MRS Manager displays a message indicating that the instance decommissioning is stopped, but the **Operating Status** of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

## 11.6.11 Managing a Host

### Scenario

When a host is abnormal or faulty, you need to stop all roles of the host on MRS Manager to check the host. After the host fault is rectified, start all roles running on the host to recover host services.

## Procedure

**Step 1** Click **Hosts**.

**Step 2** Select the check box of the target host.

**Step 3** Choose **More > Start All Roles** or **Stop All Roles** accordingly.

----End

## 11.6.12 Isolating a Host

### Scenario

If a host is found to be abnormal or faulty, affecting cluster performance or preventing services from being provided, you can temporarily exclude that host from the available nodes in the cluster. In this way, the client can access other available nodes. In scenarios where patches are to be installed in a cluster, you can also exclude a specified node from patch installation.

Users can isolate a host manually on MRS Manager based on the actual service requirements or O&M plan. Only non-management nodes can be isolated.

### Impact on the System

- After a host is isolated, all role instances on the host will be stopped. You cannot start, stop, or configure the host and any instances on the host.
- After a host is isolated, statistics about the monitoring status and indicator data of the host hardware and instances on the host cannot be collected or displayed.

## Procedure

**Step 1** On MRS Manager, click **Hosts**.

**Step 2** Select the check box of the host to be isolated.

**Step 3** Choose **More > Isolate Host**,

**Step 4** and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is isolated successfully, and the value of **Operating Status** becomes **Isolated**.

#### NOTE

For isolated hosts, you can cancel the isolation and add them to the cluster again. For details, see [Canceling Host Isolation](#).

----End

## 11.6.13 Canceling Host Isolation

### Scenario

After the exception or fault of a host is handled, you must cancel the isolation of the host for proper usage.

Users can cancel the isolation of a host on MRS Manager.

## Prerequisites

- The host is in the **Isolated** state.
- The exception or fault of the host has been rectified.

## Procedure

**Step 1** On MRS Manager, click **Hosts**.

**Step 2** Select the check box of the host to be de-isolated.

**Step 3** Choose **More > Cancel Host Isolation**,

**Step 4** and click **OK** in the displayed dialog box.

After **Operation successful.** is displayed, click **Finish**. The host is de-isolated successfully, and the value of **Operating Status** becomes **Normal**.

**Step 5** Click the name of the de-isolated host to show its status, and click **Start All Roles**.

----End

## 11.6.14 Starting or Stopping a Cluster

### Scenario

A cluster is a collection of service components. You can start or stop all services in a cluster.

### Procedure

**Step 1** On MRS Manager page, click **Services**.

**Step 2** In the upper part of the service list, choose **More > Start Cluster** or **Stop Cluster** accordingly.

----End

## 11.6.15 Synchronizing Cluster Configurations

### Scenario

If **Configuration Status** of all services or some services is **Expired** or **Failed**, synchronize configuration for the cluster or service to restore its configuration status.

- If all services in the cluster are in the **Failed** state, synchronize the cluster configuration with the background configuration.
- If all services in the cluster are in the **Failed** state, synchronize the service configuration with the background configuration.

## Impact on the System

After synchronizing cluster configurations, you need to restart the services whose configurations have expired. These services are unavailable during restart.

### Procedure

**Step 1** On MRS Manager page, click **Services**.

**Step 2** In the upper part of the service list, choose **More > Synchronize Configuration**.

**Step 3** In the displayed dialog box, select **Restart services and instances whose configuration have expired**, and click **OK** to restart the service whose configuration has expired.

When **Operation successful.** is displayed, click **Finish**. The service is started successfully.

----End

## 11.6.16 Exporting Configuration Data of a Cluster

### Scenario

You can export all configuration data of a cluster on MRS Manager to meet site requirements. The exported configuration data is used to rapidly update service configuration.

### Procedure

**Step 1** On MRS Manager page, click **Services**.

**Step 2** Choose **More > Export Cluster Configuration**.

The exported file is used to update service configurations. For details, see **Import service configuration parameters** in [Configuring Service Parameters](#).

----End

## 11.7 Log Management

### 11.7.1 About Logs

#### Log Description

MRS cluster logs are stored in the `/var/log/Bigdata` directory. The following table lists the log types.

**Table 11-17** Log types

Type	Description
Installation log	Installation logs record information about FusionInsight Manager, cluster, and service installation to help users locate installation errors.
Run logs	Run logs record the running track information, debugging information, status changes, potential problems, and error information generated during the running of services.
Audit logs	Audit logs record information about users' activities and operation instructions, which can be used to locate fault causes in security events and determine who are responsible for these faults.

The following table lists the MRS log directories.

**Table 11-18** Log directories

File Directory	Log Content
/var/log/Bigdata/audit	Component audit log.
/var/log/Bigdata/controller	Log collecting script log. Controller process log. Controller monitoring log.
/var/log/Bigdata/dbservice	DBService log.
/var/log/Bigdata/flume	Flume log.
/var/log/Bigdata/hbase	HBase log.
/var/log/Bigdata/hdfs	HDFS log.
/var/log/Bigdata/hive	Hive log.
/var/log/Bigdata/httpd	HTTPD log.
/var/log/Bigdata/hue	Hue log.
/var/log/Bigdata/kerberos	Kerberos log.
/var/log/Bigdata/ldapclient	LDAP client log.
/var/log/Bigdata/ldapserver	LDAP server log.
/var/log/Bigdata/loader	Loader log.
/var/log/Bigdata/logman	logman script log management log.
/var/log/Bigdata/mapreduce	MapReduce log.
/var/log/Bigdata/nodeagent	NodeAgent log.

File Directory	Log Content
/var/log/Bigdata/okerberos	OMS Kerberos log.
/var/log/Bigdata/oldapserver	OMS LDAP log.
/var/log/Bigdata/omm	<p><b>oms</b>: complex event processing log, alarm service log, HA log, authentication and authorization management log, and monitoring service run log of the omm server.</p> <p><b>oma</b>: installation log and run log of the omm agent.</p> <p><b>core</b>: dump log generated when the omm agent and the HA process are suspended.</p>
/var/log/Bigdata/spark	Spark log.
/var/log/Bigdata/sudo	Log generated when the <b>sudo</b> command is executed by user <b>omm</b> .
/var/log/Bigdata/timestamp	Time synchronization management log.
/var/log/Bigdata/tomcat	Tomcat log.
/var/log/Bigdata/yarn	Yarn log.
/var/log/Bigdata/zookeeper	ZooKeeper log.
/var/log/Bigdata/kafka	Kafka log.
/var/log/Bigdata/storm	Storm log.
/var/log/Bigdata/patch	Patch log.

## Run logs

[Table 11-19](#) describes the running information recorded in run logs.

**Table 11-19** Running information

Run Log	Description
Installation preparation log	Records information about preparations for the installation, such as the detection, configuration, and feedback operation information.
Process startup log	Records information about the commands executed during the process startup.
Process startup exception log	Records information about exceptions during process startup, such as dependent service errors and insufficient resources.

Run Log	Description
Process run log	Records information about the process running track information and debugging information, such as function entries and exits as well as cross-module interface messages.
Process running exception log	Records errors that cause process running errors, for example, the empty input objects or encoding or decoding failure.
Process running environment log	Records information about the process running environment, such as resource status and environment variables.
Script logs	Records information about the script execution process.
Resource reclamation log	Records information about the resource reclaiming process.
Uninstallation clearing logs	Records information about operations performed during service uninstallation, such as directory deletion and execution time

## Audit logs

Audit information recorded in audit logs includes FusionInsight Manager audit information and component audit information.

**Table 11-20** Audit information of FusionInsight Manager

Audit Log	Operation Type	Operation
Manager audit log	User management	Creating a user Modifying a user Deleting a user Creating a user group Modifying a user group Deleting a user group Adding a role Modifying a role Deleting a role Changing a password policy Changing a password Resetting a password User login User logout Unlocking the screen Downloading the authentication credential Unauthorized operation Unlocking a user account Locking a user account Locking the screen Exporting user information Exporting a user group Exporting a role

Audit Log	Operation Type	Operation
	Tenant management	Saving the static configuration Adding a tenant Deleting a tenant Associating a service with a tenant Deleting a service from a tenant Configuring resources Creating resources Deleting resources Adding a resource pool Modifying a resource pool Deleting a resource pool Restoring tenant data

Audit Log	Operation Type	Operation
	Cluster management	Starting a cluster Stopping a cluster Saving configurations Synchronizing cluster configurations Customizing cluster monitoring indicators Saving monitoring thresholds Downloading a client configuration file Configuring the northbound API Configuring the northbound SNMP API Creating a threshold template Deleting a threshold template Applying a threshold template Saving cluster monitoring configuration data Exporting configuration data Importing cluster configuration data Exporting an installation template Modifying a threshold template Canceling the application of a threshold template Masking alarms Sending an alarm Changing the OMS database password Changing the component database password Starting the health check of a cluster

Audit Log	Operation Type	Operation
		Updating the health check configuration Exporting cluster health check results Importing a certificate file Deleting historical health check reports Exporting historical health check reports Customizing report monitoring indicators Exporting report monitoring data Customizing monitoring indicators for static resource pools Exporting monitoring data of a static resource pool
	Service management	Starting a service Stopping a service Synchronizing service configurations Refreshing a service queue Customizing service monitoring indicators Restarting a service Exporting service monitoring data Importing service configuration data Starting the health check of a service Exporting service health check results Configuring the service Uploading a configuration file Downloading a configuration file

Audit Log	Operation Type	Operation
	Instance management	Synchronizing instance configurations Commissioning an instance Decommissioning an instance Starting an instance Stopping an instance Customizing instance monitoring indicators Restarting an instance Exporting instance monitoring data Importing instance configuration data
	Host management	Setting a node rack Starting all roles Stopping all roles Isolating a host Canceling host isolation Customizing host monitoring indicators Exporting host monitoring data Starting the health check of a host Exporting the health check result of a host

Audit Log	Operation Type	Operation
	Maintenance management	Exporting alarms Clearing alarms Exporting events Clearing alarms in batches Clearing alarm through SNMP Adding a trap target through SNMP Deleting a trap target through SNMP Checking alarms through SNMP Synchronizing alarms through SNMP Modifying audit dump configurations Exporting audit logs Collecting log files Downloading log files Uploading a file Deleting an uploaded file Creating a backup task Executing a backup task Stopping a backup task Deleting a backup task Modifying a backup task Locking a backup task Unlocking a backup task Creating a restoration task Executing a backup restoration task Stopping a restoration task Retrying a restoration task Deleting a restoration task

**Table 11-21** Component audit information

Audit Log	Operation Type	Operation
DBService audit log	Maintenance management	Performing backup restoration operations
HBase audit log	Data definition language (DDL) statement	Creating a table Deleting a table Modifying a table Adding a column family Modifying a column family Deleting a column family Enabling a table Disabling a table Modify the user information Changing a password User login
	Data manipulation language (DML) statement	Putting data (to the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables) Deleting data (from the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables) Checking and putting data (to the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables) Checking and deleting data (from the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables)
	Permission control	Assigning permissions to a user Canceling permission assigning

Audit Log	Operation Type	Operation
Hive audit logs	Metadata operation	Defining metadata, such as creating databases and tables Deleting metadata, such as deleting databases and tables Modifying metadata, such as adding columns and renaming tables Importing and exporting metadata
	Data maintenance	Loading data to a table Inserting data into a table
	Permissions management	Creating or deleting roles Granting/Reclaiming roles Granting/Reclaiming permissions
HDFS audit log	Permissions management	Managing permissions on files or folders Managing permissions on owner information files or folders
	File operation	Creating a folder Creating a file Opening a file Appending file content Changing a file name Deleting a file or folder Setting time property of a file Setting the number of file copies Merging files Checking the file system File links

Audit Log	Operation Type	Operation
MapReduce audit log	Application running	Starting a Container request Stopping a Container request After Container request is completed, the status of the request is displayed as succeeded. After Container request is completed, the status of the request is displayed as failed. After Container request is completed, the status of the request is displayed as suspended. Submitting a task Ending a task
LdapServer audit log	Maintenance management	Adding an operating system user Adding a user group Adding a user to user group Deleting a user Deleting a group
KrbServer audit log	Maintenance management	Changing the password of a Kerberos account Adding a Kerberos account Deleting a Kerberos account Authenticating a user
Loader audit log	Security management	User login
	Metadata management	Querying connector information Querying a framework Querying step information

Audit Log	Operation Type	Operation
	Managing data source connections	Querying a data source connection Adding a data source connection Updating a data source connection Deleting a data source connection Activating a data source connection Disabling a data source connection
	Job management	Querying a job Creating a Job Updating a Job Deleting a job Activating a job Disabling a job Querying all execution records of a job Querying the latest execution record of a job Submitting a job Stopping a job
Hue audit log	Service startup	Starting Hue
	User operation	User login User logout
	Task operation	Creating a job Modifying a job Deleting a job Submitting a task Saving a task Updating the status of a task
ZooKeeper audit log	Permissions management	Setting the access permission to Znode
	Znode operation	Creating a Znode Deleting a Znode Configuring Znode data

Audit Log	Operation Type	Operation
Storm audit log	Nimbus	Submitting a topology Stopping a topology Reallocating a topology Deactivating a topology Activating a topology
	UI	Stopping a topology Reallocating a topology Deactivating a topology Activating a topology

MRS audit logs are stored in the database. You can view and export audit logs on the **Audit** page.

The following table lists the directories to store component audit logs. Audit log files of some components are stored in **/var/log/Bigdata/audit**, such as HDFS, HBase, MapReduce, Hive, Hue, Yarn, Storm, and ZooKeeper. The component audit logs are automatically compressed and backed up to **/var/log/Bigdata/audit/bk** at 03: 00 every day. A maximum of latest 90 compressed backup files are retained, and the backup time cannot be changed.

Audit log files of other components are stored in the component log directory.

**Table 11-22** Directory for storing component audit logs

Component	Audit Log Directory
DBService	/var/log/Bigdata/audit/dbservice/dbservice_audit.log
HDFS	/var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log /var/log/Bigdata/audit/hdfs/dn/hdfs-audit-datanode.log /var/log/Bigdata/audit/hdfs/jn/hdfs-audit-journalnode.log /var/log/Bigdata/audit/hdfs/zkfc/hdfs-audit-zkfc.log /var/log/Bigdata/audit/hdfs/httpfs/hdfs-audit-httpfs.log /var/log/Bigdata/audit/hdfs/router/hdfs-audit-router.log
Mapreduce	/var/log/Bigdata/audit/mapreduce/jobhistory/mapred-audit-jobhistory.log

Component	Audit Log Directory
Hive	<code>/var/log/Bigdata/audit/hive/hiveserver/hive-audit.log</code> <code>/var/log/Bigdata/audit/hive/metastore/metastore-audit.log</code> <code>/var/log/Bigdata/audit/hive/webhcat/webhcat-audit.log</code>
Loader	<code>/var/log/Bigdata/loader/audit/default.audit</code>
Hue	<code>/var/log/Bigdata/audit/hue/hue-audits.log</code>
ZooKeeper	<code>/var/log/Bigdata/audit/zookeeper/quorumpeer/zk-audit-quorumpeer.log</code>
Spark	<code>/var/log/Bigdata/audit/spark/jdbcserver/jdbcserver-audit.log</code> <code>/var/log/Bigdata/audit/spark/jobhistory/jobhistory-audit.log</code>
Yarn	<code>/var/log/Bigdata/audit/yarn/rm/yarn-audit-resource-manager.log</code> <code>/var/log/Bigdata/audit/yarn/nm/yarn-audit-nodemanager.log</code>
Storm	<code>/var/log/Bigdata/audit/storm/nimbus/audit.log</code> <code>/var/log/Bigdata/audit/storm/ui/audit.log</code>

## 11.7.2 Manager Log List

### Log Description

**Log path:** The default storage path of Manager log files is `/var/log/Bigdata/Manager component`.

- ControllerService: `/var/log/Bigdata/controller/` (operation & maintenance system (OMS) installation and run logs)
- Httpd: `/var/log/Bigdata/httpd` (httpd installation and run logs)
- logman: `/var/log/Bigdata/logman` (log packaging tool logs)
- NodeAgent: `/var/log/Bigdata/nodeagent` (NodeAgent installation and run logs)
- okerberos: `/var/log/Bigdata/okerberos` (okerberos installation and run logs)
- oldapserver: `/var/log/Bigdata/oldapserver` (oldapserver installation and run logs)
- MetricAgent: `/var/log/Bigdata/metric_agent` (MetricAgent run log)
- omm: `/var/log/Bigdata/omm` (omm installation and run logs)
- timestamp: `/var/log/Bigdata/timestamp` (NodeAgent startup time logs)
- tomcat: `/var/log/Bigdata/tomcat` (Web process logs)

- Patch: **/var/log/Bigdata/patch** (patch installation log)
- Sudo: **/var/log/Bigdata/sudo** (sudo script execution log)
- OS: **/var/log/message file** (OS system log)
- OS Performance: **/var/log/osperf** (OS performance statistics log)
- OS Statistics: **/var/log/osinfo/statistics** (OS parameter configuration log)

**Log archiving rule:**

The automatic compression and archiving function is enabled for Manager logs. By default, when the size of a log file exceeds 10 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: *<Original log name>-<yyyy-mm-dd\_hh-mm-ss>.[ID].log.zip* A maximum of 20 latest compressed files are reserved.

**Table 11-23** Manager logs

Type	Log File Name	Description
Controller run log	controller.log	Log that records component installation, upgrade, patch installation, configuration, monitoring, alarms, and routine O&M operations
	controller_client.log	Run log of the Representational State Transfer (REST) API
	acs.log	ACS run log file
	acs_spnego.log	spnego user log in ACS
	aos.log	AOS run log
	plugin.log	AOS plug-in log
	backupplugin.log	Log that records the backup and restoration operations
	controller_config.log	Configuration run log
	controller_nodesetup.log	Controller loading task log
	controller_root.log	System log of the Controller process
controller_trace.log	Log that records the remote procedure call (RPC) communication between Controller and NodeAgent	

Type	Log File Name	Description
	controller_monitor.log	Monitoring log
	controller_fsm.log	State machine log
	controller_alarm.log	Controller alarm log
	controller_backup.log	Controller backup and recovery log
	install.log, distributeAdapterFiles.log, install_os_optimization.log	OMS installation log
	oms_ctl.log	OMS startup and stop log
	installntp.log	NTP installation log
	modify_manager_param.log	Manager parameter modification log
	backup.log	OMS backup script run log
	supressionAlarm.log	Alarm script run log
	om.log	OM certificate generation log
	backupplugin_ctl.log	Startup log of the backup and restoration plug-in process
	getLogs.log	Run log of the collection log script
	backupAuditLogs.log	Run log of the audit log backup script
	certStatus.log	Log that records regular certificate checks
	distribute.log	Certificate distribution log
	ficertgenenerate.log	Certificate replacement logs, including logs of level-2 certificates, CAS certificates, and httpd certificates
	genPwFile.log	Log that records the generation of certificate password files

Type	Log File Name	Description
	modifyproxyconf.log	Log that records the modification of the HTTPD proxy configuration
	importTar.log	Log that records the process of importing certificates into the trust library
Httpd	install.log	Httpd installation log
	access_log, error_log	Httpd run log
logman	logman.log	Log packaging tool log
NodeAgent	install.log, install_os_optimization.log	NodeAgent installation log
	installntp.log	NTP installation log
	start_ntp.log	NTP startup log
	ntpChecker.log	NTP check log
	ntpMonitor.log	NTP monitoring log
	heartbeat_trace.log	Log that records heartbeats between NodeAgent and Controller
	alarm.log	Alarm log
	monitor.log	Monitoring log
	nodeagent_ctl.log, start-agent.log	NodeAgent startup log
	agent.log	NodeAgent run log
	cert.log	Certificate log
	agentplugin.log	Agent plug-in running status monitoring log
	omapplugin.log	OMA plug-in run log
	diskhealth.log	Disk health check log
	supressionAlarm.log	Alarm script run log
updateHostFile.log	Host list update log	
collectLog.log	Run log of the node log collection script	

Type	Log File Name	Description
	host_metric_collect.log	Host index collection run log
	checkfileconfig.log	Run log file of file permission check
	entropycheck.log	Entropy check run log
	timer.log	Log of periodic node scheduling
	pluginmonitor.log	Component monitoring plug-in log
	agent_alarm_py.log	Log that records alarms upon insufficient NodeAgent file permission
okerberos	addRealm.log, modifyKerberosRealm.log	Domain handover log
	checkservice_detail.log	Okerberos health check log
	genKeytab.log	keytab generation log
	KerberosAdmin_genConfig Detail.log	Run log that records the generation of kadmin.conf when starting the kadmin process
	KerberosServer_genConfig Detail.log	Run log that records the generation of krb5kdc.conf when starting the krb5kdc process
	oms-kadmind.log	Run log of the kadmin process
	oms_kerberos_install.log, postinstall_detail.log	Okerberos installation log
	oms-krb5kdc.log	Run log of the krbkdc process
	start_detail.log	Okerberos startup log
	realmDataConfigPro- cess.log	Log rollback for domain handover failure
stop_detail.log	Okerberos stop log	
oldapserver	ldapserver_backup.log	Oldapserver backup log

Type	Log File Name	Description
	ldapservice_chk_service.log	Oldapservice health check log
	ldapservice_install.log	Oldapservice installation log
	ldapservice_start.log	Oldapservice startup log
	ldapservice_status.log	Log that records the status of the Oldapservice process
	ldapservice_stop.log	Oldapservice stop log
	ldapservice_wrap.log	Oldapservice service management log
	ldapservice_uninstall.log	Oldapservice uninstallation log
	restart_service.log	Oldapservice restart log
	ldapservice_unlockUser.log	Log that records information about unlocking LDAP users and managing accounts
omm	omsconfig.log	OMS configuration log
	check_oms_heartbeat.log	OMS heartbeat log
	monitor.log	OMS monitoring log
	ha_monitor.log	HA_Monitor operation log
	ha.log	HA operation log
	fms.log	Alarm log
	fms_ha.log	HA alarm monitoring log
	fms_script.log	Alarm control log
	config.log	Alarm configuration log
	iam.log	IAM log
	iam_script.log	IAM control log
	iam_ha.log	IAM HA monitoring log
	config.log	IAM configuration log
	operatelog.log	IAM operation log

Type	Log File Name	Description
	heartbeatcheck_ha.log	OMS heartbeat HA monitoring log
	install_oms.log	OMS installation log
	pms_ha.log	HA monitoring log
	pms_script.log	Monitoring control log
	config.log	Monitoring configuration log
	plugin.log	Monitoring plug-in run log
	pms.log	Monitoring log
	ha.log	HA run log
	cep_ha.log	CEP HA monitoring log
	cep_script.log	CEP control log
	cep.log	CEP log
	config.log	CEP configuration log
	omm_gaussdba.log	GaussDB HA monitoring log
	gaussdb-<SERIAL>.log	GaussDB run log
	gs_ctl-<DATE>.log	GaussDB control log archive log
	gs_ctl-current.log	GaussDB control log
	gs_guc-current.log	GaussDB operation log
	encrypt.log	Omm encryption log
	omm_agent_ctl.log	OMA control log
	oma_monitor.log	OMA monitoring log
	install_oma.log	OMA installation log
	config_oma.log	OMA configuration log
	omm_agent.log	OMA run log
	acs.log	ACS resource log
	aos.log	AOS resource log
	controller.log	Controller resource log

Type	Log File Name	Description
	feed_watchdog.log	feed_watchdog resource log
	floatip.log	Floating IP address resource log
	ha_ntp.log	NTP resource log
	httpd.log	Httpd resource log
	okerberos.log	Okerberos resource log
	oldap.log	OLdap resource log
	tomcat.log	Tomcat resource log
	send_alarm.log	Run log of the HA alarm sending script of the management node
timestamp	restart_stamp	NodeAgent start time log
tomcat	cas.log, localhost_access_cas_log.log	CAS run log
	catalina.log, catalina.out, host-manager.log, localhost.log, manager.log	Tomcat run log
	localhost_access_web_log.log	Log that records the access to REST APIs of FusionInsight Manager
	web.log	Run log of the web process
	northbound_ftp_sftp.log, snmp.log	Northbound log
watchdog	watchdog.log, feed_watchdog.log	watchdog run log
patch	oms_installPatch.log	OMS patch installation log
	agent_installPatch.log	Agent patch installation log
	agent_uninstallPatch.log	Agent patch uninstallation log
	NODE_AGENT_restoreFile.log	Agent patch restoration log

Type	Log File Name	Description
	NODE_AGENT_updateFile.log	Agent patch update log
	OMA_restoreFile.log	OMA patch restoration file log
	OMA_updateFile.log	OMA patch update file log
	CONTROLLER_restoreFile.log	CONTROLLER patch restoration file log
	CONTROLLER_updateFile.log	CONTROLLER patch update file log
	OMS_restoreFile.log	OMS patch restoration file log
	oms_uninstallPatch.log	OMS patch uninstallation log
	OMS_updateFile.log	OMS patch update file log
	createStackConf.log, decompress.log, decompress_OMS.log, distrExtractPatchOnOMS.log, slimReduction.log, switch_adapter.log	Patch installation log
sudo	sudo.log	Sudo script execution log

## Log Levels

**Table 11-24** describes the log levels provided by Manager. The priorities of log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the specified level are printed. The number of printed logs decreases as the specified log level increases.

**Table 11-24** Log levels

Level	Description
FATAL	Logs of this level record fatal error information about the current event processing that may result in a system crash.
ERROR	Logs of this level record error information about the current event processing, which indicates that system running is abnormal.

Level	Description
WARN	Abnormal information about the current event processing. These abnormalities will not result in system faults.
INFO	Normal running status information about the system and events.
DEBUG	Logs of this level record the system information and system debugging information.

## Log Formats

The following table lists the Manager log formats.

**Table 11-25** Log formats

Type	Component	Format	Example
Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	<yyyy-MM-dd HH:mm:ss,SSS> <Log level> <Name of the thread that generates the log> <Message in the log> <Location where the log event occurs>	2015-06-30 00:37:09,067 INFO [pool-1-thread-1] Completed Discovering Node. com.xxx.hadoop.o m.controller.tasks. nodesetup.DiscoverNodeTask.execute(DiscoverNodeTask.java:299)

## 11.7.3 Viewing and Exporting Audit Logs

### Scenario

This section describes how to view and export audit logs on MRS Manager. The audit logs can be used to trace security events, locate fault causes, and determine responsibilities.

The system record the following log information:

- User activity information, such as user login and logout, system user information modification, and system user group information modification
- User operation instruction information, such as cluster startup, stop, and software upgrade.

### Procedure

- Viewing audit logs

- a. On MRS Manager, click **Audit** to view the default audit logs.  
If the audit content of an audit log contains more than 256 characters, click the expand button of the audit log to expand the audit details. Click **Log File** to download the complete file and view the information.
  - By default, records are sorted in descending order by the **Occurred** column. You can click **Operation Type**, **Severity**, **Occurred**, **User**, **Host**, **Service**, **Instance**, or **Operation Result** to change the sorting mode.
  - All alarms of the same severity can be filtered by **Severity**. The results include cleared and uncleared alarms.Exported audit logs contain the following information:
  - **Sno**: indicates the number of audit logs generated by MRS Manager. The number is incremented by 1 when a new audit log is generated.
  - **Operation Type**: indicates the operation type of a user operation. There are nine scenarios: **Alarm**, **Auditlog**, **Backup And Restoration**, **Cluster**, **Collect Log**, **Host**, **Service**, **Tenant** and **User\_Manager**. **User\_Manager** is supported only in clusters with Kerberos authentication enabled. Each scenario contains different operation types. For example, **Alarm** includes **Export alarms**; **Cluster** includes **Start cluster**, and **Tenant** include **Add tenant**.
  - **Severity**: indicates the security level of each audit log, including **Critical**, **Major**, **Minor** and **Informational**.
  - **Start Time**: indicates the time when the operation starts. The time is .
  - **End Time**: indicates the time when the operation ends. The time is .
  - **User IP Address**: indicates the IP address used by a user to perform operations.
  - **User**: indicates the name of the user who performs the operation.
  - **Host**: indicates the node where the user operation is performed. The information is not saved if the operation does not involve a node.
  - **Service**: indicates the service in the cluster where the user operation is performed. The information is not saved if the operation does not involve a service.
  - **Instance**: indicates the role instance in the cluster where the user operation is performed. The information is not saved if the operation does not involve a role instance.
  - **Operation Result**: indicates the operation result, including **Successful**, **Failed** and **Unknown**.
  - **Content**: indicates execution information of the user operation.
- b. Click **Advanced Search**. In the search area, set search criteria and click **Search** to view audit logs of the specified type. Click **Reset** to clear the search criteria.

 NOTE

**Start Time** and **End Time** specify the start time and end time of the time range. You can search for alarms generated within the time range.

- Exporting audit logs
  - a. In the audit log list, click **Export All** to export all logs.
  - b. In the audit log list, select the check box of a log and click **Export** to export the log.

## 11.7.4 Exporting Service Logs

### Scenario

This section describes how to export logs generated by each service role from MRS Manager.

### Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

### Procedure

**Step 1** On MRS Manager, click **System**.

**Step 2** Click **Export Log** under **Maintenance**.

**Step 3** Set a service for **Service**. Set **Host** to the IP address of the host where the service is deployed. Select the corresponding time for **Start Time** and **End Time**.

**Step 4** In **Export To**, select a path for saving logs. This parameter is available only for clusters with Kerberos authentication enabled.

- **Local PC**: indicates that logs are saved to the local environment. Then go to [Step 8](#).
- **OBS**: indicates that logs are saved to OBS. This is the default option. Then go to [Step 5](#).

**Step 5** Set **OBS Path** to the path for storing service logs on OBS.

The value must be a complete path and cannot start with a slash (/). The path can be nonexistent and will be automatically created by the system. The full path of OBS can contain a maximum of 900 bytes.

**Step 6** In **Bucket**, enter the name of the created OBS file system.

**Step 7** Set **AK** and **SK** to the access key ID and secret access key of the user.

**Step 8** Click **OK**.

----End

## 11.7.5 Configuring Audit Log Exporting Parameters

### Scenario

If MRS audit logs are stored in the system for a long time, the disk space of the data directory may be insufficient. Therefore, you can set export parameters to automatically export audit logs to a specified directory on the OBS server timely, facilitating audit log management.

#### NOTE

Audit logs exported to the OBS server include service audit logs and management audit logs.

- Service audit logs are automatically compressed and stored in the `/var/log/Bigdata/audit/bk/` directory on the active management node at 03:00 every day. The file name format is `<yyy-MM-dd_HH-mm-ss>.tar.gz`. By default, a maximum of seven log files can be stored. If more than seven log files are stored, the system automatically deletes the log files generated seven days ago.
- The data range of management audit logs exported to OBS each time is from the last date when the logs are successfully exported to OBS to the date when the task is executed. When the number of management audit logs reaches 100,000, the system automatically dumps the first 90,000 audit logs to a local file and retains 10,000 audit logs in the database. The dumped log files are saved in the `/${BIGDATA_DATA_HOME}/dbdata_om/dumpData/iam/operatelog` directory on the active management node. The file name format is `OperateLog_store_YY_MM_DD_HH_MM_SS.csv`. A maximum of 50 historical audit log files can be saved.

### Prerequisites

- You have obtained the access key ID (AK) and secret access key (SK) of the account.
- A parallel file system has been created in OBS.

### Procedure

**Step 1** On MRS Manager, click **System**.

**Step 2** Choose **Export Audit Log** under **Maintenance**.

**Table 11-26** Parameters for exporting audit logs

Parameter	Value	Description
Start Time	7/24/2017 09:00:00 (example value)	(Mandatory) Specifies the start time for exporting audit logs.
Period (days)	1 day (example value)	(Mandatory) Specifies the interval for exporting audit logs. The interval ranges from 1 to 5 days.
Bucket	mrs-bucket (example value)	(Mandatory) Specifies the name of the OBS file system to which audit logs are exported.

Parameter	Value	Description
OBS path	<code>/opt/omm/oms/ auditLog</code> (example value)	(Mandatory) Specifies the OBS path to which audit logs are exported.
AK	<code>XXX</code> (example value)	(Mandatory) Specifies the user's access key ID.
SK	<code>XXX</code> (example value)	(Mandatory) Specifies the user's secret access key.

 **NOTE**

Audit logs are stored in `service_auditlog` and `manager_auditlog` on OBS, which are used to store service audit logs and management audit logs, respectively.

----End

## 11.8 Health Check Management

### 11.8.1 Performing a Health Check

#### Scenario

To ensure that cluster parameters, configurations, and monitoring are correct and that the cluster can run stably for a long time, you can perform a health check during routine maintenance.

 **NOTE**

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

#### Procedure

- Manually perform the health check for all services.
  - a. Click **Services**.
  - b. Choose **More > Start Cluster Health Check** to start the health check for the cluster.

 NOTE

- The cluster health check includes Manager, service, and host status checks.
- To perform cluster health checks, you can also choose **System > Check Health Check > Start Cluster Health Check** on MRS Manager.
- To export the health check result, click **Export Report** in the upper left corner.
- Manually perform the health check for a service.
  - a. Click **Services**. In the services list, click the desired service name.
  - b. Choose **More > Start Service Health Check** to start the health check for the service.
- Manually perform the health check for a host.
  - a. Click **Hosts**.
  - b. Select the check box of the host for which you want to check the health status.
  - c. Choose **More > Start Host Health Check** to start the health check for the host.
- Automatically performing a health check
  - a. Click **System**.
  - b. Click **Check Health Status** under **Maintenance**.
  - c. Click **Configure Health Check** to configure automatic health check items.

**Periodic Health Check:** specifies whether to enable automatic health check. The **Periodic Health Check** function is disabled by default. You can click to enable the function and select **Daily**, **Weekly**, or **Monthly** based on management requirements.
  - d. Click **OK** to save the settings. The **Health check configuration saved successfully** is displayed in the upper right corner.

## 11.8.2 Viewing and Exporting a Health Check Report

### Scenario

You can view the health check result in MRS Manager and export the health check results for further analysis.

 NOTE

A system health check includes MRS Manager, service-level, and host-level health checks:

- MRS Manager health checks focus on whether the unified management platform can provide management functions.
- Service-level health checks focus on whether components can provide services properly.
- Host-level health checks focus on whether host indicators are normal.

The system health check includes three types of check items: health status, related alarms, and customized monitoring indicators for each check object. The health check results are not always the same as the **Health Status** on the portal.

### Prerequisites

You have performed a health check.

## Procedure

- Step 1** Click **Services**.
- Step 2** Choose **More > View Cluster Health Check Report** to view the health check report of a cluster.
- Step 3** Click **Export Report** on the health check report pane to export the report and view detailed information about check items.

### NOTE

For details about how to rectify the faults of the check items, see [DBService Health Check Indicators](#) to [ZooKeeper Health Check Indicators](#).

----End

## 11.8.3 Configuring the Number of Health Check Reports to Be Reserved

### Scenario

Health check reports of MRS clusters, services, and hosts may vary with the time and scenario. You can modify the number of health check reports to be reserved on MRS Manager for later comparison.

This setting is valid for health check reports of clusters, services, and hosts. Report files are saved in `$BIGDATA_DATA_HOME/Manager/healthcheck` on the active management node by default and are automatically synchronized to the standby management node.

### Prerequisites

Users have specified service requirements and planned the save time and health check frequency, and the disk space of the active and standby management nodes is sufficient.

## Procedure

- Step 1** Choose **System > Check Health Status > Configure Health Check**.
- Step 2** Set **Max. Number of Health Check Reports** to the number of health check reports to be reserved. The value ranges from 1 to 100. The default value is 50.
- Step 3** Click **OK** to save the settings. The **Health check configuration saved successfully** is displayed in the upper right corner.

----End

## 11.8.4 Managing Health Check Reports

### Scenario

On MRS Manager, users can manage historical health check reports, for example, viewing, downloading, and deleting historical health check reports.

## Procedure

- Download a specified health check report.
  - a. Choose **System > Check Health Status**.
  - b. Locate the row that contains the target health check report and click **Download** to download the report file.
- Download specified health check reports in batches.
  - a. Choose **System > Check Health Status**.
  - b. Select multiple health check reports and click **Download File** to download them.
- Delete a specified health check report.
  - a. Choose **System > Check Health Status**.
  - b. Locate the row that contains the target health check report and click **Delete** to delete the report file.
- Delete specified health check reports in batches.
  - a. Choose **System > Check Health Status**.
  - b. Select multiple health check reports and click **Delete File** to delete them.

## 11.8.5 DBService Health Check Indicators

### Service Health Check

**Indicator:** Service Status

**Description:** This indicator is used to check whether the DBService service status is normal. If the status is abnormal, the service is unhealthy.

**Handling method:** If the indicator is abnormal, rectify the fault by referring to ALM-27001.

### Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.6 Flume Health Check Indicators

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the Flume service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to ALM-24000.

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.7 HBase Health Check Indicators

### Normal RegionServer Count

**Indicator:** Normal RegionServer Count

**Description:** This indicator is used to check the number of RegionServers that are running properly in an HBase cluster.

**Recovery Guide:** If the indicator is abnormal, check whether the status of RegionServer is normal. If the status is abnormal, resolve the problem and check that the network is normal.

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the HBase service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the status of HMaster and RegionServer is normal. If the status is abnormal, resolve the problem. Then, check whether the status of the ZooKeeper service is faulty. On the HBase client, check whether the data in the HBase table can be correctly read and locate the data reading failure cause. Handle the alarm following instructions in the alarm processing document.

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.8 Host Health Check Indicators

### Swap Usage

**Indicator:** Swap Usage

**Description:** Swap usage of the system. The value is calculated using the following formula: Swap usage = Used swap size/Total swap size. Assume that the

current threshold is set to 75.0%. If the usage of the file handles in the system exceeds the threshold, the system is unhealthy.

**Recovery Guide:**

1. Check the swap usage of the node.  
Log in to the unhealthy node and run the **free -m** command to check the total swap space and used swap space. If the swap space usage exceeds the threshold, go to [2](#).
2. If the swap usage exceeds the threshold, you are advised to expand the system capacity, for example, add nodes.

## Host File Handle Usage

**Indicator:** Host File Handle Usage

**Description:** This indicator indicates the file handle usage in the system. Host file handle usage = Number of used handles/Total number of handles. If the usage exceeds the threshold, the system is unhealthy.

**Recovery Guide:**

1. Check the file handle usage of the host.  
Log in to the unhealthy node and run the **cat /proc/sys/fs/file-nr** command. In the command output, the first and third columns indicate the number of used handles and the total number of handles, respectively. If the usage exceeds the threshold, go to [2](#).
2. If the file handle usage of the host exceeds the threshold, you are advised to check the system and analyze the file handle usage.

## NTP Offset

**Indicator:** NTP Offset

**Description:** This indicator indicates the NTP time offset. If the time deviation exceeds the threshold, the system is unhealthy.

**Recovery Guide:**

1. Check the NTP time offset.  
Log in to the unhealthy node and run the **/usr/sbin/ntpq -np** command to view the information. In the command output, the **Offset** column indicates the time offset. If the time offset is greater than the threshold, go to [2](#).
2. If the indicator is abnormal, check whether the clock source configuration is correct. Contact O&M personnel.

## Average Load

**Indicator:** Average Load

**Description:** Average system load, indicating the average number of processes in the running queue in a specified period. The system average load is calculated using the load value obtained by the uptime command. Calculation method: (Load of 1 minute + Load of 5 minutes + Load of 15 minutes)/(3 x Number of CPUs).

Assume that the current threshold is set to 2. If the average load exceeds 2, the system is unhealthy.

**Recovery Guide:**

1. Log in to the unhealthy node and run the **uptime** command. The last three columns in the command output indicate the load in 1 minute, 5 minutes, and 15 minutes, respectively. If the average system load exceeds the threshold, go to [2](#).
2. If the system average load exceeds the threshold, you are advised to perform system capacity expansion, such as adding nodes.

## D State Process

**Indicator:** D State Process

**Description:** This indicator indicates the unstopable sleep process, that is, the process in the D state. A process that is in the D state is waiting for I/O, such as disk I/O and network I/O, and experiences an I/O exception. If any process in the D state exists in the system, the system is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12028.

## Hardware Status

**Indicator:** Hardware Status

**Description:** This indicator is used to check the system hardware status, including the CPU, memory, disk, power supply, and fan. This indicator obtains related hardware information using **ipmitool sdr elist**. If the hardware status is abnormal, the hardware is unhealthy.

**Recovery Guide:**

1. Log in to the node where the check result is unhealthy. Run the **ipmitool sdr elist** command to check system hardware status. The last column in the command output indicates the hardware status. If the status is included in the following fault description table, the check result is unhealthy.

Module	Symptom
Processor	IERR Thermal Trip FRB1/BIST failure FRB2/Hang in POST failure FRB3/Processor startup/init failure Configuration Error SM BIOS Uncorrectable CPU-complex Error Disabled Throttled Uncorrectable machine check exception
Power Supply	Failure detected Predictive failure Power Supply AC lost AC lost or out-of-range AC out-of-range, but present Config Error: Vendor Mismatch Config Error: Revision Mismatch Config Error: Processor Missing Config Error: Power Supply Rating Mismatch Config Error: Voltage Rating Mismatch Config Error
Power Unit	240VA power down Interlock power down AC lost Soft-power control failure Failure detected Predictive failure
Memory	Uncorrectable ECC Parity Memory Scrub Failed Memory Device Disabled Correctable ECC logging limit reached Configuration Error Throttled Critical Overtemperature

Module	Symptom
Drive Slot	Drive Fault Predictive Failure Parity Check In Progress In Critical Array In Failed Array Rebuild In Progress Rebuild Aborted
Battery	Low Failed

2. If the indicator is abnormal, contact O&M personnel.

## Host Name

**Indicator:** Host Name

**Description:** This indicator is used to check whether the host name is set. If the host name is not set, the system is unhealthy. If the indicator is abnormal, you are advised to set the host name properly.

**Recovery Guide:**

1. Log in to the node where the check result is unhealthy.
2. Run the `hostname host name` command to change the host name to ensure that the host name is consistent with the planned host name.

**hostname** *host name* For example, to change the host name to **Bigdata-OM-01**, run the **hostname Bigdata-OM-01** command.

3. Modify the host name configuration file.

Run the **vi /etc/HOSTNAME** command to edit the file. Change the file content to **Bigdata-OM-01**. Save the file, and exit.

## Umask

**Indicator:** Umask

**Description:** This indicator is used to check whether the umask setting of user **omm** is correct. If Umask is not 0077, the system is unhealthy.

**Recovery Guide:**

1. If the indicator is abnormal, you are advised to set umask of user **omm** to 0077. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the **vi \${BIGDATA\_HOME}/.om\_profile** command and change the value of **umask** to **0077**. Save and exit.

## OMS HA Status

**Indicator:** OMS HA Status

**Description:** This indicator is used to check whether the OMS two-node cluster resources are normal. You can run the `${CONTROLLER_HOME}/sbin/status-oms.sh` command to view the detailed information about the status of the OMS two-node cluster resources. If any module is abnormal, the OMS is unhealthy.

**Recovery Guide:**

1. Log in to the active management node and run the `su - omm` command to switch to user `omm`. Run the `${CONTROLLER_HOME}/sbin/status-oms.sh` command to check the OMS status.
2. If `floatip`, `okerberos`, and `oldap` are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

If controller resources are abnormal, view `/var/log/Bigdata/controller/controller.log` of the faulty node.

If CEP resources are abnormal, view `/var/log/Bigdata/omm/oms/cep/cep.log` of the faulty node.

If AOS resources are abnormal, view `/var/log/Bigdata/controller/aos/aos.log` of the faulty node.

If `feed_watchdog` resources are abnormal, view `/var/log/Bigdata/watchdog/watchdog.log` of the abnormal node.

If HTTPD resources are abnormal, view `/var/log/Bigdata/httpd/error_log` of the abnormal node.

If FMS resources are abnormal, view `/var/log/Bigdata/omm/oms/fms/fms.log` of the abnormal node.

If PMS resources are abnormal, view `/var/log/Bigdata/omm/oms/pms/pms.log` of the abnormal node.

If IAM resources are abnormal, view `/var/log/Bigdata/omm/oms/iam/iam.log` of the abnormal node.

If the GaussDB resource is abnormal, check the `/var/log/Bigdata/omm/oms/db/omm_gaussdba.log` of the abnormal node.

If NTP resources are abnormal, view `/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log` of the abnormal node.

If Tomcat resources are abnormal, view `/var/log/Bigdata/tomcat/catalina.log` of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## Checking the Installation Directory and Data Directory

**Indicator:** Installation Directory and Data Directory Check

**Description:** This indicator checks the `lost+found` directory in the root directory of the disk partition where the installation directory (`/opt/Bigdata` by default) is located. If the directory contains the files of user `omm`, there are exceptions.

When a node is abnormal, related files are stored in the **lost+found** directory. This indicator is used to check whether files are lost in such scenarios. Check the installation directory (for example, **/opt/Bigdata**) and data directory (for example, **/srv/BigData**). If any files of non-omm users exist in the two directories, the system is unhealthy.

**Recovery Guide:**

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**. Check whether files or folders of user **omm** exist in the **lost+found** directory.

If the **omm** user file exists, you are advised to restore it and check again. If the **omm** user file does not exist, go to [2](#).

2. Check the installation directory and data directory. Check whether the files or folders of other users exist in the installation directory and data directory. If the files and folders are manually generated temporary files, you are advised to delete them and check again.

## CPU Usage

**Indicator:** CPU Usage

**Description:** This indicator is used to check whether the CPU usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12016.

## Memory Usage

**Indicator:** Memory Usage

**Description:** This indicator is used to check whether the memory usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12018.

## Host Disk Usage

**Indicator:** Host Disk Usage

**Description:** This indicator is used to check whether the host disk usage exceeds the threshold. If the disk usage exceeds the threshold, the system is unhealthy.

**Recovery Guide:** If the indicator is abnormal, the system generates an alarm. You are advised to handle the alarm by referring to ALM-12017.

## Host Disk Write Rate

**Indicator:** Host Disk Write Rate

**Description:** This indicator is used to check the disk write rate of a host. The write rate of the host disk may vary according to the service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

**Recovery Guide:** Determine whether the current disk write rate is normal based on the service scenario.

## Host Disk Read Rate

**Indicator:** Host Disk Read Rate

**Description:** This indicator is used to check the disk read rate of a host. The read rate of the host disk may vary by service scenario. Therefore, the value of this indicator reflects only the specified value. You need to determine whether the indicator is normal in specified service scenarios.

**Recovery Guide:** Determine whether the current disk read rate is normal based on the service scenario.

## Host Service Plane Network Status

**Indicator:** Host Service Plane Network Status

**Description:** This indicator is used to check the connectivity of the service plane network of the cluster host. If the hosts are disconnected, the cluster is unhealthy.

**Recovery Guide:** If the single-plane networking is used, check the IP address of the single plane. For a dual-plane network, the operation procedure is as follows:

1. Check the network connectivity between the service plane IP addresses of the active and standby management nodes.  
If the network is abnormal, go to **3**.  
If the network is normal, go to **2**.
2. Check the network connectivity between the IP address of the active management node and the IP address of the abnormal node in the cluster.
3. If the network is disconnected, contact O&M personnel to rectify the network fault to ensure that the network meets service requirements.

## Host Status

**Indicator:** Host Status

**Description:** This indicator is used to check whether the host status is normal. If a node is faulty, the host is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to ALM-12006.

## Alarm Check

**Indicator:** Alarm Check

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.9 HDFS Health Check Indicators

### Average Packet Sending Time

**Indicator:** Average Packet Sending Time

**Description:** This indicator is used to collect statistics on the average time for the DataNode in the HDFS to execute SendPacket each time. If the average time is greater than 2,000,000 ns, the DataNode is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high. Check whether the HDFS load in the cluster is high.

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the HDFS service status is normal. If a node is faulty, the host is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the health status of the KrbServer, LdapServer and ZooKeeper services are faulty. If yes, rectify the fault. Then, check whether the file writing failure is caused by HDFS SafeMode ON. Use the client to check whether data cannot be written into HDFS and locate the cause of the HDFS data writing failure. Handle the alarm following instructions in the alarm processing document.

### Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.10 Hive Health Check Indicators

### Maximum Number of Sessions Allowed by HiveServer

**Indicator:** Maximum Number of Sessions Allowed by HiveServer

**Description:** This indicator is used to check the maximum number of sessions that can be connected to Hive.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

### Number of Sessions Connected to HiveServer

**Indicator:** Number of Sessions Connected to HiveServer

**Description:** This indicator is used to check the number of Hive connections.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the Hive service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist on the host. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.11 Kafka Health Check Indicators

### Number of Available Broker Nodes

**Indicator:** Number of Brokers

**Description:** This indicator is used to check the number of available Broker nodes in a cluster. If the number of available Broker nodes in a cluster is less than 2, the cluster is unhealthy.

**Recovery Guide:** If the indicator is abnormal, go to the Kafka service instance page and click the host name of the unavailable Broker instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to the alarm handling suggestions in **Process Fault**. If the status is not **Good**, rectify the fault by referring to the handling procedure of the **Node Fault** alarm.

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the Kafka service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to the alarm "Kafka Service Unavailable".

### Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.12 KrbServer Health Check Indicators

### KerberosAdmin Service Availability

**Indicator:** KerberosAdmin Service Availability

**Description:** The system checks the KerberosAdmin service status. If the check result is abnormal, the KerberosAdmin service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the KerberosAdmin service is located is faulty or the SlapdServer service is unavailable. During the KerberosAdmin service recovery, try the following operations:

1. Check whether the node where the KerberosAdmin service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

### KerberosServer Service Availability

**Indicator:** KerberosServer Service Availability

**Description:** The system checks the KerberosServer service status. If the check result is abnormal, the KerberosServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the KerberosServer service is located is faulty or the SlapdServer service is unavailable. During the KerberosServer service recovery, try the following operations:

1. Check whether the node where the KerberosServer service locates is faulty.
2. Check whether the SlapdServer service is unavailable.

### Service Health Status

**Indicator:** Service Status

**Description:** The system checks the KrbServer service status. If the check result is abnormal, the KrbServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the KrbServer service resides is faulty or the LdapServer service is unavailable. For details, see the handling procedure of ALM-25500.

### Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check the alarm information about the KrbServer service. If any alarms exist, the KrbServer service may be abnormal.

**Recovery Guide:** If this indicator check result is abnormal, see the related alarm document to handle the alarms.

## 11.8.13 LdapServer Health Check Indicators

### SlapdServer Service Availability

**Indicator:** SlapdServer Service Availability

**Description:** The system checks the SlapdServer service status. If the status is abnormal, the SlapdServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the SlapdServer service is located is faulty or the SlapdServer process is faulty. During the SlapdServer service recovery, try the following operations:

1. Check whether the node where the SlapdServer service locates is faulty. For details, see ALM-12006.
2. Check whether the SlapdServer process is normal. For details, see ALM-12007.

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check the alarm information about the LdapServer service. If the status is abnormal, the LdapServer service is unavailable.

**Recovery Guide:** If the indicator check result is abnormal, the possible cause is that the node where the active LdapServer service resides is faulty or the active LdapServer process is faulty. For details, see ALM-25000.

### Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check the alarm information about the LdapServer service. If any alarms exist, the LdapServer service may be abnormal.

**Recovery Guide:** If this indicator check result is abnormal, see the related alarm document to handle the alarms.

## 11.8.14 Loader Health Check Indicators

### ZooKeeper Health Status

**Indicator:** ZooKeeper health status

**Description:** This indicator is used to check whether the ZooKeeper health status is normal. If the status is abnormal, the ZooKeeper service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

### HDFS Health Status

**Indicator:** HDFS health status

**Description:** This indicator is used to check whether the HDFS health status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## DBService Health Status

**Indicator:** DBService Health Status

**Description:** This indicator is used to check whether the DBService health status is normal. If the status is abnormal, the DBService service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Yarn Health Status

**Indicator:** Yarn health status

**Description:** This indicator is used to check whether the Yarn health status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## MapReduce Health Status

**Indicator:** MapReduce Health Status

**Description:** This indicator is used to check whether the MapReduce health status is normal. If the status is abnormal, the MapReduce service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Loader Process Status

**Indicator:** Loader Process Status

**Description:** This indicator is used to check whether the Loader process is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the Loader service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist for loader. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.15 MapReduce Health Check Indicators

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the MapReduce service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.16 OMS Health Check Indicators

### OMS Status Check

**Indicator:** OMS Status Check

**Description:** The OMS status check includes the HA status check and resource status check. The HA status includes **active**, **standby**, and **NULL**, indicating the active node, standby node, and unknown, respectively. The resource status includes normal, abnormal, and NULL. If the HA status is NULL, the HA status is unhealthy. If the resource status is NULL or abnormal, the resource status is unhealthy.

**Table 11-27** OMS status description

Name	Description
HA state	<b>active:</b> indicates the active node. <b>standby:</b> indicates the standby node. <b>NULL:</b> unknown

Name	Description
Resource status	<p><b>normal:</b> All resources are normal.</p> <p><b>abnormal:</b> indicates that abnormal resources exist.</p> <p><b>NULL:</b> unknown</p>

**Recovery Guide:**

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the `/${CONTROLLER_HOME}/sbin/status-oms.sh` command to check the status of OMS.
2. If the HA status is NULL, the system may be restarting. NULL is an intermediate state, and the HA status will automatically change to a normal state.
3. If the resource status is abnormal, certain component resources of FusionInsight Manager are abnormal. Check whether the status of components such as acs, aos cep, controller, feed\_watchdog, fms, gaussDB, httpd, iam, ntp, okerberos, oldap, pms, and tomcat component is normal.
4. If any Manager component resource is abnormal, see Manager component status check to rectify the fault.

**Manager Component Status Check**

**Indicator:** Manager Component Status Check

**Description:** This indicator is used to check the running status and HA status of Manager components. The resource running status includes **Normal** and **Abnormal**, and the resource HA status includes **Normal** and **Exception**. Manager components include Acs, Aos, Cep, Controller, feed\_watchdog, Floatip, Fms, GaussDB, HeartBeatCheck, httpd, IAM, NTP, Okerberos, OLDAP, PMS, and Tomcat. If the running status and HA status is not Normal, the check result is unhealthy.

**Table 11-28** Manager status description

Name	Description
Resource running status:	<p><b>Normal:</b> The system is running properly.</p> <p><b>Abnormal:</b> The running is abnormal.</p> <p><b>Stopped:</b> The task is stopped.</p> <p><b>Unknown:</b> The status is unknown.</p> <p><b>Starting:</b> The process is being started.</p> <p><b>Stopping:</b> The task is being stopped.</p> <p><b>Active_normal:</b> The active node is running properly.</p> <p><b>Standby_normal:</b> The standby node is running properly.</p> <p><b>Raising_active:</b> The node is being promoted to be the active node.</p> <p><b>Lowning_standby:</b> The node is being set to be the standby node.</p> <p><b>No_action:</b> the action does not exist.</p> <p><b>Repairing:</b> The disk is being repaired.</p> <p><b>NULL:</b> unknown</p>
Resource HA status	<p><b>Normal:</b> the status is normal.</p> <p><b>Exception:</b> indicates a fault.</p> <p><b>Non_steady:</b> indicates the non-steady state.</p> <p><b>Unknown:</b> unknown</p> <p><b>NULL:</b> unknown</p>

**Recovery Guide:**

1. Log in to the active management node and run the **su - omm** command to switch to user **omm**. Run the **`\${CONTROLLER\_HOME}/sbin/status-oms.sh** command to check the status of OMS.
2. If floatip, okerberos, and oldap are abnormal, handle the problems by referring to ALM-12002, ALM-12004, and ALM-12005 respectively.
3. If other resources are abnormal, you are advised to view the logs of the faulty modules.

If controller resources are abnormal, view **/var/log/Bigdata/controller/controller.log** of the faulty node.

If CEP resources are abnormal, view **/var/log/Bigdata/omm/oms/cep/cep.log** of the faulty node.

If AOS resources are abnormal, view **/var/log/Bigdata/controller/aos/aos.log** of the faulty node.

If feed\_watchdog resources are abnormal, view **/var/log/Bigdata/watchdog/watchdog.log** of the abnormal node.

If HTTPD resources are abnormal, view `/var/log/Bigdata/httpd/error_log` of the abnormal node.

If FMS resources are abnormal, view `/var/log/Bigdata/omm/oms/fms/fms.log` of the abnormal node.

If PMS resources are abnormal, view `/var/log/Bigdata/omm/oms/pms/pms.log` of the abnormal node.

If IAM resources are abnormal, view `/var/log/Bigdata/omm/oms/iam/iam.log` of the abnormal node.

If the GaussDB resource is abnormal, check the `/var/log/Bigdata/omm/oms/db/omm_gaussdba.log` of the abnormal node.

If NTP resources are abnormal, view `/var/log/Bigdata/omm/oms/ha/scriptlog/ha_ntp.log` of the abnormal node.

If Tomcat resources are abnormal, view `/var/log/Bigdata/tomcat/catalina.log` of the abnormal node.

4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## OMA Running Status

**Indicator:** OMA Running Status

**Description:** This indicator is used to check the running status of the OMA. The status can be **Running** or **Stopped**. If the OMA is **Stopped**, the OMA is unhealthy.

**Recovery Guide:**

1. Log in to the unhealthy node and run the `su - omm` command to switch to user `omm`.
2. Run `${OMA_PATH}/restart_oma_app` to manually start the OMA and check again. If the check result is still unhealthy, go to [3](#).
3. If manually starting the OMA cannot resolve the problem, you are advised to check the OMA logs in `/var/log/Bigdata/omm/oma/omm_agent.log`.
4. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## SSH Trust Between Each Node and the Active Management Node

**Indicator:** SSH Trust Between Each Node and the Active Management Node

**Description:** This indicator is used to check whether the SSH mutual trust is normal. If you can switch to another node through SSH from the active OMS node as user `omm` without the need of entering the password, SSH communication is normal. Otherwise, SSH communication is abnormal. In addition, if you can switch to another node through SSH from the active OMS node but fail to switch to the active OMS node from the other nodes, SSH communication is abnormal.

**Recovery Guide:**

1. If the indicator check result is abnormal, the SSH trust relationships between the nodes and the active management node are abnormal. In this case, check whether the permission of the `/home/omm` directory is `omm`. If non-omm users have the directory permission, the SSH trust relationship may be

abnormal. You are advised to run **chown omm:wheel** to modify the permission and check again. If the permission on the **/home/omm** directory is normal, go to [2](#).

2. The SSH trust relationship exception may cause heartbeat exceptions between Controller and NodeAgent, resulting in node fault alarms. In this case, rectify the fault by referring to the handling procedure of ALM-12006.

## Process Running Time

**Indicator:** Running Time of NodeAgent, Controller, and Tomcat

**Description:** This indicator is used to check the running time of the NodeAgent, Controller, and Tomcat processes. If the time is less than half an hour (1,800s), the process may have been restarted. You are advised to check the process after half an hour. If multiple check results indicate that the process runs for less than half an hour, the process is abnormal.

**Recovery Guide:**

1. Log in to the unhealthy node and run the **su - omm** command to switch to user **omm**.
2. Run the following command to check the PID based on the process name:  
**ps -ef | grep NodeAgent**
3. Run the following command to check the process startup time based on the PID:

**ps -p pid -o lstart**

4. Check whether the process start time is normal. If the process restarts repeatedly, go to [5](#).
5. View the related logs and analyze restart causes.

If the runtime of NodeAgent is abnormal, check **/var/log/Bigdata/nodeagent/agentlog/agent.log**.

If the Controller running time is abnormal, check the **/var/log/Bigdata/controller/controller.log** file.

If the Tomcat running time is abnormal, check the **/var/log/Bigdata/tomcat/web.log** file.

6. If the fault cannot be rectified based on the logs, contact O&M personnel and send the collected fault logs.

## Account and Password Expiration Check

**Indicator:** Account and Password Expiration Check

**Description:** This indicator checks the two operating system users **omm** and **ommdba** of MRS. For OS users, both the account and password expiration time must be checked. If the validity period of the account or password is not greater than 15 days, the account is abnormal.

**Recovery Guide:** If the validity period of the account or password is less than or equal to 15 days, contact O&M personnel.

## 11.8.17 Spark Health Check Indicators

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the Spark service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to ALM-28001.

### Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.18 Storm Health Check Indicators

### Number of Working Nodes

**Indicator:** Number of Supervisors

**Description:** This indicator is used to check the number of available Supervisors in a cluster. If the number of available Supervisors in a cluster is less than 1, the cluster is unhealthy.

**Recovery Guide:** If the indicator is abnormal, go to the Streaming service instance page and click the host name of the unavailable Supervisor instance. View the host health status in the **Overview** area. If the host health status is **Good**, rectify the fault by referring to ALM-12007 Process Faults. If the status is not **Good**, rectify the fault by referring to the handling procedure of the ALM-12006 Node Faults.

### Number of Idle Slots

**Indicator:** Number of Idle Slots

**Description:** This indicator is used to check the number of idle slots in a cluster. If the number of idle slots in a cluster is less than 1, the cluster is unhealthy.

**Recovery Guide:** If the indicator is abnormal, go to the Storm service instance page and check the health status of the Supervisor instance. If the health status of all Supervisor instances is **Good**, you need to expand the capacity of the Core node in the cluster. If not, rectify the fault by referring to ALM-12007 Process Faults.

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the Storm service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, rectify the fault by referring to the alarm "ALM-26051 Storm Service Unavailable".

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.19 Yarn Health Check Indicators

### Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether the Yarn service status is normal. If the number of NodeManager nodes cannot be obtained, the system is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can handle the alarm by referring to the alarm handling guide and make sure that the network is normal.

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

## 11.8.20 ZooKeeper Health Check Indicators

### Average ZooKeeper Request Processing Latency

**Indicator:** Average ZooKeeper Service Request Processing Latency

**Description:** This indicator is used to check the average delay for the ZooKeeper service to process requests. If the average delay is greater than 300 ms, the ZooKeeper service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the network speed of the cluster is normal and whether the memory or CPU usage is too high.

### ZooKeeper Connections Usage

**Indicator:** ZooKeeper Connections Usage

**Description:** This indicator is used to check whether the ZooKeeper memory usage exceeds 80%. If the disk usage exceeds the threshold, the system is unhealthy.

**Recovery Guide:** If the indicator is abnormal, you are advised to increase the memory available for the ZooKeeper service. The method of increasing the memory is as follows: Increase the value of **-Xmx** in the **GC\_OPTS** configuration item in the ZooKeeper service. After the modification, restart the ZooKeeper service for the configuration to take effect.

## Service Health Status

**Indicator:** Service Status

**Description:** This indicator is used to check whether ZooKeeper service status is normal. If the status is abnormal, the service is unhealthy.

**Recovery Guide:** If the indicator is abnormal, check whether the health status of the KrbServer and LdapServer services is faulty. If yes, rectify the fault. Log in to the ZooKeeper client, check whether the ZooKeeper data writing fails. If yes, find the failure cause based on the error message and handle the fault according to error message. Rectify the fault by following the procedure for handling ALM-13000.

## Alarm Check

**Indicator:** Alarm Information

**Description:** This indicator is used to check whether alarms exist. If alarms exist, the service is unhealthy.

**Recovery Guide:** If this indicator is abnormal, you can rectify the fault by referring to the alarm handling guide.

# 11.9 Static Service Pool Management

## 11.9.1 Viewing the Status of a Static Service Pool

### Scenario

MRS Manager manages and isolates service resources that are not running on YARN through the static service resource pool. It dynamically manages the total CPU, I/O, and memory resources that can be used by HDFS and YARN on the deployment node. The system supports time-based automatic adjustment of static service resource pools. This enables the cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

On MRS Manager, you can view the monitoring metrics of the resources used by each service in the static service pool. The monitoring metrics are as follows:

- Service Total CPU Usage
- Service Total Disk I/O Read Speed
- Service Total Disk I/O Write Speed

- Service Total Memory Usage

## Procedure

**Step 1** On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.

**Step 2** Click **Status**.

**Step 3** Check the system resource adjustment base values.

- **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
- **CPU(%)** indicates the maximum number of CPUs that can be used by services on a node.
- **Memory(%)** indicates the maximum memory that can be used by services on a node.

**Step 4** Check the cluster service resource usage.

In the chart area, select **All services** from the service drop-down list box. The resource usage status of all services in the service pool is displayed.

### NOTE

**Effective Configuration Group** indicates the resource control configuration group used by the cluster service. By default, the **default** configuration group is used at all time every day, indicating that the cluster service can use all CPUs and 70% memory of the node.

**Step 5** View the resource usage of a single service.

In the chart area, select a service from the service drop-down list box. The resource usage status of the service is displayed.

**Step 6** You can set the interval for automatically refreshing the page.

The following refresh interval options are supported:

- **Refresh every 30 seconds**
- **Refresh every 60 seconds**
- **Stop refreshing**

**Step 7** In the **Period** area, select a time range for viewing service resources. The options are as follows:

- Real time
- Last 3 hours
- Last 6 hours
- Last 24 hours
- Last week
- Last month
- Last 3 months

- Last 6 months
- Customize: If you select this option, you can customize the period for viewing monitoring data.

**Step 8** Click **View** to view the service resource data in the corresponding time range.

**Step 9** Customize a service resource report.

1. Click **Customize** and select the service source indicators to be displayed.
  - Service Total Disk I/O Read Speed
  - Service Total Memory Usage
  - Service Total Disk I/O Write Speed
  - Service Total CPU Usage
2. Click **OK** to save the selected monitoring metrics for display.

 **NOTE**

Click **Clear** to cancel all the selected monitoring metrics in a batch.

**Step 10** Export a monitoring report.

Click **Export**. MRS Manager will generate a report about the selected service resources in a specified time of period. Save the report.

 **NOTE**

To view the curve charts of monitoring metrics in a specified period, click **View**.

----End

## 11.9.2 Configuring a Static Service Pool

### Scenario

If you need to control the node resources that can be used by the cluster service or the CPU usage of the node used by the cluster in different time periods, you can adjust the resource base on MRS Manager and customize the resource configuration groups.

### Prerequisites

- After the static service pool is configured, the HDFS and YARN services need to be restarted. During the restart, the services are unavailable.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

### Procedure

**Step 1** Modify the system resource adjustment base.

1. On MRS Manager, click **System**. In the **Resource** area, click **Configure Static Service Pool**.
2. Click **Configuration**. The service pool configuration group management page is displayed.

3. In the **System Resource Adjustment Base** area, change the values of **CPU(%)** and **Memory(%)** .

Modifying **System Resource Adjustment Base** limits the maximum physical CPU and memory resource percentage of nodes that can be used by the Flume, HBase, HDFS, Impala and YARN services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

4. Click **Next**.

If you need to modify the parameters again, click **Previous** in the lower part of the page.

**Step 2** Modify the **default** configuration group of the service pool.

1. Click **default**. In the **Service Pool Configuration** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for the Flume, HBase, HDFS, Impala and YARN services.

 **NOTE**

- The sum of **CPU LIMIT(%)** used by all services can exceed 100%.
  - The sum of **CPU SHARE(%)** and **I/O(%)** used by all services must be 100%. For example, if CPU resources are allocated to the HDFS and Yarn services, the total CPU resources allocated to the two services are 100%.
  - The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
  - **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.
2. Click in the blank area of the page to complete the editing. MRS Manager generates the correct values of service pool parameters in the **Detailed Configuration** area based on the cluster hardware resources and allocation information.
  3. You can click  on the right of **Detailed Configuration** to modify the parameter values of the service pool based on service requirements.

In the **Service Pool Configuration** area, click the specified service name. The **Detailed Configuration** area displays only the parameters of the service. Manual changing of parameter values does not refresh the service resource usage. In added configuration groups, the configuration group numbers of the parameters that take effect dynamically will be displayed. For example, **HBase: RegionServer: dynamic-config1.RES\_CPUSET\_PERCENTAGE**. The parameter functions do not change.

**Table 11-29** Parameters of the static service pool

Parameter	Description
<ul style="list-style-type: none"> <li>- RES_CPUSET_PERCENTAGE</li> <li>- dynamic-configX.RES_CPUSET_PERCENTAGE</li> </ul>	Configures the service CPU percentage.

Parameter	Description
<ul style="list-style-type: none"> <li>- RES_CPU_SHARE</li> <li>- dynamic-configX.RES_CPU_SHARE</li> </ul>	Configures the service CPU share.
<ul style="list-style-type: none"> <li>- RES_BLKIO_WEIGHT</li> <li>- dynamic-configX.RES_BLKIO_WEIGHT</li> </ul>	Configures service I/O usage.
HBASE_HEAPSIZE	Configures the maximum JVM memory for RegionServer.
HADOOP_HEAPSIZE	Configures the maximum JVM memory of a DataNode.
yarn.nodemanager.resource.memory-mb	Configures the memory that can be used by NodeManager on the current node.
dfs.datanode.max.locked.memory	Configures the maximum memory that can be used by a DataNode as the HDFS cache.
FLUME_HEAPSIZE	Configures the maximum JVM memory that can be used by each Flume instance.
IMPALAD_MEM_LIMIT	Configures the maximum memory that can be used by an Impalad instance.

**Step 3** Add a customized resource configuration group.

1. Determine whether to automatically adjust resource configurations based on the time.  
 If yes, go to [Step 3.2](#).  
 If no, go to [Step 4](#).
2. Click  to add a resource configuration group. In the **Scheduling Time** area, click . The time policy configuration page is displayed.  
 Modify the following parameters based on service requirements and click **OK**.
  - **Repeat**: If selected, the resource configuration group runs repeatedly based on the scheduling period. If not selected, set the date and time when the configuration of the group of resources can be applied.
  - **Repeat Policy**: can be set to **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
  - **Between**: indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved. This parameter is valid only when **Repeat** is selected.

 **NOTE**

- The **default** group of resource configuration takes effect in all undefined time segments.
  - The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
  - The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
  - Select a repetition policy. If the end time is earlier than the start time, the next day is labeled by default. For example, if a validity period ranges from 22:00 to 06:00, the customized resource configuration takes effect from 22:00 on the current day to 06:00 on the next day.
  - If the repeat policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: [04:00 to 07:00] and [06:00 to 08:00]. In this case, the configuration of the group that uses the monthly policy prevails.
  - If the repeat policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04:00 to 07:00, on Monday and Wednesday, respectively.
3. On the **Service Pool Configuration** page, modify the resource configuration of each service. Click the blank area on the page to complete the editing, and go to [Step 4](#).

You can click  on the right of **Service Pool Configuration** to modify the parameters. Click  in the **Detailed Configuration** area to manually update the parameter values generated by the system based on service requirements.

**Step 4** Saves the settings.

Click **Save**. In the **Save Configuration** dialog box, select **Restart the affected services or instances**. Click **OK** to save the settings and restart related services.

**Operation succeeded** is displayed. click **Finish**. The service is started successfully.

----End

## 11.10 Tenant Management

### 11.10.1 Overview

#### Definition

An MRS cluster provides various resources and services for multiple organizations, departments, or applications to share. The cluster provides tenants as a logical entity to use these resources and services. A mode involving different tenants is called multi-tenant mode. Currently, only the analysis cluster supports tenant management.

## Principles

The MRS cluster provides the multi-tenant function. It supports a layered tenant model and allows dynamic adding or deleting of tenants to isolate resources. It dynamically manages and configures tenants' computing and storage resources.

The computing resources indicate tenants' Yarn task queue resources. The task queue quota can be modified, and the task queue usage status and statistics can be viewed.

The storage resources can be stored on HDFS. You can add and delete the HDFS storage directories of tenants, and set the quotas of file quantity and the storage space of the directories.

As the unified tenant management platform of MRS clusters, MRS Manager provides enterprises with time-tested multi-tenant management models, enabling centralized tenant and service management. Tenants can create and manage tenants in a cluster based on service requirements.

- Roles, computing resources, and storage resources are automatically created when tenants are created. By default, all permissions of the new computing resources and storage resources are allocated to a tenant's roles.
- Permissions to view the current tenant's resources, add a subtenant, and manage the subtenant's resources are granted to the tenant's roles by default.
- After you have modified the tenant's computing or storage resources, permissions of the tenant's roles are automatically updated.

MRS Manager supports a maximum of 512 tenants. The tenants that are created by default in the system contain **default**. Tenants that are in the topmost layer with the default tenant are called level-1 tenants.

## Resource Pools

Yarn task queues support only the label-based scheduling policy. This policy enables Yarn task queues to associate NodeManagers that have specific node labels. In this way, Yarn tasks run on specified nodes so that tasks are scheduled and certain hardware resources are utilized. For example, Yarn tasks requiring a large memory capacity can run on nodes with a large memory capacity by means of label association, preventing poor service performance.

In an MRS cluster, the tenant logically divides Yarn cluster nodes to combine multiple NodeManagers into a resource pool. Yarn task queues can be associated with specified resource pools by configuring queue capacity policies, ensuring efficient and independent resource utilization in the resource pools.

MRS Manager supports a maximum of 50 resource pools. The system has a **Default** resource pool.

### 11.10.2 Creating a Tenant

#### Scenario

You can create a tenant on MRS Manager to specify the resource usage.

## Prerequisites

- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the HDFS directory.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

## Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click **Create Tenant**. On the page that is displayed, configure tenant properties.

**Table 11-30** Tenant parameters

Parameter	Description
Name	Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).
Tenant Type	The options include <b>Leaf</b> and <b>Non-leaf</b> . If <b>Leaf</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If <b>Non-leaf</b> is selected, sub-tenants can be added to the current tenant.
Dynamic Resources	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the tenant name in Yarn. When dynamic resources are not <b>Yarn</b> , the system does not automatically create a task queue.
Default Resource Pool Capacity (%)	Specifies the percentage of the computing resources used by the current tenant in the <b>default</b> resource pool.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant in the <b>default</b> resource pool.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. If storage resources are not <b>HDFS</b> , the system does not create a storage directory under the root directory of HDFS.

Parameter	Description
Space Quota (MB)	<p>Specifies the quota for HDFS storage space used by the current tenant. The value ranges from <b>1</b> to <b>8796093022208</b>. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk.</p> <p><b>NOTE</b> To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of <b>Storage Space Quota</b> is set to <b>500</b>, the actual space for storing files is about 250 MB (<math>500/2 = 250</math>).</p>
Storage Path	<p>Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for tenant <b>ta1</b> is <b>tenant/ta1</b>. When a tenant is created for the first time, the system automatically creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</p>
Service	<p>Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click <b>Associate Services</b>. In the dialog box that is displayed, set <b>Service</b> to <b>HBase</b>. If <b>Association Mode</b> is set to <b>Exclusive</b>, service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.</p>
Description	<p>Specifies the description of the current tenant.</p>

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- If you want to use the tenant, create a system user and assign the `Manager_tenant` role and the role corresponding to the tenant to the user. For details, see [Creating a User](#).

----End

## Related Tasks

Viewing an added tenant

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** In the tenant list on the left, click the name of the added tenant.

The **Summary** tab is displayed on the right by default.

**Step 3** View **Basic Information**, **Resource Quota**, and **Statistics** of the tenant.

If HDFS is in the **Stopped** state, **Available** and **Used** of **Space** in **Resource Quota** are **unknown**.

----End

## 11.10.3 Creating a Sub-tenant

### Scenario

You can create a sub-tenant on MRS Manager if the resources of the current tenant need to be further allocated.

### Prerequisites

- A parent tenant has been added.
- A tenant name has been planned. The name must not be the same as that of a role or Yarn queue that exists in the current cluster.
- If a sub-tenant requires storage resources, a storage directory has been planned based on service requirements, and the planned directory does not exist under the storage directory of the parent tenant.
- The resources that can be allocated to the current tenant have been planned and the sum of the resource percentages of direct sub-tenants under the parent tenant at every level does not exceed 100%.

### Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** In the tenant list on the left, move the cursor to the tenant node to which a sub-tenant is to be added. Click **Create sub-tenant**. On the displayed page, configure the sub-tenant attributes according to the following table:

**Table 11-31** Sub-tenant parameters

Parameter	Description
Parent tenant	Specifies the name of the parent tenant.
Name	Specifies the name of the current tenant. The value consists of 3 to 20 characters, and can contain letters, digits, and underscores (_).

Parameter	Description
Tenant Type	The options include <b>Leaf</b> and <b>Non-leaf</b> . If <b>Leaf</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added. If <b>Non-leaf</b> is selected, sub-tenants can be added to the current tenant.
Dynamic Resources	Specifies the dynamic computing resources for the current tenant. The system automatically creates a task queue named after the sub-tenant name in the Yarn parent queue. When dynamic resources are not <b>Yarn</b> , the system does not automatically create a task queue. If the parent tenant does not have dynamic resources, the sub-tenant cannot use dynamic resources.
Default Resource Pool Capacity (%)	Specifies the percentage of the resources used by the current tenant. The base value is the total resources of the parent tenant.
Default Resource Pool Max. Capacity (%)	Specifies the maximum percentage of the computing resources used by the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	Specifies storage resources for the current tenant. The system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant. If storage resources are not <b>HDFS</b> , the system does not create a storage directory under the root directory of HDFS. If the parent tenant does not have storage resources, the sub-tenant cannot use storage resources.
Space Quota (MB)	<p>Specifies the quota for HDFS storage space used by the current tenant. The minimum value is 1, and the maximum value is the total storage quota of the parent tenant. The unit is MB. This parameter indicates the maximum HDFS storage space that can be used by a tenant, but does not indicate the actual space used. If the value is greater than the size of the HDFS physical disk, the maximum space available is the full space of the oHDFS physical disk. If the quota is greater than the quota of the parent tenant, the actual storage capacity is subject to the quota of the parent tenant.</p> <p><b>NOTE</b> To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value is set to <b>500</b>, the actual space for storing files is about 250 MB (500/2 = 250).</p>

Parameter	Description
Storage Path	Specifies the tenant's HDFS storage directory. The system automatically creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>tenant/ta1</b> , the system sets this parameter for the sub-tenant to <b>tenant/ta1/ta1s</b> . The storage path is customizable in the parent directory. The parent directory for the storage path must be the storage directory of the parent tenant.
Service	Specifies other service resources associated with the current tenant. HBase is supported. To configure this parameter, click <b>Associate Services</b> . In the dialog box that is displayed, set <b>Service</b> to <b>HBase</b> . If <b>Association Mode</b> is set to <b>Exclusive</b> , service resources are occupied exclusively. If <b>share</b> is selected, service resources are shared.
Description	Specifies the description of the current tenant.

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the settings. If the **Tenant created successfully** is displayed in the upper-right corner, the tenant is added successfully. The tenant is created successfully.

 **NOTE**

- Roles, computing resources, and storage resources are automatically created when tenants are created.
- The new role has permissions on the computing and storage resources. The role and its permissions are controlled by the system automatically and cannot be controlled manually under **Manage Role**.
- When using this tenant, create a system user and assign the user a related tenant role. For details, see [Creating a User](#).

----End

## 11.10.4 Deleting a tenant

### Scenario

You can delete a tenant that is not required on MRS Manager.

### Prerequisites

- A tenant has been added.
- You have checked whether the tenant to be deleted has sub-tenants. If the tenant has sub-tenants, delete them; otherwise, you cannot delete the tenant.

- The role of the tenant to be deleted cannot be associated with any user or user group. For details about how to cancel the binding between a role and a user, see [Modifying User Information](#).

## Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** In the tenant list on the left, move the cursor to the tenant node to be deleted and click **Delete**.

The **Delete Tenant** dialog box is displayed. If you want to save the tenant data, select **Reserve the data of this tenant**. Otherwise, the tenant's storage space will be deleted.

**Step 3** Click OK to save the settings.

It takes a few minutes to save the configuration. After the tenant is deleted successfully, the role and storage space of the tenant are also deleted.

### NOTE

- After the tenant is deleted, the task queue of the tenant still exists in Yarn.
- If you choose not to reserve data when deleting the parent tenant, data of sub-tenants is also deleted if the sub-tenants use storage resources.

----End

## 11.10.5 Managing a Tenant Directory

### Scenario

You can manage the HDFS storage directory used by a specific tenant on MRS Manager. The management operations include adding a tenant directory, modifying the directory file quota, modifying the storage space, and deleting a directory.

### Prerequisites

A tenant associated with HDFS storage resources has been added.

### Procedure

- Viewing a tenant directory
  - a. On MRS Manager, click **Tenant**.
  - b. In the tenant list on the left, click the target tenant.
  - c. Click the **Resource** tab.
  - d. View the **HDFS Storage** table.
    - The Quota column indicates the quantity quotas of files and directories.
    - The **Storage Space Quota** column indicates the storage space size of the tenant directory.

- Adding a tenant directory
  - a. On MRS Manager, click **Tenant**.
  - b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be added.
  - c. Click the **Resource** tab.
  - d. In the **HDFS Storage** table, click **Create Directory**.
    - In **Parent Directory**, select a storage directory of a parent tenant. This parameter applies only to sub-tenants. If the parent tenant has multiple directories, select any of them.
    - Set **Path** to a tenant directory path.

 **NOTE**

- If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.
- If the current tenant is a sub-tenant, the new path is created in the specified directory.

A complete HDFS storage directory can contain a maximum of 1,023 characters. An HDFS directory name contains digits, letters, spaces, and underscores (\_). The name cannot start or end with a space.

- Set **Quota** to the quotas of file and directory quantity. **Maximum Number of Files/Directories** is optional. Its value ranges from **1** to **9223372036854775806**.
- Set **Storage Space Quota** to the storage space size of the tenant directory. The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 **NOTE**

To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ( $500/2 = 250$ ).

- e. Click **OK**. The system creates tenant directories in the HDFS root directory.
- Modify a tenant directory.
    - a. On MRS Manager, click **Tenant**.
    - b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be modified.
    - c. Click the **Resource** tab.
    - d. In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.
      - Set **Quota** to the quotas of file and directory quantity. **Maximum Number of Files/Directories** is optional. Its value ranges from **1** to **9223372036854775806**.

- Set **Storage Space Quota** to the storage space size of the tenant directory.

The value of **Storage Space Quota** ranges from **1** to **8796093022208**.

 **NOTE**

To ensure data reliability, one copy of a file is automatically generated when the file is stored in HDFS. That is, two copies of the same file are stored by default. The HDFS storage space indicates the total disk space occupied by all these copies. For example, if the value of **Storage Space Quota** is set to **500**, the actual space for storing files is about 250 MB ( $500/2 = 250$ ).

- e. Click **OK**.
- Delete a tenant directory.
  - a. On MRS Manager, click **Tenant**.
  - b. In the tenant list on the left, click the tenant whose HDFS storage directory needs to be deleted.
  - c. Click the **Resource** tab.
  - d. In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

The default HDFS storage directory set during tenant creation cannot be deleted. Only the newly added HDFS storage directory can be deleted.
  - e. Click **OK**.

## 11.10.6 Restoring Tenant Data

### Scenario

Tenant data is stored on Manager and in cluster components by default. When components are restored from faults or reinstalled, some tenant configuration data may be abnormal. In this case, you can manually restore the tenant data.

### Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** In the tenant list on the left, click a tenant node.

**Step 3** Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the left of **Basic Information**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resources** and check the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available, and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Good** indicates that the component can provide services for the associated tenant. **Bad** indicates that the component cannot provide services for the tenant.

4. If any check result is abnormal, go to [Step 4](#) to restore tenant data.

**Step 4** Click **Restore Tenant Data**.

**Step 5** In the **Restore Tenant Data** window, select one or more components whose data needs to be restored. Click **OK**. The system automatically restores the tenant data.

----End

## 11.10.7 Creating a Resource Pool

### Scenario

In an MRS cluster, users can logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The system contains a **Default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

You can create a customized resource pool on MRS Manager and add hosts that have not been added to other customized resource pools to it.

### Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click the **Resource Pools** tab.

**Step 3** Click **Add Resource Pool**.

**Step 4** In **Create Resource Pool**, set the properties of the resource pool.

- **Name:** Enter a name for the resource pool. The name of the newly created resource pool cannot be **Default**.

The name consists of 1 to 20 characters and can contain digits, letters, and underscores (\_) but cannot start with an underscore (\_).

- **Hosts:** In the host list on the left, select the name of a specified host and click

to add the selected host to the resource pool. Only hosts in the cluster can be selected. The host list of a resource pool can be left blank.

**Step 5** Click **OK**.

**Step 6** After a resource pool is created, users can view the **Name**, **Members**, **Type**, **vCore** and **Memory** in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **Default** resource pool.

----End

## 11.10.8 Modifying a Resource Pool

### Scenario

You can modify members of an existing resource pool on MRS Manager.

## Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click the **Resource Pools** tab.

**Step 3** Locate the row that contains the specified resource pool, and click **Modify** in the **Operation** column.

**Step 4** In **Modify Resource Pool**, modify **Added Hosts**.

- Adding a host: Select the name of a specified host in host list on the left and click  to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click  to add the selected host to the resource pool. The host list of a resource pool can be left blank.

**Step 5** Click **OK**.

----End

## 11.10.9 Deleting a Resource Pool

### Scenario

You can delete an existing resource pool on MRS Manager.

### Prerequisites

- Any queue in a cluster cannot use the resource pool to be deleted as the default resource pool. Before deleting the resource pool, cancel the default resource pool. For details, see [Configuring a Queue](#).
- Resource distribution policies of all queues have been cleared from the resource pool being deleted. For details, see [Clearing Configuration of a Queue](#).

## Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click the **Resource Pools** tab.

**Step 3** Locate the row that contains the specified resource pool, and click **Delete** in the **Operation** column.

In the displayed dialog box, click **OK**.

----End

## 11.10.10 Configuring a Queue

### Scenario

This section describes how to modify the queue configuration for a specified tenant on MRS Manager.

### Prerequisites

A tenant associated with Yarn and allocated dynamic resources has been added.

### Procedure

- Step 1** On MRS Manager, click **Tenant**.
- Step 2** Click the **Dynamic Resource Plan** tab.
- Step 3** Click the **Queue Configuration** tab.
- Step 4** In the tenant queue table, click **Modify** in the **Operation** column of the specified tenant queue.

#### NOTE

In the tenant list on the left of the **Tenant Management** tab, click the target tenant. In the window that is displayed, choose **Resource**. On the page that is displayed, click  to open the queue modification page.

**Table 11-32** Queue configuration parameters

Parameter	Description
Maximum Application	Specifies the maximum number of applications. The value ranges from 1 to 2147483647.
Maximum AM Resource Percent	Specifies the maximum percentage of resources that can be used to run the ApplicationMaster in a cluster. The value ranges from 0 to 1.
Minimum User Limit Percent (%)	Specifies the minimum percentage of resources consumed by a user. The value ranges from 0 to 100.
User Limit Factor	Specifies the limit factor of the maximum user resource usage. The maximum user resource usage percentage can be obtained by multiplying the limit factor with the percentage of the tenant's actual resource usage in the cluster. The minimum value is <b>0</b> .
Status	Specifies the current status of a resource plan. The values are <b>Running</b> and <b>Stopped</b> .

Parameter	Description
Default Resource Pool	Specifies the resource pool used by a queue. The default value is <b>Default</b> . If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a> .

----End

## 11.10.11 Configuring the Queue Capacity Policy of a Resource Pool

### Scenario

After a resource pool is added, the capacity policies of available resources need to be configured for Yarn task queues. This ensures that tasks in the resource pool are running properly. Each queue can be configured with the queue capacity policy of only one resource pool. Users can view the queues in any resource pool and configure queue capacity policies. After the queue policies are configured, Yarn task queues and resource pools are associated.

You can configure queue policies on MRS Manager.

### Prerequisites

- A resource pool has been added.
- The task queues are not associated with other resource pools. By default, all queues are associated with the **default** resource pool.
- You have synchronized IAM users. (On the **Dashboard** page, click **Synchronize** on the right side of **IAM User Sync** to synchronize IAM users.)

### Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click the **Dynamic Resource Plan** tab.

**Step 3** In **Resource Pools**, select a specified resource pool.

**Available Resource Quota:** indicates that all resources in each resource pool are available for queues by default.

**Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.

**Step 5** In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.

- **Capacity (%)**: specifies the percentage of the current tenant's computing resource usage.
- **Maximum Capacity (%)**: specifies the percentage of the current tenant's maximum computing resource usage.

**Step 6** Click **OK** to save the settings.

----End

## 11.10.12 Clearing Configuration of a Queue

### Scenario

Users can clear the configuration of a queue on MRS Manager when the queue does not need resources from a resource pool or if a resource pool needs to be disassociated from the queue. Clearing queue configurations means that the resource capacity policy of the queue is canceled.

### Prerequisites

If a queue is to be unbound from a resource pool, this resource pool cannot serve as the default resource pool of the queue. Therefore, you must first change the default resource pool of the queue to another one. For details, see [Configuring a Queue](#).

### Procedure

**Step 1** On MRS Manager, click **Tenant**.

**Step 2** Click the **Dynamic Resource Plan** tab.

**Step 3** In **Resource Pools**, select a specified resource pool.

**Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Clear** in the **Operation** column.

In the **Clear Queue Configuration** dialog box, click **OK** to clear the queue configuration in the current resource pool.

#### NOTE

If no resource capacity policy is configured for a queue, the clearing function is unavailable for the queue by default.

----End

## 11.11 Backup and Restoration

### 11.11.1 Introduction

#### Purpose

MRS Manager provides backup and restoration for user data and system data. The backup function is provided based on components to back up Manager data (including OMS data and LdapServer data), Hive user data, component metadata saved in DBService, and HDFS metadata.

Backup and restoration tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- If the system is faulty, the data backup can be used to recover the system.
- If the active cluster is completely faulty, a mirror cluster identical to the active cluster needs to be created. You can use the backup data to restore the active cluster.

**Table 11-33** Backing up metadata

Backup Type	Backup Content
OMS	Database data (excluding alarm data) and configuration data in the cluster management system to be backed up by default
LdapServer	User information, including the username, password, key, password policy, and group information
DBService	Metadata of the components (Hive) managed by DBService
NameNode	HDFS metadata.

## Principles

### Task

Before backup or restoration, you need to create a backup or restoration task and set task parameters, such as the task name, backup data source, and type of backup file save path. Data backup and restoration can be performed by executing backup and restoration tasks. When the Manager is used to recover the data of HDFS, HBase, Hive, and NameNode, no cluster can be accessed.

Each backup task can back up data of different data sources and generates an independent backup file for each data source. All the backup files generated in each backup task form a backup file set, which can be used in restoration tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS. The backup task provides the full backup or incremental backup policies. HDFS and Hive backup tasks support the incremental backup policy, while OMS, LdapServer, DBService, and NameNode backup tasks support only the full backup policy.

 **NOTE**

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started at the same time.
- The interval at which a periodical task is automatically executed must be greater than 120s; otherwise, the task is postponed and will be executed in the next period. Manual tasks can be executed at any interval.
- When a periodic task is to be automatically executed, the current time cannot be 120s later than the task start time; otherwise, the task is postponed and executed in the next period.
- When a periodic task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, LdapServer, DBService, or NameNode backup task starts, ensure that the LocalBackup partition on the active management node has more than 20 GB available space. Otherwise, the backup task cannot be started.
- When you are planning backup and restoration tasks, select the data to be backed up or restored strictly based on the service logic, data store structure, and database or table association. The system creates a default periodic backup task **default** whose execution interval is 24 hours to perform full backup of OMS, LdapServer, DBService, and NameNode data to the Linux local disk.

## Specifications

**Table 11-34** Backup and restoration feature specifications

Item	Specifications
Maximum number of backup or restoration tasks	100
Number of concurrent running tasks	1
Maximum number of waiting tasks	199
Maximum size of backup files on a Linux local disk (GB)	600

**Table 11-35** Specifications of the **default** task

Item	OMS	LdapServer	DBService	NameNode
Backup period	1 hour			
Maximum number of copies	2			
Maximum size of a backup file	10 MB	20 MB	100 MB	1.5 GB

Item	OMS	LdapServer	DBService	NameNode
Maximum size of disk space used	20 MB	40 MB	200 MB	3 GB
Save path of backup data	<i>Data save path/LocalBackup/</i> of the active and standby management nodes			

 NOTE

The backup data of the **default** task must be periodically transferred and saved outside the cluster based on the enterprise O&M requirements.

## 11.11.2 Backing Up Metadata

### Scenario

To ensure the security of metadata either on a routine basis or before and after performing critical metadata operations (such as scale-out, scale-in, patch installation, upgrades, and migration), metadata must be backed up. The backup data can be used to recover the system if an exception occurs or if the operation has not achieved the expected result. This minimizes the adverse impact on services. Metadata includes data of OMS, LdapServer, DBService, and NameNode. MRS Manager data to be backed up includes OMS data and LdapServer data.

By default, metadata backup is supported by the **default** task. This section describes how to create a backup task and back up metadata on MRS Manager. Both automatic backup tasks and manual backup tasks are supported.

### Prerequisites

- A standby cluster for backing up data has been created, and the network is connected. The inbound rules of the two security groups on the peer cluster have been added to the two security groups in each cluster to allow all access requests of all protocols and ports of all ECSs in the security groups.
- The backup type, period, policy, and other specifications have been planned based on the service requirements and you have checked whether *Data storage path/LocalBackup/* has sufficient space on the active and standby management nodes.

### Procedure

**Step 1** Create a backup task.

1. On MRS Manager, choose **System > Back Up Data**.
2. Click **Create Backup Task**.

**Step 2** Configure a backup policy.

1. Set **Task Name** to the name of the backup task.

2. Set **Backup Mode** to the type of the backup task. **Periodic** indicates that the backup task is periodically executed. **Manual** indicates that the backup task is manually executed.

To create a periodic backup task, set the following parameters:

- **Started:** indicates the time when the task is started for the first time.
- **Period:** indicates the task execution interval. The options include **By hour** and **By day**.
- **Backup Policy:** indicates the volume of data to be backed up in each task execution. The options include **Full backup at the first time and incremental backup later**, **Full backup every time**, and **Full backup once every n times**. If you select **Full backup once every n times**, you need to specify the value of **n**.

**Step 3** Select backup sources.

In the **Configuration** area, select **OMS** and **LdapServer** under **Metadata**.

**Step 4** Set backup parameters.

1. Set **Path Type** of **OMS** and **LdapServer** to a backup directory type.

The following backup directory types are supported:

- **LocalDir:** indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup files. By default, the backup files are stored in *Data storage path/LocalBackup/*. If you select **LocalDir**, you need to set the maximum number of copies to specify the number of backup files that can be retained in the backup directory.
- **LocalHDFS:** indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
  - **Target Path:** indicates the HDFS directory for storing the backup files. The save path cannot be an HDFS hidden directory, such as a snapshot or recycle bin directory, or a default system directory.
  - **Max Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Target Instance Name:** indicates the NameService name of the backup directory. The default value is **hacluster**.

2. Click **OK**.

**Step 5** Execute the backup task.

In the **Operation** column of the created task in the backup task list, click **Back Up Now** if **Backup Mode** is set to **Periodic** or click **Start** if **Backup Mode** is set to **Manual** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *Backup task name\_Task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *Version\_Data source\_Task execution time.tar.gz*.

----End

## 11.11.3 Restoring Metadata

### Scenario

You need to restore metadata in the following scenarios: A user modifies or deletes data unexpectedly, data needs to be retrieved, system data becomes abnormal or does not achieve the expected result, all modules are faulty, and data is migrated to a new cluster.

This section describes how to restore metadata on MRS Manager. Only manual restoration tasks are supported.

---

#### NOTICE

- Data restoration can be performed only when the system version is consistent with that during data backup.
  - To restore the data when services are normal, manually back up the latest management data first and then restore the data. Otherwise, the data that is generated after the data backup and before the data restoration will be lost.
  - Use the OMS data and LdapServer data backed up at the same time to restore data. Otherwise, the service and operation may fail.
  - By default, MRS clusters use DBService to store Hive metadata.
- 

### Impact on the System

- After the data is restored, the data generated between the backup time and restoration time is lost.
- After the data is restored, the configuration of the components that depend on DBService may expire and these components need to be restarted.

### Prerequisites

- The data in the OMS and LdapServer backup files has been backed up at the same time.
- The status of the OMS resources and the LdapServer instances is normal. If the status is abnormal, data restoration cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data restoration cannot be performed.
- The cluster host topologies during data restoration and data backup are the same. If the topologies are different, data restoration cannot be performed and you need to back up data again.
- The services added to the cluster during data restoration and data backup are the same. If the services are different, data restoration cannot be performed and you need to back up data again.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data restoration cannot be performed.
- The upper-layer applications depending on the MRS cluster have been stopped.

- On MRS Manager, you have stopped all the NameNode role instances whose data is to be recovered. Other HDFS role instances are running properly. After data is recovered, the NameNode role instances need to be restarted and cannot be accessed before the restart.
- You have checked whether NameNode backup files have been stored in the *Data save path/LocalBackup/* directory on the active management node.

## Procedure

### Step 1 Check the location of backup data.

1. On MRS Manager, choose **System > Back Up Data**.
2. In the row where the specified backup task resides, choose **More > View History** in the **Operation** column to display the historical execution records of the backup task. In the window that is displayed, select a success record and click **View Backup Path** in the corresponding column to view its backup path information. Find the following information:
  - **Backup Object**: indicates the backup data source.
  - **Backup Path**: indicates the full path where backup files are stored.
3. Select the correct path, and manually copy the full path of backup files in **Backup Path**.

### Step 2 Create a restoration task.

1. On MRS Manager, choose System > Recovery Management.
2. On the page that is displayed, click **Create Restoration Task**.
3. Set **Task Name** to the name of the restoration task.

### Step 3 Select restoration sources.

In **Configuration**, select the metadata component whose data is to be restored.

### Step 4 Set the restoration parameters.

1. Set **Path Type** to a backup directory type.
2. The settings vary according to backup directory types:
  - **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select **LocalDir**, you need to set **Source Path** to specify the full path of the backup file. For example, *Data storage path/LocalBackup/Backup task name\_Task creation time/Data source\_Task execution time/Version number\_Data source\_Task execution time.tar.gz*.
  - **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster. If you select **SFTP**, set the following parameters:
    - **Source Path**: indicates the full HDFS path of a backup file. for example, *Backup path/Backup task name\_Task creation time/Version\_Data source\_Task execution time.tar.gz*.
    - **Source Instance Name**: indicates the name of NameService corresponding to the backup directory when a restoration task is being executed. The default value is **hacluster**.

3. Click **OK**.

**Step 5** Execute the restoration task.

In the restoration task list, locate the row where the created task resides, and click **Start** in the **Operation** column.

- After the restoration is successful, the progress bar is in green.
- After the restoration is successful, the restoration task cannot be executed again.
- If the restoration task fails during the first execution, rectify the fault and try to execute the task again by clicking **Start**.

**Step 6** Determine what metadata has been restored.

- If the OMS and LdapServer metadata is restored, go to [Step 7](#).
- If DBService data is restored, no further action is required.
- Restore NameNode data. On MRS Manager, choose **Services > HDFS > More > Restart Service**. The task is complete.

**Step 7** Restarting Manager for the recovered data to take effect

1. In MRS Manager, Choose **LdapServer > More > Restart Service** and click **OK**. Wait until the LdapServer service is restarted successfully.
2. Log in to the active management node. For details, see [Determining Active and Standby Management Nodes of Manager](#).
3. Run the following command to restart OMS:  

```
sh ${BIGDATA_HOME}/om-0.0.1/sbin/restart-oms.sh
```

The command has been executed successfully if the following information is displayed:  
start HA successfully.
4. On MRS Manager, choose **KrbServer > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the KrbServer service configuration is synchronized and restarted successfully.
5. Choose **Services > More > Synchronize Configuration**. Do not select Restart the services and instances whose configuration has expired. Click **OK** and wait until the cluster is configured and synchronized successfully.
6. Choose **Services > More > Stop Cluster**. After the cluster is stopped, choose **Services > More > Start Cluster**.

----End

## 11.11.4 Modifying a Backup Task

### Scenario

This section describes how to modify the parameters of a created backup task on MRS Manager to meet changing service requirements. The parameters of restoration tasks can be viewed but not modified.

## Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

## Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

## Procedure

**Step 1** On MRS Manager, choose **System > Back Up Data**.

**Step 2** In the task list, locate a specified task, click **Modify** in the **Operation** column to go to the configuration modification page.

**Step 3** Modify the following parameters on the displayed page:

- Manual backup:
  - Target Path
  - Max Number of Backup Copies
- Periodic backup:
  - Started
  - Period
  - Target Path
  - Max Number of Backup Copies

### NOTE

- When **Path Type** is set to **LocalHDFS**, **Target Path** is valid for modifying a backup task.
- After you change the value of **Target Path** for a backup task, full backup is performed by default when the task is executed for the first time.

**Step 4** Click **OK**.

----End

## 11.11.5 Viewing Backup and Restoration Tasks

### Scenario

This section describes how to view created backup and restoration tasks and check their running status on MRS Manager.

### Procedure

**Step 1** On MRS Manager, click **System**.

**Step 2** Click **Back Up Data** or **Restore Data**.

**Step 3** In the task list, obtain the previous execution result in the **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.

**Step 4** In the **Operation** column of a specified task in the task list, choose **More > View History** to view the historical record of backup and restoration execution.

In the displayed window, click **View** in the **Details** column. The task execution logs and paths are displayed.

----End

## Related Tasks

- Modifying a backup task  
For details, see [Modifying a Backup Task](#).
- Viewing a restoration task  
In the **Operation** column of the specified task in the task list, click **View Details** to view the restoration task. You can only view but cannot modify the parameters of a restoration task.
- Executing a backup or restoration task  
In the task list, locate a specified task and click **Start** in the **Operation** column to start a backup or restoration task that is ready or fails to be executed. Executed restoration tasks cannot be repeatedly executed.
- Stopping backup tasks  
In the task list, locate a specified task and click **More > Stop** in the **Operation** column to stop a backup task that is running.
- Deleting a backup or restoration task  
In the **Operation** column of the specified task in the task list, choose **More > Delete** to delete the backup or restoration task. After a task is deleted, the backup data is retained by default.
- Suspending a backup task  
In the **Operation** column of the specified task in the task list, choose **More > Suspend** to suspend the backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To cancel the suspension status of a task, click **More > Resume**.

## 11.12 Security Management

### 11.12.1 Default Users of Clusters with Kerberos Authentication Disabled

#### User Classification

The MRS cluster provides the following two types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System users	User who runs OMS processes
Database users	<ul style="list-style-type: none"> <li>User who manages OMS database and accesses data</li> <li>User who runs the database of service components (Hive, and DBService)</li> </ul>

## System users

### NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Operation	Username	Initial Password	Description
System administrator of the MRS cluster	admin	Specified by the user during the cluster creation	<p>MRS Manager administrator.</p> <p>This user also has the following permissions:</p> <ul style="list-style-type: none"> <li>Common HDFS and ZooKeeper user permissions.</li> <li>Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI.</li> <li>Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service.</li> <li>Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.</li> </ul>

Operation	Username	Initial Password	Description
MRS cluster node OS user	omm	Randomly generated by the system	Internal running user of the MRS cluster system. This user is an OS user generated on all node and does not require a unified password.
MRS cluster node OS user	root	Set by the user	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

## User Group Information

Default User Group	Description
supergroup	Primary group of user <b>admin</b> , which has no additional permissions in the cluster with Kerberos authentication disabled.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. which is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.

Default User Group	Description
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components. It is used only in clusters with Kerberos authentication enabled.
compcommon	MRS cluster internal group, used to access public resources in the cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user <b>omm</b> .
ficommon	MRS cluster common group that corresponds to <b>compcommon</b> for accessing public resource files stored in the OS of the cluster.

## Database users

MRS cluster system database users include OMS database users and DBService database users.

### NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Operation	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping.
	omm	ChangeMe@123456	User for accessing OMS database data
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component

Operation	Default User	Initial Password	Description
	hive	HiveUser@	User for Hive to connect to the DBService database
	hue	HueUser@123	User for Hue to connect to the DBService database
	sqoop	SqoopUser@	User for Loader to connect to the DBService database.

## 11.12.2 Default Users of Clusters with Kerberos Authentication Enabled

### User Classification

The MRS cluster provides the following three types of users. Users are advised to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System user	<ul style="list-style-type: none"> <li>User created on Manager for MRS cluster O&amp;M and service scenarios. There are two types of users: <ul style="list-style-type: none"> <li><b>Human-machine</b> user: used for Manager O&amp;M scenarios and component client operation scenarios.</li> <li><b>Machine-machine</b> user: used for MRS cluster application development scenarios.</li> </ul> </li> <li>User who runs OMS processes.</li> </ul>
Internal system user	Internal user who performs process communications, saves user group information, and associates user permissions.
Database user	<ul style="list-style-type: none"> <li>User who manages OMS database and accesses data.</li> <li>User who runs the database of service components (Hive, Hue, Loader, and DBService)</li> </ul>

### System User

#### NOTE

- User **ldap** of the OS is required in the MRS cluster. Do not delete this account. Otherwise, the cluster may not work properly. Password management policies are maintained by the operation users.
- Reset the passwords when you change the passwords of user **ommdba** and user **omm** for the first time. Change the passwords periodically after retrieving them.

Type	Username	Initial Password	Description
System administrator of the MRS cluster	admin	Specified by the user during the cluster creation.	<p>Manager administrator with the following permissions:</p> <ul style="list-style-type: none"> <li>• Common HDFS and ZooKeeper user permissions.</li> <li>• Permissions to submit and query MapReduce and Yarn tasks, manage Yarn queues, and access the Yarn web UI.</li> <li>• Permissions to submit, query, activate, deactivate, reassign, delete topologies, and operate all topologies of the Storm service.</li> <li>• Permissions to create, delete, authorize, reassign, consume, write, and query topics of the Kafka service.</li> </ul>
MRS cluster node OS user	omm	Randomly generated by the system.	Internal running user of the MRS cluster system. This user is an OS user generated on all nodes and does not require a unified password.
MRS cluster node OS user	root	Set by the user.	User for logging in to the node in the MRS cluster. This user is an OS user generated on all nodes.

## Internal System Users

### NOTE

Do not delete the following internal system users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
Component running user	hdfs	Hdfs@123	<p>This user is the HDFS system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. File system operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> <li>• Views and sets disk quotas for users.</li> </ul> </li> <li>2. HDFS management operation permissions: <ul style="list-style-type: none"> <li>• Views the web UI status.</li> <li>• Views and sets the active and standby HDFS status.</li> <li>• Enters and exits the HDFS in security mode.</li> <li>• Checks the HDFS file system.</li> </ul> </li> </ol>

Type	Default User	Initial Password	Description
	hbase	Hbase@123	<p>This user is the HBase system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Cluster management permission: <b>Enable</b> and <b>Disable</b> operations on tables to trigger MajorCompact and ACL operations.</li> <li>• Grants and revokes permissions, and shuts down the cluster.</li> <li>• Table management permission: Creates, modifies, and deletes tables.</li> <li>• Data management permission: Reads and writes data in tables, column families, and columns.</li> <li>• Accesses the HBase web UI.</li> </ul>
	mapred	Mapred@123	<p>This user is the MapReduce system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Submits, stops, and views the MapReduce tasks.</li> <li>• Modifies the Yarn configuration parameters.</li> <li>• Accesses the Yarn and MapReduce web UI.</li> </ul>
	spark	Spark@123	<p>This user is the Spark system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Accesses the Spark web UI.</li> <li>• Submits Spark tasks.</li> </ul>

## User Group Information

Default User Group	Description
hadoop	Users added to this user group have the permission to submit tasks to all Yarn queues.
hbase	Common user group. Users added to this user group will not have any additional permission.
hive	Users added to this user group can use Hive.
spark	Common user group. Users added to this user group will not have any additional permission.
supergroup	Users added to this user group can have the administrator permission of HBase, HDFS, and Yarn and can use Hive.
check_sec_ldap	Used to test whether the active LDAP works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. This is an internal system user group used only between components.
Manager_tenant	Tenant system user group, which is an internal system user group used only between components.
System_administrator	MRS cluster system administrator group, which is an internal system user group used only between components.
Manager_viewer	MRS Manager system viewer group, which is an internal system user group used only between components.
Manager_operator	MRS Manager system operator group, which is an internal system user group used only between components.
Manager_auditor	MRS Manager system auditor group, which is an internal system user group used only between components.
Manager_administrator	MRS Manager system administrator group, which is an internal system user group used only between components.
compcommon	Internal system group for accessing public resources in a cluster. All system users and system running users are added to this user group by default.
default_1000	User group created for tenants, which is an internal system user group used only between components.

Default User Group	Description
kafka	Kafka common user group. Users added to this group need to be granted with read and write permission by users in the <b>kafkaadmin</b> group before accessing the desired topics.
kafkasuperuser	Users added to this group have permissions to read data from and write data to all topics.
kafkaadmin	Kafka administrator group. Users added to this group have the permissions to create, delete, authorize, as well as read from and write data to all topics.
storm	Storm common user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
stormadmin	Storm administrator user group. Users added to this group have the permissions to submit topologies and manage their own topologies.
opentsdb	Common user group. Users added to this user group will not have any additional permission.
presto	Common user group. Users added to this user group will not have any additional permission.
flume	Common user group. Users added to this user group will not have any additional permission.
launcher-job	MRS internal group, which is used to submit jobs using V2 APIs.

OS User Group	Description
wheel	Primary group of MRS internal running user <b>omm</b> .
ficommon	MRS cluster common group that corresponds to <b>compcommon</b> for accessing public resource files stored in the OS of the cluster.

## Database User

MRS cluster system database users include OMS database users and DBService database users.

### NOTE

Do not delete database users. Otherwise, the cluster or components may not work properly.

Type	Default User	Initial Password	Description
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping applications.
	omm	ChangeMe@123456	User for accessing OMS database data.
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component.
	hive	HiveUser@	User for Hive to connect to the DBService database.
	hue	HueUser@123	User for Hue to connect to the DBService database.
	sqoop	SqoopUser@	User for Loader to connect to the DBService database.
	ranger	RangerUser@	User for Ranger to connect to the DBService database.

## 11.12.3 Changing the Password of an OS User

### Scenario

This section describes how to periodically change the login passwords of the OS users **omm**, **ommdba**, and **root** on MRS cluster nodes to improve the system O&M security.

Passwords of users **omm**, **ommdba**, and **root** on each node can be different.

### Procedure

- Step 1** Log in to the **Master1** node and then log in to other nodes whose OS user passwords need to be changed.
- Step 2** Run the following command to switch to user **root**:  

```
sudo su - root
```
- Step 3** Run the following command to change the passwords of users **omm**, **ommdba**, or **root**:  

```
passwd omm  
passwd ommdba  
passwd root
```

For example, if you run the **omm:passwd** command, the system displays the following information:

```
Changing password for user omm.  
New password:
```

Enter a new password. The password change policies for an OS vary according to the OS that is used.

```
Retype new password:  
passwd: all authentication tokens updated successfully.
```

#### NOTE

The default password complexity requirements of the MRS cluster are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\| [{}];:","<.>/?).
- The new password cannot be the same as last five historical passwords.

----End

## 11.12.4 Changing the password of user admin

This section describes how to periodically change the password of cluster user **admin** to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

### Changing the Password of User admin on the Cluster Node

**Step 1** Update the client of the active management node. For details, see [Updating a Client \(Versions Earlier Than 3.x\)](#).

**Step 2** Log in to the active management node.

**Step 3** (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

**Step 4** Run the following command to switch to the client directory, for example, **/opt/client**.

```
cd /opt/client
```

**Step 5** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 6** Run the following command to change the password of user **admin**: This operation takes effect in the whole cluster.

```
kpasswd admin
```

Enter the old password and then enter a new password twice.

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:'''<.>/?).
- The password cannot be the username or the reverse username.

----End

## Changing the Password of User admin on MRS Manager

You can change the password of user **admin** on MRS Manager only for clusters with Kerberos authentication enabled and clusters with Kerberos authentication disabled but the EIP function enabled.

**Step 1** Log in to MRS Manager as user **admin**.

**Step 2** Click the username in the upper right corner of the page and choose **Change Password**.

**Step 3** On the **Change Password** page, set **Old Password**, **New Password**, and **Confirm Password**.

### NOTE

The default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:'''<.>/?).
- The password cannot be the username or the reverse username.

**Step 4** Click **OK**. Log in to MRS Manager with the new password.

----End

## Resetting the Password for User admin

**Step 1** Log in to the **Master1** node.

**Step 2** (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch to the client directory, for example, **/opt/client**:

```
cd /opt/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

 **NOTE**

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

**Step 6** Run the following command to reset the password of a component running user. This operation takes effect for all servers.

**cpw** *Component running user name*

For example, to reset the password of user admin, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:"'<.>/?').
- The password cannot be the username or the reverse username.

----End

## 11.12.5 Changing the Password of the Kerberos Administrator

### Scenario

This section describes how to periodically change the password of the Kerberos administrator **kadmin** of the MRS cluster to improve the system O&M security.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

### Prerequisites

A client has been prepared on the **Master1** node.

### Procedure

**Step 1** Log in to the **Master1** node.

**Step 2** (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch to the client directory, for example, **/opt/client**.

```
cd /opt/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Run the following command to change the password of **kadmin/admin**. This operation takes effect for all servers.

```
kpasswd kadmin/admin
```

For the cluster, the default password complexity requirements are as follows:

- The password must contain at least eight characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[{]};:","<.>/?').
- The password cannot be the username or the reverse username.

----End

## 11.12.6 Changing the Passwords of the LDAP Administrator and the LDAP User

### Scenario

This section describes how to periodically change the passwords of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** and the LDAP user **pg\_search\_dn:cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

### Impact on the System

All services need to be restarted for the new password to take effect. The services are unavailable during the restart.

### Procedure

- Step 1** On MRS Manager, choose **Services > LdapServer > More**.
- Step 2** Click **Change Password**.
- Step 3** In the **Change Password** dialog box, select the user whose password needs to be modified in the **User Information** drop-down box.
- Step 4** Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The default password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#\$%^&\*()-\_+=\|[{]};:","<.>/?').
- The password cannot be the username or the reverse username.
- The new password cannot be the same as the current password.

#### NOTE

The default password of the LDAP administrator **rootdn:cn=root,dc=hadoop,dc=com** is **LdapChangeMe@123**, and that of the LDAP user **pg\_search\_dn:cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** is **pg\_search\_dn@123**. Periodically change the passwords and keep them secure.

**Step 5** Select **I have read the information and understand the impact**, and click **OK** to confirm the modification and restart the service.

----End

## 11.12.7 Changing the Password of a Component Running User

### Scenario

This section describes how to periodically change the password of the component running user of the MRS cluster to improve the system O&M security.

If the initial password is randomly generated by the system, reset the password.

If the password is changed, the downloaded user credential will be unavailable. Download the authentication credential again, and replace the old one.

### Prerequisites

A client has been prepared on the **Master1** node.

### Procedure

**Step 1** Log in to the **Master1** node.

**Step 2** (Optional) To change the password as user **omm**, run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch to the client directory, for example, **/opt/client**:

```
cd /opt/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

#### NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

**Step 6** Run the following command to reset the password of a component running user. This operation takes effect for all servers.

```
cpw Component running user name
```

For example, to reset the password of user **admin**, run the **cpw admin** command.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.

- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[{ }];:~",<.>/?).
- The password cannot be the username or the reverse username.

----End

## 11.12.8 Changing the Password of the OMS Database Administrator

### Scenario

This section describes how to periodically change the password of the OMS database administrator to improve the system O&M security.

### Procedure

**Step 1** Log in to the active management node.

 **NOTE**

The password of user **ommdba** cannot be changed on the standby management node. Otherwise, the cluster may not work properly. Change the password on the active management node only.

**Step 2** Run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch the directory:

```
cd $OMS_RUN_PATH/tools
```

**Step 4** Run the following command to change the password of user **ommdba**:

```
mod_db_passwd ommdba
```

**Step 5** Enter the old password of user **ommdba** and enter a new password twice.

The password complexity requirements are as follows:

- The password contains 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#\$%^&\*()-\_+=\|[{ }];:~",<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully.

```
Congratulations, update [ommdba] password successfully.
```

----End

## 11.12.9 Changing the Password of the Data Access User of the OMS Database

### Scenario

This section describes how to periodically change the password of the data access user of the OMS database to improve the system O&M security.

### Impact on the System

The OMS service needs to be restarted for the new password to take effect. The service is unavailable during the restart.

### Procedure

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Change OMS Database Password**.

**Step 3** Locate the row that contains user **omm**, and click **Change password** in the **Operation** column.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#\$\$%^&\*()-\_+=\| [{}];:","<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

**Step 4** Click **OK**. When **Operation successful** is displayed, click **Finish**.

**Step 5** Locate the row that contains user **omm**, and click **Restart the OMS service** in the **Operation** column to restart the OMS database.

#### NOTE

If the password is changed but the OMS database is not restarted, the status of user **omm** changes to **Waiting to restart** and the password cannot be changed until the OMS database is restarted.

**Step 6** In the displayed dialog box, select **I have read the information and understand the impact**. Click **OK**, and restart the OMS service.

----End

## 11.12.10 Changing the Password of a Component Database User

### Scenario

This section describes how to periodically change the password of the component database user to improve the system O&M security.

## Impact on the System

The services need to be restarted for the new password to take effect. The services are unavailable during the restart.

## Procedure

**Step 1** On MRS Manager, click **Services** and click the name of the database user service to be modified.

**Step 2** Determine the component database user whose password is to be changed.

- To change the password of the DBService database user, go to **Step 3**.
- To change the password of the Loader, Hive, or Hue database user, stop the service first and then execute **Step 3**.

Click **Stop Service**.

**Step 3** Choose **More > Change Password**.

**Step 4** Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password of the DBService database user contains 16 to 32 characters. The password of the Loader, Hive, or Hue database user contains 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters ('~!@#\$%^&\*()-\_+=\| [{}];:","<.>/?).
- The password cannot be the username or the reverse username.
- The password cannot be the same as the last 20 historical passwords.

**Step 5** Click **OK**. The system automatically restarts the corresponding service. When **Operation successful** is displayed, click **Finish**.

----End

## 11.12.11 Updating Cluster Keys

### Scenario

When a cluster is installed, an encryption key is generated automatically to store the security information in the cluster (such as all database user passwords and key file access passwords) in encryption mode. After the cluster is successfully installed, you are advised to periodically update the encryption key based on the following procedure.

## Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt data encrypted using the old key. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.

- When the key is updated, the cluster is stopped and cannot be accessed.

## Prerequisites

The upper-layer applications depending on the cluster are stopped.

## Procedure

**Step 1** Log in to MRS Manager and choose **Services > More > Stop Cluster**.

In the displayed dialog box, select **I have read the information and understand the impact**. Click **OK**. Wait until the system displays a message indicating that the operation is successful. Click **Finish**. The cluster is stopped successfully.

**Step 2** Log in to the active management node.

**Step 3** Run the following commands to switch the user:

```
sudo su - omm
```

**Step 4** Run the following command to disable logout upon timeout:

```
TMOUT=0
```

**Step 5** Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-0.0.1/tools
```

**Step 6** Run the following command to update the cluster key:

```
sh updateRootKey.sh
```

Enter **y** as prompted.

```
The root key update is a critical operation.  
Do you want to continue?(y/n):
```

The key is updated successfully if the following information is displayed:

```
...  
Step 4-1: The key save path is obtained successfully.  
...  
Step 4-4: The root key is sent successfully.
```

**Step 7** On MRS Manager, choose **Services > More > Start Cluster**.

In the displayed dialog box, click **OK**. After **Operation successful** is displayed, click **Finish**. The cluster is started.

----End

## 11.13 Permissions Management

### 11.13.1 Creating a Role

#### Scenario

This section describes how to create a role on MRS Manager and authorize and manage Manager and components.

Up to 1,000 roles can be created on MRS Manager.

## Prerequisites

You have learned service requirements.

## Procedure

**Step 1** On MRS Manager, choose **System > Manage Role**.

**Step 2** Click **Create Role** and fill in **Role Name** and **Description**.

**Role Name** is mandatory and contains 3 to 30 digits, letters, and underscores (\_).  
**Description** is optional.

**Step 3** In **Permission**, set role permission.

1. Click **Service Name** and select a name in **View Name**.
2. Select one or more permissions.

### NOTE

- The **Permission** parameter is optional.
- If you select **View Name** to set component permissions, you can enter a resource name in the **Search** box in the upper right corner and click . The search result is displayed.
- The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive. Results of the next page can be searched.

**Table 11-36** Manager permission description

Resource Supporting Permission Management	Permission Setting
<b>Alarm</b>	Authorizes the Manager alarm function. You can select <b>View</b> to view alarms and <b>Management</b> to manage alarms.
<b>Audit</b>	Authorizes the Manager audit log function. You can select <b>View</b> to view audit logs and <b>Management</b> to manage audit logs.
<b>Dashboard</b>	Authorizes the Manager overview function. You can select <b>View</b> to view the cluster overview.
<b>Hosts</b>	Authorizes the node management function. You can select <b>View</b> to view node information and <b>Management</b> to manage nodes.
<b>Services</b>	Authorizes the service management function. You can select <b>View</b> to view service information and <b>Management</b> to manage services.
<b>System_cluster_management</b>	Authorizes the MRS cluster management function. You can select <b>Management</b> to use the MRS patch management function.

Resource Supporting Permission Management	Permission Setting
<b>System_configuration</b>	Authorizes the MRS cluster configuration function. You can select <b>Management</b> to configure MRS clusters on Manager.
<b>System_task</b>	Authorizes the MRS cluster task function. You can select <b>Management</b> to manage periodic tasks of MRS clusters on Manager.
<b>Tenant</b>	Authorizes the Manager multi-tenant management function. You can select <b>Management</b> to manage multi-tenants.

**Table 11-37** HBase permission description

Resource Supporting Permission Management	Permission Setting
<b>SUPER_USER_GROUP</b>	Grants you HBase administrator rights.
<b>Global</b>	HBase resource type, indicating the whole HBase.
<b>Namespace</b>	HBase resource type, indicating namespace, which is used to store HBase tables. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Admin</b> permission to manage the namespace</li> <li>• <b>Create</b>: permission to create HBase tables in the namespace</li> <li>• <b>Read</b>: permission to access the namespace</li> <li>• <b>Write</b>: permission to write data to the namespace</li> <li>• <b>Execute</b>: permission to execute the coprocessor (Endpoint)</li> </ul>
<b>Table</b>	HBase resource type, indicating a data table, which is used to store data. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Admin</b>: permission to manage a data table</li> <li>• <b>Create</b>: permission to create column families and columns in a data table</li> <li>• <b>Read</b>: permission to read a data table</li> <li>• <b>Write</b>: permission to write data to a data table</li> <li>• <b>Execute</b>: permission to execute the coprocessor (Endpoint)</li> </ul>

Resource Supporting Permission Management	Permission Setting
<b>ColumnFamily</b>	<p>HBase resource type, indicating a column family, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Create</b>: permission to create columns in a column family</li> <li>• <b>Read</b>: permission to read a column family</li> <li>• <b>Write</b>: permission to write data to a column family</li> </ul>
<b>Qualifier</b>	<p>HBase resource type, indicating a column, which is used to store data. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Read</b>: permission to read a column</li> <li>• <b>Write</b>: permission to write data to a column</li> </ul>

By default, permissions of an HBase resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Read** and **Write** permissions are added to the **default** namespace, they are automatically added to the tables, column families, and columns in the namespace. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

**Table 11-38** HDFS permission description

Resource Supporting Permission Management	Permission Setting
<b>Folder</b>	<p>HDFS resource type, indicating an HDFS directory, which is used to store files or subdirectories. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Read</b>: permission to access the HDFS directory</li> <li>• <b>Write</b>: permission to write data to the HDFS directory</li> <li>• <b>Execute</b>: permission to perform an operation. It must be selected when you add access or write permission.</li> </ul>
<b>Files</b>	<p>HDFS resource type, indicating a file in HDFS. It has the following permissions:</p> <ul style="list-style-type: none"> <li>• <b>Read</b>: permission to access the file</li> <li>• <b>Write</b>: permission to write data to the file</li> <li>• <b>Execute</b>: permission to perform an operation. It must be selected when you add access or write permission.</li> </ul>

Permissions of an HDFS directory of each level are not shared by directory types of sub-levels by default. For example, if **Read** and **Execute** permissions are added to the **tmp** directory, you must select **Recursive** at the same time to add permissions to subdirectories.

**Table 11-39** Hive permission description

Resource Supporting Permission Management	Permission Setting
<b>Hive Admin Privilege</b>	Grants you Hive administrator rights.
<b>Database</b>	Hive resource type, indicating a Hive database, which is used to store Hive tables. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Select:</b> permission to query the Hive database</li> <li>• <b>Delete:</b> permission to perform the deletion operation in the Hive database</li> <li>• <b>Insert:</b> permission to perform the insertion operation in the Hive database</li> <li>• <b>Create:</b> permission to perform the creation operation in the Hive database</li> </ul>
<b>Table</b>	Hive resource type, indicating a Hive table, which is used to store data. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Select:</b> permission to query the Hive table</li> <li>• <b>Delete:</b> permission to perform the deletion operation in the Hive table</li> <li>• <b>Update:</b> grants users the <b>Update</b> permission of the Hive table</li> <li>• <b>Insert:</b> permission to perform the insertion operation in the Hive table</li> <li>• <b>Grant of Select:</b> permission to grant the <b>Select</b> permission to other users using Hive statements</li> <li>• <b>Grant of Delete:</b> permission to grant the <b>Delete</b> permission to other users using Hive statements</li> <li>• <b>Grant of Update:</b> permission to grant the <b>Update</b> permission to other users using Hive statements</li> <li>• <b>Grant of Insert:</b> permission to grant the <b>Insert</b> permission to other users using Hive statements</li> </ul>

By default, permissions of a Hive resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if **Select** and **Insert** permissions are added to the **default** database, they are automatically added to the tables and columns in the database. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

**Table 11-40** Yarn permission description

Resource Supporting Permission Management	Permission Setting
<b>Cluster Admin Operations</b>	Grants you Yarn administrator rights.
<b>root</b>	Root queue of Yarn. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Submit</b>: permission to submit jobs in the queue</li> <li>• <b>Admin</b>: permission to manage permissions of the current queue</li> </ul>
<b>Parent Queue</b>	Yarn resource type, indicating a parent queue containing sub-queues. A root queue is a type of a parent queue. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Submit</b>: permission to submit jobs in the queue</li> <li>• <b>Admin</b>: permission to manage permissions of the current queue</li> </ul>
<b>Leaf Queue</b>	Yarn resource type, indicating a leaf queue. It has the following permissions: <ul style="list-style-type: none"> <li>• <b>Submit</b>: permission to submit jobs in the queue</li> <li>• <b>Admin</b>: permission to manage permissions of the current queue</li> </ul>

By default, permissions of a Yarn resource type of each level are shared by resource types of sub-levels. However, the **Recursive** option is not selected by default. For example, if the **Submit** permission is added to the **root** queue, it is automatically added to the sub-queue. Permissions inherited by sub-queues will not be displayed as selected in the **Permission** table. If a child resource is set after the parent resource, the permission of the child resource is the union of the permissions of the parent resource and the current child resource.

**Table 11-41** Hue permission description

Resource Supporting Permission Management	Permission Setting
<b>Storage Policy Admin</b>	Grants you storage policy administrator rights.

**Step 4** Click **OK**. Return to **Manage Role**.

----End

## Related Tasks

### Modifying a role

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be modified, click **Modify** to modify role information.

 **NOTE**

If you change permissions assigned by the role, it takes 3 minutes to make new configurations take effect.

- Step 4** Click **OK**. The modification is complete.

----End

#### **Deleting a role**

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage Role**.
- Step 3** In the row of the role to be deleted, click **Delete**.
- Step 4** Click **OK**. The role is deleted.

----End

## 11.13.2 Creating a User Group

### Scenario

This section describes how to create user groups and specify their operation permissions on MRS Manager. Management of single or multiple users can be unified in the user groups. After being added to a user group, users can obtain operation permissions owned by the user group.

Up to 100 user groups can be created on MRS Manager.

### Prerequisites

You have learned service requirements and created roles required by service scenarios.

### Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User Group**.
- Step 3** Above the user group list, click **Create User Group**.
- Step 4** Input **Group Name** and **Description**.
- Group Name** is mandatory and contains 3 to 20 digits, letters, and underscores (\_). **Description** is optional.
- Step 5** In **Role**, click **Select and Add Role** to select and add specified roles.
- If you do not add the roles, the user group you are creating now does not have the permission to use MRS clusters.

**Step 6** Click **OK**. The user group is created.

----End

## Related Tasks

### Modifying a user group

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User Group**.

**Step 3** In the row of the user group to be modified, click **Modify**.

#### NOTE

If you change role permissions assigned to the user group, it takes 3 minutes to make new configurations take effect.

**Step 4** Click **OK**. The modification is complete.

----End

### Deleting a user group

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User Group**.

**Step 3** In the row of the user group to be deleted, click **Delete**.

**Step 4** Click **OK**. The user group is deleted.

----End

## 11.13.3 Creating a User

### Scenario

This section describes how to create users on MRS Manager based on site requirements and specify their operation permissions to meet service requirements.

Up to 1,000 users can be created on MRS Manager.

If a new password policy needs to be used for a new user's password, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to create a user.

### Prerequisites

MRS cluster administrators have learned service requirements and created roles and role groups required by service scenarios.

### Procedure

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User**.

**Step 3** Above the user list, click **Create User**.

**Step 4** Configure parameters as prompted and enter a username in **User Name**.

 **NOTE**

- If a username exists, you cannot create another username that only differs from the existing username in case. For example, if **User1** has been created, you cannot create **user1**.
- When you use the user you created, enter the correct username, which is case-sensitive.
- **User Name** is mandatory and contains 3 to 20 digits, letters, and underscores (\_).
- **root**, **omm**, and **ommdba** are reserved system user. Select another username.

**Step 5** Set **User Type** to either **Human-Machine** or **Machine-Machine**.

- **Human-Machine** users: used for O&M on MRS Manager and operations on component clients. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
- **Machine-Machine** users: used for MRS application development. If you select this user type, you do not need to enter a password, because the password is randomly generated.

**Step 6** In **User Group**, click **Select and Join User Group** to select user groups and add users to them.

 **NOTE**

- If roles have been added to user groups, the users can be granted with permissions of the roles.
- If you want to grant new users with Hive permissions, add the users to the Hive group.
- If a user needs to manage tenant resources, the user group must be assigned the **Manager\_tenant** role and the role corresponding to the tenant.

**Step 7** In **Primary Group**, select a group as the primary group for users to create directories and files. The drop-down list contains all groups selected in **User Group**.

**Step 8** In **Assign Rights by Role**, click **Select and Add Role** to add roles for users based on service requirements.

 **NOTE**

- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. It takes 3 minutes to make role permissions granted to the new user take effect.
- Adding a role when you create a user can specify the user rights.
- A new user can access WebUIs of HDFS, HBase, Yarn, Spark, and Hue even when roles are not assigned to the user.

**Step 9** In **Description**, provide description based on onsite service requirements.

**Description** is optional.

**Step 10** Click **OK**. The user is created.

If a new user is used in the MRS cluster for the first time, for example, used for logging in to MRS Manager or using the cluster client, the password must be changed. For details, see section **Changing the Password of an Operation User**.

----End

## 11.13.4 Modifying User Information

### Scenario

This section describes how to modify user information on MRS Manager, including information about the user group, primary group, role, and description.

### Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.
- Step 3** In the row of the user to be modified, click **Modify**.

#### NOTE

If you change user groups for or assign role permissions to the user, it takes 3 minutes to make new configurations take effect.

- Step 4** Click **OK**. The modification is complete.

----End

## 11.13.5 Locking a User

This section describes how to lock users in MRS clusters. A locked user cannot log in to MRS Manager or perform security authentication in the cluster.

A locked user can be unlocked by a MRS cluster administrator manually or until the lock duration expires. You can lock a user by using either of the following methods:

- Automatic lock: Set **Number of Password Retries** in **Configure Password Policy**. If user login attempts exceed the parameter value, the user is automatically locked. For details, see [Modifying a Password Policy](#).
- Manual lock: The MRS cluster administrator manually locks a user.

The following describes how to manually lock a user. **Machine-Machine** users cannot be locked.

### Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.
- Step 3** In the row of the user to be locked, click **Lock User**.
- Step 4** In the window that is displayed, click **Yes** to lock the user.

----End

## 11.13.6 Unlocking a User

If a user is locked because the number of login attempts exceeds the value of **Number of Password Retries**, or the user is manually locked by the MRS cluster administrator, the MRS cluster administrator can unlock the user on MRS Manager.

### Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.
- Step 3** In the row of the user to be unlocked, click **Unlock User**.
- Step 4** In the window that is displayed, click **Yes** to unlock the user.

----End

## 11.13.7 Deleting a User

### Scenario

If an MRS cluster user is not required, you can delete the user on MRS Manager.

### Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.
- Step 3** In the row of the user to be deleted, choose **More > Delete**.
- Step 4** Click **OK**.

----End

## 11.13.8 Changing the Password of an Operation User

### Scenario

Passwords of **Human-Machine** system users must be regularly changed to ensure MRS cluster security. This section describes how to change your passwords on MRS Manager.

If a new password policy needs to be used for the password modified by the user, follow instructions in [Modifying a Password Policy](#) to modify the password policy and then perform the following operations to modify the password.

### Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after changing the password of the MRS cluster user.

## Prerequisites

- You have obtained the current password policies from the MRS cluster administrator.
- You have obtained the MRS Manager access address from the MRS cluster administrator.

## Procedure

**Step 1** On MRS Manager, move the mouse cursor to  in the upper right corner. On the menu that is displayed, select **Change Password**.

**Step 2** Fill in the **Old Password**, **New Password**, and **Confirm Password**. Click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:'",<.>/?).
- The password cannot be the username or the reverse username.

----End

## 11.13.9 Initializing the Password of a System User

### Scenario

This section describes how to initialize a password on MRS Manager if a user forgets the password or the password of a public account needs to be changed regularly. After password initialization, the user must change the password upon the first login.

### Impact on the System

If you have downloaded a user authentication file, download it again and obtain the keytab file after initializing the password of the MRS cluster user.

### Initializing the Password of a Human-Machine User

**Step 1** On MRS Manager, click **System**.

**Step 2** In the **Permission** area, click **Manage User**.

**Step 3** Locate the row that contains the user whose password is to be initialized, choose **More > Initialize password**, and change the password as prompted.

In the window that is displayed, enter the password of the current MRS cluster administrator account and click **OK**. Then in **Initialize password**, click **OK**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.

- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:'''<.>/?).
- The password cannot be the username or the reverse username.

----End

## Initializing the Password of a Machine-Machine User

**Step 1** Prepare a client based on service conditions and log in to the node where the client is installed.

**Step 2** Run the following command to switch the user:

```
sudo su - omm
```

**Step 3** Run the following command to switch to the client directory, for example, **/opt/client**:

```
cd /opt/client
```

**Step 4** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 5** Run the following command to log in to the console as user **kadmin/admin**:

```
kadmin -p kadmin/admin
```

### NOTE

The default password of user **kadmin/admin** is **KAdmin@123**, which will expire upon your first login. Change the password as prompted and keep the new password secure.

**Step 6** Run the following command to reset the password of a component running user. This operation takes effect for all servers.

```
cpw Component running user name
```

For example, **cpw oms/manager**.

For the cluster, the default password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters ('~!@#\$%^&\*()-\_+=\|[]{};:'''<.>/?).
- The password cannot be the username or the reverse username.

----End

## 11.13.10 Downloading a User Authentication File

### Scenario

When a user develops big data applications and runs them in an MRS cluster that supports Kerberos authentication, the user needs to prepare a user authentication file for accessing the MRS cluster. The keytab file in the authentication file can be used for user authentication.

This section describes how to download a user authentication file and export the keytab file on MRS Manager.

 NOTE

- Before downloading a **Human-machine** user authentication file, change the password for the user on MRS Manager to make the initial password set by the MRS cluster administrator invalid. Otherwise, the exported keytab file cannot be used. For details, see [Changing the Password of an Operation User](#).
- After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

## Procedure

- Step 1** On MRS Manager, click **System**.
- Step 2** In the **Permission** area, click **Manage User**.
- Step 3** In the row of the user for whom you want to export the keytab file, choose **More > Download authentication credential** to download the authentication file. After the file is automatically generated, save it to a specified path and keep it properly.
- Step 4** Open the authentication file with a decompression program.
  - **user.keytab** indicates a user keytab file used for user authentication.
  - **krb5.conf** indicates the configuration file of the authentication server. The application connects to the authentication server according to the configuration file information when authenticating users.

----End

## 11.13.11 Modifying a Password Policy

### Scenario

This section describes how to set password and user login security rules as well as user lock rules. Password policies set on MRS Manager take effect for **Human-machine** users only, because the passwords of **Machine-machine** users are randomly generated.

If a new password policy needs to be used for a new user's password or the password modified by the user, perform the following operations to modify the password policy first, and then create a user or change the password by following instructions in [Creating a User](#) or [Changing the Password of an Operation User](#).

---

**NOTICE**

Modify password policies based on service security requirements, because they involve user management security. Otherwise, security risks may be caused.

---

## Procedure

- Step 1** On MRS Manager, click **System**.

**Step 2** Click **Configure Password Policy**.

**Step 3** Modify password policies as prompted. For parameter details, see the following table:

**Table 11-42** Password policy parameter description

Parameter	Description
<b>Minimum Password Length</b>	Indicates the minimum number of characters a password contains. The value ranges from 8 to 32. The default value is <b>8</b> .
<b>Number of Character Types</b>	Indicates the minimum number of character types a password contains. The character types are uppercase letters, lowercase letters, digits, spaces, and special characters (~!?,.,;-'(){}[]/<>@#\$%^&*+ \=). The value can be <b>3</b> or <b>4</b> . The default value <b>3</b> indicates that the password must contain at least three types of the following characters: uppercase letters, lowercase letters, digits, special characters, and spaces.
<b>Password Validity Period (days)</b>	Indicates the validity period (days) of a password. The value ranges from 0 to 90. 0 means that the password is permanently valid. The default value is <b>90</b> .
<b>Password Expiration Notification Days</b>	Indicates the number of days in advance users are notified that their passwords are about to expire. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When a user logs in to MRS Manager, a message is displayed, indicating that the password is about to expire and asking the user whether to change the password. The value ranges from <b>0</b> to <i>X</i> ( <i>X</i> must be set to the half of the password validity period and rounded down). Value <b>0</b> indicates that no notification is sent. The default value is <b>5</b> .

Parameter	Description
<b>Interval of Resetting Authentication Failure Count (min)</b>	Indicates the interval of retaining incorrect password attempts, in minutes. The value ranges from 0 to 1440. 0 indicates that incorrect password attempts are permanently retained and 1440 indicates that incorrect password attempts are retained for one day. The default value is 5.
<b>Number of Password Retries</b>	Indicates the number of consecutive wrong passwords allowed before the system locks the user. The value ranges from 3 to 30. The default value is 5.
<b>Account Lock Duration (min)</b>	Indicates the time period for which a user is locked when the user lockout conditions are met. The value ranges from 5 to 120. The default value is 5.

----End

## 11.14 Patch Operation Guide

### 11.14.1 Patch Operation Guide for Versions

If you obtain patch information from the following sources, upgrade the patch according to actual requirements.

- You obtain information about the patch released by MRS from a message pushed by the message center service.
- You obtain information about the patch by accessing the cluster and viewing patch information.

#### Preparing for Patch Installation

- Follow instructions in [Performing a Health Check](#) to check cluster status. If the cluster health status is normal, install a patch.
- You need to confirm the target patch to be installed according to the patch information in the patch content.

#### Installing a Patch

- Step 1** Log in to the MRS management console.
- Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.
- Step 3** On the **Patch Information** page, click **Install** in the **Operation** column to install the target patch.

 NOTE

- For details about rolling patch operations, see [Supporting Rolling Patches](#).
- For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## Uninstalling a Patch

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

**Step 3** On the **Patch Information** page, click **Uninstall** in the **Operation** column to uninstall the target patch.

 NOTE

- For details about rolling patch operations, see [Supporting Rolling Patches](#).
- For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## 11.14.2 Supporting Rolling Patches

The rolling patch function indicates that patches are installed or uninstalled for one or more services in a cluster by performing a rolling service restart (restarting services or instances in batches), without interrupting the services or within a minimized service interruption interval. Services in a cluster are divided into the following three types based on whether they support rolling patch:

- Services supporting rolling patch installation or uninstallation: All businesses or part of them (varying depending on different services) of the services are not interrupted during patch installation or uninstallation.
- Services not supporting rolling patch installation or uninstallation: Businesses of the services are interrupted during patch installation or uninstallation.
- Services with some roles supporting rolling patch installation or uninstallation: Some businesses of the services are not interrupted during patch installation or uninstallation.

**Table 11-43** provides services and instances that support or do not support rolling restart in the MRS cluster.

**Table 11-43** Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	ZKFC	
	JournalNode	

Service	Instance	Whether to Support Rolling Restart
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	
MapReduce	JobHistoryServer	Yes
HBase	HMaster	Yes
	RegionServer	
	ThriftServer	
	RETSerVer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
ZooKeeper	QuorumPeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes
	MonitorServer	
Storm	Nimbus	Yes
	UI	
	Supervisor	
	LogViewer	

## Installing a Patch

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

**Step 3** On the **Patch Information** page, click **Install** in the **Operation** column.

**Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

### NOTE

- Enabling the rolling patch installation function: Services are not stopped before patch installation, and rolling service restart is performed after the patch installation. This minimizes the impact on cluster services but takes more time than common patch installation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch installation function is not available in clusters with less than two Master nodes and three Core nodes.

**Step 5** Click **OK** to install the target patch.

**Step 6** View the patch installation progress.

1. Access MRS Manager. For details, see [Accessing Manager](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch installation progress.

### NOTE

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## Uninstalling a Patch

**Step 1** Log in to the MRS management console.

**Step 2** Choose **Clusters > Active Clusters** and click the name of the cluster to be queried to enter the page displaying the cluster's basic information.

**Step 3** On the **Patch Information** page, click **Uninstall** in the **Operation** column.

**Step 4** On the **Warning** page, enable or disable **Rolling Patch**.

 NOTE

- Enabling the rolling patch uninstallation function: Services are not stopped before patch uninstallation, and rolling service restart is performed after the patch uninstallation. This minimizes the impact on cluster services but takes more time than common patch uninstallation.
- Disabling the rolling patch uninstallation function: All services are stopped before patch uninstallation, and all services are restarted after the patch uninstallation. This temporarily interrupts the cluster and the services but takes less time than rolling patch uninstallation.
- The rolling patch uninstallation function is not available in clusters with less than two Master nodes and three Core nodes.

**Step 5** Click **OK** to uninstall the target patch.

**Step 6** View the patch uninstallation progress.

1. Access MRS Manager. For details, see [Accessing Manager](#).
2. Choose **System > Manage Patch**. On the **Manage Patch** page, you can view the patch uninstallation progress.

 NOTE

For the isolated host nodes in the cluster, follow instructions in [Restoring Patches for the Isolated Hosts](#) to restore the patch.

----End

## 11.15 Restoring Patches for the Isolated Hosts

If some hosts are isolated in a cluster, perform the following operations to restore patches for these isolated hosts after patch installation on other hosts in the cluster. After patch restoration, versions of the isolated host nodes are consistent with those are not isolated.

**Step 1** Access MRS Manager. For details, see [Accessing Manager](#).

**Step 2** Choose **System > Manage Patch**. The **Manage Patch** page is displayed.

**Step 3** In the **Operation** column, click **View Details**.

**Step 4** On the patch details page, select host nodes whose **Status** is **Isolated**.

**Step 5** Click **Select and Restore** to restore the isolated host nodes.

----End

## 11.16 Rolling Restart

After modifying the configuration items of a big data component, you need to restart the corresponding service to make new configurations take effect. If you use a normal restart mode, all services or instances are restarted concurrently, which may cause service interruption. To ensure that services are not affected during service restart, you can restart services or instances in batches by rolling restart. For instances in active/standby mode, a standby instance is restarted first and then an active instance is restarted. Rolling restart takes longer than normal restart.

**Table 11-44** provides services and instances that support or do not support rolling restart in the MRS cluster.

**Table 11-44** Services and instances that support or do not support rolling restart

Service	Instance	Whether to Support Rolling Restart
HDFS	NameNode	Yes
	ZKFC	
	JournalNode	
	HttpFS	
	DataNode	
Yarn	ResourceManager	Yes
	NodeManager	
Hive	MetaStore	Yes
	WebHCat	
	HiveServer	
MapReduce	JobHistoryServer	Yes
HBase	HMaster	Yes
	RegionServer	
	ThriftServer	
	RETSerVer	
Spark	JobHistory	Yes
	JDBCServer	
	SparkResource	No
Hue	Hue	No
Tez	TezUI	No
Loader	Sqoop	No
ZooKeeper	Quorumpeer	Yes
Kafka	Broker	Yes
	MirrorMaker	No
Flume	Flume	Yes
	MonitorServer	
Storm	Nimbus	Yes

Service	Instance	Whether to Support Rolling Restart
	UI	
	Supervisor	
	Logviewer	

## Restrictions

- Perform a rolling restart during off-peak hours.
  - Otherwise, a rolling restart failure may occur. For example, if the throughput of Kafka is high (over 100 MB/s) during the Kafka rolling restart, the Kafka rolling restart may fail.
  - For example, if the requests per second of each RegionServer on the native interface exceed 10,000 during the HBase rolling restart, you need to increase the number of handles to prevent a RegionServer restart failure caused by heavy loads during the restart.
- Before the restart, check the number of current requests of HBase. If requests of each RegionServer on the native interface exceed 10,000, increase the number of handles to prevent a failure.
- If the number of Core nodes in a cluster is less than six, services may be affected for a short period of time.
- Preferentially perform a rolling instance or service restart and select **Only restart instances whose configurations have expired**.

## Performing a Rolling Service Restart

- Step 1** On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.
- Step 2** On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.
- Step 3** After you enter the MRS cluster administrator password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.
- Step 4** After the rolling restart task is complete, click **Finish**.
- End

## Performing a Rolling Instance Restart

- Step 1** On MRS Manager, click **Services** and select a service for which you want to perform a rolling restart.
- Step 2** On the **Instance** tab page, select the instance to be restarted. Click **More** and select **Perform Rolling Instance Restart**.

**Step 3** After you enter the MRS cluster administrator password, the **Perform Rolling Instance Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the instance.

**Step 4** After the rolling restart task is complete, click **Finish**.

----End

## Perform a Rolling Cluster Restart

**Step 1** On MRS Manager, click **Services**. The **Services** page is displayed.

**Step 2** Click **More** and select **Perform Rolling Cluster Restart**.

**Step 3** After you enter the MRS cluster administrator password, the **Perform Rolling Cluster Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the cluster.

**Step 4** After the rolling restart task is complete, click **Finish**.

----End

## Rolling Restart Parameter Description

[Table 11-45](#) describes rolling restart parameters.

**Table 11-45** Rolling restart parameter description

Parameter	Description
Only restart instances whose configurations have expired	Specifies whether to restart only the modified instances in a cluster.
Data Node Instances to Be Batch Restarted	Specifies the number of instances that are restarted in each batch when the batch rolling restart strategy is used. The default value is <b>1</b> . The value ranges from 1 to 20. This parameter is valid only for data nodes.
Batch Interval	Specifies the interval between two batches of instances for rolling restart. The default value is <b>0</b> . The value ranges from 0 to 2147483647. The unit is second.  Note: Setting the batch interval parameter can increase the stability of the big data component process during the rolling restart. You are advised to set this parameter to a non-default value, for example, 10.
Batch Fault Tolerance Threshold	Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is <b>0</b> , which indicates that the rolling restart task ends after any batch of instances fails to be restarted. The value ranges from 0 to 214748364.

## Procedure in a Typical Scenario

- Step 1** On MRS Manager, click **Services** and select HBase. The HBase service page is displayed.
- Step 2** Click the **Service Configuration** tab, and modify an HBase parameter. After the following dialog box is displayed, click **OK** to save the configurations.

 **NOTE**

Do not select **Restart the affected services or instances**. This option indicates a normal restart. If you select this option, all services or instances will be restarted, which may cause service interruption.

- Step 3** After saving the configurations, click **Finish**.
- Step 4** Click the **Service Status** tab.
- Step 5** On the **Service Status** tab page, click **More** and select **Perform Rolling Service Restart**.
- Step 6** After you enter the MRS cluster administrator password, the **Perform Rolling Service Restart** page is displayed. Select **Only restart instances whose configurations have expired** and click **OK** to perform rolling restart for the service.
- Step 7** After the rolling restart task is complete, click **Finish**.

----End

# 12 FusionInsight Manager Operation Guide (Applicable to 3.x)

---

## 12.1 Getting Started

### 12.1.1 FusionInsight Manager Introduction

#### Overview

MRS manages and analyzes massive data and helps you rapidly obtain desired data from structured and unstructured data. The structure of open-source components is complex. The installation, configuration, and management processes are time- and labor-consuming. FusionInsight Manager is a unified enterprise-level cluster management platform and provides the following functions:

- **Cluster monitoring:** allows you to better understand status of hosts and services.
- **Graphical indicator monitoring and customization:** allow you to obtain key system information in a timely manner.
- **Service property configuration:** allows you to configure service properties based on the performance requirements of your services.
- **Cluster, service, and role instance operations:** allow you to start or stop services and clusters with just a few clicks.
- **Permission management and audit:** allow you to configure the access control and manage operation logs.

#### Supported Browsers

- Google Chrome.  
The Google Chrome 90 to 92 versions are recommended.
- Edge  
Supports the Edge browser that comes with the Windows 10 system.

 NOTE

It is recommended to access FusionInsight Manager using a browser on the Windows platform.

## Introduction to the Manager GUI

FusionInsight Manager provides a unified cluster management platform, facilitating rapid and easy O&M for clusters.

The upper part of the page is the operation bar, the middle part is the display area, and the bottom part is the taskbar.

- [Table 12-1](#) describes the functions of each portal on the operation bar.

**Table 12-1** Functions of each portal on the operation bar

Portal	Function Description
Homepage	Shows the key monitoring indicators and statuses of clusters and the host statuses in column charts, line charts, and tables. You can customize a dashboard for the key monitoring indicators and drag it onto any position on the visualized interface layout. The system overview page supports automatic data update. For details, see <a href="#">Homepage</a> .
Cluster	Provides the service monitoring, operation, and configuration guidance, which helps you manage services in a unified manner. For details, see <a href="#">Cluster</a> .
Hosts	Provides the host monitoring and operation guidance to help you manage hosts in a unified manner. For details, see <a href="#">Hosts</a> .
O&M	Allows you to query and handle alarms, and helps you identify product faults and potential risks in a timely manner, ensuring proper system running. For details, see <a href="#">O&amp;M</a> .
Audit	Allows you to query and export audit logs, and view all user activities and operations. For details, see <a href="#">Audit</a> .
Tenant Resources	Provides a unified tenant management platform. For details, see <a href="#">Tenant Resources</a> .
System	Provides FusionInsight Manager system configuration and management functions, such as user permission configuration. For details, see <a href="#">System Configuration</a> .

### 12.1.2 Querying the FusionInsight Manager Version

Before performing system upgrade and routine maintenance operations, you need to query the current FusionInsight Manager version.

- **Using the GUI**

On the **Homepage** interface, click  on the upper right corner and choose **About** from the shortcut menu. In the displayed interface, view the version number of FusionInsight Manager.

- **Using the CLI**

- a. Log in to the active management node using the IP address of this node as user **root**.
- b. Run the following command to check the FusionInsight\_Manager version and platform information:

```
su - omm
cd ${BIGDATA_HOME}/om-server/om/sbin/pack
./queryManager.sh
```

Information similar to the following is displayed:

Version	Package	Cputype
8.0.2.1	FusionInsight_Manager_8.0.2.1	x86_64

 **NOTE**

In this document, 8.0.2.1 is used as an example.

## 12.1.3 Logging In to FusionInsight Manager

### Scenarios

This section describes how to log in to FusionInsight Manager using an account after FusionInsight Manager is installed.

### Procedure

**Step 1** Obtain the URL of FusionInsight Manager.

**Step 2** On login page, enter the username and password.

**Step 3** New users need to change their passwords.

The password must meet the following requirements:

- It must contain 8 to 64 characters.
- It must contain at least four of the following character types: uppercase letters, lowercase letters, digits, spaces, and special characters `~!@#\$\$%^&\*()-\_+=+[{ }];',<.>^/?`.
- It must be different from the username or its reverse.
- It must be different from the current password.

**Step 4** Move your cursor to  in the upper right corner of FusionInsight Manager, and click **Log Out** and click **OK** from the drop-down list to log out of the current user.

----End

## 12.1.4 Logging In to the Management Node

### Scenarios

Some O&M operation scripts and commands need to be run or can be run only on the active management node. You can identify and log in to the active or standby management node based on the following operations.

### Checking and Logging In to the Active and Standby Management Nodes

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > OMS**.

In the **Basic Information** area, **Current Active** indicates the host name of the active management node, and the **Current Standby** indicates the host name of the standby management node. Click a host name to go to the host details page. On the host details page, record the IP address of the host.

**Step 3** Log in to the active or standby management node as user **omm**.

----End

### Identifying the Active and Standby Management Nodes by Running Scripts and Logging In to Them

**Step 1** Log in to any node where FusionInsight Manager is deployed as user **omm**.

**Step 2** Run the following command to identify the active and standby management nodes:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh
```

In the command output, the value of **HAActive** for the active management node is **active**, and that for the standby management node is **standby**. In the following example, **Master1** is the active management node, and **Master2** is the standby management node.

```
HAMode
double
NodeName      HostName      HAVersion      StartTime      HAActive
HAAllResOK    HARunPhase
192-168-0-30  Master1       V100R001C01    2022-05-01 23:43:02  active
normal        Activated
192-168-0-24  Master2       V100R001C01    2022-05-01 07:14:02  standby
normal        Deactivated
```

**Step 3** Run the following command to obtain the IP addresses of the active and standby management nodes.

```
cat /etc/hosts
```

The following is an example of the IP addresses of the active and standby management nodes:

```
127.0.0.1    localhost
192.168.0.30 Master1
192.168.0.24 Master2
```

**Step 4** Log in to the active or standby management node as user **omm**.

----End

## 12.2 Homepage

### 12.2.1 Overview

After you log in to FusionInsight Manager, the contents on the **Homepage** tab page are displayed by default. The **Summary** page displays the service status preview and the monitoring status report of clusters. The **Alarm Analysis** page displays statistics and analysis on top alarms.

- On the right of the operation bar, you can view the number of alarms of different severities, number of running tasks, current users, and help information.
  - Click  to view the task name, cluster, status, progress, start time, and end time of the latest 100 operation tasks in the **Task Management Center**.

 **NOTE**

For a start, stop, restart, or rolling restart task, you can click the task name in the **Task Management Center** and click **Abort**. Then, enter the MRS cluster administrator password as prompted to abort the task. After the task is aborted successfully, the task stops.

- Click  and choose any help information in the displayed short-cut menu to obtain the details. [Table 12-2](#) describes the help information in the displayed shortcut menu.

**Table 12-2** List of help information

Item	Description
About	Provides current FusionInsight Manager version number, email, website and technical support information.

- The taskbar at the bottom of the home page displays the language options of FusionInsight Manager and the current cluster time and time zone information. You can switch the system language.

### Service Status Preview Area

On the home page, the number of hosts in clusters and number of installed services are displayed on the left. You can click  to display all service information of a cluster and view status and alarm information of each service installed in the cluster.

Click  to perform basic O&M operations on the current cluster. For details, see [Table 12-3](#).

The  icon on the left of each service name indicates that the service is running properly, the  icon on the left of each service name indicates that the service is failed to start. The  icon indicates that the service is not started.

On the right of the service name, you can check whether an alarm is generated for the service. If an alarm exists, the icon is used to identify the alarm severity and display the number of alarms.

If a component supports multiple services, and multiple services are installed in a cluster, the number of installed services will be displayed on the right of the service.

The  icon displayed on the right of the service name indicates that the service configuration has expired.

## Monitoring Status Report Area

The chart area is on the right of the **Homepage**, which shows the monitoring reports of the key status, such as the status of all hosts in the cluster, host CPU usage, and host memory usage. You can customize the monitoring reports displayed in the chart area. For details about managing the monitoring indicators, see [Managing the Monitoring Indicator Report](#).

The graph data sources are displayed in the lower left. You can zoom in a monitoring report to view the detailed information or close the report.

## Alarm Analysis

The **Top 20 Alarms** table and **Analysis on Top 3 Alarms** chart are provided on the **Alarm Analysis** tab page. Click the alarm name in the **Top 20 Alarms** table to display the analysis information of this alarm only. Top alarms and their occurrence time are both provided, so that you could handle alarms accordingly to improve system stability.

## 12.2.2 Managing the Monitoring Indicator Report

### Scenarios

On FusionInsight Manager, you can customize the monitoring items displayed on the **Homepage** page and export monitoring data.

 **NOTE**

The time unit of the horizontal axis varies with the custom duration of historical reports. The details are as follows:

- If the custom duration is 0 to 25 hours, the time unit is 5 minutes. In this case, the cluster must have been installed for at least 10 minutes. The system can reserve monitoring data generated in the latest 15 days.
- If the custom duration is 25 to 150 hours, the time unit is 30 minutes. In this case, the cluster must have been installed for at least 30 minutes. The system can reserve monitoring data generated in the latest 3 months.
- If the custom duration is 150 to 300 hours, the time unit is 1 hour. In this case, the cluster must have been installed for at least 1 hour. The system can reserve monitoring data generated in the latest 3 months.
- If the custom duration is 300 hours to 300 days, the time unit is 1 day. In this case, the cluster must have been installed for at least 1 day. The system can reserve monitoring data generated in the latest 6 months.
- If the custom duration is greater than 300 days, the time unit is 7 days. In this case, the cluster must have been installed for at least 7 days. The system can reserve monitoring data generated in the latest 1 year.
- If the disk usage of the GaussDB partition used by the FusionInsight Manager storage exceeds 80%, the real-time monitoring data and monitoring data whose monitoring period is 5 minutes are cleared.
- For **Storage Resource (HDFS)** in **Tenant Resources**, if the custom duration is 0 to 300 hours, the time unit is 1 hour. In this case, the cluster must have been installed for at least one hour. The system can reserve monitoring data generated in the latest three months.

## Customizing the Monitoring Indicator Report

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Homepage**.

**Step 3** In the upper right corner of the chart area, click  and choose **Customize** from the displayed menu.

 **NOTE**

The monitoring period is in the unit of five minutes. The monitoring data of the latest one hour is displayed. After the real-time monitoring page is displayed, the real-time monitoring data generated in five minutes is displayed on the right of the monitoring graph.

**Step 4** In the navigation tree on the left, select a resource subject to be monitored.

**Step 5** Select one or more monitoring indicators from the monitoring list on the right.

**Step 6** Click **OK**.

----End

## Exporting Monitoring Data

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Homepage**.

**Step 3** In the upper right corner of the chart area of the cluster to be operated, select a time range to obtain monitoring data. For example, **1 Week**.

The default setting is real-time monitoring data, which cannot be exported. Click  to customize a time range for the monitoring data to be exported.

**Step 4** In the upper right corner of the chart area, click  and choose **Export** in the displayed menu.

----End

## Exporting the Data of Specified Monitoring Items

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Homepage**.

**Step 3** In the upper right corner of any monitoring report pane in the chart area of the cluster to be operated, click .

**Step 4** Select a time range to obtain monitoring data. For example, **1 Week**.

By default, real-time monitoring data is selected, which cannot be exported. Click  to customize a time range for the monitoring data to be exported.

**Step 5** Click **Export**.

----End

## 12.3 Cluster

### 12.3.1 Cluster Management

#### 12.3.1.1 Overview

##### Dashboard

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Dashboard** to view the status of the current cluster.

On the **Dashboard** page, you can start, stop, rolling restart, synchronize configurations for, and perform basic management operations for the current cluster, as described in [Table 12-3](#).

**Table 12-3** Management and maintenance

UI Portal	Description
<b>Start</b>	Start all services in the cluster.
<b>Stop</b>	Stop all services in the cluster.

UI Portal	Description
<b>More &gt; Restart</b>	Restart all services in the cluster.
<b>More &gt; Rolling-restart Service</b>	Restart all services in the cluster without interrupting services. For details, see <a href="#">Performing a Rolling Restart of a Cluster</a> .
<b>More &gt; Synchronize Configurations</b>	Synchronize parameter configurations for all services in the cluster.
<b>More &gt; Restart Configuration-Expired Instances</b>	Restart all instances whose configurations have expired. For details, see <a href="#">Managing Expired Configurations</a> .
<b>More &gt; Health Check</b>	<p>Perform health checks on the OMS, and all services and nodes in the cluster. The health check covers checks on the running status of each object, alarms, and user-defined monitoring metrics. The check result differs from the displayed <b>Running Status</b>.</p> <p>To export the result of the health check, click <b>Export Report</b> in the upper left corner. If any problem is detected, click <b>Help</b>.</p>
<b>More &gt; Download Client</b>	Download the default client for the user. For details, see <a href="#">Downloading the Client</a> .
<b>More &gt; Export Installation Template</b>	Export all installation configurations of the cluster in batches, including the cluster authentication mode, node information, and service configurations. This operation is performed when the cluster needs to be reinstalled in the same environment.
<b>More &gt; Export Configurations</b>	Export configurations of all services in the cluster in batches.
<b>More &gt; Enter Maintenance Mode/Exit Maintenance Mode</b>	Configure the cluster to enter or exit the maintenance mode.
<b>More &gt; O&amp;M View</b>	Check the services or hosts that are in the maintenance state.

### 12.3.1.2 Performing a Rolling Restart of a Cluster

#### Scenarios

Rolling restart means to restart a cluster without interrupting services after the service role is updated or the configuration is modified in the cluster.

If you need to restart all services in the cluster in batches without interrupting services, you can perform a rolling restart.

 NOTE

- Some services do not support a rolling restart. These services will experience a common restart during the rolling restart and may be interrupted. Perform operations as prompted.
- For configurations that must take effect immediately, for example, configuration of the port for a server, a rolling restart is not recommended. Perform a common restart instead.

## Impact on the System

Compared with a common restart, a rolling restart does not interrupt services, but it takes longer time than a common restart and may affect throughput and performance of the service to be restarted.

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster > Name of the desired cluster > Dashboard > More > Rolling-restart Service**.
- Step 3** In the displayed dialog box, enter the password of the current login user and click **OK**.
- Step 4** Set the parameters as required, as shown in [Table 12-4](#).

Table 12-4 Rolling restart parameters

Parameter	Description
<b>Restart only instances with expired configurations in the cluster</b>	Specifies whether to restart only the modified instances in a cluster.
<b>Enable rack strategy</b>	Specifies whether to enable the concurrent rolling restart of rack strategy. This option takes effect for roles that meet the rolling restart requirements of the rack strategy. (The roles support the rack-aware function, and instances of the roles belong to two or more racks). <b>NOTE</b> This parameter can be set only when a rolling restart is performed on HDFS or YARN.

Parameter	Description
<p><b>Data Nodes to Be Batch Restarted</b></p>	<p>Specifies the number of instances that are restarted for each batch when the batch rolling restart strategy is used. The default value is <b>1</b>.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• This parameter is valid only when the batch rolling restart strategy is used and the instance is the DataNode.</li> <li>• When the rack strategy is enabled, this parameter is invalid. In this case, the cluster uses the default maximum number of instances (20) configured in the rack strategy as the maximum number of instances that are concurrently restarted in a rack.</li> <li>• This parameter can be set only when a rolling restart is performed on HDFS, YARN, Kafka, Storm, or Flume.</li> <li>• This parameter for the RegionServer of HBase cannot be manually configured. Instead, it is automatically adjusted based on the number of RegionServer nodes. Specifically, if the number of RegionServer nodes is less than 30, the parameter value is <b>1</b>. If the number is greater than or equal to 30 and less than 300, the parameter value is <b>2</b>. If the number is greater than or equal to 300, the parameter value is 1% of the number (rounded-down).</li> </ul>
<p><b>Batch Interval</b></p>	<p>Specifies the interval between two batches of instances to be rolling restarted. The default value is <b>0</b>.</p>
<p><b>Decommissioning Timeout Interval</b></p>	<p>Specifies the decommissioning timeout interval for role instances during a rolling restart. The default value is 1800s.</p> <p>Some roles (such as HiveServer and JDBCServer) stop providing services before the rolling restart. Stopped instances cannot establish new connections. Existing connections will be completed after a period of time. A proper configuration of the timeout parameters can minimize the risk of service interruption.</p> <p><b>NOTE</b> This parameter can be set only when a rolling restart is performed for Hive and Spark2x.</p>
<p><b>Batch Fault Tolerance Threshold</b></p>	<p>Specifies the tolerance times when the rolling restart of instances fails to be executed in batches. The default value is <b>0</b>, which indicates that the rolling restart task ends after any batch of instances fails to be restarted.</p>

 **NOTE**

Set advanced parameters, such as **Data Nodes to Be Batch Restarted**, **Batch Interval**, and **Batch Fault Tolerance Threshold** based on site requirements. Otherwise, services may be interrupted or the performance may be severely affected. Therefore, exercise caution when performing this operation.

The following shows an example:

- If **Data Nodes to Be Batch Restarted** is too large, a great number of instances are restarted at the same time. As a result, services are interrupted or the performance is severely affected because the number of remaining instances is small.
- If **Batch Fault Tolerance Threshold** is too large, services will be interrupted when a new batch of instances is restarted after the previous instance restart failed.

**Step 5** Click **OK** and wait until the rolling restart is complete.

----End

### 12.3.1.3 Managing Expired Configurations

#### Scenarios

If a new configuration needs to be delivered to all services in the cluster, or **Configuration Status** of multiple services is set to **Expired** or **Failed** after a configuration is modified, the configuration parameters of these services are not synchronized and do not take effect, you can synchronize the configuration and restart related services for the cluster to make new configuration parameters take effect in all services.

If the configuration of the services in the cluster has been synchronized but do not take effect, you need to restart the instances whose configuration has expired.

#### Impact on the System

- After synchronizing the cluster configuration, you need to restart the services whose configuration has expired. These services are unavailable during restart.
- The instances whose configuration has expired are unavailable during restart.

#### Procedure

**Synchronize configurations.**

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Dashboard**.

**Step 3** Choose **More** > **Synchronize Configurations**.

**Step 4** In the displayed dialog box, click **OK**.

----End

**Restart instances whose configurations have expired.**

**Step 1** Choose **More** > **Restart Configuration-Expired Instances**.

**Step 2** In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 3** In the displayed dialog box, click **OK**.

You can click **View Instance** to open the list of all expired instances and confirm that the instances have been restarted.

----End

## 12.3.1.4 Downloading the Client

### Scenarios

A default client is provided for MRS clusters. You can manage the cluster, run services, and perform secondary development using this client. Before using the client, you need to download the client software package.

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Dashboard** > **More** > **Download Client**.

The **Download Cluster Client** dialog box is displayed.

**Step 3** Select a type in the **Select Client Type** dialog box.

- The **Complete Client** type indicates that the package contains scripts, compilation files, and configuration files.
- The **Configuration Files Only** type indicates that the package contains only the client configuration file.

This type is applicable to application development tasks. For example, it can be used in the following scenario: All client files are downloaded and installed and the MRS cluster administrator modifies the service configuration on FusionInsight Manager. The developer needs to update the client configuration files.

#### NOTE

There are two platform types: x86\_64 and aarch64, which can be installed on the x86 and TaiShan nodes respectively. By default, the platform type of the downloaded client is the same as that of the server.

**Step 4** Determine whether to generate a client software package file on the cluster node.

- If yes, select **Save to Path** and click **OK** to generate the client file.  
After the file is generated, it is stored in the **/tmp/FusionInsight-Client/** directory on the primary management node by default. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directory. If the client file already exists in the path, the existing client file will be replaced.

After the file is generated, copy the obtained package to another directory, as user **omm** or client installation user, for example, the **/opt/Bigdata/client** directory.

- If no, click **OK** and download the client file to the local PC.  
Download the client software package, and wait until the download is complete.

After the client is successfully downloaded, install the client by referring to [Installing a Client](#).

----End

### 12.3.1.5 Modifying Cluster Properties

#### Scenarios

FusionInsight Manager allows you to view basic attributes after the cluster is installed.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Cluster Properties**.

You can view the cluster name, cluster description, product type, cluster ID, authentication mode, cluster creation time and installed component by default.

**Step 3** Change the cluster name.

1. Click  and enter a new name.  
The following naming rules are as follows: Enter 2 to 199 characters, including letters, digits, underscores (\_), hyphens (-), and spaces. Spaces can be placed only between characters.
2. Click **OK** for the new cluster name to take effect.

**Step 4** Modify the cluster description.

1. Click  and enter a new description.  
Contains a maximum of 199 characters, including letters, digits, commas (,), periods(.), underscores(\_), spaces, or newline characters.
2. Click **OK** for the new description to take effect.

----End

### 12.3.1.6 Management Cluster Configuration

#### Scenario

FusionInsight Manager allows you to view the changes of service configuration parameters in a cluster by one click, helping you quickly locate faults and improve configuration management efficiency.

MRS cluster administrators can quickly view all non-default values of each service in the cluster, non-unified values between instances of the same role, historical records of cluster configuration modification, and parameters whose configuration status is expired in the cluster on the configuration page.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Configurations**.

**Step 3** Select an operation page based on the scenario.

- To view all non-default values:
  - a. Click **All Non-default Values**. The system displays the parameters that are inconsistent with the default values of each service, role, or instance in the current cluster.

You can click  next to a parameter value to quickly restore to the default value. You can click  to view the historical modification records of the parameter.

If a large number of parameters need to be configured, you can filter the parameters in the service filter box in the upper right corner of the page or enter keywords in the search box to search for the parameters.
  - b. If you need to change the parameter values of the configuration items, change the values according to the parameter description, and then click **Save**. In the dialog box that is displayed, click **OK**.
- To view all non-unified values:
  - a. Click **All Non-uniform Values**. The system displays configuration items with different role, instance group, service, or instance configurations in the current cluster.

Click  next to the parameter value. In the window that is displayed, you can view the differences.
  - b. If you need to change the parameter values, click  to cancel the configuration difference or manually adjust the parameter values, click **OK**, and then click **Save**. In the dialog box that is displayed, click **OK**.
- To check the expiration configurations:
  - a. Click **Expired Configurations**. Expired configuration items in the current cluster are displayed.
  - b. You can filter services in the upper corner of the page to view the expired configurations of different services, or enter keywords in the search box.
  - c. The expired configuration items do not take effect completely. If services are not affected, restart the services or instances whose configuration items have expired.
- To view historical configuration records:
  - a. Click **Historical Configurations**. The historical configuration change records of the current cluster are displayed. You can view the parameter value change details, including the service to which the parameter belongs, parameter values before and after the modification, and parameter files.
  - b. To restore a configuration change, click **Restore Configuration** in the **Operation** column. In the dialog box that is displayed, click **OK**.

**NOTE**

Some configuration items take effect only after the corresponding services are restarted. After the configuration is saved, restart the service or instance whose configuration has expired in a timely manner.

----End

## 12.3.1.7 Static Service Pool

### 12.3.1.7.1 Static Service Resources

#### Overview

The resources allocated to each service in a cluster are static service resources. Such services include Flume, HBase, HDFS and Yarn. The total volume of computing resources allocated to each service is fixed, and they are static. A tenant can exclusively use or share a service to obtain the resources required for running this service.

#### Static Service Pool

Static service pools are used to specify service resource configurations.

Static service pools centrally manage resources applicable to each service.

- They restrict the total volume of resources used for services and dynamically configure the total CPU, I/O, and memory resources applicable to nodes running Flume, HBase, HDFS and Yarn.
- The resources of services are isolated. The services in a cluster are isolated from each other, and the workload of one service has limited impact on other services.

#### Scheduling Mechanism

The time-based dynamic resource scheduling mechanism enables different volumes of static resources to be configured for services at different time, optimizing service running environments and improving the cluster efficiency.

In a complex cluster environment, multiple services share resources in the cluster, but the resource service period of each service may be different.

The following use a bank customer as an example:

- The HBase query service is heavy in the daytime.
- The query service is light, but the Hive analysis service is heavy at night.

If fixed resources are allocated to each service, the following problems may occur:

- The query service cannot obtain sufficient resources while the resources for the analysis service are idle in the daytime.
- The analysis service cannot obtain sufficient resources while the resources for the query service are idle at night.

As a result, the cluster resource utilization is low and the service capability is weak. Resolve the problem in the following ways:

- Sufficient resources need to be configured for HBase in the daytime.
- Sufficient resources need to be configured for Hive at night.

The time-based dynamic scheduling mechanism can efficiently utilize resources and run tasks.

### 12.3.1.7.2 Configuring Cluster Static Resources

#### Scenarios

You can adjust resource base on FusionInsight Manager and customize resource configuration groups if you need to control service resources used on each node in a cluster or the available CPU or I/O quotas on each node at different time segments.

#### Impact on the System

- After a static service pool is configured, the configuration status of affected services is displayed as **Expired**. You need to restart the services. Services are unavailable during restart.
- After a static service pool is configured, the maximum number of resources used by each service and role instance cannot exceed the upper limit.

#### Procedure

##### Modify the Resource Adjustment Base

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Static Service Pool Configurations**.
- Step 2** Click **Configurations** in the upper right corner. The page for configuring resource pools is displayed.
- Step 3** Change the values of **CPU (%)** and **Memory (%)** in the **System Resource Adjustment Base** area.

Modifying the system resource adjustment base changes the maximum physical CPU and memory usage on nodes by services. If multiple services are deployed on the same node, the maximum physical resource usage of all services cannot exceed the adjusted CPU or memory usage.

- Step 4** Click **Next**.

To modify parameters again, click **Previous**.

##### Modify the Default Resource Configuration Group

- Step 5** Click **default**. In the **Configure weight** table, set **CPU LIMIT(%)**, **CPU SHARE(%)**, **I/O(%)**, and **Memory(%)** for each service.

 NOTE

- The sum of **CPU LIMIT(%)** and **CPU SHARE(%)** used by all services can exceed 100%.
- The sum of **I/O(%)** used by all services can exceed 100% but not 0.
- The sum of **Memory(%)** used by all services can be greater than, smaller than, or equal to 100%.
- **Memory(%)** cannot take effect dynamically and can only be modified in the default configuration group.
- **CPU LIMIT(%)** is used to configure the ratio of the number of CPU cores that can be used by a service to those can be allocated to related nodes.
- **CPU SHARE(%)** is used to configure the ratio of the time when a service uses a CPU core to the time when other services use the CPU core. That is, the ratio of time when multiple services compete for the same CPU core.

**Step 6** Click **Generate detailed configurations based on weight configurations**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

**Step 7** Click **OK**.

In the displayed dialog box, click **OK**.

#### Add a Customized Resource Configuration Group

**Step 8** Determine whether to automatically adjust resource configurations at different time segments.

- If yes, go to [Step 9](#).
- If no, use the default configurations, and no further action is required.

**Step 9** Click **Configuration**, change the system resource adjustment base values, and click **Next**.

**Step 10** Click **Add** to add a resource configuration group.

**Step 11** In **Step 1: Scheduling Time**, click **Configuration**.

The page for configuring the time policy is displayed.

Modify the following parameters based on service requirements and click **OK**.

- **Repeat**: If this parameter is selected, the customized resource configuration is applied repeatedly based on the scheduling period. If this parameter is not selected, set the date and time when the configuration of the group of resources can be applied.
- **Repeat Policy**: The available values are **Daily**, **Weekly**, and **Monthly**. This parameter is valid only when **Repeat** is selected.
- **Between**: indicates the time period between the start time and end time when the resource configuration is applied. Set a unique time range. If the time range overlaps with that of an existing group of resource configuration, the time range cannot be saved.

 **NOTE**

- The default group of resource configuration takes effect in all undefined time segments.
- The newly added resource group is a parameter set that takes effect dynamically in a specified time range.
- The newly added resource group can be deleted. A maximum of four resource configuration groups that take effect dynamically can be added.
- Select a repetition policy. If the end time is earlier than the start time, the resource configuration ends in the next day by default. For example, if a validity period ranges from 22: 00 to 06: 00, the customized resource configuration takes effect from 22: 00 on the current day to 06: 00 on the next day.
- If the repeat policy types of multiple configuration groups are different, the time ranges can overlap. The policy types are listed as follows by priority from low to high: daily, weekly, and monthly. The following is an example. There are two resource configuration groups using the monthly and daily policies, respectively. Their application time ranges in a day overlap as follows: 04: 00 to 07: 00 and 06: 00 to 08: 00. In this case, the configuration of the group that uses the monthly policy prevails.
- If the repeat policy types of multiple resource configuration groups are the same, the time ranges of different dates can overlap. For example, if there are two weekly scheduling groups, you can set the same time range on different day for them, such as to 04: 00 to 07: 00, on Monday and Wednesday, respectively.

**Step 12** Modify the resource configuration of each service in **Step 2: Weight Configuration**.

**Step 13** Click **Generate detailed configurations based on weight configurations**. FusionInsight Manager generates the actual values of the parameters in the default weight configuration table based on the cluster hardware resources and allocation information.

**Step 14** Click **OK**.

In the displayed dialog box, click **OK**.

----End

### 12.3.1.7.3 Viewing Cluster Static Resources

#### Scenarios

The big data management platform can manage and isolate service resources that are not running on YARN using static service resource pools. The system supports time-based automatic adjustment of static service resource pools. This enables the cluster to automatically adjust the parameter values at different periods to ensure more efficient resource utilization.

MRS cluster administrators can view the monitoring indicators of resources used by each service in the static service pool on FusionInsight Manager. The monitoring indicators are as follows:

- CPU usage of services
- Total disk I/O read rate of services
- Total disk I/O write rate of services
- Total used memory of services

 NOTE

After the multi-tenant function is enabled, the CPU, I/O, and memory usage of all HBase instances can be centrally managed.

## Procedure

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Static Service Pool Configurations**.
- Step 2** In the configuration group list, click a configuration group, for example, **default**.
- Step 3** Check the system resource adjustment base values.
  - **System Resource Adjustment Base** indicates the maximum volume of resources that can be used by each node in the cluster. If a node has only one service, the service exclusively occupies the available resources on the node. If a node has multiple services, all services share the available resources on the node.
  - **CPU** indicates the maximum number of CPUs that can be used by services on a node.
  - **Memory** indicates the maximum memory that can be used by services on a node.
- Step 4** In the Chart, view the indicator data chart of cluster service resource usage.

 NOTE

- You can click **Add Service to Chart** to add static service resource data of specific services (up to 12 services) to the chart.
- For details about how to manage a single chart, see [Managing the Monitoring Indicator Report](#).

----End

## 12.3.1.8 Client Management

### 12.3.1.8.1 Managing the Client

#### Scenario

FusionInsight Manager supports unified management of client installation information in a cluster. After a user downloads and installs the client, FusionInsight Manager automatically records information about the installed (registered) client to facilitate query and management. In addition, you can manually add or modify the information about clients that are not automatically registered, for example, clients installed in earlier versions.

## Procedure

### Viewing client information

- Step 1** Log in to FusionInsight Manager.
