- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Client Management** to view the information about the installed clients in the cluster. You can view the IP address,

installation path, component list, registration time, and installation user of the node where the client is located. When you download and install the client of the latest version, the client information is automatically registered.

#### Adding client information

**Step 3** If you need to manually add information for an installed client, click **Add** and manually add the IP address, installation path, user, platform information, and registration information of the client as prompted.

**Step 4** Configure the client information and click **OK**.

#### Modifying client information

**Step 5** Information of a manually registered client can be manually modified.

On the **Client Management** page, select the desired client and click **Modify**. After information is modified, click **OK**.

#### Deleting client information

**Step 6** On the **Client Management** page, select the desired client and click **Delete**. In the displayed dialog box, click **OK**.

To delete information of multiple clients, select the desired clients and click **Batch Delete**. In the displayed dialog box, click **OK**.

#### Exporting client information

**Step 7** On the **Client Management** page, click **Export All** to export information about all registered clients to the local PC.

----End

#### NOTE

On the **Client Management** page, only components that have clients are displayed in the component list. Therefore, some components that do not have clients and special components are not displayed.

The following components are not displayed:

LdapServer, KrbServer, DBService, Hue, Mapreduce, and Flume

### 12.3.1.8.2 Batch Upgrading Clients

#### Scenario

The client package downloaded from FusionInsight Manager contains the client batch upgrade tool. If multiple clients need to be upgraded after a cluster upgrade or capacity expansion, you can use this tool to batch upgrade the clients. In addition, the tool provides a lightweight function for batch updating the **/etc/hosts** file on the nodes where the clients are located.

#### Procedure

##### Preparation Before the Client Upgrade

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **More** > **Download Client** to download the client package to the specified directory on the server.

For details, see section [Downloading the Client](#).

Decompress the downloaded client package and find the **batch\_upgrade** directory, for example, `/tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade`.

**Step 3** Choose **Cluster** > *Name of the desired cluster* > **Client Management**. On the **Client Management** page that is displayed, and click **Export All** to export the information about the selected clients to the local PC.

**Step 4** Decompress the exported client information and upload the **client-info.cfg** file to the **batch\_upgrade** directory.

**Step 5** Supplement the ciphertext password in the **client-info.cfg** file by referring to [Reference](#).

#### Batch Upgrading Clients

**Step 6** Run the `sh client_batch_upgrade.sh -u -f /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar -g /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_ClientConfig/batch_upgrade/client-info.cfg` command to perform the upgrade.

---

#### NOTICE

Because the password is configured, you are advised to delete the **client-info.cfg** file as soon as possible after the upgrade.

---

**Step 7** After the upgrade is complete, verify the upgrade result by running the `sh client_batch_upgrade.sh -c` command.

**Step 8** If the client is faulty after the upgrade, run the `sh client_batch_upgrade.sh -s` command to roll back the upgrade.

 NOTE

- The client batch upgrade tool moves the original client to the backup directory, and then uses the client package specified by the **-f** parameter to install the client again. Therefore, if the original client contains customized contents, manually save the customized contents from the backup directory or move the customized contents to the client directory after the upgrade before you run the **-c** command. Client backup path: *{Original client path}-backup*
- The **-u** parameter is the prerequisite for the **-c** and **-s** commands. You can run the **-c** command to submit or the **-s** command to perform a rollback only after the **-u** command is executed to perform an upgrade.
- You can run the **-u** command multiple times to upgrade only the clients that fail to be upgraded.
- The client batch upgrade tool also supports clients of early versions.
- To upgrade a client installed by a non-root user, the operator must have the read/write permission for the directory where the client is located and its parent directory. Otherwise, the upgrade fails.
- The client package of the **-f** parameter must be a full client. The client package of a single component or some components cannot be used as the input.

----End

## Reference

Before upgrading clients in batches, you need to manually configure the user password for remotely logging in to the client node.

Run the **vi client-info.cfg** command to add the user password.

For example:

```
clientIp,clientPath,user,password  
10.10.10.100,/home/omm/client /home/omm/client2,omm,Bigdata_123
```

The fields in the configuration file are as follows:

- **clientIp**: Indicates the IP address of the node where the client is located.
- **clientPath**: Indicates the client installation path. Multiple paths are separated by spaces. Note that the path cannot end with a slash (/).
- **user**: Indicates the username of the node.
- **password**: Indicates the user password of the node.

 NOTE

- Enter a plaintext password.
- If the execution fails, you can check **node.log** in **work\_space/log\_XXX** under the execution directory.

### 12.3.1.8.3 Updating the hosts File in Batches

#### Scenario

The client package downloaded from FusionInsight Manager contains the client batch upgrade tool which provides the lightweight functions of upgrading the client in batches and updating the **/etc/hosts** files on the nodes where the clients reside in batches.

## Prerequisites

For details about how to prepare for the upgrade, see "Preparation Before the Client Upgrade" in [Procedure](#).

## Updating the hosts File in Batches

**Step 1** Check whether the user configured on the host where the `/etc/hosts` file needs to be updated is user `root`.

- If yes, go to [Step 2](#).
- If no, change the configured user to user `root`, and go to [Step 2](#).

**Step 2** Run the `sh client_batch_upgrade.sh -r -f /tmp/FusionInsight-Client/FusionInsight_Cluster_1_Services_Client.tar` command to update the `/etc/hosts` file on the nodes where the clients are located in batches.

### NOTE

- When you batch update the `/etc/hosts` file, the client package name you entered can be either the name of a complete client package or configuration file name only (recommended).
- The configured user of the host where the `/etc/hosts` file needs to be updated must be user `root`. Otherwise, the update fails.

----End

## 12.3.2 Managing a Service

### 12.3.2.1 Overview

#### Overview

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services**.

The service management page containing the function area and service list is displayed.

**Figure 12-1** Service management page

#### Functional Area

In the function area of the service management page, you can select a view type and filter and search by services. You can use the advanced search function to select required services based on the running status.

## Service List

The service list on the service management page contains all installed services in the cluster. If the tile view mode is selected, the services will be displayed in pane style. If you select the list view mode, the services will be displayed in a table.

### NOTE

In this section, the **Tile View** is used by default.

The service list displays the running status, configuration status, role type, and number of instances of each service. On this page, you can perform some service maintenance tasks, such as starting, stopping, and restarting services.

**Table 12-5** Service running status

Status	Description
<b>Normal</b>	Indicates that the service is running properly.
<b>Faulty</b>	Indicates that the service cannot run properly.
<b>Subhealthy</b>	Indicates that some enhanced functions of the service are abnormal.
<b>Not started</b>	Indicates that the service is stopped.
<b>Unknown</b>	Indicates that the initial status of the service cannot be detected.
<b>Starting</b>	Indicates that the service is being started.
<b>Stopping</b>	Indicates that the service is being stopped.
<b>Failed to start</b>	Indicates that the service fails to be started.
<b>Failed to stop</b>	Indicates that the service fails to be stopped.

### NOTE

- If the health status of a service is **Faulty**, an alarm is generated. Rectify the fault based on the alarm information.
- HBase, Hive, Spark, and Loader may be in the **Subhealthy** state.
  - If YARN is installed but is abnormal, HBase is in the **Subhealthy** state. If the multi-instance function is enabled, all installed HBase service instances are in the **Subhealthy** state.
  - If HBase is installed but is abnormal, Hive, Spark, and Loader are in the **Subhealthy** state.
  - If any HBase instance is installed but is abnormal after the multi-instance function is enabled, Loader is in the **Subhealthy** state.
  - If an HBase instance is installed but is abnormal after the multi-instance function is enabled, the Hive and Spark instances that map to the HBase instance are in the **Subhealthy** state. That is, if HBase 2 is installed but is abnormal, Hive 2 and Spark2 are in the **Subhealthy** state.

**Table 12-6** Service configuration status

Status	Description
<b>Synchronized</b>	Indicates that all service parameter settings have taken effect in the cluster.
<b>Expired</b>	Indicates that the latest configuration is not synchronized and does not take effect after service parameter settings are modified. The configuration needs to be synchronized and the related services need to be restarted. You can click  next to <b>Configuration Status</b> to view expired configuration items.
<b>Failed</b>	Indicates that a communication or read/write exception occurs during the parameter configuration synchronization. Use <b>Synchronize Configuration</b> to rectify the fault.
<b>Synchronizing</b>	Indicates that the service parameter configuration is being synchronized.
<b>Unknown</b>	Indicates that the initial status of the service cannot be detected.

You can click a service in the service list to perform simple maintenance and management operations on the service, as described in [Table 12-7](#).

**Table 12-7** Basic management and maintenance

UI Portal	Description
<b>Start Service</b>	Start a specified service in the cluster.
<b>Stop Service</b>	Stop a specified service in the cluster.
<b>Restart Service</b>	Restart a specified service in the cluster. <b>NOTE</b> If a service is restarted, other services that depend on this service will be unavailable. Therefore, select <b>Restart upper-layer services</b> . Determine whether to perform this operation based on the displayed service list. Services are restarted one by one due to their dependency. <a href="#">Table 12-8</a> describes the restart duration of a single service.
<b>Service Rolling Restart</b>	Restart a specified service in the cluster without interrupting services. For details about the parameter settings, see <a href="#">Table 12-4</a> .

UI Portal	Description
<b>Synchronize Configuration</b>	<ul style="list-style-type: none"> <li>• Enable new configuration parameters for a specified service in the cluster.</li> <li>• Deliver new configuration parameters for services whose <b>Configuration Status is Expired</b>.</li> </ul> <p><b>NOTE</b> After some services are synchronized, restart the services for the settings to take effect.</p>

**Table 12-8** Restart time

Service Name	Restart Duration	Start Duration	Remarks
CDL	2min	CDLConnector: 1min CDLService: 1min	-
ClickHouse	4min	ClickHouseServer: 2min ClickHouseBalancer: 2min	-
HDFS	10min+x	NameNode: 4 min + x DataNode: 2 min JournalNode: 2 min Zkfc: 2 min	X indicates the duration for loading NameNode metadata. About two minutes are required for each ten million files. For example, if there are 50 million files, x indicates 10 minutes. The start duration is affected by the duration for DataNode to report data blocks.
Yarn	5min+x	ResourceManager: 3 min + x NodeManager: 2 min	x indicates the time corresponding to the number of reserved tasks that need to be restored by ResourceManager. Each 10 thousand reserved tasks require one minute.
MapReduce	2min+x	JobHistoryServer: 2 min + x	x indicates the scanning duration of historical tasks. Each 100 thousand tasks take about 2.5 minutes.
Zookeeper	2min+x	quorumpeer: 2 min + x	x indicates the duration for loading Znodes. Each one million Znodes take about one minute.

Service Name	Restart Duration	Start Duration	Remarks
Hive	3.5min	HiveServer: 3 min MetaStore: 90s WebHcat: 1 min Hiveoverall service: 3 min	-
Spark2x	5min	JobHistory2x: 5 min SparkResource2x: 5 min JDBCServer2x: 5 min	-
Flink	4min	FlinkResource: 1 min FlinkServer: 3min	-
Kafka	2min+x	Broker: 1 min + x	X indicates the data recovery duration. It takes about two minutes to start a single instance with 20000 partitions.
Storm/Streaming	6min	Nimbus: 3 min UI: 1 min Supervisor: 1 min Logviewer: 1 min	-
Flume	3min	Flume: 2 min MonitorServer: 1 min	-

## 12.3.2.2 Other Service Management Operations

### 12.3.2.2.1 Service Details Page

#### Overview

Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, click the specified service name to go to the service details page, including the **Dashboard**, **Instance**, **Instance Groups** and **Configurations** tab pages as well as function areas. For some services, the customized management tool page can be displayed. For details about the supported management tools, see [Table 12-9](#).

**Table 12-9** Customized management tools

Tool	Service	Description
Flume configuration tool	Flume	Configures collection parameters for the Flume server and client.
Flume client management tool	Flume	Views the monitoring information about the Flume client.
Kafka topic monitoring tool	Kafka	Monitors and manages Kafka topics.

The **Dashboard** page is the default page, which contains the basic information, role list, dependency table, and monitoring chart, and more. You can manage services in the upper right corner. For details about basic service management, such as starting, stopping, rolling restart, and synchronization configuration, see [Table 12-7](#). For details about other service management operations, see [Table 12-10](#).

**Table 12-10** Service management operations

Navigation Path	Description
<b>More &gt; Health Check</b>	Performs a health check for the current service. The health check items include the health status of each check object, related alarms, and user-defined monitoring indicators. The check result is not the same as the values of <b>Running Status</b> displayed on the GUI.  To export the result of the health check, click <b>Export Report</b> in the upper left corner of the checklist. If you find any problem, click <b>View Help</b> .
<b>More &gt; Download Client</b>	Download the default client that contains only specific services and perform management operations, run services, or perform secondary development on the client. For details, see <a href="#">Downloading the Client</a> .
<b>More &gt; Change Service Name</b>	Changes the name of the current service.
<b>More &gt; Perform <i>XX</i> Switchover</b>	For details, see <a href="#">Performing Active/Standby Switchover of a Role Instance</a> .
<b>More &gt; Enter/Exit Maintenance Mode</b>	Configures a service to enter/exit the maintenance mode.

Navigation Path	Description
<b>Configurations &gt; Import/Export</b>	In the scenario where services are migrated to a new cluster or the same services are deployed again, you can import or export all configuration data of a specific service to quickly copy the configuration results.

## Basic Information Area

The basic information area on the **Dashboard** tab page contains the basic status data of the service, including the running status, configuration details, version, and key information of the service. If the service supports the open-source web UIs, you can access the open-source web UIs by clicking the links in the basic information area.

### NOTE

In the current version, user **admin** does not have the permission to access all the service functions provided on the open source web UI. Create a component service administrator to access the WebUI address.

## Role List

The role list on the **Dashboard** tab page contains all roles of the service. The role list displays the running status and the number of instances of each role.

## Dependency

The dependency relationship table on the **Dashboard** tab page displays the services on which the current service depends and other services that depend on the service.

## Historical Records of Alarms and Events

The alarm and event history area displays the key alarms and events reported by the current service. Up to 20 historical records are displayed.

## Chart

The chart area is displayed on the right of the **Dashboard** tab page and contains the key monitoring indicator report of the service. You can customize the monitoring report that is displayed in the chart area, view the description of the monitoring metrics, or export the monitoring data. For a customized resource contribution chart, you can zoom in on the chart and switch between the trend chart and distribution chart.

### NOTE

Some services in the cluster provide service-level resource monitoring items. For details, see [Resource Monitoring](#).

### 12.3.2.2 Performing Active/Standby Switchover of a Role Instance

#### Scenarios

Some service roles are deployed in active/standby mode. If the active instance needs to be maintained and cannot provide services, or other maintenance is required, you can manually trigger an active/standby switchover.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page.
- Step 4** On the service details page, expand the **More** drop-down list and select **Perform Role Instance Switchover**.
- Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**.
- Step 6** In the displayed dialog box, click **OK** to perform active/standby switchover for the role instance.

#### NOTE

- The Manager component package only supports the active/standby switchover of DBService role instances.
- The HD component package supports the active/standby switchover of the following service role instances: HDFS, YARN, Storm, HBase and Mapreduce.
- When an active/standby switchover is performed for a NameNode on HDFS, a NameService must be set.
- The Porter component package only supports the active/standby switchover of Loader role instances.
- This function cannot be used for other role instances.

----End

### 12.3.2.2.3 Resource Monitoring

Some services in the cluster provide service-level resource monitoring metrics. By default, the monitoring data of the latest 12 hours is displayed. You can click  to customize a time range. The default time ranges are as follows: 12 hours, 1 day, 1 week, and 1 month. You can click  to export the corresponding report information. If a monitoring item has no data, the report cannot be exported. **Table 12-11** lists the services and monitoring items that support resource monitoring.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and click **Resource**. The resource monitoring page is displayed.

**Table 12-11** Service resource monitoring

Service	Metrics	Description
HDFS	Resource Usage (by Tenant)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usage by tenant.</li> <li>Views the metrics <b>Capacity</b> or <b>Number of File Objects</b>.</li> </ul>
	Resource Usage (by User)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usage by user.</li> <li>Views the metrics <b>Used Capacity</b> or <b>Number of File Objects</b>.</li> </ul>
	Resource Usage (by Directory)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usage by directory.</li> <li>Views the metrics <b>Used Capacity</b> or <b>Number of File Objects</b>.</li> <li>You can click  to configure space monitoring. Alternatively, you can specify an HDFS file system directory for monitoring.</li> </ul>
	Resource Usage (by Replica)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usages by replica count.</li> <li>Views the metrics <b>Used Capacity</b> or <b>File Count</b>.</li> </ul>
	Resource Usage (by File Size)	<ul style="list-style-type: none"> <li>Collects statistics on HDFS resource usages by file size.</li> <li>Views the metrics <b>Used Capacity</b> or <b>File Count</b>.</li> </ul>
	Recycle Bin (by User)	<ul style="list-style-type: none"> <li>Collects statistics on the usage of the HDFS recycle bin by user.</li> <li>Views the metrics <b>Recycle Bin Capacity</b> or <b>Number of File Objects</b>.</li> </ul>
	Operation Count	<ul style="list-style-type: none"> <li>Collects the number of operations in HDFS.</li> </ul>
	Automatic Balancer	<ul style="list-style-type: none"> <li>Collects statistics on the execution speed of HDFS automatic balancer and the total capacity of the current balancer migration.</li> </ul>
	NameNode RPC Open Connections (by User)	<ul style="list-style-type: none"> <li>Displays the number of connections of each user in the Client RPC requests connected to NameNodes.</li> </ul>
	Slow DataNodes	Displays DataNode that transmits or processes data slowly in the cluster.

Service	Metrics	Description
	Slow Disks	Displays the disk that processes data slowly on the DataNode in the cluster.
HBase	Operation Requests in Tables	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all tables on all RegionServers.
	Operation Requests on RegionServers	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests and number of all operation requests in RegionServer.
	Operation Requests for Service	Displays the number of PUT, DELETE, GET, SCAN, INCREMENT, and APPEND operation requests in all regions on RegionServers.
	HFiles on RegionServers	Displays the number of HFiles in all RegionServers.
Hive	HiveServer2-Background-Pool Threads (by IP)	Displays the number of HiveServer2-Background-Pool threads of top users. These threads are measured and displayed in a measurement period.
	HiveServer2-Handler-Pool Threads (by IP)	Displays the number of HiveServer2-Handler-Pools of top users collected and displayed in a period.
	Used MetaStore Number (by IP)	Collects statistics on and displays the MetaStore usage of top users in a period.
	Number of Hive jobs	Displays the number of user-related jobs collected by Hive in a period.
	Number of Files Accessed in the Split Phase	Displays the number of files accessed by the underlying file storage system (HDFS by default) in the Split phase in a period.
	Hive Basic Operation Time	Collects time for creating a directory (mkdirTime), creating a file (touchTime), writing a file (writeFileTime), renaming a file (renameTime), moving a file (moveTime), deleting a file (deleteFileTime), and deleting a directory (deleteCatalogTime) in a period of time.

Service	Metrics	Description
	Table Partitions	Displays the number of partitions in all Hive tables, which is displayed in the following format: <i>database # table name, number of table partitions</i> .
	HQL Map Count	Collects statistics on HQL statements executed in a period and the number of Map statements invoked during the execution. The displayed information includes users, HQL statements, and the number of Map statements.
	HQL Access Statistics	Displays the number of HQL access times in a period.
Kafka	Kafka Disk Usage Distribution	Displays the disk usage distribution statistics of the Kafka cluster.
Spark2x	HQL Access Statistics	Collects HQL access statistics in a period, including the username, HQL statement, and HQL statement execution times.
Yarn	Used resources (by task)	<ul style="list-style-type: none"> <li>Displays the number of CPU cores and memory used by a task.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
	Resource usage (by tenant)	<ul style="list-style-type: none"> <li>Displays the number of CPU cores and memory used by a tenant.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
	Resource usage ratio (by tenant)	<ul style="list-style-type: none"> <li>Displays the ratio of the number of CPU cores to the memory used by a tenant.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
	Task Duration Ranking	Displays Yarn tasks sorted by time consumption.
	ResourceManager RPC Open Connections (by User)	Displays the number of client RPC connections to ResourceManager by user.
	Operation Count	Collects statistics on the number and proportion of operations corresponding to each Yarn operation type.

Service	Metrics	Description
	Ranking of Tasks in a Queue by Resource Usage	<ul style="list-style-type: none"> <li>Displays the resources consumed by the tasks running in a queue after the queue (tenant) is selected on the GUI.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
	Ranking of Users in a Queue by Resource Usage	<ul style="list-style-type: none"> <li>Displays the resources consumed by the users who are running tasks in the queue after a queue (tenant) is selected on the GUI.</li> <li>Views the metrics <b>By memory</b> or <b>By CPU</b>.</li> </ul>
ZooKeeper	Used Resources (By Second-Level Znode)	<ul style="list-style-type: none"> <li>Displays the ZooKeeper level-2 znode resource status.</li> <li>Views the metrics <b>By Znode quantity</b> or <b>By capacity</b>.</li> </ul>
	Number of Connections (by Client IP Address)	Displays the ZooKeeper client connection resource status.

#### 12.3.2.2.4 Collecting Stack Information

##### Scenario

To meet the project requirements, you can collect the stack information about a specified role or instance on FusionInsight Manager, save the information to a local directory, and download the information. The following information can be collected:

1. jstack information.
2. jmap -histo information.
3. jmap -dump information.
4. jstack and jmap-histo information can be collected consecutively for comparison.

##### Procedure

###### Collecting stack information

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > *Name of the desired service*.
- Step 3** Choose **More** > **Collect Stack Information**.

 NOTE

- To collect stack information of multiple instances, select the desired instances in the instance list and choose **More > Collect Stack Information**.
- To collect stack information of a single instance, click the desired instance and choose **More > Collect Stack Information**.

**Step 4** In the dialog box that is displayed, select the desired role and content, configure advanced options (retain the default settings unless otherwise specified), and click **OK**.

**Step 5** After the collection is successful, click **Download**.

**Downloading stack information**

**Step 6** Choose **Cluster > Name of the desired cluster > Services > Name of the desired service**. Choose **More > Download Stack Information** in the upper right corner.

**Step 7** Select the desired role and content and click **Download** to download the stack information to the local PC.

**Clearing stack information**

**Step 8** Choose **Cluster > Name of the desired cluster > Services > Name of the desired service**.

**Step 9** Choose **More > Clear Stack Information** in the upper right corner.

**Step 10** Select the desired role and content and configure **File Directory**. Click **OK**.

----End

### 12.3.2.2.5 Switching Ranger Authentication

#### Scenarios

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster in security mode. You can set fine-grained security access policies for accessing component resources through the permission plug-in of the component. If Ranger authentication is not required, you can manually disable Ranger authentication on the service page. After Ranger authentication is disabled, the system continues to perform permission control based on the role model of FusionInsight Manager when accessing component resources.

In a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. You can manually enable Ranger authentication after installing the Ranger service.

 **NOTE**

- In a cluster in security mode, the following components support Ranger authentication: HDFS, Yarn, Kafka, Hive, HBase, Storm, Spark2x, Impala.
- In a cluster in non-security mode, the Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark2x, and Yarn.
- After Ranger authentication is enabled, all authentication of the component will be managed by Ranger. The permissions set by the original authentication plug-in will become invalid. Exercise caution when performing this operation. You are advised to deploy permissions on Ranger in advance. Please restart the service for the modification to take effect.
- After Ranger authentication is disabled, all authentication of the component will be managed by the permission plug-in of the component. The permission set on Ranger will become invalid. Exercise caution when performing this operation. You are advised to deploy permissions on Manager in advance. Please restart the service for the modification to take effect.

## Enabling Ranger Authentication

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the service details page, expand the **More** drop-down list and select **Enable Ranger**.

**Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 6** In the service list, restart the service whose configuration has expired.

----End

## Disabling Ranger Authentication

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster > Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the service details page, expand the **More** drop-down list and select **Disable Ranger**.

**Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed dialog box, click **OK**.

**Step 6** In the service list, restart the service whose configuration has expired.

----End

### 12.3.2.3 Service Configuration

### 12.3.2.3.1 Modifying Service Configuration Parameters

#### Scenarios

To meet site requirements, you can view and modify default configurations of a service on FusionInsight Manager. Configure parameters based on the information provided in the configuration description.

 **NOTE**

The parameters of DBService cannot be modified when only one DBService role instance exists in the cluster.

#### Impact on the System

- After configuring properties of a service, you need to restart the service. The service is unavailable during restart. If the instance is not restarted, the configuration status of the instance is **Expired**.
- After the service configuration parameters are modified and then take effect after restart, you need to download and install the client again or download the configuration file to update the client. For example, you can modify configuration parameters of the following services: HBase, HDFS, Hive, Spark, YARN, and MapReduce.

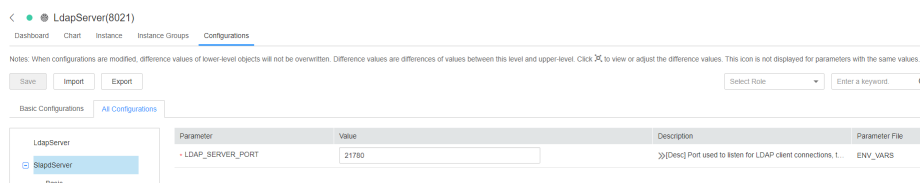

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster > Name of the desired cluster > Services**.
- Step 3** Click the specified service name on the service management page.
- Step 4** Click **Configurations**.

The **Basic Configuration** tab page is displayed by default. To modify more parameters, click the **All Configurations** tab. The navigation tree displays all configuration parameters of the service. The level-1 nodes in the navigation tree are service names or role names. The parameter category is displayed after the level-1 node is expanded.

As shown in the following figure, the first node **LdapServer** indicates the service name, and the second node **SlapdServer** indicates the role name. The configuration parameter displayed takes effect for all instances of the role and the service.

**Figure 12-2** Configuration parameter navigation tree

- Step 5** In the navigation tree, select the specified parameter category and change the parameter values on the right.

 **NOTE**

Select a port parameter value from the value range on the right. Ensure that all parameter values in the same service are within the value range and are unique. Otherwise, the service fails to be started.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.

**Step 6** Click **Save**. In the confirmation dialog box, click **OK**.

Wait until the message "Operation succeeded." is displayed. Click **Finish**.

The configuration is modified.

 **NOTE**

- To update the queue configuration of the YARN service without restarting service, choose **More > Refresh Queue** to update the queue for the configuration to take effect.
- During configuration of the **flume.config.file** parameter, you can upload and download files. After a configuration file is uploaded, the old file will be overwritten. If the configuration is not saved and the service is restarted, the configuration does not take effect. Save the configuration in time.
- If you need to restart the service for the configuration to take effect after modifying service configuration parameters, choose **More > Restart Service** in the upper right corner of the service page.

----End

### 12.3.2.3.2 Modifying Customized Configuration Parameters of a Service

#### Scenarios

All open source parameters can be configured for all MRS cluster components. Parameters used in some key application scenarios can be modified on FusionInsight Manager, and some parameters of open source features may not be configured for some component clients. To modify the component parameters that are not directly supported by FusionInsight Manager, you can add new parameters for components by using the configuration customization function on FusionInsight Manager. Newly added parameters are saved in component configuration files and take effect after restart.

#### Impact on the System

- After configuring properties of a service, you need to restart the service. The service is unavailable during restart. If the instance is not restarted, the configuration status of the instance is **Expired**.
- After the service configuration parameters are modified and then take effect after restart, you need to download and install the client again or download the configuration file to update the client.

#### Prerequisites

You have understood the meanings of parameters to be added, configuration files to take effect, and impact on components.

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page.
- Step 4** Choose **Configurations** > **All Configurations**.
- Step 5** In the navigation tree on the left, locate a level-1 node and select **Customization**. The system displays the customized parameters of the current component.
- The configuration files that save the newly added customized parameters are displayed in **Parameter File**. Different configuration files may have same open source parameters. After the parameters in different files are set to different values, the configuration takes effect depends on the loading sequence of the configuration files by components. You can customize parameters for services and roles as required. Adding customized parameters for a single role instance is not supported.
- Step 6** Locate the row where a specified parameter resides, enter the parameter name supported by the component in the **Name** column and enter the parameter value in the **Value** column.
- You can click + or - to add or delete a customized parameter.
- Step 7** Click **Save**. In the displayed **Save Configuration** dialog box, confirm the modification and click **OK**. Wait until the message "Operation succeeded" is displayed, and click **Finish**.

The configuration is saved successfully.

After the configuration is saved, restart the expired service or instance for the configuration to take effect.

----End

## Task Example (Configuring Customized Hive Parameters)

Hive depends on HDFS. By default, Hive accesses the HDFS client. The configuration parameters that have taken effect are controlled by HDFS. For example, the HDFS parameter **ipc.client.rpc.timeout** affects the RPC timeout interval for all the clients (including service and cluster clients) to connect to the HDFS server. To change the timeout interval for Hive to connect to the HDFS, you can change the timeout interval by configuring required customized parameters. After this parameter is added to the **core-site.xml** file of Hive, this parameter can be identified by the Hive service and its configuration overwrites the parameter configuration in HDFS.

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 2** Choose **Hive** > **Configurations**. On the displayed page, click the **All Configurations** tab.
- Step 3** In the navigation tree on the left, select **Customization** for the Hive service. The system displays the customized service parameters supported by Hive.

**Step 4** In `core-site.xml`, locate the row that contains the `core.site.customized.configs` parameter, enter `ipc.client.rpc.timeout` in the **Name** column, and enter a new value in the **Value** column, for example, 150000. The unit is ms.

**Step 5** Click **Save**. In the displayed **Save Configuration** dialog box, confirm the modification and click **OK**. Wait until the message "Operation succeeded" is displayed, and click **Finish**.

The configuration is saved successfully.

After the configuration is saved, restart the expired service or instance for the configuration to take effect.

----End

## 12.3.3 Instance Management

### 12.3.3.1 Instance Management Overview

#### Overview

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **Instance**. The displayed instance management page contains the function area and role instance list.

#### Functional Area

The function area allows you to perform maintenance operations on roles, such as adding roles and starting or stopping instances.

**Table 12-12** Instance management and maintenance

UI Portal	Description
<b>Start Instance</b>	Start a specified instance in the cluster. You can start a role instance in the <b>Not Started</b> , <b>Stop Failed</b> , or <b>Startup Failed</b> state to use the role instance.
<b>More &gt; Stop Instance</b>	Stop a specified instance in the cluster. Stop role instances that will no longer be used or are abnormal.
<b>More &gt; Restart Instance</b>	Restart a specified instance in the cluster. Restart an abnormal role instance to recover its functions.
<b>More &gt; Instance Rolling Restart</b>	Restart a specified instance in the cluster without interrupting services. For details about the parameter settings, see <a href="#">Performing a Rolling Restart of a Cluster</a> .

UI Portal	Description
<b>More &gt; Decommission/Recommission</b>	<p>Recommission or decommission a specified instance in the cluster to change the service availability status of the service. For details, see <a href="#">Decommissioning and Recommissioning an Instance</a>.</p> <p><b>NOTE</b> Only the role DataNode in HDFS, the role NodeManager in Yarn, the role RegionServe in HBase support the recommissioning and decommissioning functions.</p>
<i>Desired instance</i> > <b>More &gt; Synchronize Configuration</b>	<p>If <b>Configuration Status</b> of a role instance is <b>Expired</b>, the role instance is not restarted after its configurations are modified. The new configuration is saved only on FusionInsight Manager. In this case, use this function to deliver the new configuration to the specified instance.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>After synchronizing a role instance configuration, restart the role instance whose configuration has expired. The role instance is unavailable during restart.</li> <li>After the synchronization is complete, restart the instance for the configuration to take effect.</li> </ul>
<i>Desired instance</i> > <b>Instance Configurations</b>	For details, see <a href="#">Managing Instance Configurations</a> .

You can filter instances based on the role they belong to or their running status in this area.

 **NOTE**

Click **Advanced Search** to search for specific instances by specifying filter criteria, such as **Host Name**, **Management IP Address**, **Business IP Address**, or **Instance Groups**.

## Role Instance List

The role instance list contains the instances of all roles in the cluster. The list displays the running status, configuration status, hosts, and related IP addresses of each instance.

**Table 12-13** Instance running status

Status	Description
<b>Normal</b>	Indicates that the instance is running properly.
<b>Faulty</b>	Indicates that the instance cannot run properly.
<b>Decommissioned</b>	Indicates that the instance is out of service.

Status	Description
<b>Not started</b>	Indicates that the instance is stopped.
<b>Unknown</b>	Indicates that the initial status of the instance cannot be detected.
<b>Starting</b>	Indicates that the instance is being started.
<b>Stopping</b>	Indicates that the instance is being stopped.
<b>Restoring</b>	Indicates that an exception may occur in the instance and the instance is being automatically rectified.
<b>Decommissioning</b>	Indicates that the instance is being decommissioned.
<b>Recommissioning</b>	Indicates that the instance is being recommissioned.
<b>Failed to start</b>	Indicates that the service fails to be started.
<b>Failed to stop</b>	Indicates that the service fails to be stopped.

You can click an instance name to go to the instance details page and view basic information about the instance and the monitoring indicator report of the instance.

### 12.3.3.2 Decommissioning and Recommissioning an Instance

#### Scenarios

Some role instances provide services for external services in distributed and parallel mode. Services independently store information about whether each instance can be used. Therefore, you need to use FusionInsight Manager to recommission or decommission these instances to change the instance running status.

Some instances do not support the recommissioning and decommissioning functions.

 NOTE

The following roles support decommissioning and recommissioning: HDFS DataNode, Yarn NodeManager, HBase RegionServer, and Kafka Broker.

- If the number of the DataNodes is less than or equal to that of HDFS replicas, decommissioning cannot be performed. If the number of HDFS replicas is three and the number of DataNodes is less than four in the system, decommissioning cannot be performed. In this case, an error will be reported and force FusionInsight Manager to exit the decommissioning 30 minutes after FusionInsight Manager attempts to perform the decommissioning.
- During MapReduce task execution, files with 10 replicas are generated. Therefore, if the number of DataNode instances is less than 10, decommissioning cannot be performed.
- If the number of DataNode racks (the number of racks is determined by the number of racks configured for each DataNode) is greater than 1 before the decommissioning, and after some DataNodes are decommissioned, that of the remaining DataNodes changes to 1, the decommissioning will fail. Therefore, before decommissioning DataNode instances, you need to evaluate the impact of decommissioning on the number of racks to adjust the DataNodes to be decommissioned.
- If multiple DataNodes are decommissioned at the same time, and each of them stores a large volume of data, the DataNodes may fail to be decommissioned due to timeout. To avoid this problem, it is recommended that one DataNode be decommissioned each time and multiple decommissioning operations be performed.
- During broker decommissioning, if the number of remaining brokers after decommissioning is less than the number of built-in topic replicas (3 by default) of the Kafka service, the broker cannot be decommissioned. If the instance is forcibly deleted, the service functions are unavailable.
- If multiple brokers are decommissioned at the same time and the data volume of the topic partitions maintained by each broker is large, the brokers may fail to be decommissioned due to timeout. To avoid this problem, you are advised to decommission only one broker each time.

## Procedure

**Step 1** Perform the following steps to perform a health check for the DataNodes before decommissioning:

1. Log in to the client installation node as a client user and switch to the client installation directory.
2. For a security cluster, use user **hdfs** for permission authentication.  

```
source bigdata_env          #Configure client environment variables.
kinit hdfs                  #Configure kinit authentication.
Password for hdfs@HADOOP.COM: #Enter the login password of user hdfs.
```
3. Run the **hdfs fsck / -list-corruptfileblocks** command, and check the returned result.
  - If "has 0 CORRUPT files" is displayed, go to [Step 2](#).
  - If the result does not contain "has 0 CORRUPT files" and the name of the damaged file is returned, go to [Step 1.4](#).
4. Run the **hdfs dfs -rm *Name of the damaged file*** command to delete the damaged file.

 NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- Step 2** Log in to FusionInsight Manager.
- Step 3** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 4** Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.
- Step 5** Select the specified role instance to be decommissioned.
- Step 6** Select **Decommission** or **Recommission** from the **More** drop-down list.

In the displayed dialog box, enter the password of the current login user and click **OK**.

Select **I confirm to decommission these instances and accept the consequence of service performance deterioration** and click **OK** to perform the corresponding operation.

 **NOTE**

During the instance decommissioning, if the service corresponding to the instance is restarted in the cluster using another browser, FusionInsight Manager displays a message indicating that the instance decommissioning is stopped, but the operating status of the instance is displayed as **Started**. In this case, the instance has been decommissioned on the background. You need to decommission the instance again to synchronize the operating status.

----End

### 12.3.3.3 Managing Instance Configurations

#### Scenarios

You can modify configuration parameters for each role instance. In the scenario where instances are migrated to a new cluster or the corresponding service needs to be deployed again, you can import or export all configuration data of a service on FusionInsight Manager to quickly copy configuration results.

FusionInsight Manager can manage configuration parameters of a single role instance. Modifying configuration parameters and importing or exporting instance configurations do not affect other instances.

#### Impact on the System

After modifying the configuration of a role instance, you need to restart the instance. The role instance is unavailable during restart. If the instance is not restarted, the configuration status of the instance is **Expired**.

#### Modifying Instance Configuration

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.
- Step 4** Click the specified instance and select **Instance Configurations**.

By default, **Basic Configuration** is displayed. To modify more parameters, select **All Configurations**. All parameter categories supported by the instance are displayed on the **All Configurations** tab page.

**Step 5** In the navigation tree, select the specified parameter category and change the parameter values on the right.

If you are not sure about the location of a parameter, you can enter the parameter name in search box in the upper right corner. The system searches for the parameter in real time and displays the result.

**Step 6** Click **Save**. In the confirmation dialog box, click **OK**.

Wait until the message "Operation succeeded." is displayed. Click **Finish**.

The configuration is modified.

----End

## Exporting/Importing Instance Configuration

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

**Step 4** Click the specified instance and select **Instance Configurations**.

**Step 5** Click **Export** to export the configuration parameter file to the local host.

**Step 6** On the **Instance Configurations** page, click **Import**, select the configuration parameter file of the instance, and import the file.

----End

### 12.3.3.4 Viewing the Instance Configuration File

#### Scenario

FusionInsight Manager allows O&M personnel to view the content configuration files such as environment variables and role configurations of the instance node on the management page. If O&M personnel need to quickly check whether configuration items of the instance are incorrectly configured or when some hidden configuration items need to be viewed, the O&M personnel can directly view the configuration files on FusionInsight Manager. In this case, users quickly analyze configuration problems.

#### Procedure

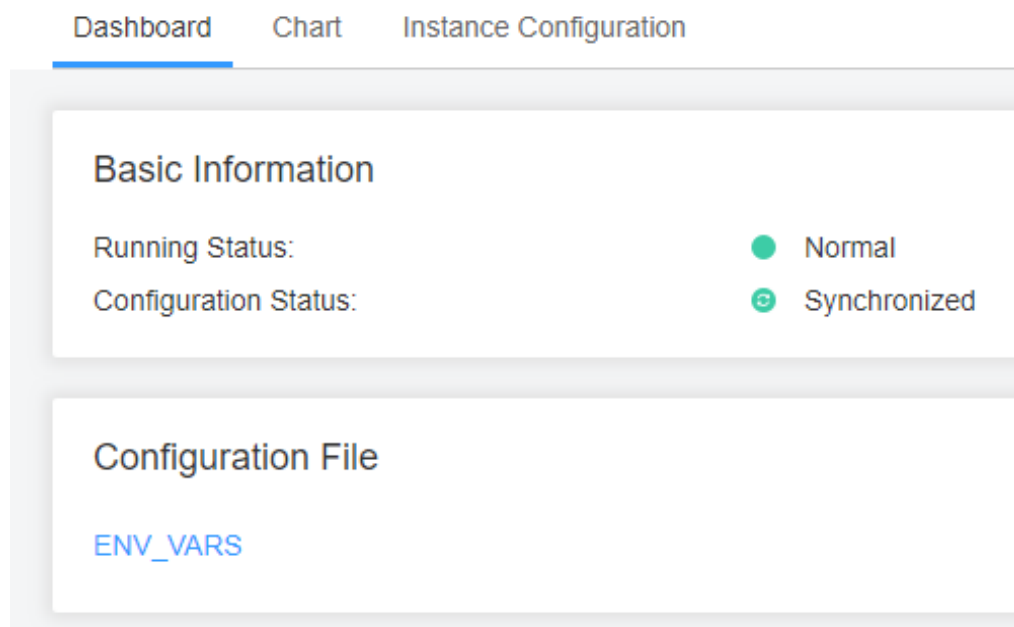

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page. On the displayed page, click the **Instance** tab.

- Step 4** Click the name of the target instance. In the **Configuration File** area on the **Instance Status** page, the configuration file list of the instance is displayed.

**Figure 12-3** Viewing the instance configuration file

- Step 5** Click the name of the configuration file to be viewed to view the parameter values in the configuration file.

To obtain the configuration file, you can download the configuration file to the local PC.

 **NOTE**

If a node in the cluster is faulty, the configuration file cannot be viewed. Rectify the fault before viewing the configuration file again.

----End

## 12.3.3.5 Instance Group

### 12.3.3.5.1 Managing Instance Groups

#### Scenarios

Instance groups can be managed on FusionInsight Manager. That is, you can group multiple instances in the same role based on a specified principle, such as the nodes with the same hardware configuration. The modification on the configuration parameters of an instance group applies to all instances in the group.

In a large cluster, instance groups are used to improve the capability of managing instances in batches in the heterogeneous environment. After instances are grouped, the instances can be configured repeatedly to reduce redundant instance configuration items and improve system performance.

## Creating an Instance Group

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page.
- Step 4** On the displayed page, click the **Instance Groups** tab.

Click  and configure parameters as prompted.

**Table 12-14** Instance group configuration parameters

Parameter	Description
<b>Group Name</b>	Indicates the instance group name. The value can contain only letters, digits, underscores (_), hyphens (-), and spaces. It must start with a letter, digit, underscore (_), or hyphen (-) and cannot ends with a space. It can contain a maximum of 99 characters.
<b>Role</b>	Indicates the role to which an instance group belongs.
<b>Copy From</b>	Indicates that the parameter values of a specified instance group are copied to the parameters of a new group. If the value is null, the default values are used for the parameters of the new group.
<b>Description</b>	Indicates the instance group description. It can contain only letters, digits, commas (,), periods (.), underscores (_), spaces, and line breaks, and can contain a maximum of 200 characters.

### NOTE

- Each instance must belong to only one instance group. When an instance is installed for the first time, it belongs to the instance group *Role name-DEFAULT* by default.
- You can delete unnecessary or unused instance groups. Before deleting an instance group, migrate all instances in the group to other instance groups, see [Deleting an Instance Group](#) to delete instance group. The default instance group cannot be deleted.

- Step 5** Click **OK**.

The instance group is created.

----End

## Modifying Properties of an Instance Group

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click the specified service name on the service management page.

**Step 4** Click the **Instance Groups** tab. On the **Instance Groups** tab page, locate the row that contains the target instance group.

Click  and configure parameters as prompted.

**Step 5** Click **OK** to save the modifications.

The default instance group cannot be modified.

----End

## Deleting an Instance Group

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** Click the **Instance Groups** tab. On the **Instance Groups** tab page, locate the row that contains the target instance group.

**Step 5** Click .

**Step 6** In the displayed dialog box, click **OK**.

The default instance group cannot be deleted.

----End

### 12.3.3.5.2 Viewing Information About an Instance Group

#### Scenarios

You can view the instance group of a specified service on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the displayed page, click the **Instance Groups** tab.

**Step 5** In the navigation tree, select a role. On the **Basic** tab page, view all instances in the instance group.

 **NOTE**

To move an instance from an instance group to another, perform the following operations:

1. Select the instance to be moved and click **Move**.
2. In the displayed dialog box, select an instance group to which the instance to be moved.

During the migration, the configuration of the new instance group is automatically inherited. If the instance configuration is modified before the migration, the configuration of the instance prevails.

3. Click **OK**.

Restart the expired service or instance for the configuration to take effect.

----End

### 12.3.3.5.3 Configuring Instantiation Group Parameters

#### Scenarios

In a large cluster, users can configure parameters for multiple instances in batches by configuring the related instance groups on FusionInsight Manager, reducing redundant instance configuration items and improving system performance.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 3** Click the specified service name on the service management page.

**Step 4** On the displayed page, click the **Instance Groups** tab.

**Step 5** In the navigation tree, select the instance group name of a role, and switch to the **Configuration** tab page. Adjust parameters to be modified, and click **Save**. The configuration takes effect for all instances in the instance group.

----End

## 12.4 Hosts

### 12.4.1 Host Management Page

#### 12.4.1.1 Viewing the Host List

#### Overview

Log in to FusionInsight Manager, and click **Hosts**. The host list is displayed on the host management page, you can view the host list and basic information of each host.

You can switch view types and set search criteria to filter and search for hosts.

## Host View

Click **Role View** to view the roles deployed on each host. If the role supports the active/standby mode, the role name is displayed in bold.

## Host List

The host list on the host management page contains all hosts in the clusters, and O&M operations can be performed on these hosts.

On the host management page, you can filter hosts by node type or cluster. The rules for filtering host types are as follows:

- A Management Node is the node where the OMS is deployed. Additionally, control roles and data roles may also be deployed on Management Nodes.
- A Control Node is the node where control roles are deployed. Additionally, data roles may also be deployed on Control Nodes.
- A Data Node is the node where only data roles are deployed.

If you select the **Host View**, the IP address, rack planning, AZ name, running status, cluster name, and hardware resource usage of each host are displayed.

**Table 12-15** Host running status

Status	Description
<b>Normal</b>	Indicates that the host is in the normal state.
<b>Faulty</b>	Indicates that the host is abnormal.
<b>Unknown</b>	Indicates that the initial status of the host cannot be detected.
<b>Isolated</b>	Indicates that the host is isolated.
<b>Suspended</b>	Indicates that the host is suspended.

### 12.4.1.2 Viewing the Host Dashboard

#### Overview

Log in to FusionInsight Manager, click **Hosts**, and click a host name in the host list. The host details page contains the basic information area, disk status area, role list area, and monitoring chart.

#### Basic Information Area

The basic information area contains the key information about the host, such as the management IP address, service IP address, host type, rack, firewall, number of CPU cores, and OS information.

## Disk Status Area

The disk status area contains all disk partitions configured for the cluster on the host and the usage of each disk partition.

## Instance List Area

The instance list area displays all role instances installed on the host and the status of each role instance. You can click the log file next to a role instance name to view the log file content of the instance online.

## Alarm and Event History

The alarm and event history area displays the key alarms and events reported by the current host. The system can display a maximum of 20 history records.

## Chart

The monitoring chart area is displayed on the right of the host details page, and contains the key monitoring metrics of the host.

You can click  > **Customize** in the upper right corner to customize the monitoring report to be displayed in the chart area. Select a time range and click  > **Export** to export detailed monitoring indicator data within the specified time range.

You can click  next to the title of a monitoring indicator to open the description of the monitoring indicator.

Click the **Chart** tab of the host to view the full monitoring chart information about the host.

## GPU Card Status Area

If the host is configured with GPU cards, the GPU card status area displays the model, location, and status of the GPU card installed on the host.

### 12.4.1.3 Checking Processes and Resources on the Active Node

#### Overview

Log in to FusionInsight Manager, click **Hosts**, and click the specified host name in the host list. On the host details page, click the **Process** and **Resource** tabs.

#### Process

On the **Process** tab page, the information about the role processes of the deployed service instances on the current host is displayed, including the process status, PID, and process running time. You can directly view the log files of each process online.

## Resource

On the **Resource** tab page, the detailed resource usage of deployed service instances on the current host is displayed, including the CPU, memory, disk, and port usage.

## 12.4.2 Host Maintenance Operations

### 12.4.2.1 Starting and Stopping All Instances on a Host

#### Scenarios

If a host is faulty, you may need to stop all the roles on the host and perform maintenance check on the host. After the host fault is rectified, start all roles running on the host to recover host services. You can start or stop all instances on a host on the host management page or host details page on FusionInsight Manager. The following describes how to perform such operations on the host management page.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Click **Hosts**.
- Step 3** Select the check box of the target host.
- Step 4** Select **Start All Instances** or **Stop All Instances** from the **More** drop-down list to start or stop all role instances.

----End

### 12.4.2.2 Performing a Host Health Check

#### Scenarios

If the running status of a host is not **Normal**, you can perform health checks on the host to check whether some basic functions are abnormal. During routine O&M, you can perform host health checks to ensure that the configuration parameters and monitoring of each role instance on the host are normal and can run stably for a long time.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Click **Hosts**.
- Step 3** Select the check box of the target host.
- Step 4** Select **Health Check** from the **More** drop-down list to start the health check.

To export the result of the health check, click **Export Report** in the upper left corner. If any problem is detected, click **Help**.

----End

### 12.4.2.3 Configuring Racks for Hosts

#### Scenarios

All hosts in a large cluster are usually deployed on multiple racks. Hosts on different racks communicate with each other through switches. The network bandwidth between different hosts on the same rack is much greater than that on different racks. In this case, plan the network topology based on the following requirements:

- To improve the communication speed, it is recommended that data be exchanged between hosts on the same rack.
- To improve the fault tolerance capability, distribute processes or data of distributed services on different hosts of multiple racks as dispersedly as possible.

Hadoop uses a file directory structure to represent hosts. [Figure 12-4](#) displays a cluster with a two-layer network structure. In this example, you are advised to name the rack for Node 1 as /Switch1/Rack1 and that for Node 4 as /Switch1/Rack2.

**Figure 12-4** Two-layer network structure

The HDFS cannot automatically determine the network topology of each DataNode in the cluster. You need to set the rack name to identify the rack where the host is located so that the NameNode can draw the network topology of the required DataNodes and back up data of the DataNodes to different racks. Similarly, YARN needs to obtain rack information and allocate tasks to different NodeManagers as required.

If the cluster network topology changes, you need to reallocate racks for hosts on FusionInsight Manager so that related services can be automatically adjusted.

## Impact on the System

If the name of the host rack is changed, policy for storing HDFS replicas, Yarn task assignment, and storage location of Kafka partitions will be affected. After the modification, restart the HDFS, Yarn, and Kafka for the configuration to take effect.

Improper rack configuration will unbalance loads (including CPU, memory, disk, and network) among nodes in the cluster, which decreases the cluster reliability and stability. Therefore, before allocating racks, take all aspects into consideration and properly set racks.

## Rack Allocation Policies

### NOTE

Physical rack: Indicates the real rack where the host resides.

Logical rack: Indicates the rack name of the host on FusionInsight Manager.

Policy 1: Each logical rack has nearly the same number of hosts.

Policy 2: The name of the logical rack of the host must comply with that of the physical rack to which the host belongs.

Policy 3: If there are only few hosts on a physical rack, combine this physical rack and other physical racks with few hosts into a logical rack, which complies with policy 1. Hosts in two equipment rooms cannot be placed in one logical rack. Otherwise, performance problems may be caused.

Policy 4: If there are lots of hosts on a physical rack, divide these hosts into multiple logical racks, which complies with policy 1. Hosts with great differences should not be placed in the same logical rack. Otherwise, the cluster reliability will be decreased.

Policy 5: You are advised to set **default** or other values for logical racks on the first layer, and the values in the same cluster must be consistent.

Policy 6: The number of hosts in each rack cannot be less than 3.

Policy 7: A cluster can contain at most 50 logical racks. If there are too many logical racks in a cluster, the maintenance is difficult.

## Best Practice Example

For example, there are 100 hosts in a cluster, 40 located in equipment room A and 60 located in equipment room B. In room A, there are 11 hosts on physical rack Ra1 and 29 hosts on physical rack Ra2. In room B, there are six hosts on physical rack Rb1, 33 hosts on physical rack Rb2, 18 hosts on physical rack Rb3, and three hosts on physical rack Rb4.

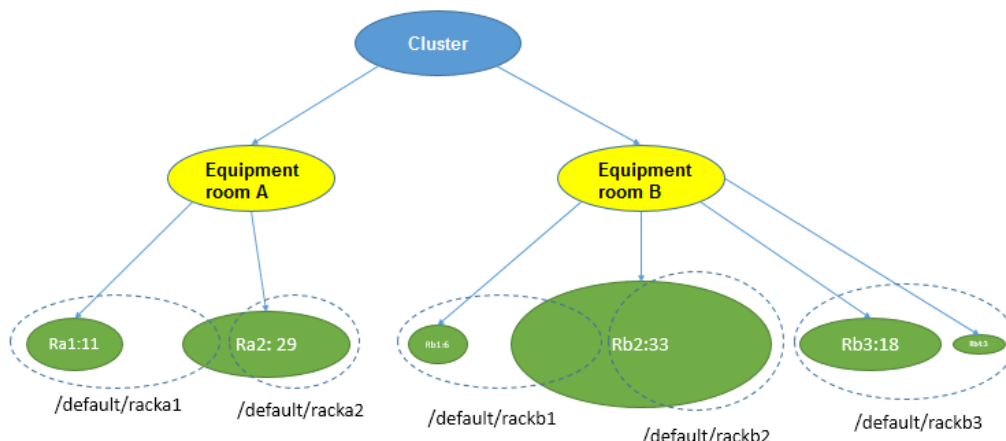

According to the rack allocation policy, each logical rack contains nearly the same number (for example, 20) of hosts. The allocation details are as follows:

- Logical rack /default/racka1: contains 11 hosts on physical rack Ra1 and nine hosts on physical rack Ra2
- Logical rack /default/racka2: contains the remaining 20 hosts (except the nine hosts of logical rack /default/racka1) on physical rack Ra2

- Logical rack /default/rackb1: contains six hosts on physical rack Rb1 and 13 hosts on physical rack Rb2
- Logical rack /default/rackb2: contains the remaining 20 hosts (except the 13 hosts of logical rack /default/rackb1) on physical rack Rb2
- Logical rack /default/rackb3: contains 18 hosts on physical rack Rb3 and three hosts on physical rack Rb4

Rack allocation example:

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Hosts**.

**Step 3** Select the check box of the target host.

**Step 4** Select **Set Rack** from the **More** drop-down list.

- Set rack names in hierarchy based on the actual network topology. Separate racks from different layers using slashes (/).
- Rack naming rules are as follows: */level1/level2/...* The number of levels must be at least 1, and the name cannot be empty. A rack can contain letters, digits, and underscores (\_) and cannot exceed 200 characters.  
For example, /default/rack0.
- If the hosts in the rack to be modified contain DataNode instances, ensure that the rack name levels of the hosts where all DataNode instances reside are the same. Otherwise, the configuration fails to be delivered.

**Step 5** Click **OK**.

----End

## 12.4.2.4 Isolating a Host

### Scenarios

If a host is abnormal or faulty and cannot provide services or affects the cluster performance, you can remove the host from the available node in the cluster temporarily so that the client can access other available nodes.

#### NOTE

Only non-management nodes can be isolated.

### Impact on the System

- After a host is isolated, all role instances on the host will be stopped, and you cannot start, stop, or configure the host and all instances on the host.
- For some services, after a host is isolated, some instances on other nodes do not work, and the service configuration status may expire.
- After a host is isolated, statistics about the monitoring status and indicator data of the host hardware and instances on the host cannot be collected or displayed.
- Retain the default SSH port (22) of the target node. Otherwise, the task described in this section will fail.

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Click **Hosts**.

**Step 3** Select the check box of the host to be isolated.

**Step 4** Select **Isolate** from the **More** drop-down list.

In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 5** In the displayed confirmation dialog box, select **I want to isolate the selected hosts and accept the consequences of possible service failures**. Click **OK**.

Wait until the message "Operation succeeded" is displayed, and click **Finish**.

**Step 6** Log in to the isolated host as user **root** and run the **kill -9 -u omm** command to stop the processes of user **omm** on the node. Then run the **ps -ef | grep'container' | grep '\${BIGDATA\_HOME}' | awk '{print \$2}' | xargs -l' '{}' kill -9' {}'** command to find and stop the container process.

**Step 7** The host is successfully isolated and **Running Status** is **Isolated**.

If you have rectified the host exception or fault, cancel the isolation status of the host before using the host.

On the **Hosts** page, select the isolated host and choose **More > Cancel Isolation**.

**NOTE**

After the isolation is canceled, all role instances on the host are not started by default. To start role instances on the host, select the target host on the **Hosts** page and choose **More > Start All Instances**.

----End

### 12.4.2.5 Exporting Host Information

#### Scenarios

You can export information about all hosts on FusionInsight Manager.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Click **Hosts**.
- Step 3** Specify the status of required hosts in the drop-down list box on the upper right corner, or click **Advanced Search** to specify hosts.
- Step 4** Click **Export All** and select **TXT** or **CSV** for **Save As**. Then, click **OK**.

----End

## 12.4.3 Resource Overview

### 12.4.3.1 Distribution

Click **Hosts > Resource Overview > Distribution**, [Figure 12-5](#) shows the interface for monitoring the cluster resource distribution. By default, the monitoring data of the latest one hour is displayed. You can click  to customize a time range. The default time ranges are 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month.

**Figure 12-5** Resource distribution overview

- Click **Select Metric** to customize the metrics to be viewed. [Table 12-16](#) shows all the metrics. After selecting a metric, the distribution of hosts in the corresponding range is displayed.

- When you move the cursor to a color block, the number of hosts in the current CPU usage range is displayed, as shown in [Figure 12-5](#). Click a column to display the hosts in the current range.
  - When you click the host name of a specified host, the page showing the host detailed information is displayed.
  - When you click **View Trends** of a specified host, the page showing the maximum, average, and minimum cluster values, and host values of the current metric are displayed. You cannot view the trends when the metric of the current cluster is **Host CPU-Memory-Disk Usage**.
- Click **Export Data** to export the metric maximum, minimum, and average values of all nodes in the current cluster in the selected time range.

**Table 12-16** Metrics

Category	Metric
Process	<ul style="list-style-type: none"> <li>• Number of Running Processes</li> <li>• Total Number of Processes</li> <li>• Total Number of omm Processes</li> <li>• Uninterruptible Sleep Process</li> </ul>
Network Status	<ul style="list-style-type: none"> <li>• Host Network Packet Collisions</li> <li>• Number of LAST_ACK States</li> <li>• Number of CLOSING States</li> <li>• Number of LISTENING States</li> <li>• Number of CLOSED States</li> <li>• Number of ESTABLISHED States</li> <li>• Number of SYN_RECV States</li> <li>• Number of TIME_WAITING States</li> <li>• Number of FIN_WAIT2 States</li> <li>• Number of FIN_WAIT1 States</li> <li>• Number of CLOSE_WAIT States</li> <li>• DNS Name Resolution Duration</li> <li>• TCP Ephemeral Port Usage</li> <li>• Host Network Packet Frame Errors</li> </ul>
Network Reading	<ul style="list-style-type: none"> <li>• Host Network Read Packets</li> <li>• Host Network Read Dropped Packets</li> <li>• Host Network Read Error Packets</li> <li>• Host Network Rx Speed</li> </ul>
Disk	<ul style="list-style-type: none"> <li>• Host Disk Write Speed</li> <li>• Host Used Disk</li> <li>• Host Free Disk</li> <li>• Host Disk Read Speed</li> <li>• Host Disk Usage</li> </ul>

Category	Metric
Memory	<ul style="list-style-type: none"> <li>• Free Memory</li> <li>• Cache Memory Size</li> <li>• Total Kernel Cache Memory Size</li> <li>• Shared Memory Size</li> <li>• Host Memory Usage</li> <li>• Used Memory</li> </ul>
Network Writing	<ul style="list-style-type: none"> <li>• Host Network Write Packets</li> <li>• Host Network Write Error Packets</li> <li>• Host Network Tx Speed</li> <li>• Host Network Write Dropped Packets</li> </ul>
CPU	<ul style="list-style-type: none"> <li>• CPU Usage of Processes Whose Priorities Have Been Changed</li> <li>• CPU Usage of User Space Processes</li> <li>• CPU Usage of Kernel Space Processes</li> <li>• Host CPU Usage</li> <li>• CPU Total Time</li> <li>• CPU Idle Time</li> </ul>
Host Status	<ul style="list-style-type: none"> <li>• Host File Handle Usage</li> <li>• Average OS Load in 1 Minute</li> <li>• Average OS Load in 5 Minutes</li> <li>• Average OS Load in 15 Minutes</li> <li>• Host PID Usage</li> </ul>

### 12.4.3.2 Trend

Choose **Hosts > Resource Overview > Trend** to view the resource trend monitoring page of all clusters or a single cluster, as shown in [Figure 12-6](#).

By default, the monitoring data of the latest one hour is displayed. You can click  to customize a time range. The default time ranges are 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month. By default, the trend chart of each metric displays the maximum, minimum, and average values of the entire cluster.

**Figure 12-6 Resource trend**

- Click **Add Host to Chart** to add trend lines of a host in the trend charts. A maximum of 12 hosts can be added.
- Choose **Customize** to customize the metrics to be displayed on the page. For details about the metrics, see [Table 12-16](#) in section [Distribution](#).
- Choose **Export Data** to export the maximum, minimum, and average values of all nodes in the cluster in the selected time range for all selected metrics.

### 12.4.3.3 Cluster

Choose **Hosts > Resource Overview > Cluster** to view the resource monitoring page of each cluster in FusionInsight Manager, as shown in [Figure 12-7](#).

By default, the monitoring data of the latest one hour is displayed. You can click to customize a time range. The default time ranges are 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month.

**Figure 12-7 Cluster resource overview**

- Click **Specify Cluster** to customize the cluster to be displayed.

- Choose **Customize** to customize the metrics to be displayed on the page. For details about the metrics, see [Table 12-16](#) in section [Distribution](#).
- Choose **Export Data** to export the counter values of all selected counters under the selected time range for each cluster.

### 12.4.3.4 Host

Click **Hosts > Resource Overview > Host**, the host resources consist of basic resources (CPU/memory) and disk resources, as shown in [Figure 12-8](#).

Click **Export Data** to export the configuration list of all hosts in the cluster, including the host name, management IP address, host type, number of cores, platform type, memory capacity, and disk size.

**Figure 12-8** Host resource overview

### Basic Configurations (CPU/Memory)

Move the cursor to the pie chart to display the information about the hardware configuration of each node in the current cluster. The information is displayed as follows: *Number of cores (platform type) Memory: Host quantity*.

Hosts that have different configurations are contained in different color blocks in a pie chart. You can click any color block to display the corresponding host list in the lower part of the page.

### Disk Configurations

The horizontal axis indicates the disk capacity (including the OS disk) of nodes, and the vertical axis indicates the number of logical disks (including the OS disk) of nodes.

When you place the cursor on a dot, the information about the disks in the current configuration state, including the number of disks, total capacity, and number of hosts, is displayed.

Click a dot to display the disks of this configuration in the lower part of the page.

## 12.5 O&M

## 12.5.1 Alarms

### 12.5.1.1 Overview of Alarms and Events

#### Alarms

Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. [Figure 12-9](#) is displayed. You can view alarm information reported by clusters in FusionInsight Manager, including the alarm name, ID, severity, and generation time. By default, the latest ten alarms are displayed on each page.

**Figure 12-9** FusionInsight Manager alarm management

Alarm Name	Alarm ID	Severity	Generated	Source	Object	Location	Operation
No periodic backup task ...	12057	Major	07/14/2020 18:04:12	0713	BackupRecovery	Source=0713;ServiceNa...	Clear Unmask View Help
No periodic backup task ...	12057	Major	07/13/2020 18:04:11	0713	BackupRecovery	Source=0713;ServiceNa...	Clear Unmask View Help
DBService Heartbeat Int...	27003	Major	07/13/2020 17:40:19	0713	DBService	Source=0713;ServiceNa...	Clear Mask View Help

#### Detailed alarm parameters

Click on the left of a specified alarm to expand the alarm parameters. [Table 12-17](#) describes the parameters.

**Table 12-17** Alarm parameters

Alarm Parameter	Description
Alarm ID	Indicates the alarm ID.
Alarm Name	Indicates the alarm information name.
Alarm Severity	There are four levels: critical, major, minor, and warning.
Source	Cluster name.
Cleared	Indicates the time when an alarm is cleared. If the alarm is not cleared, -- is displayed.
Object	Indicates the services, processes, or modules that triggers an alarm.
Automatic Clearance	The alarm can be automatically cleared after the fault is rectified.
Alarm Status	Indicates the status of the alarm. Manually Cleared Indicates the current alarm status, including automatic clearance, manual clearance, and uncleared.
Generated	Indicates the time when the alarm is generated

Alarm Parameter	Description
Alarm Cause	Indicates the possible cause of an alarm.
Serial Number	Indicates the number of alarms generated by the system.
Additional Information	Indicates the error information.
Location	Indicates the detailed information for locating the alarm, which includes the following: <ul style="list-style-type: none"> <li>• Source: identifies the cluster for which the alarm is generated.</li> <li>• ServiceName: identifies the service for which the alarm is generated.</li> <li>• RoleName: identifies the role for which the alarm is generated.</li> <li>• HostName: identifies the host for which the alarm is generated.</li> </ul>

### Manage Alarms:

- Click **Export All** to export all alarm details.
- If multiple alarms have been handled, you can select one or more alarms to be cleared and click **Clear Alarm** to clear the alarms in batches. A maximum of 300 alarms can be cleared in each batch.
- Click  to manually refresh the current page. Click  to filter alarms displayed on the page.
- You are allowed to filter specified alarms by object or cluster.
- Click **Advanced Search**. An area where you can search for alarms is displayed. You can search for alarms by alarm ID, alarm name, alarm type, start time, and end time. Click **Search** to display filtered alarms. After you click **Advanced Search** again, the number of entered search criteria is displayed.
- You can click **Clear**, **Masking**, or **Help** to perform corresponding operations on an alarm.
- If there are a large number of alarms, you can click **View by Category**. The system classifies uncleared alarms by alarm ID. After the alarm is classified, click the number of uncleared alarms next to the alarm name to view the alarm details.

## Events

Log in to FusionInsight Manager and choose **O&M > Alarm > Events**. On the displayed page, you can view the information about all events in the cluster, including the alarm name, ID, severity, generation time, object, and location. By default, the latest 10 events are displayed on each page.

**Figure 12-10** FusionInsight Manager event management

Click  on the left of a specified event. The related event parameters are displayed, as shown in [Table 12-18](#).

**Table 12-18** Event parameters

Parameter	Description
Event ID	Indicates the event ID.
Event Name	Indicates the event name.
Severity	Indicates the event severity. There are four levels: Critical, major, minor, and warning.
Generated	Indicates the time when an event occurs.
Object	Indicates the possible cause of an event.
Serial Number	Indicates the number of events generated in the system.
Location	Indicates the detailed information for locating the event, which includes the following: <ul style="list-style-type: none"> <li>• Source: identifies the cluster for which the event is generated.</li> <li>• ServiceName: identifies the service for which the event is generated.</li> <li>• RoleName: identifies the role for which the event is generated.</li> <li>• HostName: identifies the host for which the event is generated.</li> </ul>
Additional Information	Indicates the error information.
Event Cause	Indicates the possible cause of an event.
Source	Cluster name.

**Manage Events:**

- Click **Export All** to export all event details.
- Click  to manually refresh the current page. Click  to filter events displayed on the page.
- You are allowed to filter specified events by object or cluster.

- Click **Advanced Search**. An area where you can search for events is displayed. You can search for events by event ID, severity, event name, start time, and end time.

## 12.5.1.2 Configuring the Threshold

### Scenarios

You can configure monitoring indicator thresholds to monitor the health status of indicators on FusionInsight Manager. If abnormal data occurs and the preset conditions are met, the system triggers an alarm and displays the alarm information on the alarm page.

### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **O&M > Alarm > Thresholds**.
- Step 3** Select a monitoring indicator for a specified host or service in the cluster.

**Figure 12-11** Configuring indicator thresholds

For example, after selecting **Host Memory Usage**, the information about this indicator threshold is displayed.

- If the alarm sending switch is displayed as , an alarm is triggered if the alarm threshold is reached.
- The alarm ID and alarm name contain the alarm information that is triggered by the threshold:
- FusionInsight Manager checks whether the value of each monitored indicator reaches the threshold. If the number of consecutive check times is equal to the value of **Trigger Count**, and the threshold is not reached in these checks, the system sends an alarm.
- The value can be customized. **Check Period (s)** indicates the interval for the system to check monitoring indicators.
- Rules for triggering an alarm.

- Step 4** Click **Create Rule** to add rules used for monitoring indicators.

**Table 12-19** Monitoring indicator rule parameters

Parameter	Value	Description
Rule Name	CPU_MAX (example value)	Name of a rule.
Alarm Severity	<ul style="list-style-type: none"> <li>• Critical</li> <li>• Major</li> <li>• Minor</li> <li>• Warning</li> </ul>	Alarm Severity <ul style="list-style-type: none"> <li>• Critical</li> <li>• Major</li> <li>• Minor</li> <li>• Warning</li> </ul>
Threshold Type	<ul style="list-style-type: none"> <li>• Max value</li> <li>• Min value</li> </ul>	You can select the maximum or minimum value of an indicator. Setting this parameter to <b>Max value</b> , the system generates an alarm when the actual value of the indicator is greater than the threshold. Setting this parameter to <b>Min value</b> , the system generates an alarm when the actual value of the indicator is less than the threshold.
Date	<ul style="list-style-type: none"> <li>• Daily</li> <li>• Weekly</li> <li>• Others</li> </ul>	This parameter is used to set the date when the rule takes effect.
Add Date	09-30	This parameter is available only when <b>Date</b> is set to <b>Others</b> . You can set the date when the rule takes effect. Multiple options are available.
Thresholds	Start and End Time: 00:00 to 08:30	This parameter is used to set the time range when the rule takes effect.
	Threshold: 10	Specifies the threshold of the rule monitoring indicator.

 **NOTE**

For the last parameter in the table, you can click  or  to add or delete multiple start and end time or alarm indicator thresholds.

**Step 5** Click **OK** to save the rules.

**Step 6** Locate the row that contains an added rule, and click **Apply** in the **Operation** column. The value of **Effective** for this rule changes as **Yes**.

You can apply a new rule only after clicking **Cancel**.

----End

## Monitoring Indicator Reference

FusionInsight Manager alarm monitoring indicators are categorized into node information indicators and cluster service indicators. [Table 12-20](#) describes the indicators whose thresholds can be configured on nodes. For all the monitoring indicator list, see the *M*.

**Table 12-20** Monitoring indicators on each node

Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
CPU	Host CPU Usage	This indicator reflects the computing and control capabilities of the current cluster in a measurement period. By observing the indicator value, you can better understand the overall resource usage of the cluster.	90.0%
Disk	Disk Usage	Indicates the disk usage of a host.	90.0%
	Disk Inode Usage	Indicates the disk inode usage in a measurement period.	80.0%
Memory	Host Memory Usage	Indicates the average memory usage at the current time.	90.0%

Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Host Status	Host File Handle Usage	Indicates the usage of file handles of the host in a measurement period.	80.0%
	Host PID Usage	Indicates the PID usage of a host.	90%
Network Status	TCP Ephemeral Port Usage	Indicates the usage of temporary TCP ports of the host in a measurement period.	80.0%
Network Reading	Read Packet Error Rate	Indicates the read packet error rate of the network interface on the host in a measurement period.	0.5%
	Read Packet Dropped Rate	Indicates the read packet dropped rate of the network interface on the host in a measurement period.	0.5%
	Read Throughput Rate	Indicates the average read throughput (at MAC layer) of the network interface in a measurement period.	80%
Network Writing	Write Packet Error Rate	Indicates the write packet error rate of the network interface on the host in a measurement period.	0.5%

Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Write Packet Dropped Rate	Indicates the write packet dropped rate of the network interface on the host in a measurement period.	0.5%
	Write Throughput Rate	Indicates the average write throughput (at MAC layer) of the network interface in a measurement period.	80%
Process	Uninterruptible Sleep Process	Indicates the number of D state processes on the host in a measurement period.	0
	omm Process Usage	Indicates the usage of the omm process within a measurement period.	90

**Table 12-21** Cluster service indicators

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
DBService	Database	Database Connections Usage	Indicates the usage of the number of database connections.	90%
		Disk Space Usage of the Data Directory	Disk space usage of the data directory.	80%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Flume	Agent	Heap Memory Usage Calculate	Indicates the Flume heap memory usage.	95.0%
		Flume Direct Memory Usage Statistics	Indicates the Flume direct memory usage.	80.0%
		Flume Non-heap Memory Usage	Indicates the Flume non-heap memory usage.	80.0%
		Total GC duration of Flume process	Indicates the Flume total GC time.	12000ms
HBase	GC	GC time for old generation	Indicates the total GC time of RegionServer.	5000ms
		GC time for old generation	Indicates the total GC time of HMaster.	5000ms
	CPU and Memory	RegionServer Direct Memory Usage Statistics	Indicates the RegionServer Reg direct memory usage.	90%
		RegionServer Heap Memory Usage Statistics	Indicates the RegionServer heap memory usage.	90%
		HMaster Direct Memory Usage	Indicates the HMaster direct memory usage.	90%
		HMaster Heap Memory Usage Statistics	Indicates the HMaster heap memory usage.	90%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Service	Regions	Indicates the number of regions of a RegionServer.	2000
		Region in transaction count over threshold	Number of regions that are in the RIT state and reach the threshold duration.	1
	Replication	Replication sync failed times	Indicates the number of times that DR data fails to be synchronized.	1
	Queue	Compaction Queue Size	Compaction queue size.	100
HDFS	File and Block	Lost Blocks	Number of missing copy blocks in the HDFS file system.	0
		Blocks Under Replicated	Total number of blocks that need to be replicated by the NameNode.	1000
	RPC	Average Time of Active NameNode RPC Processing	Indicates the average RPC processing time.	100ms
		Average Time of Active NameNode RPC Queuing	Indicates the average RPC queuing time.	200ms
	Disk	Disk Usage	Indicates the HDFS disk usage.	80%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Percentage of DataNode Capacity	Indicates the disk usage of DataNodes in the HDFS.	80%
		Percentage of Reserved Space for Replicas of Unused Space	Indicates the percentage of the reserved disk space of all the copies to the total unused disk space of DataNodes.	90%
	Resource	Faulty DataNodes	Indicates the number of faulty DataNodes.	3
		NameNode Non Heap Memory Usage Statistics	Indicates the percentage of NameNode non-heap memory usage.	90%
		NameNode Direct Memory Usage Statistics	Indicates the percentage of direct memory used by NameNodes.	90%
		NameNode Heap Memory Usage Statistics	Indicates the percentage of NameNode non-heap memory usage.	95%
		DataNode Non Heap Memory Usage Statistics	Indicates the percentage of DataNode non-heap memory usage.	90%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		DataNode Direct Memory Usage Statistics	Indicates the percentage of direct memory used by DataNodes.	90%
		DataNode Heap Memory Usage Statistics	Indicates the percentage of DataNode non-heap memory usage.	95%
	Garbage Collection	GC Time	Indicates the Garbage collection (GC) duration of NameNodes per minute.	12000ms
		GC Time	Indicates the GC duration of DataNodes per minute.	12000ms
Hive	HQL	Percentage of HQL Statements That Are Executed Successfully by Hive	Indicates the percentage of HQL statements that are executed successfully by Hive.	90.0%
	Background	Background Thread Usage	Indicates the percentage of Background thread usage.	90%
	GC	Total GC Time in Milliseconds	Indicates the total GC time of MetaStore.	12000ms
		Total GC Time in Milliseconds	Indicates the total GC time of HiveServer.	12000ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Capacity	Percentage of HDFS Space Used by Hive to the Available Space	Indicates the percentage of HDFS space used by Hive to the available space.	85.0%
	CPU and Memory	MetaStore Direct Memory Usage Statistics	Indicates the MetaStore direct memory usage.	95%
		MetaStore Non-Heap Memory Usage Statistics	Indicates the MetaStore non-heap memory usage.	95%
		MetaStore Heap Memory Usage Statistics	Indicates the MetaStore heap memory usage.	95%
		HiveServer Direct Memory Usage Statistics	Indicates the HiveServer direct memory usage.	95%
		HiveServer Non-Heap Memory Usage Statistics	Indicates the HiveServer non-heap memory usage.	95%
		HiveServer Heap Memory Usage Statistics	Indicates the HiveServer heap memory usage.	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
	Session	Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer	Indicates the percentage of the number of sessions connected to the HiveServer to the maximum number of sessions allowed by the HiveServer.	90.0%
Kafka	Partition	Percentage of Partitions That Are Not Completely Synchronized	Indicates the percentage of partitions that are not completely synchronized to total partitions.	50%
	Other	Unavailable Partition Percentage	Disk usage of the disk where the Broker data directory is located.	40%
		User Connection Usage on Broker	User connection usage on the broker.	80%
	Disk	Broker Disk Usage	Indicates the disk usage of the disk where the Broker data directory is located.	80%
	Process	Broker GC Duration per Minute	Indicates the GC duration of the Broker process per minute.	12000ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Heap Memory Usage of Kafka	Indicates the Kafka heap memory usage.	95%
		Kafka Direct Memory Usage	Indicates the Kafka direct memory usage.	95%
Loader	Memory	Heap Memory Usage Calculate	Indicates the Loader heap memory usage.	95%
		Loader Direct Memory Usage Statistics	Indicates the Loader direct memory usage.	80.0%
		Non heap Memory Usage Calculate	Indicates the Loader non-heap memory usage.	80%
	GC	Total GC time in milliseconds	Indicates the total GC time of Loader.	12000ms
MapReduce	Garbage Collection	GC Time	Indicates the GC time.	12000ms
	Resource	JobHistoryServer Direct Memory Usage Statistics	Indicates the JobHistoryServer direct memory usage.	90%
		JobHistoryServer Non Heap Memory Usage Statistics	Indicates the JobHistoryServer non-heap memory usage.	90%
		JobHistoryServer Heap Memory Usage Statistics	Indicates the JobHistoryServer non-heap memory usage.	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Oozie	Memory	Heap Memory Usage Calculate	Indicates the Oozie heap memory usage.	95.0%
		Oozie Direct Buffer Resource Percentage	Indicates the Oozie direct memory usage.	80.0%
		Non Heap Memory Usage Calculate	Indicates the Oozie non-heap memory usage.	80%
	GC	Total GC duration of Oozie process	Indicates the Oozie total GC time.	12000ms
Spark2x	Memory	JDBCServer2x Heap Memory Usage Statistics	Indicates the JDBCServer2x heap memory usage.	95%
		JDBCServer2x Direct Memory Usage Statistics	Indicates the JDBCServer2x direct memory usage.	95%
		JDBCServer2x Non-Heap Memory Usage Statistics	Indicates the JDBCServer2x non-heap memory usage.	95%
		JobHistory2x Direct Memory Usage Statistics	Indicates the JobHistory2x direct memory usage.	95%
		JobHistory2x Non-Heap Memory Usage Statistics	Indicates the JobHistory2x non-heap memory usage.	95%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		JobHistory2x Heap Memory Usage Statistics	Indicates the JobHistory2x heap memory usage.	95%
		IndexServer2x Direct Memory Usage Statistics	Indicates the IndexServer2x direct memory usage.	95%
		IndexServer2x Heap Memory Usage Statistics	Indicates the IndexServer2x heap memory usage.	95%
		IndexServer2x Non-Heap Memory Usage Statistics	Indicates the IndexServer2x non-heap memory usage.	95%
	GC number	Full GC Number of JDBCServer2x	Indicates the total GC number of JDBCServer2x.	12
		Full GC Number of JobHistory2x	Indicates the total GC number of JobHistory2x.	12
		Full GC Number of IndexServer2x	Indicates the total GC number of IndexServer2x.	12
	GC Time	Total GC time in milliseconds	Indicates the total GC time of JDBCServer2x.	12000ms
		Total GC time in milliseconds	Indicates the total GC time of JobHistory2x.	12000ms

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		Total GC time in milliseconds	Indicates the total GC time of IndexServer2x .	12000ms
Storm	Cluster	Number of Available Supervisors	Indicates the number of available Supervisor processes in the cluster in a measurement period.	1
		Slot Usage	Indicates the slot usage in the cluster in a measurement period.	80.0%
	Nimbus	Heap Memory Usage Calculate	Indicates the Nimbus heap memory usage.	80%
Yarn	Resource	NodeManager Direct Memory Usage Statistics	Indicates the percentage of direct memory used by NodeManagers.	90%
		NodeManager Heap Memory Usage Statistics	Indicates the percentage of NodeManager heap memory usage.	95%
		NodeManager Non Heap Memory Usage Statistics	Indicates the percentage of NodeManager non-heap memory usage.	90%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		ResourceManager Direct Memory Usage Statistics	Indicates the Kafka direct memory usage.	90%
		ResourceManager Heap Memory Usage Statistics	Indicates the ResourceManager heap memory usage.	95%
		ResourceManager Non Heap Memory Usage Statistics	Indicates the ResourceManager non-heap memory usage.	90%
	CPU and Memory	Pending Memory	Pending memory capacity.	83886080MB
	Other	Failed Applications of root queue	Number of failed tasks in the <b>root</b> queue.	50
		Terminated Applications of root queue	Number of killed tasks in the <b>root</b> queue.	50
	Garbage collection	GC Time	Indicates the GC duration of NodeManager per minute.	12000ms
		GC Time	Indicates the GC duration of ResourceManager per minute.	12000ms
	Application	Pending Applications	Pending tasks.	60

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
ZooKeeper	Connection	ZooKeeper Connections Usage	Indicates the percentage of the used connections to the total connections of ZooKeeper.	80%
	CPU and Memory	Heap Memory Usage Calculate	Indicates the ZooKeeper direct memory usage.	95%
		Direct Memory Usage Calculate	Indicates the ZooKeeper heap memory usage.	80%
	GC	ZooKeeper GC Duration per Minute	Indicates the GC time of ZooKeeper every minute.	12000ms
meta	OBS Meta data Operations	Average Time for Calling the OBS Metadata API	Average time for calling the OBS metadata APIs.	500ms
		Success Rate for Calling the OBS Metadata API	Success rate of calling the OBS metadata APIs	99.0%
	OBS data write operation	Success Rate for Calling the OBS Write API	Success rate of calling the OBS data write APIs.	99.0%
	OBS data read operation	Success Rate for Calling the OBS Data Read API	Success rate of calling the OBS data read operation APIs.	99.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
Ranger	GC	UserSync GC Duration	UserSync garbage collection (GC) duration.	12000ms
		RangerAdmin GC Duration	RangerAdmin garbage collection (GC) duration.	12000ms
		TagSync GC Duration	TagSync garbage collection (GC) duration.	12000ms
	CPU and Memory	UserSync Non-Heap Memory Usage	UserSync non-heap memory usage in percentage.	80.0%
		UserSync Direct Memory Usage	UserSync direct memory usage in percentage.	80.0%
		UserSync Heap Memory Usage	UserSync heap memory usage in percentage.	95.0%
		RangerAdmin Non-Heap Memory Usage	RangerAdmin non-heap memory usage.	80.0%
		RangerAdmin Heap Memory Usage	RangerAdmin heap memory usage in percentage.	95.0%
		RangerAdmin Direct Memory Usage	RangerAdmin direct memory usage.	80.0%

Service	Monitoring Indicator Group Name	Indicator Name	Description	Default Threshold
		TagSync Direct Memory Usage	TagSync direct memory usage in percentage.	80.0%
		TagSync Non-Heap Memory Usage	TagSync non-heap memory usage in percentage.	80.0%
		TagSync Heap Memory Usage	TagSync heap memory usage in percentage.	95.0%
ClickHouse	Cluster Quota	Clickhouse service quantity quota usage in ZooKeeper	Quota of the ZooKeeper nodes used by the ClickHouse service.	90%
		Capacity quota usage of the Clickhouse service in ZooKeeper	Capacity quota of ZooKeeper directory used by the ClickHouse service.	90%
IoTDB	GC	IoTDBServer GC Duration	IoTDBServer garbage collection (GC) duration.	12000ms
	CPU and Memory	IoTDBServer Heap Memory Usage	IoTDBServer heap memory usage in percentage.	90%
		IoTDBServer Direct Memory Usage	IoTDBServer direct memory usage in percentage.	90%

### 12.5.1.3 Configuring the Alarm Masking Status

#### Scenarios

If you do not want FusionInsight Manager to report specified alarms in the following scenarios, you can manually mask the alarms.

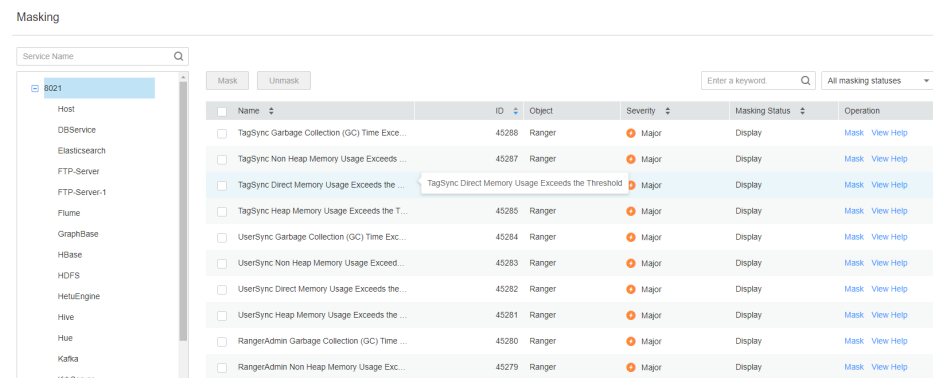

- Some unimportant alarms and minor alarms need to be masked.
- When a third-party product is integrated with FusionInsight, some alarms of the product are duplicated with the alarms of FusionInsight and need to be masked.
- When the deployment environment is special, certain alarms may be falsely reported and need to be masked.

After an alarm is masked, new alarms with the same ID as the alarm are neither displayed on the **Alarm** page nor counted. The reported alarms are still displayed.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **O&M > Alarm > Masking**.
- Step 3** In the **Masking** area, select the specified service or module.
- Step 4** Select an alarm from the alarm list.

**Figure 12-12** Masking an alarm

The information about the alarm is displayed, including the alarm name, ID, severity, masking status, and operations can be performed on the alarm.

- The masking status includes **Display** and **Mask**.
- Operations include **Mask** and **View Help**.

#### NOTE

You can filter specified alarms based on the masking status and alarm severity.

- Step 5** Set the masking status for an alarm:
  - Click **Mask**. In the displayed dialog box, click **OK** to change the alarm masking status to **Mask**.

- Click **Cancel Masking**. In the displayed dialog box, click **OK** to change the masking status of the alarm to **Display**.

----End

## 12.5.2 Log

### 12.5.2.1 Online Log Searching

#### Scenarios

FusionInsight Manager supports online search and displays component logs for log viewing scenarios, such as fault locating.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **O&M > Log > Online Search**.
- Step 3** Set the parameters listed in [Table 12-22](#) based on the logs to be queried. You can select a log generation time range, the default time ranges are 0.5 hour, 1 hour, 2 hours, 6 hours, 12 hours, 1 day, 1 week, and 1 month, or click  to customize **Start Date** and **End Date**.

**Table 12-22** Log search parameters

Parameter	Description
Search Content	Specifies the keywords or regular expressions to be searched for.
Service	Specifies the service or module for which you want to query logs.
File	Specifies the log file to be searched when only one role is selected.
Lowest Log Level	Specifies the lowest level of the logs to be queried. After selecting a level, logs of this level and higher are displayed. The log levels from low to high are as follows: TRACE, DEBUG, INFO, WARN, ERROR, and FATAL

Parameter	Description
Host Scope	<ul style="list-style-type: none"> <li>You can click  to select the hosts.</li> <li>Enter the host name of the node for which you want to query logs or the IP address of the management plane.</li> <li>Use commas (,) to separate IP addresses. For example, <b>192.168.10.10,192.168.10.11</b>.</li> <li>Use hyphens (-) to indicate an IP address segment if the IP addresses are consecutive. For example, <b>192.168.10.[10-20]</b>.</li> <li>Use hyphens (-) to indicate an IP address segment if the IP addresses are consecutive, and use commas (,) to separate IP address segments. For example, <b>192.168.10.[10-20,30-40]</b>.</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>If this parameter is not specified, all hosts are selected by default.</li> <li>A maximum of 10 expressions can be entered at a time.</li> <li>A maximum of 2000 hosts can be matched for all entered expressions at a time.</li> </ul>
Advanced Configurations	<ul style="list-style-type: none"> <li><b>Max Quantity:</b> specifies the maximum number of logs that can be displayed at a time. If the number of queried logs exceeds the preset value, the earliest logs will be ignored. If this parameter is not set, the maximum number of logs that can be displayed at a time is not limited.</li> <li><b>Timeout Duration:</b> specifies the log query timeout duration. This parameter is used to limit the maximum log query time on each node. When the query times out, the query is stopped and the query results are still displayed.</li> </ul>

**Step 4** Click **Search** to start the search. [Table 12-23](#) describes the fields in the query result.

**Table 12-23** Search results

Parameter	Description
Time	Specifies the time when a piece of log is generated.
Source Cluster	Cluster where logs are generated.
Host Name	Specifies the host name of the node where the log file that records the line of log is located.

Parameter	Description
Location	Specifies the path of the log file that records the line of log. Click the location information to go to the online log browsing page. By default, 100 lines of logs before and 100 lines after the line of log are displayed. You can click <b>More</b> on the top or bottom of the page to view more logs. Click <b>Download</b> to download the log file to the local PC.
Line No.	Specifies the line number of a line of log in the log file.
Level	Specifies the log level.
Log	Specifies the log content.

 **NOTE**

You can click **Stop** to forcibly stop the retrieval. The retrieved results are displayed in the list.

- Step 5** Click **Filter** to filter the logs displayed on the page. [Table 12-24](#) lists the fields that you can use to filter logs. After setting these parameters, click **Filter** to search for logs meeting the search criteria. You can click **Reset** to clear the entered information.

**Table 12-24** Filter

Parameter	Description
Keywords	Specifies the keywords of the logs to be searched for.
Host Name	Specifies the name of the host to be searched for.
Location	Specifies the path of the log file to be searched for.
Started	Specifies the start time for logs to be searched for.
Completed	Specifies the end time for logs to be searched for.
Source Cluster	Specifies the cluster of the logs to be searched for.

----End

## 12.5.2.2 Log Downloading

### Scenarios

FusionInsight Manager allows you to export logs generated by all instances of each service role in batches. You do not need to manually log in to a specified node to obtain the logs.

### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Log > Download**.

**Step 3** Select a log downloading range:

1. **Service:** Click  to set a service for **Service**.
2. **Host:** Set the IP address of the host where the service is deployed. You can also click  to select the host.
3. Click  in the upper right corner to select the corresponding **Start Date** and **End Date**.

**Step 4** Click **Download**.

The downloaded log package contains the topology information of the corresponding start time and end time, facilitating locating.

The topology file is named in the format of **topo\_<Topology change time>.txt**. The file contains the node IP address, node host name, and service instances installed on the node. (The OMS node is identified by Manager:Manager.)

The following shows an example:

```
192.168.204.124|suse-124|
DBService:DBServer;KrbClient:KerberosClient;LdapClient:SlapdClient;LdapServer:SlapdServer;Manager:Manager;meta:meta
```

----End

## 12.5.3 Perform a Health Check

### 12.5.3.1 Viewing a Health Check Task

#### Scenarios

You can view all health check tasks in the health check management center to check whether the cluster is affected after the modification.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Health Check**.

By default, all the saved check reports are displayed in a list, as listed in the following table.

**Table 12-25** Health check report records

Item	Description
Checked Object	Indicates the object being checked, open the drop-down menu to view the details.
Status	Indicates the check result status, including <b>No problems found</b> , <b>Problems found</b> , and <b>Checking</b> .
Check Type	Indicates the entity on which the health check is performed, including four dimensions: <b>System</b> , <b>Cluster</b> , <b>Host</b> , <b>Service</b> , and <b>OMS</b> . By default, a health check on the cluster dimension contains all checks items.
Start Mode	Indicates whether the health check is automatically triggered or manually executed.
Started	Indicates the start time of the check.
Completed	Indicates the end time of the check.
Operation	You can export the health check report and view the help information.

 **NOTE**

- In the upper pane, you can filter specified health check records by check object and result status.
- If the cluster checked, you can click **Help** in the **Checked Object** drop-down list box.
- During the health check, the system collects the recent historical data instead of the real-time monitoring data of object indicators. Therefore, the check is delayed.

----End

### 12.5.3.2 Managing Health Check Reports

#### Scenarios

You can manage all saved health check reports on FusionInsight Manager. That is, you can download or delete historical health check reports.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Health Check**.

**Step 3** Locate the row that contains a target health check report, click **Export Report**, and download the report file.

----End

### 12.5.3.3 Modifying Health Check Configuration

#### Scenarios

You can enable automatic health check to reduce manual operation time. By default, the automatic health check checks the entire cluster.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Health Check > Configuration**.

**Periodic Health Check** indicates whether to enable automatic health check. Selecting **Enable** to enable the automatic health check, and selecting **Disable** to disable the function.

Set the health check period to **Daily**, **Weekly**, or **Monthly** as required.

**Step 3** Click **OK** to save the configurations.

----End

## 12.5.4 Configuring Backup and Backup Restoration

### 12.5.4.1 Creating a Backup Task

#### Scenarios

You can create backup tasks on FusionInsight Manager. Executing backup tasks backs up related data.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Backup and Restoration > Backup Management > Create**.

**Step 3** Set **Backup Object** to **OMS** or the cluster whose data needs to be backed up.

**Step 4** Enter a task name in the **Name** text box.

**Step 5** Set **Mode** to **Periodic** or **Manual** as required.

**Table 12-26** Backup types

Type	Parameter	Description
Periodic	Started	Indicates the time when a periodic backup task is started for the first time.
	Period	Indicates the interval between the time when a task is executed last time and that when the task is started next time. The unit can be hour or day.
	Backup Policy	The following policies can be selected: <ul style="list-style-type: none"> <li>• Full backup at the first time and subsequent incremental backup</li> <li>• Full backup every time</li> <li>• Full backup once every n times</li> </ul>
Manual	N/A	You need to manually execute the task to back up data.

**Step 6** Set required parameters in the **Configuration** area.

- Metadata and service data can be backed up.
- For details about how to back up data of different components, see [Backup and Recovery Management](#).

**Step 7** Click **OK** to save the configurations.

**Step 8** In the backup task list, you can view the created backup task.

Locate the row that contains the target backup task, choose **More > Back Up Now** in the **Operation** column to execute the task immediately.

----End

## 12.5.4.2 Creating a Backup Restoration Task

### Scenarios

You can create a backup restoration task on FusionInsight Manager. After the restoration task is executed, the specified backup data is restored to the cluster.

### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **O&M > Backup and Restoration > Restoration Management**. On the displayed page, click **Create**.
- Step 3** Set **Recovery Object** to **OMS** or the cluster whose data needs to be restored.
- Step 4** Enter a task name in the **Task Name** text box.
- Step 5** Set the required parameters in the **Recovery Configuration** area.

- Metadata and service data can be restored.
- For details about how to how to restore data of different components, see [Backup and Recovery Management](#).

**Step 6** Click **OK** to save the configurations.

**Step 7** In the restoration task list, you can view the created restoration tasks.

Locate the row that contains the target backup restoration task, click **Start** in the **Operation** column to execute the restoration task immediately.

----End

### 12.5.4.3 Managing Backup and Backup Restoration Tasks

#### Scenarios

You can also maintain and manage backup restoration tasks on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **O&M > Backup and Restoration > Backup Management** or **O&M > Backup and Restoration > Restoration Management**.

**Step 3** In the **Operation** column of the specified task in the task list, select the operation to be performed.

**Table 12-27** Maintenance and management operations

Operation Entry	Description
<b>Config</b>	Modify parameters for the backup task.
<b>Recover</b>	After some service data is successfully backed up, you can use this function to quickly restore data.
<b>More &gt; Back Up Now</b>	Perform this operation to execute the backup task immediately.
<b>More &gt; Stop</b>	Perform this operation to stop a running task.
<b>More &gt; Delete</b> or <b>Delete</b>	This operation is used to delete tasks.
<b>More &gt; Suspend</b>	Perform this operation to disable the automatic backup task function.
<b>More &gt; Resume</b>	Perform this operation to enable the automatic backup task function.
<b>More &gt; View History</b> or <b>View History</b>	Perform this operation to switch to the task run log page to view the task running details and backup path.

Operation Entry	Description
View	Perform this operation to check the parameter settings of the restoration task.
Start	Perform this operation to run the restoration task.

----End

## 12.6 Audit

### 12.6.1 Overview

Log in to FusionInsight Manager and choose **Audit**. **Figure 12-13** shows the audit information, containing the operation type, security level, start time, end time, user, host name, service, instance, and operation result.

**Figure 12-13** Audit information list

Operation Type	Risk Level	Started	Completed	User	Source	Host Name	Service	Instance	Operation Result
Lock screen	Notice	07/18/2019 10:06:37	07/18/2019 10:06:37	admin	OMS	--	--	--	Successful
User login	Notice	07/18/2019 10:05:12	07/18/2019 10:05:12	admin	OMS	--	--	--	Successful
User logout	Notice	07/18/2019 10:05:02	07/18/2019 10:05:02	admin	OMS	--	--	--	Successful
Lock screen	Notice	07/18/2019 10:02:44	07/18/2019 10:02:44	admin	OMS	--	--	--	Successful
Lock screen	Notice	07/18/2019 09:57:53	07/18/2019 09:57:53	admin	OMS	--	--	--	Successful
User login	Notice	07/18/2019 09:46:03	07/18/2019 09:46:03	admin	OMS	--	--	--	Successful
User logout	Notice	07/18/2019 09:41:30	07/18/2019 09:41:30	admin	OMS	--	--	--	Successful
Restart instance	Major	07/18/2019 09:35:57	07/18/2019 09:37:33	admin	Cluster 1	--	Yarn	--	Successful
User login	Notice	07/18/2019 09:35:09	07/18/2019 09:35:09	admin	OMS	--	--	--	Successful
Lock screen	Notice	07/18/2019 09:34:15	07/18/2019 09:34:15	admin	OMS	--	--	--	Successful

- You can select audit logs at the **Critical, Major, Minor, or Notice** security level.
- In **Advanced Search**, you can set filter criteria to query audit logs.
  - You can query audit logs by user management, cluster, service, and health in the **Operation Type** column.
  - In the **Service** column, you can select a service to query corresponding audit logs.

**NOTE**

You can select -- to search for audit logs using all other search criteria except services.

- You can query audit logs by operation result, such as, **Success, Failed, or Unknown**.
- You can click to manually refresh the current page or click to modify the columns displayed in the audit table.
  - Click **Export All** to export all audit information at a time. You can export the information to a TXT or CSV file.

- For details about the audit content contained in audit management, see [Audit Logs](#).

## 12.6.2 Configuring Audit Log Dumping

### Scenarios

The audit logs of FusionInsight Manager are stored in the database by default. If the audit logs are retained for a long time, the disk space of the data directory may be insufficient. To store audit logs to another archive server, you can set the required dump parameters to automatically dump these logs. This facilitates the management of audit logs.

If you do not configure the audit log dumping, the system automatically saves the audit logs to a file when the number of audit logs reaches 100,000 pieces. The save path is `${BIGDATA_DATA_HOME}/dbdata_om/dumpData/iam/operatelog` on the active management node. The file name format is `OperateLog_store_YY_MM_DD_HH_MM_SS.csv`. The maximum number of historical audit log files is 50.

### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Audit > Configurations**.
- Step 3** Click the switch on the right of **Dump Audit Log**.

By default, **Dump Audit Log** is disabled. If this parameter is set to , the function is enabled.

- Step 4** Set the dump parameters based on information provided in [Table 12-28](#)

**Table 12-28** Audit log dump parameters

Parameter	Description	Value
SFTP IP Mode	IP address mode. The value can be <b>IPv4</b> or <b>IPv6</b> .	<b>IPv4</b>
SFTP IP	Specifies the SFTP server for storing dumped audit logs. This parameter is mandatory. You are advised to use the SFTP service based on SSH v2. Otherwise, security risks exist.	<b>192.168.10.51</b> (example value)
SFTP Port	Specifies the port of the SFTP server for storing dumped audit logs. This parameter is mandatory.	<b>22</b> (example value)
Save Path	Specifies the path for storing audit logs on the SFTP server. This parameter is mandatory.	<b>/opt/om/m/oms/auditLog</b> (example value)

Parameter	Description	Value
SFTP Username	Specifies the username for logging in to the SFTP server. This parameter is mandatory.	<b>root</b> (example value)
SFTP Password	Specifies the password for logging in to the SFTP server. This parameter is mandatory.	<b>Root_123</b> (example value)
SFTP Public key	Specifies the public key of the SFTP server. This parameter is optional. You are advised to set the public key of the SFTP server. Otherwise, security risks may exist.	-
Dumping Mode	Specifies the dump mode. This parameter is mandatory. <ul style="list-style-type: none"> <li>• <b>By Quantity</b>: If the number of pieces of logs reaches the value of this parameter (<b>100000</b> by default), the logs are dumped.</li> <li>• <b>By Time</b>: specifies the date when logs are dumped. The dumping frequency is once a year.</li> </ul>	<ul style="list-style-type: none"> <li>• By Quantity</li> <li>• By Time</li> </ul>
Dumping Date	This parameter is mandatory. It is available when the dump mode is set to <b>By Time</b> . After you select a dump date, the system starts dumping on this date. The logs to be dumped include all the audit logs generated before January 1 00:00 of the current year.	November 06 (example)

 **NOTE**

If the SFTP public key is empty, the system prompts a security risk message. Determine the security risk, then save the configuration.

**Step 5** Click **OK** to complete the settings.

 **NOTE**

Key fields in the audit log dump file are as follows:

- **USERTYPE** indicates the user type. Value **0** indicates the Human-machine user, and value **1** indicates the Machine-machine user.
- **LOGLEVEL** indicates the security level. Value **0** indicates Critical, value **1** indicates Major, value **2** indicates Minor, and value **3** indicates Warning.
- **OPERATERESULT** indicates the operation result. Value **0** indicates that the operation is successful, and value **1** indicates that the operation is failed.

----End

## 12.7 Tenant Resources

## 12.7.1 Introduction to Multi-Tenant

### 12.7.1.1 Overview

#### Definition

Multi-tenant specifies multiple resource sets (a resource set is a tenant) in a MRS big data cluster and is able to allocate and schedule resources. The resources include computing resources and storage resources.

#### Background

Modern enterprise data clusters are developing towards centralization and cloudification. Enterprise-class big data clusters must meet the following requirements:

- Carry data of different types and formats and run jobs and applications of different types (analysis, query, and stream processing).
- Isolate data of a user from that of another user who has demanding requirements on data security, such as a bank or government institute.

The preceding requirements bring the following challenges to the big data cluster:

- Proper allocation and scheduling of resources to ensure stable operating of applications and jobs
- Strict access control to ensure data and service security

Multi-tenant isolates the resources of a big data cluster into resource sets. Users can lease desired resource sets to run applications and jobs and store data. In a big data cluster, multiple resource sets can be deployed to meet diverse requirements of multiple users.

The MRS enterprise-class big data cluster provides a complete enterprise-class big data multi-tenant solution.

#### Highlights

- Proper resource configuration and isolation  
The resources of a tenant are isolated from those of another tenant. The resource use of a tenant does not affect other tenants. This mechanism ensures that each tenant can configure resources based on service requirements, improving resource utilization.
- Resource consumption measurement and statistics  
Tenants are system resource applicants and consumers. System resources are planned and allocated based on tenants. Resource consumption by tenants can be measured and recorded.
- Ensured data security and access security  
In multi-tenant scenarios, the data of each tenant is stored separately to ensure data security. The access to tenants' resources is controlled to ensure access security.

## 12.7.1.2 Technical Principles

### 12.7.1.2.1 Multi-Tenant Management

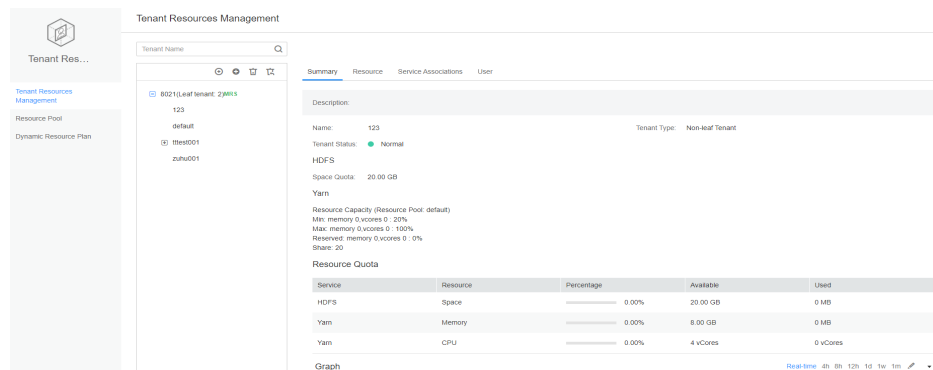

#### Unified Multi-Tenant Management

FusionInsight Manager is a unified multi-tenant management platform, which integrates multiple functions, such as tenant lifecycle management, tenant resource configuration, and tenant resource usage statistics, delivering a mature multi-tenant management model and achieving centralized tenant and service management.

#### Graphical User Interface

FusionInsight Manager provides the graphical multi-tenant management interface and manages and operates multiple levels of tenants using the tree structure. Additionally, FusionInsight Manager integrates the basic information and resource quota of the current tenant in one interface to facilitate O&M and management, as shown in [Figure 12-14](#).

**Figure 12-14** Tenant management page of FusionInsight Manager

#### Level-based Tenant Management

FusionInsight Manager supports a level-based tenant management model in which you can add sub-tenants to an existing tenant to re-configure resources. Sub-tenants of level-1 tenants belong to level-2 tenants, and so on. FusionInsight Manager provides enterprises with a field-tested multi-tenant management model, enabling centralized tenant and service management.

#### Simplified Rights Management

In FusionInsight Manager, common users are shielded from internal rights management details and MRS cluster administrators' rights management operations are simplified, improving rights management usability and user experience.

- FusionInsight Manager adopts the role-based access control (RBAC) mode to configure rights for users as required during multi-tenant management.
- Administrator of tenants, the administrator has tenants' management rights, including viewing resources and services of the current tenant, adding or deleting sub-tenants of the current tenant, and managing rights of sub-

tenants' resources. The administrator of a single tenant can be defined and the management over a tenant can be delegated to another user except the system administrator.

- Roles corresponding to tenants, roles have all rights on the computing resources and storage resources of a tenant. During the creation of a tenant, the system automatically creates a corresponding role. You can add a user and bind the user to the tenant role so that it can use the resources of the tenant.

## Clear Resource Management

- **Self-Service Resource Configuration**

In FusionInsight Manager, you can configure the computing resources and storage resources during the creation of a tenant and add, modify, or delete the resources of a tenant.

Rights of the role that corresponds to the current tenant are updated automatically when you modify the computing resources and storage resources of a tenant.

- **Resource Usage Statistics**

Resource usage statistics is critical to make O&M decisions based on the status of cluster applications and services, improving the cluster O&M efficiency. The FusionInsight Manager displays the resource statistics of tenant through the **Resource Quota**, including the dynamic computing resource VCores and Memory of tenant and the usage statistics of HDFS storage resources (Space).

### NOTE

- **Resource Quotas** dynamically calculates the resource usage of tenants.

Service	Resource	Percentage	Available	Used
HDFS	Space	 0.00%	20.00 GB	0 MB
Yarn	Memory	 0.00%	8.00 GB	0 MB
Yarn	CPU	 0.00%	4 vCores	0 vCores

The available resources of the Capacity scheduler and Superior scheduler are calculated as follows:

- Capacity

Available Yarn resources (memory and CPU) = Resource capacity (%) x Total capacity of the resource pool

If a queue crosses multiple resource pools, the available resources of the queue are the total available resources allocated by each resource pool.

- Superior

The available Yarn resources (memory and CPU) are allocated in proportion based on the queue weight.

- When the tenant administrator is bound to a tenant role, the tenant administrator has the rights to manage the tenant and use all resources of the tenant.

- **Graphical Resource Monitoring**

The resource graphical monitoring supports the graphical display of monitoring items listed in [Table 12-29](#), as shown in [Figure 12-15](#).

**Figure 12-15** Refined monitoring

By default, the real-time monitoring data is displayed. You can click  to customize a time range. The default time ranges include 4 hours, 8 hours, 12 hours, 1 day, 1 week, and 1 month. Click  and choose **Export** from the shortcut menu to export the monitoring item information.

**Table 12-29** Item

Service	Metric	Description
HDFS	HDFS Tenant Space Details <ul style="list-style-type: none"> <li>Allocated Space</li> <li>Used Space</li> </ul>	HDFS can select a specified storage directory for monitoring. The storage directory is the same as the directory added by the current tenant in <b>Resource</b> .
	HDFS Tenant File Object Details <ul style="list-style-type: none"> <li>Number of Used File Objects</li> </ul>	
Yarn	Yarn Allocated Cores <ul style="list-style-type: none"> <li>Maximum Number of CPU Cores in an AM</li> <li>Allocated Cores</li> <li>Number of Used CPU Cores in an AM</li> </ul>	Monitoring information of the current tenant can be displayed. If no subitem is configured for a tenant, this information is not displayed. The monitoring data is obtained from <b>Scheduler &gt; Application Queues &gt; Queue: <i>tenant name</i></b> on the native WebUI of Yarn.

Service	Metric	Description
	Yarn Allocated Memory <ul style="list-style-type: none"> <li>Allocated Maximum AM Memory</li> <li>Allocated Memory</li> <li>Used AM Memory</li> </ul>	

### 12.7.1.2.2 Models Related to Multi-Tenant

#### Models Related to Multi-Tenant

Figure 12-16 shows the models related to multi-tenant.

Figure 12-16 Models related to multi-tenant

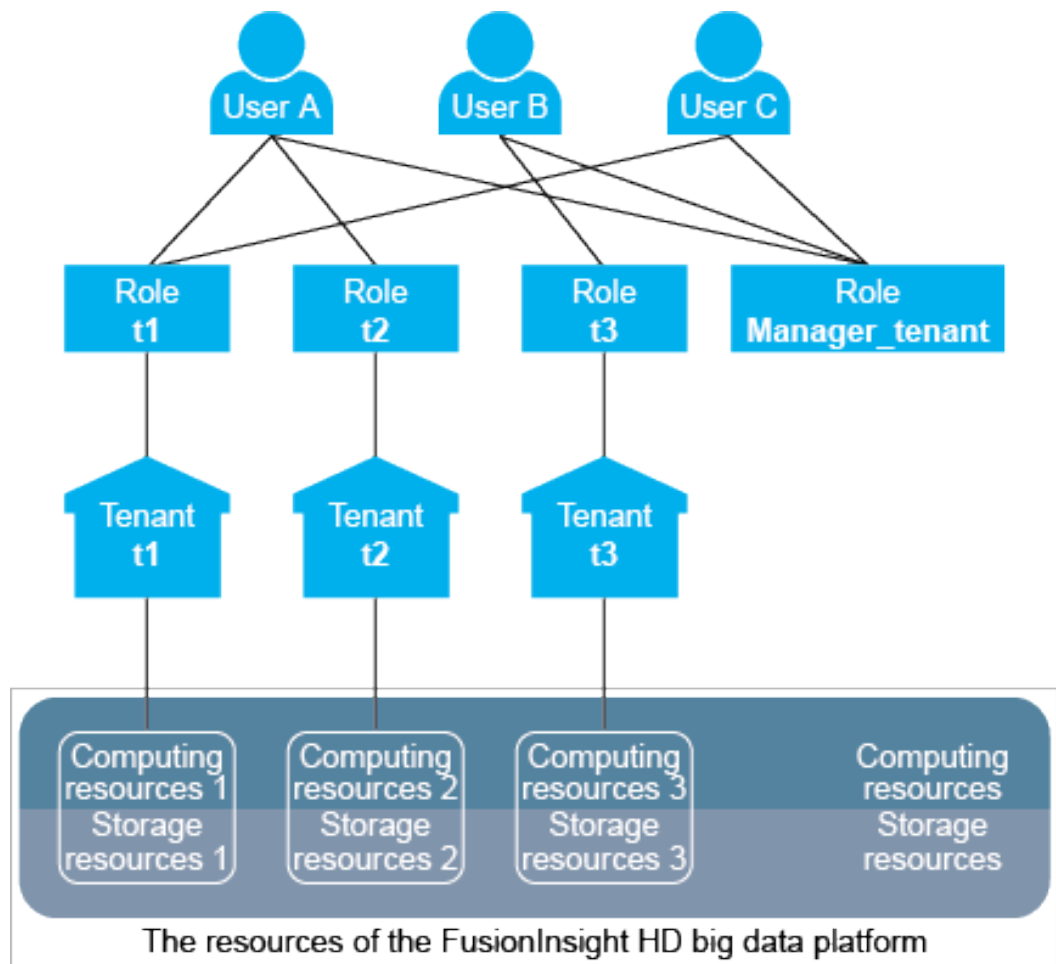

Table 12-30 describes the concepts involved in Figure 12-16.

**Table 12-30** Concepts involved

Concept	Description
User	<p>A natural person who has a name and password and uses the big data platform.</p> <p><b>Figure 12-16</b> shows three different users: user A, user B, and user C.</p>
Role	<p>A role is a carrier of one or more rights. Rights are assigned to specific objects, for example, access rights for the / <b>tenant</b> directory in HDFS.</p> <p><b>Figure 12-16</b> shows four roles: role <b>t1</b>, role <b>t2</b>, role <b>t3</b>, and role <b>Manager_tenant</b>.</p> <ul style="list-style-type: none"> <li>• Roles <b>t1</b>, <b>t2</b>, and <b>t3</b> are automatically generated when tenants are created. The role names are the same as the tenant names. That is, roles <b>t1</b>, <b>t2</b>, and <b>t3</b> map to tenants <b>t1</b>, <b>t2</b>, and <b>t3</b>. Role names and tenant names need to be used together.</li> <li>• Role <b>Manager_tenant</b> is the role of the cluster and cannot be used separately.</li> </ul>
Tenant	<p>A tenant is a resource set divided from a big data cluster. Multi-tenant refers to multiple tenants. The source sets further divided in a tenant are called sub-tenants.</p> <p><b>Figure 12-16</b> shows three tenants: tenant <b>t1</b>, tenant <b>t2</b>, and tenant <b>t3</b>.</p>
Resource	<ul style="list-style-type: none"> <li>• Computing resources include CPUs and memory. The computing resources of a tenant are divided from the total computing resources of the cluster. One tenant cannot occupy the computing resources of another tenant.</li> </ul> <p>In <b>Figure 12-16</b>, computing resources 1, 2, and 3 are divided from the cluster's computing resources by tenants <b>t1</b>, <b>t2</b>, and <b>t3</b>.</p> <ul style="list-style-type: none"> <li>• Storage resources include disks and third-party storage systems. The storage resources of a tenant are divided from the total storage resources of the cluster. One tenant cannot occupy the storage resources of another tenant.</li> </ul> <p>In <b>Figure 12-16</b>, storage resources 1, 2, and 3 are divided from the cluster's storage resources by tenants <b>t1</b>, <b>t2</b>, and <b>t3</b>.</p>

If a user wants to use a tenant's resources or add or delete a sub-tenant from a tenant, the user needs to be bound to both the tenant role and role **Manager\_tenant**. **Table 12-31** shows the roles bound to each user in **Table 12-31**.

**Table 12-31** Roles bound to each user

User	Role	Rights
User A	<ul style="list-style-type: none"> <li>• Role <b>t1</b></li> <li>• Role <b>t2</b></li> <li>• Role <b>Manager_tenant</b></li> </ul>	<ul style="list-style-type: none"> <li>• Uses the resources of tenants <b>t1</b> and <b>t2</b>.</li> <li>• Adds or deletes sub-tenants for tenants <b>t1</b> and <b>t2</b>.</li> </ul>
User B	<ul style="list-style-type: none"> <li>• Role <b>t3</b></li> <li>• Role <b>Manager_tenant</b></li> </ul>	<ul style="list-style-type: none"> <li>• Uses the resources of tenant <b>t3</b>.</li> <li>• Adds or deletes sub-tenants for tenant <b>t3</b>.</li> </ul>
User C	<ul style="list-style-type: none"> <li>• Role <b>t1</b></li> <li>• Role <b>Manager_tenant</b></li> </ul>	<ul style="list-style-type: none"> <li>• Uses the resources of tenant <b>t1</b>.</li> <li>• Adds or deletes sub-tenants for tenant <b>t1</b>.</li> </ul>

One user can be bound to multiple roles, and one role can be bound to multiple users. Users are associated with tenants by binding themselves to the tenants. For this reason, tenants and users are in many-to-many relationship. One user can use the resources of multiple tenants, and multiple users can use the resources of a tenant. In [Figure 12-16](#), user A uses the resources of tenants **t1** and **t2**, and users A and C uses the resources of tenant **t1**.

 **NOTE**

The parent tenant, sub-tenant, level-1 tenants, and level-2 tenants are designed for multi-tenant service scenarios. Pay attention to the differences between these concepts and those of leaf tenant and non-leaf tenant on FusionInsight Manager.

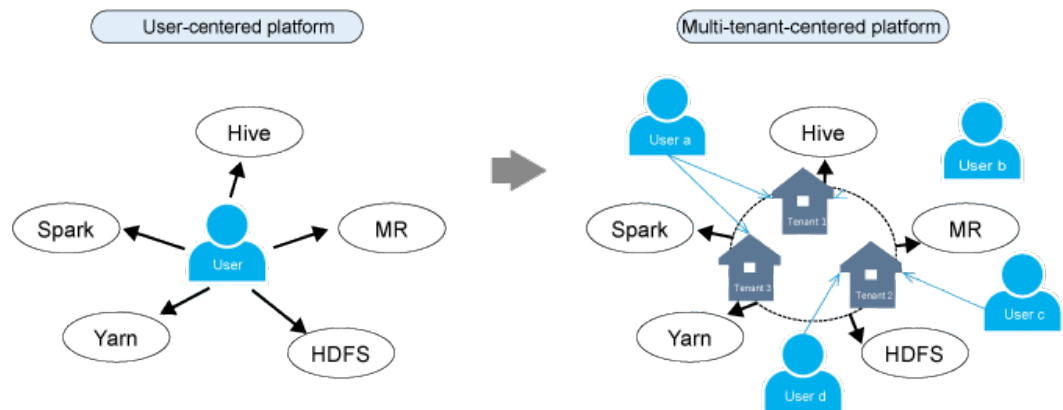

- Level-1 tenant: The name is determined by the tenant's level. For example, the created tenant is a level-1 tenant whose sub-tenant is a level-2 tenant.
- Parent tenant and sub-tenant: indicates the hierarchical relationship between tenants.
- Non-leaf tenant resource: indicates the tenant resource type selected during tenant creation, which can be used to create sub-tenants.
- Leaf tenant resource: indicates the tenant resource type selected during tenant creation, which cannot be used to create sub-tenants.

## Multi-Tenant Platform

Tenant is a core concept of the FusionInsight big data platform. It assists in transforming the big data platform from the user-centered platform to the multi-tenant-centered platform to better cope with the multi-tenant application environment of modern enterprises.

**Figure 12-17** User-centered platform and multi-tenant-centered platform

On the user-centered big data platform, users can directly access and use all resources and services.

- However, some cluster resources may not be used, lowering resource utilization.
- The data of different users may be stored together, decreasing data security.

On the multi-tenant-centered big data platform, users use required resources and services by accessing the tenants.

- Resources are allocated and scheduled based on application requirements and used based on tenants, increasing resource utilization.
- Users can access the resources of tenants only after being assigned roles, enhancing access security.
- The data of tenants is isolated, ensuring data security.

### 12.7.1.2.3 Resource Overview

The resources of the MRS big data platform are divided into computing resources and storage resources. Multi-tenant enables resource isolation:

- **Computing Resource**  
Computing resources include CPUs and memory. One tenant cannot occupy the computing resources of another tenant.
- **Storage Resource**  
Storage resources include disks and third-party storage systems. One tenant cannot access the data of another tenant.

## Computing Resource

Computing resources are divided into static service resources and dynamic resources.

- **Static service resources**  
Static service resources are computing resources allocated to each service. The total volume of computing resources allocated to each service is fixed. Such services include Flume, HBase, HDFS and Yarn.
- **Dynamic resources**

Dynamic resources are computing resources dynamically scheduled to a task queue by distributed resource management service Yarn. Yarn dynamically schedules resources for the task queues of Mapreduce, Spark2x, Flink, and Hive.

 **NOTE**

The resources allocated to Yarn in a big data cluster are static service resources and can be dynamically allocated to task queues by Yarn.

## Storage Resource

Storage resources are data storage resources that can be allocated by distributed file storage service HDFS. Directories are used as the basic unit of HDFS storage resource allocation. Tenants can obtain storage resources by specifying directories in the HDFS file system.

### 12.7.1.2.4 Dynamic Resources

#### Overview

Yarn provides the distributed resource management function for a big data cluster. The total volume of resources allocated to Yarn can be configured. Then Yarn allocates and schedules computing resources for task queues. The computing resources of Mapreduce, Spark, Flink and Hive task queues are allocated and scheduled by Yarn.

Yarn queues are basic units of computing resource allocation.

For tenants, the resources obtained using Yarn task queues are dynamic resources. Users can dynamically create and modify the quotas of task queues and view the status and statistics of task queues.

#### Resource Pool

Complex cluster environments and upper-layer requirements are facing enterprise IT systems. For example:

- Heterogeneous cluster: The computing speed, storage capacity, and network performance of each node in the cluster are different. All the tasks of complex applications need to be properly allocated to each compute node in the cluster based on service requirements.
- Computing isolation: Data must be shared among multiple departments but computing resources must be distributed onto different compute nodes.

Compute nodes must be partitioned.

Resource pools are used to specify the configuration of dynamic resources. Yarn task queues are associated with resource pools for resource allocation and scheduling.

Only one default resource pool can be set for a tenant. Users can bind to the role of a tenant to use the resources in the resource pool of the tenant. If resources in multiple resource pools need to be used, users can bind themselves to multiple tenant roles.

## Scheduling Mechanism

Yarn dynamic resources support label based scheduling. This policy creates labels for compute nodes (Yarn NodeManager nodes) of Yarn clusters and adds the compute nodes with the same label into the same resource pool. Then Yarn dynamically associates the task queues with resource pools based on the resource requirements of the task queues.

For example, a cluster has more than 40 nodes. Labels Normal, HighCPU, HighMEM, and HighIO are created based on the hardware and network configurations of nodes and added four resource pools. [Table 12-32](#) describes the performance of each node in the resource pool.

**Table 12-32** Performance of each node in a resource pool

Label	Number of Nodes	Hardware and Network Configuration	Added To	Association
Normal	10	Minor	Resource pool A	Common task queue
HighCPU	10	High-performance CPU	Resource pool B	Computing-intensive task queue
HighMEM	10	Large memory	Resource pool C	Memory-intensive task queue
HighIO	10	High-performance network	Resource pool D	I/O-intensive task queue

Task queues can use the compute nodes in the associated resource pools only.

- Common task queues are associated with resource pool A and use nodes with hardware and network configurations labeled with Normal.
- Computing-intensive task queues are associated with resource pool B and use nodes with CPUs labeled with HighCPU.
- Memory-intensive task queues are associated with resource pool C and use nodes with memory labeled with HighMEM.
- I/O-intensive task queues are associated with resource pool C and use nodes with the network labeled with HighIO.

Yarn task queues are associated with specified resource pools to efficiently utilize resources in resource pools and ensure node performance.

FusionInsight Manager supports a maximum of add 50 resource pools. A default resource pool is included in the system by default.

## Introduction to Schedulers

Schedulers are divided into the open source Capacity scheduler and Superior scheduler. By default, the Superior scheduler is enabled for the MRS cluster.

- The Capacity scheduler is an open source capacity regulator.
- The Superior scheduler is an enhanced version and named after the Lake Superior, indicating that the scheduler can manage a large amount of data.

To meet enterprise requirements and tackle challenges facing the Yarn community in scheduling. The Superior scheduler not only integrates the advantages of the current Capacity scheduler and Fair scheduler, but also provides the following enhancements:

- **Enhanced resource sharing policy**  
The Superior scheduler supports queue hierarchy. It integrates the functions of open source schedulers and shares resources based on configurable policies. In terms of instances, MRS cluster administrators can use the Superior scheduler to configure an absolute value or a percentage policy for queue resources. The resource sharing policy of the Superior scheduler enhances the label scheduling policy of Yarn as a resource pool feature. Nodes in a Yarn cluster can be grouped based on the capacity or service type to ensure that queues can more efficiently utilize resources.
- **Tenant-based resource reservation policy**  
Resources required by tenants must be ensured for running critical tasks. The Superior scheduler builds a resource reservation mechanism. With this mechanism, reserved resources can be allocated to tasks run by tenant queues in a timely manner to ensure proper task execution.
- **Fair sharing among tenants and resource pool users**  
The Superior scheduler allows shared resources to be configured for users in a queue. Each tenant may have users with different weights. Heavily weighted users may require more shared resources.
- **Ensured scheduling performance in a big cluster**  
The Superior scheduler receives heartbeats from each NodeManager and saves resource information in memory, which enables the scheduler to control cluster resource usage globally. The Superior scheduler uses the push scheduling model, which makes the scheduling more precise and efficient and remarkably improves cluster resource utilization. Additionally, the Superior scheduler delivers excellent performance when the interval between NodeManager heartbeats is long and prevents heartbeat storms in big clusters.
- **Priority policy**  
If the minimum resource requirement of a service cannot be met after the service obtains all available resources, a preemption occurs. The preemption function is disabled by default.

## 12.7.1.2.5 Storage Resource

### Overview

As a distributed file storage service in a big data cluster, HDFS stores all the user data of the upper-layer applications in the big data cluster, including the data written to HBase tables or Hive tables.

Directories are used as the basic unit of HDFS storage resource allocation. HDFS supports the conventional hierarchical file structure. Users can create directories and create, delete, move, or rename files in directories. Tenants can obtain storage resources by specifying directories in the HDFS file system.

### Scheduling Mechanism

HDFS directories can be stored on nodes with specified labels or disks of specified hardware types. For example:

- When both real-time query and data analysis tasks are running in one cluster, the real-time query tasks are deployed on some nodes; therefore, the queried data must be stored on these nodes.
- Based on actual service requirements, key data needs to be stored on nodes with high reliability.

MRS cluster administrators can flexibly configure HDFS data storage policies based on actual service requirements and data features to store data on specified nodes.

For tenants, storage resources indicate the HDFS resources occupied by them. They can implement storage resource scheduling by storing data of specified directories in storage paths configured by tenants to ensure data isolation between tenants.

Users can add or delete HDFS storage directories of tenants and set the file quantity quota and storage capacity quota of directories to manage storage resources.

## 12.7.1.3 Multi-Tenant Use

### 12.7.1.3.1 Overview

Tenants are used in resource control and service isolation scenarios. You need to confirm the service scenarios of cluster resources, and then plan tenants.

#### NOTE

- By default, the Yarn component of the newly installed cluster uses the Superior scheduler. For details, see [Using the Superior Scheduler in Multi-Tenant Scenarios](#).
- When the Yarn component of a cluster uses the Capacity scheduler, see [Using the Capacity Scheduler in Multi-Tenant Scenarios](#).
- You can query the value of `yarn.resourcemanager.scheduler.class` of Yarn to obtain the scheduler type. For details about how to switch the scheduler type, see [Switching the Scheduler](#).

Multi-tenant involves three types of operations: creating a tenant, managing tenants, and managing resources. [Table 12-33](#) describes the operations.

**Table 12-33** Operations involved in multi-tenant

Operation	Action	Description
Creating a tenant	<ul style="list-style-type: none"> <li>• Adding a tenant</li> <li>• Adding a sub-tenant</li> <li>• Creating a user and binding the user to the role of a tenant</li> </ul>	<p>During the creation of a tenant, you can configure its computing resources, storage resources, and associated services based on service requirements. In addition, you can add users to the tenant and bind necessary roles to these users.</p> <p>A user who creates level-1 tenants must be bound to the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p> <p>A user who creates sub-tenants must be bound to the role of the parent tenant at least.</p>
Managing tenants	<ul style="list-style-type: none"> <li>• Managing tenant directories</li> <li>• Restoring tenant data</li> <li>• Clearing unassociated queues of a tenant</li> <li>• Deleting a tenant</li> </ul>	<p>Modifies tenants as the services change.</p> <p>A user who manages or deletes level-1 tenants and restores tenants' data must be bound to the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p> <p>A user who manages or deletes sub-tenants must be bound to the role of the parent tenant at least.</p>
Managing resources	<ul style="list-style-type: none"> <li>• Adding a resource pool</li> <li>• Modifying a resource pool</li> <li>• Deleting a resource pool</li> <li>• Configuring a queue</li> <li>• Configuring the queue capacity policy of a resource pool</li> <li>• Clearing queue configurations</li> </ul>	<p>Reconfigure resources for tenants as the services change.</p> <p>A user who manages resources must be bound to the <b>Manager_administrator</b> or <b>System_administrator</b> role.</p>

### 12.7.1.3.2 Process Overview

You need to confirm the service scenarios of cluster and plan user rights. After that, administrators need to add tenants and configure dynamic resources, storage resources, and related services for tenants on FusionInsight Manager.

**Figure 12-18** shows the procedure of creating a tenant.

**Figure 12-18** Creating a tenant

**Table 12-34** describes the operations.

**Table 12-34** Description on creating a tenant

Operation	Description
Adding a Tenant	Configures computing resources, storage resources, and related services for tenants.
Adding a Sub-Tenant	Configures computing resources, storage resources, and related services for tenants.
Adding a User and Binding the User to a Tenant Role	If a user wants to use the resources of <b>tenant1</b> or add or delete a sub-tenant for <b>tenant1</b> , the user must be bound with the <b>Manager_tenant</b> and <b>tenant1_cluster ID</b> roles.

## 12.7.2 Using the Superior Scheduler in Multi-Tenant Scenarios

### 12.7.2.1 Creating Tenants

#### 12.7.2.1.1 Adding a Tenant

##### Scenario

Based on the resource consumption and isolation plan and requirements of services, you can create tenants on FusionInsight Manager to meet actual application scenarios.

##### Prerequisites

- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

##### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** Click . On the displayed page, configure tenant properties based on [Table 12-35](#).

**Table 12-35** Tenant parameters

Parameter	Description
Cluster	Select the cluster for which you want to create a tenant.
Name	<ul style="list-style-type: none"><li>• Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li></ul>
Tenant Type	<p>Specifies whether the specified tenant is a leaf tenant.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul>

Parameter	Description
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"> <li>When <b>Yarn</b> is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. <ul style="list-style-type: none"> <li>A leaf tenant can directly submit tasks to the task queue.</li> <li>A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named <b>Default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue.</li> </ul> </li> <li>When dynamic resources are not <b>Yarn</b> resources, the system does not automatically create a task queue.</li> </ul>
Configuration Mode	<p>Indicates the configuration mode of computing resource parameters.</p> <ul style="list-style-type: none"> <li>If you select <b>Basic</b>, you only need to set <b>Default Resource Pool Capacity (%)</b>.</li> <li>If you select <b>Advanced</b>, you can manually configure the resource allocation weight and the minimum, maximum, and reserved resources of a tenant.</li> </ul>
Default Resource Pool Capacity (%)	<p>Specifies the computing resource usage in the default resource pool of the current tenant. The value ranges from 0 to 100%.</p>
Weight	<p>Resource allocation weight. The value ranges from 0 to 100.</p>
Minimum Resource	<p>Resources guaranteed for the tenant resource (preemption supported). The value can be a percentage of the parent tenant resource's resources or an absolute value. When a tenant resource has a light workload, the resources of the tenant resource are automatically allocated to other tenant resources. When the available resources of the tenant resource do not meet the minimum threshold, the tenant resource can preempt the resources lent to other tenant resources.</p>
Maximum Resource	<p>Maximum resources that a tenant resource can use. The value can be a percentage of the parent tenant resource's resources or an absolute value.</p>

Parameter	Description
Reserved Resource	Resources reserved for a tenant resource. Even when a tenant resource has no workload, other tenant resources cannot use the reserved resources of the tenant resource. The value can be a percentage of the parent tenant resource's resources or an absolute value.
Storage Resource	Specifies storage resources of the current tenant. <ul style="list-style-type: none"> <li>When <b>HDFS</b> is selected, the system automatically allocates storage resources.</li> <li>When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li> </ul>
Quota	Specifies the file and directory quantity quota.
Space Quota	Specifies the used HDFS storage space quota of the current tenant. <ul style="list-style-type: none"> <li>Value range: When Space Quota unit is set to <b>MB</b>, this parameter ranges from <b>1</b> to <b>8796093022208</b>. When Space Quota unit is set to <b>GB</b>, this parameter ranges from <b>1</b> to <b>8589934592</b>.</li> <li>This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used.</li> <li>If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space.</li> </ul>
Storage Path	Specifies the HDFS storage directory for a tenant. <ul style="list-style-type: none"> <li>The system creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for <b>ta1</b> is <b>/tenant/ta1</b>.</li> <li>When a tenant is created for the first time, the system creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li> </ul>
Service	For details about whether to associate resources of other services, see <a href="#">Step 4</a> .
Description	Configure the description of the current tenant.

 NOTE

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant\_name\_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- During the creation of a tenant, the system automatically creates a Yarn task queue named after the tenant. If the queue name exists, the new queue is named **Tenant name-N**. **N** indicates a natural number starting from 1. When a same name exists, the value **N** increases automatically to differentiate the queue from others. For example, **saletenant**, **saletenant-1**, and **saletenant-2**.

**Step 3** Whether the current tenant need to associate resources of other services.

- If yes, go to [4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
  - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
  - **Share** indicates shared service resources, which can be used by other tenants.

 NOTE

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
- Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
- Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.

3. Click **OK**.

**Step 5** Click **OK**. When **Tenant created successfully**. is displayed on the page, the tenant is added successfully.

----End

### 12.7.2.1.2 Adding a Sub-Tenant

#### Scenario

Based on the resource consumption and isolation plan and requirements of services, you can create Sub-Tenants on FusionInsight Manager, and allocate resources of the current tenant to meet the actual application scenario.

## Prerequisites

- A parent tenant has been added, and belongs to a non-leaf tenant.
- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

## Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, move the cursor to the tenant node to which the sub-tenant is added. Click . In the displayed window, configure the sub-tenant properties based on [Table 12-36](#).

**Table 12-36** Sub-tenant parameters

Parameter	Description
Cluster	Specifies the cluster of the parent tenant.
Parent Tenant Resource	Specifies the name of the parent tenant.
Name	<ul style="list-style-type: none"><li>• Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_).</li><li>• Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li></ul>
Tenant Type	<p>Specifies whether the specified tenant is a leaf tenant.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.</li></ul>

Parameter	Description
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"> <li>When <b>Yarn</b> is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. <ul style="list-style-type: none"> <li>A leaf tenant can directly submit tasks to the task queue.</li> <li>A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named <b>Default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue.</li> </ul> </li> <li>When dynamic resources are not <b>Yarn</b> resources, the system does not automatically create a task queue.</li> </ul>
Configuration Mode	<p>Indicates the configuration mode of computing resource parameters.</p> <ul style="list-style-type: none"> <li>If you select <b>Basic</b>, you only need to set <b>Default Resource Pool Capacity (%)</b>.</li> <li>If you select <b>Advanced</b>, you can manually configure the resource allocation weight and the minimum, maximum, and reserved resources of a tenant.</li> </ul>
Default Resource Pool Capacity (%)	<p>Specifies the computing resource usage of the current tenant. The base value is the total resources of the parent tenant.</p>
Weight	<p>Resource allocation weight. The value ranges from 0 to 100.</p>
Minimum Resource	<p>Resources guaranteed for the tenant resource (preemption supported). The value can be a percentage of the parent tenant resource's resources or an absolute value. When a tenant resource has a light workload, the resources of the tenant resource are automatically allocated to other tenant resources. When the available resources of the tenant resource do not meet the minimum threshold, the tenant resource can preempt the resources lent to other tenant resources.</p>
Maximum Resource	<p>Maximum resources that a tenant resource can use. The value can be a percentage of the parent tenant resource's resources or an absolute value.</p>

Parameter	Description
Reserved Resource	Resources reserved for a tenant resource. Even when a tenant resource has no workload, other tenant resources cannot use the reserved resources of the tenant resource. The value can be a percentage of the parent tenant resource's resources or an absolute value.
Storage Resource	Specifies storage resources of the current tenant. <ul style="list-style-type: none"> <li>When <b>HDFS</b> is selected, the system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant.</li> <li>When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li> </ul>
Quota	Specifies the file and directory quantity quota.
Space Quota	Specifies the used HDFS storage space quota of the current tenant. <ul style="list-style-type: none"> <li>When <b>Space Quota Unit</b> is set to <b>MB</b>, this parameter ranges from <b>1</b> to <b>8796093022208</b>. When <b>Space Quota Unit</b> is set to <b>GB</b>, this parameter ranges from <b>1</b> to <b>8589934592</b>. The maximum value of this parameter does not exceed the total storage quota of the parent tenant.</li> <li>This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used.</li> <li>If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space.</li> <li>If this quota is greater than the quota of the parent tenant, the actual storage space will be affected by the quota of the parent tenant.</li> </ul>
Storage Path	Specifies the HDFS storage directory for a tenant. <ul style="list-style-type: none"> <li>The system creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>/tenant/ta1</b>, the system sets the <b>Storage Path</b> for the sub-tenant to <b>/tenant/ta1/ta1s</b>.</li> <li>The storage path is customizable in the parent directory.</li> </ul>
Service	For details about whether to associate resources of other services, see <a href="#">Step 4</a> .
Description	Configure the description of the current tenant.

 NOTE

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant name\_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- The sub-tenant can further allocate the resources of the current tenant. The sum of the resource percentage of direct sub-tenants of a parent tenant cannot exceed 100%. The sum of the computing resource percentage of all level-1 tenants cannot exceed 100%.

**Step 3** Whether the current tenant need to associate resources of other services.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
  - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
  - **Share** indicates shared service resources, which can be used by other tenants.

 NOTE

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
- Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
- Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.

3. Click **OK**.

**Step 5** Click **OK**. When **Tenant created successfully**. is displayed on the page, the tenant is added successfully.

----End

### 12.7.2.1.3 Adding a User and Binding the User to a Tenant Role

#### Scenario

The created tenant cannot directly log in to the cluster to access resources. MRS cluster administrators need to create a user for a tenant on FusionInsight Manager and bind the user to a tenant role to assign operation rights to the user.

## Prerequisites

The MRS cluster administrator has understood service requirements and created a tenant.

## Procedure

**Step 1** On FusionInsight Manager, click **System > Permission > User**.

**Step 2** To add a user to the system, click **Create**.

To bind tenant rights to an existing user in the system, click **Modify** in the column where the user locates. The configuration page is displayed.

For details about configuring parameters of a user, see [Table 12-37](#).

**Table 12-37** User parameters

Parameter	Description
Username	<p>Specifies the name of the current tenant. The value consists of 3 to 32 characters, which can be letters, digits, underlines (<u> </u>), hyphens(-), or spaces.</p> <ul style="list-style-type: none"> <li>• <b>Username</b> cannot be the same as any username of the OS on each node in the cluster. Otherwise, the user account cannot be used properly.</li> <li>• Usernames of the same letters but different cases are not supported. For example, if <b>User1</b> already exists, user <b>user1</b> cannot be created. When using user <b>User1</b>, enter the correct username.</li> </ul>
User Type	<p>Options include <b>Human-Machine</b> and <b>Machine-Machine</b>.</p> <ul style="list-style-type: none"> <li>• <b>Human-Machine</b> user: Used in FusionInsight Manager O&amp;M scenarios and component client operation scenarios. If you select <b>Human-Machine</b>, you need to set <b>Password</b> and <b>Confirm password</b>.</li> <li>• <b>Machine-Machine</b> user: Used in application development scenarios. If you select <b>Machine-Machine</b>, the user password is generated randomly.</li> </ul>
Password	<p>If you select <b>Human-Machine</b>, set <b>Password</b>.</p> <p>The password must contain 8 to 64 characters, consisting at least 4 of uppercase letters, lowercase letters, digits, and special characters and spaces. Cannot be the username or username spelled backwards.</p>
Confirm Password	Enter the password again.

Parameter	Description
User Group	In <b>User Group</b> , click <b>Add</b> to add the user to a user group. <ul style="list-style-type: none"><li>• If a role is added to a user group, users in the user group can obtain the rights of the role.</li><li>• For example, assign Hive rights to the new user and add the user to the <b>Hive</b> group.</li></ul>
Primary Group	Select a group as the primary group of directories and files of the user. The drop-down list contains groups that are selected in <b>User Group</b> .
Role	Click <b>Add</b> to add a role to the user as required. <b>NOTE</b> <ul style="list-style-type: none"><li>• If a user wants to use resources allocated to <b>tenant1</b> add sub-tenants to or delete sub-tenants from <b>tenant1</b>, bind the <b>Manager_tenant</b> and <b>tenant1_cluster ID</b> roles to the user.</li></ul>
Description	Configure the description of the current user.

**Step 3** Click **OK**.

----End

## 12.7.2.2 Managing Tenants

### 12.7.2.2.1 Managing a Tenant Directory

#### Scenario

You can manage the HDFS storage directory used by a specified tenant on FusionInsight Manager based on service requirements. The management operations include adding tenant directories, modifying quantity quotas of files and directories, and storage space quota of the directory, and deleting directories.

#### Prerequisites

Tenants with HDFS storage resources are added.

#### Procedure

**View a tenant directory.**

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click a target tenant.

**Step 3** Click **Resource**.

**Step 4** View the **HDFS Storage** table.

- The **Quota** column indicates quantity quotas of files and directories.
- The **Space Quota** column indicates storage space sizes of tenant directories.

----End

#### Add a tenant directory.

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

**Step 3** Click **Resource**.

**Step 4** In the **HDFS Storage** table, click **Create Directory**.

- The **Parent Directory** indicates the storage directory of the parent tenant corresponding to the current tenant.

#### NOTE

This parameter is not displayed if the current tenant is not a sub-tenant.

- Set **Path** to a tenant directory path.

#### NOTE

If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

#### NOTE

The number of used files is collected every hour. Therefore, the alarm indicating that the file number exceeds the threshold is delayed.

- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

#### NOTE

The used storage space is collected every hour. Therefore, the alarm indicating that the storage space exceeds the threshold is delayed.

**Step 5** Click **OK**.

----End

#### Modify a tenant directory properties.

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

**Step 3** Click **Resource**.

**Step 4** In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.
- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

**Step 5** Click **OK**.

----End

**Delete tenant directory.**

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

**Step 3** Click **Resource**.

**Step 4** In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

 **NOTE**

The tenant directory that is created by the system during tenant creation cannot be deleted.

**Step 5** Click **OK**.

----End

## 12.7.2.2.2 Restoring Tenant Data

### Scenario

Tenant data is stored on Manager and in cluster components. After components are recovered from faults or reinstalled, some tenant configuration data may be in the abnormal state. You need to manually restore the configuration data on FusionInsight Manager.

### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click a tenant node.

**Step 3** Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the right of **Tenant Status**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.

2. Click **Resource** and check the color of the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Normal** indicates that the component can provide services for the associated tenant. **Not Available** indicates that the component cannot provide services for the tenant.
4. If any of the preceding check items is abnormal, go to **Step 4** to restore tenant data.

**Step 4** Click . In the dialog box that is displayed, enter the password of the administrator who has logged in for authentication, and click **OK**.

**Step 5** In the **Restore Tenant Resource Data** window, select one or multiple components whose data needs to be restored and click **OK**. The system automatically restores the tenant data.

----End

### 12.7.2.2.3 Deleting a Tenant

#### Scenario

Based on service requirements, you can delete tenants that are no longer used on FusionInsight Manager to release resources occupied by tenants.

#### Prerequisites

- A tenant has been added.
- The tenant to be deleted has no sub-tenant.
- The role of the tenant to be deleted is not associated with any user or user group.

#### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, select the tenant to be deleted and click .

 **NOTE**

- If you want to save the tenant data, select **Reserve the data of this tenant resource..** Otherwise, the tenant's storage space will be deleted.

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the configuration. The tenant is deleted successfully. Roles and the storage space of the tenant are also deleted.

 **NOTE**

After the tenant is deleted, the task queue of the tenant still exists in Yarn. The task queue of the tenant is not displayed on the role management page in Yarn.

----End

## 12.7.2.3 Managing Resources

### 12.7.2.3.1 Add a Resource Pool

#### Scenario

This section describes how to logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. You can create a customized resource pool on FusionInsight Manager and add hosts that are not added to other customized resource pools to the newly created resource pool.

The system contains a **default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** Click **Add Resource Pool**.

**Step 4** In **Add Resource Pool**, set the properties of the resource pool.

- **Cluster:** Select the name of the cluster to which the resource pool is to be added.
- **Name:** Enter the name of the resource pool. The resource pool name consists of 1 to 50 characters, including digits, letters, or underscores (\_), but cannot start with an underscore (\_).
- **Resource Label:** Resource label of the resource pool, including letters, digits, underscores (\_) or hyphens(-). The value contains 1 to 50 characters and must start with a digit or letter.
- **Resource:** In the host list on the left, select the name of a specified host and click  to add the selected host to the resource pool. Only hosts in the current cluster can be selected. The host list of a resource pool can be left blank.

#### NOTE

You can select the **Resource** based on the host name, CPU, memory, operating system and platform type.

**Step 5** Click **OK** to save the settings.

After the resource pool is created, you can view the name, type, and members of the resource pool in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **default** resource pool.

----End

### 12.7.2.3.2 Modifying a Resource Pool

#### Scenario

If hosts in the resource pool need to be adjusted based on service requirements, you can modify members in the existing resource pool on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** Locate the row that contains the specified resource pool in the resource pool list, and click **Edit** in the **Operation** column.

**Step 4** In **Edit Resource Pool**, modify Hosts.

- Adding a host: In the host list on the left, select the name of a specified host and click  to add the selected host to the resource pool.
- Deleting a host: In the host list on the right, select the name of a specified host and click  to delete the selected host from the resource pool. The host list of a resource pool can be left blank.

**Step 5** Click **OK** to save the settings.

----End

### 12.7.2.3.3 Deleting a Resource Pool

#### Scenario

This section describes how to delete an existing resource pool on FusionInsight Manager.

#### Prerequisites

- Any queue in the cluster cannot use the resource pool to be deleted as its default resource pool; therefore, cancel the default resource pool before deleting a resource pool. For details, see [Configuring a Queue](#).
- Additionally, any queue in the cluster is not allowed to configure the resource distribution policy in the resource pool to be deleted; therefore, clear the policy before deleting a resource pool. For details, see [Clearing Queue Configurations](#).

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** Locate the row that contains the specified resource pool in the resource pool list, and click **Delete** in the **Operation** column.

**Step 4** In the window that is displayed, click **OK**.

----End

### 12.7.2.3.4 Configuring a Queue

#### Scenario

You can modify queue configuration of a specific tenant on FusionInsight Manager based on service requirements.

#### Prerequisites

Tenants who use the Superior scheduler have been added.

#### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** Click the **Dynamic Resource Plan** tab.

**Step 3** Click the **Queue Configuration** tab.

**Step 4** Set **Cluster** to the name of the cluster to be operated. In the tenant queue table, click **Modify** in the **Operation** column of the specific tenant queue.

#### NOTE

- You can also open the queue modification page as follows: Click the target tenant in the tenant list on the left of the **Tenant Resources Management** tab page. In the window that is displayed, click **Resource**. On the page that is displayed, click  behind **Queue Configuration (queue name)**.
- One queue can be bound to only one non-default resource pool.

**Table 12-38** Queue configuration parameters

Parameter	Description
Max Master Shares(%)	Indicates the maximum percentage of resources occupied by all ApplicationMasters in the current queue.
Max Allocated vCores	Indicates the maximum number of cores allocated to a Yarn container in the current queue. The default value is -1, indicating that the value range is not limited.
Max Allocated Memory(MB)	Indicates the maximum memory allocated to a Yarn container in the current queue. The default value is -1, indicating that the value range is not limited.

Parameter	Description
Max Running Apps	Indicates the maximum number of tasks supported by the current queue at one time. The default value is <b>-1</b> , which indicates that the number of tasks that can be executed concurrently in the queue is not restricted (same meaning as the parameter value left blank). Value <b>0</b> indicates that no task can be executed. The value ranges from -1 to 2147483647.
Max Running Apps per User	Indicates the maximum number of tasks allowed for a user in the current queue at one time. The default value is <b>-1</b> , which indicates that the number of tasks that can be executed concurrently in the queue is not restricted (same meaning as the parameter value left blank). Value <b>0</b> indicates that no task can be executed. The value ranges from -1 to 2147483647.
Max Pending Apps	Indicates the maximum number of tasks that can be suspended in the current queue at one time. The default value is <b>-1</b> , which indicates that the number of tasks that can be suspended concurrently in the queue is not restricted (same meaning as the parameter value left blank). Value <b>0</b> indicates that no task can be suspended. The value ranges from -1 to 2147483647.
Resource Allocation Rule	Indicates the rule for allocating resources to different tasks of a user. The rule can be FIFO or FAIR. If a user submits multiple tasks in the current queue and the rule is FIFO, the tasks are executed one by one in sequential order; if the rule is FAIR, resources are evenly allocated to all tasks.
Default Resource Label	Indicates that tasks are executed on a node with a specified resource label.
Active	<ul style="list-style-type: none"> <li>● <b>ACTIVE</b>: indicates that the current queue can receive and execute tasks.</li> <li>● <b>INACTIVE</b>: indicates that the current queue can receive but cannot execute tasks. Tasks submitted to the queue are suspended.</li> </ul>
Open	<ul style="list-style-type: none"> <li>● <b>OPEN</b>: indicates that the current queue is opened.</li> <li>● <b>CLOSED</b>: indicates that the current queue is closed. Tasks submitted to the queue are rejected.</li> </ul>
Migrate Queue Upon Fault	If multi-az availability is enabled for the cluster and an AZ is faulty, set <b>Migrate Queue Upon Fault</b> to <b>TRUE</b> to submit running queues of the tenant to other AZs.

**Step 5** Click **OK**. The queue configuration is complete.

----End

### 12.7.2.3.5 Configuring the Queue Capacity Policy of a Resource Pool

#### Scenario

After a resource pool is added, capacity policies of available resources need to be configured for Yarn task queues to ensure the proper running of tasks in the resource pool.

This section describes how to configure the queue policy on FusionInsight Manager. Tenant queues with the Superior scheduler can use resources in different resource pools.

#### Prerequisites

- You have logged in to FusionInsight Manager.
- You have added a resource pool.
- The task queue is not associated with resource pools of other queues except the default resource pool.

#### Procedure

- Step 1** On FusionInsight Manager, click **Tenant Resources**.
- Step 2** Click the **Dynamic Resource Plan** tab.
- Step 3** Click the **Resource Distribution Policy** tab.
- Step 4** Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.
- Step 5** Locate the specified queue in **Resource Allocation**, and click **Modify** in the **Operation** column.
- Step 6** On the **Resource Configuration Policy** tab page in **Modify Resource Allocation**, configure the resource allocation policy for the task queue in the resource pool.
  - **Weight**: indicates the resources that a tenant can obtain. Its initial value is the same as the minimum resource percentage.
  - **Minimum Resource**: indicates the minimum resources that a tenant can obtain.
  - **Maximum Resource**: indicates the maximum resources that a tenant can obtain.
  - **Reserved Resource**: indicates the resources that are reserved for a tenant and cannot be shared by other tenants.
- Step 7** On the **User Policy** tab page in **Modify Resource Allocation**, configure the user policy.

#### NOTE

**defaultUser(built-in)** indicates that the policy specified by **defaultUser** is used if a user does not specify a policy. The default policy cannot be deleted.

- Click **Add User Policy** to add a user policy.
  - **Username**: indicates the user name.

- **Weight:** indicates the resources that a user can obtain.
- **Max vCores:** indicates the maximum number of virtual cores that a user can obtain.
- **Max Memory(MB):** indicates the maximum memory that a user can obtain.
- Click **Modify** in the **Operation** column to modify a user policy.
- Click **Clear** in the **Operation** column to delete a user policy.

**Step 8** Click **OK** to save the configuration.

----End

### 12.7.2.3.6 Clearing Queue Configurations

#### Scenario

You can clear queue configurations on FusionInsight Manager if a queue does not need resources from a resource pool or a resource pool needs to be disassociated from a queue. Clearing queue configurations means that the resource capacity policy of a queue in the resource pool is canceled.

#### Prerequisites

If a queue is to be unbound from a resource pool, you have ensured that the resource pool is not the default resource pool of the queue. For details, see [Configuring a Queue](#).

#### Procedure

- Step 1** Log in to FusionInsight Manager portal.
- Step 2** Choose **Tenant Resources > Dynamic Resource Plan**
- Step 3** Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.
- Step 4** Locate the row that contains the specified queue in **Resource Allocation** and click **Clear** in the **Operation** column.
- Step 5** In **Clear Queue Configuration**, click **OK** to clear the queue configurations in the current resource pool.

----End

### 12.7.2.4 Managing Global User Policies

#### Scenario

If a tenant uses a Superior scheduler, the system can control the policy for a specific user in using the resource scheduler, including:

- Maximum number of running tasks
- Maximum number of suspended tasks

- Default queue

## Procedure

- Add a scheduling policy.
  - a. On FusionInsight Manager, click **Tenant Resources**.
  - b. Click the **Dynamic Resource Plan** tab.
  - c. Click **Global User Policy**.

### NOTE

**defaults(default setting)** indicates that the default policy is used if a user does not specify the global user policy. The default policy cannot be deleted.

- d. Click **Create Global User Policy**. In the window that is displayed, configure the following parameters:
    - **Cluster**: Select the cluster to be operated.
    - **Username**: indicates the user for whom resource scheduling is controlled. Enter the name of an existing user in the cluster.
    - **Max Running Apps**: indicates the maximum number of tasks that the user can run in the cluster.
    - **Max Pending Apps**: indicates the maximum number of tasks that the user can suspend in the cluster.
    - **Default Queue**: indicates the user queue. Enter the name of an existing queue in the cluster.
- Modify a policy.
    - a. On FusionInsight Manager, click **Tenant Resources**.
    - b. Click the **Dynamic Resource Plan** tab.
    - c. Click **Global User Policy**.
    - d. In the row that contains the desired user policy, click **Modify** in the **Operation** column.
    - e. After adjusting the parameters, click **OK**.
  - Delete a policy.
    - a. On FusionInsight Manager, click **Tenant Resources**.
    - b. Click the **Dynamic Resource Plan** tab.
    - c. Click **Global User Policy**.
    - d. In the row that contains the desired user policy, click **Delete** in the **Operation** column.

In the window that is displayed, click **OK**.

## 12.7.3 Using the Capacity Scheduler in Multi-Tenant Scenarios

### 12.7.3.1 Creating Tenants

### 12.7.3.1.1 Adding a Tenant

#### Scenario

Based on the resource consumption and isolation plan and requirements of services, you can create tenants on FusionInsight Manager to meet actual application scenarios.

#### Prerequisites

- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

#### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** Click . On the displayed page, configure tenant properties based on [Table 12-39](#).

**Table 12-39** Tenant parameters

Parameter	Description
Cluster	Select the cluster for which you want to create a tenant.
Name	<ul style="list-style-type: none"><li>• Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_).</li><li>• Plan a tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li></ul>
Tenant Type	<p>Specifies whether the specified tenant is a leaf tenant.</p> <ul style="list-style-type: none"><li>• When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li><li>• When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant.</li></ul>

Parameter	Description
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"> <li>When <b>Yarn</b> is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. <ul style="list-style-type: none"> <li>A leaf tenant can directly submit tasks to the task queue.</li> <li>A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named <b>Default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue.</li> </ul> </li> <li>When dynamic resources are not <b>Yarn</b> resources, the system does not automatically create a task queue.</li> </ul>
Default Resource Pool Capacity (%)	Specifies the computing resource usage in the <b>Default</b> resource pool of the current tenant. The value ranges from 0 to 100%.
Default Resource Pool Max Capacity (%)	Specifies the maximum computing resource usage in the <b>Default</b> resource pool of the current tenant. The value ranges from 0 to 100%.
Storage Resource	<p>Specifies storage resources of the current tenant.</p> <ul style="list-style-type: none"> <li>When <b>HDFS</b> is selected, the system automatically allocates storage resources.</li> <li>When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li> </ul>
Quota	Specifies the file and directory quantity quota.
Space Quota	<p>Specifies the used HDFS storage space quota of the current tenant.</p> <ul style="list-style-type: none"> <li>Value range: When Space Quota unit is set to <b>MB</b>, this parameter ranges from <b>1</b> to <b>8796093022208</b>. When Space Quota unit is set to <b>GB</b>, this parameter ranges from <b>1</b> to <b>8589934592</b>.</li> <li>This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used.</li> <li>If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space.</li> </ul>

Parameter	Description
Storage Path	<p>Specifies the HDFS storage directory for a tenant.</p> <ul style="list-style-type: none"><li>• The system creates a file folder named after the tenant name in the <b>/tenant</b> directory by default. For example, the default HDFS storage directory for <b>ta1</b> is <b>/tenant/ta1</b>.</li><li>• When a tenant is created for the first time, the system creates the <b>/tenant</b> directory in the HDFS root directory. The storage path is customizable.</li></ul>
Description	Configure the description of the current tenant.

 **NOTE**

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant name\_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- During the creation of a tenant, the system automatically creates a Yarn task queue named after the tenant. If the queue name exists, the new queue is named **Tenant name-N**. **N** indicates a natural number starting from 1. When a same name exists, the value **N** increases automatically to differentiate the queue from others. For example, **saletenant**, **saletenant-1**, and **saletenant-2**.

**Step 3** Whether the current tenant need to associate resources of other services.

- If yes, go to [4](#).
- If no, go to [Step 5](#).

**Step 4** Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
  - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
  - **Share** indicates shared service resources, which can be used by other tenants.

 **NOTE**

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
  - Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
  - Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.
3. Click **OK**.

**Step 5** Click **OK**. When **Tenant created successfully.** is displayed on the page, the tenant is added successfully.

----End

### 12.7.3.1.2 Adding a Sub-Tenant

#### Scenario

Based on the resource consumption and isolation plan and requirements of services, you can create Sub-Tenants on FusionInsight Manager, and allocate resources of the current tenant to meet the actual application scenario.

#### Prerequisites

- A parent tenant has been added, and belongs to a non-leaf tenant.
- A tenant name has been planned based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.
- Resources to be allocated to the current tenant have been planned to ensure that the sum of capacities of direct sub-tenants at every level cannot exceed the current tenant.

#### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, move the cursor to the tenant node to which the sub-tenant is added. Click . In the displayed window, configure the sub-tenant properties based on [Table 12-40](#).

**Table 12-40** Sub-tenant parameters

Parameter	Description
Cluster	Specifies the cluster of the parent tenant.
Parent Tenant Resource	Specifies the name of the parent tenant.

Parameter	Description
Name	<ul style="list-style-type: none"> <li>Specifies the name of the current tenant. The value consists of 3 to 50 characters, which can be letters, digits, or underscores (_).</li> <li>Plan a sub-tenant name based on service requirements. The name cannot be the same as that of a role, HDFS directory, or Yarn queue that exists in the current cluster.</li> </ul>
Tenant Type	<p>Specifies whether the specified tenant is a leaf tenant.</p> <ul style="list-style-type: none"> <li>When <b>Leaf Tenant</b> is selected, the current tenant is a leaf tenant and no sub-tenant can be added.</li> <li>When <b>Non-leaf Tenant</b> is selected, the current tenant is not a leaf tenant and sub-tenants can be added to the current tenant. However, the tenant depth cannot exceed 5 levels.</li> </ul>
Computing Resource	<p>Specifies the dynamic computing resources for the current tenant.</p> <ul style="list-style-type: none"> <li>When <b>Yarn</b> is selected, the system automatically creates a task queue in Yarn and the queue is named the same as the name of the tenant. <ul style="list-style-type: none"> <li>A leaf tenant can directly submit tasks to the task queue.</li> <li>A non-leaf tenant cannot directly submit tasks to the task queue. However, Yarn adds an extra task queue (hidden) named <b>Default</b> for the non-leaf tenant to record the remaining resource capacity of the tenant. Actual tasks do not run in this queue.</li> </ul> </li> <li>When dynamic resources are not <b>Yarn</b> resources, the system does not automatically create a task queue.</li> </ul>
Default Resource Pool Capacity (%)	Specifies the computing resource usage of the current tenant. The base value is the total resources of the parent tenant.
Default Resource Pool Max Capacity (%)	Specifies the maximum computing resource usage of the current tenant. The base value is the total resources of the parent tenant.
Storage Resource	<p>Specifies storage resources of the current tenant.</p> <ul style="list-style-type: none"> <li>When <b>HDFS</b> is selected, the system automatically creates a file in the HDFS parent tenant directory. The file is named the same as the name of the sub-tenant.</li> <li>When <b>HDFS</b> is not selected, the system does not automatically allocate storage resources.</li> </ul>

Parameter	Description
Quota	Specifies the file and directory quantity quota.
Space Quota	<p>Specifies the used HDFS storage space quota of the current tenant.</p> <ul style="list-style-type: none"><li>When <b>Space Quota Unit</b> is set to <b>MB</b>, this parameter ranges from <b>1</b> to <b>8796093022208</b>. When <b>Space Quota Unit</b> is set to <b>GB</b>, this parameter ranges from <b>1</b> to <b>8589934592</b>. The maximum value of this parameter does not exceed the total storage quota of the parent tenant.</li><li>This parameter indicates the maximum HDFS storage space that can be used by the tenant, but does not indicate the actual space used.</li><li>If the value is greater than the size of the HDFS physical disk space, the maximum space that can be used is all the HDFS physical disk space.</li><li>If this quota is greater than the quota of the parent tenant, the actual storage space will be affected by the quota of the parent tenant.</li></ul>
Storage Path	<p>Specifies the HDFS storage directory for a tenant.</p> <ul style="list-style-type: none"><li>The system creates a file folder named after the sub-tenant name in the directory of the parent tenant by default. For example, if the sub-tenant is <b>ta1s</b> and the parent directory is <b>/tenant/ta1</b>, the system sets the <b>Storage Path</b> for the sub-tenant to <b>/tenant/ta1/ta1s</b>.</li><li>The storage path is customizable in the parent directory.</li></ul>
Description	Configure the description of the current tenant.

 **NOTE**

During the creation of a tenant, the system automatically creates a corresponding role, the computing resources, and the storage resources.

- The new role has the rights on the computing resources and storage resources. The role and its rights are controlled by the system automatically and cannot be controlled manually under **System > Permission > Role**. The role name is *tenant name\_cluster ID*. By default, the cluster ID of the first cluster is not displayed.
- When using this tenant, create a system user and bind the user to the role of the tenant. For details, see [Adding a User and Binding the User to a Tenant Role](#).
- The sub-tenant can further allocate the resources of the current tenant. The sum of the resource percentage of direct sub-tenants of a parent tenant cannot exceed 100%. The sum of the computing resource percentage of all level-1 tenants cannot exceed 100%.

**Step 3** Whether the current tenant need to associate resources of other services.

- If yes, go to [Step 4](#).

- If no, go to [Step 5](#).

**Step 4** Click **Associated Service** to configure other service resources used by the current tenant.

1. Select **HBase** in **Service**.
2. Make a selection in **Association Type**:
  - **Exclusive** indicates service resources used by the tenant exclusively. Other tenants cannot associate with this service.
  - **Share** indicates shared service resources, which can be used by other tenants.

 **NOTE**

- When creating a tenant, you can only associate HBase with the tenant. For existing tenants, you can associate the following services: HDFS, HBase, and Yarn.
- Associating existing tenants with service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page and click **Associated Service** to associate the current tenant with service services.
- Canceling the association between existing tenants and service resources: In the tenant list on the left of the **Tenant Management** page, click the target tenant. Then, switch to the **Service Association** tab page, click **Delete**, select **I have read the information and understand the impact.**, and click **OK** to cancel the association with service.

3. Click **OK**.

**Step 5** Click **OK**. When **Tenant created successfully.** is displayed on the page, the tenant is added successfully.

----End

### 12.7.3.1.3 Adding a User and Binding the User to a Tenant Role

#### Scenario

The created tenant cannot directly log in to the cluster to access resources. You need to create a user for a tenant on FusionInsight Manager and bind the user to a tenant role to assign operation rights to the user.

#### Prerequisites

The MRS cluster administrator has understood service requirements and created a tenant.

#### Procedure

**Step 1** On FusionInsight Manager, click **System > Permission > User**.

**Step 2** To add a user to the system, click **Create**.

To bind tenant rights to an existing user in the system, click **Modify** in the column where the user locates. The configuration page is displayed.

For details about configuring parameters of a user, see [Table 12-41](#).

**Table 12-41** User parameters

Parameter	Description
Username	<p>Specifies the name of the current tenant. The value consists of 3 to 32 characters, which can be letters, digits, underlines (_), hyphens(-), or spaces.</p> <ul style="list-style-type: none"> <li>• <b>Username</b> cannot be the same as any username of the OS on each node in the cluster. Otherwise, the user account cannot be used properly.</li> <li>• Usernames of the same letters but different cases are not supported. For example, if <b>User1</b> already exists, user <b>user1</b> cannot be created. When using user <b>User1</b>, enter the correct username.</li> </ul>
User Type	<p>Options include <b>Human-Machine</b> and <b>Machine-Machine</b>.</p> <ul style="list-style-type: none"> <li>• <b>Human-Machine</b> user: Used in FusionInsight Manager O&amp;M scenarios and component client operation scenarios. If you select <b>Human-Machine</b>, you need to set <b>Password</b> and <b>Confirm password</b>.</li> <li>• <b>Machine-Machine</b> user: Used in application development scenarios. If you select <b>Machine-Machine</b>, the user password is generated randomly.</li> </ul>
Password	<p>If you select <b>Human-Machine</b>, set <b>Password</b>. The password must contain 8 to 64 characters, consisting at least 4 of uppercase letters, lowercase letters, digits, and special characters and spaces. Cannot be the username or username spelled backwards.</p>
Confirm Password	Enter the password again.
User Group	<p>In <b>User Group</b>, click <b>Add</b> to add the user to a user group.</p> <ul style="list-style-type: none"> <li>• If a role is added to a user group, users in the user group can obtain the rights of the role.</li> <li>• For example, assign Hive rights to the new user and add the user to the <b>Hive</b> group.</li> </ul>
Primary Group	Select a group as the primary group of directories and files of the user. The drop-down list contains groups that are selected in <b>User Group</b> .
Role	<p>Click <b>Add</b> to add a role to the user as required.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• If a user wants to use resources allocated to <b>tenant1</b> add sub-tenants to or delete sub-tenants from <b>tenant1</b>, bind the <b>Manager_tenant</b> and <b>tenant1_cluster ID</b> roles to the user.</li> </ul>

Parameter	Description
Description	Configure the description of the current user.

**Step 3** Click **OK**.

----End

## 12.7.3.2 Managing Tenants

### 12.7.3.2.1 Managing a Tenant Directory

#### Scenario

You can manage the HDFS storage directory used by a specified tenant on FusionInsight Manager based on service requirements. The management operations include adding tenant directories, modifying quantity quotas of files and directories, and storage space quota of the directory, and deleting directories.

#### Prerequisites

Tenants with HDFS storage resources are added.

#### Procedure

##### View a tenant directory.

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click a target tenant.

**Step 3** Click **Resource**.

**Step 4** View the **HDFS Storage** table.

- The **Quota** column indicates quantity quotas of files and directories.
- The **Space Quota** column indicates storage space sizes of tenant directories.

----End

##### Add a tenant directory.

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

**Step 3** Click **Resource**.

**Step 4** In the **HDFS Storage** table, click **Create Directory**.

- The **Parent Directory** indicates the storage directory of the parent tenant corresponding to the current tenant.

#### NOTE

This parameter is not displayed if the current tenant is not a sub-tenant.

- Set **Path** to a tenant directory path.

 **NOTE**

If the current tenant is not a sub-tenant, the new path is created in the HDFS root directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.

 **NOTE**

The number of used files is collected every hour. Therefore, the alarm indicating that the file number exceeds the threshold is delayed.

- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

 **NOTE**

The used storage space is collected every hour. Therefore, the alarm indicating that the storage space exceeds the threshold is delayed.

**Step 5** Click **OK**.

----End

**Modify a tenant directory properties.**

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

**Step 3** Click **Resource**.

**Step 4** In the **HDFS Storage** table, click **Modify** in the **Operation** column of the specified tenant directory.

- Set **Quota** to the quotas of file and directory quantity.
- **File Number Threshold (%)** takes effect only when **Quota** is specified. If the ratio of the number of used files to the value of **Quota** exceeds the value of this threshold, an alarm is generated. If this parameter is not specified, no alarm is reported in this scenario.
- Set **Space Quota** to storage space sizes of tenant directories.
- **Storage Space Threshold (%)**: If the ratio of used storage space to the value of **Space Quota** exceeds the value of this parameter, an alarm is generated. If this parameter is not specified, no alarm is generated in this scenario.

**Step 5** Click **OK**.

----End

**Delete tenant directory.**

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click the tenant whose HDFS storage directory needs to be changed.

**Step 3** Click **Resource**.

**Step 4** In the **HDFS Storage** table, click **Delete** in the **Operation** column of the specified tenant directory.

 **NOTE**

The tenant directory that is created by the system during tenant creation cannot be deleted.

**Step 5** Click **OK**.

----End

### 12.7.3.2.2 Restoring Tenant Data

#### Scenario

Tenant data is stored on Manager and in cluster components. After components are recovered from faults or reinstalled, some tenant configuration data may be in the abnormal state. You need to manually restore the configuration data on FusionInsight Manager.

#### Prerequisites

You have logged in to FusionInsight Manager.

#### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, click a tenant node.

**Step 3** Check the status of the tenant data.

1. In **Summary**, check the color of the circle on the right of **Tenant Status**. Green indicates that the tenant is available and gray indicates that the tenant is unavailable.
2. Click **Resource** and check the color of the circle on the left of **Yarn** or **HDFS Storage**. Green indicates that the resource is available and gray indicates that the resource is unavailable.
3. Click **Service Association** and check the **Status** column of the associated service table. **Normal** indicates that the component can provide services for the associated tenant. **Not Available** indicates that the component cannot provide services for the tenant.
4. If any of the preceding check items is abnormal, go to **Step 4** to restore tenant data.

**Step 4** Click . In the dialog box that is displayed, enter the password of the administrator who has logged in for authentication, and click **OK**.

**Step 5** In the **Restore Tenant Resource Data** window, select one or multiple components whose data needs to be restored and click **OK**. The system automatically restores the tenant data.

----End

### 12.7.3.2.3 Deleting a Tenant

#### Scenario

Based on service requirements, you can delete tenants that are no longer used on FusionInsight Manager to release resources occupied by tenants.

#### Prerequisites

- A tenant has been added.
- The tenant to be deleted has no sub-tenant.
- The role of the tenant to be deleted is not associated with any user or user group.

#### Procedure

**Step 1** On FusionInsight Manager, click **Tenant Resources**.

**Step 2** In the tenant list on the left, select the tenant to be deleted and click .

##### NOTE

- If you want to save the tenant data, select **Reserve the data of this tenant resource..** Otherwise, the tenant's storage space will be deleted.

**Step 3** Click **OK** to save the settings.

It takes a few minutes to save the configuration. The tenant is deleted successfully. Roles and the storage space of the tenant are also deleted.

##### NOTE

After the tenant is deleted, the task queue of the tenant still exists in Yarn. The task queue of the tenant is not displayed on the role management page in Yarn.

----End

### 12.7.3.2.4 Clearing Unassociated Queues of a Tenant in Capacity Scheduler Mode

#### Scenario

In Yarn Capacity Scheduler mode, to delete a tenant, set the capacity of a tenant's queue to **0** and the state of the tenant to **STOPPED** to delete a tenant. However, queues of the tenant remain in the Yarn service. Queues cannot be automatically deleted due to the Yarn mechanism. The MRS cluster administrator can run the commands to manually delete the queues.

## Impact on the System

- Running the script will restart the controller service, synchronize Yarn configuration, and restart instances of the active and standby ResourceManagers.
- You cannot log in to FusionInsight Manager and perform operations on FusionInsight Manager when restarting the controller service.
- After the instances of the active and standby ResourceManagers are restarted, an alarm will be reported indicating that Yarn and components that depend on Yarn will be temporarily unavailable.

## Prerequisites

- You have logged in to FusionInsight Manager.
- Queues of a deleted tenant still exist.

## Procedure

**Step 1** Check whether queues of the deleted tenant still exist.

1. On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. Click **ResourceManager(Active)** to go to the ResourceManager WebUI.
2. Click **Scheduler** on the left pane, and you can see that queues of the tenant still exist. The state of the tenant is STOPPED and **Configured Capacity** is set to **0**.

**Step 2** Log in to the active OMS node as user **omm**.

**Step 3** Go to the `/${BIGDATA_HOME}/om-server/om/sbin` directory and run the `cleanQueuesAndRestartRM.sh` script.

```
cd ${BIGDATA_HOME}/om-server/om/sbin
./cleanQueuesAndRestartRM.sh -c Cluster ID
```

### NOTE

Replace *Cluster ID* with the ID of the cluster to be operated, which can be queried by choosing **Cluster** > *Name of the desired cluster* > **Cluster Properties** on FusionInsight Manager.

During the script execution, enter **yes** and the password.

```
Running the script will restart Controller and restart ResourceManager.
Are you sure you want to continue connecting (yes/no)?yes
Please input admin password:
Begin to backup queues ...
...
```

**Step 4** After the script is successfully executed, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** on FusionInsight Manager. Click **ResourceManager(Active)** to go to the ResourceManager WebUI.

**Step 5** Click **Scheduler** on the left pane and check whether queues of the deleted tenant are cleared.

----End

## 12.7.3.3 Managing Resources

### 12.7.3.3.1 Add a Resource Pool

#### Scenario

This section describes how to logically divide Yarn cluster nodes to combine multiple NodeManagers into a Yarn resource pool. Each NodeManager belongs to one resource pool only. The MRS cluster administrator can create a customized resource pool on FusionInsight Manager and add hosts that are not added to other customized resource pools to the newly created resource pool.

The system contains a **Default** resource pool by default. All NodeManagers that are not added to customized resource pools belong to this resource pool.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Resource Pool**.

**Step 3** Click **Add Resource Pool**.

**Step 4** In **Add Resource Pool**, set the properties of the resource pool.

- **Cluster:** Select the name of the cluster to which the resource pool is to be added.
- **Name:** Enter the name of the resource pool. The resource pool name consists of 1 to 50 characters, including digits, letters, or underscores (\_), but cannot start with an underscore (\_).
- **Resource:** In the host list on the left, select the name of a specified host and click  to add the selected host to the resource pool. Only hosts in the current cluster can be selected. The host list of a resource pool can be left blank.

#### NOTE

You can select the **Resource** based on the host name, CPU, memory, operating system and platform type.

**Step 5** Click **OK** to save the settings.

After the resource pool is created, you can view the name, type, and members of the resource pool in the resource pool list. Hosts that are added to the customized resource pool are no longer members of the **Default** resource pool.

----End

### 12.7.3.3.2 Modifying a Resource Pool

#### Scenario

If hosts in the resource pool need to be adjusted based on service requirements, MRS cluster administrators can modify members in the existing resource pool on FusionInsight Manager.

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Tenant Resources > Resource Pool**.
- Step 3** Locate the row that contains the specified resource pool in the resource pool list, and click **Edit** in the **Operation** column.
- Step 4** In **Edit Resource Pool**, modify Hosts.
- Adding a host: In the host list on the left, select the name of a specified host and click  to add the selected host to the resource pool.
  - Deleting a host: In the host list on the right, select the name of a specified host and click  to delete the selected host from the resource pool. The host list of a resource pool can be left blank.
- Step 5** Click **OK** to save the settings.
- End

### 12.7.3.3 Deleting a Resource Pool

## Scenario

This section describes how to delete an existing resource pool on FusionInsight Manager.

## Prerequisites

- Any queue in the cluster cannot use the resource pool to be deleted as its default resource pool; therefore, cancel the default resource pool before deleting a resource pool. For details, see [Configuring a Queue](#).
- Additionally, any queue in the cluster is not allowed to configure the resource distribution policy in the resource pool to be deleted; therefore, clear the policy before deleting a resource pool. For details, see [Clearing Queue Configurations](#).

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Tenant Resources > Resource Pool**.
- Step 3** Locate the row that contains the specified resource pool in the resource pool list, and click **Delete** in the **Operation** column.
- Step 4** In the window that is displayed, click **OK**.
- End

### 12.7.3.3.4 Configuring a Queue

#### Scenario

You can modify queue configuration of a specific tenant on FusionInsight Manager based on service requirements.

#### Prerequisites

Tenants who use the Capacity scheduler have been added.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Tenant Resources > Dynamic Resource Plan**.

By default, the **Resource Distribution Policy** tab page is displayed.

**Step 3** Click the **Queue Configuration** tab.

**Step 4** Set **Cluster** to the name of the cluster to be operated. In the tenant queue table, click **Modify** in the **Operation** column of the specific tenant queue.

#### NOTE

- You can also open the queue modification page as follows: Click the target tenant in the tenant list on the left of the **Tenant Resources Management** tab page. In the window that is displayed, click **Resource**. On the page that is displayed, click  behind the **Queue Configuration (queue name)**.
- One queue can be bound to only one non-Default resource pool. A newly added resource pool can be bound to only one queue, which serves as the default resource pool of the queue.

**Table 12-42** Queue configuration parameters

Parameter	Description
<b>Tenant Resources Name (Queue)</b>	Tenant name and queue name.
<b>Maximum Application</b>	Specifies the maximum number of applications.
<b>Maximum AM Resource Percent</b>	Specifies the maximum percentage of resources that can be used to run the application master in a cluster.

Parameter	Description
<b>Minimum User Limit Percent(%)</b>	<p>Specifies the minimum resource assurance (percentage) of a user. The resources for each user in a queue are limited at any time. If application programs of multiple users are running at the same time in a queue, the resource usage of each user fluctuates between the minimum value and the maximum value. The minimum value is determined by the number of running application programs, while the maximum value is determined by this parameter.</p> <p>For example, assume that this parameter is set to 25. If two users submit application programs to the queue, each user can use a maximum of 50% resources; if three users submit application programs to the queue, each user can use a maximum of 33% resources; if four users submit application programs to the queue, each user can use a maximum of 25% resources.</p>
<b>User Limit Factor</b>	<p>Specifies the maximum user resource usage limit factor. The maximum user resource usage percentage can be obtained by multiplying the actual resource usage percent of the current tenant in the cluster with this factor.</p>
<b>Status</b>	<p>Specifies the current status of a resource plan. <b>Running</b> indicates that the resource plan is running. <b>Stopped</b> indicates that the resource plan is stopped.</p>
<b>Default Resource Pool</b>	<p>Specifies the resource pool used by a queue. The default value is <b>Default</b>. If you want to change the resource pool, configure the queue capacity first. For details, see <a href="#">Configuring the Queue Capacity Policy of a Resource Pool</a>.</p>

**Step 5** Click **OK**. The queue configuration is complete.

----End

### 12.7.3.3.5 Configuring the Queue Capacity Policy of a Resource Pool

#### Scenario

After a resource pool is added, the capacity policy of available resources needs to be configured for Yarn task queues to ensure proper task running in the resource pool. Each queue can be configured with the queue capacity policy of one resource pool only.

You can View queues in any resource pool and configure the queue capacity policy. After the queue policies are configured, Yarn task queues are associated with resource pools.

## Prerequisites

Queues are added, this is, tenants associated to compute resources are created.

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Tenant Resources > Dynamic Resource Plan**.  
By default, the **Resource Distribution Policy** tab page is displayed.
- Step 3** Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.
- Step 4** Locate the specified queue in the **Resource Allocation** table, and click **Modify** in the **Operation** column.
- Step 5** In **Modify Resource Allocation**, configure the resource capacity policy of the task queue in the resource pool.
  - **Resource Capacity (%)**: specifies the computing resource usage percent of the current tenant.
  - **Maximum Resource Capacity (%)**: specifies the maximum computing resource usage percent of the current tenant.
- Step 6** Click **OK** to save the settings.

### NOTE

To cancel the resource capacity policy of the task queue in the resource pool, delete the resource capacity value and save the setting. Then the queue is disassociated with the resource pool. Change the default resource pool of the queue to another resource pool. For details, see [Configuring a Queue](#).

----End

### 12.7.3.3.6 Clearing Queue Configurations

## Scenario

The MRS cluster administrator can clear queue configurations on FusionInsight Manager if a queue does not need resources from a resource pool or a resource pool needs to be disassociated from a queue. Clearing queue configurations means that the resource capacity policy of a queue in the resource pool is canceled.

## Prerequisites

If a queue is to be unbound from a resource pool, you have ensured that the resource pool is not the default resource pool of the queue. For details, see [Configuring a Queue](#).

## Procedure

- Step 1** Log in to FusionInsight Manager portal.

**Step 2** Choose **Tenant Resources > Dynamic Resource Plan**

**Step 3** Set **Cluster** to the name of the cluster to be operated. In **Resource Pool**, select the specified resource pool.

**Step 4** Locate the row that contains the specified queue in **Resource Allocation** and click **Clear** in the **Operation** column.

**Step 5** In **Clear Queue Configuration**, click **OK** to clear the queue configurations in the current resource pool.

----End

## 12.7.4 Switching the Scheduler

### Scenario

The newly installed MRS cluster uses the Superior scheduler by default. If the cluster is upgraded from an earlier version, you can switch the Yarn scheduler from the Capacity scheduler to the Superior scheduler by one click.

### Prerequisites

- The network connection for the cluster is proper and secure, and the Yarn service status is normal.
- During scheduler switching, tenants cannot be added, deleted, or modified. In addition, services cannot be started or stopped.

### Impact on the System

- Because the Resource Manager is restarted during scheduler switching, submitting tasks to Yarn fails.
- During scheduler switching, tasks in a job being executed on Yarn will continue, but new tasks cannot be started.
- After scheduler switching is complete, tasks on Yarn may fail, causing service interruption.
- After scheduler switching is complete, parameters of the Superior scheduler are used for tenant management.
- After the scheduler is switched, resources in the Superior scheduler cannot be allocated to the tenant queue whose **capacity** is **0** in the Capacity scheduler. As a result, tasks submitted to the tenant queue fail to be executed. You are advised not to set **capacity** of the tenant queue to **0** in the Capacity scheduler.
- After scheduler switching is complete, you cannot add or delete resource pools, Yarn node labels, or tenants during the trial period. If resource pools, Yarn node labels, or tenants are added or deleted, rollback to the Capacity scheduler is not allowed.

#### NOTE

- The recommended trial period for scheduler switching is one week. If resource pools, Yarn node labels, or tenants are added or deleted during this period, the trial period ends immediately.

- Rollback of scheduler switching may cause the loss of partial or all Yarn task information.

## Switching from the Capacity scheduler to the Superior scheduler

**Step 1** Ensure that the Yarn service status is normal.

1. Log in to FusionInsight Manager as user **admin**.
2. Choose **Cluster** > *Name of the desired cluster* > **Services** and check whether the Yarn service status is normal.

**Step 2** Log in to the active OMS node as **user omm**.

**Step 3** Switch the scheduler.

The following switching modes are available:

0: The Capacity scheduler is switched to the Superior scheduler, and the Capacity scheduler configurations are converted into the Superior scheduler configurations.

1: Only the Capacity scheduler configurations are converted into the Superior scheduler configurations.

2: Only the Capacity scheduler is switched to the Superior scheduler.

- Mode 0 is recommended if the cluster environment is simple and the number of tenants is less than 20.

Run the following command:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c Cluster ID -m 0
```

### NOTE

Replace *Cluster ID* with the ID of the cluster to be operated, which can be queried by choosing **Cluster** > *Name of the desired cluster* > **Cluster Properties** on FusionInsight Manager.

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to convert Capacity scheduler configurations to Superior. Please wait...
Convert configurations successfully. Start to switch the Yarn scheduler to Superior. Please wait...
Switch the Yarn scheduler to Superior successfully.
```

- If the cluster environment or tenant information is complex and you need to retain the queue information of the Capacity scheduler on the Superior scheduler, it is recommended that you use mode 1 first to convert the Capacity scheduler configurations. After checking the converted configuration information, use mode 2 to switch the Capacity scheduler to the Superior scheduler.

- a. Run the following command to convert the Capacity scheduler configurations into the Superior scheduler configurations:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c Cluster ID -m 1
```

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1
Start to convert Capacity scheduler configurations to Superior. Please wait...
Convert configurations successfully.
```

- b. Run the following command to switch the Capacity scheduler to the Superior scheduler:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c  
Cluster ID -m 2
```

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1  
Start to switch the Yarn scheduler to Superior. Please wait...  
Switch the Yarn scheduler to Superior successfully.
```

- If you do not need the queue information of the Capacity scheduler, use mode 2.
  - a. Log in to FusionInsight Manager and delete all tenants except the default tenant.
  - b. Log in to FusionInsight Manager and delete all resource pools except the default resource pool.

Run the following command to switch the Capacity scheduler to the Superior scheduler:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/switchScheduler.sh -c  
Cluster ID -m 2
```

```
Start to convert Capacity scheduler to Superior Scheduler, clusterId=1  
Start to switch the Yarn scheduler to Superior. Please wait...  
Switch the Yarn scheduler to Superior successfully.
```

#### NOTE

You can query the scheduler switching logs on the active OMS node.

- `${BIGDATA_LOG_HOME}/controller/aos/switch_scheduler.log`
- `${BIGDATA_LOG_HOME}/controller/aos/aos.log`

----End

## 12.8 System Configuration

### 12.8.1 Configuring Permission

#### 12.8.1.1 Managing Users

##### 12.8.1.1.1 Creating a User

#### Scenarios

FusionInsight Manager supports 50000 users (including built-in users) at the maximum. By default, only user **admin** has the highest operation rights of FusionInsight Manager. You need to create users on FusionInsight Manager and assign operation rights to the user based on site requirements.

#### Prerequisites

You have learned service requirements and created roles required by service scenarios.

## Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **System > Permission > User**.
- Step 3** On the user list page, click **Create**.
- Step 4** Set **Username**. Enter 3 to 32 characters, including digits, letters, underlines (\_), hyphens(-), or spaces. It is case insensitive. It cannot be the same as the username in the system or OS.
- Step 5** Set **User Type** to either **Human-Machine** or **Machine-Machine**.
- **Human-Machine** user: used in scenarios such as FusionInsight Manager O&M and component operations on a client. If you select this user type, you need to enter a password and confirm the password in **Password** and **Confirm Password** accordingly.
  - **Machine-Machine** user: used for component development. If you select this user type, you do not need to enter a password, because the password is randomly generated.
- Step 6** In the **User Group** area, click **Add** to add one or more user groups to the list as required.

 **NOTE**

- If the selected user group is bound to a role or a permission policy is configured in Ranger, the user obtains the permission of the corresponding role.
- After FusionInsight Manager is installed, some user groups generated by default have special permissions. Select a correct user group based on the user group description on the GUI.
- If existing user groups cannot be used, click **Create User Group** to create a user group. For details, see [Adding a User Group](#).

- Step 7** Select a group from all groups added in **User Group** as the primary group for creating directories and files.

The drop-down list contains all the groups added to the **User Group** area.

 **NOTE**

A user can belong to multiple groups (including the primary and secondary groups, only one primary group, and multiple secondary groups). The primary group of a user is set to facilitate maintenance and comply with the permission mechanism of the hadoop community. In addition, the user's primary group and other groups have the same functions in terms of rights control.

- Step 8** In the **Role** area, click **Add** to bind a role for each user.

 **NOTE**

- Adding a role when you create a user can specify the user rights.
- When you create a user, if permissions of a user group that is granted to the user cannot meet service requirements, you can assign other created roles to the user. If an existing role cannot be used, click **Create Role** to create a role. For details, see [Adding a Role](#).

The role and rights assignment takes effect about 3 minutes later. If the rights obtained from the user group meet the requirements, you do not need to add a role.

- After the Ranger authentication is enabled for a component, users are granted with all permissions except the permissions of the default user group or role.
- If the user is not added to a user group, or no role is configured for the user, no information is displayed after the user logs in to FusionInsight Manager.

**Step 9** Enter information in the **Description** text box as required.

**Step 10** Click **OK**.

The user is created.

----End

### 12.8.1.1.2 Modifying User Information

#### Scenarios

You can modify user information on FusionInsight Manager, including the user group, primary group, role permission assignment, and user description.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row where the user whose information needs to be modified, click **Modify**.

Modify the parameters based on site-requirements.

 **NOTE**

Changing the user group of a user or modifying the role rights of a user takes effect 3 minutes at most after the operation is performed.

 **NOTE**

**Step 4** Click **OK**.

----End

### 12.8.1.1.3 Exporting User Information

#### Scenarios

You can export information about created users on FusionInsight Manager.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Click **Export All** to export all user information at a time.

User information contains the following fields: Username, creation time, description, user type (**0** indicates a **Human-Machine** account, **1** indicates a **Machine-Machine** account), primary group, user group list, and roles the user bound to.

**Step 4** In the **Save Type** drop-down list, select **TXT** or **CSV**. Click **Export**.

----End

### 12.8.1.1.4 Locking a User

## Scenarios

Users may be suspended for a long time due to service changes. For security purposes, you can lock such users.

You can lock a user by using either of the following methods:

- Automatic lock: You can set the number of consecutive incorrect password attempts in the password policy to lock the users who fail to log in to the system for a specified number of times. For details, see [Configuring Password Policies](#).
- Manual lock: You manually lock a user.

This section describes how to lock the account manually. **Machine-Machine** users cannot be locked.

## Impact on the System

After a user is locked, you cannot log in to FusionInsight Manager again or perform identity authentication again in the cluster. The locked user can be used only after you manually unlock the user or wait for the lock time to expire.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the user to be locked, and click **Lock**.

**Step 4** In the displayed dialog box, select **I have read the information and understand the impact.**, and click **OK**.

----End

### 12.8.1.1.5 Unlocking a User

#### Scenarios

You can unlock a user on FusionInsight Manager if the user is locked after the number of login attempts using incorrect passwords exceeds the threshold. Only users created on FusionInsight Manager can be unlocked.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **System > Permission > User**.
- Step 3** Locate the row that contains the user to be unlocked, and click **Unlock**.
- Step 4** In the displayed dialog box, select **I have read the information and understand the impact.**, and click **OK**.

----End

### 12.8.1.1.6 Deleting a User

#### Scenarios

Based on service requirements, you need to delete system users who are no longer used on FusionInsight Manager.

#### NOTE

- After a user is deleted, the provisioned ticket granting ticket (TGT) is still valid within 24 hours. The user can use the TGT for security authentication and access the system.
- If the name of a new user is the same as that of a deleted user, all owner rights of the deleted user are inherited. You are advised to determine whether to delete the resources owned by the user based on site requirements, for example, files in the HDFS.
- The default user **admin** cannot be deleted.

#### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **System > Permission > User**.
- Step 3** Locate the row that contains the user to be deleted, choose **More > Delete**.

#### NOTE

To delete multiple users in batches, select the users to be deleted and click **Delete**.

- Step 4** In the displayed dialog box, click **OK**.

----End

### 12.8.1.1.7 Changing a User Password

#### Scenarios

For security purposes, the password of a **Human-Machine** user must be changed periodically.

If users have the permission to use FusionInsight Manager, they can change their password on FusionInsight Manager.

If users do not have the permission to use FusionInsight Manager, they can change their passwords on the client.

#### Prerequisites

- Users have obtained the current password policies from the MRS cluster administrator.
- Users have installed the client on any node in the cluster and obtain the IP address of the node. Contact the MRS cluster administrator to obtain the password of the client installation user.

#### Changing Passwords Using FusionInsight Manager

**Step 1** Log in to FusionInsight Manager.

**Step 2** Move the cursor to the username in the upper right corner of the page.

In the displayed dialog box, click **Password changed**.

**Step 3** On the displayed page, set **Old Password**, **New Password**, and **Confirm Password**, and click **OK**.

By default, the password must meet the following complexity requirements:

- It must contain at least eight characters.
- The password must contain at least four types of the following characters: Uppercase letters, lowercase letters, digits, spaces, and special characters. The following special characters are supported: `~!@#%&\*()-\_+=+[[{}];',<.>^/?
- It must be different from the username or its reverse.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- It cannot be the same as the password used in the latest *N* times. *N* is the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

#### Changing a Password on the Client

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to switch to the client directory, for example, **/opt/Bigdata/client**:

```
cd /opt/Bigdata/client
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Run the following command to change the password of a system user. This operation takes effect for all servers.

```
kpasswd System user name
```

For example, if you want to change the password of system user **test1**, run the **kpasswd test1** command.

By default, the password must meet the following complexity requirements:

- It must contain at least eight characters.
- The password must contain at least four types of the following characters: Uppercase letters, lowercase letters, digits, spaces, and special characters. The following special characters are supported: `~!@#\$%^&\*()-\_+=+[[{}];',<.>\/\?
- It must be different from the username or its reverse.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- It cannot be the same as the password used in the latest *N* times. *N* is the value of **Repetition Rule** in [Configuring Password Policies](#).

 **NOTE**

If an error occurs during the running of the **kpasswd** command, try the following operations:

- Stop the SSH session and start it again.
- Run the **kdestroy** command and then run the **kpasswd** command again.

----End

### 12.8.1.1.8 Initializing a Password

#### Scenarios

If a user forgets the password or the public account password needs to be changed periodically, you can initialize the password on FusionInsight Manager. After the password is initialized, the system user needs to change the password upon first login.

 **NOTE**

This operation applies only to **Human-Machine** users.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the user to be initialized, choose **More > Initialize Password**. In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

**Step 4** Enter a password and confirm the password in **New Password** and **Confirm Password** accordingly. Click **OK**.

By default, the password must meet the following complexity requirements:

- It must contain at least eight characters.
- The password must contain at least four types of the following characters: Uppercase letters, lowercase letters, digits, spaces, and special characters. The following special characters are supported: `~!@#\$\$%^&\*()-\_+=|[{}];',<.>\/\?
- It must be different from the username or its reverse.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- It cannot be the same as the password used in the latest *N* times. *N* is the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

### 12.8.1.1.9 Exporting an Authentication Credential File

#### Scenarios

If a user uses a security mode cluster to develop applications, the keytab file of the user needs to be obtained for security authentication. You can export keytab files on FusionInsight Manager.

#### NOTE

After a user password is changed, the exported keytab file becomes invalid, and you need to export a keytab file again.

#### Prerequisites

Before downloading the keytab file of a Human-Machine user, the password of the user must be changed at least once on the Manager portal or a client; otherwise, the downloaded keytab file cannot be used. For details, see [Changing a User Password](#).

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > User**.

**Step 3** Locate the row that contains the user whose keytab file needs to be exported, choose **More > Download Authentication Credential**, specify the save path after the file is automatically generated, and keep the file properly.

The authentication credential includes the **krb5.conf** file of the Kerberos service.

After the authentication credential file is decompressed, you can obtain the following two files:

- The **krb5.conf** file contains the authentication service connection information.
- The **user.keytab** file contains user authentication information.

----End

## 12.8.1.2 Managing User Groups

### Scenarios

FusionInsight Manager supports 5000 user groups (including built-in user groups) at the maximum. You can create and manage different user groups based on service scenarios on FusionInsight Manager. A user group is bound to a role to obtain operation rights. After a user is added to a user group, the user group can obtain the operation rights of the user group. A user group can be used to classify users and manage multiple users.

### Prerequisites

- You have learned service requirements and created roles required by service scenarios.
- Log in to FusionInsight Manager.

### Adding a User Group

**Step 1** Choose **System > Permission > User Group**.

**Step 2** Above the user group list, click **Create User Group**.

**Step 3** Set **Group Name** and **Description**.

A group name consists of letters, digits, underlines (\_), hyphens(-), or spaces. A group name can contain 1 to 64 characters. It is case insensitive. It cannot be the same as the group name in the system.

**Step 4** In the **Role** area, click **Add** to select a role and add it.

#### NOTE

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the rights of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign rights to user groups.
- If the policy conditions of HDFS and Yarn resource requests in Ranger are not covered, the component ACL rules still take effect.

**Step 5** In the **User** area, click **Add** to select a user and add it.

**Step 6** Click **OK**.

The user group is created.

----End

### Viewing User Group Information

By default, all users are displayed in the user group list. Click the arrow on the left of a specified user group name to view the details about the user group, such as the number of users, users in the group, and roles bound to the user group.

### Modifying Information About a User Group

Locate the row that contains the user group to be modified, click **Modify** to modify the information about the user group.

## Exporting Information About a User Group

Click **Export All** to export all user groups information at a time. You can export the user group information in TXT or CSV format.

The user group information contains the following fields: user group name, description, user list, and role list

## Deleting a User Group

Locate the row that contains the user group to be deleted, and click **Delete**. To delete multiple user groups in batches, select the user groups to be deleted and click **Delete** above the user group list. The user group contains users and cannot be deleted. To delete a user group, delete all users in the user group by modifying the user group, and then delete the user group.

### 12.8.1.3 Managing Roles

#### Scenarios

FusionInsight Manager supports 5000 roles (including built-in roles, excluding roles created by tenants) at the maximum. Based on different service requirements, you need to create and manage different roles on FusionInsight Manager and perform authorization management for FusionInsight Manager and components using roles.

#### Prerequisites

- You have learned service requirements.
- Log in to FusionInsight Manager.

#### Adding a Role

**Step 1** Choose **System > Permission > Role**.

**Step 2** On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

A role name consists of letters, digits, and underlines (\_). A role name can contain 3 to 50 characters. It cannot be the same as the role name in the system.

**Step 3** In the **Configure Resource Permission** list, select the cluster whose rights are to be added and select service rights for the role.

When setting rights for a component, enter a resource name in the **Search** text box in the upper right corner and click the search icon to view the search result.

The search scope covers only directories with current permissions. You cannot search subdirectories. Search by keywords supports fuzzy match and is case-insensitive.

 **NOTE**

- For components (except HDFS and Yarn) for which Ranger authorization has been enabled, the rights of non-default roles on Manager do not take effect. You need to configure Ranger policies to assign rights to user groups.
- If the policy conditions of HDFS and Yarn resource requests in Ranger are not covered, the component ACL rules still take effect.
- A maximum of 1000 permissions can be configured for a component at a time.

**Step 4** Click **OK**.

----End

## Modifying the Role Information

Locate the row that contains the role to be modified and click **Modify**.

## Exporting Role Information

Click **Export All** to export all roles information at a time. You can export the information to a TXT or CSV file.

The role information contains the following fields: Role name, description, and the information about whether the role is the default role.

## Deleting a Role

Locate the row that contains the role to be deleted, and click **Delete**. To delete multiple roles in batches, select the roles to be deleted and click **Delete** above the role list. Roles cannot be deleted when bound by users. To delete a user group, delete all users in the user group by modifying the user group, and then delete the user group.

## Task Example (Creating a Manager Role)

**Step 1** Choose **System > Permission > Role**.

**Step 2** On the displayed page, click **Create Role** and fill in **Role Name** and **Description**.

**Step 3** In the **Configure Resource Permission** list, click **Manager**. Set the role permission as follows:

Manager permissions:

- Cluster:
  - **view**: view permission for **Cluster** page, view permission for **Alarm** and **Event** page under **O&M > Alarm**.
  - **management**: management permission for **Cluster** and **O&M** page.
- User:
  - **view**: view permission for **Permission** page under **System**.
  - **management**: management permission for **Permission** page under **System**.
- Audit:
  - **management**: management permission for **Audit** page.

- Tenant:  
**management:** management permission for **Tenant** page, view permission for **Alarm** and **Event** page under **O&M > Alarm**.
- System:  
**management:** management permission for System page except the **Permission** page, view permission for **Alarm** and **Event** page under **O&M > Alarm**.

**Step 4** Click **OK**.

----End

## 12.8.1.4 Security Policy

### 12.8.1.4.1 Configuring Password Policies

#### Scenarios

Based on service security requirements, you can set password security rules, user login security rules, and user locking rules on FusionInsight Manager.

---

#### NOTICE

- Modify password policies based on service security requirements, because they involve user management security. Otherwise, security risks may be caused.
  - Change the user password after modifying the password policy, and then the new password policy can take effect.
- 

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Permission > Security Policy > Password Policy**.

**Step 3** Modify the password policy as prompted.

For details about the parameters for modifying the password policy, see [Table 12-43](#).

**Table 12-43** Password policy parameters

Parameter	Description
Minimum Password Length	Indicates the minimum number of characters a password contains. The value ranges from <b>8</b> to <b>64</b> . The default value is <b>8</b> .

Parameter	Description
Character Types	Indicates how many character types in the following 5 types a password can contain: uppercase letters, lowercase letters, digits, and special characters (including ~`!?,.,;:_'(){}[]/<>@#\$\$%^&*+ \= and spaces). The value can be <b>4</b> or <b>5</b> . The default value is <b>4</b> , which means that a password can contain uppercase letters, lowercase letters, digits, and the special characters. If you set the parameter to <b>5</b> , a password can contain all the five character types mentioned above.
Password Retries	Indicates the number of consecutive wrong password attempts allowed before the system locks the user. The value ranges from <b>3</b> to <b>30</b> . Default value is <b>5</b> .
User Lockup Time (Min)	Indicates the time period during which a user is locked when the user lockout conditions are met. The value ranges from <b>5</b> to <b>120</b> . Default value is <b>5</b> .
Password Validity Period (Day)	Indicates the validity period of a password. The value ranges from <b>0</b> to <b>90</b> . <b>0</b> indicates that the password is permanently valid. The default value is <b>90</b> .
Repetition Rule	When modifying a password, you are not allowed to use the password that has been used in the recent <i>N</i> times. <i>N</i> ranges from 1 to 5, and the default value is 1. This policy applies to only Human-machine users.
Password Expiration Notification Days	Indicates the number of days in advance users are notified that their passwords are about to expire. It is used to notify password expiration in advance. After the value is set, if the difference between the cluster time and the password expiration time is smaller than this value, the user receives password expiration notifications. When logging in to FusionInsight Manager, the user will be notified that the password is about to expire and a message is displayed asking the user to change the password. The value ranges from <b>0</b> to <i>X</i> ( <i>X</i> must be set to the half of the password validity period and rounded down). The value <b>0</b> indicates that no notification is sent. The default value is <b>5</b> .
Interval for Deleting Authentication Failure Records (Min)	Indicates the interval of retaining incorrect password attempts. The value ranges from <b>0</b> to <b>1440</b> . <b>0</b> indicates that incorrect password attempts are permanently retained, and <b>1440</b> indicates that incorrect password attempts are retained for one day. Default value is <b>5</b> .

**Step 4** Click **OK** to save the configurations.

----End

## 12.8.1.4.2 Configuring the Independent Attribute

### Scenarios

User **admin** or MRS cluster administrators who are bound to the `Manager_administrator` role can configure the Independent attribute function on FusionInsight Manager so that common users (all service users in the cluster) can set or cancel their own Independent attributes.

After the Independent attribute switch is turned on, users need to log in and set the Independent attribute.

### Restrictions

- MRS cluster administrators cannot set or cancel the Independent attribute of a user.
- MRS cluster administrators cannot obtain the authentication credentials of independent users.

### Prerequisites

You have obtained the required MRS cluster administrator username and password.

### Procedure

#### Configuring the Independent Attribute Function Switch

- Step 1** Log in to FusionInsight Manager as user **admin** or a user bound to the `Manager_administrator` role.
- Step 2** Choose **System > Permission > Security Policy > Configuration Independent**.
- Step 3** Open or Close the **Independent Attribute**, enter the password as prompted and click **OK**.
- Step 4** After the authentication succeeds, and the OMS configuration is modified, click **Finish**.

#### NOTE

After the Independent attribute function switch is closed:

- A user who has the attribute can cancel it by moving the cursor to the username in the upper right corner of the page and choose **Cancel Independent** from the displayed shortcut menu. After the cancellation, the user cannot set the attribute again. After the attribute is cancelled, existing independent tables will retain the attribute. However, the user cannot create independent tables again.
- Users without this attribute cannot set or cancel the attribute.

#### Configuring the Independent Attribute

- Step 5** Log in to FusionInsight Manager as a user.

**NOTICE**

After the Independent attribute is set by a user, MRS cluster administrators cannot initialize the password of the user. If the user password is forgotten, the password cannot be retrieved.

User **admin** cannot set the Independent attribute.

**Step 6** Move the cursor to the username in the upper right corner of the page.

**Step 7** Choose **Set Independent** or **Cancel Independent** from the displayed shortcut menu.

 **NOTE**

- If the Independent attribute function switch is turned on, and the attribute of the user is set, **Cancel Independent** is displayed in the shortcut menu.
- If the Independent attribute function switch is turned on, and the attribute of the user is cancelled, **Set Independent** is displayed in the shortcut menu.
- If the Independent attribute function switch is turned off, and the attribute of the user is set, **Cancel Independent** is displayed in the shortcut menu.
- If the Independent attribute function switch is turned off, and the attribute of the user is cancelled, no options are displayed in the shortcut menu.

**Step 8** Enter the password as prompted and click **OK**.

**Step 9** After the authentication succeeds, click **OK** in the confirmation dialog box.

----End

## 12.8.2 Configuring Interconnections

### 12.8.2.1 Configuring SNMP Northbound Parameters

#### Scenarios

If users need to view alarms and monitoring data of a cluster on the O&M platform, you can use the simple network management protocol (SNMP) on FusionInsight Manager to report related data to the network management system (NMS)

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Interconnection > SNMP**.

**Step 3** Turn on the switch on the right of **SNMP Service**.

The SNMP service is disabled by default.  indicates that the service is enabled.

**Step 4** Set interconnection parameters based on the information provided in [Table 12-44](#).

**Table 12-44** Interconnection parameters

Parameter	Description
Version	Specifies the version of the SNMP, which can be: <ul style="list-style-type: none"> <li>• <b>V2C</b>: This is an earlier version with low security.</li> <li>• <b>V3</b>: This is a higher version with higher security. <b>V3</b> is recommended.</li> </ul>
Local Port	Specifies the local port. The default value is <b>20000</b> . The value ranges from <b>1025</b> to <b>65535</b> .
Read Community Name	This parameter is available only when <b>Version</b> is set to <b>V2C</b> . It is used to set the read-only community name.
Write Community Name	This parameter is available only when <b>Version</b> is set to <b>V2C</b> . It is used to set the write-only community name.
Security Username	This parameter is available only when <b>Version</b> is set to <b>V3</b> . It is used to set the protocol security username.
Authentication Protocol	This parameter is available only when <b>Version</b> is set to <b>V3</b> . It is used to set the authentication protocol. SHA is recommended.
Authentication Password	This parameter is available only when <b>Version</b> is set to <b>V3</b> . It is used to set the authentication key.
Confirm Password	This parameter is available only when <b>Version</b> is set to <b>V3</b> . It is used to confirm the authentication key.
Encryption Protocol	This parameter is available only when <b>Version</b> is set to <b>V3</b> . It is used to set the encryption protocol. AES256 is recommended.
Encryption Password	This parameter is available only when <b>Version</b> is set to <b>V3</b> . It is used to set the encryption key.
Confirm Password	This parameter is available only when <b>Version</b> is set to <b>V3</b> . It is used to confirm the encryption key.

 NOTE

- The value of **Security Username** cannot contain repeated character strings with the unit length is a common factor of 64 (such as 1, 2, 4, and 8), for example, **abab** and **abcdabcd**.
- The authentication password and encryption password must contain 8 to 16 characters, including at least three types of the following characters: uppercase letters, lowercase letters, digits, and special characters. The two passwords must be different. The two passwords cannot be the same as the security username or the reverse of the security username.
- For security purposes, you need to periodically change the authentication and encryption passwords when using SNMP.
- If SNMPv3 is used, a security user will be locked after five consecutive authentication failures within 5 minutes. The user will be automatically unlocked 5 minutes later.

**Step 5** Click **Create Trap Target**. On the displayed dialog box, set the following parameters:

- **Target Symbol**: specifies the trap target ID, which is the ID of the NMS or host that receives traps. The value consists of 1 to 255 characters, including letters or digits.
- **Target IP Address Mode**: specifies the IP address mode of the destination IP address. This parameter can be set to **IPV4** or **IPV6**.
- **Target IP Address**: specifies the IP address of the target trap. Destination IP address, which must be able to communicate with the management plane IP address of the management node.
- **Target Port**: specifies the port receiving traps. The port number must be consistent with the peer end and ranges from 0 to 65535.
- **Trap Community Name**: This parameter is available only when **Version** is set to **V2C** and is used to report the community name.

Click **OK**.

The **Create Trap Target** dialog box is closed.

**Step 6** Click **OK** to complete the settings.

----End

## 12.8.2.2 Configuring Syslog Northbound Parameters

### Scenarios

If users need to view alarms and events of a cluster on the unified alarm reporting platform, you can use the Syslog protocol on FusionInsight Manager to report related data to the alarm platform.

---

**NOTICE**

If the Syslog protocol is not encrypted, data may be stolen.

---

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Interconnection > Syslog**.

**Step 3** Turn on the switch on the right of **Syslog Service**.

The Syslog service is disabled by default.  indicates that the service is enabled.

**Step 4** Set northbound parameters based on information provided in [Table 12-45](#).

**Table 12-45** Syslog interconnection parameters

Parameter Area	Parameter	Description
Syslog Protocol	Server IP Address Mode	Set the IP address mode of the interconnected server. The value can be IPv4 or IPv6.
	Server IP Address	Sets the IP address of the interconnection server.
	Server Port	Specifies the port number for interconnection.
	Protocol	Sets the protocol type. The available values are as follows: <ul style="list-style-type: none"> <li>• TCP</li> <li>• UDP</li> </ul>
	Severity Level	Specifies the severity of the reported message. The options are as follows: <ul style="list-style-type: none"> <li>• Emergency</li> <li>• Alert</li> <li>• Critical</li> <li>• Error</li> <li>• Warning</li> <li>• Notice</li> <li>• Informational (default value)</li> <li>• Debug</li> </ul> <p><b>NOTE</b> Severity and Facility determine the priority of the sent message. <b>Priority = Facility × 8 + Severity</b> For details about the values of Severity and Facility, see <a href="#">Table 12-46</a>.</p>
	Facility	Sets the module where the log is generated. For details about the available value of this parameter, see <a href="#">Table 12-46</a> . The default value <b>local use 0 (local0)</b> is recommended.

Parameter Area	Parameter	Description
	Identifier	Sets the product ID. The default value is <b>FusionInsight Manager</b> . The identifier can contain a maximum of 256 characters, including letters, digits, underscores (_), spaces,  , \$, {, }, periods (.), and hyphens (-).
Report Message	Report Format	Sets the message format of the alarm report. For details, see help information on the page. The packet can contain letters, digits, underscores (_), spaces,  , \$, {, }, periods (.), and hyphens (-), and cannot exceed 1024 characters. <b>NOTE</b> For details about the information field in the packet format, see <a href="#">Table 12-47</a> .
	Alarm Type	Sets the type of the alarm to be reported.
	Alarm Severities	Sets the level of the alarm to be reported.
Uncleared Alarm Reporting	Periodic Uncleared Alarm Reporting	Sets whether to report uncleared alarms in a specified period. Turn on the switch indicates that the function is enabled, and turn off the switch indicates that the function is disabled. The switch is turned off by default.
	Report Interval (min)	Sets the interval at which alarms are reported periodically. This parameter is valid only when the switch is turned on on the right of <b>Periodic Uncleared Alarm Reporting</b> . The default value is <b>15</b> , in minutes. The value ranges from 5 to 1440 (one day).
Heartbeat Settings	Heartbeat Reporting	Sets whether to periodically report Syslog heartbeat messages. Turn on the switch indicates that the function is enabled, and turn off the switch indicates that the function is disabled. The switch is turned off by default.
	Heartbeat Period (min)	Sets the interval at which heartbeat messages are periodically reported. This parameter is valid only when the switch is turned on on the right of <b>Heartbeat Reporting</b> . The default value is 15, in minutes. The value ranges from 1 to 60.
	Heartbeat Packet	Sets the heartbeat message to be reported. This parameter is enabled if the switch is turned on on the right of <b>Heartbeat Reporting</b> , and cannot be left blank. The value can contain a maximum of 256 characters, including digits, letters, underscores (_), vertical bars ( ), colons (:), spaces, commas (,), and periods (.).

 **NOTE**

After the periodic heartbeat packet function is enabled, packets may be interrupted during automatic recovery of some cluster error tolerance (for example, active/standby OMS switchover). In this case, wait for automatic recovery.

**Step 5** Click **OK** to complete the settings.

----End

### 12.8.2.3 Configuring Monitoring Indicator Data Dump

#### Scenarios

The monitoring data reporting function writes the monitoring data collected in the system into a text file and uploads the file to a specified server in FTP or SFTP mode.

Before using this function, you need to perform related configurations on FusionInsight Manager.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **System > Interconnection > Upload Performance Data**.

**Step 3** Click the switch on the right of **Upload Performance Data**.

**Upload Performance Data** is disabled by default.  indicates the function is enabled.

**Step 4** Set the upload parameters based on information provided in [Table 12-48](#).

**Table 12-48** Uploading configuration parameters

Parameter	Description
FTP IP Address Mode	Specifies the server IP address mode. This parameter is mandatory. The value can be IPv4 or IPv6.
FTP IP Address	Specifies the FTP server for storing monitoring files after the monitoring indicator data is interconnected. This parameter is mandatory.
FTP Port	Specifies the port connected to the FTP server. This parameter is mandatory.
FTP Username	Specifies the username for logging in to the FTP server. This parameter is mandatory.
FTP Password	Specifies the password for logging in to the FTP server. This parameter is mandatory.
Save Path	Specifies the path for storing monitoring files on the FTP server. This parameter is mandatory.
Dump Interval (s)	Specifies the interval at which monitoring files are periodically stored on the FTP server, in seconds. This parameter is mandatory.
Dump Mode	Specifies the protocol used for sending monitoring files. This parameter is mandatory. The available values are <b>FTP</b> and <b>SFTP</b> . You are advised to use the SFTP mode based on SSH Version 2 (SSHv2). Otherwise, security risks may exist.

Parameter	Description
SFTP Service Public Key	Specifies the public key of the FTP server. This parameter is optional. This parameter is valid only when <b>Dump Mode</b> is set to <b>SFTP</b> .

**Step 5** Click **OK** to complete the settings.

 **NOTE**

In the scenario where the dump mode SFTP is used, if the public key of the SFTP service is empty, the system displays a security risk warning. Determine the security risk, and then save the configuration.

----End

## Data Format

After the configuration is complete, the monitoring data reporting function periodically writes monitoring data in the cluster to text files and reports the files to the corresponding FTP/SFTP service based on the configured reporting period.

- Principles for Generating Monitoring Files
  - The monitoring indicators are written to files generated every 30, 60, and 300 seconds based on the indicator collection period.
    - 30s: indicates real-time indicators whose default collection period is 30s.
    - 60s: indicates real-time indicators whose default collection period is 60s.
    - 300s: indicates all other indicators except the ones whose period is 30s or 60s.
  - File name format: **metirc\_{Period}\_{File creation time YYYYMMDDHHMMSS}.log**  
 For example: **metric\_60\_20160908085915.log**  
**metric\_300\_20160908085613.log**
- Monitoring File Contents
  - Format of monitoring files:
 

cluster ID |cluster name |indicator ID|collection time|collection host|unit|indicator value. Separate the fields from each other using vertical bars (|), for example:

```
1|xx1|Host|Host|10000413|2022/06/18 10:05:00|189-66-254-146|KB/s|309.910
1|xx1|Host|Host|10000413|2022/06/18 10:05:00|189-66-254-152|KB/s|72.870
2|xx2|Host|Host|10000413|2022/06/18 10:05:00|189-66-254-163|KB/s|100.650
```

Note: The actual files are not in the format.
  - Interval for uploading monitoring files:
 

The interval for uploading monitoring files can be set using the **Dump Interval (s)** parameter on the page. Currently, the interval can be set to 30s to 300s. After the configuration is complete, the system periodically uploads files to the corresponding FTP/SFTP server at the specified interval.
- Monitoring Indicator Description File

- Indicator set file

The indicator set file **all-shown-metric-zh\_CN** contains detailed information about all indicators. After obtaining the indicator IDs from the files reported by the third-party system, you can query details about the indicators from the indicator set file.

Location of the indicator set file:

Active and standby OMS nodes: *{FusionInsight installation path}* /**om-server/om/etc/om/all-shown-metric-zh\_CN**

Contents of the indicator set file:

```
Real-time indicator ID, 5-minute indicator ID, indicator name, indicator collection period
(second), whether to collect data by default, service to which the indicator belongs, and role to
which the indicator belongs
00101,10.000101,JobHistoryServer non-heap memory usage,30,false,Mapreduce,JobHistoryServer
00102,10.000102,JobHistoryServer Non-heap memory allocation
volume,30,false,Mapreduce,JobHistoryServer
00103,10.000103,JobHistoryServer heap memory usage,30,false,Mapreduce,JobHistoryServer
00104,10.000104,JobHistoryServer heap memory allocation
volume,30,false,Mapreduce,JobHistoryServer
00105, 10.000105,Number of blocked threads,30,false,Mapreduce,JobHistoryServer
00106,10.000106,Number of running threads,30,false,Mapreduce,JobHistoryServer
00107,10.000107,GC time,30,false,Mapreduce,JobHistoryServer
00110,10.00011,JobHistoryServer CPU usage,30,false,Mapreduce,JobHistoryServer
Real-Time Metric ID,5-Minute Metric ID,Metric Name,Metric Collection Period (s),Collected by
Default,Service Belonged To,Role Belonged To 00101,10000101,Used Non Heap Memory of
JobHistoryServer,60,false,Mapreduce,JobHistoryServer
00102,10000102,Allocated Non Heap Memory of
JobHistoryServer,60,false,Mapreduce,JobHistoryServer
00103,10000103,Used Heap Memory of
JobHistoryServer,60,false,Mapreduce,JobHistoryServer
00104,10000104,Allocated Heap Memory of
JobHistoryServer,60,false,Mapreduce,JobHistoryServer
00105,10000105,Blocked
Threads,30,false,Mapreduce,JobHistoryServer
00106,10000106,Running
Threads,30,false,Mapreduce,JobHistoryServer
00107,10000107,GC Time,60,false,Mapreduce,JobHistoryServer
```

- Field description of critical indicators

**Real-Time Metric ID:** indicates the ID of the indicator whose collection period is 30s or 60s.

**5-Minute Metric:** The ID of a 5-minute (300s) indicator.

**Metric Collection Period (s):** Real-time collection period of indicators. The value can be **30** or **60**.

**Service Belonged To:** Name of the service to which an indicator belongs, indicating the service type, for example, HDFS and HBase.

Role to which an indicator belongs: indicates the name (type) of the role to which an indicator belongs, for example, JobServer or RegionServer.

- Description

For metrics whose collection period is 30s/60s, you can find the corresponding metric description by referring to the first column, that is, **Real-Time Metric ID**.

For metrics whose collection period is 300s, you can find the corresponding metric description by referring to the second column, that is, **5-Minute Metric**.

## 12.8.3 Importing a Certificate

### Scenarios

CA certificates are used to encrypt data during communication for FusionInsight Manager modules, component clients of the cluster, and component servers of the cluster to implement secure communication. CA certificates can be quickly imported to FusionInsight Manager for product security. Import CA certificates in following scenarios:

- When the cluster is installed for the first time, you need to replace the enterprise certificate.
- If the enterprise certificate has expired or security hardening is required, you need to replace it with a new certificate.

### Impact on the System

- During certificate replacement, the cluster needs to be restarted. In this case, the system cannot be accessed and cannot provide services.
- After the certificate is replaced, the certificates used by all components and FusionInsight Manager modules are automatically updated.
- After the certificate is replaced, you need to reinstall the certificate in the local environment where the certificate is not trusted.

### Prerequisites

- The certificate file and key file can be applied for from the enterprise certificate administrator or generated by the MRS cluster administrator.
- Obtain the files to be imported to the MRS cluster, including the CA certificate file (such as \*.crt), key file (\*.key), and file (password.property) that saves the key file password. The certificate name and key name can contain uppercase letters, lowercase letters, and digits. After the preceding files are generated, they need to be compressed into a package in TAR format.
- Prepare a password for accessing the key file. For example, **Userpwd@123**. The password complexity requirements are as follows. If the password complexity does not meet the following requirements, security risks may exist:
  - It must contain at least eight characters.
  - It must contain at least four of the following character types: uppercase letters, lowercase letters, digits, and special characters ~`!?,;:\_'(){}[]/<>@#\$\$%^&\*+|\=.
- When applying for a certificate from the certificate administrator, provide the password for accessing the key file and apply for the certificate files in CRT, CER, CERT, and PEM formats and the key files in KEY and PEM formats. The applied certificates must have the issuing function.

### Procedure

**Step 1** Log in to FusionInsight Manager and choose **System > Certificate**.

**Step 2** Click **...** on the right of **Upload Certificate**. In the File selection dialog box, view the obtained TAR package of the certificate file and select the file.

**Step 3** Click **Upload**.

The system uploads the compressed package and automatically imports the package.

**Step 4** After the package is imported, the system prompts you to synchronize the configuration and restart the web service for the new certificate to take effect. Click **OK**.

**Step 5** In the displayed dialog box, enter the password of the current login user and click **OK**. The cluster configuration is automatically synchronized and the web service is restarted.

**Step 6** After the cluster is restarted, enter the URL for accessing FusionInsight Manager in the address box of the browser and check whether the FusionInsight Manager WebUI can be successfully displayed.

**Step 7** Log in to FusionInsight Manager.

**Step 8** Choose **Cluster > Name of the desired cluster > Dashboard > More > Restart**.

**Step 9** In the displayed dialog box, enter the password of the current login user and click **OK**.

----End

## 12.8.4 OMS Management

### 12.8.4.1 Overview of the OMS Maintenance Page

#### Overview

Log in to FusionInsight Manager, choose **System > OMS**. On the displayed OMS maintenance page, you can perform maintenance operations on the OMS, including viewing basic information, viewing the service status of OMS service modules, and manually triggering health checks.

#### Basic Information

OMS-associated information is displayed on FusionInsight Manager, as listed in [Table 12-49](#).

**Table 12-49** OMS information

Item	Description
Version	Indicates the OMS version, which is consistent with the FusionInsight Manager version.
IP Mode	Indicates the IP address mode of the current cluster network.
HA Mode	Indicates the OMS working mode, which is specified by the configuration file during FusionInsight Manager installation.

Item	Description
Current Active	Indicates the host name of the active OMS node, that is, the host name of the active management node. Click a host name to go to the host details page.
Current Standby	Indicates the host name of the standby OMS node, that is, the host name of the standby management node. Click a host name to go to the host details page.
Duration	Indicates the duration for starting the OMS process.

## OMS Service Status

FusionInsight Manager displays the running status of all OMS service modules. If the status of each service module is displayed as , the OMS is running properly.

## Health check

You can click **Health Check** on the OMS maintenance page to check the OMS status. If some check items are faulty, you can open the check description for troubleshooting.

## Entering or Exiting Maintenance Mode

Configure OMS to enter or exit the maintenance mode.

## System Parameters

In the large cluster scenario, connect to the DMPS cluster.

### 12.8.4.2 Changing the OMS Database Password

#### Scenario

Periodically change the password for the OMS data access user to ensure the system O&M security.

#### Impact on the System

The OMS service needs to be restarted for the password changing to take effect. The FusionInsight Manager is unavailable during the restart.

#### Procedure

- Step 1** Choose **System > OMS > gaussDB > Change Password** on FusionInsight Manager.
- Step 2** Locate the row that contains user **omm** and click **Change Password** in the **Operation** to change the password for the OMS database user.

**Step 3** In the displayed window, enter the password of the current login administrator user and click **OK**.

**Step 4** Enter the old and new passwords as prompted.

The password complexity requirements are as follows:

- The password ranges from 8 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`!@#\$\$%^&\*()-+\_=|[{}];",<.>/?
- The password cannot be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

**Step 5** Click **OK**. After the system displays **Operation succeeded**, click **Finish**.

**Step 6** Locate the row that contains user **omm** and click **Restart OMS Service** in the **Operation** to restart the OMS database.

**Step 7** In the displayed window, enter the password of the current login administrator user and click **OK**.

**Step 8** In the dialog box that is displayed, click **OK**, and then restart the OMS service.

----End

### 12.8.4.3 Modifying OMS Service Configuration Parameters

#### Scenarios

Based on the security requirements of the user environment, you can modify the Kerberos and LDAP configurations in the OMS on FusionInsight Manager.

#### Impact on the System

After the OMS service configuration parameters are modified, the corresponding OMS module needs to be restarted. In this case, FusionInsight Manager cannot be used.

#### Procedure

##### Modify okerberos Configuration

**Step 1** Log in to FusionInsight Manager and choose **System > OMS**.

**Step 2** Locate the row that contains the okerberos, click **Modify Configuration**.

**Step 3** Modify the parameters based on information provided in [Table 12-50](#).

**Table 12-50** okerberos parameter configuration

Parameter	Description
KDC Timeout (ms)	Timeout duration for an application to connect to the Kerberos, in milliseconds. The value must be an integer.
Max. Retries	Maximum number of attempts for the connection between an application to the Kerberos, in seconds. Set the parameter to an integer.
LDAP Timeout (ms)	Timeout interval for the Kerberos to connect to the LDAP, in milliseconds.
LDAP Search Timeout (ms)	Timeout duration for Kerberos to query user information in the LDAP, in milliseconds.
Kadmin Listening Port	Port number of the kadmin service.
KDC Listening Port	Port number of the kinit service.
Kpasswd Listening Port	Port number of the kpasswd service.

**Step 4** Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the displayed confirmation dialog box, click **OK**.

#### Modify the oldap Configuration

**Step 5** Locate the row that contains the on-line data processor (oldap), click **Modify Configuration**.

**Step 6** Modify the parameters based on information provided in [Table 12-51](#).

**Table 12-51** OLDAP parameter configuration

Parameter	Description
LDAP Listening Port	LDAP service port number

**Step 7** Click **OK**.

In the displayed dialog box, enter the password of the current login user and click **OK**. In the confirmation dialog box, click **OK**.

----End

## 12.8.5 Component Management

## 12.8.5.1 Viewing Component Packages

### Scenarios

A complete MRS cluster consists of multiple component packages. Before installing some services on FusionInsight Manager, check whether the component packages corresponding to the services have been installed.

### Procedure

**Step 1** Log in to FusionInsight Manager and choose **System > Component**.

**Step 2** On the **Installed Component** tab page, view all components.

 **NOTE**

You can view the registered OS and platform type in the **Platform Type** column.

**Step 3** Click  on the left of a component name to view the services and version numbers contained in the component.

----End

## 12.9 Cluster Management

### 12.9.1 Configuring Client

#### 12.9.1.1 Installing a Client

##### Scenario

Install the clients of all services (except Flume). MRS provides shell scripts for different services for maintenance personnel to log in to related maintenance clients and implement maintenance operations.

 **NOTE**

- Reinstall the client after server configuration is modified on the Manager portal or after the system is upgraded. Otherwise, the versions of the client and server will be inconsistent.

##### Prerequisites

- The client installation directory is automatically created if it does not exist. If it already exists, it must be empty. The directory cannot contain any space.
- If the node where the client is to be installed is a server outside the cluster, it must be able to communicate with the service plane. Otherwise, the client will fail to be installed.
- The client must be enabled with the NTP service and synchronize time with the server. Otherwise, the client will fail to be installed.
- The HDFS and MapReduce components are stored in the same directory (*client directory/HDFS/*) after being downloaded.

- You can install or use the client as any user. Obtain the username and password from the MRS cluster administrator. This section uses user **user\_client** as an example. User **user\_client** is the owner of the server file directory (such as **/opt/Bigdata/client**) and the client installation directory (such as **/opt/Bigdata/hadoopclient**) with the permissions of **755**.
- You have obtained the component service user (default user or new user) and password.
- If the **/var/tmp/patch** directory already exists when you install the client as non-**root** or non-**omm** user, change the permission on the directory to **777** and the permission on the logs in the directory to **666**.

## Procedure

### Step 1 Obtain the software package.

Log in to FusionInsight Manager. Click the wanted cluster from the **Cluster** drop-down list.

Choose **More > Download Client**. The **Download Cluster Client** window is displayed.

#### NOTE

In a single-client scenario, choose **Cluster > Name of the desired cluster > Services > Service name > More > Download Client**. The **Download Client** dialog box is displayed.

### Step 2 Set **Select Client type** to **Complete Client**.

**Configuration Files Only** is to download client configuration files in the following scenario: After all clients are downloaded and installed and MRS cluster administrators modify server configuration on the Manager portal, development personnel need to update the configuration files during application development.

There are two client software packages:

- **x86\_64**: client software package that can be deployed on the x86 platform.
- **aarch64**: client software package that can be deployed on the TaiShan platform.

#### NOTE

The cluster supports **x86\_64** and **aarch64** clients. However, the client type must match the architecture of the target node. Otherwise, the client installation will fail.

### Step 3 Determine whether to generate a client file on the cluster node?

- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. The directory can be customized and user **omm** has the read, write, and execute permission on the directory. Click **OK**, copy the software package to the file directory, for example, **/opt/Bigdata/client**, on the server where the client is to be installed as user **omm** or **root**. Then, go to [Step 5](#).

#### NOTE

If you cannot obtain permissions of user **root**, use the **omm** user.

- If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete, and go to **Step 4**.

**Step 4** Upload the software package. Use WinSCP to upload the software package to the server file directory where the client is to be installed (such as **/opt/Bigdata/client**) as the user who is to install the client (any user, such as user **user\_client**).

The format of the client software package name is as follows: **FusionInsight\_Cluster\_<Cluster ID>\_Services\_Client.tar**. The following steps and sections use **FusionInsight\_Cluster\_1\_Services\_Client.tar** as an example.

 **NOTE**

- The host where the client is to be installed can be a node in the cluster or outside the cluster. If the node is a server outside the cluster, it must be able to communicate with the cluster, and the NTP service must be enabled to ensure that the time is the same as that on the server.
- For example, you can configure NTP clock sources for external client servers as well as clusters. Then you can execute the **ntpq -np** command to check whether the time is synchronized.

- If there is a \* before the result of the NTP clock source IP address, it means time synchronization is normal, as follows:

```
remote refid st t when poll reach delay offset jitter
=====
====
*10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
```

- If there is no \* before the result of the NTP clock source IP address, and the result of **refid** is **.INIT**, or the results showed abnormal, it means synchronization is exception, please contact technical support.

```
remote refid st t when poll reach delay offset jitter
=====
====
10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
```

- You can also configure the same chrony clock source for external servers as that for the cluster. After the configuration, run the **chronyc sources** command to check whether the time is synchronized.

- In the command output, if an asterisk (\*) exists before the IP address of the chrony service on the active OMS node, the synchronization is in normal state. For example:

```
MS Name/IP address      Stratum Poll Reach LastRx Last sample
=====
====
^* 10.10.10.162         10 10 377 626 +16us[ +15us] +/- 308us
```

- If there is no asterisk (\*) before the IP address of the NTP service on the active OMS node and **Reach** is "0", the synchronization is abnormal.

```
MS Name/IP address      Stratum Poll Reach LastRx Last sample
=====
====
^? 10.1.1.1            0 10 0 - +0ns[ +0ns] +/- 0ns
```

**Step 5** Log in to the server where the client software package is located as user **user\_client**.

**Step 6** Decompress the package.

Go to the directory where the package is stored, for example, **/opt/Bigdata/client**. Run the following command to decompress the package to a local directory:

**tar -xvf FusionInsight\_Cluster\_1\_Services\_Client.tar**

**Step 7** Verify the software package.

Run the **sha256sum** to verify the retrieved file, for example,

```
sha256sum -c FusionInsight_Cluster_1_Services_ClientConfig.tar.sha256
```

```
FusionInsight_Cluster_1_Services_Client.tar: OK
```

**Step 8** Run the following command to decompress the retrieved file:

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig.tar
```

**Step 9** Configure network connections for the client.

1. Ensure that the host where the client is installed can communicate with the hosts listed in the **hosts** file stored in the directory containing the decompressed package, for example, **/opt/Bigdata/client/FusionInsight\_Cluster\_<Cluster ID>\_Services\_ClientConfig/hosts**.
2. If the host where the client is installed is not a host in the cluster, you need to set the mapping between the host name and the service plane IP address for each cluster node in **/etc/hosts**, user **root** rights are required to modify the file. Each host name uniquely maps an IP address. You can perform the following steps to import the domain name mapping of the cluster to the **hosts** file:
  - a. Switch to the **root** user or a user who has permission to modify the **hosts** file.  

```
su - root
```
  - b. Go to the directory where the client package is decompressed.  

```
cd /opt/Bigdata/client/FusionInsight_Cluster_1_Services_ClientConfig
```
  - c. Run the **cat realm.ini >> /etc/hosts** command to import the domain name mapping to the hosts file.

**NOTE**

- If the host where the client is installed is not a host in the cluster, configure network connections for the client to prevent errors from occurring when you run commands on the client.
- If the Spark task is run in yarn-client mode, add the **spark.driver.host** parameter in the *Client installation directory*/**Spark/spark/conf/spark-defaults.conf** file and set the parameter value to the IP address of the client.
- When yarn-client mode is used, to ensure that the Spark WebUI can properly display information, add the mappings between the client IP addresses and host names to the hosts file on the active and standby Yarn nodes, that is, the ResourceManager nodes in the cluster.

**Step 10** Go to the directory where the installation package is stored, and run the following command to install the client to the specified directory (an absolute path), for example, **/opt/hadoopclient**:

```
cd /opt/Bigdata/client/FusionInsight_Cluster_1_Services_ClientConfig
```

Run the **./install.sh /opt/hadoopclient** command and wait for the client installation to complete. The client is successfully installed if information similar to the following is displayed:

```
The component client is installed successfully
```

 NOTE

- If the `/opt/hadoopclient` directory has been used by the client of all or some installed services, use another directory when another client is installed.
- Delete the client installation directory to uninstall the client.
- To ensure that the client you install can only be used by you, add the `-o` parameter. That is, run the `./install.sh /opt/hadoopclient -o` command to install the client.
- If the NTP server is to be installed in **chrony** mode, ensure that the parameter **chrony** is added in the installation process, that is, run the command `./install.sh /opt/hadoopclient -o chrony` to install the client.
- Because HBase uses the Ruby syntax, if the installed client contains the HBase client, it is recommended that the client installation directory contain only uppercase letters, lowercase letters, digits, and `_-?.@+=` characters.
- If the client node is a server outside the cluster and cannot communicate with the service plane IP address of the active OMS node or cannot access port 20029 of the active OMS node, the client can be successfully installed but cannot be registered with the cluster and cannot be displayed on the GUI.

**Step 11** Log in to the client to check whether the client is successfully installed.

1. Run the `cd /opt/hadoopclient` command to go to the client installation directory.
2. Run the `source bigdata_env` command to configure the environment variables for the client.
3. If the cluster is in security mode, run the following command to set kinit authentication and enter the password for logging in to the client, In normal mode, user authentication is not required:

**kinit admin**

```
Password for admin@HADOOP.COM: #Enter the login password of user admin (this password is the same as the user password for cluster login).
```

4. Run the `klist` command to view and confirm authentication details.

```
Ticket cache: FILE:/tmp/krb5cc_0
```

```
Default principal: admin@HADOOP.COM
```

```
Valid starting Expires Service principal
04/09/13 18:22:35 04/10/13 18:22:29 krbtgt/HADOOP.COM@HADOOP.COM
```

 NOTE

- When kinit authentication is used, the ticket is stored in the `/tmp/krb5cc_uid` directory by default.  
*uid* indicates the ID of the user who logs in to the operating system. For example, if the UID of user **root** is **0**, the ticket generated for kinit authentication after user **root** logs in to the system is stored in the `/tmp/krb5cc_0` directory.
- If kinit authentication is used and the same user is used to log in to the operating system, there is a risk that tickets are overwritten. You can set the `-c cache_name` parameter to specify the ticket buffer location or set the `KRB5CCNAME` environment variable to avoid this problem.

**Step 12** After the cluster is reinstalled, the client that has been installed is no longer available. Perform the following operations to reinstall the client.

1. Log in to the node where the client is located as user **root**.
2. Run the following command to check the directory where the client is located. (In the following example, the client is located in the `/opt/hadoopclient` directory.)

```
ll /opt
```

```
drwxr-x---. 6 root root 4096 Dec 11 19:00 hadoopclient
drwxr-xr-x. 3 root root 4096 Dec 9 02:04 godi
drwx-----. 2 root root 16384 Nov 6 01:03 lost+found
drwxr-xr-x. 2 root root 4096 Nov 7 09:49 rh
```

3. Run the **mv** command to remove the directory where the client program is located and all files in this directory. (For example, remove the **/opt/hadoopclient** directory and all files in it.)

```
mv /opt/hadoopclient /tmp/clientbackup
```

4. Reinstall the client.

----End

## 12.9.1.2 Using a Client

### Scenario

After a client is installed, you can use shell commands on the client in an O&M scenario or service scenario, or use example projects on the client in an application development scenario.

Use a client in an O&M scenario or service scenario. For details about shell commands, see the .

### Prerequisites

- You have installed the client. For example, the installation directory is **/opt/Bigdata/client**.
- The component service user can be created by the MRS cluster administrator as required.

The keytab file must be downloaded for a **Machine-Machine** user. Change the password of the **Human-Machine** user at the first login.

### Procedure

**Step 1** Log in to the node where the client is installed as the client installation user.

**Step 2** Run the following command to go to the client installation directory:

```
cd /opt/Bigdata/client
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** If the cluster uses the Security Mode, run the following command to perform user authentication. If the cluster uses the Normal Mode, no user authentication is required.

```
kinit component service user
```

**Step 5** Run shell commands based on the actual service requirements.

The methods vary according to client type.

----End

### 12.9.1.3 Updating the Configuration of the Installed Client

#### Scenario

The cluster provides a client for you to connect to a server, view task results, or manage data. If you modify service configuration parameters on FusionInsight Manager and restart the service, you need to download and install the installed client again or use the configuration file to update the client.

#### Prerequisites

You have installed the client.

#### Procedure

##### Method 1:

- Step 1** Log in to FusionInsight Manager. Click the wanted cluster from the **Cluster** drop-down list..
- Step 2** Choose **More > Download Client > Configuration Files Only**.
- The generated compressed file contains the configuration files of all services.
- Step 3** Determine whether a configuration file needs to be generated on the cluster node.
- If yes, select **Save to Path**, and click **OK** to generate the client file. By default, the client file is generated in **/tmp/FusionInsight-Client** on the active management node. You can also store the client file in other directories, and user **omm** has the read, write, and execute permissions on the directories. Then, go to **Step 4**.
  - If no, click **OK**, specify a local save path, and download the complete client. Wait until the download is complete, and go to **Step 4**.
- Step 4** Use WinSCP to save the compressed file to the installation directory of the client as the client installation user, such as **/opt/hadoopclient**.
- Step 5** Decompress the software package.
- Run the following commands to enter into the directory where the client is installed, and decompress the file to a local directory. For example, the downloaded client file is **FusionInsight\_Cluster\_1\_Services\_Client.tar**.

```
cd /opt/hadoopclient
```

```
tar -xvf FusionInsight_Cluster_1_Services_Client.tar
```

- Step 6** Verify the software package.

Run the **sha256sum** command to verify the retrieved file. Check whether the command output is consistent with the information in the **sha256** file. Example command:

```
sha256sum -c  
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar.sha256
```

```
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar: OK
```

**Step 7** Decompress the package to obtain the configuration file.

```
tar -xvf FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles.tar
```

**Step 8** Run the following command in the client installation directory to update the client using the configuration file:

```
sh refreshConfig.sh Client installation directory Directory where the configuration file is located
```

For example, run the following command:

```
sh refreshConfig.sh /opt/hadoopclient /opt/hadoopclient/  
FusionInsight_Cluster_1_Services_ClientConfig_ConfigFiles
```

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

**Method 2:**

**Step 1** Log in to the client installation node as user **root**.

**Step 2** Go to the client installation directory, for example, **/opt/Bigdata/client** and run the following command to update the configuration file:

```
cd /opt/Bigdata/client
```

```
sh autoRefreshConfig.sh
```

**Step 3** Enter the username and password of the FusionInsight Manager administrator and the floating IP address of FusionInsight Manager.

**Step 4** Enter the names of the components whose configuration needs to be updated. Use commas (,) to separate the component names. Press **Enter** to update the configurations of all components if necessary.

If the following information is displayed, the configurations have been updated successfully.

```
Succeed to refresh components client config.
```

----End

## 12.9.2 Managing Mutual Trust Relationships Between Managers

### 12.9.2.1 Introduction to Mutual Trust Relationships Between Clusters

#### Function Description

By default, users of big data clusters in safe mode can only access resources in the cluster. In other clusters, they cannot perform identity authentication to access resources in safe mode.

## Features

- **Domain**

The usage range of users in each system is called a **domain**. Each Manager system must have a unique domain name. Cross-Manager access means users to be used across domains.
- **User Encryption**

Cross-Manager mutual trust relationships can be configured by using FusionInsight Manager. The current Kerberos server supports only **aes256-cts-hmac-sha1-96:normal** and **aes128-cts-hmac-sha1-96:normal**. Encryption types for encrypting cross-domain users cannot be changed.
- **User Authentication**

After cross-manager mutual trust is configured, if a user with the same name exists in the two systems and the user with the same name in the peer system has the permission to access a resource in the system, the current system user can access the remote resource.
- **Direct Mutual Trust**

When cross-cluster mutual trust relationships are built between two clusters, the system saves the mutual-trust receipts. Users can access the remote system through the mutual-trust receipts.

### 12.9.2.2 Changing Manager System Domain Name

#### Scenario

The usage range of users in each FusionInsight Manager is called a domain. Each system must have a unique domain name. The domain name of the FusionInsight Manager is generated during installation. To change the domain name to a specific domain name, run the FusionInsight Manager command.

---

#### NOTICE

- Changing the system domain name is a high-risk operation. Before performing operations in this section, ensure that the OMS data has been backed up by referring to [Backing Up Manager Data](#).
- 

#### Impact on the System

- During the configuration, all of the clusters need to be restarted and are unavailable during restart.
- During the configuration, the domain names will be changed, and the passwords of Kerberos administrator and OMS Kerberos administrator will be initialized. You need to use the default passwords and change the password. For details, see [User Information Overview](#). If a component running user whose password is generated randomly by the system is used for identity authentication, see [Exporting an Authentication Credential File](#) to download the keytab file again.
- After the system domain name is changed, passwords of the **admin** user, component running user, and the **Human-machine** user added by the MRS

cluster administrator before the domain name is changed will be reset to the same. Change the passwords. The reset password consists of two parts: one part is generated by the system and the other is set by the user. The system generating part is Admin@123, which is the default password. For details about the user-defined part, see descriptions of **Password Suffix** in [Table 12-53](#). For example, if the generated part is **Admin@123** and the user-defined part is **Admin@123**, the new password is **Admin@123Admin@123**.

- The new password must meet the password policies. To obtain the new **Human-machine** user password, log in to the active OMS as user **omm** and run the following script:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh passwd_suffix
user_name
```

- *passwd\_suffix* indicates the user setting part (**Admin@123** by default).
- *user\_name* is optional (**admin** by default).

For Example:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/get_reset_pwd.sh Admin@123
```

To get the reset password after changing cluster domain name.

```
pwd_min_len : 8
pwd_char_types : 4
```

The password reset after changing cluster domain name is: "Admin@123Admin@123"

In this example, **pwd\_min\_len** and **pwd\_char\_types** indicate the minimum password length and number of password character types respectively defined in the password policies. **Admin@123Admin@123** indicates the **Human-Machine** user password after the system domain name is changed.

- The reset password after the inter-system domain name is changed consists of two parts: one part is generated by the system and the other is set by the user. The reset password must meet the password policy. In case of insufficient length, add one or multiple at-signs (@) between Admin@123 and user setting part. If there are five character types, add a space on the right of Admin@123.

For example, when the default user setting part and the default user password policy are used, and the password must contain at least eight characters of four types, the new password is **Admin@123Admin@123**. When the user setting part is Test@123 and default user password policy is used, the new password is **Admin@123Test@123**. The password contains 17 characters of four types. If the current password policy must be met, process the password according to [Table 12-52](#).

**Table 12-52** Password processing

Minimum Password Length	Number of Character Types	Password Policy Satisfaction	New Password
8 to 17 characters	4	Password policies are met.	Admin@123Test@123
18 characters	4	Add an at sign (@).	Admin@123@Test@123

Minimum Password Length	Number of Character Types	Password Policy Satisfaction	New Password
19 characters	4	Add two at signs (@).	Admin@123@@Test@123
8 to 18 characters	5	Add a space.	Admin@123 Test@123
19 characters	5	Add a space and an at sign (@).	Admin@123 @Test@123
20 characters	5	Add a space and two at signs (@).	Admin@123 @@Test@123

- After the system domain name is changed, download the **keytab** file for the **Machine-Machine** user added by the MRS cluster administrator before the domain name is changed.
- After the system domain name is changed, download and install the client again.

## Prerequisites

- You have specified service requirements and planned domain names for the systems.  
A domain name can contain only uppercase letters, digits, dots (.), and underscores (\_), and must start with a letter or a digit.
- **Running Status** of all services in the Manager clusters is **Normal**.
- The **acl.compare.shortName** parameter of the ZooKeeper service of all clusters in the Manager must be set to the default value **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.

## Procedure

- Step 1** Log in to FusionInsight Manager of a cluster.
- Step 2** Choose **System > Permission > Domain and Mutual Trust**.
- Step 3** Change parameters.

**Table 12-53** Related Parameters

Parameter	Description
<b>Local Domain</b>	Set the value to the domain name of the system.

Parameter	Description
<b>Password Suffix</b>	<p>The user sets part of the <b>Human-Machine</b> user after password reset. The default value is <b>Admin@123</b>.</p> <p><b>NOTE</b></p> <p>This parameter is only changed <b>Local Domain</b> parameters to take effect. The following conditions must be met:</p> <ul style="list-style-type: none"><li>• The password ranges from 8 to 16 characters.</li><li>• The password must contain at least three types of the following: uppercase letters, lowercase letters, numbers, and the following special characters: `~!@#%&amp;*()-_+= []{};':&lt;.&gt;/?` and space.</li></ul>

**Step 4** Click **OK**. After the modification is complete, proceed with the subsequent steps. Do not perform the subsequent steps in advance.

**Step 5** Log in to the active management node as user **omm**.

**Step 6** Run the following command to restart the domain update configuration:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh
```

The command is run successfully if the following information is displayed.

Modify realm successfully. Use the new password to log into FusionInsight again.

 **NOTE**

After restart, some hosts and services cannot be accessed and an alarm is generated. This problem can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is run.

**Step 7** Log in to the FusionInsight Manager as the reset user **admin** and password (for example, Admin@123Admin@123). On the FusionInsight Manager home page, click **\*\*\*** next to the name of the cluster to be operated and select **Restart**.

In the displayed confirmation dialog box, click **OK**.

In the displayed dialog box, click **OK**. Wait for a while until a message indicating that the operation is successful is displayed. Click **Finish**.

**Step 8** Log out from FusionInsight Manager and then log in to it again. If the login is successful, the configuration is successful.

**Step 9** Log in to the active management node as user **omm** and run the following command to update the job submission client configuration:

```
sh /opt/executor/bin/refresh-client-config.sh
```

----End

### 12.9.2.3 Configuring Cross-Manager Cluster Mutual Trust Relationships

#### Scenario

When two clusters in different security modes need to access each other's resources, you can set up a mutual trust system so that users of external systems can use the system.

The usage range of users in each system is called a **domain**. Each Manager system must have a unique domain name. Cross-Manager access means users to be used across domains.

#### NOTE

A maximum of 500 mutual trust clusters can be configured.

## Impact on the System

- After cross-Cluster mutual trust is configured, users of an external system can be used in the local system. You need to periodically check the user rights in the Manager system based on enterprise service and security requirements.
- When configuring cross-cluster mutual trust, you need to stop all clusters, which interrupts services.
- After cross-Cluster mutual trust is configured, each of the clusters trusting each other can add Kerberos internal users "*krbtgt/local cluster domain name@external cluster domain name*" and "*krbtgt/external cluster domain name@local cluster domain name*". The two users cannot be deleted. The default password is **Admin@123**. Based on enterprise service and security requirements, you need to change the password periodically. The passwords of the four users in the two systems trusting each other must be the same. For details, see [Changing the Password for a Component Running User](#). Connections of cross-Manager service applications may be affected during the password change.
- After configuring the cross-Cluster mutual trust relationship, download and install the client again for each cluster.
- After cross-Cluster mutual trust is configured, verify services. For information about how to access the resources in the remote system by using users in the local system, see [Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured](#).

## Prerequisites

- You have specified service requirements and planned domain names for the systems. A domain name can contain only uppercase letters, digits, dots (.), and underscores (\_), and must start with a letter or a digit.
- Before configuring cross-Cluster mutual trust, ensure that the domain names of the two Manager systems are different. When an ECS or BMS cluster is created on MRS, a unique system domain name is randomly generated. Generally, you do not need to change the system domain name.
- Before cross-Cluster mutual trust is configured, ensure that the two systems do not have the same host name or the same IP address.
- Time of two systems configured trust relationships must be consistent and the Network Time Protocol (NTP) service in the two systems must use the same time source.
- **Running Status** of all services in the Manager clusters is **Normal**.
- The **acl.compare.shortName** parameter of the ZooKeeper service of all clusters in the Manager must be set to the default value **true**. Otherwise, change the value to **true** and restart the ZooKeeper service.

## Procedure

**Step 1** Log in to the FusionInsight Manager of one of the two systems to be configured with mutual trust.

Click **Stop** next to the cluster to be operated. Enter the administrator password. In the **Stop Cluster** dialog box that is displayed, click **OK**. Wait until the cluster is stopped.

**Step 2** Stop all clusters on the home page.

Click **Stop** next to the target cluster and select **Stop**. Enter the password. In the **Stop Cluster** dialog box that is displayed, click **OK**. Wait until the cluster is stopped.

**Step 3** Choose **System > Permission > Domain and Mutual Trust**.

**Step 4** Change the **Peer Mutual Trust Domain** parameter

**Table 12-54** Related Parameters

Parameters	Description
<b>realm_name</b>	Set the value to the domain name of the peer system.
<b>ip_port</b>	<p>Set the value to the KDC address of the peer system.</p> <p>The parameter value format is <i>IP address of the node where the Kerberos service of the mutual trust cluster is to be configured in the peer system:port</i>.</p> <ul style="list-style-type: none"> <li>In dual-plane networking, you need to enter the service IP address.</li> <li>If an IPv6 address is used, the IP address must be enclosed in square brackets ([ ]).</li> <li>Use a comma to separate the KDC addresses of the active and standby Kerberos services or multiple clusters in the peer system need to establish mutual trust with the local system.</li> <li>You can obtain the port number by viewing the <b>kdc_ports</b> parameter of the KrbServer service. The default value is 21732. You can obtain the IP address of the node where the service is deployed by clicking the <b>Instances</b> tab on the <b>KrbServer</b> service page and viewing the <b>Service IP Address</b> of the <b>KerberosServer</b> role.</li> </ul> <p>For example, if the Kerberos service is deployed on 10.0.0.1 and 10.0.0.2, to establish mutual trust with the local system, the corresponding parameter value is <b>10.0.0.1:21732,10.0.0.2:21732</b>.</p>

 NOTE

If you need to configure trust relationships for multiple Manager systems, click  to add a new project and set parameters. A maximum of 16 systems can be mutually trusted. Click  to delete redundant configurations.

**Step 5** Click **OK**.

**Step 6** Log in to the active management node using the active management IP address as user **omm**. Run the following command to update domain configuration:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-RealmConfig.sh
```

The command is run successfully if the following information is displayed:

```
Modify realm successfully. Use the new password to log into FusionInsight again.
```

After restart, some hosts and services cannot be accessed and an alarm is generated. This problem can be automatically resolved in about 1 minute after **restart-RealmConfig.sh** is run.

**Step 7** Log in to the FusionInsight Manager and start all clusters.

Click **\*\*\*** > **Start** next to the cluster to be operated. In the **Start Cluster** dialog box that is displayed, click **OK**. Wait until the cluster is started.

**Step 8** Log in to FusionInsight Manager of the other system and repeat the preceding operations.

----End

## 12.9.2.4 Assigning User Permissions After Cross-Cluster Mutual Trust Is Configured

### Scenario

After cross-Cluster mutual trust is configured, assign users the access permission for the systems so that the users can perform required service operations in the systems.

### Prerequisites

The mutual trust relationship between Manager systems has been configured.

### Procedure

**Step 1** Log in to FusionInsight Manager of local system.

**Step 2** Choose **System** > **Permission** > **User** to check whether the user who performs the service operation exists.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

**Step 3** Click  on the left of a specified user, check whether the permissions assigned for the user group where the user resides and the role meet the service requirements.

If not, create a role and bind the role to the user, or modify the permissions of the user group or role. For details, see [Configuring Permission](#).

- Step 4** Create the user required by the service and associate the required user group or role. For details, see [Creating a User](#).
- Step 5** Log in to FusionInsight Manager of remote system and repeat [Step 2](#) to [Step 4](#) to create the same user as that in cluster A and assign required permissions.

----End

## 12.9.3 Configuring Periodical Alarm and Audit Information Backup

### Scenario

Modify the related configuration file to periodically back up the alarm, audit information of FusionInsight Manager and service audit information of to the specified storage location.

The backup can be performed using FTP or SFTP. FTP does not encrypt data, which may cause potential security risks. Therefore, SFTP is recommended.

### Procedure

- Step 1** Log in to the active management node using the active management IP address as user **omm**.

 **NOTE**

Perform this operation only on the active management node. This operation is not supported on the standby management node.

- Step 2** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

- Step 3** Run the following command to configure periodically the alarm, audit information of FusionInsight Manager and service audit information backup:

```
./setNorthBound.sh -t Information type -i Remote server IP address -p SFTP or FTP port used by the server -u Username -d Save path -c Interval (minute) -m Number of information records in each file -s Flag for enabling or disabling backup -e Specified protocol
```

Example:

```
./setNorthBound.sh -t alarm -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp
```

This script will modify the alarm information backup configuration file **alarm\_collect\_upload.properties**. The file save path is **\${BIGDATA\_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config**.

```
./setNorthBound.sh -t audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp
```

This script will modify the audit information backup configuration file **audit\_collect\_upload.properties**. The file save path is `${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config`.

```
./setNorthBound.sh -t service_audit -i 10.0.0.10 -p 22 -u sftpuser -d /tmp/ -c 10 -m 100 -s true -e sftp
```

This script will modify the service audit information backup configuration file **service\_audit\_collect\_upload.properties**. The file save path is `${BIGDATA_HOME}/om-server/tomcat/webapps/web/WEB-INF/classes/config`.

**Step 4** Enter the password as prompted. The password is encrypted and saved in the configuration file.

Please input sftp/ftp server password:

**Step 5** If the following information is displayed, the operation is successful. The configuration file will be automatically synchronized to the standby management node.

```
execute command syncfile successfully.  
Config Succeed.
```

----End

## 12.9.4 Modifying the Manager Routing Table

### Scenario

After the FusionInsight Manager is installed, the system automatically creates two pieces of routing information on the active management node. Run the **ip rule list** command to view the routing information, as shown in the following example:

```
0: from all lookup local  
32764: from all to 10.10.100.100 lookup ntp_rt #FusionInsight Manager NTP routing information created  
by the system. The information is not displayed when no external NTP clock source is configured.  
FusionInsight Manager  
from 1El Managemr_rt #FusionInsight Manager routing information created by the system  
32766: from all lookup main  
32767: from all lookup default
```

#### NOTE

If the external NTP server has not been configured, only the OM routing information **om\_rt** will be created.

When the routing information created by the FusionInsight Manager system conflicts with the routing information of the enterprise, use the **autoroute.sh** tool to disable or enable routes created by FusionInsight Manager.

### Impact on the System

After the routing information created by the FusionInsight Manager system is disabled and before the new routing information is set, FusionInsight Manager cannot be accessed but operating of the cluster will not be affected.

### Prerequisites

The Manager has already been installed.

## Disable the routing information created by the system.

- Step 1** Log in to the active management node as user **omm**. Run the following commands to disable the routing information created by the system:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

```
./autoroute.sh disable
```

```
Deactivating Route.  
Route operation (disable) successful.
```

- Step 2** Run the following command to view the execution result:

```
ip rule list
```

```
0: from all lookup local  
32766: from all lookup main  
32767: from all lookup default
```

- Step 3** Run the following command and enter the password of user **root** to switch to user **root**:

```
su - root
```

- Step 4** Run the following commands to manually create *WS floating IP address* routing information:

```
ip route add WS floating IP address Network segment number/WS floating IP address subnet mask scope link src WS floating IP address dev WS floating IP address NIC table om_rt
```

```
ip route add default via WS floating IP address gateway dev WS floating IP address NIC table om_rt
```

```
ip rule add from WS floating IP address table om_rt
```

For example,

```
ip route add 192.168.0.0/255.255.255.0 scope link src 192.168.0.117 dev eth0:ws table om_rt
```

```
ip route add default via 192.168.0.254 dev eth0:ws table om_rt
```

```
ip rule add from 192.168.0.117 table om_rt
```

### NOTE

If the IP address mode of the current network is IPv6, run the **ip -6 route add** command.

- Step 5** Run the following commands to manually create *NTP service* routing information (Skip this step when no external NTP clock source is configured.):

```
ip route add default via NtpIP address gateway dev NIC of the local host IP address table ntp_rt
```

```
ip rule add to NTP IP address table ntp_rt
```

*NIC of the local host IP address* indicates the NIC that can interwork with the network segment where the NTP server is located.

For example,

```
ip route add default via 10.10.100.254 dev eth0 table ntp_rt
```

```
ip rule add to 10.10.100.100 table ntp_rt
```

- Step 6** Run the following command to view the execution result. For example, if routing information of which the routing table names are **om\_rt** and **ntp\_rt** is generated, the operation is successful.

```
ip rule list
```

```
0: from all lookup local
32764: from all to 10.10.100.100 lookup ntp_rt #The information is not displayed when no external NTP
clock source is configured.
32765: from 192.168.0.117 lookup om_rt
32766: from all lookup main
32767: from all lookup default
```

```
----End
```

## Enable the routing information created by the system.

- Step 1** Log in to the active management node as user **omm**.
- Step 2** Run the following commands to enable the routing information created by the system:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

```
./autoroute.sh enable
```

```
Activating Route.
Route operation (enable) successful.
```

- Step 3** Run the following command to view the execution result. For example, if routing information of which the routing table names are **ntp\_rt** and **om\_rt** is generated, the operation is successful.

```
ip rule list
```

```
0: from all lookup local
32764: from all to 10.10.100.100 lookup ntp_rt #The information is not displayed when no external NTP
clock source is configured.
32765: from 192.168.0.117 lookup om_rt
32766: from all lookup main
32767: from all lookup default
```

```
----End
```

## 12.9.5 Switching to Maintenance Mode

### Scenario

FusionInsight Manager allows you to set clusters, services, hosts, or OMSs to the maintenance mode. In this way, objects in the maintenance mode do not report alarms. This prevents the system from generating a large number of meaningless alarms during maintenance and changes such as upgrade, which affects O&M personnel's judgment on the cluster status.

- Cluster maintenance mode

If the cluster is not officially brought online or is temporarily offline for O&M operations (for example, non-rolling upgrade), you can set the entire cluster to the maintenance mode.

- **Service maintenance mode**  
When maintaining a specific service (for example, performing commissioning operations that may affect services, such as restarting service instances in batches, powering on or off nodes related to the service, or repairing the service), you can configure only the involved services to the maintenance mode.
- **Host maintenance mode**  
When performing maintenance operations on a host (for example, powering on or off a node, isolating a host, reinstalling a host, upgrading the OS, or replacing nodes), you can set the involved hosts to the maintenance mode.
- **OMS maintenance mode**  
You can set the OMS node to the maintenance mode when restarting, replacing, or repairing the OMS node.

## Impact on the System

In maintenance mode, the alarms that are not caused by maintenance operations are also suppressed. The alarms can be reported only after the system exits the maintenance mode. Therefore, exercise caution when setting the maintenance mode.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Set the maintenance mode.

Determine the object for which maintenance mode needs to be configured based on the actual operation scenario. For details, see [Table 12-55](#).

**Table 12-55** Switching to maintenance mode

Scenario	Procedure
Configuring a cluster to enter maintenance mode	<ol style="list-style-type: none"> <li>1. On the home page, click  next to the target cluster name and click <b>Enter Maintenance Mode</b>.</li> <li>2. In the dialog box that is displayed, click <b>OK</b>. After the cluster enters maintenance mode, the status of the cluster is displayed as . After maintenance is complete, click <b>Exit Maintenance Mode</b>. The cluster exits maintenance mode.</li> </ol>

Scenario	Procedure
Configuring services to enter maintenance mode	<ol style="list-style-type: none"> <li>1. On the management page, choose <b>Cluster</b> &gt; <i>Name of the desired cluster</i> &gt; <b>Services</b> &gt; <i>Service name</i>.</li> <li>2. On the service details page, choose <b>More</b> &gt; <b>Enter Maintenance Mode</b>.</li> <li>3. In the dialog box that is displayed, click <b>OK</b>. After a service enters maintenance mode, the status of the service in the service list is displayed as . After maintenance is complete, click <b>Exit Maintenance Mode</b>. The service exits the maintenance mode.</li> </ol> <p><b>NOTE</b> When configuring a service to enter the maintenance mode, you are advised to set other upper-layer services that depend on the service to the maintenance mode.</p>
Configuring a host to enter maintenance mode	<ol style="list-style-type: none"> <li>1. Click <b>Hosts</b> on the management page.</li> <li>2. On the host page, select the target host and choose <b>More</b> &gt; <b>Enter Maintenance Mode</b>.</li> <li>3. In the dialog box that is displayed, click <b>OK</b>. After the host enters maintenance mode, the status of the host in the host list is displayed as . After maintenance is complete, choose <b>More</b> &gt; <b>Exit Maintenance Mode</b>. The host exits maintenance mode.</li> </ol>
Configuring the OMS to enter maintenance mode	<ol style="list-style-type: none"> <li>1. On the management page, choose <b>System</b> &gt; <b>OMS</b> &gt; <b>Enter Maintenance Mode</b>.</li> <li>2. In the dialog box that is displayed, click <b>OK</b>. After the OMS enters maintenance state, the OMS status is displayed as . After maintenance is complete, click <b>Exit Maintenance Mode</b>. The OMS exits maintenance mode.</li> </ol>

**Step 3** View the cluster maintenance view.

On the home page of the management page, click  next to the name of the target cluster and click **O&M View**. In the displayed window, view the services and hosts in maintenance mode in the cluster.

After the maintenance is complete, you can select services and hosts in batches in the maintenance mode view and click **Exit Maintenance Mode** to exit the maintenance mode in batches.

**Figure 12-19** Exiting maintenance mode in batches

### Maintenance Mode View

----End

## 12.9.6 Routine Maintenance

To ensure a long-term proper and stable running of the system, MRS cluster administrators or maintenance engineers need to check the items listed in [Table 12-56](#) periodically and rectify faults based on the check results. It is recommended that system administrators record the result in each task scenario and sign off based on the enterprise management regulations.

**Table 12-56** Check items

Routine Maintenance Period	Task	Routine Maintenance Content
Every day	Checking the cluster service status	<ul style="list-style-type: none"> <li>• Check whether the running status, and configuration status of each service are normal and whether the status icons are in green.</li> <li>• Check whether the running status, and configuration status of the role instances of each service are normal and whether the status icons are in green.</li> <li>• Check whether the active/standby status of role instances of each service can be properly displayed.</li> <li>• Check whether the <b>Dashboard</b> results of services and role instances are normal.</li> </ul>
	Checking the cluster host status	<ul style="list-style-type: none"> <li>• Check whether the running status of each host is normal and whether the status icon is in green.</li> <li>• Check the current disk usage, memory usage, and CPU usage of each host. Check whether the current memory usage and CPU usage are ascending.</li> </ul>
	Checking the cluster alarm information	Check whether there are alarms generated in the previous day and automatically cleared.
	Checking the cluster audit information	Check whether there are <b>Critical</b> and <b>Major</b> operations performed in the previous day and whether the operations are valid.
	Checking the cluster backup	Check whether the OMS, LDAP, DBService, and NameNodeOMS, LDAP, and DBService were automatically backed up in the previous day.
	Checking the health check results	Perform the health check on FusionInsight Manager, and download the health check report to check whether any exception exists in the current cluster. You are advised to enable the automatic health check, export the latest cluster health check result, and repair unhealthy items based on the result.

Routine Maintenance Period	Task	Routine Maintenance Content
	Checking the network communication	Check the cluster network running status and check whether delay exists in the network communication between nodes.
	Checking the storage status	Check whether the total amount of cluster data storage increases suddenly. <ul style="list-style-type: none"> <li>● Check whether the disk usage is reaching the threshold, and find the causes, such as whether there is junk data or cold data needs to be deleted.</li> <li>● Check whether the services are increasing and whether the disk partitions need to be expanded.</li> </ul>
	Checking logs	<ul style="list-style-type: none"> <li>● Check whether any failed or suspended MapReduce or Spark job exists, view the <b>/tmp/logs/\${username}/logs/\${application id}</b> log file in HDFS, and rectify the fault.</li> <li>● Check the Yarn job logs, view the logs recording failed or suspended jobs, and delete the duplicate data.</li> <li>● Check the worker logs of Storm.</li> <li>● Back up logs to the storage server.</li> </ul>
Every week	Managing users	Check whether the user passwords are about to expire and notify users to change their passwords. To change the password of a <b>Machine-Machine</b> user, the keytab file needs to be downloaded again.
	Analyzing alarms	Export the alarms generated in a specified period and analyze them.
	Scanning disks	Check the disk health status. You are advised to use professional disk health check tools to perform the check.
	Collecting statistics of storage	Check the cluster node disk data in batches and check whether the data is evenly stored. Select the disks where the data amount is too large or too small and check whether the disks are normal.
	Recording changes	Arrange and record the operations on cluster configuration parameters and files to provide references for fault analysis and rectification.

Routine Maintenance Period	Task	Routine Maintenance Content
Every month	Analyzing logs	<ul style="list-style-type: none"> <li>Collect and analyze the hardware logs of cluster node servers, such as the BMC system logs.</li> <li>Collect and analyze the OS logs of cluster node servers.</li> <li>Collect and analyze the cluster logs.</li> </ul>
	Diagnosing the network	Analyze the cluster network health status.
	Managing hardware	Check the equipment rooms where the devices are running and clean the devices.

## 12.10 Log Management

### 12.10.1 About Logs

#### Log Description

The log file path of the MRS cluster is `/var/log/Bigdata`. The following table lists the log types.

**Table 12-57** Log types

Log Type	Description
Installation logs	Installation logs record information about FusionInsight Manager, cluster, and service installation to help users locate installation errors.
Run logs	Run logs record the running track information, debugging information, status changes, potential problems, and error information generated during the running of services.
Audit logs	Audit logs record information about users' activities and operation instructions, which can be used to locate fault causes in security events and determine who are responsible for these faults.

The following table lists the MRS log directories.

**Table 12-58** Log directories

Directory	Log
/var/log/Bigdata/audit	Component audit log.
/var/log/Bigdata/controller	Log collecting script log. Controller process log. Controller monitoring log.
/var/log/Bigdata/dbservice	DBService log.
/var/log/Bigdata/flume	Flume log.
/var/log/Bigdata/hbase	HBase log.
/var/log/Bigdata/hdfs	HDFS log.
/var/log/Bigdata/hive	Hive log.
/var/log/Bigdata/httpd	httpd log.
/var/log/Bigdata/hue	Hue log.
/var/log/Bigdata/kerberos	Kerberos log.
/var/log/Bigdata/ldapclient	LDAP client log.
/var/log/Bigdata/ldapserver	LDAP server log.
/var/log/Bigdata/loader	Loader log.
/var/log/Bigdata/logman	logman script log management log.
/var/log/Bigdata/mapreduce	MapReduce log.
/var/log/Bigdata/nodeagent	NodeAgent log.
/var/log/Bigdata/okerberos	OMS Kerberos log.
/var/log/Bigdata/oldapserver	OMS LDAP log.
/var/log/Bigdata/ metric_agent	Run log file of MetricAgent.
/var/log/Bigdata/omm	oms: complex event processing log, alarm service log, HA log, authentication and authorization management log, and monitoring service run log of the omm server. oma: installation log and run log of the omm agent. core: dump log generated when the omm agent and the HA process are suspended.
/var/log/Bigdata/spark2x	Spark2x log.
/var/log/Bigdata/sudo	Log generated when the <b>sudo</b> command is executed by user <b>omm</b> .

Directory	Log
/var/log/Bigdata/timestamp	Time synchronization management log.
/var/log/Bigdata/tomcat	Tomcat log.
/var/log/Bigdata/watchdog	Watchdog log.
/var/log/Bigdata/yarn	YARN log.
/var/log/Bigdata/zookeeper	ZooKeeper log.
/var/log/Bigdata/oozie	Oozie log.
/var/log/Bigdata/kafka	Kafka log.
/var/log/Bigdata/storm	Storm log.
/var/log/Bigdata/upgrade	OMS upgrade log file.
/var/log/Bigdata/update-service	Upgrade service logs.

 **NOTE**

After the multi-instance function is enabled, if the MRS cluster administrator adds multiple HBase, Hive, and Spark service instances, the log description, log level, and log format of the newly added service instances are the same as those of the original service logs. Service instance logs are stored separately in the **/var/log/Bigdata/*servicenameN*** directory. The audit logs of the HBase and Hive service instances are stored in the **/var/log/Bigdata/audit/*servicenameN*** directory. For example, the logs of HBase1 are stored in the **/var/log/Bigdata/hbase1** and **/var/log/Bigdata/audit/hbase1** directories.

## Installation Logs.

**Table 12-59** Installation logs

Installation Log	Description
Configuration log	Records information about the configuration process before the installation.
FusionInsight Manager installation log	Records information about the two-node FusionInsight Manager installation.
Cluster installation log	Records information about the cluster installation.

## Run Logs

**Table 12-60** describes the running information recorded in run logs.

**Table 12-60** Running information

Run Log	Description
Installation preparation log	Records information about preparations for the installation, such as the detection, configuration, and feedback operation information.
Process startup log	Records information about the commands executed during the process startup.
Process startup exception log	Records information about exceptions during process startup, such as dependent service errors and insufficient resources.
Process run log	Records information about the process running track information and debugging information, such as function entries and exits as well as cross-module interface messages.
Process running exception log	Records errors that cause process running errors, for example, the empty input objects or encoding or decoding failure.
Process running environment log	Records information about the process running environment, such as resource status and environment variables.
Script log	Records information about the script execution process.
Resource reclamation log	Records information about the resource reclaiming process.
Uninstallation clearing logs	Records information about operations performed during service uninstallation, such as directory deletion and execution time

## Audit Logs

Audit information recorded in audit logs includes FusionInsight Manager audit information and component audit information.

**Table 12-61** Audit information of FusionInsight Manager

Operation Type	Operation
User management	Creating a user. Modifying a user. Deleting a user. Creating a user group. Modifying a user group. Deleting a group. Adding a role. Changing the user's roles. Deleting a role. Changing a password policy. Changing a password. Resetting a password. Logging in. Logging out. Unlocking the screen. Downloading the authentication credential. Unauthorized operation. Unlocking a user account. Locking a user account. Locking the screen. Exporting a user. Exporting a user group. Exporting a role.

Operation Type	Operation
Cluster	<p>Starting a cluster.</p> <p>Stopping a cluster.</p> <p>Restarting a cluster.</p> <p>Performing a rolling restart of a cluster.</p> <p>Restarting all expired instances.</p> <p>Saving configurations.</p> <p>Synchronizing cluster configurations.</p> <p>Customizing cluster monitoring indicators.</p> <p>Configuring monitoring dump.</p> <p>Saving monitoring thresholds.</p> <p>Downloading a client configuration file.</p> <p>Configuring the northbound Syslog interface.</p> <p>Configuring the northbound SNMP interface.</p> <p>Clearing alarms using SNMP.</p> <p>Adding a trap target using SNMP.</p> <p>Deleting a trap target using SNMP.</p> <p>Checking alarms using SNMP.</p> <p>Synchronizing alarms using SNMP.</p> <p>Creating a threshold template.</p> <p>Deleting a threshold template.</p> <p>Applying a threshold template.</p> <p>Saving cluster monitoring configurations.</p> <p>Exporting configurations.</p> <p>Importing cluster configurations.</p> <p>Exporting an installation template.</p> <p>Modifying a threshold template.</p> <p>Canceling the application of a threshold template.</p> <p>Masking an alarm.</p> <p>Sending an alarm.</p> <p>Changing the OMS database password.</p> <p>Changing the component database password.</p> <p>Restarting OMM and Controller.</p> <p>Starting the health check of a cluster.</p> <p>Importing a certificate file.</p> <p>Configuring SSO information.</p> <p>Deleting historical health check reports.</p> <p>Modifying cluster properties.</p>

Operation Type	Operation
	<p>Running maintenance commands in synchronous mode.</p> <p>Running maintenance commands in asynchronous mode.</p> <p>Customizing report monitoring indicators.</p> <p>Exporting report monitoring data.</p> <p>Running a command in asynchronous mode using SNMP.</p> <p>Restarting the web service.</p> <p>Customizing monitoring indicators for static resource pools.</p> <p>Exporting monitoring data of a static resource pool.</p> <p>Customizing dashboard monitoring indicators.</p> <p>Stopping a task.</p> <p>Restoring configurations.</p> <p>Modifying domain and trust relationship configurations.</p> <p>Modifying system parameters.</p> <p>Making a cluster enter the maintenance mode.</p> <p>Making a cluster exit the maintenance mode.</p> <p>Making OMS enter the maintenance mode.</p> <p>Making OMS exit the maintenance mode.</p> <p>Making services in a cluster exit the maintenance mode in batches.</p> <p>Modifying OMS configurations.</p> <p>Enabling threshold alarms.</p> <p>Synchronizing all cluster configurations.</p>

Operation Type	Operation
Service	<p>Starting a service.</p> <p>Stopping a service.</p> <p>Synchronizing service configurations.</p> <p>Refreshing a service queue.</p> <p>Customizing service monitoring indicators.</p> <p>Restarting a service.</p> <p>Performing a rolling service restart</p> <p>Exporting service monitoring data.</p> <p>Importing service configuration data.</p> <p>Starting the health check of a service.</p> <p>Configuring a service.</p> <p>Uploading a configuration file.</p> <p>Downloading a configuration file.</p> <p>Synchronizing instance configurations.</p> <p>Commissioning an instance.</p> <p>Decommissioning an instance.</p> <p>Starting an instance.</p> <p>Stopping an instance.</p> <p>Customizing instance monitoring indicators.</p> <p>Restarting an instance.</p> <p>Performing a rolling restart of an instance.</p> <p>Exporting instance monitoring data.</p> <p>Importing instance configuration data.</p> <p>Creating an instance group.</p> <p>Modifying an instance group.</p> <p>Deleting an instance group.</p> <p>Moving an instance to another instance group.</p> <p>Making a service enter the maintenance mode.</p> <p>Making a service exit the maintenance mode.</p> <p>Changing the name of a service.</p> <p>Modifying service association.</p> <p>Downloading monitoring data.</p> <p>Masking alarms.</p> <p>Unmasking alarms.</p> <p>Exporting report data of a service.</p> <p>Adding custom parameters for a report.</p> <p>Modifying custom parameters of a report.</p> <p>Deleting custom parameters of a report.</p>

Operation Type	Operation
	Switching over control nodes. Adding a mount table. Modifying a mount table.
Host	Setting a node rack. Starting all roles. Stopping all roles. Isolating a host. Canceling isolation of a host. Customizing host monitoring indicators. Exporting host monitoring data. Making a host enter the maintenance mode. Making a host exit the maintenance mode. Exporting basic host information. Exporting host distribution report data. Exporting host trend report data. Exporting host cluster report data. Exporting report data of a service. Customizing host cluster monitoring indicators. Customizing host cluster trend monitoring indicators.
Alarm	Exporting alarms. Clearing alarms. Exporting events. Clearing alarms in batches.
Log collection	Collecting log files. Downloading log files. Collecting service stack information. Collecting instance stack information. Preparing service stack information. Preparing instance stack information. Clearing service stack information. Clearing instance stack information.
Audit log	Modifying audit dump configurations. Exporting audit logs.

Operation Type	Operation
Data backup and restoration	Creating a backup task. Executing a backup task. Executing backup tasks in batches. Stopping a backup task. Deleting a backup task. Modifying a backup task. Locking a backup task. Unlocking a backup task. Creating a restoration task. Executing a restoration task. Stopping a restoration task. Retrying a restoration task. Deleting a restoration task.

Operation Type	Operation
Multi-tenant	<p>Saving static configurations.</p> <p>Adding a tenant.</p> <p>Deleting a tenant.</p> <p>Associating a service with a tenant.</p> <p>Deleting a service from a tenant.</p> <p>Configuring resources.</p> <p>Creating a resource.</p> <p>Deleting a resource.</p> <p>Adding a resource pool.</p> <p>Modifying a resource pool.</p> <p>Deleting a resource pool.</p> <p>Restoring tenant data.</p> <p>Modifying global configurations of a tenant.</p> <p>Modifying queue configurations of a capacity scheduler.</p> <p>Modifying queue configurations of a super scheduler.</p> <p>Modifying resource distribution of a capacity scheduler.</p> <p>Clearing resource distribution of a capacity scheduler.</p> <p>Modifying resource distribution of a super scheduler.</p> <p>Clearing resource distribution of a super scheduler.</p> <p>Adding a resource catalog.</p> <p>Modifying a resource catalog.</p> <p>Deleting a resource catalog.</p> <p>Customizing tenant monitoring indicators.</p>

Operation Type	Operation
Health check	<ul style="list-style-type: none"> <li>Starting the health check of a cluster.</li> <li>Starting the health check of a service.</li> <li>Starting the health check of a host.</li> <li>Starting the health check of OMS.</li> <li>Starting system health check.</li> <li>Updating the health check configuration.</li> <li>Exporting health check reports.</li> <li>Exporting health check results of a cluster.</li> <li>Exporting health check results of a service.</li> <li>Exporting health check results of a host.</li> <li>Deleting historical health check reports.</li> <li>Exporting historical health check reports.</li> <li>Downloading a health check report.</li> </ul>

**Table 12-62** Component audit information

Audit Log	Operation Type	Operation
ClickHouse audit log	Maintenance management	<ul style="list-style-type: none"> <li>Granting permissions</li> <li>Revoking permissions</li> <li>Authentication and login information</li> </ul>
	Service operation	<ul style="list-style-type: none"> <li>Creating databases or tables</li> <li>Inserting, deleting, querying, and migrating data</li> </ul>
DBService audit log	Maintenance management	<ul style="list-style-type: none"> <li>Performing backup restoration operations.</li> </ul>
HBase audit logs	DDL (data definition) statement	<ul style="list-style-type: none"> <li>Creating a table.</li> <li>Deleting a table.</li> <li>Modifying a table.</li> <li>Adding a column family.</li> <li>Modifying a column family.</li> <li>Deleting a column family.</li> <li>Enabling a table.</li> <li>Disabling a table.</li> <li>Modifying user information.</li> <li>Changing a password.</li> <li>Logging in.</li> </ul>

Audit Log	Operation Type	Operation
	DML (data operation) statement	Putting data (to the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables). Deleting data (from the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables). Checking and importing data (for the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables). Checking and deleting data (the <b>hbase:meta</b> , <b>_ctmeta_</b> , and <b>hbase:acl</b> tables).
	Permission control	Assigning permissions users. Canceling user authorization.
HDFS audit logs	Rights management	File/Folder access permission. File/folder owner information.
	File operation	Creating a folder. Creating a file. Opening a file. Appending file content. Changing a file name. Deleting a file or folder. Setting time property of a file. Setting the number of file copies. Merging files. Checking the file system. File link.
Hive audit logs	Metadata operation	Defining metadata, such as creating databases and tables. Deleting metadata, such as deleting databases and tables. Modifying metadata, such as adding columns and renaming tables. Importing and exporting metadata.
	Data maintenance	Loading data to a table. Inserting data into a table.
	Rights management	Creating or deleting a role. Granting/Reclaiming roles. Granting/Reclaiming permissions.
Hue audit log	Service startup	Starting Hue.

Audit Log	Operation Type	Operation
	User operation	User login. User logout.
	Task operations	Creating a task. Modifying a task. Deleting a task. Submitting a task. Saving a task. Updating the status of a task.
KrbServer audit log	Maintenance management	Changing the password of a Kerberos account. Adding a Kerberos account. Deleting a Kerberos account. Authenticating users.
LdapServer audit log	Maintenance management	Adding an operating system user. Adding a user group. Adding a user to user group. Deleting a user. Deleting a group.
Loader audit logs	Security management	User login.
	Metadata management	Querying connector information. Querying a framework. Querying step information.
	Data source connection management	Querying a data source connection. Adding a data source connection. Updating a data source connection. Deleting a data source connection. Activating a data source connection. Disabling a data source connection.

Audit Log	Operation Type	Operation
	Job management	Querying a job. Creating a job. Updating a job. Deleting a job. Activating a job. Disabling a job. Querying all execution records of a job. Querying the latest execution record of a job. Submitting a job. Stopping a job.
MapReduce audit log	Application running	Starting a Container request. Stopping a Container request. After Container request is completed, the status of the request is displayed as succeeded. After Container request is completed, the status of the request is displayed as failed. After Container request is completed, the status of the request is displayed as suspended. Submitting a task. Ending a task.
Oozie audit log	Task management	Submitting a task. Starting a task. Killing a task. Suspending a task. Resuming a task. Running a task again.
Spark2x audit logs	Metadata operations	Defining metadata, such as creating databases and tables. Deleting metadata, such as deleting databases and tables. Modifying metadata, such as adding columns and renaming tables. Importing and exporting metadata.
	Data maintenance	Loading data to a table Inserting data into a table

Audit Log	Operation Type	Operation
Storm audit log	Nimbus	Submitting a topology. Stopping a topology. Reallocating a topology. Deactivating a topology. Activating a topology.
	UI	Stopping a topology. Reallocating a topology. Deactivating a topology. Activating a topology.
Yarn audit logs	Job submission	Submits a job to a queue.
ZooKeeper audit logs	Rights management	Setting access permission to Znode.
	Znode operation	Creating Znodes. Deleting Znodes. Configuring ZNODE dataZnode

FusionInsight Manager audit logs are stored in the database. You can view and export the audit logs on the **Audit** page.

The following table lists the directories to store component audit logs. Audit log files of some components are stored in **/var/log/Bigdata/audit**, such as HDFS, HBase, MapReduce, Hive, Hue, YARN, Redis, Storm, and ZooKeeper. The component audit logs are automatically compressed and backed up to **/var/log/Bigdata/audit/bk** at 03: 00 every day. A maximum of latest 90 compressed backup files are retained, and the backup time cannot be changed. Configure the number of reserved audit log files. For details, see [Configuring the Number of Local Backup Audit Log Files](#).

Audit log files of other components are stored in the component log directory.

**Table 12-63** Directory for storing component audit logs

Component	Audit Log Directory
DBService	/var/log/Bigdata/audit/dbservice/dbservice_audit.log

Component	Audit Log Directory
HBase	/var/log/Bigdata/audit/hbase/hm/hbase-audit-hmaster.log /var/log/Bigdata/audit/hbase/hm/hbase-ranger-audit-hmaster.log /var/log/Bigdata/audit/hbase/rs/hbase-audit-regionserver.log /var/log/Bigdata/audit/hbase/rs/hbase-ranger-audit-regionserver.log /var/log/Bigdata/audit/hbase/rt/hbase-audit-restserver.log /var/log/Bigdata/audit/hbase/ts/hbase-audit-thriftserver.log
HDFS	/var/log/Bigdata/audit/hdfs/nn/hdfs-audit-namenode.log /var/log/Bigdata/audit/hdfs/nn/ranger-plugin-audit.log /var/log/Bigdata/audit/hdfs/dn/hdfs-audit-datanode.log /var/log/Bigdata/audit/hdfs/jn/hdfs-audit-journalnode.log /var/log/Bigdata/audit/hdfs/zkfc/hdfs-audit-zkfc.log /var/log/Bigdata/audit/hdfs/httpfs/hdfs-audit-httpfs.log /var/log/Bigdata/audit/hdfs/router/hdfs-audit-router.log
Hive	/var/log/Bigdata/audit/hive/hiveserver/hive-audit.log /var/log/Bigdata/audit/hive/hiveserver/hive-rangeraudit.log /var/log/Bigdata/audit/hive/metastore/metastore-audit.log /var/log/Bigdata/audit/hive/webhcat/webhcat-audit.log
Hue	/var/log/Bigdata/audit/hue/hue-audits.log
Kafka	/var/log/Bigdata/audit/kafka/audit.log
Loader	/var/log/Bigdata/loader/audit/default.audit
Mapreduce	/var/log/Bigdata/audit/mapreduce/jobhistory/mapred-audit-jobhistory.log
Oozie	/var/log/Bigdata/audit/oozie/oozie-audit.log

## 12.10.2 Manager Log List

### Log Description

**Log path:** The default storage path of Manager log files is **/var/log/Bigdata/Manager component**.

- ControllerService: **/var/log/Bigdata/controller/** (operation & maintenance system (OMS) installation and run logs)
- Httpd: **/var/log/Bigdata/httpd** (httpd installation and run logs)
- logman: **/var/log/Bigdata/logman** (log packaging tool logs)
- NodeAgent: **/var/log/Bigdata/nodeagent** (NodeAgent installation and run logs)
- okerberos: **/var/log/Bigdata/okerberos** (okerberos installation and run logs)
- oldapserver: **/var/log/Bigdata/oldapserver** (oldapserver installation and run logs)
- MetricAgent: **/var/log/Bigdata/metric\_agent** (MetricAgent run log)
- omm: **/var/log/Bigdata/omm** (omm installation and run logs)
- timestamp: **/var/log/Bigdata/timestamp** (NodeAgent startup time logs)
- tomcat: **/var/log/Bigdata/tomcat** (Web process logs)
- watchdog: **/var/log/Bigdata/watchdog** (watchdog logs)
- Upgrade: **/var/log/Bigdata/upgrade** (OMS log upgrade)
- UpdateService: **/var/log/Bigdata/update-service** (upgrade service log)
- Sudo: **/var/log/Bigdata/sudo** (sudo script execution log)
- OS: **/var/log/message file** (OS system log)
- OS Performance: **/var/log/osperf** (OS performance statistics log)
- OS Statistics: **/var/log/osinfo/statistics** (OS parameter configuration log)

#### Log archive rule:

The automatic compression and archiving function is enabled for Manager logs. By default, when the size of a log file exceeds 10 MB, the log file is automatically compressed. The naming rule of a compressed log file is as follows: **<Original log name>-<yyyy-mm-dd\_hh-mm-ss>.[ID].log.zip** A maximum of 20 latest compressed files are retained.

**Table 12-64** Manager logs

Log Type	Log File Name	Description
Controller run log	controller.log	Log file that records component installation, upgrade, configuration, monitoring, alarms, and routine O&M operations
	controller_client.log	Run log file of the Representational State Transfer (REST) API
	acs.log	Acs run log file
	acs_spnego.log	spnego user logs in ACS
	aos.log	Aos run log file
	plugin.log	Aos plug-in logs
	backupplugin.log	Run log file that records the backup and restoration operations
	controller_config.log	Configuration run log file
	controller_nodesetup.log	Controller loading task log file
	controller_root.log	System log file of the Controller process
	controller_trace.log	Log file that records the remote procedure call (RPC) communication between Controller and NodeAgent
	controller_monitor.log	Monitoring logs
	controller_fsm.log	State machine log file
	controller_alarm.log	Controller alarm logs
	controller_backup.log	Controller backup and recovery logs
install.log, restore_package.log, installPack.log, distributeAdapterFiles.log, install_os_optimization.log	OMS installation log file	

Log Type	Log File Name	Description
	oms_ctl.log	OMS startup and stop logs
	preInstall_client.log	Preprocessing logs before client installation
	installntp.log	NTP installation log file
	modify_manager_param.log	Modifying Manager parameter logs
	backup.log	OMS backup script running log file
	supressionAlarm.log	Alarm script run log file
	om.log	OM certificate generation log file
	backupplugin_ctl.log	Startup logs of the backup and restoration plug-in process
	getLogs.log	Run logs of the collection log script
	backupAuditLogs.log	Audit log backup script run log
	certStatus.log	Log file that records regular certificate checks
	distribute.log	Certificate distribution log
	ficertgenenerate.log	Certificate replacement logs, including level-2 certificates, cas certificates, and httpd certificates
	genPwFile.log	Log file that records the generation of certificate password files
	modifyproxyconf.log	Log file for modifying the HTTPD proxy configuration
	importTar.log	Log file that records the process of importing certificates into the trust library.

Log Type	Log File Name	Description
Httpd	install.log	Httpd installation log file
	access_log, error_log	Httpd run log file
logman	logman.log	Log packaging tool log file
NodeAgent	install.log, install_os_optimization.log	NodeAgent installation log file
	installntp.log	NTP installation log file
	start_ntp.log	NTP startup log file
	ntpChecker.log	NTP check log file
	ntpMonitor.log	NTP monitoring log file
	heartbeat_trace.log	Log file that records heartbeats between NodeAgent and Controller
	alarm.log	Alarm log
	monitor.log	Monitoring log file
	nodeagent_ctl.log, start-agent.log	NodeAgent startup log file
	agent.log	NodeAgent run log file
	cert.log	Certificate log file
	agentplugin.log	Agent plug-in running status monitoring log file
	omaplugin.log	OMA plug-in run log file
	diskhealth.log	Disk health check log file
	supressionAlarm.log	Alarm script run log file
	updateHostFile.log	Host list update log file
	collectLog.log	Run log of the node log collection script
host_metric_collect.log	Host index collection run log	

Log Type	Log File Name	Description
	checkfileconfig.log	Run log file of file permission check
	entropycheck.log	Entropy check run log file
	timer.log	Log of scheduled node scheduling
	pluginmonitor.log	Component monitoring plug-in log
	agent_alarm_py.log	Log file that records alarms upon insufficient NodeAgent file permission
okerberos	addRealm.log, modifyKerberosRealm.log	Realm handover log file
	checkservice_detail.log	Okerberos health check log file
	genKeytab.log	keytab generation log file
	KerberosAdmin_genConfigDetail.log	Run log file of generating kadmin.conf when starting the kadmin process
	KerberosServer_genConfigDetail.log	Run log file of generating krb5kdc.conf when starting the krb5kdc process
	oms-kadmind.log	Run log file of the kadmin process
	oms_kerberos_install.log, postinstall_detail.log	Okerberos installation log file
	oms-krb5kdc.log	Run log file of the krbkdc process
	start_detail.log	Okerberos startup log file
	realmDataConfigProcess.log	Log file rollback for realm handover failure.
	stop_detail.log	Okerberos stop log file
oldapserver	ldapserver_backup.log	Oldapserver backup log file

Log Type	Log File Name	Description
	ldapservice_chk_service.log	Oldapservice health check log file
	ldapservice_install.log	Oldapservice installation log file
	ldapservice_start.log	Oldapservice startup log file
	ldapservice_status.log	Log file that records the status of the Oldapservice process
	ldapservice_stop.log	Oldapservice stop log file
	ldapservice_wrap.log	Oldapservice service management log file
	ldapservice_uninstall.log	Oldapservice uninstallation log file
	restart_service.log	Oldapservice restart log file
	ldapservice_unlockUser.log	Log file that records information about unlocking LDAP users and managing accounts
metric_agent	gc.log	MetricAgent JAVA VM gc log file
	metric_agent.log	Run log file of MetricAgent.
	metric_agent_qps.log	Log file that records MetricAgent Internal queue length and qps information
	metric_agent_root.log	All run logs of MetricAgent
	start.log	Log file that records information about the MetricAgent startup and stop
omm	omsconfig.log	OMS configuration log file
	check_oms_heartbeat.log	OMS heartbeat log file
	monitor.log	OMS monitoring log file

Log Type	Log File Name	Description
	ha_monitor.log	HA_Monitor operation log file
	ha.log	HA operation log file
	fms.log	Alarm log file
	fms_ha.log	HA alarm monitoring log file
	fms_script.log	Alarm control log file
	config.log	Alarm configuration log file
	iam.log	IAM log file
	iam_script.log	IAM control log file
	iam_ha.log	IAM HA monitoring log file
	config.log	IAM configuration log file
	operatelog.log	IAM operation log file
	heartbeatcheck_ha.log	OMS heartbeat HA monitoring log file
	install_oms.log	OMS installation log file
	pms_ha.log	HA monitoring log file
	pms_script.log	Monitoring control log file
	config.log	Monitoring configuration log file
	plugin.log	Monitoring plug-in run log file
	pms.log	Monitoring log file
	ha.log	HA run log file
	cep_ha.log	CEP HA monitoring log file
	cep_script.log	CEP control log file
	cep.log	CEP log file
	config.log	CEP configuration log file

Log Type	Log File Name	Description
	omm_gaussdba.log	GaussDB HA monitoring log file
	gaussdb-<SERIAL>.log	GaussDB run log file
	gs_ctl-<DATE>.log	GaussDB control log archive log file
	gs_ctl-current.log	GaussDB control log file
	gs_guc-current.log	GaussDB operation log file
	encrypt.log	Omm encryption log file
	omm_agent_ctl.log	OMA control log file
	oma_monitor.log	OMA monitoring log file
	install_oma.log	OMA installation log file
	config_oma.log	OMA configuration log file
	omm_agent.log	OMA run log file
	acs.log	ACS resource log file
	aos.log	AOS resource log file
	controller.log	Controller resource log file
	feed_watchdog.log	feed_watchdog resource log file
	floatip.log	Floating IP address resource log file
	ha_ntp.log	NTP resource log file
	httpd.log	Httpd resource log file
	okerberos.log	Okerberos resource log file
	oldap.log	OLdap resource log file
	tomcat.log	Tomcat resource log file
	send_alarm.log	Run log file of the HA alarm sending script of the management node
timestamp	restart_stamp	NodeAgent start time log file

Log Type	Log File Name	Description
tomcat	cas.log, localhost_access_cas_log.l og	CAS run log file
	catalina.log, catalina.out, host-manager.log, localhost.log, manager.log	Tomcat run log file
	localhost_access_web_log. log	Log file that records the access to REST APIs of FusionInsight Manager
	web.log	Run log file of the Web process
	northbound_ftp_sftp.log, snmp.log	Northbound logs
	perfStats.log	Performance statistics log file
watchdog	watchdog.log, feed_watchdog.log	watchdog run log file
update-service	omm_upd_server.log	UPDServer run log file
	omm_upd_agent.log	UPDAgent run log file
	update-manager.log	UPDManager run log file
	install.log	Installation logs during service upgrade
	uninstall.log	Uninstallation logs during service upgrade

Log Type	Log File Name	Description
	catalina.<Time>.log, catalina.out, host-manager.<Time>.log, localhost.<Time>.log, manager.<Time>.log, manager_access_log.<Time>.txt, web_service_access_log.<Time>.txt, catalina.log, gc-update-service.log.0.current, update-manager.controller, update-web-service.controller, update-web-service.log, commit_rm_distributed.log, commit_rm_upload_package.log, common_omagent_operator.log, forbid_monitor.log, initialize_package_atoms.log, initialize_unzip_pack.log, omm-upd.log, register_patch_pack.log, resume_monitor.logrollback_clear_patch.log, unregister_patch_pack.log, update-rcommupd.log, update-rcupdatemanager.log, update-service.log	Run logs during service upgrade
upgrade	upgrade.log_<Time>	OMS upgrade log file
	rollback.log_<Time>	OMS rollback log file
sudo	sudo.log	Sudo script execution log file

## Log Level

**Table 12-65** describes the log levels provided by Manager. The log levels are FATAL, ERROR, WARN, INFO, and DEBUG in descending order. Logs whose levels are higher than or equal to the set level are printed by programmer. The number of printed logs decreases as the set log level increases.

**Table 12-65** Log levels

Severity	Description
FATAL	Logs of this level record fatal error information about the current event processing that may result in a system crash.
ERROR	Logs of this level record error information about the current event processing, which indicates that system running is abnormal.
WARN	Logs of this level record abnormal information about the current event processing. These abnormalities will not result in system faults.
INFO	Logs of this level record normal running status information about the system and events.
DEBUG	Logs of this level record system information and system commissioning information.

## Log Format

The following table lists the Manager log formats.

**Table 12-66** Log format

Log Type	Component	Format	Example
Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	Controller, Httpd, logman, NodeAgent, okerberos, oldapserver, omm, tomcat, upgrade	<yyyy-MM-dd HH:mm:ss, SSS> <Log Level> <Name of the thread for which the log is generated> <Log message> <Location where the log event occurs>	2020-06-30 00:37:09,067 INFO [pool-1-thread-1] Completed Discovering Node. com.xxx.hadoop.omm.controller.tasks.nodesetup.DiscoverNodeTask.execute(DiscoverNodeTask.java:299)

## 12.10.3 Configuring the Log Level and Log File Size

### Scenarios

If you need to change the log level of logs, you can change the log level of FusionInsight Manager. For a specific service, you can change the log level and the log file size to prevent the failure in saving logs due to insufficient disk space.

## Impact on the System

The services need to be restarted for the new configuration to take effect. During the restart, the services are unavailable.

## Changing the FusionInsight Manager Log Level

1. Log in to the active management node as user **omm**.
2. Run the following command to switch to the required directory:  
**cd \${BIGDATA\_HOME}/om-server/om/sbin**
3. Run the following command to change the log level:

```
./setLogLevel.sh Log level parameters
```

The log level parameters are as follows and are listed in descending order by priority: FATAL, ERROR, WARN, INFO, and DEBUG. A program prints logs higher than or equal to a specified level. The higher the log level is, the fewer logs are printed.

- **DEFAULT**: After this parameter is set, the default log level is used.
- **FATAL**: severity of a critical error log. After this parameter is set, only logs of the FATAL level is recorded.
- **ERROR**: error log level. After this parameter is set, logs of the ERROR and FATAL levels are displayed.
- **WARN**: warning log level. After this parameter is set, logs of the WARN, ERROR, and FATAL levels are recorded.
- **INFO** (default): informational log level. After this parameter is set, logs of the INFO, WARN, ERROR, and FATAL levels are displayed.
- **DEBUG**: debugging log level. After this parameter is set, logs of the DEBUG, INFO, WARN, ERROR, and FATAL levels are displayed.
- **TRACE**: tracing log level. After this parameter is set, logs of the TRACE, DEBUG, INFO, WARN, ERROR, and FATAL levels are displayed.

### NOTE

The log levels of components are different as defined in open-source code.

4. Download and view logs to verify that the log level settings take effect. For details, see [Log](#).

## Changing the Service Log Level and Log File Size

### NOTE

The KrbServer, LdapServer, and DBService do not support the modification of the service log level and log file size.

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 3** Click a service in the service list. On the displayed page, switch to the **Configurations** tab page.
- Step 4** On the displayed page, click the **All Configurations** tab. Expand the role instance displayed on the left of the page. Click **Log** of the role to be modified.

- Step 5** Search for the parameter description and select the log level to be changed, or set the log file size in configuration page. The unit of the log file size is MB.

---

**NOTICE**

- The system automatically deletes logs based on the configured log size. To save more information, set the log file size a larger value. To ensure the integrity of log files, you are advised to manually back up the log files to another directory based on the actual service traffic before the log files are cleared according to clearance rules.
- Some services do not support the function of changing the log level on the GUI.

- 
- Step 6** Click **Save**. In the **Save Configuration** dialog box, click **OK**.

- Step 7** Download and view logs to verify that the log level settings take effect.

----End

## 12.10.4 Configuring the Number of Local Backup Audit Log Files

### Scenarios

Audit logs of cluster components are classified by name and stored in the `/var/log/Bigdata/audit` directory on each cluster node. The OMS automatically backs up the audit log directories at 03:00 every day.

The audit log directory on each node is compressed and named in the `<IP address of the node>.tar.gz` format. All compressed files are compressed and named in the `<yyyy-MM-dd_HH-mm-ss>.tar.gz` format and saved in the `/var/log/Bigdata/audit/bk/` directory on the active management node. In addition, the standby management node saves a copy of it.

By default, the maximum number of files that can be backed up by the OMS is 90. MRS cluster administrators can configure the maximum number.

### Procedure

- Step 1** Log in to the active management node as user **omm**.

 **NOTE**

Perform this operation only on the active management node. This operation is not supported on the standby management nodes; otherwise, the cluster cannot work properly.

- Step 2** Run the following command to switch to the required directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

- Step 3** Run the following command to change the maximum number of backup audit log files to be reserved:

```
./modifyLogConfig.sh -m Maximum number of backup files that can be reserved by OMS
```

The default value is 90. The value ranges from 0 to 365. The greater the value is, the larger disk space is occupied.

If the following information is displayed, the operation is successful:

```
Modify log config successfully
```

----End

## 12.10.5 Viewing Role Instance Logs

### Scenario

FusionInsight Manager allows you to view the logs of each role instance online,

### Procedure

- Step 1** Log in to FusionInsight Manager.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > *Service name* > **Instance** and click the name of the instance whose logs you want to view. The instance status page is displayed.
- Step 3** In the **Log** area, click the name of the log file to be viewed to preview the log content online.

#### NOTE

- On the **Hosts** page, click a host name. In the **Instance** area on the host details page, you can view the log files of all role instances on the host.
- By default, a maximum of 100 lines of a log can be displayed. You can click **Load More** to view more logs. Click **Download** to download the log file to the local PC. For details about how to download service logs in batches, see [Log Downloading](#).

**Figure 12-20** Viewing instance logs

## 12.11 Backup and Recovery Management

### 12.11.1 Introduction

#### Overview

FusionInsight Manager provides backup and restoration capabilities for user data and system data in a cluster. The backup function is provided by component. The system supports backup of Manager data, component metadata (DBService, HDFS NameNode, HBase, Kafka and Yarn), and service data (HBase, HDFS, Hive).

The backup function supports data backup to the local disk, local HDFS, remote HDFS, NAS (NFS/CIFS), SFTP server and OBS. For details, see section [Backing Up Data](#).

For components supporting multi-service, multiple instances of the same service can be backed up and restored. The backup and restoration operations are the same as those when there is one instance.

#### NOTE

MRS 3.1.0 and later versions support backing up data to OBS.

The backup and recovery tasks are performed in the following scenarios:

- Routine backup is performed to ensure the data security of the system and components.
- When the system is faulty, the data backup can be used to recover the system.
- When the active cluster is completely faulty, an image cluster same as the active cluster needs to be created, and backed up data can be used to perform restoration operations.

**Table 12-67** Backing up Manager configuration data based on service requirements

Backup Type	Backup Content	Backup Directory Type
OMS	Back up database data (excluding alarm data) and configuration data in the cluster management system by default.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• LocalHDFS</li> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• SFTP</li> <li>• OBS</li> </ul>

**Table 12-68** Backing up component metadata or other data based on service requirements

Backup Type	Backup Content	Backup Directory Type
DBService	Back up metadata of components (including Loader, Hive, Spark, Oozie, Hue) managed by DBService. After the multi-instance function is enabled, the metadata of multiple Hive and Spark service instances is backed up.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• LocalHDFS</li> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• SFTP</li> <li>• OBS</li> </ul>
Kafka	Kafka metadata.	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• LocalHDFS</li> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• OBS</li> </ul>

Backup Type	Backup Content	Backup Directory Type
NameNode	Back up HDFS metadata. For clusters enabled with multi-service, the backup and recovery function is supported for these NameServices and the backup and recovery operations are consistent with those of the default instance <b>hacluster</b> .	<ul style="list-style-type: none"> <li>• LocalDir</li> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• SFTP</li> <li>• OBS</li> </ul>
Yarn	Back up information about the Yarn service resource pool.	
HBase	<b>tableinfo</b> file and data files of HBase	

**Table 12-69** Backing up service data of specific components based on service requirements

Backup Type	Backup Content	Backup Directory Type
HBase	Back up table-level user data. For clusters enabled with multi-service, the multiple HBase service instances can be backed up and restored. The backup and restoration operations are the same as those for the HBase service instance.	<ul style="list-style-type: none"> <li>• RemoteHDFS</li> <li>• NFS</li> <li>• CIFS</li> <li>• SFTP</li> </ul>
HDFS	Back up the directories or files that correspond to user services. <b>NOTE</b> Encrypted directories cannot be backed up or restored.	
Hive	Back up table-level user data. For clusters enabled with multi-service, the multiple Hive service instances can be backed up and restored. The backup and restoration operations are the same as those for the Hive service instance.	

Note that some components do not provide the data backup and restoration functions:

- Kafka supports copies and allows multiple copies to be specified when a topic is created.
- Mapreduce and Yarn data is stored in the HDFS. Therefore, MapReduce and Yarn depend on the HDFS to provide the backup and restoration functions.
- Backup and restoration of service data in ZooKeeper are performed by their own upper-layer components.

## Principles

### Task

Before backup or recovery, you need to create a backup or recovery task and set task parameters, such as the task name, backup data source, and type of backup file save path. Data backup and recovery can be performed by executing backup and recovery tasks. When the Manager is used to recover the data of HDFS, HBase, Hive, and NameNode, the cluster cannot be accessed.

Each backup task can back up data of different data sources and generates an independent backup file for each data source. All the backup files generated in each backup task form a backup file set, which can be used in recovery tasks. Backup data can be stored on Linux local disks, local cluster HDFS, and standby cluster HDFS. The backup task provides the full backup or incremental backup policies. HBase, HDFS, and Hive backup tasks support the incremental backup policy, while OMS, DBService, and NameNode backup task supports only the full backup policy.

### NOTE

Task execution rules:

- If a task is being executed, the task cannot be executed repeatedly and other tasks cannot be started too.
- The interval at which a periodical task is automatically executed must be greater than 120s; otherwise, the task is postponed and executed in the next period. Manual tasks can be executed at any interval.
- When a period task is to be automatically executed, the current time cannot be 120s later than the task start time; otherwise, the task is postponed and executed in the next period.
- When a periodical task is locked, it cannot be automatically executed and needs to be manually unlocked.
- Before an OMS, LdapServer, Kafka or NameNode backup task starts, ensure that the **LocalBackup** partition on the active management node has more than 20 GB available space; otherwise, the backup task cannot be started.

When planning backup and recovery tasks, select the data to be backed up or recovered strictly based on the service logic, data store structure, and database or table association. By default, the system creates the periodic backup tasks **default-oms** and **default-cluster ID** at an interval of one hour, to fully back up OMS and metadata of DBService and NameNode to the local disk.

### Snapshot

The system adopts snapshot technology to quickly back up data. Snapshots include HBase snapshots HDFS snapshots.

- HBase snapshot

An HBase snapshot is a backup file of HBase tables at a specified time point. This backup file does not copy service data or affect the RegionServer. The HBase snapshot copies table metadata, including table descriptor, region info, and HFile reference information. The metadata can be used to recover data before the snapshot creation time.

- HDFS snapshot

An HDFS snapshot is a read-only backup copy of the HDFS file system at a specified time point. The snapshot is used in data backup, misoperation protection, and disaster recovery scenarios.

The snapshot function can be enabled for any HDFS directory to create the related snapshot file. Before creating a snapshot for a directory, the system automatically enables the snapshot function for the directory. Creating a snapshot does not affect any HDFS operation. A maximum of 65536 snapshots can be created for each HDFS directory.

When a snapshot is being created for an HDFS directory, the directory cannot be deleted or modified before the snapshot is created. Snapshots cannot be created for the upper-layer directories or subdirectories of the directory.

### **DistCp**

Distributed copy (DistCp) is a tool used to perform large-amount data replication in the cluster HDFS or between the HDFSs of different clusters. In an HBase, HDFS or Hive metadata backup or recovery task, if the data is backed up in the HDFS of the standby cluster, the system invokes DistCp to perform the operation. Install the MRS system of the same version on the active and standby clusters.

DistCp uses Mapreduce to implement data distribution, troubleshooting, recovery, and report. DistCp specifies different Map jobs for various source files and directories in the specified list. Each Map job copies the data in the partition that corresponds to the specified file in the list.

To use DistCp to perform data replication between the HDFS of two clusters, configure the trust relationship and cross-cluster replication function for both clusters (The mutual trust relationship does not need to be configured for clusters managed by the same FusionInsight Manager.). When backing up the cluster data to HDFS in another cluster, you need to install the Yarn component. Otherwise, the backup fails.

### **Local rapid recovery**

After using DistCp to back up the HBase, HDFS, and Hive data of the local cluster in the HDFS of the standby cluster, the HDFS of the local cluster retains the backup data snapshots. Users can create local rapid recovery tasks to recovery day by using the snapshot files in the HDFS of the local cluster.

### **NAS**

Network Attached Storage (NAS) is a dedicated data storage server which includes the storage device and embedded system software. It provides the cross-platform file sharing function. By using NFS (supporting NFSv3 and NFSv4) and CIFS (supporting SMBv2 and SMBv3) protocols, users can connect the FusionInsight service plane with the NAS server to back up or restore data to or from the NAS.

 NOTE

- Before data is backed up to the NAS, the system automatically mounts the NAS shared address to a local partition. After the backup is complete, the system uninstalls the NAS shared partition.
- To prevent backup and restoration failures, do not access the shared address where the NAS server mounts to the local host during data backup and restoration, for example, `/srv/BigData/LocalBackup/nas`.
- When service data is backed up to the NAS, DistCp is used.

## Specifications

**Table 12-70** Backup and recovery feature specifications

Item	Parameter
Maximum number of backup or recovery tasks in a cluster	100
Number of concurrent running tasks	1
Maximum number of waiting tasks	199
Maximum size of backup files on a Linux local disk (GB)	600

 NOTE

If service data is stored in the ZooKeeper upper-layer components, ensure that the number of znodes in a single backup or restoration task is not too large. Otherwise, the task will fail, and the ZooKeeper service performance will be affected. To check the number of znodes in a single backup or restoration task, perform as follows:

- Ensure that the number of znodes in a single backup or restoration task is less than the upper limit of OS file handles.
  1. To check the upper limit at the system level, run the `cat /proc/sys/fs/file-max` command.
  2. To check the upper limit at the user level, run the `ulimit -n` command.
- If the number of znodes in the parent directory exceeds the upper limit, back up and restore data in its sub-directories in batches. To check the number of znodes using ZooKeeper client scripts, perform as follows:
  1. On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Zookeeper** > **Instance** and view the management IP address of each ZooKeeper role.
  2. Log in to the node where the client resides and run the following command:  
`zkCli.sh -server ip:port`, where, the IP address can be any management IP address, and the default port number is 2181.
  3. If the following information is displayed, login to the ZooKeeper server succeeds:  

```
WatchedEvent state:SyncConnected type:None path:null
[zk: ip:port(CONNECTED) 0]
```
  4. Run the `getusage` command to check the number of znodes in the directory to be backed up. For example:  
`getusage /hbase/region`. In the command output, **Node count** indicates the number of znodes stored in the **region** directory.

**Table 12-71** Specifications of the **default** task

Item	OMS	HBase	Kafka	DBService	NameNode
Backup period	1 hour				
Maximum number of copies	168 (Historical records of seven days)				24 (Historical records of one day)
Maximum size of a backup file	10 MB	10 MB	512MB	100 MB	20 GB
Maximum size of disk space used	1.64 GB	1.64 GB	84GB	16.41 GB	480 GB
Save path of backup data	<i>Data path</i> / <b>LocalBackup/</b> on active and standby management nodes				

 NOTE

- The administrator must regularly transfer the backup data of the default task to an external cluster based on the enterprise's O&M requirements.
- The administrator can create a DistCp backup task to store data of OMS, DBService, and NameNode to an external cluster.
- The running duration of a cluster data backup task can be calculated based on the volume of data to be backed up divided by the network bandwidth between the cluster and backup device. In actual scenarios, you are advised to multiply the calculated duration by 1.5 as a reference value.
- Performing a data backup task affects the maximum I/O performance of the cluster. Therefore, it is recommended that the backup task run time be staggered from the cluster peak hours.

## 12.11.2 Enabling Cross-Cluster Replication

### Scenario

DistCp is used to replicate the data stored in HDFS from a cluster to another cluster. DistCp depends on the cross-cluster replication function, which is disabled by default. You need to enable it for both clusters.

This section describes how to modify parameters on FusionInsight Manager to enable the cross-cluster replication function.

### Impact on the System

Yarn needs to be restarted to enable the cross-cluster replication function and cannot be accessed during restart.

### Prerequisites

- The **hadoop.rpc.protection** parameter of HDFS in the two clusters for data replication must use the same data transmission mode. The default value is **privacy**, indicating encrypted transmission. The value **authentication** indicates that transmission is not encrypted.
- For clusters in security mode, you need to configure mutual trust between clusters.

### Procedure

**Step 1** Log in to FusionInsight Manager of one of the two clusters.

**Step 2** Choose **Cluster > *Name of the desired cluster* > Services > Yarn > Configurations**, and click **All Configurations**.

**Step 3** In the navigation pane, choose **Yarn > Distcp**.

**Step 4** Modify **dfs.namenode.rpc-address**, set **haclusterX.remotenn1** to the service IP address and RPC port of one NameNode instance of the peer cluster, and set **haclusterX.remotenn2** to the service IP address and RPC port number of the other NameNode instance of the peer cluster.

**haclusterX.remotenn1** and **haclusterX.remotenn2** do not distinguish active and standby NameNodes. The default NameNode RPC port is 8020 and cannot be modified on Manager.

Examples of modified parameter values: **10.1.1.1:8020** and **10.1.1.2:8020**.

 **NOTE**

- If data of the current cluster needs to be backed up to the HDFS of multiple clusters, you can configure the corresponding NameNode RPC addresses to haclusterX1, haclusterX2, haclusterX3, and haclusterX4.

**Step 5** Click **Save**. In the confirmation dialog box, click **OK**.

**Step 6** Restart the Yarn service.

**Step 7** Log in to FusionInsight Manager of the other cluster and repeat **Step 2** to **Step 6**.

----End

## 12.11.3 Backing Up Data

### 12.11.3.1 Backing Up Manager Data

#### Scenario

To ensure FusionInsight Manager data security routinely or before and after a critical operation (such as capacity expansion and reduction) on Manager, Manager data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up Manager data. Both automatic backup tasks and manual backup tasks are supported.

#### Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether *Data path/LocalBackup/* has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.

- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Set **Backup Object** to **OMS**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-72** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.
<b>Period</b>	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .
<b>Backup Policy</b>	<ul style="list-style-type: none"> <li>• <b>Full backup at the first time and incremental backup subsequently</b></li> <li>• <b>Full backup every time</b></li> <li>• <b>Full backup once every n time</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>• If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

**Step 6** Set **Configuration** to **OMS**.

**Step 7** Set **Path Type** of **OMS** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file.

The default save path is *Cluster data path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this value, you need to set **Maximum Number of Backup Copies** to specify the number of backup files that can be retained in the backup directory.

- **LocalHDFS:** indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this value, you need to set the following parameters:

- **Target Path:** indicates the backup file save path in the HDFS. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **Cluster for Backup:** Enter the cluster name mapping to the backup directory.
- **Target NameService Name:** indicates the NameService name that corresponds to the backup directory. The default value is **hacluster**.
- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **Source Cluster:** Select the cluster of the Yarn queue used by the backup data from **Source Cluster**.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.  
If you select NFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.

- **Server Shared Path:** indicates the configured shared directory on the NAS server.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select CIFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Server Shared Path:** indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select SFTP, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Server Shared Path:** Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **OBS:** indicates that the backup files are stored in the OBS. If you select this value, you need to set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.

 **NOTE**

MRS 3.1.0 and later versions support backing up data to OBS.

**Step 8** Click **OK** to save the settings.

**Step 9** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory.

The format of the subdirectory name is *backup task name\_task creation time*, and the subdirectory is used to save data source backup files.

The format of the backup file name is *version\_data source\_task execution time.tar.gz*.

----End

### 12.11.3.2 Backing Up DBService Data

#### Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on DBService, DBService data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up DBService data. Both automatic backup tasks and manual backup tasks are supported.

#### Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether *Data path/LocalBackup/* has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

#### Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-73** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.
<b>Period</b>	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .
<b>Backup Policy</b>	<ul style="list-style-type: none"> <li>• <b>Full backup at the first time and incremental backup subsequently</b></li> <li>• <b>Full backup every time</b></li> <li>• <b>Full backup once every n time</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>• If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

**Step 6** Set **Configuration** to **DBService**.

 **NOTE**

If there are multiple DBServices, all DBServices are backed up by default. You can click **Assign Service** to specify the DBService to be backed up.

**Step 7** Set **Path Type** of **DBService** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file.

The default save path is *Cluster data path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this value, you need to set **Maximum Number of Backup Copies** to specify the number of backup files that can be retained in the backup directory.

- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this value, you need to set the following parameters:

- **Target Path:** indicates the backup file save path in the HDFS. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **Target NameService name:** indicates the NameService name that corresponds to the backup directory. The default value is **hacluster**.
- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Destination NameService Name:** indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.

If you select NFS, set the following parameters:

- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** indicates the NAS server IP address.
- **Server Shared Path:** indicates the configured shared directory on the NAS server.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.

If you select CIFS, set the following parameters:

- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Server IP Address:** indicates the NAS server IP address.
- **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
- **Username:** indicates the user name that is configured when setting the CIFS protocol.
- **Password:** indicates the password that is configured when setting the CIFS protocol.
- **Server Shared Path:** indicates the configured shared directory on the NAS server.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.  
If you select SFTP, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Server Shared Path:** Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **OBS:** indicates that the backup files are stored in the OBS.  
If you select this value, you need to set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.

 **NOTE**

MRS 3.1.0 and later versions support backing up data to OBS.

**Step 8** Click **OK** to save the settings.

**Step 9** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version\_data source\_task execution time.tar.gz*.

----End

### 12.11.3.3 Backing Up HBase Metadata

#### Scenario

To avoid that the HBase service becomes unavailable when the HBase system table directory and files are corrupted or after a MRS cluster administrator performs a critical operation (such as upgrade and migration) on HBase, HBase metadata (tableinfo and HFile) needs to be backed up to ensure security. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up HBase metadata. Both automatic backup tasks and manual backup tasks are supported.

#### Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- The `fs.defaultFS` parameter of HBase must be the same as that of Yarn and HDFS.
- If HBase data is stored in the local HDFS, HBase metadata can be backed up to OBS. If HBase data is stored on OBS, data backup is not supported.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

#### Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** Click **Create**.
- Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-74** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.
<b>Period</b>	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .
<b>Backup Policy</b>	<ul style="list-style-type: none"> <li>• <b>Full backup at the first time and incremental backup subsequently</b></li> <li>• <b>Full backup every time</b></li> <li>• <b>Full backup once every n time</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>• If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

**Step 6** In **Configuration**, select **HBase** under **Metadata and other data**.

 **NOTE**

If there are multiple HBase services, all HBase services are backed up by default. You can click **Assign Service** to specify the HBase to be backed up.

**Step 7** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file.  
The default save path is *Cluster data path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.  
If you select this value, you need to set **Maximum Number of Backup Copies** to specify the number of backup files that can be retained in the backup directory.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**,

- haclusterX1, haclusterX2, haclusterX3, or haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol. If you select NFS, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the NAS server IP address.
    - **Server Shared Path:** indicates the configured shared directory on the NAS server.
    - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select CIFS, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the NAS server IP address.
    - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
    - **Username:** indicates the user name that is configured when setting the CIFS protocol.
    - **Password:** indicates the password that is configured when setting the CIFS protocol.
    - **Server Shared Path:** indicates the configured shared directory on the NAS server.
    - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select SFTP, set the following parameters:

- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP Address:** Enter the IP address of the server where the backup data is stored.
- **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
- **Username:** Enter the username for connecting to the server using SFTP.
- **Password:** Enter the password for connecting to the server using SFTP.
- **Server Shared Path:** Enter the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **OBS:** indicates that the backup files are stored in the OBS.  
If you select this value, you need to set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.

 **NOTE**

MRS 3.1.0 and later versions support backing up data to OBS.

**Step 8** Click **OK** to save the settings.

**Step 9** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version\_data source\_task execution time.tar.gz*.

----End

### 12.11.3.4 Backing Up HBase Service Data

#### Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on HBase, HBase data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up HBase data. Both automatic backup tasks and manual backup tasks are supported.

The following scenarios may occur when HBase backs up data:

- When a user creates an HBase table, **KEEP\_DELETED\_CELLS** is set to **false** by default. When the user backs up this HBase table, deleted data will be backed

up and junk data may exist after data restoration. Based on service requirements, this parameter needs to be set to **true** manually when an HBase table is created.

- When a user manually specifies the time stamp when writing data into an HBase table and the specified time is earlier than the last backup time of the HBase table, new data may not be backed up in incremental backup tasks.
- The HBase backup function does not support backing up the access control lists (ACLs) of read, write, create, execute, and MRS cluster administrative operations on HBase globals or namespaces. After the HBase data is restored, the administrator needs to set new permission for roles on FusionInsight Manager.
- Assume that an HBase backup task has been created and the current backup data in the standby cluster is lost. The next incremental task will fail and a new HBase backup task needs to be created. The next full backup task will be normal.

## Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- Check whether HDFS of the standby cluster has sufficient space. It is recommended the directory for storing backup files be a user-defined directory.
- On the HDFS client, run `hdfs lsSnapshottableDir` as user `hdfs` to check the list of directories for which HDFS snapshots have been created in the current cluster. Ensure that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- The `fs.defaultFS` parameter of HBase must be the same as that of Yarn and HDFS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-75** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.
<b>Period</b>	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .
<b>Backup Policy</b>	<ul style="list-style-type: none"> <li>• <b>Full backup at the first time and incremental backup subsequently</b></li> <li>• <b>Full backup every time</b></li> <li>• <b>Full backup once every n time</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>• If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

**Step 6** In **Configuration**, select **HBase > HBase** under **Service Data**.

**Step 7** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.

- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.  
If you select NFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory on the NAS server.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.  
If you select CIFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** indicates the user name that is configured when setting the CIFS protocol.

- **Password:** indicates the password that is configured when setting the CIFS protocol.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **Server Shared Path:** indicates the configured shared directory on the NAS server.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.  
If you select SFTP, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Server Shared Path:** Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **10**.

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple HBase tables to be backed up.

The following methods are supported to select backup data:

- Select directly  
Click the name of a naming space in the navigation tree to show all the tables in the naming space, and select specified tables.
- Select using regular expressions
  - Click **Query Regular Expression**.

- Enter the naming space where the HBase tables are located in the first text box as prompted. The naming space must be the same as the existing naming space, for example, **default**.
- Enter a regular expression in the second text box. Standard regular expressions are supported. For example, if all tables in the database need to be filtered, enter **([\s\S]\*?)**. If tables of which the names consisting of letters and digits, such as **tb1**, need to be filtered, enter **tb\d\***.
- Click **Refresh** to view the selected tables in **Directory Name**.
- Click **Synchronize** to save the result.

 **NOTE**

- When entering regular expressions, you can click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of check failure are as follows:

- Target NameNode IP address is incorrect.
- The queue name is incorrect.
- The HDFS parent directory or subdirectory where HBase table data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.

**Step 11** Click **OK** to save the settings.

**Step 12** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_data source\_task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are saved to the related snapshot directories.

----End

### 12.11.3.5 Backing Up NameNode Data

#### Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on NameNode, NameNode data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up NameNode data. Both automatic backup tasks and manual backup tasks are supported.

## Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether *Data path/LocalBackup/* has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-76** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.
<b>Period</b>	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .

Parameter Name	Description
<b>Backup Policy</b>	<p>Only <b>Full backup every time</b> is supported.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

**Step 6** Set **Configuration** to **NameNode**.

**Step 7** Set **Path Type** of **NameNode** to a backup directory type.

The following backup directory types are supported:

- LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file. The default save path is *Data path/LocalBackup/*.

If you select this value, you need to set the following parameters:

  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name**: indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

- **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol. If you select NFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.
  - **Server Shared Path:** indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select CIFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Server Shared Path:** indicates the configured shared directory on the NAS server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select SFTP, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.

- **Username:** Enter the username for connecting to the server using SFTP.
- **Password:** Enter the password for connecting to the server using SFTP.
- **Server Shared Path:** Enter the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **OBS:** indicates that the backup files are stored in the OBS.  
If you select this value, you need to set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

 **NOTE**

MRS 3.1.0 and later versions support backing up data to OBS.

**Step 8** Click **OK** to save the settings.

**Step 9** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version\_data source\_task execution time.tar.gz*.

----End

### 12.11.3.6 Backing Up HDFS Service Data

#### Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on HDFS, HDFS data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up HDFS data. Both automatic backup tasks and manual backup tasks are supported.

 **NOTE**

Encrypted directories cannot be backed up or restored.

## Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- Check whether HDFS of the standby cluster has sufficient space. It is recommended the directory for storing backup files be a user-defined directory.
- On the HDFS client, run `hdfs lsSnapshottableDir` as user `hdfs` to check the list of directories for which HDFS snapshots have been created in the current cluster. Ensure that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-77** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.

Parameter Name	Description
Period	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .
Backup Policy	<ul style="list-style-type: none"> <li>• <b>Full backup at the first time and incremental backup subsequently</b></li> <li>• <b>Full backup every time</b></li> <li>• <b>Full backup once every n time</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>• If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

**Step 6** Set **Configuration** to **HDFS**.

**Step 7** Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
- **Queue Name**: indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.

- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.  
If you select NFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory on the NAS server.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.  
If you select CIFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory on the NAS server.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.

- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**
- **SFTP:** Indicates that backup files are stored in the server using SFTP.  
If you select SFTP, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Server Shared Path:** Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple HDFS directories to be backed up based on service requirements.

The following methods are supported to select backup data:

- Select directly  
Click the name of a directory in the navigation tree to show all the subdirectories in the directory, and select specified directories.
- Select using regular expressions
  - Click **Query Regular Expression**.
  - Enter the parent directory full path of the directory in the first text box as prompted. The directory must be the same as the existing directory, for example, **/tmp**.
  - Enter a regular expression in the second text box. Standard regular expressions are supported. For example, if all files or subdirectories in the parent directory need to be filtered, enter **([s\S]\*?)**. If files of which the names consisting of letters and digits, such as **file 1**, need to be filtered, enter **file\d\***.

- Click **Refresh** to view the selected tables in **Directory Name**.
- Click **Synchronize** to save the result.

**NOTE**

- When entering regular expressions, you can click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.
- The backup directory cannot contain files that have been written for a long time. Otherwise, the backup task will fail. Therefore, you are advised not to perform operations on the top-level directory, such as **/user**, **/tmp**, and **/mr-history**.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of check failure are as follows:

- Target NameNode IP address is incorrect.
- The queue name is incorrect.
- The HDFS parent directory or subdirectory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.
- The name of the NameService is incorrect.

**Step 11** Click **OK** to save the settings.

**Step 12** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_data source\_task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are saved to the related snapshot directories.

----End

### 12.11.3.7 Backing Up Hive Service Data

#### Scenario

To ensure system data security routinely or before and after a critical operation (such as upgrade and migration) on Hive, Hive data needs to be backed up. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up Hive data. Both automatic backup tasks and manual backup tasks are supported.

- The Hive backup and recovery function cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and recovery tasks, the user needs to manage a unified recovery point based on the service scenario to ensure proper service running.

- The Hive backup and recovery function does not support Hive on RDB data tables. The original data tables need to be backed up and recovered in the external database independently.
- Assume that a Hive backup task has been created and includes Hive on HBase tables, and the current backup data in the standby cluster is lost. The next incremental task will fail and a new Hive backup task needs to be created. The next full backup task will be normal.

## Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- Check whether HDFS of the standby cluster has sufficient space. It is recommended the directory for storing backup files be a user-defined directory.
- On the HDFS client, run `hdfs lsSnapshottableDir` as user `hdfs` to check the list of directories for which HDFS snapshots have been created in the current cluster. Ensure that the HDFS parent directory or subdirectory where data files to be backed up are stored does not have HDFS snapshots. Otherwise, the backup task cannot be created.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-78** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.
<b>Period</b>	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .
<b>Backup Policy</b>	<ul style="list-style-type: none"> <li>● <b>Full backup at the first time and incremental backup subsequently</b></li> <li>● <b>Full backup every time</b></li> <li>● <b>Full backup once every n time</b></li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>● Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>● If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

**Step 6** Set **Configuration** to **Hive > Hive**.

**Step 7** Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Target NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Target Path**: indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as **snapshot** or **recycle bin** directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
- **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.

- **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol. If you select NFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Server shared Path:** indicates the configured shared directory on the NAS server.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
  - **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select CIFS, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Server Shared Path:** indicates the configured shared directory on the NAS server.

- **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select SFTP, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP Address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Server Shared Path:** Enter the backup path on the SFTP server.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **NameService Name:** indicates the NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**

**Step 8** Set **Maximum Number of Recovery Points** to the number of snapshots that can be retained in the cluster.

**Step 9** Set **Backup Content** to one or multiple Hive tables to be backed up.

The following methods are supported to select backup data:

- Select directly
  - Click the name of a database in the navigation tree to show all the tables in the database, and select specified tables.
- Select using regular expressions
  - Click **Query Regular Expression**.
  - Enter the database where the Hive tables are located in the first text box as prompted. The database must be the same as the existing database, for example, **default**.

- Enter a regular expression in the second text box. Standard regular expressions are supported. For example, if all tables in the database need to be filtered, enter `([\s\S]*?)`. If tables of which the names consisting of letters and digits, such as `tb 7`, need to be filtered, enter `tb\d*`.
- Click **Refresh** to view the selected tables in **Directory Name**.
- Click **Synchronize** to save the result.

**NOTE**

- When entering regular expressions, you can click **+** or **-** to add or delete an expression.
- If the selected table or directory is incorrect, click **Clear Selected Node** to deselect it.

**Step 10** Click **Verify** to check whether the backup task is configured correctly.

The possible causes of check failure are as follows:

- Target NameNode IP address is incorrect.
- The queue name is incorrect.
- The HDFS parent directory or subdirectory where data files to be backed up are stored has HDFS snapshots.
- The directory or table to be backed up does not exist.

**Step 11** Click **OK** to save the settings.

**Step 12** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_data source\_task creation time*, and the subdirectory is used to save latest data source backup files. All the backup file sets are saved to the related snapshot directories.

----End

### 12.11.3.8 Backing Up Kafka Metadata

#### Scenario

To ensure Kafka metadata security or before and after a critical operation (such as upgrade and migration) on ZooKeeper, Kafka metadata needs to be backed up. The backup data can be used to recover the system in time if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a backup task in FusionInsight Manager to back up Kafka metadata. Both automatic backup tasks and manual backup tasks are supported.

#### Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.

- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Based on the service requirements, plan the backup type, period, policy, and other specifications, and check whether *Data path*/LocalBackup/ has sufficient space on active and standby management nodes.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Mode** to the type of the backup task.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Table 12-79** Periodic backup parameters

Parameter Name	Description
<b>Started</b>	Indicates the time when the task is started for the first time.
<b>Period</b>	Indicates task execution interval. The options include <b>Hours</b> and <b>Days</b> .

Parameter Name	Description
Backup Policy	<ul style="list-style-type: none"> <li>• Full backup at the first time and incremental backup subsequently</li> <li>• Full backup every time</li> <li>• Full backup once every n time</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• Incremental backup is not supported when Manager data and component metadata are backed up. Only <b>Full backup every time</b> is supported.</li> <li>• If <b>Mode</b> is set to <b>Periodic</b> and the <b>Path Type</b> is set to <b>NFS</b> or <b>CIFS</b>, the incremental backup function cannot be used. If incremental backup is used in this scenario, data in full backup will be updated in each incremental backup, and no recovery point will be generated.</li> </ul>

### Step 6 Set Configuration to Kafka.

 **NOTE**

If there are multiple Kafka services, all Kafka services are backed up by default. You can click **Assign Service** to specify the Kafka to be backed up.

### Step 7 Set Path Type of Kafka to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file. The default save path is *Data path/LocalBackup/*.  
If you select this value, you need to set **Maximum number of backup copies** to specify the number of backup files that can be retained in the backup directory.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select this value, you need to set the following parameters:
  - **Target path**: indicates the backup file save path in the HDFS. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies**: indicates the number of backup files that can be retained in the backup directory.
  - **Target NameService Name**: indicates the NameService name that corresponds to the backup directory. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.  
If you select this value, you need to set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**,

- haclusterX1, haclusterX2, haclusterX3, or haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target path:** indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory, such as **/hbase** or **/user/hbase/backup**.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol. If you select NFS, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the NAS server IP address.
    - **Server Shared Path:** indicates the configured shared directory on the NAS server.
    - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select CIFS, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the NAS server IP address.
    - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
    - **Username:** indicates the user name that is configured when setting the CIFS protocol.
    - **Password:** indicates the password that is configured when setting the CIFS protocol.
    - **Server Shared Path:** indicates the configured shared directory on the NAS server.
    - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **OBS:** indicates that the backup files are stored in the OBS. If you select this value, you need to set the following parameters:

- **Target Path:** indicates the OBS directory for storing backup data.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.

 **NOTE**

MRS 3.1.0 and later versions support backing up data to OBS.

**Step 8** Click **OK** to save the settings.

**Step 9** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version\_data source\_task execution time.tar.gz*.

----End

### 12.11.3.9 Backing Up Yarn Resource Pool Data

#### Scenario

To ensure the data security of the Yarn resource pool, the MRS cluster administrator can back up Yarn-related data so that the system can be restored in a timely manner when an exception occurs or the expected result is not achieved, minimizing the impact on services.

On FusionInsight Manager, the MRS cluster administrator can create Yarn backup tasks and back up data. Automatic or manual data backup tasks can be created.

Resource pool information is also stored in DBService. Therefore, you need to manually trigger a DBService backup before backing up Yarn data. If only Yarn data is backed up, the Yarn data stored in ZooKeeper is inconsistent with that stored in DBService.

#### Prerequisites

- If you want to back up data to the remote HDFS. A standby cluster for backing up data has been created. The mode of the standby cluster is the same as that of the active cluster. In other backup modes, you do not need to prepare the standby cluster.
- If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.

- Based on the service requirements, plan backup policies, such as the backup task type, period, backup object, and YARN queue that required by the backup task.
- If you want to back up data to the NAS, you need to deploy the NAS server in advance.
- If you want to back up data to the OBS, ensure that the current cluster is connected to OBS and you have the permission to access OBS.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** Click **Create**.

**Step 3** Set **Name** to the name of the backup task.

**Step 4** Select the cluster to be operated from **Backup Object**.

**Step 5** Set **Manual** for **Mode**.

**Periodic** indicates that the backup task is periodically executed and **Manual** indicates that the backup task is manually executed.

**Step 6** In **Configuration**, select **Yarn** and **DBService** under **Metadata and other data**.

### NOTE

- Resource pool information is also stored in DBService. Therefore, you need to manually trigger a DBService backup before backing up Yarn data. If only Yarn data is backed up, the Yarn data stored in ZooKeeper is inconsistent with that stored in DBService.
- If there are multiple Yarn services, all Yarn services are backed up by default. You can click **Assign Service** to specify the HBase to be backed up.

**Step 7** Set **Path Type** of **DBService** to a backup directory type. For details, see [Backing Up DBService Data](#).

**Step 8** Set **Path Type** of **Yarn** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node and the standby management node automatically synchronizes the backup file.

The default save path is *Cluster data path/LocalBackup/*, for example, */srv/BigData/LocalBackup*.

If you select this value, you need to set **Maximum Number of Backup Copies** to specify the number of backup files that can be retained in the backup directory.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Destination NameService Name**: indicates the NameService name of the standby cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in

- remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Target NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Target Path:** indicates the HDFS directory for storing standby cluster backup data. The save path cannot be an HDFS hidden directory, such as snapshot or recycle bin directory, or a default system directory.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the source cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol. If you select NFS, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the NAS server IP address.
    - **Server Shared Path:** indicates the configured shared directory on the NAS server.
    - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select CIFS, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP Address:** indicates the NAS server IP address.
    - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
    - **Username:** indicates the user name that is configured when setting the CIFS protocol.
    - **Password:** indicates the password that is configured when setting the CIFS protocol.
    - **Server Shared Path:** indicates the configured shared directory on the NAS server.
    - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
  - **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select SFTP, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Server IP Address:** Enter the IP address of the server where the backup data is stored.
- **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
- **Username:** Enter the username for connecting to the server using SFTP.
- **Password:** Enter the password for connecting to the server using SFTP.
- **Server Shared Path:** Enter the backup path on the SFTP server.
- **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.
- **OBS:** indicates that the backup files are stored in the OBS.  
If you select this value, you need to set the following parameters:
  - **Target Path:** indicates the OBS directory for storing backup data.
  - **Maximum Number of Backup Copies:** indicates the number of backup files that can be retained in the backup directory.

 **NOTE**

MRS 3.1.0 and later versions support backing up data to OBS.

**Step 9** Click **OK** to save the settings.

**Step 10** In the **Operation** column of the created task in the backup task list, choose **More > Back Up Now** to execute the backup task.

After the backup task is executed, the system automatically creates a subdirectory for each backup task in the backup directory. The format of the subdirectory name is *backup task name\_task creation time*, and the subdirectory is used to save data source backup files. The format of the backup file name is *version\_data source\_task execution time.tar.gz*.

----End

## 12.11.4 Recovering Data

### 12.11.4.1 Recovering Manager Data

#### Scenario

Manager data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After a MRS cluster administrator performs critical data adjustment in FusionInsight Manager, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover Manager data. Only manual recovery tasks are supported.

**NOTICE**

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Manager data that is generated after the data backup and before the data recovery will be lost.

## Impact on the System

- In the recovery process, the Controller needs to be restarted and FusionInsight Manager cannot be logged in or operated during the restart.
- In the recovery process, all clusters need to be restarted and cannot be accessed during the restart.
- After Manager data recovery, the data, such as system configuration, user information, alarm information, and audit information, that is generated after the data backup and before the data recovery will be lost. This may result in data query failure or cluster access failure.
- After the Manager data is recovered, the system forces the LdapServer of each cluster to synchronize data from the OLadp.

## Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- The status of the OMS resources and the LdapServer instances of each cluster is normal. If the status is abnormal, data recovery cannot be performed.
- The status of the cluster hosts and services is normal. If the status is abnormal, data recovery cannot be performed.
- The cluster host topologies during data recovery and data backup are the same. If the topologies are different, data recovery cannot be performed and you need to back up data again.
- The services added to the cluster during data recovery and data backup are the same. If the topologies are different, data recovery cannot be performed and you need to back up data again.
- The upper-layer applications that depend on the MRS cluster are stopped.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management > Create**.

**Step 4** Set **Task Name** to the name of the recovery task.

**Step 5** Set **Recovery Object** to **OMS**.

**Step 6** Select **OMS**.

**Step 7** Set **Path Type** of **OMS** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select this value, you need to set **Source Path** to select the backup file, for example, *version\_data source\_task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.

If you select this value, you need to set the following parameters:

- **Source Path**: indicates the full path of the backup file in HDFS, for example, *backup path/backup task name\_task creation time/version\_data source\_task execution time.tar.gz*.
- **Cluster for Restoration**: Enter the cluster name mapping to the restoration directory.
- **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when the recovery task is executed. The default value is **hacluster**.

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.

- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path:** indicates the full path of the HDFS directory for storing standby cluster backup data. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **Source Cluster:** Select the cluster of the Yarn queue used by the recovery data from **Source Cluster**.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.  
If you select **NFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.  
If you select **CIFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** Indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.  
If you select **SFTP**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** Enter the IP address of the server where the backup data is stored.

- **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
- **Username:** Enter the username for connecting to the server using SFTP.
- **Password:** Enter the password for connecting to the server using SFTP.
- **Source Path:** Enter the full path of the backup file on the backup server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **OBS:** indicates that the backup files are stored in the OBS directory.  
If you select this value, you need to set the following parameters:
  - **Source Path:** indicates the full path for storing backup data in OBS. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.

 **NOTE**

MRS 3.1.0 and later versions support saving backup files to OBS.

**Step 8** Click **OK** to save the settings.

**Step 9** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 10** Log in to the active and standby management nodes as user **omm**.

**Step 11** Run the following command to restart OMS:

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-oms.sh
```

The command is run successfully if the following information is displayed:

```
start HA successfully.
```

Run `sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh` to check whether **HAAllResOK** of the management node is **Normal** and whether FusionInsight Manager can be logged in again. If yes, the restart is successful.

**Step 12** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > KrbServer > More > Synchronize Configuration**, click **OK**, and wait for the KrbServer configuration to be synchronized and the service to be restarted.

**Step 13** Choose **Cluster > Name of the desired cluster > More > Synchronize Configurations**, click **OK**, and wait for the cluster configuration to be synchronized.

**Step 14** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > More > Restart**. In the displayed dialog box, enter the password of the current login user and click **OK**. Wait for the cluster to be restarted.

----End

## 12.11.4.2 Recovering DBService Data

### Scenario

DBService data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After a MRS cluster administrator performs critical data adjustment in DBService, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover DBService data. Only manual recovery tasks are supported.

---

#### NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the DBService data that is generated after the data backup and before the data recovery will be lost.
  - By default, MRS uses DBService to store the metadata of Hive, Hue, Loader, Spark, Oozie. Recovering DBService data will recover the metadata of all these components.
- 

### Impact on the System

- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the configuration of the components that depend on DBService may expire and these components need to be restarted.

### Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- The status of the active and standby DBService instances is normal. If the status is abnormal, data recovery cannot be performed.

### Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose O&M > > **Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Select the cluster to be operated from **Recovery Object**.

**Step 6** Set **Task Name** to the name of the recovery task.

**Step 7** Select **DBService**.

 **NOTE**

If there are multiple DBServices, you can specify the DBService to be recovered.

**Step 8** Set **Path Type** of **DBService** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select this value, you need to set **Source Path** to select the backup file, for example, *version\_data source\_task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select this value, you need to set the following parameters:
  - **Source Path**: indicates the full path of the backup file in HDFS, for example, *backup path/backup task name\_task creation time/version\_data source\_task execution time.tar.gz*.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when the recovery task is executed. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path:** indicates the full path of the HDFS directory for storing standby cluster backup data. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.  
If you select **NFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.  
If you select **CIFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** Indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.  
If you select **SFTP**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.

- **Source Path:** Enter the full path of the backup file on the backup server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **OBS:** indicates that the backup files are stored in the OBS directory. If you select this value, you need to set the following parameters:
  - **Source Path:** indicates the full path for storing backup data in OBS. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.

 **NOTE**

MRS 3.1.0 and later versions support saving backup files to OBS.

**Step 9** Click **OK** to save the settings.

**Step 10** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

### 12.11.4.3 Recovering HBase Metadata

#### Scenario

To avoid that the HBase service becomes unavailable when the HBase system table directory and files are corrupted or after a MRS cluster administrator performs a critical operation (such as upgrade and migration) on HBase, HBase metadata (tableinfo and HFile) needs to be backed up to ensure security. The backup data can be used to recover the system if an exception occurs or the operation has not achieved the expected result, minimizing the adverse impact on services.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover HBase metadata. Only manual recovery tasks are supported.

**NOTICE**

- Data recovery can be performed only when the system version is consistent with that of data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.
  - It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.
- HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.

## Impact on the System

- Before recovering metadata, you need to stop the HBase service, during which the HBase upper-layer applications are unavailable.
- After the metadata is recovered, the data produced between the backup time and restoration time is lost.
- After the metadata is recovered, the HBase upper-layer applications need to be started.

## Prerequisites

- If the active cluster employs the security mode, cross-cluster trust relationship has been configured for the active and standby clusters. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster employs the normal mode, no cross-cluster trust relationship is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Check the directory for saving the HBase backup file.
- Stop the HBase upper-layer applications.
- You have logged in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the recovery task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HBase** under **Metadata and other data**.

 **NOTE**

If there are multiple HBase services, you can specify the HBase to be recovered.

**Step 8** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select this value, you need to set **Source Path** to select the backup file, for example, *version\_data source\_task execution time.tar.gz*.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Server IP address:** indicates the NAS server IP address.
- **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** Indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select **SFTP**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Source Path:** Enter the full path of the backup file on the backup server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **OBS:** indicates that the backup files are stored in the OBS directory. If you select this value, you need to set the following parameters:
  - **Source Path:** indicates the full path for storing backup data in OBS. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.

 **NOTE**

MRS 3.1.0 and later versions support saving backup files to OBS.

**Step 9** Click **OK** to save the settings.

**Step 10** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.

- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

## 12.11.4.4 Recovering HBase Service Data

### Scenario

HBase data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After a MRS cluster administrator performs critical data adjustment in HBase, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover HBase data. Only manual recovery tasks are supported.

---

#### NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HBase data that is generated after the data backup and before the data recovery will be lost.
- 

### Impact on the System

- During the data recovery process, the system disables the HBase table to be recovered and the table cannot be accessed in this moment. The data recovery process takes several minutes, during which the HBase upper-layer applications are unavailable.
- During data recovery, user authentication stops and users cannot create new connections.
- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the HBase upper-layer applications need to be started.

### Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).

- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Check the directory for saving the HBase backup file.
- Stop the HBase upper-layer applications.
- You have logged in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.

Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the recovery task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **HBase** under **Service Data**.

**Step 8** Set **Path Type** of **HBase** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.

- **Source Path:** indicates the full path of the HDFS directory for storing standby cluster backup data. For example, *backup\_path/backup task name\_data source\_task creation time/*.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Maximum number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup\_path/backup task name\_data source\_task creation time/*.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** Indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup\_path/backup task name\_data source\_task creation time/*.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.

- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.  
If you select **SFTP**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Source Path:** Enter the full path of the backup file on the backup server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.

**Step 9** Set **Backup Data** column in **Data Configuration** to one or multiple backup data sources to be recovered. In the **Target Namespace** column, specify the target naming space after backup data recovery.

You are advised to set **Target Namespace** to a location that is difference from the backup naming space.

**Step 10** Set **Force recovery** to **YES**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **NO**, the recovery task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the recovery task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified naming space does not exist, the verification fails.
- If the forcibly replacement conditions are not met, the verification fails.

**Step 12** Click **OK** to save the settings.

**Step 13** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.

- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 14** Check whether HBase data is restored in an environment where HBase is newly installed or reinstalled.

- If yes, you need to set new permission for roles on FusionInsight Manager based on the original service plan.
- If no, the task is complete.

----End

### 12.11.4.5 Recovering NameNode Data

#### Scenario

NameNode data needs to be recovered in the following scenarios: HDFS metadata is modified or deleted unexpectedly and needs to be restored. After a MRS cluster administrator performs critical data adjustment in NameNode, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover NameNode data. Only manual recovery tasks are supported.

---

#### NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the NameNode data that is generated after the data backup and before the data recovery will be lost.
- It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.

HBase metadata cannot be restored at the same time as NameNode metadata. As a result, data restoration fails.

---

#### Impact on the System

- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the NameNode needs to be restarted and is unavailable during the restart.
- After data is restored, metadata and service data may not be matched, HDFS enters the security mode, and the HDFS service cannot be started.

## Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- You have logged in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).
- On FusionInsight Manager, all the NameNode role instances whose data is to be recovered are stopped. Other HDFS role instances must keep running. After data is recovered, the NameNode role instances need to be restarted. The NameNode role instances cannot be accessed during the restart.
- The NameNode backup files are stored *Data path/LocalBackup/* on the active management node.

## Procedure

**Step 1** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance > NameNode** to check whether the NameNode instances of the data to be restored are stopped. If the NameNode instances are not stopped, stop them.

**Step 2** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 3** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 4** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 5** Click **Create**.

**Step 6** Set **Task Name** to the name of the recovery task.

**Step 7** Select the cluster to be operated from **Recovery Object**.

**Step 8** Select **NameNode**.

**Step 9** Set **Path Type** of **NameNode** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.

If you select this value, you need to set the following parameters:

- **Source Path**: indicates the full path of the local disk for storing standby cluster backup data. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

- **RemoteHDFS(DistCp)**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **Queue Name**: indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

If you select NFS, set the following parameters:

- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP address**: indicates the NAS server IP address.
- **Source Path**: indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol.

If you select **CIFS**, set the following parameters:

- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.
  - **Password**: indicates the password that is configured when setting the CIFS protocol.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **SFTP**: Indicates that backup files are stored in the server using SFTP.

If you select **SFTP**, set the following parameters:

- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: Enter the IP address of the server where the backup data is stored.
  - **Port**: Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username**: Enter the username for connecting to the server using SFTP.
  - **Password**: Enter the password for connecting to the server using SFTP.
  - **Source Path**: Enter the full path of the backup file on the backup server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
  - **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **OBS**: indicates that the backup files are stored in the OBS directory.

If you select this value, you need to set the following parameters:

- **Source Path**: indicates the full path for storing backup data in OBS. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.

 **NOTE**

MRS 3.1.0 and later versions support saving backup files to OBS.

**Step 10** Click **OK** to save the settings.

**Step 11** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

**Step 12** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **More** > **Restart Service**.

In the displayed window, enter the password of the current user and click **OK**. After the system displays "**Operation succeeded**", click **Finish**. The service is successfully started.

----End

## 12.11.4.6 Recovering HDFS Service Data

### Scenario

HDFS data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After a MRS cluster administrator performs critical data adjustment in HDFS, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover HDFS data. Only manual recovery tasks are supported.

---

#### NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the HDFS data that is generated after the data backup and before the data recovery will be lost.
  - The HDFS restoration operation cannot be performed for the directories used by running Yarn tasks, for example, **/tmp/logs**, **/tmp/archived**, and **/tmp/hadoop-yarn/staging**. Otherwise, data restoration using Distcp tasks fails due to file loss.
  - If the backup data is EC data, data can only be restored to the directory configured with the same EC policy but not the directory not configured with the same EC policy or configured with the replica policy. Similarly, if the backup data is replica data, data can only be restored to the replica directory but not the EC directory.
- 

### Impact on the System

- During data recovery, user authentication stops and users cannot create new connections.

- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the HDFS upper-layer applications need to be started.

## Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- The HDFS backup file save path is correct.
- Ensure that the backup data and target directory use the same EC policy or replica policy.
- The HDFS upper-layer applications are stopped.
- You have logged in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the recovery task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** Select **HDFS**.

**Step 8** Set **Path Type** of **HDFS** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS:** indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path:** indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name\_data source\_task creation time/***.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol. If you select NFS, set the following parameters:
    - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
    - **Server IP address:** indicates the NAS server IP address.
    - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name\_data source\_task creation time/***.
    - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
    - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
    - **Target NameService Name:** indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
    - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.

- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.  
If you select **CIFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** Indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup\_path/backup task name\_data source\_task creation time/*.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
  - **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP.  
If you select **SFTP**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Source Path:** Enter the full path of the backup file on the backup server. For example, *backup\_path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.

- **Target NameService Name:** indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.

**Step 9** Set **Backup Data** column in **Data Configuration** to one or multiple backup data sources to be recovered based on service requirements. In the **Target Path** column, specify the target location after backup data recovery.

You are advised to set **Target Path** to a new path that is difference from the backup path.

**Step 10** Click **Verify** to check whether the recovery task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be recovered does not exist, the verification fails.

**Step 11** Click **OK** to save the settings.

**Step 12** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

## 12.11.4.7 Recovering Hive Service Data

### Scenario

Hive data needs to be recovered in the following scenarios: data is modified or deleted unexpectedly and needs to be restored. After a MRS cluster administrator performs critical data adjustment in Hive, an exception occurs or the operation has not achieved the expected result. All modules are faulty and become unavailable. Data is migrated to a new cluster.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover Hive data. Only manual recovery tasks are supported.

Hive backup and recovery cannot identify the service and structure relationships of objects such as Hive tables, indexes, and views. When executing backup and recovery tasks, the user needs to manage a unified recovery point based on the service scenario to ensure proper service running.

**NOTICE**

- Data recovery can be performed only when the system version is consistent with that of data backup.
- To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the Hive data that is generated after the data backup and before the data recovery will be lost.

**Impact on the System**

- During data recovery, user authentication stops and users cannot create new connections.
- After the data is recovered, the data produced between the backup time and restoration time is lost.
- After the data is recovered, the Hive upper-layer applications need to be started.

**Prerequisites**

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.
- Plan the database for storing recovered data tables, the HDFS save path of data tables, and the list of users who can access recovered data.
- The Hive backup file save path is correct.
- The Hive upper-layer applications are stopped.
- You have logged in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).

**Procedure**

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.

- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the recovery task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** Select **Hive**.

**Step 8** Set **Path Type** of **Hive** to a backup directory type.

The following backup directory types are supported:

- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, **backup path/backup task name\_data source\_task creation time/**.
- **Queue Name**: indicates the name of the YARN queue used for backup task execution.
- **Recovery Point List**: Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name**: indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **Maximum Number of Maps**: indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s)**: indicates the maximum bandwidth of a map. The default value of this parameter is **100**.

- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol.

If you select NFS, set the following parameters:

- **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.

- **Server IP address:** indicates the NAS server IP address.
- **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/*.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **100**.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** indicates the NAS server IP address.
  - **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username:** Indicates the user name that is configured when setting the CIFS protocol.
  - **Password:** indicates the password that is configured when setting the CIFS protocol.
  - **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/*.
  - **Queue Name:** indicates the name of the YARN queue used for backup task execution.
  - **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
  - **Target NameService Name:** indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
  - **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select **SFTP**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** Enter the IP address of the server where the backup data is stored.

- **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
- **Username:** Enter the username for connecting to the server using SFTP.
- **Password:** Enter the password for connecting to the server using SFTP.
- **Source Path:** Enter the full path of the backup file on the backup server. For example, *backup path/backup task name\_data source\_task creation time/*.
- **Queue Name:** indicates the name of the YARN queue used for backup task execution.
- **Recovery Point List:** Click **Refresh** and select an HDFS directory that has been backed up in the standby cluster.
- **Target NameService Name:** indicates the target NameService that corresponds to the selected backup directory. The default value of this parameter is **hacluster**.
- **Maximum Number of Maps:** indicates the maximum number of maps in a MapReduce task. The default value of this parameter is **20**.
- **Maximum Bandwidth of a Map (MB/s):** indicates the maximum bandwidth of a map. The default value of this parameter is **1**.

**Step 9** Set **Backup Data** in the **Data Configuration** to one or multiple backup data sources to be recovered based on service requirements. In the **Target Database** and **Target Path** columns, specify the target database and file save path after backup data recovery.

Configuration restrictions:

- Data can be recovered to the original database, but data tables must be stored in a new path that is difference from the backup path.
- To recover Hive index tables, select the Hive data tables that correspond to the Hive index tables to be recovered.
- If a new recovery directory is selected to avoid affecting the current data, HDFS permission must be manually granted so that users who have permission of backup tables can access this directory.
- Data can be recovered to other databases. In this case, HDFS permission must be manually granted so that users who have permission of backup tables can access the HDFS directory that corresponds to the database.

**Step 10** Set **Force recovery** to **YES**, which indicates to forcibly recover all backup data when a data table with the same name already exists. If the data table contains new data added after backup, the new data will be lost after the data recovery. If you set the parameter to **NO**, the recovery task is not executed if a data table with the same name exists.

**Step 11** Click **Verify** to check whether the recovery task is configured correctly.

- If the queue name is incorrect, the verification fails.
- If the specified directory to be recovered does not exist, the verification fails.
- If the forcibly replacement conditions are not met, the verification fails.

**Step 12** Click **OK** to save the settings.

**Step 13** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

## 12.11.4.8 Recovering Kafka Metadata

### Scenario

Kafka metadata needs to be recovered in the following scenarios: Data is modified or deleted unexpectedly and needs to be restored; after MRS cluster administrator performs a critical operation (such as upgrade and critical data adjustment) on ZooKeeper, an exception occurs or the operation has not achieved the expected result; all Kafka modules are faulty and become unavailable; data is migrated to a new cluster.

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover Kafka data. Only manual recovery tasks are supported.

---

#### NOTICE

- Data recovery can be performed only when the system version is consistent with that of data backup.
  - To recover Kafka metadata when the service is running properly, you are advised to manually back up the latest Kafka metadata before recovery. Otherwise, the Kafka metadata that is generated after the data backup and before the data recovery will be lost.
- 

### Impact on the System

- After the metadata is recovered, the data generated between the backup point in time and the recovery point in time is lost.
- After the metadata is recovered, the offset information stored on ZooKeeper by Kafka consumers is restored to a previous state, resulting in repeated consumption.

### Prerequisites

- To restore data from the remote HDFS, you need to prepare the standby cluster. If the active cluster is deployed in security mode and the active and standby clusters are not managed by the same FusionInsight Manager, configure system mutual trust. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster is deployed in normal mode, do not configure mutual trust.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- The time of the active cluster and standby cluster must be the same, and the NTP service in the active and standby clusters must use the same time source.

- The Kafka service is disabled first, and then enabled upon data recovery.
- You have logged in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the recovery task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** Select **Kafka** in **Restoration Configuration**.

### NOTE

If there are multiple Kafka services, you can specify the Kafka to be recovered.

**Step 8** Set **Path Type** of **Kafka** to a backup directory type.

The settings vary according to backup directory types:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node.  
If you select this value, you need to set **Source Path** to select the backup file, for example, *version\_data/source/task execution time.tar.gz*.
- **LocalHDFS**: indicates that the backup files are stored in the HDFS directory of the current cluster.  
If you select this value, you need to set the following parameters:
  - **Source Path**: indicates the full path of the backup file in HDFS, for example, *backup path/backup task name\_task creation time/version\_data/source/task execution time.tar.gz*.
  - **Source NameService Name**: indicates the NameService name that corresponds to the backup directory when the recovery task is executed. The default value is **hacluster**.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster.

If you select this value, you need to set the following parameters:

- **Source NameService Name:** indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Source NameNode IP Address:** indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
- **Source Path:** indicates the full path of the HDFS directory for storing standby cluster backup data. For example, ***backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz***.
- **Queue Name:** indicates the name of the Yarn queue used for backup task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- **NFS:** indicates that backup files are stored in the NAS over the NFS protocol.

If you select NFS, set the following parameters:

- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP address:** indicates the NAS server IP address.
- **Source Path:** indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz***.
- **CIFS:** indicates that backup files are stored in the NAS over the CIFS protocol.

If you select CIFS, set the following parameters:

- **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
- **Server IP address:** indicates the NAS server IP address.
- **Port:** indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
- **Username:** Indicates the user name that is configured when setting the CIFS protocol.
- **Password:** indicates the password that is configured when setting the CIFS protocol.
- **Source Path:** indicates the complete path of the backup file on the NAS server. For example, ***backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz***.
- **OBS:** indicates that the backup files are stored in the OBS directory.

If you select this value, you need to set the following parameters:

- **Source Path:** indicates the full path for storing backup data in OBS. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.

 NOTE

MRS 3.1.0 and later versions support saving backup files to OBS.

**Step 9** Click **OK** to save the settings.

**Step 10** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

## 12.11.4.9 Recovering Yarn Data

### Scenario

MRS cluster administrators can create a recovery task in FusionInsight Manager to recover Yarn metadata. Only manual recovery tasks are supported.

---

**NOTICE**

- Data recovery can be performed only when the system version is consistent with that of data backup.
  - To recover data when the service is running properly, you are advised to manually back up the latest management data before recovering data. Otherwise, the data that is generated after the data backup and before the data recovery will be lost.
  - It is recommended that a data restoration task restore the metadata of only one component to prevent the data restoration of other components from being affected by stopping a service or instance. If data of multiple components is restored at the same time, data restoration may fail.
- 

### Impact on the System

- Resource pool information is also stored in DBService. Therefore, when restoring Yarn data, you need to manually trigger the restoration of the DBService data backed up at the corresponding time. If only Yarn data is restored, the Yarn data stored in ZooKeeper is inconsistent with that stored in DBService. As a result, the Yarn resource pool is abnormal. Exercise caution when performing this operation and ensure that the Yarn data to be restored is consistent with the DBService data.
- Before recovering metadata, you need to stop the Yarn service, during which the Yarn upper-layer applications are unavailable.

- After the metadata is recovered, the data produced between the backup time and restoration time is lost.
- After the metadata is recovered, the Yarn upper-layer applications need to be started.

## Prerequisites

- If the active cluster employs the security mode, cross-cluster trust relationship has been configured for the active and standby clusters. For details, see [Configuring Cross-Manager Cluster Mutual Trust Relationships](#). If the active cluster employs the normal mode, no cross-cluster trust relationship is required.
- Cross-cluster replication has been configured for the active and standby clusters. For details, see [Enabling Cross-Cluster Replication](#).
- Check the directory for saving the Yarn backup file.
- Stop the Yarn upper-layer applications.
- You have logged in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the **Operation** column of a specified task in the task list, click **More > View History** to view historical backup task execution records.

In the displayed window, locate a specified success record and click **View** in the **Backup Path** column to view the backup path information of the task and find the following information:

- **Backup Object** specifies the data source of the backup data.
- **Backup Path** specifies the full path where the backup files are saved.  
Select the correct item, and manually copy the full path of backup files in **Backup Path**.

**Step 3** On FusionInsight Manager, choose **O&M > Backup and Restoration > Restoration Management**.

**Step 4** Click **Create**.

**Step 5** Set **Task Name** to the name of the recovery task.

**Step 6** Select the cluster to be operated from **Recovery Object**.

**Step 7** In **Restoration Configuration**, select **Yarn** and **DBService** under **Metadata and other data**.

### NOTE

Resource pool information is also stored in DBService. Therefore, when restoring Yarn data, you need to manually trigger the restoration of the DBService data backed up at the corresponding time. If only Yarn data is restored, the Yarn data stored in ZooKeeper is inconsistent with that stored in DBService. As a result, the Yarn resource pool is abnormal. Exercise caution when performing this operation and ensure that the Yarn data to be restored is consistent with the DBService data.

**Step 8** Set **Path Type** of **DBService** to a backup directory type. For details, see [Recovering DBService Data](#)

**Step 9** Set **Path Type** of **Yarn** to a backup directory type.

The following backup directory types are supported:

- **LocalDir**: indicates that the backup files are stored on the local disk of the active management node. If you select this value, you need to set **Source Path** to select the backup file, for example, *version\_data source\_task execution time.tar.gz*.
- **RemoteHDFS**: indicates that the backup files are stored in the HDFS directory of the standby cluster. If you select this value, you need to set the following parameters:
  - **Source NameService Name**: indicates the NameService name of the backup data cluster. You can set it to the NameService name (**haclusterX**, **haclusterX1**, **haclusterX2**, **haclusterX3**, or **haclusterX4**) of the built-in remote cluster of the cluster, or the NameService name of a configured remote cluster.
  - **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Source NameNode IP Address**: indicates the NameNode service plane IP address of the standby cluster, supporting the active node or standby node.
  - **Source Path**: indicates the full path of the HDFS directory for storing standby cluster backup data. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
  - **Queue Name**: indicates the name of the YARN queue used for backup task execution.
- **NFS**: indicates that backup files are stored in the NAS over the NFS protocol. If you select **NFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Source Path**: indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **CIFS**: indicates that backup files are stored in the NAS over the CIFS protocol. If you select **CIFS**, set the following parameters:
  - **IP Mode**: mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address**: indicates the NAS server IP address.
  - **Port**: indicates the port ID used by the CIFS protocol to connect to the NAS server. The default value is **445**.
  - **Username**: Indicates the user name that is configured when setting the CIFS protocol.

- **Password:** indicates the password that is configured when setting the CIFS protocol.
- **Source Path:** indicates the complete path of the backup file on the NAS server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **SFTP:** Indicates that backup files are stored in the server using SFTP. If you select **SFTP**, set the following parameters:
  - **IP Mode:** mode of the target IP address. The system automatically selects the IP address mode based on the cluster network type, for example, **IPv4** or **IPv6**.
  - **Server IP address:** Enter the IP address of the server where the backup data is stored.
  - **Port:** Enter the port number used by the SFTP protocol to connect to the backup server. The default value is **22**.
  - **Username:** Enter the username for connecting to the server using SFTP.
  - **Password:** Enter the password for connecting to the server using SFTP.
  - **Source Path:** Enter the full path of the backup file on the backup server. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.
- **OBS:** indicates that the backup files are stored in the OBS directory. If you select this value, you need to set the following parameters:
  - **Source Path:** indicates the full path for storing backup data in OBS. For example, *backup path/backup task name\_data source\_task creation time/version\_data source\_task execution time.tar.gz*.

 **NOTE**

MRS 3.1.0 and later versions support saving backup files to OBS.

**Step 10** Click **OK** to save the settings.

**Step 11** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

- After the recovery is successful, the progress bar is in green.
- After the recovery is successful, the recovery task cannot be executed again.
- If the recovery task fails during the first execution, rectify the fault and click **Retry** to execute the task again.

----End

## 12.11.5 Managing Local Quick Recovery Tasks

### Scenario

When DistCp is used to back up data, the backup snapshot is saved to HDFS of the active cluster. FusionInsight Manager supports using the local snapshot for quick data recovery, requiring less time than recovering data from the standby cluster.

Use FusionInsight Manager and the snapshots on HDFS of the active cluster to create a local quick recovery task and execute the task.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.
- Step 2** In the backup task list, locate a created task and click **Restore** in the **Operation** column.
- Step 3** Check whether the system displays **No data is available for quick restoration. Create a task on the restoration management page to restore data**.
- If yes, click **OK** to close the dialog box. No backup data snapshot is created in the active cluster, and no further action is required.
  - If no, go to **Step 4** to create a local quick recovery task.

 **NOTE**

Metadata does not support quick restoration.

- Step 4** Set **Name** to the name of the local quick recovery task.
- Step 5** Set **Configuration** to a data source.
- Step 6** Set **Recovery Point List** to a recovery point that contains the backup data.
- Step 7** Set **Queue Name** to the name of the Yarn queue used in the task execution. The name must be the same as the name of the queue that is running properly in the cluster.
- Step 8** Set **Data Configuration** to the object to be recovered.
- Step 9** Click **Verify**. After "The restoration task configuration is verified successfully." is displayed, click **OK**.
- Step 10** Click **OK**.
- Step 11** In the recovery task list, locate a created task and click **Start** in the **Operation** column to execute the recovery task.

After the task is complete, **Task Status** of the task is displayed as **Successful**.

----End

## 12.11.6 Modifying a Backup Task

### Scenario

Modify the parameters of a created backup task on FusionInsight Manager to meet changing service requirements. The parameters of recovery tasks can only be viewed but cannot be modified.

### Impact on the System

After a backup task is modified, the new parameters take effect when the task is executed next time.

## Prerequisites

- A backup task has been created.
- A new backup task policy has been planned based on the actual situation.

## Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

**Step 2** In the task list, locate a specified task, click **Configure** in the **Operation** column to go to the configuration modification page.

On the displayed page, modify the following parameters:

- **Started**
- **Period**
- **Destination NameService Name**
- **Target NameNode IP Address**
- **Target Path**
- **Maximum Number of Backup Copies**
- **Maximum Number of Recovery Points**
- **Maximum Number of Maps**
- **Maximum Bandwidth of a Map**

 **NOTE**

After the **Target Path** parameter of a backup task is modified, this task will be performed as a full backup task for the first time by default.

**Step 3** Click **OK** to save the settings.

----End

## 12.11.7 Viewing Backup and Recovery Tasks

### Scenario

On FusionInsight Manager, view created backup and recovery tasks and check their running status.

### Prerequisites

You have logged in to FusionInsight Manager. For details, see Logging In to the Management System.

### Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Backup and Restoration**.

**Step 2** Click **Backup Management** or **Restoration Management**.

- Step 3** In the task list, obtain the previous execution result in the **Task Status** and **Task Progress** column. Green indicates that the task is executed successfully, and red indicates that the execution fails.
- Step 4** In the task list, locate a specified task and choose **More > View History** or **click View History** in the **Operation** column to display historical records of backup and recovery task execution.

In the displayed window, click  before a specified record to display log information about the execution.

----End

## Related Tasks

- Starting Backup and Recovery Tasks  
In the task list, locate a specified task and choose **More > Back Up Now** or **click Start** in the **Operation** column to start a backup or recovery task that is ready or fails to be executed. Executed recovery tasks cannot be repeatedly executed.
- Stopping Backup and Recovery Tasks  
In the task list, locate a specified task and choose **More > Stop** or **click Stop** in the **Operation** column to stop a backup or recovery task that is running.
- Deleting Backup and Recovery Tasks  
In the task list, locate a specified task and choose **More > Delete** or **click Delete** in the **Operation** column to delete a backup or recovery task. Backup data will be reserved by default after a task is deleted.
- Suspending Backup Tasks  
In the task list, locate a specified task and choose **More > Suspend** in the **Operation** column to suspend a backup task. Only periodic backup tasks can be suspended. Suspended backup tasks are no longer executed automatically. When you suspend a backup task that is being executed, the task execution stops. To Resume a task, choose **More > Resume**.

## 12.12 Security Management

### 12.12.1 Security Overview

#### 12.12.1.1 Rights Model

##### Role-based Access Control

FusionInsight adopts the role-based access control (RBAC) mode to perform rights management on the big data system. It integrates the rights management functions of the components to centrally manage rights. Common users are shielded from internal rights management details, and MRS cluster administrators' rights management operations are simplified, improving rights management usability and user experience.

The rights model of FusionInsight is "users-user groups-roles-rights".

**Figure 12-21** Rights model

- **Rights**

Rights are defined by components and allow users to access resources of components. Different components have different rights for their resources.

Example:

- HDFS provides read, write, and execute permissions on file resources.
- HBase provides create, write, and read permissions on table resources.

- **Role**

Role is a collection of component rights. Each role can have multiple rights of multiple components. Different roles can have the rights of a resource of one component.

- **User group**

User group is a collection of users. When a user group is bound to a role, users in this group obtain the rights defined by the role.

Different user groups can be associated with the same role, and a user group can be associated with no role. In principle, the user group does not have the rights of any component resources.

**NOTE**

In some components, the system grants related rights to specific user groups by default.

- **User**

Users are visitors to the system. Each user has the rights of the user group and role associated with the user. Users need to be added to the user group or associated roles to obtain the corresponding rights.

## Policy-based Access Control

The Ranger component uses policy-based access control (PBAC) to manage permissions and implement fine-grained data access control on components such as HDFS, Hive, and HBase.

### NOTE

The component supports only one permission control mechanism. After the Ranger permission control policy is enabled for the component, the permission on the component in the role created on FusionInsight Manager becomes invalid. You need to add a policy on the Ranger management page to grant permissions on resources. If the policy conditions of HDFS and Yarn resource requests in Ranger are not covered, the component ACL rules still take effect.

The ranger permission model consists of multiple permission policies. The permission policies are as follows:

- **Resource**  
Objects provided by components for users to access, such as HDFS files or folders, queues in Yarn, and databases, tables, and columns in Hive.
- **User**  
Indicates the user who accesses the system. The rights of each user are obtained based on the policy associated with the user. Information about users, user groups, and roles in the LDAP is periodically synchronized to the Ranger.
- **Permission**  
In a policy, you can configure various access conditions for resources, such as file read/write, permission conditions, rejection conditions, and exception conditions.

### 12.12.1.2 Rights Mechanism

FusionInsight adopts the Lightweight Directory Access Protocol (LDAP) to store data of users and user groups. Information about role definitions is stored in the relational database and the mapping between roles and rights is saved in components.

FusionInsight uses Kerberos for unified authentication.

The verification process of user rights is as follows:

1. A client (a user terminal or FusionInsight component service) invokes the FusionInsight authentication interface.
2. FusionInsight uses the login username and password for Kerberos authentication.
3. If the authentication succeeds, the client sends a request for accessing the server (a FusionInsight component service).
4. The server finds the user group and role to which the login user belongs.

5. The server obtains all rights of the user group and the role.
6. The server determines whether the client has the permission to access the resources it applies for.

**Example (RBAC):**

There are three files in HDFS, fileA, fileB, and fileC.

- roleA has read and write permissions for fileA and roleB has the read permission for fileB.
- groupA is bound to roleA and groupB is bound to roleB.
- userA belongs to groupA and roleB, and userB belongs to groupB.

When userA successfully logs in to the system and accesses HDFS:

1. HDFS obtains the role (roleB) to which userA is bound.
2. HDFS also obtains the role (roleA) to which the user group of userA is bound.
3. In this case, userA has all the rights of roleA and roleB.
4. As a result, userA has read and write permissions for fileA, has the read permission on fileB, and has no permission for fileC.

Similarly, when userB successfully logs in to the system and accesses HDFS:

1. userB only has the rights of roleB.
2. As a result, userB has the read permission on fileB, and has no permissions for fileA and fileC.

### 12.12.1.3 Authentication Policies

The big data platform performs user identity authentication to prevent invalid users from accessing the cluster. The cluster provides authentication capabilities in both Security Mode and Normal mode.

## Security Mode

The cluster in Security Mode uses the Kerberos authentication protocol to perform security authentication. The Kerberos protocol supports mutual authentication between the client and the server. This improves security and eliminates the security risks caused by using the network to send user credentials to simulate authentication. In cluster, KrbServer service provides Kerberos authentication support.

### Kerberos user object

In the Kerberos protocol, a user object is a principal. A complete user object consists of a username and domain name. In O&M management or application development scenarios, a user can connect to the cluster server only after the user is authenticated on the client. In O&M and service scenarios, **Human-machine** and **Machine-machine** users are used. The difference between **Human-machine** and **Machine-machine** users is that the passwords of **Machine-machine** users are randomly generated by the system.

### Kerberos authentication

The Kerberos authentication supports two modes: password authentication mode and keytab authentication mode. The validity period of authentication is 24 hours by default.

- Password authentication: Identity authentication is performed by entering the correct password of a user. This mode is mainly used in O&M management scenarios where **Human-machine** users are used. The command is **kinit Username**.
- Keytab authentication: The keytab file includes the user principal and encryption information of user credentials. When the keytab file is used for authentication, the system automatically uses encrypted credential information to perform authentication and the user password does not need to be entered. This mode is mainly used in component application development scenarios where **Machine-machine** users are used. The keytab file can also be used in the **kinit** command.

## Normal Mode

When the cluster is in Normal Mode, different components use different open-source authentication mechanisms, and the **kinit** authentication command is not supported. FusionInsight Manager (including DBService, KrbServer, and LdapServer) uses the username and password authentication mode. [Table 12-80](#) lists the authentication mechanisms used by components.

**Table 12-80** Component authentication modes

Service	Authentication Mode
CDL	No authentication
ClickHouse	Simple authentication
Flume	No authentication
HBase	<ul style="list-style-type: none"> <li>• WebUI: No authentication</li> <li>• Client: Simple authentication</li> </ul>
HDFS	<ul style="list-style-type: none"> <li>• WebUI: No authentication</li> <li>• Client: Simple authentication</li> </ul>
Hive	Simple authentication
Hue	Username and password authentication
Kafka	No authentication
Loader	<ul style="list-style-type: none"> <li>• WebUI: Username and password authentication</li> <li>• Client: No authentication</li> </ul>
Mapreduce	<ul style="list-style-type: none"> <li>• WebUI: No authentication</li> <li>• Client: No authentication</li> </ul>
Oozie	<ul style="list-style-type: none"> <li>• WebUI: Username and password authentication</li> <li>• Client: Simple authentication</li> </ul>

Service	Authentication Mode
Spark2x	<ul style="list-style-type: none"><li>• WebUI: No authentication</li><li>• Client: Simple authentication</li></ul>
Storm	No authentication
Yarn	<ul style="list-style-type: none"><li>• WebUI: No authentication</li><li>• Client: Simple authentication</li></ul>
ZooKeeper	Simple authentication

The authentication modes are described as follows:

- **Simple authentication:** During the connection from the client to the server, the execution user on the client (such as the OS user **root** or **omm**) is used for automatic authentication by default. MRS cluster administrators or service users are unaware of the authentication and do not need to run the **kinit** command to perform the authentication.
- **Username and password authentication:** The usernames and passwords of **Human-machine** users are used for authentication.
- **No authentication:** Any user can access the server by default.

## 12.12.1.4 Permission Verification Policies

### Security Mode

After a user is authenticated by the big data platform, the system determines whether to verify the user's permission based on the actual permission management configuration to ensure that the user has limited or all permission on resources. If the user does not have sufficient permission, the user can access resources only after the MRS cluster administrator grant related permission on each component to the user. The cluster provides permission verification capabilities in both Security Mode and Normal Mode. Permission on components is the same in the two modes.

By default, the Ranger service is installed and Ranger authentication is enabled for a newly installed cluster in security mode. You can set fine-grained security access policies for accessing component resources through the permission plug-in of the component. If Ranger authentication is not required, you can manually disable Ranger authentication on the service page. After Ranger authentication is disabled, the system continues to perform permission control based on the role model of FusionInsight Manager when accessing component resources.

In a cluster in security mode, the following components support Ranger authentication: HDFS, Yarn, Kafka, Hive, HBase, Storm, Spark2x, Impala.

In a cluster upgraded from an earlier version, Ranger authentication is not used by default when users access component resources. The administrator can manually enable Ranger authentication after installing the Ranger service.

By default, all components in the cluster in Security Mode perform permission verification on access in a unified manner, and the permission verification function cannot be disabled.

## Normal Mode

Different components in the cluster in Normal Mode use different open-source permission verification behavior. [Table 12-81](#) lists detailed permission verification mechanisms.

In a cluster in non-security mode, the Ranger supports permission control on component resources based on OS users. The following components support Ranger authentication: HBase, HDFS, Hive, Spark2x, and Yarn.

**Table 12-81** Component permission verification modes in Normal Mode

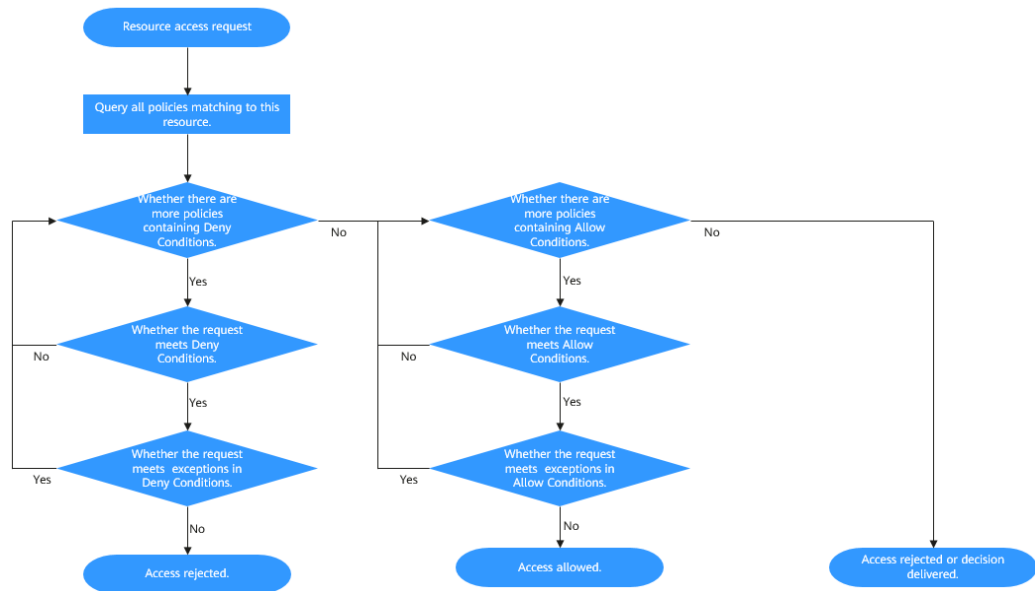

Service	Permission Verification	Permission Verification Enabling and Disabling
ClickHouse	Required	Not supported
Flume	Not required	Not supported
HBase	Not required	Supported
HDFS	Required	Supported
Hive	Not required	Not supported
Hue	Not required	Not supported
Kafka	Not required	Not supported
Loader	Not required	Not supported
Mapreduce	Not required	Not supported
Oozie	Required	Not supported
Spark2x	Not required	Not supported
Storm	Not required	Not supported
Yarn	Not required	Supported
ZooKeeper	Required	Supported

## Condition Priorities of the Ranger Permission Policy

When configuring a permission policy for a resource, you can configure Allow Conditions, Exclude from Allow Conditions, Deny Conditions, and Exclude from Deny Conditions for the resource, to meet unexpected requirements in different scenarios.

The priorities of different conditions are listed in descending order: Exclude from Deny Conditions > Deny Conditions > Exclude from Allow Conditions > Allow Conditions

The following figure shows the process of determining condition priorities. If the component resource request does not match the permission policy in Ranger, the system rejects the access by default. However, for HDFS and Yarn, the system delivers the decision to the access control layer of the component for determination.

For example, if you want to grant the read and write permissions of the **FileA** folder to the **groupA** user group, but the user in the group is not **UserA**, you can add an allowed condition and an exception condition.

### 12.12.1.5 User Information Overview

#### User Classification

The MRS cluster provides the following three types of users. You need to periodically change the passwords. It is not recommended to use the default passwords.

User Type	Description
System users	<ul style="list-style-type: none"> <li>● User created on FusionInsight Manager for O&amp;M and service scenarios. There are two types of users:               <ul style="list-style-type: none"> <li>– <b>Human-machine</b> user: used in scenarios such as FusionInsight Manager O&amp;M and operations on a component client. When creating a user of this type, you need to set password and confirm password by referring to <a href="#">Creating a User</a>.</li> <li>– <b>Machine-machine</b> user: used for system application development.</li> </ul> </li> <li>● User who runs OMS processes</li> </ul>

User Type	Description
Internal system users	Internal user to perform Kerberos authentication, process communications, save user group information, and associate user permissions. It is recommended that internal system users not be used in O&M scenarios. Operations can be performed as user <b>admin</b> or another user created by the MRS cluster administrator based on service requirements.
Database users	<ul style="list-style-type: none"> <li>• User who manages OMS database and accesses data</li> <li>• User who runs service components (Hue, Hive, Loader, Oozie, Ranger, and DBService) in the database.</li> </ul>

## System Users

 NOTE

- User **root** of the OS is required, the password of user **root** on all nodes must be the same.
- User **ldap** of the OS is required. Do not delete this account. Otherwise, the cluster may not work properly. The OS administrator maintains the password management policies.

User Type	Username	Initial Password	Description	Password Change Method
System administrator	admin	Admin@123	FusionInsight Manager administrator. <b>NOTE</b> By default, user <b>admin</b> does not have the management permission on other components. For example, when accessing the native UI of a component, the user fails to access the complete component information due to insufficient management permission on the component.	For details, see <a href="#">Changing the Password for User admin</a> .

User Type	Username	Initial Password	Description	Password Change Method
Node OS user	ommdba	Random password	User that creates the system database. This user is an OS user generated on the management node and does not require a unified password. This account cannot be used for remote login.	For details, see <a href="#">Changing the Password for an OS User</a> .
	omm	Random password	Internal running user of the system. This user is an OS user generated on all node and does not require a unified password.	

### Internal System Users

User Type	Default User	Initial Password	Description	Password Change Method
Kerberos administrator	kadmin/admin	Admin@123	Used to add, delete, modify, and query user accounts on Kerberos.	For details, see <a href="#">Changing the Password for the Kerberos Administrator</a> .
OMS Kerberos administrator	kadmin/admin	Admin@123	Used to add, delete, modify, and query user accounts on OMS Kerberos.	For details, see <a href="#">Changing the Password for the OMS Kerberos Administrator</a> .
LDAP administrator	cn=root,dc=hadoop,dc=com	LdapChangeMe@123	Used to add, delete, modify, and query the user account information on LDAP.	For details, see <a href="#">Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP)</a> .

User Type	Default User	Initial Password	Description	Password Change Method
OMS LDAP administrator	cn=root,dc=hadoop,dc=com	LdapChangeMe@123	Used to add, delete, modify, and query the user account information on OMS LDAP.	
LDAP user	cn=pg_search_dn,ou=Users,dc=hadoop,dc=com	Randomly generated by the system	Used to query information about users and user groups on LDAP.	
OMS LDAP user	cn=pg_search_dn,ou=Users,dc=hadoop,dc=com	Randomly generated by the system	Used to query information about users and user groups on OMS LDAP.	
LDAP administrator account	cn=krbkdc,ou=Users,dc=hadoop,dc=com	LdapChangeMe@123	Used to query Kerberos component authentication account information.	For details, see <a href="#">Changing the Password for the LDAP Administrator</a> .
	cn=krbadmin,ou=Users,dc=hadoop,dc=com	LdapChangeMe@123	Used to add, delete, modify, and query Kerberos component authentication account information.	

User Type	Default User	Initial Password	Description	Password Change Method
Component running user	hdfs	Hdfs@123	<p>This user is the HDFS system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. File system operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> <li>• Views and sets disk quotas for users.</li> </ul> </li> <li>2. HDFS management operation permissions: <ul style="list-style-type: none"> <li>• Views the web UI status.</li> <li>• Views and sets the active and standby HDFS status.</li> <li>• Enters and exits the HDFS in security mode.</li> <li>• Checks the HDFS file system.</li> </ul> </li> <li>3. Logs in to the FTP service page.</li> </ol>	<p>For details, see <a href="#">Changing the Password for a Component Running User</a>.</p>

User Type	Default User	Initial Password	Description	Password Change Method
	hbase	Hbase@123	<p>This user is the HBase and HBase1 to HBase4 system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Cluster management permission: Performs <b>Enable</b> and <b>Disable</b> operations on tables to trigger MajorCompact and ACL operations.</li> <li>• Grants and revokes permissions, and shuts down the cluster.</li> <li>• Table management permission: Creates, modifies, and deletes tables.</li> <li>• Data management permission: Reads data in tables, column families, and columns.</li> <li>• Logs in to the HMaster web UI.</li> <li>• Logs in to the FTP service page.</li> </ul>	

User Type	Default User	Initial Password	Description	Password Change Method
	mapred	Mapred@123	<p>This user is the MapReduce system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Submits, stops, and views the MapReduce tasks.</li> <li>• Modifies the Yarn configuration parameters.</li> <li>• Logs in to the FTP service page.</li> <li>• Logs in to the Yarn web UI.</li> </ul>	
	zookeeper	ZooKeeper@123	<p>This user is the ZooKeeper system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Adds, deletes, modifies, and queries all nodes in ZooKeeper.</li> <li>• Modifies and queries quotas of all nodes in ZooKeeper.</li> </ul>	
	rangeradmin	Rangeradmin@123	<p>This user has the Ranger system management permissions and user permissions:</p> <ul style="list-style-type: none"> <li>• Ranger web UI management permission</li> <li>• Management permission of each component that uses Ranger authentication</li> </ul>	
	rangerauditor	Rangerauditor@123	Default audit user of the Ranger system.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive	Hive@123	<p>This user is the Hive system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> <li>4. Ranger policy management permission</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive1	Hive1@123	<p>This user is the Hive1 system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive1 administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> <li>4. Ranger policy management permission</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive2	Hive2@123	<p>This user is the Hive2 system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive2 administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> <li>4. Ranger policy management permission</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive3	Hive3@123	<p>This user is the Hive3 system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive3 administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> <li>4. Ranger policy management permission</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive4	Hive4@123	<p>This user is the Hive4 system administrator and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive4 administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> <li>4. Ranger policy management permission</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	kafka	Kafka@123	<p>This user is the Kafka system administrator and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Creates, deletes, produces, and consumes the topic; modifies the topic configuration.</li> <li>• Controls the cluster metadata, modifies the configuration, migrates the replica, elects the leader, and manages ACL.</li> <li>• Submits, queries, and deletes the consumer group offset.</li> <li>• Queries the delegation token.</li> <li>• Queries and submits the transaction.</li> </ul>	
	storm	Admin@123	<p>Storm system administrator</p> <p>User permission: Submits Storm tasks.</p>	
	rangeruser sync	Randomly generated by the system	Synchronizes users and internal users of user groups.	
	rangertagsync	Randomly generated by the system	Internal user for synchronizing tags.	

User Type	Default User	Initial Password	Description	Password Change Method
	oms/ manager	Randomly generated by the system	Controller and NodeAgent authentication user. The user has the permission on the <b>supergroup</b> group.	
	backup/ manager	Randomly generated by the system	User for running backup and restoration tasks. The user has the permission on the <b>supergroup</b> , <b>wheel</b> , and <b>ficommon</b> groups. After cross-system mutual trust is configured, the user has the permission to access data in the HDFS, HBase, Hive, and ZooKeeper systems.	

User Type	Default User	Initial Password	Description	Password Change Method
	hdfs/hadoop.<System domain name>	Randomly generated by the system	<p>This user is used to start the HDFS and has the following permissions:</p> <ol style="list-style-type: none"> <li>1. File system operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> <li>• Views and sets disk quotas for users.</li> </ul> </li> <li>2. HDFS management operation permissions: <ul style="list-style-type: none"> <li>• Views the web UI status.</li> <li>• Views and sets the active and standby HDFS status.</li> <li>• Enters and exits the HDFS in security mode.</li> <li>• Checks the HDFS file system.</li> </ul> </li> <li>3. Logs in to the FTP service page.</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	mapred/hadoop.<System domain name>	Randomly generated by the system	<p>This user is used to start the MapReduce and has the following permissions:</p> <ul style="list-style-type: none"> <li>• Submits, stops, and views the MapReduce tasks.</li> <li>• Modifies the Yarn configuration parameters.</li> <li>• Logs in to the FTP service page.</li> <li>• Logs in to the Yarn web UI.</li> </ul>	
	mr_zk/hadoop.<System domain name>	Randomly generated by the system	Used for MapReduce to access ZooKeeper.	
	hbase/hadoop.<System domain name>	Randomly generated by the system	User for the authentication between internal components during the HBase system startup.	
	hbase/zkclient.<System domain name>	Randomly generated by the system	User for HBase to perform ZooKeeper authentication in a security mode cluster.	
	thrift/hadoop.<System domain name>	Randomly generated by the system	ThriftServer system startup user.	

User Type	Default User	Initial Password	Description	Password Change Method
	thrift/ <hostname>	Randomly generated by the system	User for the ThriftServer system to access HBase. This user has the read, write, execution, creation, and administration permission on all NameSpaces and tables of HBase. <hostname> indicates the name of the host where the ThriftServer node is installed in the cluster.	

User Type	Default User	Initial Password	Description	Password Change Method
	hive/hadoop.< <i>System domain name</i> >	Randomly generated by the system	<p>User for the authentication between internal components during the Hive system startup. The user permissions are as follows:</p> <ol style="list-style-type: none"> <li>1. Hive administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive1/hadoop.< <i>System domain name</i> >	Randomly generated by the system	<p>User for the authentication between internal components during the Hive1 system startup. The user has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive1 administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive2/hadoop.< <i>System domain name</i> >	Randomly generated by the system	<p>User for the authentication between internal components during the Hive2 system startup. The user has the following permissions:</p> <ol style="list-style-type: none"> <li>1. Hive2 administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive3/hadoop.< <i>System domain name</i> >	Randomly generated by the system	<p>User for the authentication between internal components during the Hive3 system startup. The user permissions are as follows:</p> <ol style="list-style-type: none"> <li>1. Hive3 administrator permissions: <ul style="list-style-type: none"> <li>• Creates, deletes, and modifies a database.</li> <li>• Creates, queries, modifies, and deletes a table.</li> <li>• Queries, inserts, and uploads data.</li> </ul> </li> <li>2. HDFS file operation permissions: <ul style="list-style-type: none"> <li>• Views, modifies, and creates files.</li> <li>• Views and creates directories.</li> <li>• Views and modifies the groups where files belong.</li> </ul> </li> <li>3. Submits and stops the MapReduce tasks.</li> </ol>	

User Type	Default User	Initial Password	Description	Password Change Method
	hive4/hadoop.<System domain name>	Randomly generated by the system	<p>User for the authentication between internal components during the Hive4 system startup. The user permissions are as follows:</p> <ol style="list-style-type: none"> <li>Hive4 administrator permissions: <ul style="list-style-type: none"> <li>Creates, deletes, and modifies a database.</li> <li>Creates, queries, modifies, and deletes a table.</li> <li>Queries, inserts, and uploads data.</li> </ul> </li> <li>HDFS file operation permissions: <ul style="list-style-type: none"> <li>Views, modifies, and creates files.</li> <li>Views and creates directories.</li> <li>Views and modifies the groups where files belong.</li> </ul> </li> <li>Submits and stops the MapReduce tasks.</li> </ol>	
	loader/hadoop.<System domain name>	Randomly generated by the system	User for Loader system startup and Kerberos authentication	

User Type	Default User	Initial Password	Description	Password Change Method
	HTTP/ <hostname>	Randomly generated by the system	Used to connect to the HTTP interface of each component. <hostname> indicates the host name of a node in the cluster.	
	hue	Randomly generated by the system	User for Hue system startup, Kerberos authentication, and HDFS and Hive access	
	flume	Randomly generated by the system	User for Flume system startup and HDFS and Kafka access. The user has read and write permission of the HDFS directory / <b>flume</b> .	
	flume_server	Randomly generated by the system	User for Flume system startup and HDFS and Kafka access. The user has read and write permission of the HDFS directory / <b>flume</b> .	
	spark2x/hadoop.<System domain name>	Randomly generated by the system	This user is the Spark2x system administrator and has the following user permissions: 1. Starts the Spark2x service. 2. Submits Spark2x tasks.	
	spark_zk/hadoop.<System domain name>	Randomly generated by the system	Used for Spark2x to access ZooKeeper.	

User Type	Default User	Initial Password	Description	Password Change Method
	spark2x1/hadoop.<System domain name>	Randomly generated by the system	This user is the Spark2x1 system administrator and has the following user permissions: 1. Starts the Spark2x1 service. 2. Submits Spark2x tasks.	
	spark2x2/hadoop.<System domain name>	Randomly generated by the system	This user is the Spark2x2 system administrator and has the following user permissions: 1. Starts the Spark2x2 service. 2. Submits Spark2x tasks.	
	spark2x3/hadoop.<System domain name>	Randomly generated by the system	This user is the Spark2x3 system administrator and has the following user permissions: 1. Starts the Spark2x3 service. 2. Submits Spark2x tasks.	
	spark2x4/hadoop.<System domain name>	Randomly generated by the system	This user is the Spark2x4 system administrator and has the following user permissions: 1. Starts the Spark2x4 service. 2. Submits Spark2x tasks.	
	zookeeper/hadoop.<System domain name>	Randomly generated by the system	ZooKeeper system startup user.	

User Type	Default User	Initial Password	Description	Password Change Method
	zkcli/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	ZooKeeper server login user.	
	oozie	Randomly generated by the system	User for Oozie system startup and Kerberos authentication.	
	kafka/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Used for security authentication of Kafka.	
	storm/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Storm system startup user.	
	storm_zk/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Used for the Worker process to access ZooKeeper.	
	flink/ hadoop.< <i>System domain name</i> >	Randomly generated by the system	Internal user of the Flink service.	
	check_ker_M	Randomly generated by the system	User who performs a system internal test about whether the Kerberos service is normal.	
	tez	Randomly generated by the system	User for TezUI system startup, Kerberos authentication, and access to Yarn	

User Type	Default User	Initial Password	Description	Password Change Method
	K/M	Randomly generated by the system	Kerberos internal functional user. This user cannot be deleted, and its password cannot be changed. This internal account can only be used on nodes where Kerberos service is installed.	None
	kadmin/changepw	Randomly generated by the system		
	kadmin/history	Randomly generated by the system		
	krbtgt<System domain name>	Randomly generated by the system		
LDAP user	admin	None	FusionInsight Manager administrator. The primary group is <b>compcommon</b> , which does not have the group permission but has the permission of the <b>Manager_administrator</b> role.	The LDAP user cannot log in to the system, and the password cannot be changed.
	backup		The primary group is <b>compcommon</b> .	
	backup/manager		The primary group is <b>compcommon</b> .	
	oms		The primary group is <b>compcommon</b> .	
	oms/manager		The primary group is <b>compcommon</b> .	
	clientregister		The primary group is <b>compcommon</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	zookeeper		The primary group is <b>hadoop</b> .	
	zookeeper/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	zkcli		The primary group is <b>hadoop</b> .	
	zkcli/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	flume		The primary group is <b>hadoop</b> .	
	flume_server		The primary group is <b>hadoop</b> .	
	hdfs		The primary group is <b>hadoop</b> .	
	hdfs/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	mapred		The primary group is <b>hadoop</b> .	
	mapred/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	mr_zk		The primary group is <b>hadoop</b> .	
	mr_zk/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	hue		The primary group is <b>supergroup</b> .	
	hive		The primary group is <b>hive</b> .	
	hive/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hive</b> .	
	hive1		The primary group is <b>hive1</b> .	
	hive1/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hive1</b> .	
	hive2		The primary group is <b>hive2</b> .	
	hive2/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hive2</b> .	
	hive3		The primary group is <b>hive3</b> .	
	hive3/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hive3</b> .	
	hive4		The primary group is <b>hive4</b> .	
	hive4/ hadoop.< <i>S</i> <i>ystem</i> <i>domain</i> <i>name</i> >		The primary group is <b>hive4</b> .	
	hbase		The primary group is <b>hadoop</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	hbase/ hadoop.< <i>S</i> <i>system</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	thrift		The primary group is <b>hadoop</b> .	
	thrift/ hadoop.< <i>S</i> <i>system</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	oozie		The primary group is <b>hadoop</b> .	
	hbase/ zkclient.< <i>S</i> <i>system</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	loader		The primary group is <b>hadoop</b> .	
	loader/ hadoop.< <i>S</i> <i>system</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	spark2x		The primary group is <b>hadoop</b> .	
	spark2x/ hadoop.< <i>S</i> <i>system</i> <i>domain</i> <i>name</i> >		The primary group is <b>hadoop</b> .	
	spark_zk		The primary group is <b>hadoop</b> .	
	spark2x1		The primary group is <b>hadoop</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	spark2x1/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	spark2x2		The primary group is <b>hadoop</b> .	
	spark2x2/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	spark2x3		The primary group is <b>hadoop</b> .	
	spark2x3/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	spark2x4		The primary group is <b>hadoop</b> .	
	spark2x4/ hadoop.< <i>System domain name</i> >		The primary group is <b>hadoop</b> .	
	kafka		The primary group is <b>kafkaadmin</b> .	
	kafka/ hadoop.< <i>System domain name</i> >		The primary group is <b>kafkaadmin</b> .	
	storm		The primary group is <b>stormadmin</b> .	
	storm/ hadoop.< <i>System domain name</i> >		The primary group is <b>stormadmin</b> .	

User Type	Default User	Initial Password	Description	Password Change Method
	storm_zk		The primary group is <b>storm</b> .	
	storm_zk/ hadoop.< <i>System domain name</i> >		The primary group is <b>storm</b> .	
	kms/ hadoop		The primary group is <b>kmsadmin</b> .	
	knox		The primary group is <b>compcommon</b> .	
	executor		The primary group is <b>compcommon</b> .	

 **NOTE**

Log in to FusionInsight Manager, choose **System > Permission > Domain and Mutual Trust**, and check the value of **Local Domain**. In the preceding table, all letters in the system domain name contained in the username of the system internal user are lowercase letters.

For example, if **Local Domain** is set to **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**, the username of default HDFS startup user is **hdfs/hadoop.9427068f-6efa-4833-b43e-60cb641e5b6c.com**.

## Database Users

The system database users include OMS database users and DBService database users.

Database Type	Default User	Initial Password	Description	Password Change Method
OMS database	ommdba	dbChangeMe@123456	OMS database administrator who performs maintenance operations, such as creating, starting, and stopping.	For details, see <a href="#">Changing the Password for the OMS Database Administrator</a> .

Database Type	Default User	Initial Password	Description	Password Change Method
	omm	ChangeMe@123456	User for accessing OMS database data	For details, see <a href="#">Changing the Password for the OMS Database Data Access User</a> .
DBService database	omm	dbserverAdmin@123	Administrator of the GaussDB database in the DBService component	For details, see <a href="#">Changing the Password for a Component Database User</a> .
	hive	HiveUser@	User for Hive to connect to the DBService database <b>hivemeta</b> .	
	hive1	HiveUser@	User for Hive1 to connect to the DBService database <b>hivemeta1</b> .	
	hive2	HiveUser@	User for Hive2 to connect to the DBService database <b>hivemeta2</b> .	
	hive3	HiveUser@	User for Hive3 to connect to the DBService database <b>hivemeta3</b> .	
	hive4	HiveUser@	User for Hive4 to connect to the DBService database <b>hivemeta4</b> .	
	hive <i>N</i>	HiveUser@	User for <b>Hive-N</b> to connect to the DBService database <b>hive<i>N</i>meta</b> when multiple services are installed.  For example, the user for <b>Hive-1</b> to connect to the DBService database <b>hive1meta</b> is <b>hive11</b> .	
	hue	HueUser@123	User for Hue to connect to the DBService database <b>hue</b> .	

Database Type	Default User	Initial Password	Description	Password Change Method
	sqoop	SqoopUser@	User for Loader to connect to the DBService database <b>sqoop</b> .	
	sqoopN	SqoopUser@	User for <b>Loader-N</b> to connect to the DBService database <b>sqoopN</b> when multiple services are installed.  For example, the user for <b>Loader-1</b> to connect to the DBService database <b>sqoop1</b> is <b>sqoop1</b> .	
	oozie	OozieUser@	User for Oozie to connect to the DBService database <b>oozie</b> .	
	oozieN	OozieUser@	User for <b>Oozie-N</b> to connect to the DBService database <b>oozieN</b> when multiple services are installed.  For example, the user for <b>Oozie-1</b> to connect to the DBService database <b>oozie1</b> is <b>oozie1</b> .	
	rangeraadmin	Admin12!	User for Ranger to connect to the DBService database <b>ranger</b> .	

### 12.12.1.6 Definitions

#### Role

Default Role	Description
Manager_administrator	<p>Manager administrator who has all permissions for Manager.</p> <p>Manager administrators can create first-level tenants, create and modify user groups, and specify user permissions.</p>

Default Role	Description
Manager_operator	Manager operator who has all the permissions on the <b>Homepage, Cluster, Hosts</b> , and <b>O&amp;M</b> tab pages.
Manager_auditor	Manager auditor who has all permissions on the <b>Audit</b> tab page. Manager auditors can view and manage Manager system audit logs.
Manager_viewer	Manager viewer who has the permission to view information about <b>Homepage, Cluster, Hosts, Alarm, Event</b> , and <b>System &gt; Permission</b> .
Manager_tenant	Manager tenant administrator. This role can create and manage sub-tenants for the non-leaf tenants to which the current user belongs. It has the permission to view alarms and events on <b>O&amp;M &gt; Alarm</b> .
System_administrator	System administrator, this role has Manager system administrator rights and all services administrator rights.
default	This role is the default role created for the <b>default</b> tenant. It has the management permissions on the Yarn component and the default queue. The default role of the default tenant that is not the first cluster to be installed is <b>c&lt;cluster ID&gt;_default</b> .
Manager_administrator_180	FusionInsight Manager System administrator group. Internal system user group, which is used only between components.
Manager_auditor_181	FusionInsight Manager system auditor group. Internal system user group, which is used only between components.
Manager_operator_182	FusionInsight Manager system operator group. Internal system user group, which is used only between components.
Manager_viewer_183	FusionInsight Manager system viewer group. Internal system user group, which is used only between components.
System_administrator_186	System administrator group. Internal system user group, which is used only between components.
Manager_tenant_187	Tenant system user group. Internal system user group, which is used only between components.
default_1000	This group is created for tenant. Internal system user group, which is used only between components.

## User group

Type	Default User Group	Description
OS User Group	hadoop	Users added to this group are granted the permission to submit all Yarn queue tasks.
	hadoopmanager	Users added to this user group can have the O&M manager rights of HDFS and Yarn. The O&M manager of HDFS can access the NameNode WebUI and perform active to standby switchover manually. The O&M manager of Yarn can access the ResourceManager WebUI, operate NodeManager nodes, refresh queues, and set node labels, but cannot submit tasks.
	hive	Common user group. Hive users must belong to this user group.
	hive1	Common user group. Hive1 users must belong to this user group.
	hive2	Common user group. Hive2 users must belong to this user group.
	hive3	Common user group. Hive3 users must belong to this user group.
	hive4	Common user group. Hive4 users must belong to this user group.
	kafka	Kafka common user group. A user in this group can access a topic only when a user in the kafkaadmin group grants the read and write permission of the topic to the user.
	kafkaadmin	Kafka administrator group. Users in this group have the rights to create, delete, authorize, read, and write all topics.
	kafkasuperuser	Topic read/write user group of Kafka. Users added to this group have the read and write permissions on all topics.
	storm	Users who are added to the storm user group can submit topologies and manage their own topologies.
	stormadmin	Users who are added to the stormadmin user group can have the storm administrator rights and can submit topologies and manage all topologies.
	supergroup	Users added to this user group can have the administrator rights of HBase, HDFS and Yarn and can use Hive.
yarnviewgroup	Indicates the read-only user group of the Yarn task. Users in this user group can have the view permission on Yarn and Mapreduce tasks.	

Type	Default User Group	Description
	check_sec_ldap	Perform internal test on the active LDAP to see whether it works properly. This user group is generated randomly in a test and automatically deleted after the test is complete. Internal system user group, which is used only between components.
	compcommon	System internal group for accessing cluster system resources. All system users and system running users are added to this user group by default.
OS User Group	wheel	Primary group of the FusionInsight internal running user omm.
	ficommon	System common group that corresponds to <b>compcommon</b> for accessing cluster common resource files stored in the OS.

 NOTE

If the current cluster is not the cluster that is installed for the first time in FusionInsight Manager, the default user group name of all components except Manager in the cluster is `c<cluster ID>_default user group name`, for example, `c2_hadoop`.

## User

For details, see [User Information Overview](#).

### Service-related User Security Parameters

- HDFS**  
 The `dfs.permissions.superusergroup` parameter specifies the administrator group with the highest permission on the HDFS. The default value is **supergroup**.
- Spark2x and Corresponding Multi-Instances**  
 The `spark.admin.acls` parameter specifies the administrator list of the Spark2x. Members in the list are authorized to manage all Spark tasks. Users not added in the list cannot manage all Spark tasks. The default value is **admin**.

#### 12.12.1.7 FusionInsight Manager Security Functions

You can query and set user rights data through the following FusionInsight Manager modules:

- User management: Users can be added, deleted, modified, queried, bound to user groups, and assigned with roles. For details, see [Managing Users](#).
- User group management: User groups can be added, deleted, modified, queried, and bound to roles. For details, see [Managing User Groups](#).

- Role management: Roles can be added, deleted, modified, queried, and assigned with the resource access rights of one or multiple components. For details, see [Managing Roles](#).
- Tenant management: Tenants can be added, deleted, modified, queried, and bound to component resources. The system generates a role for each tenant to facilitate management. If a tenant is assigned with the rights of some resources, its corresponding role also has these rights. For details, see [Tenant Resources](#).

## 12.12.2 Account Management

### 12.12.2.1 Account Security Settings

#### 12.12.2.1.1 Unlocking LDAP Users and Management Accounts

##### Scenario

If the LDAP user `cn=pg_search_dn,ou=Users,dc=hadoop,dc=com` and LDAP management accounts `cn=krbkdc,ou=Users,dc=hadoop,dc=com` and `cn=krbadmin,ou=Users,dc=hadoop,dc=com` are locked, the MRS cluster administrator must unlock these accounts.

##### NOTE

If you input an incorrect password for the LDAP user or management account for five consecutive times, the LDAP user or management account is locked. The account is automatically unlocked after 5 minutes.

##### Procedure

**Step 1** Log in to the active management node as user **omm** using the management IP address.

**Step 2** Run the following command to switch the specified directory:

```
cd ${BIGDATA_HOME}/om-server/om/ldapserver/ldapserver/local/script
```

**Step 3** Run the following command to unlock the LDAP user or management account:

```
./ldapserver_unlockUsers.sh USER_NAME
```

In the command, *USER\_NAME* indicates the name of the user to be unlocked.

For example, to unlock the LDAP management **account** `cn=krbkdc,ou=Users,dc=hadoop,dc=com`, run the following command:

```
./ldapserver_unlockUsers.sh krbkdc
```

After the script is executed, enter the password of user **krbkdc** behind **ROOT\_DN\_PASSWORD**. If the following information is displayed, the account is successfully unlocked.

```
Unlock user krbkdc successfully.
```

----End

## 12.12.2.1.2 Unlocking an Internal System User

### Scenario

If the service is abnormal, the internal user of the system may be locked. Please unlock the user promptly. Otherwise, the proper running of the cluster will be affected. For the list of system internal users, see [User Information Overview](#). The internal user of the system cannot be unlocked using FusionInsight Manager.

### Prerequisites

Obtain the default passwords of LDAP administrators **cn=root, dc=hadoop, and dc=com** based on the [User Information Overview](#) information list.

### Procedure

**Step 1** Use the following method to confirm whether the internal system username is locked:

1. oldap port number obtaining method:
  - a. Log in to the FusionInsight Manager, select **System > OMS > oldap > Modify Configuration**.
  - b. The **LDAP Listening Port** parameter value is **oldap port**.
2. Query domain name obtaining method:
  - a. Log in to the FusionInsight Manager, select **System > Permission > Domain and Mutual Trust**.
  - b. The **Local Domain** parameter value is the domain name.  
For example, the current system domain name is **9427068F-6EFA-4833-B43E-60CB641E5B6C.COM**.

3. Run the following command on each node in the cluster as user **omm** to query the number of password authentication failures:

```
ldapsearch -H ldaps://OMS_FLOAT_IP address:Oldap port -LLL -x -D  
cn=root,dc=hadoop,dc=com -b krbPrincipalName=internal system  
username@domain name,cn=domain  
name,cn=krbcontainer,dc=hadoop,dc=com -w Password of LDAP  
administrator cn=root,dc=hadoop,dc=com -e ppolicy | grep  
krbLoginFailedCount
```

For example, query the number of password authentication failures for user **oms/manager**.

```
ldapsearch -H ldaps://10.5.146.118:21750 -LLL -x -D  
cn=root,dc=hadoop,dc=com -b krbPrincipalName=oms/  
manager@9427068F-6EFA-4833-  
B43E-60CB641E5B6C.COM,cn=9427068F-6EFA-4833-  
B43E-60CB641E5B6C.COM,cn=krbcontainer,dc=hadoop,dc=com -w  
LdapChangeMe@123 -e ppolicy | grep krbLoginFailedCount
```

```
krbLoginFailedCount: 5
```

4. Log in to the FusionInsight Manager, select **System > Permission > Security Policy > Password Policy**.
5. View the Number of **Password Retries** parameter value, if the value is smaller than or equal to **krbLoginFailedCount**, the user is locked.

 NOTE

You can also check whether internal users are locked by viewing operations logs.

**Step 2** Log in to active management node as user omm, run the following command to unlock the user.

```
sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/unlockuser.sh --  
userName internal system username
```

For example,

```
sh ${BIGDATA_HOME}/om-server/om/share/om/acs/config/unlockuser.sh --  
userName oms/manager
```

----End

### 12.12.2.1.3 Enabling and Disabling Permission Verification on Cluster Components

#### Scenario

When the cluster is deployed in Security Mode or Normal Mode, HDFS and ZooKeeper verify the permission of users who attempt to access the services by default. Users without related permission cannot access resources in HDFS and ZooKeeper. When the cluster is deployed in Normal Mode, HBase and Yarn do not verify the permission of users who attempt to access the services by default. All users can access resources in HBase and Yarn.

Based on actual service requirements, the MRS cluster administrator can enable permission verification on HBase and Yarn in the cluster in Normal Mode or disable permission verification on HDFS and ZooKeeper.

#### Impact on the System

After the permission verification is modified, the service configuration will expire. You need to restart the corresponding service for the configuration to take effect.

#### Procedure

**Enable permission verification on HBase.**

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for parameters **hbase.coprocessor.region.classes**, **hbase.coprocessor.master.classes**, and **hbase.coprocessor.regionserver.classes**.

Add the coprocessor parameter value **org.apache.hadoop.hbase.security.access.AccessController** to the end of the values of the preceding parameters, and separate the value from the original coprocessor parameter values by using a comma (,).

**Step 5** Click **Save** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

### Disable permission verification on HBase.

#### NOTE

After HBase permission verification is disabled, the existing permission data will be retained. If you want to delete permission information, disable permission verification, enter the HBase shell, and delete table **hbase:acl**.

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for parameters **hbase.coprocessor.region.classes**, **hbase.coprocessor.master.classes**, and **hbase.coprocessor.regionserver.classes**.

Delete the coprocessor parameter value **org.apache.hadoop.hbase.security.access.AccessController**.

**Step 5** Click **Save** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

### Disable permission verification on HDFS.

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for parameters **dfs.namenode.acls.enabled** and **dfs.permissions.enabled**.

- **dfs.namenode.acls.enabled** specifies whether the HDFS ACL is enabled. The default value is **true**, which indicates that the ACL is enabled. Change the value to **false**.
- **dfs.permissions.enabled** specifies whether the permission check is enabled on HDFS. The default value is **true**, which indicates that the permission check is enabled. Change the value to **false**. After the parameters are modified, the directories, owners and groups of files, and permission information in HDFS retain the same.

**Step 5** Click **Save Configuration** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

### Enable permission verification on Yarn.

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for the parameter **yarn.acl.enable**.

**yarn.acl.enable** specifies whether the permission check is enabled on Yarn.

- In normal mode, the value is set to **false** by default to disable permission check. To enable permission check, change the value to **true**.
- In security mode, the value is set to **true** by default to enable authentication.

**Step 5** Click **Save** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

**Disable permission verification on ZooKeeper.**

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations**.

**Step 3** Click **All Configurations**.

**Step 4** Search for the parameter **skipACL**.

**skipACL** specifies whether the ZooKeeper permission check is skipped. The default value is **no**, which indicates that the permission check is used. Change the value to **yes**.

**Step 5** Click **Save** and click **OK**.

When **Operation succeeded** is displayed, click **Finish**.

----End

#### 12.12.2.1.4 Logging In to a Non-Cluster Node Using a Cluster User in Normal Mode

##### Scenario

When the cluster is installed in normal mode, the component clients do not support Kerberos authentication and cannot use the **kinit** command. Therefore, nodes outside the cluster cannot use users in the cluster by default. This may result in a user authentication failure when one of these nodes access a component server.

The node administrator can configure a user who has the same name as that of a user for a node outside the cluster, allow the user to log in to the node using the SSH protocol, and connect to the servers of components in the cluster by using the user who logs in to the OS.

##### Prerequisites

- The node outside the cluster can connect to the cluster service plane.
- The KrbServer service of the cluster is running properly.

- You have obtained the password of user **root** of the node outside the cluster.
- A **Human-machine** user has been planned and added to the cluster, and you have obtained the authentication credential file. For details, see [Creating a User](#) and [Exporting an Authentication Credential File](#).

## Procedure

**Step 1** Log in to the node where a user is to be added as user **root**.

**Step 2** Run the following commands:

```
rpm -qa | grep pam and rpm -qa| grepkrb5-client
```

The following RPM packages are displayed:

```
pam_krb5-32bit-2.3.1-47.12.1
pam-modules-32bit-11-1.22.1
yast2-pam-2.17.3-0.5.211
pam-32bit-1.1.5-0.10.17
pam_mount-32bit-0.47-13.16.1
pam-config-0.79-2.5.58
pam_krb5-2.3.1-47.12.1
pam-doc-1.1.5-0.10.17
pam-modules-11-1.22.1
pam_mount-0.47-13.16.1
pam_ldap-184-147.20
pam-1.1.5-0.10.17
krb5-client-1.6.3
```

**Step 3** Check whether the RPM packages in the list are installed in the OS.

- If yes, go to [Step 5](#).
- If no, go to [Step 4](#).

**Step 4** Obtain the lacked RPM packages from the OS image, upload the files to the current directory, and run the following command to install the RPM packages:

```
rpm -ivh *.rpm
```

### NOTE

The RPM packages to be installed may bring security risks. The risks that may be brought by the installation of these RPM packages must be taken into consideration during OS hardening.

After the RPM packages are installed, go to [Step 5](#).

**Step 5** Run the following command to configure Kerberos authentication on PAM:

```
pam-config --add --krb5
```

### NOTE

If you need to cancel Kerberos authentication and system user login on a non-cluster node, run the **pam-config --delete --krb5** command as user **root**.

**Step 6** Decompress the authentication credential file to obtain **krb5.conf**, use WinSCP to upload this configuration file to the **/etc** directory on the node outside the cluster, and run the following command to configure related permission to enable other users to access the file, such as permission **604**:

```
chmod 604 /etc/krb5.conf
```

**Step 7** Run the following command in the connection session as user **root** to add the corresponding OS user to the **Human-machine** user, and specify **root** as the primary group.

The OS user password is the same as the initial password when the **Human-machine** user is created on Manager.

```
useradd Username -m -d /home/admin_test -g root -s /bin/bash
```

For example, if the name of the **Human-machine** user is **admin\_test**, run the following command:

```
useradd admin_test -m -d /home/admin_test -g root -s /bin/bash
```

#### NOTE

When you use the newly added OS user to log in to the node by using the SSH protocol for the first time, the system prompts that the password has expired after you enter the user password, and the system prompts that the password needs to be changed after you enter the user password again. You need to enter a new password that meets the password complexity requirements of both the node OS and the cluster.

----End

## 12.12.2.2 Changing the Password for a System User

### 12.12.2.2.1 Changing the Password for User admin

#### Scenario

The user **admin** is the administrator account of FusionInsight Manager, periodically change the password for user **admin** to improve system security.

#### Procedure

**Step 1** Log in to FusionInsight Manager.

Log in to the system as user **admin**.

**Step 2** Move the cursor to **Hello, admin** in the upper right corner of the page.

In the displayed menu, click **Change Password**.

**Step 3** Set **Old Password**, **New Password**, and **Confirm Password**, and click **OK**.

The password complexity requirements are as follows by default:

- The password ranges from 8 to 64 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, spaces, and special characters which can only be ~`!?,;,-\_'(){}[]/<>@#\$\$%^&\*+|\=.
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.

- The password cannot be the same as the password that used in latest  $N$  times.  $N$  indicates the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

## 12.12.2.2 Changing the Password for an OS User

### Scenario

During FusionInsight Manager installation, the system automatically creates user **omm** and **ommdba** on each node in the cluster. Periodically change the login passwords of the OS users **omm** and **ommdba** of the cluster node to improve the system O&M security.

The passwords of users **omm** and **ommdba** of the nodes can be different.

### Prerequisites

- Obtain the IP address of the node where the passwords of users **omm** and **ommdba** are to be changed.
- You need to obtain the password of user **root** before modifying user **ommdba** and **omm**.

## Change the password of an OS User

**Step 1** Log in to the node where the password is to be changed as user **root**.

**Step 2** Run the following command to change the user password:

```
passwd ommdba
```

Red Hat system displays the following information:

```
Changing password for user ommdba.  
New password:
```

**Step 3** Enter a new password. The policy for changing the password of an OS user varies according to the OS that is actually used.

```
Retype New Password:  
Password changed.
```

----End

## 12.12.2.3 Changing the Password for a System Internal User

### 12.12.2.3.1 Changing the Password for the Kerberos Administrator

#### Scenario

Periodically change the password for the Kerberos administrator **kadmin** to improve the system O&M security.

If the user password is changed, the OMS Kerberos administrator password is changed as well.

## Prerequisites

You have installed the client on any node in the cluster and obtain the IP address of the node.

## Procedure

**Step 1** Log in to the node where the client is installed as user root.

**Step 2** Run the following command to go to the client directory, such as `/opt/hadoopclient`:

```
cd /opt/hadoopclient
```

**Step 3** Run the following command to configure environment variables:

```
source bigdata_env
```

**Step 4** Run the following command to change the password for kadmin/admin. The password changing takes effect on all servers.

```
kpasswd kadmin/admin
```

The password complexity requirements are as follows by default:

- The password contains at least 8 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, spaces, and special characters which can only be `~`!?,;:_'(){}[]/<>@#%$^&*+|\=`.
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- The password cannot be the same as the password that used in latest *N* times. *N* indicates the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

### 12.12.2.3.2 Changing the Password for the OMS Kerberos Administrator

#### Scenario

Periodically change the password for the OMS Kerberos administrator **kadmin** to improve the system O&M security.

If the user password is changed, the Kerberos administrator password is changed as well.

#### Procedure

**Step 1** Log in to the management node using the management IP address as user **omm**.

**Step 2** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts
```

**Step 3** Run the following command to configure environment variables:

```
source component_env
```

**Step 4** Run the following command to change the password for kadmin/admin. The password changing takes effect on all servers.

```
kpasswd kadmin/admin
```

The password complexity requirements are as follows by default:

- The password contains at least 8 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be `~`!?,;:-'(){}[]/<>@#$$%^&*+|\=.`
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- The password cannot be the same as the password that used in latest *N* times. *N* indicates the value of **Repetition Rule** in [Configuring Password Policies](#).

----End

### 12.12.2.3.3 Changing the Passwords of the LDAP Administrator and the LDAP User (Including OMS LDAP)

#### Scenario

Periodically change the passwords of LDAP administrator **cn=root,dc=hadoop,dc=com** and LDAP user **cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.

If the passwords are changed, the password of the OMS LDAP administrator or user is changed as well.

#### NOTE

If the cluster is upgraded from an early version to a latest version, the LDAP administrator password will inherit the password policy of the old cluster. To ensure system security, you are advised to change the password after the cluster upgrade.

#### Impact on the System

- Changing the user password of the LdapServer service is a high-risk operation and requires restarting the KrbServer and LdapServer services. If KrbServer is restarted, users may fail to be queried by running the **id** command on nodes in the cluster temporarily. Therefore, exercise caution when restarting KrbServer.
- After the password of LDAP user **cn=pg\_search\_dn,ou=Users,dc=hadoop,dc=com** is changed, the user may be locked in the LDAP component. Therefore, you are advised to unlock the user after changing the password. For details about how to unlock the user, see [Unlocking LDAP Users and Management Accounts](#).

## Prerequisites

Before changing the password of LDAP user `cn=pg_search_dn,ou=Users,dc=hadoop,dc=com`, ensure that the user is not locked by running the following command on the active management node of the cluster:

### NOTE

To query the LDAP port number, perform the following steps:

1. Log in to FusionInsight Manager, choose **System > OMS > oldap > Modify Configuration**:
2. The value of **LDAP Service Listening Port** is the LDAP port.

```
ldapsearch -H ldaps://Floating IP address of OMS:LDAP port-LLL -x -D
cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -W -b
cn=pg_search_dn,ou=Users,dc=hadoop,dc=com -e ppolicy
```

Enter the password of the LDAP user `pg_search_dn`. If the following information is displayed, the user is locked. In this case, unlock the user. For details, see [Unlocking LDAP Users and Management Accounts](#).

```
ldap_bind: Invalid credentials (49); Account locked
```

## Procedure

**Step 1** Log in to FusionInsight Manager and choose **Cluster > Name of the desired cluster > Service > LdapServer**.

**Step 2** Choose **More > Change Database Password**. In the displayed dialog box, enter the password of the current login user and click **OK**.

**Step 3** In the **Change Password** dialog box, select the user whose password to be modified in the **User Information** drop-down box.

**Step 4** Enter the old password in the **Old Password** text box, and enter the new password in the **New Password** and **Confirm Password** text boxes.

The password complexity requirements are as follows by default:

- The password must contain 16 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, spaces, and special characters (`~!@#$%^&*()-_+=|[]{};,<.>/?`).
- The password cannot be the same as the username or reverse username.
- The password cannot be the same as the current password.

**Step 5** Select **I have read the information and understood the impact** and click **OK** to confirm the modification and restart the service.

----End

### 12.12.2.3.4 Changing the Password for the LDAP Administrator

#### Scenario

Periodically change the passwords of LDAP administrator accounts `cn=krbkd,ou=Users,dc=hadoop,dc=com` and

**cn=krbadmin,ou=Users,dc=hadoop,dc=com** to improve the system O&M security.If the user password is changed, the OMS LDAP administrator password is changed as well.

## Impact on the System

1. You need to restart the KrbServer service after changing the password.
2. After the password is changed, check whether the LDAP management accounts **cn=krbkdc,ou=Users,dc=hadoop,dc=com** and **cn=krbkdc,ou=Users,dc=hadoop,dc=com** are locked. Run the following command on the active OMS node to check whether **krbkdc** is locked (similar method for **krbadmin**):

### NOTE

ldap port number obtaining method:

1. Log in to the FusionInsight Manager, select **System > OMS > ldap > Modify Configuration**.
2. The **LDAP Listening Port** parameter value is ldap port.

```
ldapsearch -H ldaps://OMS_FLOAT_ IP address:Oldap port -LLL -x -D  
cn=krbkdc,ou=Users,dc=hadoop,dc=com -W -b cn=  
krbkdc,ou=Users,dc=hadoop,dc=com -e ppolicy
```

Enter the password for the LDAP management account **krbkdc**. If the following message is displayed, the account is locked. For details on how to unlock the account, see [Unlocking LDAP Users and Management Accounts](#).

```
ldap_bind: Invalid credentials (49); Account locked
```

## Prerequisites

You have obtained the active management node IP address.

## Procedure

**Step 1** Log in to the management node using the active management IP address as user **omm**.

**Step 2** Run the following command to go to the related directory:

```
cd ${BIGDATA_HOME}/om-server/om/meta-0.0.1-SNAPSHOT/kerberos/scripts
```

**Step 3** Run the following command to change the password of the LDAP administrator accounts.

```
./okerberos_modpwd.sh
```

Enter the old password and enter a new password twice.

The password complexity requirements are as follows:

- The password ranges from 16 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ``~!@#$%^&*()-_+=+[{]};<.>/?`.
- The password cannot be the same as the previous password.

If the following information is displayed, the password is changed successfully.

```
Modify kerberos server password successfully.
```

- Step 4** Log in to FusionInsight Manager and choose **Cluster > Name of the desired cluster > Services > KrbServer > More > Restart Service**. Enter the password and do not select **Restart upper-layer services**. Click **OK** to restart the KrbServer service.

----End

### 12.12.2.3.5 Changing the Password for a Component Running User

#### Scenario

Periodically change the password for each component running user to improve the system O&M security.

Component running users can be classified into the following two types depending on whether their initial passwords are randomly generated by the system:

- If the initial password of a component running user is randomly generated by the system, the user is of the **Machine-Machine** type.
- If the initial password of a component running user is not randomly generated by the system, the user is of the **Human-Machine** type.

#### Impact on the System

All services need to be restarted for the password changing to take effect. The services are unavailable during the cluster restart.

#### Prerequisites

You have installed the client on any node in the cluster and obtain the IP address of the node.

#### Procedure

- Step 1** Log in to the node where the client is installed as user **root**.
- Step 2** Run the following command to go to the client directory, such as **/opt/Bigdata/client**:
- ```
cd /opt/Bigdata/client
```
- Step 3** Run the following command to configure environment variables:
- ```
source bigdata_env
```
- Step 4** Run the following command and enter the password of user **kadmin/admin** to log in to the **kadmin** console:
- ```
kadmin -p kadmin/admin
```

#### NOTE

The default password of user **kadmin/admin** is **Admin@123**, Change the password as prompted and keep the new password secure.

**Step 5** Run the following command to change the password of an internal system user. The password changing takes effect on all servers.

```
cpw internal system username
```

For example: **cpw oms/manager**

The password complexity requirements are as follows by default:

- The password contains at least 8 characters.
- The password must contain at least four types of the following: lowercase letters, uppercase letters, digits, spaces, and special characters which can only be ~`!?,;:\_'(){}[]/<>@#\$\$%^&\*+|\|=.
- The password cannot be the same as the username or reverse username.
- The password cannot be a common password that is easy to crack, for example, **Admin@12345**.
- The password cannot be the same as the password that used in latest *N* times. *N* indicates the value of **Repetition Rule** in **Configuring Password Policies**. The policy affects only users of the **Human-Machine** type.

 **NOTE**

Run the following command to check user information:

```
getprinc internal system username
```

For example: **getprinc oms/manager**

**Step 6** Determine the type of the user whose password needs to be changed.

- If the user is a **Machine-Machine** user, perform **Step 7**.
- If the user is a **Human-Machine** user, the password is changed and no further action is required.

**Step 7** Log in to FusionInsight Manager.

**Step 8** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **More** > **Restart**.

**Step 9** In the displayed window, enter the password of the current login administrator user and click **OK**.

**Step 10** In the displayed dialog box, click **OK** to restart the cluster.

**Step 11** After the system displays "**Operation succeeded**", click **Finish**. The cluster is successfully started.

----End

## 12.12.2.4 Changing the Password for a Database User

### 12.12.2.4.1 Changing the Password for the OMS Database Administrator

#### Scenario

Periodically change the password for the OMS database administrator to ensure the system O&M security.

## Procedure

**Step 1** Log in to the active management node using the active management IP address as user **root**.

 **NOTE**

The password of user **ommdba** cannot be changed on the standby management node; otherwise, the cluster cannot work properly. The password of user **ommdba** can be changed after the system administrator performs operation only on the active management node. The operation does not need to be performed on the standby management node.

**Step 2** Run the following command to switch to the user:

```
su - omm
```

**Step 3** Run the following command to go to the directory:

```
cd $OMS_RUN_PATH/tools
```

**Step 4** Run the following command to change the password for user **ommdba**:

```
mod_db_passwd ommdba
```

**Step 5** Enter the old password of user **ommdba** and enter a new password twice. The password changing takes effect on all servers.

The password complexity requirements are as follows:

- The password ranges from 16 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`!@#%&^&\*()-+\_=\\|[{];",<.>/?
- The password cannot be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully.

```
Congratulations, update [ommdba] password successfully.
```

```
----End
```

### 12.12.2.4.2 Changing the Password for the OMS Database Data Access User

#### Scenario

Periodically change the password for the OMS data access user to ensure the system O&M security.

#### Impact on the System

The OMS service needs to be restarted for the password changing to take effect. The cluster is unavailable during the restart.

#### Procedure

**Step 1** Choose **System > OMS > gaussDB > Change Password** on FusionInsight Manager.

- Step 2** Locate the row that contains user **omm** and click **Change Password** in the **Operation** to change the password for the OMS database user.
- Step 3** In the displayed window, enter the password of the current login administrator user and click **OK**.
- Step 4** Enter the old and new passwords as prompted.
- The password complexity requirements are as follows:
- The password ranges from 8 to 32 characters.
  - The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`!@#\$\$%^&\*()-+\_=\\|{};";<.>/?
  - The password cannot be the same as the username or reverse username.
  - The password cannot be the same as the last 20 historical passwords.
- Step 5** Click **OK**. After the system displays **Operation succeeded**, click **Finish**.
- Step 6** Locate the row that contains user **omm** and click **Restart OMS Service** in the **Operation** to restart the OMS database.
- Step 7** In the displayed window, enter the password of the current login administrator user and click **OK**.
- Step 8** In the dialog box that is displayed, click **OK**, and then restart the OMS service.
- End

### 12.12.2.4.3 Changing the Password for a Component Database User

#### Scenario

Periodically change the password for each component database user to improve the system O&M security.

#### Impact on the System

The services need to be restarted for the password changing to take effect. The services are unavailable during the restart.

#### Procedure

- Step 1** Choose **Cluster > Name of the desired cluster > Services** on FusionInsight Manager.
- Step 2** Determine the component database user whose password is to be changed.
- To change the password for the other service database user, you must stop the service first, and go to **Step 3**.
- Step 3** Click the service whose database user password is to be changed and choose **More > Change Database Password**. In the displayed window, enter the password of the current login administrator user and click **OK**.
- Step 4** Enter the old and new passwords as prompted.
- The password complexity requirements are as follows:

- The passwords of component databases contain 8 to 32 characters.
- The password must contain at least three types of the following: lowercase letters, uppercase letters, digits, and special characters which can only be ~`!@#\$\$%^&\*()-+\_=|[{}];",<.>/?
- The password cannot be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

**Step 5** Select **I have read the information and understood the impact.** and click **OK**.

**Step 6** After the password is changed, choose **More > Restart Service**. In the dialog box that is displayed, enter the password of the current login user, click **OK**, select **Restart upper-layer services**, and click **OK** to restart the service.

----End

#### 12.12.2.4.4 Changing the Password for User omm in DBService

**Step 1** Log in to the active DBService node as user **root**.

 **NOTE**

The password of user **omm** for the DBService database cannot be changed on the standby DBService node. Change the password on the active DBService node only.

**Step 2** Run the following command to switch the user.

```
su - omm
```

**Step 3** Run the following command to switch the directory:

```
source $DBSERVER_HOME/.dbservice_profile  
cd ${DBSERVICE_SOFTWARE_DIR}/sbin/
```

**Step 4** Run the following command to change the password of user **omm**:

```
sh modifyDBPwd.sh
```

**Step 5** Enter the old password of user **omm** and enter a new password twice.

The password complexity requirements are as follows:

- The password must contain 8 to 32 characters.
- The password must contain at least three types of the following: uppercase letters, lowercase letters, digits, and special characters (~`!@#\$\$%^&\*()-+\_=|[{}];",<.>/?).
- Must not be the same as the username or reverse username.
- The password cannot be the same as the last 20 historical passwords.

If the following information is displayed, the password is changed successfully:

```
Successful to modify password.
```

----End

### 12.12.3 Security Hardening

### 12.12.3.1 Hardening Policy

#### Hardening Tomcat

Tomcat is hardened as follows based on open-source software during FusionInsight Manager software installation and use:

- The Tomcat version is upgraded to the official version.
- Rights on directories under webapplications are set to 500. Some directories under webapplications support the write permission.
- The Tomcat installation package is automatically deleted after system software is installed.
- The automatic deployment function is disabled for projects under webapplications. Only three projects, web, cas and client-registry projects, are deployed.
- Some unused http methods are disabled, preventing attacks by using the http methods.
- The default shutdown port and command of the Tomcat server are changed to prevent hackers from shutting down the server and attacking servers and applications.
- To ensure security, the value of **maxHttpHeaderSize** is changed, which enables server administrators to control abnormal requests of clients.
- The Tomcat version description file is modified after Tomcat is installed.
- To prevent disclosure of Tomcat information, the Server attributes of Connector are modified so that attackers cannot obtain information about the server.
- Rights on files and directories of Tomcat, such as the configuration files, executable files, log directories, and temporary folders, are under control.
- Session facade recycling is disabled to prevent request leakage.
- LegacyCookieProcessor is used as CookieProcessor to prevent the leakage of sensitive data in cookies.

#### Hardening LDAP

LDAP is hardened as follows after a cluster is installed:

- In the LDAP configuration file, the password of the MRS cluster administrator account is encrypted using SHA. After the openldap is upgraded to 2.4.39 or later, data is automatically synchronized between the active and standby LDAP nodes using the SASL External mechanism, which prevents disclosure of the password.
- The LDAP service in the cluster supports the SSLv3 protocol by default, which can be used safely. When the openldap is upgraded to 2.4.39 or later, the LDAP automatically users TLS1.0 or later to prevent unknown security risks.

#### Hardening JDK

- If the client process uses the AES256 encryption algorithm, JDK security hardening is required. The operations are as follows:

Obtain the Java Cryptography Extension (JCE) package whose version matches that of JDK. The JCE package contains **local\_policy.jar** and **US\_export\_policy.jar**. Copy the JAR files to the following directory and replace the files in the directory.

Linux: **JDK installation directory/jre/lib/security**

Windows: **JDK installation directory\jre\lib\security**

#### NOTE

Access the Open JDK open-source community to obtain the JCE file.

- If the client process uses the SM4 encryption algorithm, the JAR package needs to be updated.

Obtain the **SMS4JA.jar** in **Client installation directory/JDK/jdk/jre/lib/ext/**, and copy the JAR package to the following directory:

Linux: **JDK directory/jre/lib/ext/**

Windows: **JDK directory\jre\lib\ext\**

## 12.12.3.2 Configuring a Trusted IP Address to Access LDAP

### Scenario

By default, the LDAP service deployed in the OMS and cluster can be accessed by any IP address. To enable the LDAP service to be accessed by only trusted IP addresses, you can configure the INPUT policy in the iptables filtering list.

### Impact on the System

After the configuration, the LDAP service cannot be accessed by IP addresses that are not configured. Before the expansion, the added IP addresses need to be configured as trusted IP addresses.

### Prerequisites

- You have collected the management plane IP addresses and service plane IP addresses of all nodes in the cluster and all floating IP addresses.
- You have obtained the root user account and password of all nodes in the cluster.

### Procedure

**Configure trusted IP addresses for the LDAP service on the OMS.**

- Step 1** Confirm the management node IP address. For details, see [Logging In to the Management Node](#).
- Step 2** Log in to FusionInsight Manager. For details, see [Logging In to FusionInsight Manager](#).
- Step 3** Choose **System > OMS**, and choose **oldap > Modify Configuration**, and view the OMS LDAP port number (which is the value of **LDAP Listening Port**). The default port number is **21750**.

**Step 4** Log in to the active management node using the active management IP address as user **root**.

**Step 5** Run the following command to view the INPUT policy in the iptables filtering list:

**iptables -L**

For example, when no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source      destination
```

**Step 6** Run the following command to configure all IP addresses used by the cluster as trusted IP addresses. Each IP address needs to be added independently.

**iptables -A INPUT -s *Trusted IP address* -p tcp --dport *Port number* -j ACCEPT**

For example, to configure 10.0.0.1 as a trusted IP address and enable it to access port 21750, you need to run the following command:

**iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21750 -j ACCEPT**

**Step 7** Run the following command to configure all IP addresses as untrusted IP addresses. The trusted IP addresses will not be affected by this rule.

**iptables -A INPUT -p tcp --dport *Port number* -j DROP**

For example, to disable all IP addresses to access port 21750, you need to run the following command:

**iptables -A INPUT -p tcp --dport 21750 -j DROP**

**Step 8** Run the following command to view the modified INPUT policy in the iptables filtering list:

**iptables -L**

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target     prot opt source      destination      tcp dpt:21750
ACCEPT    tcp  --  10.0.0.1     anywhere
DROP      tcp  --  anywhere    anywhere         tcp dpt:21750
```

**Step 9** Run the following command to view the rules and rule numbers in the iptables filtering list:

**iptables -L -n --line-number**

```
Chain INPUT (policy ACCEPT)
num target     prot opt source      destination      tcp dpt:21750
1 DROP      tcp  --  0.0.0.0/0   0.0.0.0/0         tcp dpt:21750
```

**Step 10** Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

**iptables -D INPUT *number of the rule to be deleted***

For example, to delete rule 1, run the following command:

**iptables -D INPUT 1**

**Step 11** Log in to the standby management node using the standby management IP address as user **root**, and repeat [Step 5](#) to [Step 10](#).

**Configure trusted IP addresses for the LDAP service in the cluster.**

**Step 12** Log in to FusionInsight Manager.

**Step 13** Choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Instance**, and view the nodes where the LDAP services locate.

**Step 14** Go to the **Configurations** page, and view the cluster LDAP port number (which is the value of **LDAP\_SERVER\_PORT**). The default port number is **21780**.

**Step 15** Log in to the LDAP node using the LDAP service IP address as user **root**.

**Step 16** Run the following command to view the INPUT policy in the iptables filtering list:

**iptables -L**

For example, when no rule is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target    prot opt source      destination
```

**Step 17** Run the following command to configure all IP addresses used by the cluster as trusted IP addresses. Each IP address needs to be added independently.

**iptables -A INPUT -s Trusted IP address -p tcp --dport Port number -j ACCEPT**

For example, to configure 10.0.0.1 as a trusted IP address and enable it to access port 21780, you need to run the following command:

**iptables -A INPUT -s 10.0.0.1 -p tcp --dport 21780 -j ACCEPT**

**Step 18** Run the following command to configure all IP addresses as untrusted IP addresses. The trusted IP addresses will not be affected by this rule.

**iptables -A INPUT -p tcp --dport Port number -j DROP**

For example, to disable all IP addresses to access port 21780, you need to run the following command:

**iptables -A INPUT -p tcp --dport 21780 -j DROP**

**Step 19** Run the following command to view the modified INPUT policy in the iptables filtering list:

**iptables -L**

For example, after a trusted IP address is configured, the INPUT policy is displayed as follows:

```
Chain INPUT (policy ACCEPT)
target    prot opt source      destination
ACCEPT    tcp  --  10.0.0.1    anywhere    tcp dpt:21780
DROP      tcp  --  anywhere    anywhere    tcp dpt:21780
```

**Step 20** Run the following command to view the rules and rule numbers in the iptables filtering list:

**iptables -L -n --line-number**

```
Chain INPUT (policy ACCEPT)
num target    prot opt source      destination
1 DROP      tcp  --  0.0.0.0/0    0.0.0.0/0    tcp dpt:21750
```

**Step 21** Run the following command to delete the desired rule from the iptables filtering list based on site requirement:

**iptables -D INPUT** *number of the rule to be deleted*

For example, to delete rule 1, run the following command:

**iptables -D INPUT 1**

**Step 22** Log in to the LDAP node using the IP address of another LDAP service IP address as user **root**, and repeat [Step 16](#) to [Step 21](#).

----End

### 12.12.3.3 HFile and WAL Encryption

#### HFile and WAL Encryption

---

**NOTICE**

- Setting the HFile and WAL encryption mode to SMS4 or AES has a great impact on the system and will cause data loss in case of any misoperation. Therefore, this operation is not recommended.
  - Batch data import using Bulkload does not support data encryption.
- 

HFile and Write ahead log (WAL) in HBase are not encrypted by default. To encrypt them, perform the following operations.

**Step 1** On any HBase node, run the following commands to create a key file as user **omm**:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-  
HBase-2.2.3/hbase/bin/hbase-encrypt.sh <path>/hbase.jks <type> <length>  
<alias>
```

- *<path>/hbase.jks* indicates the path of the generated jks file.
- **<type>** indicates the encryption type, which can be SMS 4 or AES.
- **<length>** indicates the key length. SMS 4 supports 16-bit and AES supports 128-bit.
- *<alias>* indicates the alias name of key file. When you create the key file for the first time, retain the default value **omm**.

For example, to generate an SMS4 encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-  
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks SMS4 16  
omm
```

To generate an AES encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-  
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks AES 128  
omm
```

 NOTE

- The cluster operation user must have the **rw** permission of the `<path>/hbase.jks` directory. The directory requires already exists.
- After running the command, enter the same `<password>` four times. The password encrypted in [Step 3](#) is the same as the password in this step.

**Step 2** Distribute the generated key files to the same directory on all nodes in the cluster and assign read and write permission to user **omm**.

 NOTE

- You need to select a safe procedure to distribute keys based on the enterprise security requirements.
- If the key files of some nodes are lost, repeat the step to copy the key files from other nodes.

**Step 3** On FusionInsight Manager, set **hbase.crypto.keyprovider.parameters.encryptedtext** to the encrypted password. Set **hbase.crypto.keyprovider.parameters.uri** to the path and name of the key file.

- Format of **hbase.crypto.keyprovider.parameters.uri**: `jceks://<key_Path_Name>`.  
`<key_Path_Name>` indicates the path of the key file. For example, if the path of the key file is `/home/hbase/conf/hbase.jks`, set this parameter to `jceks:///home/hbase/conf/hbase.jks`.
- Format of **hbase.crypto.keyprovider.parameters.encryptedtext**: `<encrypted_password>`.  
`<encrypted_password>` indicates the encrypted password generated during the key file creation. The parameter value is displayed in ciphertext. Run the following command as user **omm** to obtain the related encrypted password on the nodes where HBase service is installed:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh
```

 NOTE

After running the command, enter the `<password>`. The password is the same as that in [Step 1](#).

**Step 4** On FusionInsight Manager, set **hbase.crypto.key.algorithm** to **SMS4** or **AES** to use SMS4 or AES for HFile encryption.

**Step 5** On FusionInsight Manager, set **hbase.crypto.wal.algorithm** to **SMS4** or **AES** to use SMS4 or AES for WAL encryption.

**Step 6** On FusionInsight Manager, set **hbase.regionserver.wal.encryption** to **true**.

**Step 7** Save the settings and restart the HBase service for the settings to take effect.

**Step 8** Set the encryption mode when creating an HBase table. `<type>` indicates the encryption type.

- When creating a table using commands, directly set the encryption mode to SMS4 or AES.

```
create ' <table name>', {NAME => 'd', ENCRYPTION => '<type>'}
```

During the **HFile and WAL Encryption** operation, the related key file must be generated and its password must be set to ensure system security. After a period of running, you can replace the key file with a new one to encrypt HFile and WAL.

**Step 1** Run the following command to generate a new key file as user **omm**:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh <path>/hbase.jks <type> <length>
<alias-new>
```

- *<path>/hbase.jks*: indicates the path of the generated **hbase.jks** file. The path and file name must be consistent with those of the key file generated in **HFile and WAL Encryption**.
- *<alias-new>*: indicates the alias of the key file. The alias must be different with that of the old key file.
- *<type>* indicates the encryption type, which can be SMS 4 or AES.
- *<length>* indicates the key length. SMS 4 supports 16-bit and AES supports 128-bit.

For example, to generate an SMS4 encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks SMS4 16
omm_new
```

To generate an AES encryption key, run the following command:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-
HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks AES 128
omm_new
```

 **NOTE**

- The cluster operation user must have the **rw** permission of the *<path>/hbase.jks* directory. The directory requires already exists.
- After running the command, enter the same *<password>* three times. The password indicates the password of key files. The password of the old key file can be used, which does not cause any security risk.

**Step 2** Distribute the generated key files to the same directory on all nodes in the cluster and assign read and write permission to user **omm**.

 **NOTE**

You need to select a safe procedure to distribute keys based on the enterprise security requirements.

**Step 3** On the HBase service configuration page of FusionInsight Manager, add custom configuration items, set **hbase.crypto.master.key.name** to **omm\_new**, set **hbase.crypto.master.alternate.key.name** to **omm**, and save the settings.

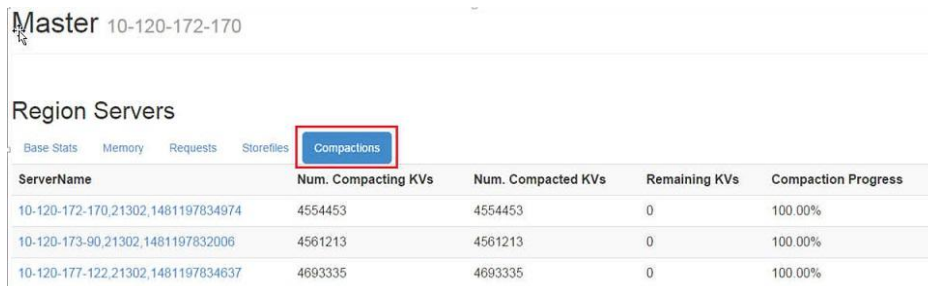

| Parameter              | Value                                  |              |
|------------------------|----------------------------------------|--------------|
| hadoop.config.expandor | <b>Name</b>                            | <b>Value</b> |
|                        | hbase.crypto.master.key.name           | omm_new      |
|                        | hbase.crypto.master.alternate.key.name | omm          |

**Step 4** Restart the HBase service for the configuration to take effect.

**Step 5** In HBase shell, run the **major compact** command to generate the HFile file based on the new encryption algorithm.

```
major_compact '<table_name>'
```

**Step 6** You can view the major compact progress from the HMaster web page.

| ServerName                         | Num. Compacting KVs | Num. Compacted KVs | Remaining KVs | Compaction Progress |
|------------------------------------|---------------------|--------------------|---------------|---------------------|
| 10-120-172-170.21302,1481197834974 | 4554453             | 4554453            | 0             | 100.00%             |
| 10-120-173-90.21302,1481197832006  | 4561213             | 4561213            | 0             | 100.00%             |
| 10-120-177-122.21302,1481197834637 | 4693335             | 4693335            | 0             | 100.00%             |

**Step 7** When all items in **Compaction Progress** reach **100%** and those in **Remaining KVs** are **0**, run the following command as user **omm** to destroy the old key file:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh <path>/hbase.jks <alias-old>
```

- `<path>/hbase.jks`: indicates the path of the generated `hbase.jks` file. The path and file name must be consistent with those of the key file generated.
- `<alias-old>`: indicates the alias of the old key file to be deleted.

For example:

```
sh ${BIGDATA_HOME}/FusionInsight_HD_8.0.2.1/install/FusionInsight-HBase-2.2.3/hbase/bin/hbase-encrypt.sh /home/hbase/conf/hbase.jks omm
```

#### NOTE

The cluster operation user must have the **rw** permission for the `<path>/hbase.jks` directory. The directory requires already exists.

**Step 8** Repeat **Step 2** and distribute the updated key files again.

**Step 9** Delete the HBase self-defined configuration item **hbase.crypto.master.alternate.key.name** added in **Step 3** from FusionInsight Manager.

**Step 10** Repeat **Step 4** for the configuration to take effect.

----End

## 12.12.3.4 Security Configuration

### Configuring Security Channel Encryption

The channels between components are not encrypted by default. You can set the following parameters to configure security channel encryption.

Page access: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > *component* > **Configurations**. Click **All Configurations**. Enter the parameter name in the search box.

 NOTE

Restart the corresponding service after configuration.

**Table 12-82** Parameter description

| Parameter                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Default Value |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| hbase.rpc.protection      | <p>Indicates whether the HBase channels, including the remote procedure call (RPC) channels for HBase clients to access the HBase server and the RPC channels between the HMaster and RegionServer, are encrypted. If this parameter is set to <b>privacy</b>, the channels are encrypted and the authentication, integrity, and privacy functions are enabled. If this parameter is set to <b>integrity</b>, the channels are not encrypted and only the authentication and integrity functions are enabled. If this parameter is set to <b>authentication</b>, the channels are not encrypted, only packets are authenticated, and integrity and privacy are not required.</p> <p><b>NOTE</b><br/>The privacy mode encrypts transmitted content, including sensitive information such as user tokens, to ensure the security of the transmitted content. However, this mode has great impact on performance. Compared with the other two modes, this mode reduces read/write performance by about 60%. Modify the configuration based on the enterprise security requirements. The configuration items on the client and server must be the same.</p> | -             |
| dfs.encrypt.data.transfer | <p>Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. The HDFS data transfer channels include the data transfer channels between DataNodes and the Data Transfer (DT) channels for clients to access DataNodes. The value <b>true</b> indicates that the channels are encrypted. The channels are not encrypted by default.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>false</b>  |

| Parameter                           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Default Value                                                                                                                   |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| dfs.encrypt.data.transfer.algorithm | <p>Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. This parameter is valid only when dfs.encrypt.data.transfer is set to true.</p> <p>The default value is <b>3des</b>, which indicates that the 3DES algorithm is used for encryption. The value can also be set to <b>rc4</b>; however, to avoid security risks, do not set the parameter to this value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>3des</b>                                                                                                                     |
| hadoop.rpc.protection               | <p>Indicates whether the RPC channels of each module in Hadoop are encrypted. The channels include:</p> <ul style="list-style-type: none"> <li>• RPC channels for clients to access HDFS</li> <li>• RPC channels between modules in HDFS, for example, RPC channels between DataNode and NameNode</li> <li>• RPC channels for clients to access YARN</li> <li>• RPC channels between NodeManager and ResourceManager</li> <li>• RPC channels for Spark to access YARN and HDFS</li> <li>• RPC channels for MapReduce to access YARN and HDFS</li> <li>• RPC channels for HBase to access HDFS</li> </ul> <p>The <b>privacy</b> indicates that the channels are encrypted by default. The <b>authentication</b> indicates that channels are not encrypted.</p> <p><b>NOTE</b><br/>You can set this parameter on the HDFS component configuration page. The parameter setting is valid globally, that is, the setting of whether the RPC channel is encrypted takes effect on all modules in Hadoop.</p> | <ul style="list-style-type: none"> <li>• Security mode: <b>privacy</b></li> <li>• Normal Mode: <b>authentication</b></li> </ul> |

## Setting the Maximum Number of Concurrent Web Connections

To ensure Web server security, the number of new connections is limited when the number of user connections reaches a specific threshold. This prevents DDOS attacks and service unavailability caused by too many users accessing the web server at the same time.

**Page access:**

Page access: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > *component* > **Configurations**. Click **All Configurations**. Enter the parameter name in the search box.

**Table 12-83** Parameter description

| Parameter                      | Description                                                                                                        | Default Value |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------|---------------|
| hadoop.http.server.MaxRequests | Specifies the maximum number of concurrent web connections of each component.<br>Components include HDFS and YARN. | 2000          |
| spark.connection.maxRequest    | Maximum number of request connections of JobHistory.                                                               | 5000          |

### 12.12.3.5 Configuring an IP Address Whitelist for Modifications Allowed by HBase

If the Replication function is enabled for HBase clusters, a protection mechanism for data modification is added on the standby HBase cluster to ensure data consistency between the active and standby clusters. Upon receiving an RPC request for data modification, the standby HBase cluster checks the permission of the user who sends the request (only HBase manage users have the modification permission). Then it checks the validity of the source IP address of the request. Only modification requests from IP addresses in the white list are accepted. The IP address white list is configured by the **hbase.replication.allowedIPs** item.

Page access: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > *component* > **Configurations**. Click **All Configurations**. Enter the parameter name in the search box.

**Table 12-84** Parameter description

| Parameter                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Default Value |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| hbase.replication.allowedIPs | <p>Allows replication request processing from configured IP addresses only. It supports comma separated regex patterns. Each pattern can be any of the following:</p> <ul style="list-style-type: none"> <li>• Regex Pattern<br/>eg: 10.18.40.* , 10.18.* , 10.18.40.11</li> <li>• Range Pattern (Range can be specified only in the last octet)<br/>eg: 10.18.40.[10 to 20]</li> </ul> <p>If this item is empty (default value), the white list contains only the IP address of the RegionServer of the cluster, indicating that only modification requests from the RegionServer of the standby HBase cluster are accepted.</p> | N/A           |

### 12.12.3.6 Updating a Key for a Cluster

#### Scenario

When a cluster is installed, an encryption key is generated automatically by the system so that the security information in the cluster (such as all database user passwords and key file access passwords) can be stored in encryption mode. After the cluster is installed, if the original key is accidentally disclosed or a new key is required, you can perform the following operations to manually update the key.

#### Impact on the System

- After a cluster key is updated, a new key is generated randomly in the cluster. This key is used to encrypt and decrypt the newly stored data. The old key is not deleted, and it is used to decrypt old encrypted data. After security information is modified, for example, a database user password is changed, the new password is encrypted using the new key.
- When a key is updated for a cluster, the cluster must be stopped and cannot be accessed.

#### Prerequisites

- You have obtained the IP addresses of the active and standby management nodes. For details, see [Logging In to the Management Node](#).
- You have stopped the upper-layer service applications that depend on the cluster.

## Procedure

**Step 1** Log in to FusionInsight Manager.

**Step 2** Choose **Cluster** > *Name of the desired cluster* > **Stop**, and enter the password of the current login administrator for authentication.

In the displayed window, click **OK**. **Operation succeeded** is displayed. Click **Finish**. The cluster is stopped.

**Step 3** Log in to the active management node as user **omm** with the IP address of the active management node.

**Step 4** Run the following command to prevent you from being forcibly logged out when a timeout occurs:

```
TMOUT=0
```

### NOTE

After the operations in this section are complete, run the **TMOUT=Timeout interval** command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

**Step 5** Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-server/om/tools
```

**Step 6** Run the following command to update the cluster key:

```
sh updateRootKey.sh
```

Enter **y** as prompted.

The root key update is a critical operation.  
Do you want to continue?(y/n):

If the following information is displayed, the key is updated successfully.

```
Step 4-1: The key save path is obtained successfully.  
...  
Step 4-4: The root key is sent successfully.
```

**Step 7** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Start**.

In the confirmation dialog box, click **OK** to start the cluster. **Operation succeeded** is displayed. Click **Finish**. The cluster is started.

----End

### 12.12.3.7 Hardening the LDAP

#### Configure the LDAP firewall policy.

In the cluster adopting the dual-plane networking, the LDAP is deployed on the service plane. To ensure the LDAP data security, you are advised to configure the firewall policy for the whole cluster to disable relevant LDAP ports.

**Step 1** Log in to FusionInsight Manager.

- Step 2** Click **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **Configurations**.
- Step 3** Check the value of **LDAP\_SERVER\_PORT**, which is the service port of LdapServer.
- Step 4** To ensure data security, configure the firewall policy for the whole cluster to disable the LdapServer port based on the customer's firewall environment.
- End

## Enable the LDAP Audit Log Output.

Users can set the audit log output level of the LDAP service and output audit logs in a specified directory, for example, **/var/log/messages**. The logs output can be used to check user activities and operation commands.

### NOTE

If the function of LDAP audit log output is enabled, massive logs are generated, affecting the cluster performance. Exercise caution when enabling this function.

- Step 1** Log in to any LdapServer node.
- Step 2** Run the following command to edit the **slapd.conf.consumer** file, and set the value of **loglevel** to **256** (You can view the log level definition by running the **man slapd.conf** command on the OS).

```
cd ${BIGDATA_HOME}/FusionInsight_BASE_8.0.2.1/install/FusionInsight-ldapservice-2.7.0/ldapservice/local/template
```

```
vi slapd.conf.consumer
```

```
...
pidfile      [PID_FILE_SLAPD_PID]
argsfile     [PID_FILE_SLAPD_ARGS]
loglevel 256
...
```

- Step 3** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **LdapServer** > **More** > **Restart Service**, enter the administrator password, and restart the service.
- End

## 12.12.3.8 Configuring Kafka Data Encryption During Transmission

### Scenario

Data between the Kafka client and the broker is transmitted in plain text. The Kafka client may be deployed in an untrusted network, exposing the transmitting data to leakage and tampering risks.

### Procedure

The channel between components is not encrypted by default. You can set the following parameters to enable security channel encryption.

Navigation path for setting parameters: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Kafka** > **Configuration**. On the

displayed page, click the **All Configurations** tab. Enter a parameter name in the search box.

 **NOTE**

After the configuration, restart the corresponding service for the settings to take effect.

**Table 12-85** describes the parameters related to transmission encryption on the Kafka server.

**Table 12-85** Parameters relevant to Kafka data encryption during transmission

| Parameter                      | Description                                                                                                                                                                                 | Default Value  |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| ssl.mode.enable                | Indicates whether to enable the Secure Sockets Layer (SSL) protocol. If this parameter is set to <b>true</b> , services relevant to the SSL protocol are started during the broker startup. | false          |
| security.inter.broker.protocol | Indicates communication protocol between brokers. The communication protocol can be PLAINTEXT, SSL, SASL_PLAINTEXT, or SASL_SSL.                                                            | SASL_PLAINTEXT |

The SSL protocol can be configured for the server or client to encrypt transmission and communication only after **ssl.mode.enable** is set to **true** and broker enables the **SSL** and **SASL\_SSL** protocols.

### 12.12.3.9 Configuring HDFS Data Encryption During Transmission

#### Configuring HDFS Security Channel Encryption

The channel between components is not encrypted by default. You can set parameters to enable security channel encryption.

Navigation path for setting parameters: On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations**. On the displayed page, click the **All Configurations** tab. Enter a parameter name in the search box.

 **NOTE**

After the configuration, restart the corresponding service for the settings to take effect.

**Table 12-86** Parameters

| Configuration Item    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Default Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hadoop.rpc.protection | <p><b>NOTICE</b></p> <ul style="list-style-type: none"> <li>The setting takes effect only after the service is restarted. Rolling restart is not supported.</li> <li>After the setting, you need to download the client configuration file again. Otherwise, HDFS cannot provide the read and write services.</li> </ul> <p>Indicates whether the RPC channels of each module in Hadoop are encrypted. The channels include:</p> <ul style="list-style-type: none"> <li>RPC channels for clients to access HDFS</li> <li>RPC channels between modules in HDFS, for example, between DataNode and NameNode</li> <li>RPC channels for clients to access Yarn</li> <li>RPC channels between NodeManager and ResourceManager</li> <li>RPC channels for Spark to access Yarn and HDFS</li> <li>RPC channels for MapReduce to access Yarn and HDFS</li> <li>RPC channels for HBase to access HDFS</li> </ul> <p><b>NOTE</b><br/>The setting takes effect globally, that is, the encryption attribute of the RPC channel of each module in the Hadoop takes effect.</p> | <ul style="list-style-type: none"> <li>Security mode: privacy</li> <li>Normal mode: authentication</li> </ul> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li><b>authentication:</b> indicates that only authentication is required.</li> <li><b>integrity:</b> indicates that authentication and consistency check need to be performed.</li> <li><b>privacy:</b> indicates that authentication, consistency check, and encryption need to be performed.</li> </ul> |

| Configuration Item                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Default Value         |
|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| dfs.encrypt.data.transf<br>er               | <p>Indicates whether the HDFS data transfer channels and the channels for clients to access HDFS are encrypted. The HDFS data transfer channels include the data transfer channels between DataNodes and the Data Transfer (DT) channels for clients to access DataNodes. The value <b>true</b> indicates that the channels are encrypted. The channels are not encrypted by default.</p> <p><b>NOTE</b></p> <ul style="list-style-type: none"> <li>• This parameter is valid only when <b>hadoop.rpc.protection</b> is set to <b>privacy</b>.</li> <li>• If a large amount of service data is transmitted, enabling encryption by default severely affects system performance.</li> <li>• If data transmission encryption is configured for one cluster in the trusted cluster, the same data transmission encryption must be configured for the peer cluster.</li> </ul> | false                 |
| dfs.encrypt.data.transf<br>er.algorithm     | <p>Indicates the algorithm to encrypt the HDFS data transfer channels and the channels for clients to access HDFS. This parameter is valid only when <b>dfs.encrypt.data.transfer</b> is set to <b>true</b>.</p> <p><b>NOTE</b></p> <p>The default value is <b>3des</b>, indicating that 3DES algorithm is used to encrypt data. The value can also be set to <b>rc4</b>. However, to avoid security risks, you are not advised to set the parameter to this value.</p>                                                                                                                                                                                                                                                                                                                                                                                                    | 3des                  |
| dfs.encrypt.data.transf<br>er.cipher.suites | <p>This parameter can be left empty or set to <b>AES/CTR/NoPadding</b> to specify the cipher suite for data encryption. If this parameter is not specified, the encryption algorithm specified by <b>dfs.encrypt.data.transfer.algorithm</b> is used for data encryption. The default value is <b>AES/CTR/NoPadding</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | AES/CTR/<br>NoPadding |

### 12.12.3.10 Configuring Communication Authentication for Storm Processes

#### Scenario

The authentication function is disabled by default during the communication of Storm service processes. You can decide whether to enable this function based on the specific service scenario.

#### Procedure

Page access: On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Configurations**. Click **All Configurations**. Enter the parameter name in the search box.

 **NOTE**

Restart the corresponding service after configuration.

**Table 12-87** Parameter description

| Item                                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Default Value |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| storm.messaging.netty.authentication | <p>Indicates whether to enable the Netty communication authentication framework for service processes. Netty communication authentication is disabled by default, but you can enable it for a specific topology. If this parameter is configured on the client, the client configuration prevails. Otherwise, the cluster configuration prevails.</p> <p><b>NOTE</b><br/>Exercise caution when you enable the Netty communication authentication framework because this will affect the topology throughput.</p> | false         |

### 12.12.3.11 Encrypting the Communication Between Controller and Agent

#### Scenario

After a cluster is installed, Controller and Agent need to communicate with each other. The Kerberos authentication is used during the communication. By default, the communication is not encrypted during the communication for the sake of cluster performance. Users who have demanding security requirements can use the method described in this section for encryption.

## Impact on the System

- Controller and all Agents automatically restart, which interrupts FusionInsight Manager.
- The performance of management nodes decreases in large clusters. You are advised to enable the encryption function for clusters with a maximum of 200 nodes.

## Prerequisites

You have obtained the IP addresses of the active and standby management nodes.

## Procedure

**Step 1** Log in to the active management node as user **omm**.

**Step 2** Run the following command to disable user logout on system timeout:

```
TMOUT=0
```

### NOTE

After the operations in this section are complete, run the **TMOUT=Timeout interval** command to restore the timeout interval in a timely manner. For example, **TMOUT=600** indicates that a user is logged out if the user does not perform any operation within 600 seconds.

**Step 3** Run the following command to switch the directory:

```
cd ${CONTROLLER_HOME}/sbin
```

**Step 4** Run the following command to enable communication encryption:

```
./enableRPCencrypt.sh -t
```

Run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHASStatus** of the active management node Controller is **Normal** and whether you can log in to FusionInsight Manager again. If yes, the enablement is successful.

**Step 5** Run the following command to disable communication encryption when necessary:

```
./enableRPCencrypt.sh -f
```

Run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check whether **ResHASStatus** of the active management node Controller is **Normal** and whether you can log in to FusionInsight Manager again. If yes, the disablement is successful.

----End

## 12.12.3.12 Updating SSH Keys for User omm

### Scenario

During cluster installation, the system automatically generates the SSH public key and private key for user **omm** to establish the trust relationship between nodes.

After the cluster is installed, if the original keys are accidentally disclosed or new keys are used, you can perform the following operations to manually change the keys.

## Prerequisites

- The cluster has been stopped.
- No other management operations are being performed.

## Procedure

**Step 1** Log in as user `omm` to the node whose SSH keys need to be replaced.

If the node is a Manager management node, run the following command on the active management node.

**Step 2** Run the following command to disable user logout upon system timeout:

```
TMOUT=0
```

### NOTE

After the operations in this section are complete, run the `TMOUT=Timeout interval` command to restore the timeout interval in a timely manner. For example, `TMOUT=600` indicates that a user is logged out if the user does not perform any operation within 600 seconds.

**Step 3** Run the following command to generate a key for the node:

- If the node is a Manager management node, run the following command:  

```
sh ${CONTROLLER_HOME}/sbin/update-ssh-key.sh
```
- If the node is a non-Manager management node, run the following command:  

```
sh ${NODE_AGENT_HOME}/bin/update-ssh-key.sh
```

If **Succeed to update ssh private key.** is displayed when the preceding command is executed, the SSH key is generated successfully.

**Step 4** Run the following command to copy the public key of the node to the active management node:

```
scp ${HOME}/.ssh/id_rsa.pub oms_ip:${HOME}/.ssh/id_rsa.pub_bak
```

`oms_ip`: indicates the IP address of the active management node.

Enter the password of user `omm` to copy the files.

**Step 5** Log in to the active management node as user `omm`.

**Step 6** Run the following command to disable user logout on system timeout:

```
TMOUT=0
```

**Step 7** Run the following command to switch the directory:

```
cd ${HOME}/.ssh
```

**Step 8** Run the following command to delete the discarded public keys from the `authorized_keys` file of the active management node:

```
sed -i "$(cat id_rsa.pub_bak | awk '{print $3}')$/d" authorized_keys
```

**Step 9** Run the following command to add new public keys:

```
cat id_rsa.pub_bak >> authorized_keys
```

**Step 10** Run the following command to move the temporary public key file, for example, /tmp.

```
mv -rf id_rsa.pub_bak /tmp
```

**Step 11** Copy the **authorized\_keys** file of the active management node to the other nodes in the cluster:

```
scp authorized_keys node_ip:${HOME}/.ssh/authorized_keys
```

**node\_ip**: indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

**Step 12** Run the following command to confirm private key replacement without entering the password:

```
ssh node_ip
```

**node\_ip**: indicates the IP address of another node in the cluster. Multiple IP addresses are not supported.

**Step 13** Log in to the FusionInsight Manager. On the **Homepage** page, click  > **Start** to start the cluster.

----End

## 12.12.4 Security Maintenance

### 12.12.4.1 Account Maintenance Suggestions

You are advised to perform routine checks on accounts. The check covers the following items:

- Check whether the accounts of the OS, FusionInsight Manager, and each component are necessary and whether temporary accounts have been deleted.
- Check whether the permissions of the accounts are appropriate. Different MRS cluster administrators have different rights.
- Check and audit the logins and operation records of all types of accounts.

### 12.12.4.2 Password Maintenance Suggestions

User identity authentication is a must for accessing the application system. The complexity and validity period of user accounts and passwords must meet customers' security requirements.

The password maintenance suggestions are as follows:

1. Dedicated personnel must be arranged to manage the OS password.
2. The passwords must meet the complexity requirements, such as minimum password length or character types.

3. Passwords must be encrypted before transfer. Generally, do not transfer passwords using emails.
4. Passwords must be encrypted in configuration files.
5. Enterprise users need to change the passwords when the system is handed over.
6. Passwords must be periodically changed.

### 12.12.4.3 Logs Maintenance Suggestions

Operation logs help discover exceptions such as illegal operations and login by unauthorized users. The system records important operations in logs. You can use operation logs to locate problems.

#### Checking Logs Regularly

Check system operation logs periodically and handle exceptions such as unauthorized operations or logins in a timely manner.

#### Backing Up Logs Regularly

The audit logs provided by FusionInsight Manager and cluster record the user activities and operations. You can export the audit logs on FusionInsight Manager. If there are too many audit logs in the system, you can configure dump parameters to dump audit logs to a specified server to ensure that the cluster nodes disk space is sufficient.

#### Maintenance Owner

Network monitoring engineers and system maintenance engineers

### 12.12.5 Security Statement

#### JDK Usage Statement

MRS is a big data cluster that provides distributed data analysis and computing capabilities for users. OpenJDK is the built-in JDK of MRS, which is mainly applied in the following scenarios:

- Performing O&M for platform services
- Running the Linux client (mostly for service request submission and application O&M)

#### JDK Risk Statement

The system implements permission control on the built-in JDK. Only users in related groups of the FusionInsight platform can access the JDK. In addition, the platform is deployed on a customer's intranet, which has low security risks.

#### JDK Hardening

For details about how to harden the JDK, see "Hardening JDK" in [Hardening Policy](#).

## Public IP Addresses in Hue

Hue uses the test cases of third-party packages, such as **ipaddress**, **requests**, and **Django**, and uses the public IP addresses in the comments of the test cases. However, these public IP addresses are not involved when Hue provides services, and the Hue configuration file does not involve these public IP addresses.

## 12.13 Alarm Reference (Applicable to MRS 3.x)

### 12.13.1 ALM-12001 Audit Log Dumping Failure

#### Description

Cluster audit logs need to be dumped on a third-party server due to the local historical data backup policy. The system starts to check the dump server at 3 a.m. every day. If the dump server meets the configuration conditions, audit logs can be successfully dumped. This alarm is generated when the audit log dump fails if the disk space of the dump directory on the third-party server is insufficient or a user changes the username, password, or dump directory of the dump server.

#### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12001    | Minor          | Yes        |

#### Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

#### Impact on the System

System can store a maximum of only 50 dump files locally. If the fault persists on the dump server, the local audit logs may be lost, and the first 50 audit logs that exceed the current time cannot be queried.

## Possible Causes

- The network connection is abnormal.
- The username, password, or dump directory of the dump server does not meet the configuration conditions.
- The disk space of the dump directory is insufficient.

## Procedure

### Check whether the network connection is normal.

**Step 1** On the FusionInsight Manager home page, choose **Audit > Configurations**.

**Step 2** Check whether the SFTP IP on the dump configuration page is valid.

Log in to the node where Manager is located as user **root** and run the **ping** command to check whether the network connection between the SFTP server and the cluster is normal.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** Repair the network connection, reset the SFTP password, and click **OK**.

**Step 4** Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check whether the username, password, or dump directory are correct.

**Step 5** On the dump configuration page, check whether the username, password, and dump directory of the third-party server are correct.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** Change the username, password, or dump directory, reset the SFTP password and click **OK**.

**Step 7** Wait for 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

### Check whether the disk space of the dump directory is sufficient.

**Step 8** Log in to the third-party server as user **root** and run the **df** command to check whether the disk space of the dump directory of the third-party server exceeds 100 MB.

- If yes, go to [Step 11](#).
- If no, go to [Step 9](#).

**Step 9** Expand disk space capacity for the third-party server, Reset the SFTP password and click **OK**

**Step 10** Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Reset the dump rule.**

**Step 11** On the FusionInsight Manager home page, choose **Audit > Configurations**.

**Step 12** Reset dump rules, set the parameters properly, and click **OK**.

**Step 13** Wait for 2 minutes, view real-time alarms and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Collect fault information.**

**Step 14** On the FusionInsight Manager, choose **O&M > Log > Download**.

**Step 15** Select **OmmServer** from the **Service** and click **OK**.

**Step 16** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 17** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.2 ALM-12004 OLdap Resource Abnormal

### Description

The system checks LDAP resources every 60 seconds. This alarm is generated when the system detects that the LDAP resources in Manager are abnormal for six consecutive times.

This alarm is cleared when the Ldap resource in the Manager recovers and the alarm handling is complete.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12004    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

Manager active/standby switchover may occur. The Manager and WebUI authentication service of components is unavailable. Security authentication and user management functions cannot be provided for upper-layer web services. As a result, you may fail to log in to the Manager and WebUI of components.

## Possible Causes

The LdapServer process in the Manager is abnormal.

## Procedure

### Check whether the LdapServer process in the Manager is normal.

**Step 1** Log in the Manager node in the cluster as user **omm**.

Log in to FusionInsight Manager using the floating IP address, and run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

**Step 2** Run **ps -ef | grep slapd** command to check whether the LdapServer resource process in the **\${BIGDATA\_HOME}/om-server/om/** in the process configuration file is running properly.

#### NOTE

You can determine that the resource is normal by checking the following information:

1. After the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command runs, **ResHAStatus** of the OLdap is **Normal**.
2. After the **ps -ef | grep slapd** command runs, the slapd process of port 21750 can be viewed.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 4](#).

**Step 3** Run the **kill -2 ldap pid** command to restart the LdapServer process and wait for 20 seconds. The HA starts the OLdap process automatically. Check whether the current OLdap resource is in normal state.

- If yes, the operation is complete.
- If no, go to [Step 4](#).

**Collect fault information.**

**Step 4** On the FusionInsight Manager home page, choose **O&M > Log > Download**.

**Step 5** Select **OmsLdapServer** and **OmmServer** from the **Service** and click **OK**.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.3 ALM-12005 OKerberos Resource Abnormal

### Description

The alarm module checks the status of the Kerberos resource in Manager every 80 seconds. This alarm is generated when the alarm module detects that the Kerberos resources are abnormal for six consecutive times.

This alarm is cleared when the Kerberos resource recovers and the alarm handling is complete.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12005    | Major          | Yes        |

### Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |

| Name     | Meaning                                              |
|----------|------------------------------------------------------|
| RoleName | Specifies the role for which the alarm is generated. |
| HostName | Specifies the host for which the alarm is generated. |

## Impact on the System

The component WebUI authentication services are unavailable and cannot provide security authentication functions for web upper-layer services. Users may be unable to log in to FusionInsight Manager and the WebUIs of components.

## Possible Causes

The OLdap resource on which the Okerberos depends is abnormal.

## Procedure

**Check whether the OLdap resource on which the Okerberos depends is abnormal in the Manager.**

**Step 1** Log in the Manager node in the cluster as user **omm**.

Log in to FusionInsight Manager using the floating IP address, and run the **sh \$ {BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check the information about the current Manager two-node cluster.

**Step 2** Run the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the OLdap resource status managed by HA is normal. (In single-node mode, the OLdap resource is in the Active\_normal state; in the two-node mode, the OLdap resource is in the Active\_normal state on the active node and in the Standby\_normal state on the standby node.)

- If yes, go to [Step 4](#).
- If no, go to [Step 3](#).

**Step 3** See the procedure in [ALM-12004 OLdap Resource Abnormal](#) to resolve the problem. After the OLdap resource status recovers, check whether the Okerberos resource status is normal.

- If yes, the operation is complete.
- If no, go to [Step 4](#).

**Collect fault information.**

**Step 4** On the FusionInsight Manager home page, choose **O&M > Log > Download**.

**Step 5** Select **OmsKerberos** and **OmmServer** from the **Service** and click **OK**.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.4 ALM-12006 Node Fault

### Alarm Description

Controller checks the NodeAgent heartbeat every 30 seconds. If Controller does not receive heartbeat messages from a NodeAgent, it attempts to restart the NodeAgent process. This alarm is generated if the NodeAgent fails to be restarted for three consecutive times.

This alarm is cleared when Controller can properly receive the status report of the NodeAgent.

#### NOTE

In MRS 3.3.0 and later versions, the alarm name is changed to **NodeAgent Process Is Abnormal**.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12006    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description                                                        |
|-------------|--------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

## Impact on the System

NodeAgent process is abnormal, heartbeat messages cannot be reported to the platform. If the problem is caused by network faults, hardware faults, or SSH mutual trust, component services cannot be normal.

## Possible Causes

- The network is disconnected, the hardware is faulty, or the operating system runs slowly.
- The memory of the NodeAgent process is insufficient.
- The NodeAgent process is faulty.

## Handling Procedure

**Check whether the network is disconnected, whether the hardware is faulty, or whether the operating system runs commands slowly.**

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, click the host name, and view the IP address of the host for which the alarm is generated.

**Step 2** Log in to the active management node as user **root**.

### NOTE

If the faulty node is the active management node and fails login, the network of the active management node may be faulty. In this case, go to [Step 4](#).

**Step 3** Run the **ping *IP address of the faulty host*** command to check whether the faulty node is reachable.

- If yes, go to [Step 12](#).
- If no, go to [Step 4](#).

**Step 4** Contact the network administrator to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Step 6** Contact the hardware administrator to check whether the hardware (CPU or memory) of the node is faulty.

- If yes, go to [Step 7](#).
- If no, go to [Step 12](#).

**Step 7** Repair or replace faulty components and restart the node. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

- Step 8** If a large number of node faults are reported in the cluster, the floating IP addresses may be abnormal. As a result, Controller cannot detect the NodeAgent heartbeat.

Log in to any management node and view the `/var/log/Bigdata/omm/oms/ha/scriptlog/floatip.log` log to check whether the logs generated one to two minutes before and after the faults occur are complete.

For example, a complete log is in the following format:

```
2017-12-09 04:10:51,000 INFO (floatip) Read from ${BIGDATA_HOME}/om-server_*/om/etc/om/routeSetConf.ini,value is : yes
2017-12-09 04:10:51,000 INFO (floatip) check wsNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check omNetExport : eth0 is up.
2017-12-09 04:10:51,000 INFO (floatip) check wsInterface : eRth0:oms, wsFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check omInterface : eth0:oms, omFloatIp: XXX.XXX.XXX.XXX.
2017-12-09 04:10:51,000 INFO (floatip) check wsFloatIp : XXX.XXX.XXX.XXX is reachable.
2017-12-09 04:10:52,000 INFO (floatip) check omFloatIp : XXX.XXX.XXX.XXX is reachable.
```

- If yes, go to [Step 12](#).
- If no, go to [Step 9](#).

- Step 9** Check whether the omNetExport log is printed after the wsNetExport is detected or whether the interval for printing two logs exceeds 10 seconds or longer.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

- Step 10** View the `/var/log/message` file of the OS to check whether sssd frequently restarts or nscd exception information is displayed when the fault occurs.

sssd restart example

```
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

Example nscd exception information

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780:
Can't contact LDAP server
```

- If yes, go to [Step 11](#).
- If no, go to [Step 12](#).

- Step 11** Check whether the LdapServer node is faulty, for example, the service IP address is unreachable or the network latency is too high. If the fault occurs periodically, locate and eliminate it and run the `top` command to check whether abnormal software exists.

**Check whether the memory of the NodeAgent process is insufficient.**

- Step 12** Log in to the faulty node as user `root` and run the following command to view the NodeAgent process logs:

```
vi /var/log/Bigdata/nodeagent/scriptlog/agent_gc.log.*.current
```

**Step 13** Check whether the log file contains an error indicating that the metaspace size or heap memory size is insufficient.

- If yes, go to [Step 14](#).
- If no, go to [Step 17](#).

**Step 14** Run the `su - omm` command to switch to user `omm`, edit the corresponding file based on the cluster version, increase the values of `nodeagent.Xms` (initial heap memory) and `nodeagent.Xmx` (maximum heap memory), and save the modification.

The path of the file containing the parameters is as follows:

- Versions earlier than MRS 3.2.1: `/opt/Bigdata/om-agent/nodeagent/bin/nodeagent_ctl.sh`
- MRS 3.2.1 or later: `$NODE_AGENT_HOME/etc/agent/nodeagent.properties`

**Step 15** Run the following commands to restart the NodeAgent service:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/stop-agent.sh
```

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/start-agent.sh
```

**Step 16** Wait a moment and check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

**Check whether the NodeAgent process is faulty.**

**Step 17** Log in to the faulty node as user `omm` and run the following command:

```
ps -ef | grep "Dprocess.name=nodeagent" | grep -v grep
```

**Step 18** Check whether the command output is empty.

- If yes, go to [Step 19](#).
- If no, go to [Step 21](#).

**Step 19** View the NodeAgent startup and run logs to locate the fault. After the fault is rectified, go to [Step 20](#).

- NodeAgent run logs: `/var/log/Bigdata/nodeagent/agentlog/agent.log`
- NodeAgent start and stop logs: `/var/log/Bigdata/nodeagent/scriptlog/nodeagent_ctl.log`

**Step 20** Run the following commands to restart the NodeAgent service:

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/stop-agent.sh
```

```
sh ${BIGDATA_HOME}/om-agent/nodeagent/bin/start-agent.sh
```

**Collect fault information.**

**Step 21** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 22** Select the following nodes from **Services** and click **OK**.

- NodeAgent
- Controller

- OS

**Step 23** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 24** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.5 ALM-12007 Process Fault

### Description

This alarm is generated when the process health check module detects that the process connection status is **Bad** for three consecutive times. The process health check module checks the process status every 5 seconds.

This alarm is cleared when the process can be connected.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12007    | Major          | Yes        |

### Parameters

| Name        | Meaning                                                           |
|-------------|-------------------------------------------------------------------|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

The impact varies depending on the instance that is faulty.

For example, if an HDFS instance is faulty, the impacts are as follows:

- If a DataNode instance is faulty, read and write operations cannot be performed on data blocks stored on the DataNode, which may cause data loss or unavailability. However, data in HDFS is redundant. Therefore, the client can access data from other DataNodes.
- If an HttpFS instance is faulty, the client cannot access files in HDFS over HTTP. However, the client can use other methods (such as shell commands) to access files in HDFS.
- If a JournalNode instance is faulty, namespaces and data logs cannot be stored to disks, which may cause data loss or unavailability. However, HDFS stores backups on other JournalNodes. Therefore, the faulty JournalNode can be recovered and data can be rebalanced.
- If a NameNode deployed in active/standby mode is faulty, an active/standby switchover occurs. If only one NameNode is deployed, the client cannot read or write any HDFS data. On MRS, NameNodes must be deployed in two-node mode.
- If a Router instance is faulty, the client cannot access data on the router. However, the client can use other Routers or directly access data on the backend NameNode.
- If a ZKFC instance is faulty, the NameNode does not continuously and automatically fail over. As a result, data cannot be read from or write to HDFS by the client. In this case, you need to enable automatic failover on other available ZKFC instances to restore the HDFS cluster.

## Possible Causes

- The instance process is abnormal.
- The disk space is insufficient.

### NOTE

If a large number of process fault alarms exist in a time segment, files in the installation directory may be deleted mistakenly or permission on the directory may be modified.

## Procedure

**Check whether the instance process is abnormal.**

**Step 1** In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click  in the row where the alarm is located, and click the host name to view the host address for which the alarm is generated

**Step 2** On the **Alarms** page, check whether the **ALM-12006 Node Fault** is generated.

- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

**Step 3** Handle the alarm according to **ALM-12006 Node Fault**.

**Step 4** Log in to the host for which the alarm is generated as user **root**. Check whether the installation directory user, user group, and permission of the alarm role are correct. The user, user group, and the permission must be **omm:ficommon 750**.

For example, the NameNode installation directory is `${BIGDATA_HOME}/FusionInsight_Current/1_8_NameNode/etc`.

- If yes, go to **Step 6**.
- If no, go to **Step 5**.

**Step 5** Run the following command to set the permission to **750** and **User:Group** to **omm:ficommon**:

```
chmod 750 <folder_name>
```

```
chown omm:ficommon <folder_name>
```

**Step 6** Wait for 5 minutes. In the alarm list, check whether **ALM-12007 Process Fault** is cleared.

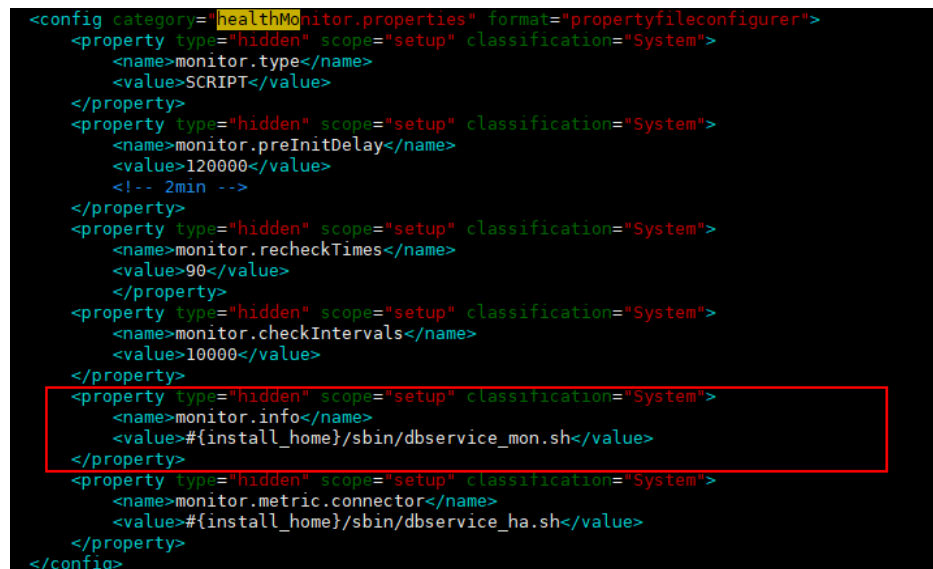

- If yes, no further action is required.
- If no, go to **Step 7**.

**Step 7** Log in to the active OMS node as user **root** and run the following command to view the **configurations.xml** file. In the preceding command, "Service name" is the service name queried in **Step 1**.

```
vi $BIGDATA_HOME/components/current/Service name/configurations.xml
```

Search for the keyword **healthMonitor.properties**, find the health check configuration item corresponding to the alarm reporting instance, and record the interface or script path specified by **monitor.info**, as shown in the following figure.

Check the logs recorded in the interface or script and rectify the fault.

```
<config category="healthMonitor.properties" format="propertyfileconfigurer">
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.type</name>
    <value>SCRIPT</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.preInitDelay</name>
    <value>120000</value>
    <!-- 2min -->
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.recheckTimes</name>
    <value>90</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.checkIntervals</name>
    <value>10000</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.info</name>
    <value>#install_home}/sbin/dbservice_mon.sh</value>
  </property>
  <property type="hidden" scope="setup" classification="System">
    <name>monitor.metric.connector</name>
    <value>#install_home}/sbin/dbservice_ha.sh</value>
  </property>
</config>
```

**Step 8** Wait for 5 minutes. In the alarm list, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

**Check whether disk space is sufficient.**

- Step 9** On the FusionInsight Manager, check whether the alarm list contains **ALM-12017 Insufficient Disk Capacity**.
- If yes, go to **Step 10**.
  - If no, go to **Step 13**.
- Step 10** Rectify the fault by following the steps provided in **ALM-12017 Insufficient Disk Capacity**.
- Step 11** Wait for 5 minutes. In the alarm list, check whether **ALM-12017 Insufficient Disk Capacity** is cleared.
- If yes, go to **Step 12**.
  - If no, go to **Step 13**.
- Step 12** Wait for 5 minutes. In the alarm list, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 13**.
- Collect fault information.**
- Step 13** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 14** According to the service name obtained in **Step 1**, select the component and **NodeAgent** from the **Service** and click **OK**.
- Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 16** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.6 ALM-12010 Manager Heartbeat Interruption Between the Active and Standby Nodes

### Description

This alarm is generated when the active Mager does not receive the heartbeat signal from the standby Manager within 7 seconds.

This alarm is cleared when the active Manager receives heartbeat signals from the standby Manager.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
12010	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

When the active Manager process is abnormal, the active/standby switchover cannot be performed, affecting basic O&M functions.

## Possible Causes

- The link between the active and standby Manager is abnormal.
- The node name configuration is incorrect.
- The port is disabled by the firewall.

## Procedure

**Check whether the network between the active and standby Manager server is normal.**

- Step 1** In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click  in the row containing the alarm and view the IP address of the standby Manager (Peer Manager) server in the alarm details.
- Step 2** Log in to the active OMS node as user **root**.
- Step 3** Run the **ping *standby Manager heartbeat IP address*** command to check whether the standby Manager server is reachable.
  - If yes, go to [Step 6](#).
  - If no, go to [Step 4](#).
- Step 4** Contact the network administrator to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Rectify the network fault and check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether the node name is correctly configured.**

**Step 6** Run the following command to go to the software installation directory of the active OMS node:

```
cd /opt
```

**Step 7** Run the following command to find the configuration file directory of the active and standby nodes.

```
find -name hacom_local.xml
```

**Step 8** Run the following command to go to the **workspace** directory:

```
cd${BIGDATA_HOME}/om-server/OMS/workspace0/ha/local/hacom/conf/
```

**Step 9** Run the **vim** command to open the **hacom\_local.xml** file. Check whether the local and peer nodes are correctly configured. The local node is configured as the active node, and the peer node is configured as the standby node.

- If yes, go to [Step 12](#).
- If no, go to [Step 10](#).

**Step 10** Modify the configuration of the active and standby nodes in the **hacom\_local.xml** file and press **Esc** to return to the command mode. Run the **:wq** command to save the modification and exit.

**Step 11** Check whether the alarm is cleared automatically.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Check whether the port is disabled by the firewall.**

**Step 12** Run the **lsof -i :20012** command to check whether the heartbeat ports of the active and standby nodes are enabled. If the command output is displayed, the ports are enabled. Otherwise, the ports are disabled by the firewall.

- If yes, go to [Step 13](#).
- If no, go to [Step 16](#).

**Step 13** Run the **iptables -P INPUT ACCEPT** command to avoid the server disconnection.

**Step 14** Run the following command to clear the firewall:

```
iptables -F
```

**Step 15** Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 16](#).

**Collect fault information.**

**Step 16** On the FusionInsight Manager, choose **O&M > Log > Download**.

**Step 17** Select the following nodes from the **Service** and click **OK**:

- OmmServer
- Controller
- NodeAgent

**Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 19** Contact the O&M personnel and send the collected log information.

----End

### Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

### Related Information

None

## 12.13.7 ALM-12011 Manager Data Synchronization Exception Between the Active and Standby Nodes

### Description

The system checks data synchronization between the active and standby Manager nodes every 60 seconds. This alarm is generated when the standby Manager fails to synchronize files with the active Manager.

This alarm is cleared when the standby Manager synchronizes files with the active Manager.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12011	Critical	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The configuration file of the standby Manager is not updated. When an active/standby switchover occurs, the configuration file that fails to be synchronized may be lost. Manager and some components may not run properly.

## Possible Causes

- The link between the active and standby Managers is interrupted or The storage space of the `/srv/BigData/LocalBackup` directory is full.
- The synchronization file does not exist or the file permission is incorrect.

## Procedure

**Check whether the network between the active Manager server and the standby Manager server is normal.**

- Step 1** In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**, click  in the row where the alarm is located and obtain the standby Manager server IP address (Peer Manager IP address) in the alarm details.
- Step 2** Log in to the active Manager server as user **root**.
- Step 3** Run the `ping standby Manager IP address` command to check whether the standby Manager server is reachable.
- If yes, go to **Step 6**.
  - If no, go to **Step 4**.
- Step 4** Contact the network administrator to check whether the network is faulty.
- If yes, go to **Step 5**.
  - If no, go to **Step 6**.
- Step 5** Rectify the network fault and check whether the alarm is cleared from the alarm list.
- If yes, no further action is required.
  - If no, go to **Step 6**.

**Check whether the storage space of the `/srv/BigData/LocalBackup` directory is full.**

- Step 6** Run the following command to check whether the storage space of the `/srv/BigData/LocalBackup` directory is full:

**df -hl /srv/BigData/LocalBackup**

- If yes, go to [Step 7](#).
- If no, go to [Step 10](#).

**Step 7** Run the following command to clear unnecessary backup files:

```
rm -rf Directory to be cleared
```

Example:

```
rm -rf /srv/BigData/LocalBackup/0/default-oms_20191211143443
```

**Step 8** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**.

In the **Operation** column of the backup task to be performed, click **Configure** and change the value of **Maximum Number of Backup Copies** to reduce the number of backup file sets.

**Step 9** Wait about 1 minute and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check whether the synchronization file exists and whether the file permission is normal.**

**Step 10** Run the following command to check whether the synchronization file exists.

```
find /srv/BigData/ -name "sed*"
```

```
find /opt -name "sed*"
```

- If yes, go to [Step 11](#).
- If no, go to [Step 12](#).

**Step 11** Run the following command to view the synchronization file information and permission obtained in [Step 10](#).

```
ll path of the file to be found
```

- If the size of the file is 0 and the permission column is -, the file is a junk file. Run the following command to delete it.

```
rm -rf files to be deleted
```

Wait for several minutes and check whether the alarm is cleared. If the alarm persists, go to [Step 12](#).

- If the file size is not 0, go to [Step 12](#).

**Step 12** View the log files generated when the alarm is generated.

1. Run the following command to switch to the HA run log file path.

```
cd /var/log/Bigdata/omm/oms/ha/runlog/
```

2. Decompress and view the log files generated when the alarm is generated.

For example, if the name of the file to be viewed is

**ha.log.2021-03-22\_12-00-07.gz**, run the following command:

```
gunzip ha.log.2021-03-22_12-00-07.gz
```

**vi** *ha.log.2021-03-22\_12-00-07*

Check whether error information is reported before and after the alarm generation time.

- If yes, rectify the fault based on the error information. Then go to [Step 13](#).

For example, if the following error information is displayed, the directory permission is insufficient. In this case, change the directory permission to be the same as that on the normal node.

```

**Step 16** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 17** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.8 ALM-12012 NTP Service Is Abnormal

### Alarm Description

The system checks whether the NTP service on a node synchronizes time with the NTP service on the active OMS node every 60 seconds. This alarm is generated when the NTP service fails to synchronize time for two consecutive times.

This alarm is generated when the time difference between the NTP service on a node and the NTP service on the active OMS node is greater than or equal to 20s

for two consecutive times. This alarm is cleared when the time difference is less than 20s.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12012	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The time on the node is inconsistent with that on other nodes in the cluster. Therefore, some FusionInsight applications on the node may not run properly. If the time difference between the node and other Kerberos service instances keeps increasing, Kerberos authentication on the node may fail and service exceptions occur.

## Possible Causes

- The NTP service on the current node cannot start properly.
- The current node fails to synchronize time with the NTP service on the active OMS node.
- The key authenticated by the NTP service on the current node is inconsistent with that on the active OMS node.
- The time offset between the node and the NTP service on the active OMS node is large.

## Handling Procedure

**Check the NTP service mode of the node.**

- Step 1** Log in to the active management node as user **root**, run the **su - omm** command to switch to user **omm**, and run the following command to check the resource status on the active and standby nodes:

**sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh**

- If "chrony" is displayed in the **ResName** column of the command output, go to [Step 2](#).
- If "ntp" is displayed in the **ResName** column, go to [Step 20](#).

 **NOTE**

If both "chrony" and "ntp" are displayed in the **ResName** column of the command output, the NTP service mode is being switched. Wait for 10 minutes and go to [Step 1](#) again. If both "chrony" and "ntp" persist, contact O&M personnel.

**Check whether the chrony service on the node is started properly.**

**Step 2** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**.

**Step 3** Check whether the chronyd process is running on the node where the alarm is generated. Log in to the node for which the alarm is generated as user **root** and run the **ps -ef | grep chronyd | grep -v grep** command to check whether the command output contains the chronyd process.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

**Step 4** Start the NTP service.

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether the current node can synchronize time properly with the chrony service on the active OMS node.**

**Step 6** Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

- If yes, go to [Step 7](#).
- If no, go to [Step 17](#).

**Step 7** Check whether the synchronization with the chrony service on the active OMS node is faulty.

Log in to the node for which the alarm is generated as user **root** and run the **chronyc sources** command.

In the command output, if there is an asterisk (\*) before the IP address of the chrony service on the active OMS node, the synchronization is normal. The command output is as follows:

```
MS Name/IP address      Stratum Poll Reach LastRx Last sample
=====
^* 10.10.10.162         10 10 377 626 +16us[ +15us] +/- 308us
```

In the command output, if there is no asterisk (\*) before the IP address of the NTP service on the active OMS node, and the value of **Reach** is **0**, the synchronization is abnormal.

MS Name/IP address	Stratum	Poll	Reach	LastRx	Last sample
^? 10.1.1.1	0	10	0	-	+0ns[ +0ns] +/- 0ns

- If yes, go to [Step 8](#).
- If no, go to [Step 38](#).

**Step 8** The chrony synchronization failure is typically caused by the system firewall. If the firewall can be disabled, disable it. If the firewall cannot be disabled, check the firewall configuration policy and ensure that UDP ports 123 and 323 are not disabled. (For details, see the firewall configuration policy of each system.)

**Step 9** Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Step 10** Log in to the active OMS node as user **root** and run the following command to view the authentication code whose key index is **1M**:

In Red Hat Enterprise Linux, run the **cat \${BIGDATA\_HOME}/om-server/OMS/workspace/conf/chrony.keys** command.

**Step 11** Run the following command to check whether the key is the same as that queried in [Step 10](#):

In Red Hat Enterprise Linux, run the **diff \${BIGDATA\_HOME}/om-server/OMS/workspace/conf/chrony.keys /etc/chrony.keys** command.

 **NOTE**

If the keys are the same, no result is returned after the command is executed. For example:

```
host01:~ # cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys
1 M sdYbq;o^CzEAWo<U=Tw5
host01:~ # diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/chrony.keys /etc/chrony.keys
host01:~ #
```

- If yes, go to [Step 12](#).
- If no, go to [Step 38](#).

**Step 12** Run the **cat \${BIGDATA\_HOME}/om-server/om/packaged-distributables/ntpKeyFile** command to check whether the key is the same as that queried in [Step 10](#). (Compare the key with that of the authentication key index **1M** queried in [Step 10](#).)

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

**Step 13** Log in to the faulty node as user **root** and run the **cat /etc/chrony.keys** command in Red Hat Enterprise Linux to check whether the key is the same as that queried in [Step 12](#) (compare it with that of the authentication key index **1M** for comparison).

- If yes, go to [Step 38](#).
- If no, go to [Step 14](#).

**Step 14** Run the **su - omm** command to switch to user **omm**, change the key of the authentication key index **1M** in **\${NODE\_AGENT\_HOME}/chrony.keys** to the key of **ntpKeyFile** in [Step 12](#), and go to [Step 16](#).

**Step 15** Run the following commands as user **root** or **omm** to change the NTP key of the active OMS node (change **ntp.keys** to **ntpkeys** in Red Hat Enterprise Linux):

```
cd ${BIGDATA_HOME}/om-server/OMS/workspace/conf
```

```
sed -i ``cat chrony.keys | grep -n '1 M'|awk -F ':' '{print $1}``d" chrony.keys
```

```
echo "1 M `cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/  
ntpKeyFile`" >> chrony.keys
```

Check whether the key of the authentication key index **1M** in **chrony.keys** is the same as that of **ntpKeyFile**.

- If yes, go to [Step 16](#).
- If no, change the key of the authentication key index **1M** in **chrony.keys** to the key of **ntpKeyFile** and go to [Step 16](#).

**Step 16** After 5 minutes, run the **systemctl restart chronyd** command to restart the chrony service on the active OMS node. After 15 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

**Check whether the time deviation between the node and the chrony service on the active OMS node is large.**

**Step 17** Check whether the time deviation is large in additional information of the alarm.

- If yes, go to [Step 18](#).
- If no, go to [Step 38](#).

**Step 18** On the **Hosts** tab page, select the host for which the alarm is generated, and choose **More > Stop All Instances** to stop all the services on the node.

If the time on the alarm node is later than that on the chrony service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

If the time on the alarm node is earlier than that on the chrony service of the active OMS node, wait until the time deviation is due and adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

 **NOTE**

If you do not wait, data loss may occur.

**Step 19** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

**Check whether the NTP service on the node is started properly.**

**Step 20** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**.

- Step 21** Check whether the ntpd process is running on the node using the following method. Log in to the alarm node as user **root** and run the **ps -ef | grep ntpd | grep -v grep** command to check whether the command output contains the ntpd process.
- If yes, go to [Step 24](#).
  - If no, go to [Step 22](#).

**Step 22** Run the **service ntp start** command (or the **service ntpd start** command in Red Hat Enterprise Linux) to start the NTP service.

**Step 23** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 24](#).

**Check whether the node can synchronize time properly with the NTP service on the active OMS node.**

**Step 24** Check whether the node can synchronize time with the NTP service on the active OMS node based on additional information of the alarm.

- If yes, go to [Step 25](#).
- If no, go to [Step 35](#).

**Step 25** Check whether the synchronization with the NTP service on the active OMS node is faulty.

Log in to the alarm node as user **root** and run the **ntpq -np** command.

If an asterisk (\*) exists before the IP address of the NTP service on the active OMS node in the command output, the synchronization is in normal state. The command output is as follows:

```
remote refid st t when poll reach delay offset jitter
=====
*10.10.10.162 .LOCL. 1 u 1 16 377 0.270 -1.562 0.014
```

If there is no asterisk (\*) before the IP address of the NTP service on the active OMS node, as shown in the following command output, and the value of **refid** is **.INIT.**, the synchronization is abnormal.

```
remote refid st t when poll reach delay offset jitter
=====
10.10.10.162 .INIT. 1 u 1 16 377 0.270 -1.562 0.014
```

- If yes, go to [Step 26](#).
- If no, go to [Step 38](#).

**Step 26** The NTP synchronization failure is typically caused by the system firewall. If the firewall can be disabled, run the **iptables -F** command to disable it. If the firewall cannot be disabled, run the **iptables -L** command to check the firewall configuration policy and ensure that the UDP port 123 is not disabled. (For details, see the firewall configuration policy of each system.)

**Step 27** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 28](#).

**Step 28** Log in to the active OMS node as user **root** and run the following command to view the authentication key index **1M**:

In SUSE Linux, run the `cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys` command.

In Red Hat Enterprise Linux or EulerOS, run the `cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntpkeys` command.

**Step 29** Run the following command to check whether the key is the same as that queried in [Step 28](#):

In SUSE Linux, run the `diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys /etc/ntp.keys` command.

In Red Hat Enterprise Linux or EulerOS, run the `diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntpkeys /etc/ntp/ntpkeys` command.

#### NOTE

If the keys are the same, no result is returned after the command is executed. For example:

```
host01:~ # cat ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys
1 M sdYbq;o^CzEAWo<U=Tw5
host01:~ # diff ${BIGDATA_HOME}/om-server/OMS/workspace/conf/ntp.keys /etc/ntp.keys
host01:~ #
```

- If yes, go to [Step 30](#).
- If no, go to [Step 38](#).

**Step 30** Run the `cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile` command to check whether the key is the same as that queried in [Step 28](#). (Compare the key with that of the authentication key index **1M** queried in [Step 28](#).)

- If yes, go to [Step 31](#).
- If no, go to [Step 33](#).

**Step 31** Log in to the faulty node as user **root** and run the `cat /etc/ntp.keys` command in SUSE Linux (or the `cat /etc/ntp/ntpkeys` command in Red Hat Enterprise Linux) to check whether the key is the same as the value queried in [Step 30](#) (use the key of the authentication key index **1M** for comparison).

- If yes, go to [Step 38](#).
- If no, go to [Step 32](#).

**Step 32** Run the `su - omm` command to switch to user **omm**, change the key of the authentication key index **1M** in `${NODE_AGENT_HOME}/ntp.keys` (`${NODE_AGENT_HOME}/ntpkeys` in Red Hat Enterprise Linux) to the key of `ntpKeyFile` in [Step 30](#), and go to [Step 34](#).

**Step 33** Run the following commands as user **root** or **omm** to change the NTP key of the active OMS node (change `ntp.keys` to `ntpkeys` in Red Hat Enterprise Linux):

```
cd ${BIGDATA_HOME}/om-server/OMS/workspace/conf
sed -i "`cat ntp.keys | grep -n '1 M'|awk -F ':' '{print $1}'`d" ntp.keys
echo "1 M `cat ${BIGDATA_HOME}/om-server/om/packaged-distributables/ntpKeyFile`" >>ntp.keys
```

Check whether the key of the authentication key index **1M** in `ntp.keys` is the same as that of `ntpKeyFile`.

- If yes, go to [Step 34](#).
- If no, change the key of the authentication key index **1M** in **ntp.keys** to the key of **ntpKeyFile** and go to [Step 34](#).

**Step 34** After 5 minutes, run the **service ntp restart** command to restart the NTP service on the active OMS node. After 15 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

**Check whether the time deviation between the node and the NTP service on the active OMS node is large.**

**Step 35** Check whether the time deviation is large in additional information of the alarm.

- If yes, go to [Step 36](#).
- If no, go to [Step 38](#).

**Step 36** On the **Hosts** tab page, select the host for which the alarm is generated, and choose **More > Stop All Instances** to stop all the services on the node.

If the time on the alarm node is later than that on the NTP service of the active OMS node, adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

If the time on the alarm node is earlier than that on the NTP service of the active OMS node, wait until the time deviation is due and adjust the time of the alarm node. After adjusting the time, choose **More > Start All Instances** to start the services on the node.

 **NOTE**

If you do not wait, data loss may occur.

**Step 37** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 38](#).

**Collect fault information.**

**Step 38** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 39** Expand the **Service** drop-down list, select **NodeAgent** and **OmmServer** for the target cluster, and click **OK**. Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

**Step 40** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 41** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

### 12.13.9 ALM-12014 Partition Lost

#### Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted is lost (because the device is removed or goes offline, or the partition is deleted). The system checks the partition status periodically.

#### Attribute

Alarm ID	Alarm Severity	Auto Clear
12014	Major	<ul style="list-style-type: none"><li>• Yes: MRS 3.3.0 and later versions</li><li>• No: Versions earlier than MRS 3.3.0</li></ul>

#### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

#### Impact on the System

- Data loss: The device partition is lost and the data stored in the partition is lost.
- System breakdown: If the system disk is lost, the system deployed on the node cannot run properly. In some cases, the system may break down and cannot be started.

- Service failure: Read and write jobs on the lost device partition fail to run or run slowly.
- Service interruption: Customers may need time to restore data and systems, and services cannot be provided.
- Security risk: Important data may be stolen or disclosed, which severely affects customer services.

## Possible Causes

- The hard disk is removed.
- The hard disk is offline, or a bad sector exists on the hard disk.

## Procedure

- Step 1** On FusionInsight Manager, click **O&M > Alarm > Alarms**, and click  in the row where the alarm is located.
- Step 2** Obtain **HostName**, **PartitionName** and **DirName** from **Location**.
- Step 3** Check whether the disk of **PartitionName** on **HostName** is inserted to the correct server slot.
- If yes, go to [Step 4](#).
  - If no, go to [Step 5](#).
- Step 4** Contact hardware engineers to remove the faulty disk.
- Step 5** Log in to the **HostName** node where an alarm is reported and check whether there is a line containing **DirName** in the **/etc/fstab** file as user **root**.
- If yes, go to [Step 6](#).
  - If no, go to [Step 7](#).
- Step 6** Run the **vi /etc/fstab** command to edit the file and delete the line containing **DirName**.
- Step 7** Contact hardware engineers to insert a new disk. For details, see the hardware product document of the relevant model. If the faulty disk is in a RAID group, configure the RAID group. For details, see the configuration methods of the relevant RAID controller card.
- Step 8** Wait 20 to 30 minutes (The disk size determines the waiting time), and run the **mount** command to check whether the disk has been mounted to the **DirName** directory.
- If yes, go to [Step 9](#) for MRS 3.3.0 and later, MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions. For clusters earlier than MRS 3.3.0, manually clear the alarm. No further action is required.
  - If no, go to [Step 10](#).
- Step 9** Wait about 2 minute and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 10](#).

**Collect fault information.**

- Step 10** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 11** Select the **OmmServer** from the Services drop-down list and click **OK**.
- Step 12** Set Start Date for log collection to 10 minutes ahead of the alarm generation time and End Date to 10 minutes behind the alarm generation time and click **Download**.
- Step 13** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

MRS 3.3.0 and later, MRS 3.1.0.0.10/3.1.5.0.3 and later patch versions: After the fault is rectified, the system automatically clears this alarm.

Versions earlier than MRS 3.3.0: After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

## Related Information

None

## 12.13.10 ALM-12015 Partition Filesystem Readonly

### Description

The system checks the partition status every 60 seconds. This alarm is generated when the system detects that a partition to which service directories are mounted enters the read-only mode (due to a bad sector or a faulty file system). The system checks the partition status periodically.

This alarm is cleared when the system detects that the partition to which service directories are mounted exits from the read-only mode (because the file system is restored to read/write mode, the device is removed, or the device is formatted).

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12015	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
DirName	Specifies the directory for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

## Impact on the System

- Service failure: If a job needs to modify the data on the read-only device partition, the job may fail to run.
- Latency: If some components need to synchronize data to the read-only device partition, data synchronization may fail or time out, causing service delay.

## Possible Causes

The hard disk is faulty, for example, a bad sector exists.

## Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, click  in the row where the alarm is located.
- Step 2** Obtain **HostName** and **PartitionName** from **Location**. **HostName** is the node where the alarm is reported, and **PartitionName** is the partition of the faulty disk.
- Step 3** Contact hardware engineers to check whether the disk is faulty. If the disk is faulty, remove it from the server.
- Step 4** After the disk is removed, alarm **ALM-12014 Partition Lost** is reported. Handle the alarm. For details, see [ALM-12014 Partition Lost](#). After the alarm **ALM-12014 Partition Lost** is cleared, alarm **ALM-12015 Partition Filesystem Readonly** is automatically cleared.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.11 ALM-12016 CPU Usage Exceeds the Threshold

### Description

The system checks the CPU usage every 30 seconds and compares the actual CPU usage with the threshold. The CPU usage has a default threshold. This alarm is generated when the CPU usage exceeds the threshold for several times (configurable, 10 times by default) consecutively.

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is 1 and the CPU usage is smaller than or equal to the threshold; the value of **Trigger Count** is greater than 1 and the CPU usage is smaller than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12016	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

- Latency: If the CPU usage of a host is too high, service processes may run slowly and services may be delayed.
- Service failure: If the host CPU usage is too high, service processing may slow down, time out, or fail. As a result, jobs may fail to run.

## Possible Causes

- The alarm threshold or alarm smoothing times are incorrect.
- CPU configuration cannot meet service requirements. The CPU usage reaches the upper limit. Or the service is in peak hours. As a result, the CPU usage reaches the upper limit in a short period of time.

## Procedure

**Check whether the alarm threshold or alarm Trigger Count are correct.**

**Step 1** Change the alarm threshold and alarm **Trigger Count** based on CPU usage.

On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > CPU > Host CPU Usage** and change the alarm smoothing times based on CPU usage, as shown in [Figure 12-22](#).

### NOTE

This option defines the alarm check phase. **Trigger Count** indicates the alarm check threshold. An alarm is generated when the number of check times exceeds the threshold.

**Figure 12-22** Setting alarm smoothing times

On **Host CPU Usage** page and click **Modify** in the **Operation** column to change the alarm threshold, as shown in [Figure 12-23](#).

**Figure 12-23** Setting an alarm threshold

Thresholds > **Modify Rule**

---

\* Rule Name:

\* Severity:

\* Threshold Type:  Max value  Min value

\* Date:  Daily  
 Weekly  
 Other

Thresholds:      Start and End Time      Threshold

-        %

**Step 2** After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Check whether the CPU usage reaches the upper limit.**

**Step 3** In the alarm list on FusionInsight Manager, click  in the row where the alarm is located to view the alarm host address in the alarm details.

**Step 4** On the **Hosts** page, click the node on which the alarm is reported.

**Step 5** View the CPU usage for 5 minutes. If the CPU usage exceeds the threshold for multiple times, contact the system administrator to add more CPUs.

**Step 6** Check whether the current traffic is in peak hours. If the alarm is generated during peak hours, you are advised to expand the capacity of the node or contact the system administrator to add more CPUs.

**Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On the FusionInsight Manager in the active cluster, choose **O&M > Log > Download**.

**Step 9** Select **OmmServer** from the **Service** and click **OK**.

**Step 10** Set **Start Date** for log collection to 10 minutes ahead of the alarm generation time and **End Date** to 10 minutes behind the alarm generation time in **Time Range** and click **Download**.

**Step 11** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.12 ALM-12017 Insufficient Disk Capacity

### Description

The system checks the host disk usage of the system every 30 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold, this alarm is generated when the host disk usage exceeds the specified threshold.

When the **Trigger Count** is 1, this alarm is cleared when the usage of a host disk partition is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the usage of a host disk partition is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12017	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the device partition for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Service failure: If you need to modify or use data on the disk when the disk capacity is insufficient, the job may fail.

## Possible Causes

- The alarm threshold is incorrect.
- Disk configuration of the server cannot meet service requirements.

## Procedure

Check whether the alarm threshold is appropriate.

**Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Disk > Disk Usage** and check whether the threshold (configurable, 90% by default) is appropriate.

- If yes, go to **Step 2**.
- If no, go to **Step 4**.

**Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Disk > Disk Usage** and click **Modify** in the **Operation** column to change the alarm threshold based on site requirements. As shown in **Figure 12-24**:

**Figure 12-24** Setting an alarm threshold

Thresholds > **Modify Rule**

---

\* Rule Name:

\* Severity:

\* Threshold Type:  Max value  Min value

\* Date:  Daily  
 Weekly  
 Other

Thresholds: Start and End Time      Threshold

-        %

**Step 3** After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the disk usage reaches the upper limit.**

**Step 4** In the alarm list on FusionInsight Manager, click  in the row where the alarm is located to view the alarm host name and disk partition information in the alarm details.

**Step 5** Log in to the node where the alarm is generated as user **root**.

**Step 6** Run the `df -lmPT | awk '$2 != "iso9660" | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1` command to check the system disk partition usage. Check whether the disk is mounted to the following directories based on the disk partition name obtained in [Step 4](#): `/`, `/opt`, `/tmp`, `/var`, `/var/log`, and `/srv/BigData`(can be customized).

- If yes, the disk is a system disk. Then go to [Step 10](#).
- If no, the disk is not a system disk. Then go to [Step 7](#).

**Step 7** Run the `df -lmPT | awk '$2 != "iso9660" | grep '^/dev/' | awk '{"readlink -m "$1 | getline real }{$1=real; print $0}' | sort -u -k 1,1` command to check the system disk partition usage. Determine the role of the disk based on the disk partition name obtained in [Step 4](#).

**Step 8** Check the disk service.

In MRS, check whether the disk service is HDFS, Yarn, Kafka, Supervisor.

- If yes, adjust the capacity. Then go to [Step 9](#).
- If no, go to [Step 12](#).

**Step 9** After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Step 10** Run the `find / -xdev -size +500M -exec ls -l {} \;` command to check whether a file larger than 500 MB exists on the node and disk.

- If yes, go to [Step 11](#).
- If no, go to [Step 12](#).

**Step 11** Handle the large file and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Step 12** Contact the system administrator to expand the disk capacity.

**Step 13** After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Collect fault information.**

**Step 14** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 15** Select **OMS** from the **Service** and click **OK**.

**Step 16** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 17** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.13 ALM-12018 Memory Usage Exceeds the Threshold

### Description

The system checks the memory usage of the system every 30 seconds and compares the actual memory usage with the threshold. The memory usage has a default threshold, this alarm is generated when the value of the memory usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the host memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host memory usage is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12018	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

- Latency: If the host memory usage is too high, service processes may run slowly and services may be delayed.
- Service failure: If the host memory usage is too high, memory overflow may occur in service processes and jobs may fail.

## Possible Causes

Memory configuration cannot meet service requirements. The memory usage reaches the upper limit.

## Procedure

### Expand the system.

- Step 1** In the alarm list on FusionInsight Manager, click  in the row where the alarm is located to view the alarm host address in the alarm details.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** If the memory usage exceeds the threshold, perform memory capacity expansion.
- Step 4** Run the command **free -m | grep Mem): | awk '{printf("%s,", \$3 \* 100 / \$2)}'** to check the system memory usage.
- Step 5** Wait for 5 minutes, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 6](#).

### Collect fault information.

- Step 6** On the FusionInsight Manager in the active cluster, choose **O&M > Log > Download**.
- Step 7** Select **OmmServer** from the **Service** and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.14 ALM-12027 Host PID Usage Exceeds the Threshold

### Description

The system checks the PID usage every 30 seconds and compares the actual PID usage with the default PID usage threshold. This alarm is generated when the system detects that the PID usage exceeds the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the PID usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the PID usage is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12027	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

Service failure: If the PID usage of the host is too high, PIDs cannot be allocated to new service processes. As a result, jobs may fail to be executed.

## Possible Causes

Too many processes are running on the node. You need to increase the value of **pid\_max**.

## Procedure

**Increase the value of pid\_max.**

- Step 1** In the alarm list on FusionInsight Manager, click  in the row where the alarm is located to view the alarm host address in the alarm details.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the **cat /proc/sys/kernel/pid\_max** command to check the value of **pid\_max**.
- Step 4** If the PID usage exceeds the threshold, edit the **/etc/sysctl.conf** file and increase the value of **kernel.pid\_max** to twice of the value of **pid\_max** queried in **Step 3**. If this parameter does not exist, add it to the end of the file.

For example, change the parameter to **kernel.pid\_max=65536** and run the following command to make the parameter take effect immediately:

```
sysctl -p
```

### NOTE

The maximum value of **kernel.pid\_max** is as follows:

- On 32-bit systems: 32768
- On 64-bit systems: 4194304 ( $2^{22}$ )

- Step 5** Wait for 5 minutes, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

**Collect fault information.**

- Step 6** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.
- Step 7** Select all services from the **Service** and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.15 ALM-12028 Number of Processes in the D State and Z State on a Host Exceeds the Threshold

### Alarm Description

The system checks the number of processes in the D state and Z state of user **omm** on the host every 30 seconds and compares the actual number with the threshold. The number of processes in the D state and Z state on the host has a default threshold range. This alarm is generated when the number of processes exceeds the threshold.

This alarm is cleared when **Trigger Count** is **1** and the total number of processes in the D state and Z state of user **omm** on the host does not exceed the threshold. This alarm is cleared when **Trigger Count** is greater than **1** and the total number of processes in the D state and Z state of user **omm** on the host is less than or equal to 90% of the threshold.

#### NOTE

The function of checking the number of processes in the Z state on the host applies to MRS 3.2.0 or later.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12028	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

- Latency: New service processes cannot be created. Concurrent task processing may be slow and services may be delayed.

- Service failure: New service processes cannot be created, which may cause job failures.

## Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state.

## Handling Procedure

**Check the processes in the D state and Z state.**

**Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the IP address of the host for which the alarm is generated.

**Step 2** Log in to the host for which the alarm is generated as user **root**. () Then run the **su - omm** command to switch to user **omm**.

**Step 3** Run the following command as user **omm** to view the PID of the process that is in the D state and Z state:

```
ps -elf | grep -v "\[thread_checkio\]" | awk 'NR!=1 {print $2, $3, $4}' | grep omm | awk -F ' ' '{print $1, $3}' | grep -E "Z|D" | awk '{print $2}'
```

**Step 4** Check whether the command output is empty.

- If yes, the service process is running properly. Then go to [Step 6](#).
- If no, go to [Step 5](#).

**Step 5** Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

**Step 6** Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect the fault information.**

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 8** Select **OMS** for **Service** and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

### 12.13.16 ALM-12033 Slow Disk Fault

#### Alarm Description

**For MRS 3.3.0 and its later versions:**

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The `svctm` latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected `svctm` take no less than 150 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The `svctm` latency reaches 1000 ms within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. At least 50% of detected `svctm` take no less than 20 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when neither of the preceding conditions is met for three consecutive detection periods (30 or 300 seconds).

**For versions earlier than MRS 3.3.0:**

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - The system runs the `iostat` command every 3 seconds by default, and detects that the `svctm` value exceeds 1000 ms in at least seven consecutive periods within 30 seconds.
  - The system runs the `iostat` command every 3 seconds, and detects that more than 50% of I/Os take more than 150 ms within 300s.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - The system runs the `iostat` command every 3 seconds by default, and detects that the `svctm` value exceeds 1000 ms for at least 10 periods within 30 seconds.
  - The system runs the `iostat` command every 3 seconds by default, and detects that more than 60% of I/Os take more than 20 ms within 300s.

This alarm is automatically cleared when the preceding conditions have not been met for 15 minutes.

 **NOTE**

For details about how to obtain the `svctm` value, see [Related Information](#).

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
12033	<ul style="list-style-type: none"><li>• Minor: MRS 3.3.0 and its later versions</li><li>• Major: versions earlier than MRS 3.3.0</li></ul>	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
DiskName	Specifies the disk for which the alarm was generated.

## Impact on the System

- The system I/O performance deteriorates, which means slow response and low throughput. For example, job submission is slow, page responds slowly, interface response times out, and the system is in error or even crash.
- System fault: Customer services may be interrupted. The system may break down and the key information stored on the faulty disk may be lost.

## Possible Causes

The disk is aged or has bad sectors.

## Handling Procedure

**Check the disk status.**

**Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**.

**Step 2** View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is generated.

- Step 3** Check whether the node for which the alarm is generated is in a virtualization environment.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** Check whether the storage performance provided by the virtualization environment meets the hardware requirements. Then, go to [Step 5](#).
- Step 5** Log in to the alarm node as user **root**, run the **df -h** command, and check whether the command output contains the value of the **DiskName** field.
- If yes, go to [Step 7](#).
  - If no, go to [Step 6](#).
- Step 6** Run the **lsblk** command to check whether the mapping between the value of **DiskName** and the disk has been created.

```
sda                8:0    0 27810G 0
├─sda1             8:1    0   509M 0 /boot
└─sda2             8:2    0 278.4G 0
   ├─system-opt (dm-0) 253:0   0   50G 0 /opt
   ├─system-root (dm-1) 253:1   0   50G 0 /
   ├─system-swap (dm-2) 253:2   0   50G 0
   └─system-var (dm-3) 253:3   0   50G 0 /var
```

- If yes, go to [Step 7](#).
  - If no, go to [Step 22](#).
- Step 7** Log in to the alarm node as user **root**, run the **lsscsi | grep "/dev/sd[x]"** command to view the disk information, and check whether RAID has been set up.

 **NOTE**

In the command, **/dev/sd[x]** indicates the disk name obtained in [Step 2](#).

Example:

```
lsscsi | grep "/dev/sda"
```

In the command output, if **ATA**, **SATA**, or **SAS** is displayed in the third line, the disk has not been organized into a RAID group. If other information is displayed, RAID has been set up.

- If yes, go to [Step 12](#).
- If no, go to [Step 8](#).

- Step 8** Run the **smartctl -i /dev/sd[x]** command to check whether the hardware supports the SMART tool.

Example:

```
smartctl -i /dev/sda
```

In the command output, if "SMART support is: Enabled" is displayed, the hardware supports SMART. If "Device does not support SMART" or other information is displayed, the hardware does not support SMART.

- If yes, go to [Step 9](#).
- If no, go to [Step 16](#).

**Step 9** Run the `smartctl -H --all /dev/sd[x]` command to check basic SMART information and determine whether the disk is working properly.

Example:

```
smartctl -H --all /dev/sda
```

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated\_Sector\_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to [Step 10](#).
- If no, go to [Step 18](#).

**Step 10** Run the `smartctl -l error -H /dev/sd[x]` command to check the Glist of the disk and determine whether the disk is normal.

Example:

```
smartctl -l error -H /dev/sda
```

Check the **Command/Feature\_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can trigger the disk SMART self-check.

- If yes, go to [Step 11](#).
- If no, go to [Step 18](#).

**Step 11** Run the `smartctl -t long /dev/sd[x]` command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat [Step 9](#) and [Step 10](#) to check whether the disk is working properly.

Example:

```
smartctl -t long /dev/sda
```

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

**Step 12** Run the `smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]` command to check whether the hardware supports SMART.

 **NOTE**

- In the command, **[sat|scsi]** indicates the disk type. Both types need to be used.
- **[DID]** indicates the slot information. Slots 0 to 15 need to be used.

For example, run the following commands in sequence:

```
smartctl -d sat+megaraid,0 -H --all /dev/sda
```

```
smartctl -d sat+megaraid,1 -H --all /dev/sda
```

```
smartctl -d sat+megaraid,2 -H --all /dev/sda
```

...

Try the command combinations of different disk types and slot information. If "SMART support is: Enabled" is displayed in the command output, the disk supports SMART. Record the parameters of the disk type and slot information when a command is successfully executed. If "SMART support is: Enabled" is not displayed in the command output, the disk does not support SMART.

- If yes, go to [Step 13](#).
- If no, go to [Step 16](#).

**Step 13** Run the `smartctl -d [sat|scsi]+megaraid,[DID] -H --all /dev/sd[x]` command recorded in [Step 12](#) to check basic SMART information and determine whether the disk is normal.

Example:

```
smartctl -d sat+megaraid,2 -H --all /dev/sda
```

Check the value of **SMART overall-health self-assessment test result** in the command output. If the value is **FAILED**, the disk is faulty and needs to be replaced. If the value is **PASSED**, check the value of **Reallocated\_Sector\_Ct** or **Elements in grown defect list**. If the value is greater than 100, the disk is faulty and needs to be replaced.

- If yes, go to [Step 14](#).
- If no, go to [Step 18](#).

**Step 14** Run the `smartctl -d [sat|scsi]+megaraid,[DID] -l error -H /dev/sd[x]` command to check the Glist of the disk and determine whether the hard disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -l error -H /dev/sda
```

Check the **Command/Feature\_name** column in the command output. If **READ SECTOR(S)** or **WRITE SECTOR(S)** is displayed, the disk has bad sectors. If other errors occur, the disk circuit board is faulty. Both errors indicate that the disk is abnormal and needs to be replaced.

If "No Errors Logged" is displayed, no error log exists. You can trigger the disk SMART self-check.

- If yes, go to [Step 15](#).
- If no, go to [Step 18](#).

**Step 15** Run the `smartctl -d [sat|scsi]+megaraid,[DID] -t long /dev/sd[x]` command to trigger the disk SMART self-check. After the command is executed, the time when the self-check is to be completed is displayed. After the self-check is completed, repeat [Step 13](#) and [Step 14](#) to check whether the disk is working properly.

Example:

```
smartctl -d sat+megaraid,2 -t long /dev/sda
```

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

**Step 16** If the configured RAID controller card does not support SMART, the disk does not support SMART. In this case, use the check tool provided by the corresponding RAID controller card vendor to rectify the fault. Then go to [Step 17](#).

For example, LSI is a MegaCLI tool.

**Step 17** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, click **Clear** in the **Operation** column of the alarm, and check whether the alarm is reported on the same disk again.

If the alarm is reported for three times, replace the disk.

- If yes, go to [Step 18](#).
- If no, no further action is required.

**Replace the disk.**

**Step 18** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**.

**Step 19** View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

**Step 20** Replace the disk.

**Step 21** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 22](#).

**Collect the fault information.**

**Step 22** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 23** Select **OMS** for **Service** and click **OK**.

**Step 24** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 25** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

The **svctm** value can be obtained as follows:

- MRS 3.1.0:

Run the **iostat -x -t** command in the OS.

```

omm@node-master1hxyk ~]$ iostat -x -t
Linux 3.10.0-862.14.1.5.el7.x86_64 (node-master1hxyk) 11/11/2022 _x86_64_ (4 CPU)

11/11/2022 03:35:20 PM
avg-cpu:  %user   %nice %system %iowait  %steal   %idle
           27.66    0.00   15.66    0.63    0.00   56.06

Device:            rrqm/s   wrqm/s     r/s     w/s    kB/s    kB/s   avgrq-sz  avgqu-sz   await  r_await  w_await    svctm  butil
vda                 0.13    29.26    1.71    23.51   187.56   608.08    63.11     0.91    36.02   50.86   34.94    0.64   1.62

253 7 vda7 157987 105 3477434 149542 6507759 1629060 140677872 14351373 0 1679157 11117724 0 0 0 0
253 8 vda8 312935 8169 22369722 458354 12181277 34364199 531855680 17727525 0 9061647 11387424 0 0 0 0
253 16 vdb 275920 21939 15977738 2171665 39477604 28238831 2653881640 482234435 0 30581946 465964144 0 0 0 0
253 17 vdb1 275439 21939 15948866 2171472 31293358 28238811 2653881432 481841639 0 30038274 465857164 0 0 0 0
7 0 loop0 356 0 17442 150 0 0 0 0 149 105 0 0 0 0
    
```

In the two commands:

In the data collected for the first time, the number in the fourth column is the **rd\_ios\_old** value, the number in the eighth column is the **wr\_ios\_old** value, and the number in the thirteenth column is the **tot\_ticks\_old** value.

In the data collected for the second time, the number in the fourth column is the **rd\_ios\_new** value, the number in the eighth column is the **wr\_ios\_new** value, and the number in the thirteenth column is the **tot\_ticks\_new** value.

In this case, the value of **svctm** is as follows:

$$(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197$$

## 12.13.17 ALM-12034 Periodical Backup Failure

### Description

The system executes the periodic backup task every 60 minutes. This alarm is generated when a periodical backup task fails to be executed. This alarm is cleared when the next backup task is executed successfully.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
12034	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TaskName	Specifies the task.

### Impact on the System

The periodic backup task failed, resulting in no available backup packages during the time period when the backup failed. When a system exception occurs and you need to use the backup package to restore data, no backup package is available during the failure period. As a result, data during the failure period cannot be restored.

### Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

### Procedure

**Check whether the disk space is sufficient.**

**Step 1** In the FusionInsight Manager portal, click **O&M > Alarm > Alarms**.

- Step 2** In the alarm list, click  in the row where the alarm is located and obtain **TaskName** from **Location**.
- Step 3** Log in to the active node of the cluster as the **root** user and check the backup and restoration logs in `/var/log/Bigdata/controller/backup/`.
- ```
cd /var/log/Bigdata/controller/backup/
```
- `vi Log file name`
- Check whether the log file contains information similar to the following:
- ```
Upload backup files to *** file failed, error info: ***
```
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** On FusionInsight Manager, choose **O&M > Backup and Restoration > Backup Management**. Locate the backup task based on **TaskName**, click **Configure** in the **Operation** column, and check whether all configuration items are correctly configured.
- If yes, go to [Step 7](#).
  - If no, modify the configuration, save the modification, and go to [Step 5](#).
- Step 5** Choose **More > Back Up Now** to start the backup task and check whether the backup task is successfully executed.
- If yes, go to [Step 6](#).
  - If no, go to [Step 7](#).
- Step 6** After 2 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).
- Step 7** Choose **More > View History** in the **Operation** column. In the displayed dialog box view the task details.
- Step 8** In the displayed dialog box and click  to check whether the following message is displayed: Failed to backup xx due to insufficient disk space, move the data in the xx directory to other directories.
- If yes, go to [Step 9](#).
  - If no, go to [Step 16](#).
- Step 9** Choose **Backup Path > View** and obtain the **Backup Path**.
- Step 10** Log in to the node as user **root** and run the following command to check the node mounting details:
- ```
df -h
```
- Step 11** Check whether the available space of the node to which the backup path is mounted is less than 20 GB.
- If yes, go to [9](#).
  - If no, go to [Step 16](#).

- Step 12** Check whether there are many backup packages in the backup directory.
- If yes, go to [Step 13](#).
  - If no, go to [Step 16](#).
- Step 13** Enable the available space of the node to which the backup directory is mounted to be greater than 20 GB by moving backup packages out of the backup directory or delete the backup packages.
- Step 14** After the problem is resolved, perform the backup task again and check whether the backup task execution is successful.
- If yes, go to [Step 15](#).
  - If no, go to [Step 16](#).
- Step 15** After 2 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 16](#).
- Collect fault information.**
- Step 16** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 17** Select **Controller** from the **Service** and click **OK**.
- Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 19** Contact the O&M personnel and send the collected log information.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.18 ALM-12035 Unknown Data Status After Recovery Task Failure

### Description

After the recovery task fails, the system automatically rolls back every 60 minutes. If the rollback fails, data may be lost. If this occurs, an alarm is reported. This alarm is cleared when the next recovery task execution is successful.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12035    | Critical       | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |
| TaskName    | Specifies the task.   |

## Impact on the System

After the recovery task fails, the system automatically rolls back. If the rollback fails, data may be lost or the data status may be unknown, which may affect services.

## Possible Causes

The alarm cause depends on the task details. Handle the alarm according to the logs and alarm details.

## Procedure

### Collect fault information.

- Step 1** In the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the running status of the component meets the requirements. (The OMS and DBService must be in the normal state, and other components must be stopped.)
- If yes, go to [Step 9](#).
  - If no, go to [Step 2](#).
- Step 2** Restore the component status as required and start the recovery task again.
- Step 3** Log in to the FusionInsight Manager portal and click **O&M** > **Alarm** > **Alarms**.
- Step 4** In the alarm list, click  in the row where the alarm is located to obtain **TaskName** from **Location**.

**Step 5** Choose **O&M > Backup and Restoration > Restoration Management**.

**Step 6** Find the restoration task by **Task Name** and view the task details.

**Step 7** Perform the recovery task again and check whether the recovery task execution is successful.

- If yes, go to **8**.
- If no, go to **9**.

**Step 8** After 2 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **9**.

#### **Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 10** Select **Controller** from the **Service** and click **OK**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected log information.

----End

## **Alarm Clearing**

After the fault is rectified, the system automatically clears this alarm.

## **Related Information**

None

## **12.13.19 ALM-12037 NTP Server Abnormal**

### **Description**

The system checks the NTP server status every 60 seconds. This alarm is generated when the system detects that the NTP server is abnormal for 10 consecutive times.

This alarm is cleared when the NTP server recovers.

### **Attribute**

| <b>Alarm ID</b> | <b>Alarm Severity</b> | <b>Auto Clear</b> |
|-----------------|-----------------------|-------------------|
| 12037           | Major                 | Yes               |

## Parameters

| Name        | Meaning  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm is generated.            |
| ServiceName | Specifies the service for which the alarm is generated.                      |
| RoleName    | Specifies the role for which the alarm is generated.                         |
| HostName    | Specifies the IP address of the NTP server for which the alarm is generated. |

## Impact on the System

- The NTP server configured on the active OMS node is abnormal. In this case, the active OMS node cannot synchronize time with the NTP server and a time offset may be generated in the cluster.
- If the time difference exceeds 5 minutes, the client outside the cluster fails to authenticate the client inside the cluster. As a result, the job may fail to run.

## Possible Causes

- The NTP server network is abnormal.
- The NTP server authentication fails.
- The NTP server time cannot be obtained.
- The time obtained from the NTP server is not continuously updated.

## Procedure

### Check the NTP server network.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and click  in the row where the alarm is located.
- Step 2** View the alarm additional information to check whether the NTP server fails to be pinged.
- If yes, go to [Step 3](#).
  - If no, go to [Step 4](#).
- Step 3** Contact the network administrator to check the network configuration and ensure that the network between the NTP server and the active OMS node is normal. Then, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 4](#).

### Check whether the NTP server authentication fails.

**Step 4** Log in to the active OMS node as user **root**.

**Step 5** Run the following command to check the status of the resources on the active and standby nodes:

```
su - omm
```

```
sh ${BIGDATA_HOME}/om-server/om/sbin/status-oms.sh
```

- If "chrony" is displayed in the **ResName** column of the command output, go to [Step 6](#).
- If "ntp" is displayed in the **ResName** column, go to [Step 7](#).

 **NOTE**

If both "chrony" and "ntp" are displayed in the **ResName** column of the command output, the NTP service mode is being switched. Wait for 10 minutes and perform [Step 5](#) again. If both "chrony" and "ntp" still exist in the **ResName** column, contact O&M personnel.

**Step 6** Run the command **chronyc sources** to check whether the NTP server authentication fails.

If the value of **Reach** for chrony is **0**, the connection or authentication fails.

- If yes, go to [Step 12](#).
- If no, go to [Step 8](#).

**Step 7** Run the command **ntpq -np** to check whether the NTP server authentication fails.

If **refid** of the NTP server is **.AUTH.**, the authentication fails.

- If yes, go to [Step 12](#).
- If no, go to [Step 8](#).

**Check whether the time can be obtained from the NTP server.**

**Step 8** View the alarm additional information to check whether the time can be obtained from the NTP server.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

**Step 9** Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is normal, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check whether the time obtained from the NTP server is not continuously updated.**

**Step 10** View the alarm additional information to check whether the time obtained from the NTP server is not continuously updated.

- If yes, go to [Step 11](#).
- If no, go to [Step 12](#).

**Step 11** Contact the provider of the NTP server to rectify the NTP server fault. After the NTP server is normal, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Collect fault information.**

**Step 12** On the FusionInsight Manager, choose **O&M > Log > Download**.

**Step 13** Select **NodeAgent** and **OmmServer** from the **Service** and click **OK**.

**Step 14** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 15** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.20 ALM-12038 Monitoring Indicator Dumping Failure

## Description

After monitoring indicator dumping is configured on FusionInsight Manager, the system checks the monitoring indicator dumping result at the dumping interval (60 seconds by default). This alarm is generated when the dumping fails.

This alarm is cleared when dumping is successful.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12038    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |

| Name     | Meaning  |
|----------|--|
| HostName | Specifies the host for which the alarm is generated. |

## Impact on the System

The upper-layer management system cannot obtain monitoring indicators from the FusionInsight Manager system.

## Possible Causes

- The server cannot be connected.
- The save path on the server cannot be accessed.
- The monitoring indicator file fails to be uploaded.

## Procedure

**Check whether the server connection is normal.**

- Step 1** Check whether the network between the FusionInsight Manager system and the server is normal.
- If yes, go to [Step 3](#).
  - If no, go to [Step 2](#).
- Step 2** Contact the network administrator to recover the network and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 3](#).
- Step 3** Choose **System > Interconnection > Upload Performance Data** and check whether the FTP username, password, port, dump mode, and public key configured on the upload performance data page are consistent with the configuration on the server.
- If yes, go to [Step 5](#).
  - If no, go to [Step 4](#).
- Step 4** Enter the correct configuration information, click **OK**, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).

**Check the permission of the save path on the server is correct.**

- Step 5** Choose **System > Interconnection > Upload Performance Data** and check the configuration items **FTP Username**, **Save Path**, and **Dump Mode**.
- If the dump mode is FTP, go to [Step 6](#).
  - If the dump mode is SFTP, go to [Step 7](#).

- Step 6** Log in to the server in FTP mode. In the default path, check whether **FTP Username** has the read and write permission of the relative path **Save Path**.
- If yes, go to [Step 9](#).
  - If no, go to [Step 8](#).
- Step 7** Log in to the server in SFTP mode and check whether **FTP Username** has the read and write permission of the absolute path **Save Path**.
- If yes, go to [Step 9](#).
  - If no, go to [Step 8](#).
- Step 8** Add the read and write permission and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 9](#).

**Check whether the save path on the server has sufficient disk space.**

- Step 9** Log in to the server and check whether the save path has sufficient disk space.
- If yes, go to [Step 11](#).
  - If no, go to [Step 10](#).
- Step 10** Delete unnecessary files or go to the monitoring indicator dumping configuration page to change the save path. Then, check whether the save path has sufficient disk space.
- If yes, no further action is required.
  - If no, go to [Step 11](#).

**Collect fault information.**

- Step 11** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 12** Select **OMS** from the **Service** and click **OK**.
- Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 14** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.21 ALM-12039 Active/Standby OMS Databases Not Synchronized

### Description

The system checks the data synchronization status between the active and standby OMS Databases every 10 seconds. This alarm is generated when the synchronization status cannot be queried for 30 consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the data synchronization status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12039    | Critical       | Yes        |

### Parameters

| Name                | Meaning   |
|---------------------|---|
| Source              | Specifies the cluster or system for which the alarm is generated. |
| ServiceName         | Specifies the service for which the alarm is generated.           |
| RoleName            | Specifies the role for which the alarm is generated.              |
| HostName            | Specifies the host for which the alarm is generated.              |
| Local GaussDB HA IP | Specifies the HA IP address of the local GaussDB.                 |
| Peer GaussDB HA IP  | Specifies the HA IP address of the peer GaussDB.                  |
| SYNC_PERCENT        | Specifies the synchronization percentage.                         |

### Impact on the System

If the active/standby of the OMS database is not synchronized, data in the active database cannot be synchronized to the standby database. If the active instance is abnormal during the alarm reporting period, service data may be lost or data on the FusionInsight Manager may be abnormal.

## Possible Causes

- The network between the active and standby nodes is unstable.
- The standby OMS Database is abnormal.
- The standby node disk space is full.

## Procedure

**Check whether the network between the active and standby nodes is normal.**

**Step 1** Log in to FusionInsight Manager, click **O&M > Alarm > Alarms**, click  in the row where the alarm is located, and query the standby OMS Database IP address.

**Step 2** Log in to the active OMS Database node as user **root**.

**Step 3** Run the **ping Standby OMS Database heartbeat IP address** command to check whether the standby OMS Database node is reachable.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

**Step 4** Contact the network administrator to check whether the network is faulty.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Rectify the network fault and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether the standby OMS Database is normal.** (Skip this check for versions later than MRS 3.1.2.)

**Step 6** Log in to the standby OMS Database node as user **root**.

**Step 7** Run the **su - omm** command to switch to user **omm**.

**Step 8** Go to the **`\${BIGDATA\_HOME}/om-server/om/sbin/`** directory and run the **./status-oms.sh** command to check whether the OMS Database resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to [Step 9](#).
- If no, go to [Step 16](#).

**Check whether the standby node disk space is full.**

**Step 9** Log in to the standby OMS Database node as user **root**.

**Step 10** Run the **su - omm** command to switch to user **omm**.

**Step 11** Run the **echo `\${BIGDATA\_DATA\_HOME}/dbdata\_om`** command to obtain the OMS Database data directory.

**Step 12** Run the **df -h** command to view the system disk partition usage information.

- Step 13** Check whether the disk where the OMS Database data directory is mounted is full.
- If yes, go to [Step 14](#).
  - If no, go to [Step 16](#).
- Step 14** Expand the disk capacity.
- Step 15** After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 16](#).
- Collect fault information.**
- Step 16** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 17** Select **OMMServer** from the **Service** and click **OK**.
- Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 19** Contact the O&M personnel and send the collected log information.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.22 ALM-12040 Insufficient System Entropy

### Alarm Description

MRS 3.2.0 or later:

The system checks whether the rng-tools or haveged tool has been enabled and correctly configured every 5 minutes. If neither tool is configured, this alarm is generated. If either is configured, the system continues to check the entropy. If the entropy is less than 100 for five consecutive times, this alarm is generated.

This alarm is cleared when rng-tools or haveged has been installed and enabled on the target node and the entropy of the OS is greater than or equal to 100 in at least one of five entropy checks.

MRS 3.1.2 or earlier:

The system checks the entropy for five consecutive times at 00:00 every day. Specifically, the system checks whether rng-tools or haveged has been enabled and correctly configured. If neither is configured, the system continues to check the entropy. If the entropy is less than 100 for five consecutive times, this alarm is reported.

This alarm is cleared when the system detects that the true random number mode has been configured, the random number parameters have been configured in the pseudo-random number mode, or neither mode is configured but the entropy of the OS is greater than or equal to 100 in at least one of five entropy checks.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12040    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

## Impact on the System

The entropy of the operating system of the node is insufficient. As a result, commands such as encryption and decryption are executed slowly on the node. As a result, the service processing performance of each instance deteriorates, and even service processes cannot be executed properly.

## Possible Causes

- rng-tools or haveged has not been installed or started.
- The entropy of the OS is smaller than 100 for multiple consecutive times.

## Handling Procedure

**Check whether haveged or rng-tools has been installed or started.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**.
- Step 2** Check the value of **HostName** in the **Location** area to obtain the name of the host for which the alarm is generated.
- Step 3** Log in to the node for which the alarm is generated as user **root**.
- Step 4** Run the **/bin/rpm -qa | grep -w "haveged"** command to check the haveged installation status and check whether the command output is empty.

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

**Step 5** Run the `/sbin/service haveged status |grep "running"` command and check the command output.

- If the command is executed successfully, haveged has been installed and configured correctly and is running properly. Go to [Step 8](#).
- If the command fails to execute, haveged is not running properly. Run the following command to manually restart haveged and go to [Step 9](#):

```
systemctl restart haveged.service
```

**Step 6** Run the `/bin/rpm -qa | grep -w "rng-tools"` command to check the rng-tools installation and check whether the command output is empty.

- If yes, contact the OS vendor to install and start haveged or rng-tools. Then go to [Step 9](#).
- If no, go to [Step 7](#).

**Step 7** Run the `ps -ef | grep -v "grep" | grep rngd | tr -d " " | grep "\-r/dev/urandom"` command and check the command output.

- If the command is executed successfully, rngd has been installed and configured correctly and is running properly. Go to [Step 8](#).
- If the command fails to execute, rngd is not running properly. Run the following command to manually restart rngd and go to [Step 9](#):

```
systemctl restart rngd.service
```

#### Check the entropy of the OS.

**Step 8** Manually check the entropy of the OS.

Log in to the target node as user **root** and run the `cat /proc/sys/kernel/random/entropy_avail` command to check whether the entropy of the OS meets cluster installation requirements (no less than 100).

- If yes, the entropy of the OS is not less than 100. Go to [Step 9](#).
- If no, the entropy of the OS is less than 100. Use either of the following methods and go to [Step 9](#).
  - Method 1: Use haveged (true random number mode). Contact the OS vendor to install and start haveged.
  - Method 2: Use rng-tools (pseudo-random number mode). Contact the OS vendor to install and start rng-tools and configure it based on the OS type.

**Step 9** Wait until the system to check the entropy at 00:00 on the following day and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

#### Collect fault information.

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 11** Select **NodeAgent** for **Service** and click **OK**.
- Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 13** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## 12.13.23 ALM-12041 Incorrect Permission on Key Files

### Description

The system checks whether the permission, user, and user group information about critical directories or files is normal every 5 minutes. This alarm is generated when the information is abnormal.

This alarm is cleared when the information becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12041    | Major          | Yes        |

### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated.      |
| RoleName    | Specifies the role name for which the alarm is generated.         |
| HostName    | Specifies the object (host ID) for which the alarm is generated.  |
| PathName    | Specifies the path or name of the abnormal file.                  |

### Impact on the System

System functions are unavailable.

- If the permission on the okerberos and oldap key files is abnormal, authentication fails and jobs may fail.
- If the permission on the controller and pms key files is abnormal, the process may be faulty, which may affect the elastic scaling performance.
- If the permission on key Tomcat files is abnormal, the login and viewing functions of FusionInsight Manager are affected.

## Possible Causes

The file permission is abnormal or the file is lost due to a user manually modified information such as the file permission, user, and user group, or the system is powered off unexpectedly.

## Procedure

**Check whether the abnormal file exists and whether the permission on the abnormal file is correct.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.
- Step 2** Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.
- Step 3** Log in to the node for which the alarm is generated as user **root**.
- Step 4** Run the **ll *pathName*** command, where *pathName* indicates the name of the abnormal file to obtain the user, permission, and user group information about the file or directory.
- Step 5** Go to **`\${BIGDATA\_HOME}/om-agent/nodeagent/etc/agent/autocheck** directory. Then run the **vi keyfile** command and search for the name of the abnormal file and check the due permission of the file.

### NOTE

To ensure proper configuration synchronization between the active and standby OMS servers, files, directories, and files and sub-directories in the directories configured in **`\${SOMS\_RUN\_PATH}/workspace/ha/module/hasync/plugin/conf/filesync.xml** will also be monitored except files and directories in **keyfile**. User **omm** must have read and write permissions of files and read and execute permissions of directories.

- Step 6** Compare the real-world permission of the file with the due permission obtained in [Step 5](#) and correct the permission, user, and user group information for the file.
- Step 7** Wait a hour and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 8](#).

 **NOTE**

If the disk partition where the cluster installation directory resides is used up, some temporary files will be generated in the program installation directory when running the **sed** command fails. Users do not have the read, write, and execute permissions of these temporary files. The system reports an alarm indicating that permissions of temporary files are abnormal if these files are within the monitoring range of the alarm. Perform the preceding alarm handling processes to clear the alarm. Alternatively, you can directly delete the temporary files after confirming that files with abnormal permissions are temporary. The temporary file generated after a **sed** command execution failure is similar to the following.

```
-rwx-----. 1 omm wheel 347 Jan 26 13:11 REALM_RESET_CONFIG
-rwx-----. 1 omm wheel 351 Jan 22 09:07 REALM_RESET_CONFIG_KRB
----- 1 omm wheel 0 Jan 26 13:15 sedbT8Cs4
-rwx-----. 1 omm wheel 7457 Jan 22 03:20 unlockuser.sh
```

**Collect fault information.**

- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
  - Step 9** Select **NodeAgent** from the **Service** and click **OK**.
  - Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
  - Step 11** Contact the O&M personnel and send the collected log information.
- End

**Alarm Clearing**

After the fault is rectified, the system automatically clears this alarm.

**Related Information**

None

**12.13.24 ALM-12042 Incorrect Configuration of Key Files**

**Description**

The system checks whether critical configurations are correct every 5 minutes. This alarm is generated when the configurations are abnormal.

This alarm is cleared when the configurations become normal.

**Attribute**

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12042    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service name for which the alarm is generated.      |
| RoleName    | Specifies the role name for which the alarm is generated.         |
| HostName    | Specifies the object (host ID) for which the alarm is generated.  |
| PathName    | Specifies the path or name of the abnormal file.                  |

## Impact on the System

Functions related to the file are abnormal.

- If the permission on the okerberos and oldap key files is abnormal, authentication fails and jobs may fail.
- If the permission on the controller and pms key files is abnormal, the process may be faulty, which may affect the elastic scaling performance.
- If the permission on key Tomcat files is abnormal, the login and viewing functions of FusionInsight Manager are affected.

## Possible Causes

The file configuration is modified manually or the system is powered off unexpectedly.

## Procedure

### Check abnormal file configuration.

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**.

**Step 2** Check the value of **HostName** to obtain the host name involved in this alarm. Check the value of **PathName** to obtain the path or name of the abnormal file.

**Step 3** Log in to the node for which the alarm is generated as user **root**.

**Step 4** View the `$BIGDATA_LOG_HOME/nodeagent/scriptlog/checkfileconfig.log` file and analyze the cause based on the error log. Locate the check standards of the file in the [Related Information](#) and manually check and modify the file based on the standards.

Run the `vi file name` command to enter the editing mode, and then press **Insert** to start editing.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq** to save the settings and exit.

For example:

```
vi /etc/ssh/sshd_config
```

**Step 5** Wait a hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select **NodeAgent** from the **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

- **Check standards of /etc/fstab**

Check whether the partitions configured in the **/etc/fstab** file can be found in **/proc/mounts**.

Check whether the swap partitions configured in **fstab** correspond to those in **/proc/swaps**.
- **Check the /etc/hosts configuration file.**

Run **cat /etc/hosts**. If any of the following situations occurs, the **/etc/hosts** configuration file is abnormal:

  - a. The **/etc/hosts** file does not exist.
  - b. The host name is not configured in the file.
  - c. The host name maps to multiple IP addresses in the file.
  - d. The IP address corresponding to the host name does not exist in the command output of the **ifconfig** command.
  - e. One IP address maps to multiple host names in the file.
- **Check standards of /etc/ssh/sshd\_config**

Run the **vi /etc/ssh/sshd\_config** command to check whether configuration items are configured as follows:

  - a. The value of **UseDNS** must be set to **no**.
  - b. The value of **MaxStartups** must be greater than or equal to 1000.

- c. At least one of the **PasswordAuthentication** and **ChallengeResponseAuthentication** parameters must be left blank or at least one of the parameters be set to **yes**.

## 12.13.25 ALM-12045 Read Packet Dropped Rate Exceeds the Threshold

### Alarm Description

The system checks the read packet dropped rate every 30 seconds. This alarm is generated when the read packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Dropped Rate**.

This alarm is cleared when **Trigger Count** is 1 and the read packet dropped rate is less than or equal to the threshold. This alarm is cleared when **Trigger Count** is greater than 1 and the read packet dropped rate is less than or equal to 90% of the threshold.

The alarm detection is disabled by default. If you want to enable this function, check whether this function can be enabled based on Checking System Environments.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12045    | Major          | Yes          |

### Alarm Parameters

| Parameter         | Description  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated.           |
| RoleName          | Specifies the role for which the alarm was generated.              |
| HostName          | Specifies the host for which the alarm was generated.              |
| PortName          | Specifies the network port for which the alarm was generated.      |
| Trigger Condition | Specifies the threshold for triggering the alarm.                  |

## Impact on the System

- **Latency:** When the read packet loss rate of the host network exceeds the threshold, request response is slowed down and services are delayed.
- **Service failure:** When the read packet loss rate of the host network exceeds the threshold, requests cannot be properly responded or times out, which may cause job running failures.

Risk warning: In SUSE kernel 3.0 or later or Red Hat 7.2, the system kernel modifies the mechanism for counting the number of dropped read packets. In this case, this alarm may be generated even if the network is running properly, but services are not affected. You are advised to check the system environment first.

## Possible Causes

- The NICs are bonded in active/standby mode.
- The alarm threshold is improperly configured.
- The network quality is poor.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated and the NIC name.

**Check whether the NICs are bonded in active/standby mode.**

**Step 2** Log in to the alarm node as user **omm** and run the **ls -l /proc/net/bonding** command to check whether the **/proc/net/bonding** directory exists on the node.

- If yes, the bond mode is configured for the node. Go to [Step 3](#).

```
# ls -l /proc/net/bonding/  
total 0  
-r--r--r-- 1 root root 0 Oct 11 17:35 bond0
```

- If no, the bond mode is not configured for the node. Go to [Step 5](#).

```
# ls -l /proc/net/bonding/  
ls: cannot access /proc/net/bonding/: No such file or directory
```

**Step 3** Run the **cat /proc/net/bonding/bond0** command to check whether the value of **Bonding Mode** in the configuration file is **fault-tolerance**.

### NOTE

In the command, **bond0** indicates the name of the bond configuration file. Use the file name obtained in [Step 2](#).

```
# cat /proc/net/bonding/bond0  
Ethernet Channel Bonding Driver: v3.7.1 (April 27, 2011)
```

```
Bonding Mode: fault-tolerance (active-backup)  
Primary Slave: eth1 (primary_reselect always)  
Currently Active Slave: eth1  
MII Status: up  
MII Polling Interval (ms): 100  
Up Delay (ms): 0  
Down Delay (ms): 0
```

```
Slave Interface: eth0  
MII Status: up  
Speed: 1000 Mbps  
Duplex: full
```

```
Link Failure Count: 1  
Slave queue ID: 0
```

```
Slave Interface: eth1  
MII Status: up  
Speed: 1000 Mbps  
Duplex: full  
Link Failure Count: 1  
Slave queue ID: 0
```

- If yes, the NICs are bonded in active/standby mode. Go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Check whether the NIC specified by **NetworkCardName** in the alarm is the standby NIC.

- If yes, the alarm of the standby NIC cannot be automatically cleared. Manually clear the alarm on the alarm management page. No further action is required.
- If no, go to [Step 5](#).

 **NOTE**

To determine the standby NIC, check the `/proc/net/bonding/bond0` configuration file. If the NIC name corresponding to **NetworkCardName** is **Slave Interface** but not **Currently Active Slave** (the current active NIC), the NIC is the standby one.

**Check whether the threshold is set properly.**

**Step 5** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Dropped Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Dropped Rate**. Click **Modify** in the **Operation** column to change the threshold. See [Figure 12-25](#).

**Figure 12-25** Configuring the alarm threshold

Thresholds: Start and End Time      Threshold

-        %

**Step 7** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 8**.

**Check whether the network connection is normal.**

**Step 8** Contact the network administrator to check whether the network is normal.

- If yes, rectify the fault and go to **Step 9**.
- If no, go to **Step 10**.

**Step 9** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 10**.

**Collect the fault information.**

**Step 10** On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Select **OMS** for **Service** and click **OK**.

**Step 12** Expand the **Hosts** dialog box and select the alarm node and the active OMS node.

**Step 13** Click in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 14** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

### 12.13.26 ALM-12046 Write Packet Dropped Rate Exceeds the Threshold

#### Alarm Description

The system checks the write packet dropped rate every 30 seconds. This alarm is generated when the write packet dropped rate exceeds the threshold (the default threshold is 0.5%) for multiple times (the default value is 5).

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Packet Dropped Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the network write packet dropped rate is less than or equal to 90% of the threshold.

#### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12046    | Major          | Yes          |

#### Alarm Parameters

| Parameter         | Description  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated.           |
| RoleName          | Specifies the role for which the alarm was generated.              |
| HostName          | Specifies the host for which the alarm was generated.              |
| Port Name         | Specifies the network port for which the alarm was generated.      |
| Trigger Condition | Specifies the threshold for triggering the alarm.                  |

## Impact on the System

- Latency: Requests are responded slowly and services are delayed.
- Service failure: Requests cannot be responded or time out. Jobs may fail to run.

## Possible Causes

- The alarm threshold is improperly configured.
- The network quality is poor.

## Handling Procedure

Check whether the threshold is set properly.

**Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Packet Dropped Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Packet Dropped Rate**. Click **Modify** in the **Operation** column to change the threshold.

See [Figure 12-26](#).

## 12.13.27 ALM-12047 Read Packet Error Rate Exceeds the Threshold

### Alarm Description

The system checks the read packet error rate every 30 seconds. This alarm is generated when the read packet error rate exceeds the threshold (the default threshold is **0.5%**) for multiple times (the default value is **5**).

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Host** > **Network Reading** > **Read Packet Error Rate**.

If **Trigger Count** is **1**, this alarm is cleared when the read packet error rate is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the read packet error rate is less than or equal to 90% of the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12047    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated.           |
| RoleName          | Specifies the role for which the alarm was generated.              |
| HostName          | Specifies the host for which the alarm was generated.              |
| Port Name         | Specifies the network port for which the alarm was generated.      |
| Trigger Condition | Specifies the threshold for triggering the alarm.                  |

## Impact on the System

- Latency: Requests are responded slowly and services are delayed.
- Service failure: Requests cannot be responded or time out. Jobs may fail to run.

## Possible Causes

- The alarm threshold is improperly configured.
- The network quality is poor.

## Handling Procedure

**Check whether the threshold is set properly.**

**Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Error Rate**, and check whether the alarm threshold is configured properly. The default value is **0.5%**. You can adjust the threshold as needed.

- If yes, go to **Step 4**.
- If no, go to **Step 2**.

**Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Packet Error Rate**. Click **Modify** in the **Operation** column to change the threshold.

See [Figure 12-27](#).

### 12.13.29 ALM-12049 Network Read Throughput Rate Exceeds the Threshold

#### Description

The system checks the network read throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network read throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network read throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network read throughput rate is less than or equal to 90% of the threshold.

#### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12049    | Major          | Yes        |

#### Parameters

| Name              | Meaning  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm is generated.  |
| ServiceName       | Specifies the service for which the alarm is generated.  |
| RoleName          | Specifies the role for which the alarm is generated.   |
| HostName          | Specifies the host for which the alarm is generated.   |
| NetworkCardName   | Specifies the network port for which the alarm is generated.   |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

- Latency: When the host network read throughput exceeds the threshold, the request response slows down, causing service delay.
- Service failure: When the host network read throughput exceeds the threshold, requests cannot be properly responded or timed out, which may cause job execution failures.

## Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

## Procedure

Check whether the threshold is set properly.

**Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** Based on actual usage condition, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Reading > Read Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

For details, see [Figure 12-29](#).

**Figure 12-29** Setting alarm thresholds

-   %

**Step 3** Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the network port rate can meet the service requirements.**

**Step 4** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the network port name for which the alarm is generated.

**Step 5** Log in to the host for which the alarm is generated as user **root**.

**Step 6** Run the **ethtool network port name** command to check the maximum speed of the current network port.

 **NOTE**

In the VM environment, you cannot run a command to query the network port rate. It is recommended that you contact the system administrator to confirm whether the network port rate meets the requirements.

**Step 7** If the network read throughput rate exceeds the threshold, contact the system administrator to increase the network port rate.

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

**Step 10** Select **OMS** from the **Service** and click **OK**.

**Step 11** Set **Host** to the node for which the alarm is generated and the active OMS node.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 12.13.30 ALM-12050 Network Write Throughput Rate Exceeds the Threshold

### Description

The system checks the network write throughput rate every 30 seconds and compares the actual throughput rate with the threshold (the default threshold is 80%). This alarm is generated when the system detects that the network write throughput rate exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Throughput Rate**.

When the **Trigger Count** is 1, this alarm is cleared when the network write throughput rate is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the network write throughput rate is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12050    | Major          | Yes        |

### Parameters

| Name              | Meaning  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm is generated.  |
| ServiceName       | Specifies the service for which the alarm is generated.  |
| RoleName          | Specifies the role for which the alarm is generated.   |
| HostName          | Specifies the host for which the alarm is generated.   |
| NetworkCardName   | Specifies the network port for which the alarm is generated.   |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

- Latency: When the host network write throughput exceeds the threshold, the request response is slowed down and services are delayed.
- Service failure: When the host network write throughput exceeds the threshold, requests cannot be responded or times out, which may cause job running failures.

## Possible Causes

- The alarm threshold is set improperly.
- The network port rate cannot meet the current service requirements.

## Procedure

Check whether the threshold is set properly.

**Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Throughput Rate** and check whether the alarm threshold is set properly. (By default, 80% is a proper value. However, users can configure the value as required.)

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Based on actual usage condition, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Writing > Write Throughput Rate** and click **Modify** in the **Operation** column to modify the alarm threshold.

## 12.13.31 ALM-12051 Disk Inode Usage Exceeds the Threshold

### Description

The system checks the disk Inode usage every 30 seconds and compares the actual Inode usage with the threshold (the default threshold is 80%). This alarm is generated when the Inode usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Disk > Disk Inode Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the disk Inode usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the disk Inode usage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12051    | Major          | Yes        |

### Parameters

| Name              | Meaning  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm is generated.  |
| ServiceName       | Specifies the service for which the alarm is generated.  |
| RoleName          | Specifies the role for which the alarm is generated.   |
| HostName          | Specifies the host for which the alarm is generated.   |
| PartitionName     | Specifies the disk partition for which the alarm is generated.   |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

Service failure: If you need to modify or use data on the disk when data cannot be written to the file system, the job may fail.

## Possible Causes

Massive small files are stored in the disk.

## Procedure

### Massive small files are stored in the disk.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host and the disk partition for which the alarm is generated.

**Step 2** Log in to the host for which the alarm is generated as user **root**.

**Step 3** Run the **df -i | grep -iE "partition name/FileSystem"** command to check the current disk Inode usage.

```
# df -i | grep -iE "xvda2/FileSystem"
Filesystem          Inodes  IUsed  IFree IUse% Mounted on
/dev/xvda2          2359296 207420 2151876   9% /
```

**Step 4** If the Inode usage exceeds the threshold, manually check small files stored in the disk partition and confirm whether these small files can be deleted.

#### NOTE

Run the **for i in /\*; do echo \$i; find \$i|wc -l; done** command to query the number of files in a partition. Replace **/\*** with the specified partition.

```
# for i in /srv/*; do echo $i; find $i|wc -l; done
/srv/BigData
4284
/srv/ftp
1
/srv/www
13
```

- If yes, run the **rm -rf Path of the file or folder** to be deleted command to delete the file or folder and go to [Step 5](#).

#### NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If no, expand the capacity. Then, perform [Step 5](#).

**Step 5** Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

### Collect fault information.

**Step 6** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

**Step 7** Select **OMS** from the **Service** and click **OK**.

**Step 8** Set **Host** to the node for which the alarm is generated and the active OMS node.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.32 ALM-12052 TCP Temporary Port Usage Exceeds the Threshold

### Description

The system checks the TCP temporary port usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the TCP temporary port usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Network Status > TCP Ephemeral Port Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the TCP temporary port usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the TCP temporary port usage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12052    | Major          | Yes        |

### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

| Name              | Meaning  |
|-------------------|--|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

Services on the host cannot establish external connections, and therefore they are interrupted.

## Possible Causes

- The temporary port cannot meet the current service requirements.
- The system is abnormal.

## Procedure

### Expand the temporary port number range.

- Step 1** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **omm**.
- Step 3** Run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 1` command to obtain the value of the start port and run the `cat /proc/sys/net/ipv4/ip_local_port_range |cut -f 2` command to obtain the value of the end port. The total number of temporary ports is the value of the end port minus the value of the start port. If the total number of temporary ports is smaller than 28,232, the random port range of the OS is narrow. Contact the system administrator to increase the port range.
- Step 4** Run the `ss -ant 2>/dev/null | grep -v LISTEN | awk 'NR > 2 {print $4}' | awk -F':' '{print $NF}' | awk '$1 > "Value of the start port" {print $1}' | sort -u | wc -l` command to calculate the number of used temporary ports.
- Step 5** The formula for calculating the usage of the temporary ports is: Usage of the temporary ports = (Number of used temporary ports/Total number of temporary ports) x 100%. Check whether the temporary port usage exceeds the threshold.
- If yes, go to [Step 7](#).
  - If no, go to [Step 6](#).
- Step 6** Wait for 5 minutes, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

### Check whether the system environment is abnormal.

- Step 7** Run the following command to import the temporary file and view the frequently used ports in the **port\_result.txt** file:

**netstat -tnp|sort > \$BIGDATA\_HOME/tmp/port\_result.txt**

```
netstat -tnp|sort
Active Internet connections (w/o servers)

Proto Recv Send LocalAddress ForeignAddress State PID/ProgramName tcp 0 0 10-120-85-154:45433 10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45434 10-120-85-154:9866 CLOSE_WAIT 94237/java
tcp 0 0 10-120-85-154:45435 10-120-85-154:9866 CLOSE_WAIT 94237/java
...
```

**Step 8** Run the following command to view the processes that occupy a large number of ports:

```
ps -ef |grep PID
```

**NOTE**

- PID is the processes ID queried in [Step 7](#).
- Run the following command to collect information about all processes and check the processes that occupy a large number of ports:

```
ps -ef > $BIGDATA_HOME/tmp/ps_result.txt
```

**Step 9** After obtaining the administrator's approval, clear the processes that occupy a large number of ports. Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect fault information.**

**Step 10** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

**Step 11** Select **OMS** from the **Service** and click **OK**.

**Step 12** Set **Host** to the node for which the alarm is generated and the active OMS node.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected log information and files **port\_result.txt** and **ps\_result.txt**. Then, delete the two residual temporary files from the environment.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.33 ALM-12053 Host File Handle Usage Exceeds the Threshold

### Description

The system checks the file handle usage every 30 seconds and compares the actual usage with the threshold (the default threshold is 80%). This alarm is generated when the host file handle usage exceeds the threshold for several times (5 times by default) consecutively.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Host Status > Host File Handle Usage**.

When the **Trigger Count** is 1, this alarm is cleared when the host file handle usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the host file handle usage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12053    | Major          | Yes        |

### Parameters

| Name              | Meaning  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm is generated.  |
| ServiceName       | Specifies the service for which the alarm is generated.  |
| RoleName          | Specifies the role for which the alarm is generated.   |
| HostName          | Specifies the host for which the alarm is generated.   |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

Service failure: When the host file handle usage exceeds the threshold, system applications cannot perform I/O operations such as file opening and network operations. As a result, the program is abnormal, which may cause job running failure.

## Possible Causes

- The application process is abnormal. For example, the opened file or socket is not closed.
- The number of file handles cannot meet the current service requirements.
- The system is abnormal.

## Procedure

### Check information about files opened in processes.

**Step 1** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

**Step 2** Log in to the host for which the alarm is generated as user **root**.

**Step 3** Run the following command to check the process that occupies excessive file handles.

```
for proc in /proc/[0-9]*; do if [ -d "$proc/fd" ]; then num_fds=$(ls -l "$proc/fd" | wc -l); pid=$(basename $proc); echo "$num_fds ${pid}" ; fi; done | sort -nr | more
```

**Step 4** Check whether the processes in which a large number of files are opened are normal. For example, check whether there are files or sockets not closed.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** Release the abnormal processes that occupy too many file handles.

**Step 6** Five minutes later, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

### Increase the number of file handles.

**Step 7** On FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and obtain the IP address of the host for which the alarm is generated.

**Step 8** Log in to the host for which the alarm is generated as user **root**.

**Step 9** Contact the system administrator to increase the number of system file handles.

**Step 10** Run the `cat /proc/sys/fs/file-nr` command to view the used handles and the maximum number of file handles. The first value is the number of used handles, the third value is the maximum number. Please check whether the usage exceeds the threshold.

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

```
# cat /proc/sys/fs/file-nr  
12704 0 640000
```

**Step 11** Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Check whether the system environment is abnormal.**

**Step 12** Contact the system administrator to check whether the operating system is abnormal.

- If yes, go to [Step 13](#) to rectify the fault.
- If no, go to [Step 14](#).

**Step 13** Wait for 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Collect fault information.**

**Step 14** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

**Step 15** Select **OMS** from the **Service** and click **OK**.

**Step 16** Set **Host** to the node for which the alarm is generated and the active OMS node.

**Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 18** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.34 ALM-12054 Invalid Certificate File

### Alarm Description

The system checks whether the certificate file is invalid (has expired or is not valid yet) on 23:00 every day. This alarm is generated when the certificate file is invalid.

This alarm is cleared when a valid certificate is imported and the alarm detection mechanism is triggered on the next hour.

 **NOTE**

For MRS 3.2.0 or later, the certificate file is checked at the beginning of each hour.  
For versions earlier than MRS 3.2.0, the certificate file is checked on 23:00 every day.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12054    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated.           |
| RoleName          | Specifies the role for which the alarm was generated.              |
| HostName          | Specifies the host for which the alarm was generated.              |
| Trigger Condition | Specifies the threshold for triggering the alarm.                  |

## Impact on the System

The functions of the related modules cannot be used.

## Possible Causes

No certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is imported to the system, the certificate fails to be imported, or the certificate file is invalid.

## Handling Procedure

**Check the alarm cause.**

**Step 1** On FusionInsight Manager, locate the target alarm in the real-time alarm list and click .

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to [Step 2](#).
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to [Step 3](#).

- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to **Step 4**.
- If **Certificate has expired** is displayed in the additional information, view **Location** to obtain the name of the host for which the alarm is generated. Then, log in to the host as user **omm** and perform **Step 2** to **Step 4** in sequence to check whether the certificates have expired. If these certificates have not expired, check whether other certificates have been imported. If yes, import the certificate files again.

### Check the validity period of the certificate files in the system.

**Step 2** Check whether the current system time is in the validity period of the CA certificate.

Run the **bash \${CONTROLLER\_HOME}/security/cert/conf/querycertvalidity.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 5**.

**Step 3** Check whether the current system time is in the validity period of the HA root certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

**Step 4** Check whether the current system time is in the validity period of the HA user certificate.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to **Step 7**.
- If no, go to **Step 6**.

The following is an example of the effective time and due time of a CA or HA certificate:

Certificate:

```
Data:
  Version: 3 (0x2)
  Serial Number:
    97:d5:0e:84:af:ec:34:d8
  Signature Algorithm: sha256WithRSAEncryption
  Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
  Validity
    Not Before: Dec 13 06:38:26 2016 GMT          // Effective time
    Not After : Dec 11 06:38:26 2026 GMT          // Due time
```

### Import certificate files.

**Step 5** Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

**Step 6** Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. The alarm is automatically cleared after the CA certificate is imported. Check whether this alarm is reported again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

**Collect the fault information.**

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 8** In the **Services** area, select **Controller**, **OmmServer**, **OmmCore**, and **Tomcat**, and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.35 ALM-12055 Certificate File Is About to Expire

### Alarm Description

The system checks the certificate file on 23:00 every day. This alarm is generated if the certificate file is about to expire within 30 days.

This alarm is cleared when a certificate that is not about to expire is imported and the alarm detection mechanism is triggered on the next hour.

 **NOTE**

For MRS 3.2.0 or later, the certificate file is checked at the beginning of each hour.  
For versions earlier than MRS 3.2.0, the certificate file is checked on 23:00 every day.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12055    | Minor          | Yes          |

## Alarm Parameters

| Parameter         | Description  |
|-------------------|--|
| Source            | Specifies the cluster or system for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated.           |
| RoleName          | Specifies the role for which the alarm was generated.              |
| HostName          | Specifies the host for which the alarm was generated.              |
| Trigger Condition | Specifies the threshold for triggering the alarm.                  |

## Impact on the System

Some functions will be unavailable if the certificate expires.

## Possible Causes

The remaining validity period of a system certificate (CA certificate, HA root certificate, HA user certificate, Gaussdb root certificate, or Gaussdb user certificate) is less than 30 days.

## Handling Procedure

**Check the alarm cause.**

**Step 1** On FusionInsight Manager, locate the target alarm in the real-time alarm list and click .

View **Additional Information** to obtain the additional information about the alarm.

- If **CA Certificate** is displayed in the additional alarm information, log in to the active OMS management node as user **omm** and go to [Step 2](#).
- If **HA root Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to [Step 3](#).

- If **HA server Certificate** is displayed in the additional information, view **Location** to obtain the name of the host involved in this alarm. Then, log in to the host as user **omm** and go to [Step 4](#).

#### Check the validity period of the certificate files in the system.

- Step 2** Check whether the remaining validity period of the CA certificate is smaller than the alarm threshold.

Run the **bash \${CONTROLLER\_HOME}/security/cert/conf/validcert.sh** command to check the effective time and due time of the CA root certificate.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

- Step 3** Check whether the remaining validity period of the HA root certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/root-ca.crt** command to check the effective time and due time of the HA root certificate.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

- Step 4** Check whether the remaining validity period of the HA user certificate is smaller than the alarm threshold.

Run the **openssl x509 -noout -text -in \${CONTROLLER\_HOME}/security/certHA/server.crt** command to check the effective time and due time of the HA user certificate.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

The following is an example of the effective time and due time of a CA or HA certificate:

Certificate:

```
Data:
  Version: 3 (0x2)
  Serial Number:
    97:d5:0e:84:af:ec:34:d8
  Signature Algorithm: sha256WithRSAEncryption
  Issuer: C=CN, ST=xxx, L=yyy, O=zzz, OU=IT, CN=HADOOP.COM
  Validity
    Not Before: Dec 13 06:38:26 2016 GMT      // Effective time
    Not After : Dec 11 06:38:26 2026 GMT      // Due time
```

#### Import certificate files.

- Step 5** Import a new CA certificate file.

Apply for or generate a new CA certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

**Step 6** Import a new HA certificate file.

Apply for or generate a new HA certificate file and import it to the system. Manually clear the alarm and check whether this alarm is generated again during periodic check.

- If yes, go to [Step 7](#).
- If no, no further action is required.

**Collect the fault information.**

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 8** In the **Services** area, select **Controller, OmmServer, OmmCore, and Tomcat**, and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.36 ALM-12057 Metadata Not Configured with the Task to Periodically Back Up Data to a Third-Party Server

## Description

After the system is installed, it checks whether the task for periodically backing up metadata to the third-party server, and then performs the check hourly. If the task for periodically backing up metadata to a third-party server is not configured, a critical alarm is generated.

This alarm is cleared when a user creates such a backup task.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12057    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

If the metadata is not backed up to a third-party server, when the active/standby management nodes in the cluster are faulty and the local backup data is lost, if you want to use the backup package to restore the cluster metadata, no backup package is available.

## Possible Causes

Metadata is not configured with the task to periodically back up data to a third-party server.

## Procedure

- Step 1** On the FusionInsight Manager portal choose **O&M > Alarm > Alarms**.
- Step 2** In the alarm list, click  in the row where the alarm is located and identify the data module from which the alarm is generated based on **Additional Information**.
- Step 3** Choose **O&M > Backup and Restoration > Backup Management > Create**.
- Step 4** Configure a backup task. The backup data to be configured is consistent with the data in Additional Information of the alarm.
- Step 5** After the backup task is created successfully, wait for two minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 6](#).

### Collect fault information

- Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 7** In the **Service** area, select **Controller** and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

### 12.13.37 ALM-12061 Process Usage Exceeds the Threshold

#### Description

The system checks the usage of the omm process every 30 seconds. Users can run the `ps -o nlwp, pid, args, -u omm | awk '{sum+=$1} END {print "", sum}'` command to obtain the number of concurrent processes of user **omm**. Run the `ulimit -u` command to obtain the maximum number of processes that can be simultaneously opened by user **omm**. Divide the number of concurrent processes by the maximum number to obtain the process usage of user **omm**. The process usage has a default threshold. This alarm is generated when the process usage exceeds the threshold.

If **Trigger Count** is **3** and the process usage is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the process usage is less than or equal to 90% of the threshold, this alarm is cleared.

#### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12061    | Major          | Yes        |

#### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

| Name              | Meaning   |
|-------------------|---|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

## Impact on the System

Service failure: When the process usage exceeds the threshold, you cannot switch to user **omm**. A new **omm** thread cannot be created. As a result, the job may fail to run.

## Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of processes (including threads) that can be concurrently opened by user **omm** is inappropriate.
- An excessive number of threads are opened at the same time.

## Procedure

**Check whether the alarm threshold or alarm hit number is properly configured.**

- Step 1** On the FusionInsight Manager, change the alarm threshold and **Trigger Count** based on the actual CPU usage.

Specifically, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Process > omm Process Usage** to change Trigger Count.

### NOTE

The alarm is generated when the process usage exceeds the threshold for the times specified by **Trigger Count**.

Set the alarm threshold based on the actual process usage. To check the process usage, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Host > Process > omm Process Usage**, as shown in [Figure 12-31](#).

**Figure 12-31** Setting an alarm threshold

Thresholds > **Modify Rule**

---

\* Rule Name:

\* Severity:

\* Threshold Type:  Max value  Min value

\* Date:  Daily  
 Weekly  
 Other

Thresholds:      Start and End Time      Threshold

-        %

**Step 2** 2 minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 3](#).

**Check whether the maximum number of processes (including threads) opened by user omm is appropriate.**

**Step 3** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

**Step 4** Log in to the host where the alarm is generated as user **root**.

**Step 5** Run the **su - omm** command to switch to user **omm**.

**Step 6** Run the **ulimit -u** command to obtain the maximum number of threads that can be concurrently opened by user **omm** and check whether the number is greater than or equal to 60000.

- If it is, go to [Step 8](#).
- If it is not, go to [Step 7](#).

**Step 7** Run the **ulimit -u 60000** command to change the maximum number to 60000. Two minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 12](#).

**Check whether an excessive number of processes are opened at the same time.**

**Step 8** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

**Step 9** Log in to the host where the alarm is generated as user **root**.

**Step 10** Run the **ps -o nlwp, pid, lwp, args, -u omm|sort -n** command to check the numbers of threads used by the system.

The result is sorted based on the thread number. Analyze the top 5 thread numbers and check whether the threads are incorrectly used.

- If it is, perform the following operations to stop the parent processes of the top 5 abnormally used processes without affecting services, go to [Step 11](#).
  - a. Run the following command to query the parent process of the corresponding process:  
**ps -ef | grep "Process ID"**  
The third column in the command output is the parent process ID.
  - b. Run the following command to stop the parent process:  
**kill -9 parent process ID**
- If it is not, run the **ulimit -u** command to change the maximum number to be greater than 60000.

**Step 11** Five minutes later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 12](#).

**Collect fault information.**

**Step 12** On the FusionInsight Manager home page of the active clusters, choose **O&M > Log > Download**.

**Step 13** Select **OmmServer** and **NodeAgent** from the **Service** and click **OK**.

**Step 14** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 15** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.38 ALM-12062 OMS Parameter Configurations Mismatch with the Cluster Scale

### Description

The system checks whether the OMS parameter configurations match with the cluster scale at each top hour. If the OMS parameter configurations do not meet

the cluster scale requirements, the system generates this alarm. This alarm is automatically cleared when the OMS parameter configurations are modified.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12062    | Major          | Yes        |

## Parameters

| Parameter   | Description   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated.   |
| ServiceName | Specifies the name of the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.                |
| HostName    | Specifies the host for which the alarm is generated.                |

## Impact on the System

If the parameters configured for the current cluster are smaller than the configuration standard required by the cluster scale, problems such as job running delay and slow service page response may occur. In severe cases, the Agent or OMS process on the cluster node is abnormal. As a result, component jobs fail to be submitted and OMS data fails to be synchronized.

## Possible Causes

The OMS parameter configurations mismatch with the cluster scale.

## Procedure

**Check whether the OMS parameter configurations match with the cluster scale.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **vi \$BIGDATA\_LOG\_HOME/controller/scriptlog/modify\_manager\_param.log** command to open the log file and search for the log file containing the following information: Current oms configurations cannot

support *xx* nodes. In the information, *xx* indicates the number of nodes in the cluster.

**Step 5** Optimize the current cluster configuration by following the instructions in [Optimizing Manager Configurations Based on the Number of Cluster Nodes](#).

**Step 6** One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** Select **Controller** from the **Service** and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

### Optimizing Manager Configurations Based on the Number of Cluster Nodes

**Step 1** Log in to the active Manager node as user **omm**.

**Step 2** Run the following command to switch the directory:

```
cd ${BIGDATA_HOME}/om-server/om/sbin
```

**Step 3** Run the following command to view the current Manager configurations.

```
sh oms_config_info.sh -q
```

**Step 4** Run the following command to specify the number of nodes in the current cluster.

Command format: **sh oms\_config\_info.sh -s *number of nodes***

Example:

```
sh oms_config_info.sh -s 1000
```

Enter **y** as prompted.

The following configurations will be modified:

| Module     | Parameter                                 | Current | Target    |
|------------|---|---------|-----------|
| Controller | controller.Xmx                            | 4096m   | => 16384m |
| Controller | controller.Xms                            | 1024m   | => 8192m  |
| Controller | controller.node.heartbeat.error.threshold | 30000   | => 60000  |
| Pms        | pms.mem                                   | 8192m   | => 10240m |

Do you really want to do this operation? (y/n):

The configurations are updated successfully if the following information is displayed:

```
...
Operation has been completed. Now restarting OMS server.           [done]
Restarted oms server successfully.
```

 **NOTE**

- OMS is automatically restarted during the configuration update process.
- Clusters with similar quantities of nodes have same Manager configurations. For example, when the number of nodes is changed from 100 to 101, no configuration item needs to be updated.

----End

## 12.13.39 ALM-12063 Unavailable Disk

### Description

The system checks whether the data disk of the current host is available at the top of each hour. The system creates files, writes files, and deletes files in the mount directory of the disk. If the operations fail, the alarm is generated. If the operations succeed, the disk is available, and the alarm is cleared.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12063    | Major          | Yes        |

### Parameters

| Parameter   | Description   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated.   |
| ServiceName | Specifies the name of the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.                |
| HostName    | Specifies the host for which the alarm is generated.                |
| DiskName    | Specifies the disk for which the alarm is generated.                |

## Impact on the System

Service failure: If you need to modify or use data on a disk that is unwritable or unreadable, the job may fail.

## Possible Causes

- The permission of the disk mount directory is abnormal.
- There are disk bad sectors.

## Procedure

**Check whether the permission of the disk mount directory is normal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and **DiskName** for the disk for which the alarm is generated.
- Step 2** Log in to the host where the alarm is generated as user **root**.
- Step 3** Run the **df -h |grep DiskName** command to obtain the mount point and check whether the permission of the mount directory is unwritable or unreadable.
- If it is, go to [Step 4](#).
  - If it is not, go to [Step 8](#).

### NOTE

If the permission of the mount directory is 000 or the owner is **root**, the mount directory is unreadable and unwritable.

- Step 4** Modify the directory permission.
- Step 5** One hour later, check whether this alarm is cleared.
- If it is, no further action is required.
  - If it is not, go to [Step 6](#).
- Step 6** Contact hardware engineers to rectify the disk.
- Step 7** One hour later, check whether this alarm is cleared.
- If it is, no further action is required.
  - If it is not, go to [Step 8](#).

**Collect fault information.**

- Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 9** Select **NodeAgent** from the **Service** and click **OK**.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.40 ALM-12064 Host Random Port Range Conflicts with Cluster Used Port

## Alarm Description

The system checks whether the random port range of the host conflicts with the range of ports used by the Cluster system every hour. The alarm is generated if they conflict. The alarm is automatically cleared when the random port range of the host is changed to the normal range.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12064    | Major          | Yes        |

## Parameters

| Parameter   | Description   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated.   |
| ServiceName | Specifies the name of the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.                |
| HostName    | Specifies the host for which the alarm is generated.                |

## Impact on the System

- If ports such as okerberos and oldap are occupied, authentication fails and jobs may fail.
- If the controller and pms ports are occupied, the process is faulty, which may affect the elastic scaling performance.
- If the Tomcat port is occupied, the login and query functions of FusionInsight Manager are affected.

## Possible Causes

The random port range configuration is modified.

## Procedure

### Check the random port range of the system.

**Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host for which the alarm is generated.

**Step 2** Log in to the host where the alarm is generated as user **root**.

**Step 3** Run the `cat /proc/sys/net/ipv4/ip_local_port_range` command to obtain the random port range of the host and check whether the minimum value is smaller than 32768.

- If it is, go to [Step 4](#).
- If it is not, goto [Step 7](#).

**Step 4** Run the `vim /etc/sysctl.conf` command to change the value of `net.ipv4.ip_local_port_range` to **32768 61000**. If this parameter does not exist, add the following configuration: `net.ipv4.ip_local_port_range = 32768 61000`.

**Step 5** Run the `sysctl -p /etc/sysctl.conf` command for the modification to take effect.

**Step 6** One hour later, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

### Collect fault information.

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** Select **NodeAgent** for **Service** and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.41 ALM-12066 Trust Relationships Between Nodes Become Invalid

### Alarm Description

The system checks whether the trust relationship between the active OMS node and other Agent nodes is normal every hour. The alarm is generated if the mutual trust fails. This alarm is automatically cleared after the fault is rectified.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12066    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

### Impact on the System

Some operations (such as restart, configuration synchronization, and instance status query) that need to connect to the node may fail. If the trust relationships between nodes are invalid, services may be affected.

### Possible Causes

- The `/etc/ssh/sshd_config` configuration file is damaged.
- The password of user `omm` has expired.

### Handling Procedure

**Check the status of the `/etc/ssh/sshd_config` configuration file.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm and click  to view the host list in the alarm details.

- Step 2** Log in to the active OMS node as user **omm**.
- Step 3** Run the **ssh** command, for example, **ssh host2**, on each node in the alarm details to check whether the connection fails. (*host2* is a node other than the OMS node in the alarm details.)
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** Open the **/etc/ssh/sshd\_config** configuration file on *host2* and check whether **AllowUsers** or **DenyUsers** is configured for other nodes.
- If yes, go to **Step 5**.
  - If no, contact OS experts.
- Step 5** Modify the whitelist or blacklist to ensure that user **omm** is in the whitelist or not in the blacklist. Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

#### Check the status of the password of user **omm**.

- Step 6** Check the interaction information of the **ssh** command.
- If the password of user **omm** is required, go to **Step 7**.
  - If message "Enter passphrase for key '/home/omm/.ssh/id\_rsa':" is displayed, go to **Step 9**.
  - If the connection is set up successfully, run the following command to restart **ssh-agent** and then go to **Step 3**:  

```
ps -ef|grep ssh-agent |grep -v grep |awk '{print $2}' |xargs kill -9
```
- Step 7** Check the trust list (**/home/omm/.ssh/authorized\_keys**) of user **omm** on the OMS node and *host2* node. Check whether the trust list contains the public key file (**/home/omm/.ssh/id\_rsa.pub**) of user **omm** on the peer host.
- If yes, contact OS experts.
  - If no, add the public key of user **omm** of the peer host to the trust list of the local host.
- Step 8** Add the public key of user **omm** of the peer host to the trust list of the local host. Run the **ssh** command, for example, **ssh host2**, on each node in the alarm details to check whether the connection fails. (*host2* is a node other than the OMS node in the alarm details.)
- If yes, go to **Step 9**.
  - If no, check whether the alarm is cleared. If the alarm is cleared, no further action is required; otherwise, go to **Step 9**.

#### Collect the fault information.

- Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 10** Select **Controller** for **Service** and click **OK**.
- Step 11** Click  in the upper right corner to set the log collection time range. Generally, the time range is 10 minutes before and after the alarm generation time. Click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

Perform the following steps to handle abnormal trust relationships between nodes:

### NOTICE

- Perform this operation as user **omm**.
- If the network between nodes is disconnected, rectify the network fault first. Check whether the two nodes are connected to the same security group and whether **hosts.deny** and **hosts.allow** are set.

1. Run the **ssh-add -l** command on both nodes to check whether any identities exist.

```

[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ll .ssh/
total 32
-rw----- 1 omm wheel  0 Dec 29 14:17 agent.pid
-rw----- 1 omm wheel 12901 Mar  9 14:48 authorized_keys
-rw----- 1 omm wheel  54 Sep 24 11:42 config
-rw----- 1 omm wheel 1766 Sep 24 11:43 id_rsa
-rw----- 1 omm wheel 402 Sep 24 11:42 id_rsa.pub
-rw----- 1 omm wheel  88 Jun  8 2020 id_rsa.sha256
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/
agentlog/  alarmlog/  monitorlog/  scriptlog/
[omm@node-group-2eU40 ~]$ vim /var/log/Bigdata/nodeagent/scriptlog/
agent_alarm_py.log          install.log
agent_alarm_py.log.1       installntp.log

```

- If yes, go to **4**.
  - If no, go to **2**.
2. If no identities are displayed, run the **ps -ef|grep ssh-agent** command to find the **ssh-agent** process, stop the process, and wait for the process to automatically restart.

```

[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent
omm      18729      1  0 14:53 ?        00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid
omm      25098      1  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh
omm      25206 25098  0 14:54 ?        00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh
omm      27201 4913  0 14:54 pts/0    00:00:00 grep --color=auto ssh-agent
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$
[omm@node-group-2eU40 ~]$ ssh-add -l

```

3. Run the **ssh-add -l** command to check whether the identities have been added. If yes, manually run the **ssh** command to check whether the trust relationship is normal.

```
omm 22276 4913 0 14:53 pts/0 00:00:00 grep --color=auto ssh-agent
omm@node-group-2eU40 ~]$
omm@node-group-2eU40 ~]$
omm@node-group-2eU40 ~]$ ssh-add -l
The agent has no identities.
omm@node-group-2eU40 ~]$
omm@node-group-2eU40 ~]$ ps -ef|grep ssh-agent
omm 18729 1 0 14:53 ? 00:00:00 ssh-agent -a /home/omm/.ssh/agent.pid
omm 25098 1 0 14:54 ? 00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor-startup.sh
omm 25286 25098 0 14:54 ? 00:00:00 bash /opt/Bigdata/om-agent/nodeagent/bin/ssh-agent-monitor.sh
omm 27201 4913 0 14:54 pts/0 00:00:00 grep --color=auto ssh-agent
omm@node-group-2eU40 ~]$
omm@node-group-2eU40 ~]$ ssh-add -l
2048 SHA256:uChnRUbhhlHYxpF0Z1bS0zym1KXMIaFyvn0IMpiZjg /home/omm/.ssh/id_rsa (RSA)
omm@node-group-2eU40 ~]$
omm@node-group-2eU40 ~]$ ssh 10.33.109.226
Warning: Permanently added '10.33.109.226' (ECDSA) to the list of known hosts.
Last login: Tue Mar 9 14:53:49 2021
```

4. If identities exist, check whether the `/home/omm/.ssh/authorized_keys` file contains the information in the `/home/omm/.ssh/id_rsa.pub` file of the peer node. If it does not, manually add the information.
5. Check whether the permissions on the files in the `/home/omm/.ssh` directory are modified.
6. Check the `/var/log/Bigdata/nodeagent/scriptlog/ssh-agent-monitor.log` file.
7. If the `/home` directory of user `omm` is deleted, contact MRS support personnel for assistance.

## 12.13.42 ALM-12067 Tomcat Resource Is Abnormal

### Alarm Description

HA checks the Tomcat resources of Manager every 85 seconds. This alarm is generated when HA detects that the Tomcat resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the Tomcat resources become normal.

**Resource Type** of Tomcat is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Tomcat resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12067    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |

| Parameter | Description   |
|-----------|---|
| RoleName  | Specifies the role for which the alarm was generated. |
| HostName  | Specifies the host for which the alarm was generated. |

## Impact on the System

An active/standby Manager switchover may occur. The Manager and component web UIs are unavailable. The cluster management function cannot be provided for upper-layer web applications, and users may fail to log in to the Manager and component web UIs.

## Possible Causes

- The Tomcat directory permission is abnormal, and the Tomcat process is abnormal.

## Handling Procedure

**Check whether the permission on the Tomcat directory is normal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the IP address of the host for which the alarm is generated.
- Step 2** Log in to the alarm host as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/ha/scriptlog/tomcat.log** command to check whether the Tomcat resource log contains keyword **Cannot find XXX** and rectify the file permission based on the keyword.
- Step 5** After 5 minutes, check whether the alarm is automatically cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** In the **Services** area, select **OmmServer** and **Tomcat**, and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

### 12.13.43 ALM-12068 ACS Resource Exception

#### Alarm Description

HA checks the ACS resources of Manager every 80 seconds. This alarm is generated when HA detects that the ACS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the ACS resources are normal.

**Resource Type** of ACS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new ACS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

#### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12068    | Major          | Yes          |

#### Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

#### Impact on the System

An active/standby Manager switchover may occur. The security authentication and user management functions cannot be provided for ACS upper-layer applications. As a result, you may fail to log in to Manager and component web UIs.

## Possible Causes

The ACS process is abnormal.

## Handling Procedure

**Check whether the ACS process is normal.**

**Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.

**Step 2** Log in to the alarm host as user **root**.

**Step 3** Run the **su - omm** command and then **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** to check whether the status of the ACS resources managed by the HA is normal. In the single-node system, the ACS resource is in the normal state. In the dual-node system, the ACS resource is in the normal state on the active node and in the stopped state on the standby node.

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

**Step 4** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/ha/scriptlog/acs.log** command to check whether the ACS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.

**Step 5** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect the fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.44 ALM-12069 AOS Resource Exception

### Alarm Description

HA checks the AOS resources of Manager every 81 seconds. This alarm is generated when HA detects that the AOS resources are abnormal for two consecutive times.

This alarm is cleared when HA detects that the AOS resources become normal.

**Resource Type** of AOS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new AOS resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12069    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

### Impact on the System

An active/standby Manager switchover may occur. Tenant and role management cannot be provided for AOS upper-layer applications. As a result, you may fail to log in to Manager and component web UIs.

### Possible Causes

The AOS process is abnormal.

### Handling Procedure

**Check whether the AOS process is normal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.
- Step 2** Log in to the alarm host as user **root**.
- Step 3** Run the **su - omm** command and then **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** to check whether the status of the AOS resources managed by the HA is normal. In the single-node system, the AOS resource is in the normal state. In the dual-node system, the AOS resource is in the normal state on the active node and in the stopped state on the standby node.
- If yes, go to [Step 6](#).
  - If no, go to [Step 4](#).
- Step 4** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/ha/scriptlog/aos.log** command to check whether the AOS resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.
- Step 5** After 5 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).
- Collect the fault information.**
- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.45 ALM-12070 Controller Resource Is Abnormal

## Alarm Description

HA checks the controller resources of Manager every 80 seconds. This alarm is generated when HA detects that the controller resources are abnormal for 2 consecutive times.

This alarm is cleared when the Controller resource is normal.

**Resource Type** of Controller is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Controller resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12070    | Major          | Yes        |

## Parameters

| Parameter   | Description   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated.   |
| ServiceName | Specifies the name of the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.                |
| HostName    | Specifies the host for which the alarm is generated.                |

## Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The Controller process repeatedly restarts, which may cause the native UI of the service login failure.

## Possible Causes

The Controller process is abnormal.

## Procedure

**Check whether the controller process is normal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**. Run the **sh \$ {BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the Controller resources

managed by the HA is normal. In the single-node system, the Controller resource is in the normal state. In the dual-node system, the Controller resource is in the normal state on the active node and in the stopped state on the standby node.

- If it is, go to [Step 6](#).
- If it is not, go to [Step 4](#).

**Step 4** Run the `vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/controller.log` command to view the Controller resource logs, and run the `vi $BIGDATA_LOG_HOME/controller/controller.log` command to view the Controller running logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

**Step 5** Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 7** Select **Controller** and **OmmServe** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour before and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.46 ALM-12071 Httpd Resource Is Abnormal

### Description

HA checks the httpd resources of Manager every 120 seconds. This alarm is generated when HA detects that the httpd resources are abnormal for 10 consecutive times.

This alarm is cleared when the httpd resource is normal.

**Resource Type** of httpd is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new httpd resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12071    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The httpd process is repeatedly restarts, which may lead to the failure to visit the native service UI.

## Possible Causes

The httpd process is abnormal.

## Procedure

**Check whether the httpd process is abnormal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the httpd resources managed by the HA is normal. In the single-node system, the httpd resource is in the normal state. In the dual-node system, the httpd resource is in the normal state on the active node and in the stopped state on the standby node.
  - If it is, go to [Step 7](#).

- If it is not, go to [Step 5](#).

**Step 5** Run the `vi $BIGDATA_LOG_HOME/omm/oms/ha/scriptlog/httpd.log` command to view the httpd resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

**Step 6** Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** Select **Controller** and **OmmServer** for **Service** and click **OK**.

**Step 9** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.47 ALM-12072 FloatIP Resource Is Abnormal

### Description

HA checks the floatip resources of Manager every 9 seconds. This alarm is generated when HA detects that the floatip resources are abnormal for 3 consecutive times.

This alarm is cleared when the FloatIP resource is normal.

**Resource Type** of FloatIP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FloatIP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12072    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The FloatIP process is repeatedly restarts, which may lead to the failure to visit the native service UI.

## Possible Causes

- The floating IP address is abnormal.

## Procedure

### Check the floating IP address status of the active management node.

**Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the address of the host for which the alarm is generated and the resource name.

**Step 2** Log in to the active management node as user **root**.

**Step 3** Run the following command, go to the **`\${BIGDATA\_HOME}/om-server/om/sbin/`** directory.

```
su - omm
```

```
cd `${BIGDATA_HOME}/om-server/om/sbin/`
```

**Step 4** Run the **sh status-oms.sh** command, and execute the **status-oms.sh** script to check whether the floating IP address of the active FusionInsight Manager is normal. View the command output, locate the row where **ResName** is **floatip**, and check whether the following information is displayed.

For example:

```
10-10-10-160 floatip Normal Normal Single_active
```

- If it is, go to [Step 8](#).
- If it is not, go to [Step 5](#).

- Step 5** Run the **ifconfig** command to check whether the NIC with the floating IP address exists.
- If it does, go to **Step 8**.
  - If it does not, go to **Step 6**.
- Step 6** Run the **ifconfig NIC name Floating IPaddress netmask Subnet mask** command to reconfigure the NIC with the floating IP address. (For example, **ifconfig eth0 10.10.10.102 netmask 255.255.255.0**).
- Step 7** Five minutes later, check whether the alarm is cleared.
- If it is, no further action is required.
  - If it is not, go to **Step 8**.
- Collect fault information.**
- Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 9** Select **Controller** and **OmmServer** for **Service** and click **OK**.
- Step 10** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected log information.
- End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.48 ALM-12073 CEP Resource Is Abnormal

### Description

HA checks the cep resources of Manager every 60 seconds. This alarm is generated when HA detects that the cep resources are abnormal for 2 consecutive times.

This alarm is cleared when the CEP resource is normal.

**Resource Type** of CEP is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new CEP resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12073    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The CEP process repeatedly restarts. As a result, monitoring data collection fails during the alarm reporting period. In severe cases, monitoring data during the alarm reporting period may be lost.

## Possible Causes

The CEP process is abnormal.

## Procedure

### Check whether the CEP process is abnormal.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su -omm** command and then the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the CEP resources managed by the HA is normal. In the single-node system, the CEP resource is in the normal state. In the dual-node system, the CEP resource is in the normal state on the active node and in the stopped state on the standby node.
  - If it is, go to [Step 6](#).

- If it is not, go to [Step 4](#).

**Step 4** Run the `vi $BIGDATA_LOG_HOME/omm/oms/cep/cep.log` and `vi $BIGDATA_LOG_HOME/omm/oms/cep/scriptlog/cep_ha.log` commands to view the CEP resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

**Step 5** Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 7** Select **Controller** and **OmmServer** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.49 ALM-12074 FMS Resource Is Abnormal

### Description

HA checks the fms resources of Manager every 60 seconds. This alarm is generated when HA detects that the fms resources are abnormal for 2 consecutive times.

This alarm is cleared when the FMS resource is normal.

**Resource Type** of FMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new FMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12074    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The FMS process repeatedly restarts. As a result, the alarm data reported during the alarm reporting period is abnormal. In severe cases, the alarm data reported during the alarm reporting period may fail to be reported and cleared.

## Possible Causes

The FMS process is abnormal.

## Procedure

### Check whether the FMS process is abnormal.

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su -omm** command and then the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the FMS resources managed by the HA is normal. In the single-node system, the FMS resource is in the normal state. In the dual-node system, the FMS resource is in the normal state on the active node and in the stopped state on the standby node.
- If it is, go to [Step 6](#).
  - If it is not, go to [Step 4](#).
- Step 4** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/fms/fms.log** and **vi \$BIGDATA\_LOG\_HOME/omm/oms/fms/scriptlog/fms\_ha.log** commands to view the FMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.

**Step 5** 5 minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M> Log > Download**.

**Step 7** Select **Controller** and **OmmServer** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.50 ALM-12075 PMS Resource Is Abnormal

### Description

HA checks the pms resources of Manager every 55 seconds. This alarm is generated when HA detects that the pms resources are abnormal for three consecutive times.

This alarm is cleared when the PMS resource is normal.

**Resource Type** of PMS is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new PMS resources have been enabled on the new active FusionInsight Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby switchover.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12075    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- The alarm persists for a long time, causing frequent active/standby switchovers of FusionInsight Manager. As a result, users cannot log in to FusionInsight Manager and perform O&M operations.
- The PMS process repeatedly restarts. As a result, monitoring data collection fails during the alarm reporting period. In severe cases, monitoring data may be lost during the alarm reporting period.

## Possible Causes

The PMS process is abnormal.

## Procedure

**Check whether the PMS process is abnormal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su -omm** command and then the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the PMS resources managed by the HA is normal. In the single-node system, the PMS resource is in the normal state. In the dual-node system, the PMS resource is in the normal state on the active node and in the stopped state on the standby node.
  - If it is, go to **Step 6**.
  - If it is not, go to **Step 4**.
- Step 4** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/pms/pms.log** and **vi \$BIGDATA\_LOG\_HOME/omm/oms/pms/scriptlog/pms\_ha.log** commands to view the PMS resource logs, check whether the keyword **ERROR** exists. Analyze the logs to locate and rectify the fault.
- Step 5** Five minutes later, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M> Log > Download**.

**Step 7** Select **Controller** and **OmmServer** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 1 hour before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.51 ALM-12076 GaussDB Resource Is Abnormal

## Description

HA checks the Manager database every 10 seconds. This alarm is generated when HA detects that the database is abnormal for 3 consecutive times.

This alarm is cleared when the database is normal.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12076    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |

| Name     | Meaning  |
|----------|--|
| HostName | Specifies the host for which the alarm is generated. |

## Impact on the System

If the database is abnormal, all core services and related service processes of Manager, such as the alarm, monitoring, and query functions, are affected.

## Possible Causes

An exception occurs in the database.

## Procedure

**Check the database status of the active and standby management nodes.**

- Step 1** Log in to the active and standby management nodes respectively as user **root**. Run the **su - ommdba** command to switch to user **ommdba**, and then run the **gs\_ctl query** command to check whether the following information is displayed in the command output.

Command output of the active management node:

```
Ha state:
LOCAL_ROLE: Primary
STATIC_CONNECTIONS      : 1
DB_STATE                 : Normal
DETAIL_INFORMATION      : user/password invalid
Senders info:
No information
Receiver info:
No information
```

Command output of the standby management node:

```
Ha state:
LOCAL_ROLE: Standby
STATIC_CONNECTIONS      : 1
DB_STATE                 : Normal
DETAIL_INFORMATION      : user/password invalid
Senders info:
No information

## 12.13.52 ALM-12077 User omm Expired

### Description

The system starts at 00:00 every day to check whether user **omm** has expired every eight hours. This alarm is generated if the user account has expired.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12077    | Major          | Yes        |

### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

### Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

### Possible Causes

User **omm** has expired.

### Procedure

**Check whether user omm in the system has expired.**

**Step 1** Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

**Step 2** View the value of **Account expires** to check whether the user configurations have expired.

 NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

**Step 3** Run the **chage -E 'yyyy-MM-dd' omm** command to set the expiration time of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 5** Select **NodeAgent** for **Service** and click **OK**.

**Step 6** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.53 ALM-12078 Password of User omm Expired

### Description

The system starts at 00:00 every day to check whether the password of user **omm** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **omm** password is changed and the user password status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12078    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services. The **crontab** scheduled task cannot be executed, affecting the ClickHouse service.

## Possible Causes

The password of user **omm** has expired.

## Procedure

**Check whether the password of user omm in the system has expired.**

**Step 1** Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

**Step 2** View the value of **Password expires** to check whether the user configurations have expired.

### NOTE

If the parameter value is **never**, the user configurations never expire.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

**Step 3** Run the **chage -M 'days' omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M> Log > Download**.

**Step 5** Select **NodeAgent** for **Service** and click **OK**.

**Step 6** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.54 ALM-12079 User omm Is About to Expire

### Description

The system starts at 00:00 every day to check whether user **omm** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **omm** is changed and the user account status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12079    | Minor          | Yes        |

### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

User **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

## Possible Causes

The account of user **omm** is about to expire.

## Procedure

**Check whether user omm is about to expire.**

**Step 1** Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

**Step 2** View the value of **Account expires** to check whether the user configurations are about to expire.

### NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to [Step 3](#).
- If they are not, go to [Step 4](#).

**Step 3** Run the **chage -E 'yyyy-MM-dd' omm** command to set the validity period of user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 5** Select **NodeAgent** for **Service** and click **OK**.

**Step 6** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## 12.13.55 ALM-12080 Password of User omm Is About to Expire

### Description

The system starts at 00:00 every day to check whether the password of user **omm** is about to expire every 8 hours. This alarm is generated if the password will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **omm** password is reset and the user password status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12080    | Minor          | Yes        |

### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

### Impact on the System

The password of user **omm** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services. The **crontab** scheduled task cannot be executed, affecting the ClickHouse service.

### Possible Causes

The password of user **omm** is about to expire.

### Procedure

**Check whether the password of user omm in the system is about to expire.**

**Step 1** Log in to the faulty node as user **root**.

Run the **chage -l omm** command to view the information about the password of user **omm**.

**Step 2** View the value of **Password expires** to check whether the user configurations are about to expire.

 **NOTE**

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password are about to expire within 15 days.

- If they are, go to **Step 3**.
- If they are not, go to **Step 4**.

**Step 3** Run the **chage -M 'days' omm** command to set the validity period of the password for user **omm**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M> Log > Download**.

**Step 5** Select **NodeAgent** for **Service** and click **OK**.

**Step 6** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

## 12.13.56 ALM-12081 User ommdba Expired

### Description

The system starts at 00:00 every day to check whether user **ommdba** has expired every 8 hours. This alarm is generated if the user account has expired.

This alarm is cleared when the expiration time of user **ommdba** is reset and the user account status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12081    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

The OMS database cannot be managed and data cannot be accessed.

## Possible Causes

The account of user **ommdba** for the host has expired.

## Procedure

### Check whether user ommdba has expired.

**Step 1** Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

**Step 2** View the value of **Account expires** to check whether the user configurations have expired.

#### NOTE

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

**Step 3** Run the **chage -E 'yyyy-MM-dd' omm** command to set the validity period of user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

### Collect fault information.

**Step 4** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 5** Select **NodeAgent** for **Service** and click **OK**.

**Step 6** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.57 ALM-12082 User ommdba Is About to Expire

### Description

The system starts at 00:00 every day to check whether user **ommdba** is about to expire every 8 hours. This alarm is generated if the user account will expire no less than 15 days later.

This alarm is cleared when the expiration time of user **ommdba** is reset and the user account status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |

## 12.13.59 ALM-12084 Password of User ommdba Expired

### Description

The system starts at 00:00 every day to check whether the password of user **ommdba** has expired every 8 hours. This alarm is generated if the password has expired.

This alarm is cleared when the expiration time of user **ommdba** password is reset and the user password status becomes normal.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12084    | Major          | Yes        |

## Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

The password of user **ommdba** has expired. The node trust relationship is unavailable, and FusionInsight Manager cannot manage the services.

## Possible Causes

The password of user **ommdba** for the host has expired.

## Procedure

**Check whether the password of user ommdba in the system has expired.**

**Step 1** Log in to the faulty node as user **root**.

Run the **chage -l ommdba** command to view the information about the password of user **ommdba**.

**Step 2** View the value of **Password expires** to check whether the user configurations have expired.

 **NOTE**

If the parameter value is **never**, the user and password are valid permanently; if the value is a date, check whether the user and password have expired.

- If they do, go to [Step 3](#).
- If they do not, go to [Step 4](#).

**Step 3** Run the **chage -M 'days' ommdba** command to set the validity period of the password for user **ommdba**. Eight hours later, check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 5** Select **NodeAgent** for **Service** and click **OK**.

**Step 6** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

## 12.13.60 ALM-12085 Service Audit Log Dump Failure

### Description

The system dumps service audit logs at 03:00 every day and stores them on the OMS node. This alarm is generated when the dump fails. This alarm is cleared when the next dump succeeds.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12085    | Minor          | Yes        |

### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

If the audit logs of a component fail to be dumped, the audit logs cannot be retrieved if they are aged locally. This affects service analysis and troubleshooting of the component.

## Possible Causes

- The service audit logs are oversized.
- The OMS backup storage space is insufficient.
- The storage space of a host where the service is located is insufficient.

## Procedure

### Check whether the service audit logs are oversized.

**Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and view the IP address of the host and additional information for which the alarm is generated.

**Step 2** Log in to the host where the alarm is generated as user **root**.

**Step 3** Run the **vi \${BIGDATA\_LOG\_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "LOG SIZE is more than 5000MB" can be searched.

- If it can, go to **Step 4**.
- If it cannot, go to **Step 5**.

**Step 4** Check whether the oversized service audit logs are caused by exceptions.

### The OMS backup storage space is insufficient.

**Step 5** Run the **vi \${BIGDATA\_LOG\_HOME}/controller/scriptlog/getLogs.log** command to check whether the keyword "Collect log failed, too many logs on" can be searched.

- If it can, obtain the host IP address following the keyword "Collect log failed, too many logs on", and go to **Step 6**.
- If it cannot, go to **Step 11**.

**Step 6** Log in to the host with the IP address obtained in **Step 5** as user **root**.

**Step 7** Run the **vi {BIGDATA\_LOG\_HOME}/nodeagent/scriptlog/collectLog.log** command to check whether the keyword "log size exceeds" can be searched.

- If it can, go to **Step 9**.
- If it cannot, go to **Step 8**.

**Step 8** Check whether the alarm additional information contains the keyword "no enough space".

- If yes, go to **Step 9**.
- If no, go to **Step 11**.

**Step 9** Perform the following operations to expand the disk capacity (only for MRS 3.1.2 and earlier versions) or reduce the maximum number of audit log backups:

- Expand the capacity of the OMS node.

- Run the following command to edit the file and decrease the value of **MAX\_NUM\_BK\_AUDITLOG**.

```
vi ${CONTROLLER_HOME}/etc/om/componentsauditlog.properties
```

**Step 10** In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 11](#).

**Check whether the space of the host where the service is located is insufficient.**

**Step 11** Run the `vi ${BIGDATA_LOG_HOME}/controller/scriptlog/getLogs.log` command to check whether the keyword "Collect log failed, no enough space on *hostip*" can be searched.

- If it can, obtain the IP address of the abnormal host and go to [Step 12](#).
- If it cannot, go to [Step 15](#).

**Step 12** Log in to the host with the IP address obtained as user **root**, and run the `df "$BIGDATA_HOME/tmp" -lP | tail -1 | awk '{print ($4/1024)}'` command to obtain the remaining space of the host log directory. Check whether the value is less than 1000 MB.

- If it is, go to [Step 13](#).
- If it is not, go to [Step 15](#).

**Step 13** Expand the capacity of the node

**Step 14** In the next execution period, 03:00, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 15](#).

**Collect fault information.**

**Step 15** On FusionInsight Manager, choose **O&M> Log > Download**.

**Step 16** Select **Controller** for **Service** and click **OK**.

**Step 17** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 18** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.61 ALM-12087 System Is in the Upgrade Observation Period

### Description

The system checks whether it is in the upgrade observation period at 00:00 every day and checks whether the duration that it has been in the upgrade observation state exceeds the preset upgrade observation period, 10 days by default. This alarm is generated when the system is in the upgrade observation period and the duration that the system has been in the upgrade observation state exceeds the preset period (10 days by default). This alarm is automatically cleared if the system exits the upgrade observation period after the user performs a rollback or submission.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12087    | Major          | Yes        |

### Parameters

| Name                              | Meaning  |
|-----------------------------------|--|
| Source                            | Specifies the cluster or system for which the alarm is generated.        |
| ServiceName                       | Specifies the service for which the alarm is generated.                  |
| RoleName                          | Specifies the role for which the alarm is generated.                     |
| HostName                          | Specifies the host for which the alarm is generated.                     |
| Upgrade Observation Period (Days) | Specifies the days that the system is in the upgrade observation period. |

### Impact on the System

During the upgrade observation period, do not add or delete users, instances, roles, services, hosts, or resource pools that affect the management topology.

### Possible Causes

The upgrade task is not submitted a specified period of time (10 days by default) after the system upgrade.

## Procedure

**Check whether the system is in the upgrade observation period.**

**Step 1** Log in to the active management node as user **root**.

**Step 2** Run the following commands to switch to user **omm** and log in to the **omm** database:

```
su - omm
```

```
gsqll -U omm -W omm database password -p 20015
```

**Step 3** Run the **select \* from OM\_CLUSTERS** command to view cluster information.

**Step 4** Check whether the value of **upgradObservationPeriod isON** is **true**, as shown in [Figure 12-32](#).

- If it is, the system is in the upgrade observation period. Use the UpdateTool to submit the upgrade task. For details, see the upgrade guide of the corresponding version.
- If it is not, go to [Step 6](#).

**Figure 12-32** Cluster information

```
CLUSTER_ID | CLUSTER_NAME | CLUSTER_DESCRIPTION | STACK_NAME | STACK_TIME | PRESTACK_NAME | PRESTACK_TIME | STACK_MODEL | CURRENT_PATCH_VERSION | IS_DETACHED | UPDATE_MODE | OBSERVATION_PERIOD | EXTERNAL_PARAM  
-----  
cluster_1 | Test_1 | | DEFAULT_STACK | 1552390738666 | | Sec | | 0 | | ('upgradObservationPeriod': {'isOn': true, 'proje  
: '199318993146781010', 'type': 'UPGRADE'}, 'updateEndTime': 1552391484884), 'patchObservationPeriod': {'isOn': false, 'updateEndTime': 0}) | {}
```

**Step 5** In the early morning of the next day, check whether this alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select **Controller** from the **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.62 ALM-12089 Inter-Node Network Is Abnormal

### Description

The alarm module checks the network health status of nodes in the cluster every 10 seconds. This alarm is generated when the network between two nodes is unreachable or the network status is unstable.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12089    | Major          | Yes        |

### Parameters

| Name        | Meaning   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

### Impact on the System

- Data transmission becomes slow or interrupted. Data may be lost or incomplete.
- Task scheduling is affected. For example, Yarn tasks cannot be executed properly or fail to be executed due to timeout.
- Data processing is affected. For example, HDFS data synchronization fails or the data is inaccurate.
- System performance deteriorates. The efficiency and quality of data processing is low.

### Possible Causes

- The node breaks down.
- The network is faulty.

### Procedure

**Check the network health status.**

**Step 1** In the alarm list on FusionInsight Manager, click the drop-down button of the alarm and view **Additional Information**. Record the source IP address and destination IP address of the node for which the alarm is reported.

**Step 2** Log in to the node for which the alarm is reported. On the node, ping the target node to check whether the network between the two nodes is normal.

- If yes, go to [6](#).
- If no, go to [3](#).

**Check the node status.**

**Step 3** On FusionInsight Manager, click **Host** and check whether the host list contains the faulty node to determine whether the faulty node has been removed from the cluster.

- If yes, go to [5](#).
- If no, go to [4](#).

**Step 4** Check whether the faulty node is powered off.

- If yes, start the faulty node and go to [Step 2](#).
- If no, contact related personnel to find root cause, if need to remove the faulty nodes from the cluster and go to [5](#), otherwise go to [6](#).

**Step 5** Remove the file `$NODE_AGENT_HOME/etc/agent/hosts.ini` of all nodes in the cluster, and clean up the file `/var/log/Bigdata/unreachable/unreachable_ip_info.log`, and then manually clear the alarm.

**Step 6** Wait for 30 seconds and checking if the alarm was been cleared.

- If yes, no further action is required.
- If no, go to [7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **OmmAgent** from the **Service** and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.63 ALM-12091 Abnormal disaster Resources

### Alarm Description

HA checks the disaster resources of Manager every 86 seconds. This alarm is generated when HA detects that the disaster resources have been abnormal for 10 consecutive times.

This alarm is cleared when HA detects that the disaster resources become normal.

**Resource Type** of disaster is **Single-active**. Active/Standby switchover will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new disaster resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12091    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

### Impact on the System

- The active/standby Manager switchover occurs.
- The disaster process restarts repeatedly, which may cause active/standby DR to be unavailable.

### Possible Causes

The disaster process is abnormal.

### Handling Procedure

**Check whether the disaster process is normal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the disaster resources managed by the HA is normal. In the single-node system, the disaster resource is in the normal state. In the dual-node system, the disaster resource is in the normal state on the active node and in the stopped state on the standby node.
- If yes, go to **Step 7**.
  - If no, go to **Step 5**.
- Step 5** Run the **vi \${BIGDATA\_LOG\_HOME}/disaster/disaster.log** command to check whether the disaster resource log of HA contains the keyword **ERROR**. If yes, analyze the logs to locate the resource exception cause and fix the exception.
- Step 6** Wait 5 minutes and check whether the alarm is automatically cleared.
- If yes, no further action is required.
  - If no, go to **Step 7**.
- Collect fault information.**
- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the **Service** drop-down list, select **Disaster** for the target cluster, and click **OK**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.64 ALM-12101 AZ Unhealthy

### Description

After the AZ DR function is enabled, the system checks the AZ health status every 5 minutes. This alarm is generated when the system detects that the AZ is subhealthy or unhealthy. This alarm is cleared when the AZ becomes healthy.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 12101    | Critical       | Yes        |

## Parameters

| Parameter   | Meaning   |
|-------------|---|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| AZName      | Specifies the AZ for which the alarm is generated.      |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The health status of an AZ is determined by whether the health status of storage resources (HDFS), computing resources (Yarn), and key roles in the AZ exceeds the configured threshold.

An AZ is subhealthy when:

- The computing resources (Yarn) are unhealthy, but the storage resources (HDFS) are healthy. Tasks cannot be submitted to the local AZ, but data can still be read and written in the local AZ.
- The computing resources (Yarn) are healthy, but some storage resources (HDFS) are unhealthy. Tasks can be submitted to the local AZ, and some data can be read and written in the local AZ. This depends on the locality of data detected by Spark/Hive scheduling.

An AZ is unhealthy when:

- The computing resources (Yarn) are healthy, but the storage resources (HDFS) are unhealthy. Although tasks can be submitted to the local AZ, data cannot be read or written in the local AZ. As a result, the tasks submitted to the local AZ are invalid.
- The computing resources (Yarn) and storage resources (HDFS) are unhealthy. Tasks cannot be submitted to the local AZ, and data cannot be read or written in the local AZ.
- The health status of key roles except Yarn and HDFS is lower than the configured threshold.

## Possible Causes

- The computing resources (Yarn) are unhealthy.
- The storage resources (HDFS) are unhealthy.
- Some storage resources (HDFS) are unhealthy.
- Key roles except Yarn and HDFS are unhealthy.

## Procedure

### Disable the DR drill.

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Cross-AZ HA**. The Cross-AZ HA page is displayed.
- Step 2** In the AZ DR list, check whether **Perform DR Drill** in the **Operation** column of the AZ whose health status is **Unhealthy** is gray.
- If yes, go to **Step 4**.
  - If no, go to **Step 3**.
- Step 3** Click **Restore** in the **Operation** column of the target AZ. Wait 2 minutes and refresh the page to view the health status of the AZ. Check whether the health status is normal.
- If yes, no further action is required.
  - If no, go to **Step 4**.

### Collect the fault information.

- Step 4** Log in to the active management node as user **root**.
- Step 5** View logs of unhealthy services.
- HDFS log files are stored in `/var/log/Bigdata/hdfs/nn/hdfs-az-state.log`.
  - Yarn log files are stored in `/var/log/Bigdata/yarn/rm/yarn-az-state.log`.
  - For other services, view the service health check logs in the corresponding service log directory.
- Step 6** Contact O&M personnel and provide detailed log file information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.65 ALM-12102 AZ HA Component Is Not Deployed Based on DR Requirements

## Alarm Description

The alarm module checks the deployment status of AZ HA components every 5 minutes. This alarm is generated when the components that support DR are not

deployed based on DR requirements after AZ is enabled. This alarm is cleared when the components are deployed based on DR requirements.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12102    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |

## Impact on the System

The cross-AZ HA capability of a single cluster is affected.

## Possible Causes

The roles of the components that support DR are not deployed based on DR requirements.

## Handling Procedure

**Obtain alarm information.**

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**.

**Step 2** In the alarm list, click  in the row that contains the alarm and view the roles that are not deployed based on DR requirements in **Additional Information**.

**Redeploy the role instance.**

**Step 3** Choose **Cluster > Services > Name of the desired service > Instance**. On the instance page, redeploy or adjust the role instance.

**Step 4** Check whether the alarm is cleared 10 minutes later.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.66 ALM-12103 Executor Resource Exception

### Alarm Description

HA checks the Executor resources of Manager every 30 seconds. This alarm is generated when HA detects that the Executor resources are abnormal for two consecutive times.

This alarm is cleared when the Executor resources are normal.

**Resource Type** of Executor is **Single-active**. Active/standby will be triggered upon resource exceptions. When this alarm is generated, the active/standby switchover is complete and new Executor resources have been enabled on the new active Manager. In this case, this alarm is cleared. This alarm is used to notify users of the cause of the active/standby Manager switchover.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12103    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

### Impact on the System

- The active/standby Manager switchover occurs.
- The Executor process keeps restarting. As a result, the cluster page may fail to be accessed.

### Possible Causes

The Executor process is abnormal.

## Handling Procedure

**Check whether the Executor process is abnormal.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.
- Step 2** Log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **sh \${BIGDATA\_HOME}/om-server/OMS/workspace0/ha/module/hacom/script/status\_ha.sh** command to check whether the status of the Executor resources managed by the HA is normal. In the single-node system, the Executor resource is in the normal state. In the dual-node system, the Executor resource is in the normal state on the active node and in the stopped state on the standby node.
- If yes, go to [Step 7](#).
  - If no, go to [Step 5](#).
- Step 5** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/ha/scriptlog/executor.log** command to check whether the Executor resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.
- Step 6** After 5 minutes, check whether this alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

**Collect the fault information.**

- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

## 12.13.67 ALM-12104 Abnormal Knox Resources

### Alarm Description

HA checks the Knox resources of Manager every 70 seconds. This alarm is generated when HA detects that the Knox resources are abnormal for three consecutive times.

This alarm is cleared when HA detects that the Knox resources are normal.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12104    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

## Impact on the System

Requests sent by upper-layer services by using Knox cannot be properly processed.

## Possible Causes

The Knox process is abnormal.

## Handling Procedure

Check whether the Knox process is normal.

- Step 1** Log in to FusionInsight Manager. In the alarm list, locate the row that contains the alarm and view the name of the host for which the alarm is generated.
- Step 2** Use PuTTY to log in to the host for which the alarm is generated as user **root**.
- Step 3** Run the **su - omm** command to switch to user **omm**.
- Step 4** Run the **sh \${BIGDATA\_HOME}/om-server/om/sbin/status-oms.sh** command to check whether the status of the Knox resources managed by HA is normal. If the status is normal, the Knox resources are normal. Otherwise, the Knox resources are abnormal.
  - If yes, go to [Step 7](#).
  - If no, go to [Step 5](#).
- Step 5** Run the **vi \$BIGDATA\_LOG\_HOME/omm/oms/ha/scriptlog/knox.log** command to check whether the Knox resource log of HA contains the keyword **ERROR**. If yes, analyze the log to locate the resource exception cause and fix the exception.

**Step 6** After 5 minutes, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

Collect the fault information.

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 8** In the **Services** area, select **Controller** and **OmmServer**, and click **OK**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

## 12.13.68 ALM-12110 Failed to get ECS temporary AK/SK

### Alarm Description

Meta calls the ECS API to obtain the AK/SK information every 5 minutes and caches the information. Before the AK/SK expires, Meta calls the API again to update it. This alarm is generated when Meta fails to call the API for three consecutive times.

This alarm is cleared when Meta successfully calls the ECS API.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12110    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

The cluster cannot obtain the latest temporary AK/SK. In the storage and compute separation scenario, OBS may fail to be accessed. As a result, component services cannot be properly processed.

## Possible Causes

- The meta role of the MRS cluster is abnormal.
- The cluster has been bound to an agency and accessed OBS but has been unbound from the agency. As a result, the cluster has not been bound to any agency.

## Handling Procedure

**Check the status of the meta role.**

**Step 1** On FusionInsight Manager of the cluster, choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and determine the IP address of the host for which the alarm is generated.

**Step 2** On FusionInsight Manager of the cluster, choose **Cluster > Services > meta**. On the page that is displayed, click the **Instances** tab, and check whether the meta role corresponding to the host for which the alarm is generated is normal.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** Select the abnormal role, click **More**, and select **Restart Instance** to restart the abnormal meta role.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** Log in to the host obtained in [Step 1](#) and check whether the `/var/log/Bigdata/meta/mrs-meta.log` file contains error information. If yes, rectify the fault based on the log information.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Rebind the cluster to an agency.**

**Step 7** Log in to the MRS management console.

**Step 8** In the navigation pane on the left, choose **Active Clusters**. On the page that is displayed, click the cluster name to go to its overview page. Then, check whether the cluster is bound to an agency in the O&M management area.

- If yes, go to [Step 10](#).
- If no, go to [Step 9](#).

**Step 9** Click **Manage Agency**. On the page that is displayed, rebind the cluster to an agency. Then check whether the alarm is cleared a few minutes later.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect fault information.**

**Step 10** On FusionInsight Manager of the active cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Expand the **Service** drop-down list, select **meta** for the target cluster, and click **OK**.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## 12.13.69 ALM-12172 Failed to Report Metrics to Cloud Eye

### Alarm Description

After metric sharing is enabled for a cluster, the Controller periodically collects cluster metrics and reports them to Cloud Eye.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12172    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |

### Impact on the System

MRS monitoring metrics are unavailable on Cloud Eye.

## Possible Causes

- Failed to call Cloud Eye APIs due to insufficient permissions.
- Failed to report data to Cloud Eye due to network problems.
- Failed to report data to Cloud Eye due to internal errors.

## Handling Procedure

**Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, and view the additional information in the alarm details.

**Step 2** Rectify the fault based on the following scenarios:

- If "Call CES to send metrics fail. Permission exception" is displayed in the additional information, the token of the resource tenant is invalid. Restart the Controller and obtain the token again. The detailed procedure is as follows:
  - a. Log in to FusionInsight Manager, click the task center icon in the upper right corner, and verify that no task is being executed in the task center.
  - b. Use PuTTY to log in to the active management node as user **omm**.
  - c. Restart the controller.

```
sh ${BIGDATA_HOME}/om-server/om/sbin/restart-controller.sh
```
  - d. Wait for 5 minutes and check whether the alarm is cleared.
    - If yes, no further action is required.
    - If no, go to **Step 3**.
- If "Call CES to send metrics fail. Request CES error code xxx" or "CES internal error code xxx" is displayed, the function service is abnormal. Go to **Step 3**.
- If "Call CES to send metrics fail. Too many request" is displayed in additional alarm information, the service request triggers traffic control. Go to **Step 3**.

### Collect fault information.

**Step 3** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 4** On the displayed page, select **Controller** of **OMS** for **Service**, and click **OK**. Select the active node for **Host** and click **OK**.

**Step 5** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 6** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.70 ALM-12180 Suspended Disk I/O

### Alarm Description

#### For MRS 3.3.0 and its later versions:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 6 seconds within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 1000 ms within 300 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency reaches 3 seconds within 30 seconds in at least seven collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
  - By default, the system collects data every 3 seconds. At least 50% of detected svctm take no less than 500 ms within 300 seconds.

The collection period is 3 seconds, and the detection period is 30 or 300 seconds. This alarm is automatically cleared when neither of the preceding conditions is met for three consecutive detection periods (30 or 300 seconds).

#### For versions earlier than MRS 3.3.0:

- For HDDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency exceeds 6 seconds within 30 seconds in at least 10 collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.
- For SSDs, the alarm is triggered when any of the following conditions is met:
  - By default, the system collects data every 3 seconds. The svctm latency exceeds 2 seconds within 30 seconds in at least 10 collection periods.
  - By default, the system collects data every 3 seconds. The disk queue depth (**avgqu-sz**) is greater than 0, the IOPS or bandwidth is 0, and **ioutil** is greater than 99% in at least 10 collection periods within 30 seconds.

This alarm is automatically cleared when the preceding conditions have not been met for 90s.

 NOTE

For details about how to obtain and calculate related parameters, see [Related Information](#).

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12180    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |
| HostName    | Specifies the host for which the alarm was generated.              |
| DiskName    | Specifies the disk for which the alarm was generated.              |

## Impact on the System

If the I/O usage keeps increasing, operations will be affected and services will be interrupted. The possible impacts are as follows:

- The system I/O performance deteriorates, which means slow response and low throughput. For example, job submission is slow, page responds slowly, interface response times out, and the system is in error or even crash.
- Customer services may be interrupted. The system may break down and the key information stored on the faulty disk may be lost.

## Possible Causes

The disk is aged.

## Handling Procedure

**Replace the disk.**

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**.

**Step 2** View the detailed information about the alarm. Check the values of **HostName** and **DiskName** in the location information to obtain the information about the faulty disk for which the alarm is reported.

**Step 3** Replace the hard disk.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Collect fault information.**

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** Select **OMS** for **Service** and click **OK**.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

Obtain and calculate related parameters as follows:

- Run the following command in the OS to collect data:

**iostat -x -t 1 1**

```
[root@ ~]# iostat -x -t 1 1
Linux 4.18.0-147.5.2.10.el8.x86_64 (node-master1cgyv) 10/12/2022 _x86_64_ (8 CPU)
10/12/2022 05:24:09 PM
avg-cpu:  %user   %nice %system %iowait  %steal   %idle
           24.49    0.00   13.82    0.11    0.00   61.58

Device:            r/s   kB/s   rrqm/s   %rrqm  r_await  rareq-sz   w/s   kB/s   wrqm/s   %wrqm  w_await  wareq-sz   d/s   kB/s   drqm/s   %drqm  d_await  dareq-sz   aqu-sz   %util
dm-0                1.59   57.23    0.00   0.00    1.22   35.94   15.80   124.80    0.00   0.00    2.39    7.90    0.00   0.00   0.00   0.00   0.00   0.00   0.04   0.79

```

Parameters are as follows:

**avgqu-sz** indicates the disk queue depth.

The sum of **r/s** and **w/s** is the IOPS.

The sum of **rkB/s** and **wkB/s** is the bandwidth.

**%util** is the **ioutil** value.

- MRS 3.1.0:

Run the **iostat -x -t** command in the OS.

```
lomm@node-master1hxyk ~]$ iostat -x -t
Linux 3.10.0-862.14.1.5.el7.x86_64 (node-master1hxyk) 11/11/2022 _x86_64_ (4 CPU)
11/11/2022 03:35:20 PM
avg-cpu:  %user   %nice %system %iowait  %steal   %idle
           27.66    0.00   15.66    0.63    0.00   56.06

Device:            rrqm/s   wrqm/s   r/s     w/s   rkB/s   kB/s   avgrq-sz   avgqu-sz   await  r_await  w_await   svctm   iutil
vda                0.13   29.26   1.71   23.51  187.56  608.08   63.11    0.91   36.02   50.86   34.94   0.64   1.62
vdb                 0.00   14.45   0.08   27.34   1.35   301.81   22.12    0.08   2.81   26.57   2.74   0.53   1.45
```

- Calculate **svctm** as follows in versions later than MRS 3.1.0:  

$$svctm = (tot\_ticks\_new - tot\_ticks\_old) / (rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old)$$
- Versions earlier than MRS 3.3.0: If **rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old = 0**, then **svctm = 0**.
- MRS 3.3.0 and its later versions:  
 When the detection period is 30 seconds, if **rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old = 0**, then **svctm = 0**.  
 When the detection period is 300 seconds and **rd\_ios\_new + wr\_ios\_new - rd\_ios\_old - wr\_ios\_old = 0**, if **tot\_ticks\_new - tot\_ticks\_old = 0**, then **svctm = 0**; otherwise, the value of **svctm** is infinite.

The parameters can be obtained as follows:

The system runs the **cat /proc/diskstats** command every 3 seconds to collect data. For example:

```
omm@ >>> jls cat /proc/diskstats
253 0 vda 1101553 35446 83439787 3338546 28744856 48314024 1054257652 52667332 0 19569526 10342913 0 0 0 0

253 7 vda7 157987 105 3477434 149542 6507759 1029060 140677872 14351373 0 1679157 11117724 0 0 0 0
253 8 vda8 312935 8169 22369722 458354 12181277 34364199 531855680 17727525 0 9061647 11387424 0 0 0 0
253 16 vdb 275920 21939 15977738 2171665 39477604 28238831 2653881640 482234435 0 30581946 465964144 0 0 0 0
253 17 vdb1 275439 21939 15948866 2171472 31293358 28238811 2653881432 481841639 0 30038274 465857164 0 0 0 0
253 0 loop0 356 0 17442 150 0 0 0 0 0 149 105 0 0 0 0
```

In the two commands:

In the data collected for the first time, the number in the fourth column is the **rd\_ios\_old** value, the number in the eighth column is the **wr\_ios\_old** value, and the number in the thirteenth column is the **tot\_ticks\_old** value.

In the data collected for the second time, the number in the fourth column is the **rd\_ios\_new** value, the number in the eighth column is the **wr\_ios\_new** value, and the number in the thirteenth column is the **tot\_ticks\_new** value.

In this case, the value of **svctm** is as follows:

$$(19571460 - 19569526) / (1101553 + 28747977 - 1101553 - 28744856) = 0.6197$$

## 12.13.71 ALM-12186 CGroup Task Usage Exceeds the Threshold

### Alarm Description

The system checks the CGroup task usage of user **omm** every 5 minutes. This alarm is generated when the CGroup task usage exceeds 90%. This alarm is cleared when the CGroup task usage is less than or equal to 90%.

CGroup task usage = Number of used CGroup tasks/Maximum number of CGroup tasks

You can run the `systemctl status user-$(id -u).slice | grep limit | awk -F ' '{print $2}'` command as user `omm` to obtain the number of used CGroup tasks of this user and run the `echo $(systemctl status user-$(id -u).slice | grep limit | awk -F ' '{print $4}') | sed -e 's/)//g'` command to obtain the maximum number of CGroup tasks allowed for this user.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12186    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |
| RoleName    | Specifies the role for which the alarm is generated.              |
| HostName    | Specifies the host for which the alarm is generated.              |

## Impact on the System

- Failed to switch to user `omm`.
- Failed to create new `omm` processes.
- A faulty service or process cannot be restarted.

## Possible Causes

The CGroup task usage exceeds 90%.

## Handling Procedure

**Check the maximum number of threads that can be concurrently opened by user `omm` is properly set.**

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the page that is displayed, click  in the row containing the alarm, and view the name of the host for which the alarm is generated in **Location**. Click the host name to view its IP address.

**Step 2** Log in to the host for which the alarm is generated as user `omm`.

**Step 3** Run the following command to obtain the maximum number of threads that can be concurrently opened by user **omm** and check whether this number is greater than or equal to **60000**:

```
systemctl status user-$(id -u).slice | grep limit
```

- If yes, go to [Step 6](#).
- If no, go to [Step 4](#).

**Step 4** Switch to user **root** and run the following command to change the value for user **omm** to **60000**:

```
systemctl set-property user-2000.slice TasksMax=60000
```

**Step 5** Change the value of **UserTasksMax** in the `/etc/systemd/logind.conf` file to **60000**. (If the parameter is commented out, uncomment it.) Save the file, wait 5 minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager of the cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, select **OmmServer** and **NodeAgent** for the target cluster, and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 12.13.72 ALM-12187 Failed to Expand Disk Partition Capacity

## Alarm Description

The system checks the disk space every 60 seconds. When detecting that the disk space is expanded, the system expands disk partition. This alarm is generated when the disk partition fails to be expanded.

This alarm is cleared when the system detects that the disk partition is successfully expanded.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12187    | Minor          | Yes          |

## Alarm Parameters

| Parameter          | Description   |
|--------------------|---|
| Source             | Specifies the cluster or system for which the alarm is generated. |
| ServiceName        | Specifies the service for which the alarm is generated.           |
| RoleName           | Specifies the role for which the alarm is generated.              |
| HostName           | Specifies the host for which the alarm is generated.              |
| MountDirectoryName | Specifies the directory for which the alarm is generated.         |

## Impact on the System

A disk partition scale-out failure may have the following impacts on the system:

- Data may be lost. (It is important to back up key information before scale-out.)
- The system may be unstable or cannot be started because the system files may be damaged.
- The disk may be unavailable. In this case, you need to format the disk and partition it again.
- The system performance may deteriorate because the disk partition space is not enough. The performance remains low until the disk partition is scaled out successfully.

## Possible Causes

- The growpart scale-out tool is not installed.
- The system fails to execute the command for expanding disk partition.

## Handling Procedure

**Check whether growpart is installed.**

- Step 1** Log in to FusionInsight Manager, click **O&M**, and choose **Alarm > Alarms** to view the alarm details. In the **Location** column, check the name of the host and mount

directory for which the alarm is generated. Click the host name to view its IP address.

**Step 2** Log in to the node for which the alarm is generated as user **root**.

**Step 3** Run the following command to check whether growpart is installed:

**which growpart**

If information similar to the following is displayed, the growpart tool is installed. Otherwise, contact O&M personnel to install the growpart tool.

```
[root@xxx ~]#which growpart
/usr/bin/growpart
```

**Step 4** Wait for 5 minutes, then choose **O&M**, and choose **Alarm > Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Run the disk partition expansion command.**

**Step 5** Run the following command to view the disk and partition information:

**lsblk**

Search for the partition and the disk based on the mount directory name in the alarm location information, and check the disk and partition sizes.

In the following example, the mount directory is **/srv/BigData/data1**, the used disk is **/dev/vdb**, and the disk partition is **/dev/vdb1**.

```
[root@ ~]# lsblk
NAME        MAJ:MIN RM  SIZE RO  TYPE MOUNTPOINT
loop0       7:0    0   1.5G 0 loop /media
vda         253:0   0   500G 0 disk
├─vda1      253:1   0   220G 0 part /
├─vda2      253:2   0     1K 0 part
├─vda5      253:5   0    10G 0 part /tmp
├─vda6      253:6   0    10G 0 part /var
├─vda7      253:7   0    60G 0 part /srv/BigData
├─vda8      253:8   0   180G 0 part /var/log
vdb         253:16  0   650G 0 disk
└─vdb1      253:17  0   600G 0 part /srv/BigData/data1
```

**Step 6** Run the following command to expand the partition using growpart:

**growpart** *Data disk Partition number*

Run the following command:

**growpart /dev/vdb 1**

If information similar to the following is displayed, the execution is successful. If the execution fails, contact O&M personnel.

```
[root@host- ~]# growpart /dev/vdb 1
CHANGED: partition=1 start=2048 old: size=1258287104 end=1258289152 new: size=1363146719 end=1363148767
```

**Step 7** Run the following command to expand the file system size of the disk partition:

**resize2fs** *Disk partition*

Run the following command:

```
resize2fs /dev/vdb1
```

If information similar to the following is displayed, the execution is successful:

```
[root@host- ~]# resize2fs /dev/vdb1
resize2fs 1.46.4 (18-Aug-2021)
Filesystem at /dev/vdb1 is mounted on /srv/BigData/data1; on-line resizing required
old_desc_blocks = 75, new_desc_blocks = 82
The filesystem on /dev/vdb1 is now 170393339 (4k) blocks long.
```

**Step 8** Wait for 5 minutes, click **O&M**, and choose **Alarm > Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 12.13.73 ALM-12188 diskmgmt Disk Monitoring Unavailable

## Alarm Description

NodeAgent checks the status of the diskmgmt disk monitoring service every 5 minutes. This alarm is generated when diskmgmt disk monitoring is unavailable.

This alarm is cleared when the diskmgmt disk monitoring service recovers.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12188    | Minor          | Yes          |

## Alarm Parameters

| Parameter   | Description   |
|-------------|---|
| Source      | Specifies the cluster or system for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated.           |

| Parameter | Description  |
|-----------|--|
| RoleName  | Specifies the role for which the alarm is generated. |
| HostName  | Specifies the host for which the alarm is generated. |

## Impact on the System

When diskmgmt disk monitoring is unavailable, the read-only detection of the device partition file system, device partition loss detection, and disk partition scale-out detection cannot be performed.

## Possible Causes

- The diskmgmt disk monitoring service does not exist.
- The diskmgmt disk monitoring service is not started.

## Handling Procedure

**Check whether the diskmgmt disk monitoring service exists.**

**Step 1** Log in to FusionInsight Manager, click **O&M**, and choose **Alarm > Alarms** to view the alarm details. In the **Location** column, check the name of the host for which the alarm is generated. Click the host name to view its IP address.

**Step 2** Log in to the node for which the alarm is generated as user **root**.

**Step 3** Run the following command to check whether the core service file exists:

```
stat /usr/local/diskmgmt/inner/diskmgtd
```

If the file does not exist, contact O&M personnel.

**Start the diskmgmt disk monitoring service.**

**Step 4** Run the following command to start the diskmgmt disk monitoring service:

```
systemctl restart diskmgmt
```

**Step 5** Run the following command to check whether the diskmgmt disk monitoring service is started:

```
systemctl status diskmgmt
```

- If information similar to the following is displayed, the service is started successfully. Go to **Step 6**.

```
[root@host: ~]# systemctl status diskmgmt
● diskmgmt.service - Disk monitor service
   Loaded: loaded (/usr/lib/systemd/system/diskmgmt.service; enabled; vendor preset: disabled)
   Active: active (running) since Thu 2023-08-10 09:29:18 CST; 5 days ago
     Main PID: 33996 (diskmgtd)
        Tasks: 2 (limit: 407663)
       Memory: 5.6M
      CGroup: /system.slice/diskmgmt.service
             └─ 33996 /bin/bash /usr/local/diskmgmt/inner/diskmgtd
                1974506 sleep 8

Notice: journal has been rotated since unit was started, output may be incomplete.
```

- If no, contact O&M personnel.

**Step 6** Wait for 5 minutes, click **O&M**, and choose **Alarm > Alarms** on FusionInsight Manager. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, contact O&M personnel.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 12.13.74 ALM-12190 Number of Knox Connections Exceeds the Threshold

## Alarm Description

The system periodically checks the number of connections to all Knox topologies. This alarm is generated when the number of connections to a topology exceeds the threshold (90% by default). This alarm is automatically cleared when the number of connections to a topology falls below the threshold.

### NOTE

This alarm applies to clusters of MRS 3.1.0 or later.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 12190    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description  |
|-------------|--|
| Source      | Specifies the cluster or system for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated.           |
| RoleName    | Specifies the role for which the alarm was generated.              |

| Parameter | Description  |
|-----------|--|
| HostName  | Specifies the host for which the alarm was generated.          |
| Topology  | Specifies the Knox topology for which the alarm was generated. |

## Impact on the System

The topology may reach the upper limit of connections and fail to forward requests, adversely affecting the MRS functions.

## Possible Causes

Hue or Manager is too frequently used, but the default maximum number of Knox connections is small.

## Handling Procedure

**Step 1** Log in to active and standby OMS nodes as user **root**, respectively.

**Step 2** Add the following configuration to the **gateway-site.xml** file on the active and standby OMS nodes to increase the number of thread pools:

```
vi /opt/knox/conf/gateway-site.xml
```

```
<property>
<name>gateway.httpClient.maxConnections</name>
<value>64</value>
</property>
```

**Step 3** Log in to the active OMS node as user **omm** and run the following command to restart the Knox process:

```
sh /opt/knox/bin/restart-knox.sh
```

**Step 4** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** Contact O&M personnel to rectify the fault.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.75 ALM-13000 ZooKeeper Service Unavailable

### Description

The system checks the ZooKeeper service status every 60 seconds. This alarm is generated when the ZooKeeper service is unavailable.

This alarm is cleared when the ZooKeeper service recovers.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
13000	Critical	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

ZooKeeper cannot provide coordination services for upper layer components and the components (such as Yarn and Flink) that depend on ZooKeeper may not run properly.

### Possible Causes

- The DNS is installed on the ZooKeeper node.
- The network is faulty.
- The KrbServer service is abnormal.
- The ZooKeeper instance is abnormal.
- The disk capacity is insufficient.

### Procedure

**Check the DNS.**

- Step 1** Check whether the DNS is installed on the node where the ZooKeeper instance is located. On the Linux node where the ZooKeeper instance is located, run the `cat /etc/resolv.conf` command to check whether the file is empty.
- If yes, go to [Step 2](#).
  - If no, go to [Step 3](#).
- Step 2** Run the `service named status` command to check whether the DNS is started.
- If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** Run the `service named stop` command to stop the DNS service. If "Shutting down name server BIND waiting for named to shut down (28s)" is displayed, the DNS service is stopped successfully. Comment out the content (if any) in `/etc/resolv.conf`.
- Step 4** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).
- Check the network status.**
- Step 5** On the Linux node where the ZooKeeper instance is located, run the `ping` command to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.
- If yes, go to [Step 9](#).
  - If no, go to [Step 6](#).
- Step 6** Modify the IP addresses in `/etc/hosts` and add the host name and IP address mapping.
- Step 7** Run the `ping` command again to check whether the host names of other nodes where the ZooKeeper instance is located can be pinged successfully.
- If yes, go to [Step 8](#).
  - If no, go to [Step 23](#).
- Step 8** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 9](#).
- Check the KrbServer service status (Skip this step if the normal mode is used).**
- Step 9** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services**.
- Step 10** Check whether the KrbServer service is normal.
- If yes, go to [Step 13](#).
  - If no, go to [Step 11](#).
- Step 11** Perform operations based on "ALM-25500 KrbServer Service Unavailable" and check whether the KrbServer service is recovered.
- If yes, go to [Step 12](#).

- If no, go to [Step 23](#).

**Step 12** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Check the ZooKeeper service instance status.**

**Step 13** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > quorumpeer**.

**Step 14** Check whether the ZooKeeper instances are normal.

- If yes, go to [Step 18](#).
- If no, go to [Step 15](#).

**Step 15** Select instances whose status is not good, and choose **More > Restart Instance**.

 **NOTE**

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

**Step 16** Check whether the instance status is good after restart.

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

**Step 17** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

**Check disk status.**

**Step 18** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > ZooKeeper > quorumpeer**, and check the node host information of the ZooKeeper instance.

**Step 19** On FusionInsight Manager, click **Host**.

**Step 20** In the **Disk** column, check whether the disk space of each node where ZooKeeper instances are located is insufficient (disk usage exceeds 80%).

- If yes, go to [Step 21](#).
- If no, go to [Step 23](#).

**Step 21** Expand disk capacity. For details, see "ALM-12017 Insufficient Disk Capacity".

**Step 22** On the **O&M > Alarm > Alarms** tab, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 23](#).

**Collect fault information.**

**Step 23** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 24** Select the following nodes in the required cluster from the **Service**: (KrbServer logs do not need to be downloaded in normal mode.)

- ZooKeeper
- KrbServer

**Step 25** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 26** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.76 ALM-13001 Available ZooKeeper Connections Are Insufficient

## Description

The system checks ZooKeeper connections every 60 seconds. This alarm is generated when the system detects that the number of used ZooKeeper instance connections exceeds the threshold (80% of the maximum connections).

When the **Trigger Count** is 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of used ZooKeeper instance connections is smaller than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
13001	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Available ZooKeeper connections are insufficient. When the connection usage reaches 100%, the ZooKeeper cannot process external connections. As a result, upstream components (such as Yarn and Flink) cannot run properly.

## Possible Causes

The number of connections to the ZooKeeper node exceeds the threshold. Connection leakage occurs on some connection processes, or the maximum number of connections does not comply with the actual scenario.

## Procedure

### Check connection status.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Connections Are Insufficient** and confirm the node IP address of the host for which the alarm is generated in the Location Information.
- Step 2** Obtain the PID of the ZooKeeper process. Log in to the node involved in this alarm as user **root** and run the **pgrep -f proc\_zookeeper** command.
- Step 3** Check whether the PID can be correctly obtained.
  - If yes, go to **Step 4**.
  - If no, go to **Step 15**.
- Step 4** Obtain all the IP addresses connected to the ZooKeeper instance and the number of connections and check 10 IP addresses with top connections. Run the following command based on the obtained PID: **lsof -i|grep \$pid | awk '{print \$9}' | cut -d : -f 2 | cut -d \>-f 2 | awk '{a[\$1]++} END {for(i in a){print i,a[i] | "sort -r -g -k 2"}}' | head -10**. (The PID obtained in the preceding step is used.)
- Step 5** Check whether node IP addresses and number of connections are successfully obtained.
  - If yes, go to **Step 6**.
  - If no, go to **Step 15**.

- Step 6** Obtain the ID of the port connected to the process. Run the following command based on the obtained PID and IP address: `lsof -i|grep $pid | awk '{print $9}'|cut -d \> -f 2 |grep $IP| cut -d : -f 2`. (The PID and IP address obtained in the preceding step are used.)
- Step 7** Check whether the port ID is successfully obtained.
- If yes, go to [Step 8](#).
  - If no, go to [Step 15](#).
- Step 8** Obtain the ID of the connected process. Log in to each IP address and run the following command based on the obtained port ID: `lsof -i|grep $port`. (The port ID obtained in the preceding step is used.)
- Step 9** Check whether the process ID is successfully obtained.
- If yes, go to [Step 10](#).
  - If no, go to [Step 15](#).
- Step 10** Check whether connection leakage occurs on the process based on the obtained process ID.
- If yes, go to [Step 11](#).
  - If no, go to [Step 12](#).
- Step 11** Close the process where connection leakage occurs and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 12](#).
- Step 12** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations** > **quorumpeer** > **Performance** and increase the value of **maxCnxns** as required.
- Step 13** Save the configuration and restart the ZooKeeper service.
-  **NOTE**
- The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.
- Step 14** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 15](#).
- Collect fault information.**
- Step 15** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.
- Step 16** Select **ZooKeeper** in the required cluster from the **Service**:
- Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 18** Contact the O&M personnel and send the collected log information.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.77 ALM-13002 ZooKeeper Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the ZooKeeper service every 30 seconds. The alarm is generated when the direct memory usage of a ZooKeeper instance exceeds the threshold (80% of the maximum memory).

When the **Trigger Count** is 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the ZooKeeper Direct memory usage is less than 80% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
13002	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available memory of ZooKeeper is insufficient, memory overflow may occur and services may break down. As a result, upstream services (such as HDFS and Yarn) fail to run.

## Possible Causes

The direct memory of the ZooKeeper instance is overused or the direct memory is inappropriately allocated.

## Procedure

### Check the direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ZooKeeper Direct Memory Usage Exceeds the Threshold**. Check the IP address of the instance that reports the alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Instance > quorumpeer(the IP address checked)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**.
- Step 3** Check whether the used direct buffer memory of ZooKeeper reaches 80% of the maximum direct buffer memory specified for ZooKeeper.
- If yes, go to **Step 4**.
  - If no, go to **Step 8**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > quorumpeer > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC\_OPTS** parameter.
- If yes, in the **GC\_OPTS** parameter, delete "-XX:MaxDirectMemorySize" and go to **Step 5**.
  - If no, go to **Step 6**.
- Step 5** Save the configuration and restart the ZooKeeper service.
-  **NOTE**
- The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.
- Step 6** Check whether the **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold** exists.
- If yes, handle the alarm by referring to **ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold**.
  - If no, go to **Step 7**.
- Step 7** Check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 9** Select **ZooKeeper** in the required cluster from the **Service**.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.78 ALM-13003 GC Duration of the ZooKeeper Process Exceeds the Threshold

## Alarm Description

The system checks the garbage collection (GC) duration of the ZooKeeper process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13003	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

The ZooKeeper process may respond slowly. Services of upper-layer components (such as Yarn, Flink, and Spark) may fail.

## Possible Causes

The heap memory of the ZooKeeper process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

### Check the GC duration.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, click the drop-down list of **GC Duration of the ZooKeeper Process Exceeds the Threshold**. View the IP address of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Instance > quorumpeer**. Click the drop-down list in the upper right corner of **Chart**, choose **Customize > GC**, select **ZooKeeper GC Duration per Minute**, and click **OK** to check the GC duration statistics of the ZooKeeper process collected every minute.
- Step 3** Check whether the GC duration of the ZooKeeper process collected every minute exceeds the threshold (12 seconds by default).
  - If yes, go to **Step 4**.
  - If no, go to **Step 8**.
- Step 4** Check whether memory leakage occurs in the application.
- Step 5** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > ZooKeeper > Configurations > All Configurations > quorumpeer > System**. Increase the value of the **GC\_OPTS** parameter as required.

### NOTE

Generally, **-Xmx** is twice of ZooKeeper data capacity. If the capacity of ZooKeeper reaches 2 GB, set **GC\_OPTS** as follows:

```
-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1
```

**Step 6** Save the configuration and restart the ZooKeeper service.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect the fault information.**

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 9** Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.79 ALM-13004 ZooKeeper Heap Memory Usage Exceeds the Threshold

### Description

The system checks the heap memory usage of the ZooKeeper service every 60 seconds. The alarm is generated when the heap memory usage of a ZooKeeper instance exceeds the threshold (95% of the maximum memory).

The alarm is cleared when the memory usage is less than the threshold.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
13004	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available ZooKeeper heap memory is insufficient, memory overflow may cause service breakdown, and upstream components (such as Yarn, Flink, and Spark) may fail to run.

## Possible Causes

The heap memory of the ZooKeeper instance is overused or the heap memory is inappropriately allocated.

## Procedure

### Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, On the displayed interface, click the drop-down button of **ZooKeeper Heap Memory Usage Exceeds the Threshold** and confirm the node IP address of the host for which the alarm is generated in the Location Information.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Instance**, click **quorumpeer** in the **Role** column of the corresponding IP address. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > CPU and Memory**, and select **ZooKeeper Heap And Direct Buffer Resource Percentage**, click **OK**. Check the heap memory usage.
- Step 3** Check whether the used heap memory of ZooKeeper reaches 95% of the maximum heap memory specified for ZooKeeper.
  - If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > quorumpeer > System**. Increase the value of **-Xmx** in **GC\_OPTS** as required. The details are as follows:
1. On the **Instance** tab, click **quorumpeer** in the **Role** column of the corresponding IP address. Choose **Customize > CPU and Memory** in the upper right corner, and select **ZooKeeper Heap And Direct Buffer Resource**, click **OK** to check the heap memory used by ZooKeeper.
  2. Change the value of **-Xmx** in the **GC\_OPTS** parameter based on the actual heap memory usage. Generally, the value is twice the size of the ZooKeeper data volume. For example, if 2 GB ZooKeeper heap memory is used, the following configurations are recommended: **-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=512M -XX:MetaspaceSize=64M -XX:MaxMetaspaceSize=64M -XX:CMSFullGCsBeforeCompaction=1**

- Step 5** Save the configuration and restart the ZooKeeper service.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

- Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

- Step 8** Select **ZooKeeper** in the required cluster from the **Service**.

- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

- Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.80 ALM-13005 Failed to Set the Quota of Top Directories of ZooKeeper Components

### Description

The system sets quotas for each ZooKeeper top-level directory in the **customized.quota** configuration item and components every 5 hours. This alarm is generated when the system fails to set the quota for a directory.

This alarm is cleared when the setting succeeds after a failure.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13005	Minor	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

### Impact on the System

Components can write a large amount of data to the top-level directory of ZooKeeper. As a result, services or services of upstream components (such as Yarn, Flink, and Spark) that depend on the top-level directory are abnormal.

### Possible Causes

The quota for the alarm directory is inappropriate.

### Procedure

**Check whether the quota for the alarm directory is appropriate.**

- Step 1** Log in to FusionInsight Manager, and choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper**. On the displayed page, choose **Configurations** > **All Configurations** > **Quota**. Check whether the directory for which the alarm is reported and its quota exist in the **customized.quota** configuration item.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

**Step 2** Check whether the alarm directory for which the alarm is reported is in the following alarm list.

**Table 12-88** Component alarm directory

Component	Alarm Directory
Hbase	/hbase
Hive	/beelinesql
Yarn	/rmstore
Storm	/stormroot
Streaming	/storm
Kafka	/kafka

- If yes, go to [Step 3](#).
- If no, go to [Step 7](#).

**Step 3** View the component of the alarm directory in the table, open the corresponding service page, and choose **Configurations > All Configurations**. On the displayed page, search for **zk.quota** in the upper right corner. The search result is the quota of the alarm directory.

**Step 4** Check whether the quota of the alarm directory for which the alarm is reported is appropriate. The quota must be greater than or equal to the actual value, which can be obtained in **Trigger Condition**.

**Step 5** Modify the **services.quota** value as prompted and save the configuration.

**Step 6** After the time specified by **service.quotas.auto.check.cron.expression**, check whether the alarm is cleared.

The **service.quotas.auto.check.cron.expression** parameter indicates the scheduled expression used by ZooKeeper to set the directory quota. You can choose **Cluster > Services > ZooKeeper > Configurations > All Configurations** on FusionInsight Manager and set this parameter. The default value is `*/5 * * * *`, indicating 5 minutes.

- If it is, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **ZooKeeper** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.81 ALM-13006 Znode Number or Capacity Exceeds the Threshold

## Description

The system periodically detects the status of secondary Znode in the ZooKeeper service data directory every four hours. This alarm is generated when the number or capacity of secondary Znodes exceeds the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13006	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

## Impact on the System

A large amount of data is written to the ZooKeeper data directory space. As a result, services of upstream components (such as Yarn, Flink, and Spark) that

depend on this directory are abnormal. For details, see the alarm location information.

## Possible Causes

A large amount of data is written to the ZooKeeper data directory. The threshold is not appropriate.

## Procedure

**Check whether a large amount of data is written to the directory for which the alarm is generated.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **Znode Number or Capacity Exceeds the Threshold**. Confirm the Znode for which the alarm is generated in Location Information.
  - Step 2** Log in to FusionInsight Manager, open the ZooKeeper service interface, and select **Resource**. In the table **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written to the top-level Znode for which the alarm is reported.
    - If it is, go to **Step 3**.
    - If it is not, go to **Step 4**.
  - Step 3** Log in to the ZooKeeper client and delete the data in the top-level Znode.
  - Step 4** Log in to FusionInsight Manager and open the ZooKeeper service interface. On the **Resource** page, choose  > **By Znode quantity** in **Used Resources (By Second-Level Znode)**. **Threshold Configuration of By Znode quantity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.Znode.count** by choosing **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > Quota**.
  - Step 5** In the **Used Resources (By Second-Level Znode)**, choose  > **By capacity**. The **Threshold Settings** page of **By Capacity** is displayed. Click **Modify** under **Operation**. Increase the threshold by referring to the value of **max.data.size** by choosing **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > Quota**.
  - Step 6** Check whether the alarm is cleared.
    - If it is, no further action is required.
    - If it is not, go to **Step 7**.
- Collect fault information.**
- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
  - Step 8** Select **ZooKeeper** in the required cluster from the **Service**.
  - Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.82 ALM-13007 Available ZooKeeper Client Connections Are Insufficient

## Description

The system periodically detects the number of active processes between the ZooKeeper client and the ZooKeeper server every 60 seconds. This alarm is generated when the number of connections exceeds the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13007	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the host name for which the alarm is generated.
ClientIP	Specifies the client IP address.
ServerIP	Specifies the server IP address.
Trigger Condition	Specifies the cause of the alarm.

## Impact on the System

A large number of processes are connected to ZooKeeper, and the number of ZooKeeper connections is used up. As a result, services of upstream components (such as Yarn, Flink, and Spark) are abnormal.

## Possible Causes

A large number of client processes are connected to ZooKeeper. The thresholds are not appropriate.

## Procedure

**Check whether there are a large number of client processes connected to ZooKeeper.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **Available ZooKeeper Client Connections Are Insufficient**. Confirm the node IP address of the host for which the alarm is generated in the Location Information.
  - Step 2** Open the ZooKeeper service interface, click **Resource** to enter the **Resource** page, and check whether the number of connections of the client with the IP address specified by **Number of Connections (By Client IP Address)** is large.
    - If it is, go to **Step 3**.
    - If it is not, go to **Step 4**.
  - Step 3** Check whether connection leakage occurs on the client process.
  - Step 4** Click  in the **Number of Connections (by Client IP Address)** to enter the **Thresholds** page, and click **Modify** under **Operation**. Increase the threshold by referring to the value of **maxClientCnxns** by choosing **Cluster > Name of the desired cluster > Services > ZooKeeper > Configurations > All Configurations > quorumpeer**.
  - Step 5** Check whether the alarm is cleared.
    - If it is, no further action is required.
    - If it is not, go to **Step 6**.
- Collect fault information.**
- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
  - Step 7** Select **ZooKeeper** in the required cluster from the **Service**.
  - Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
  - Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.83 ALM-13008 ZooKeeper Znode Usage Exceeds the Threshold

### Description

The system checks the level-2 Znode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13008	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

### Impact on the System

When a large amount of data is written to the ZooKeeper data directory space, ZooKeeper cannot provide services for external systems. As a result, services of upstream components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

### Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

## Procedure

**Check whether a large amount of data is written into the directory for which the alarm is generated.**

- Step 1** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper**, and click **Resource**. Click **By Znode quantity in Used Resources (By Second-Level Znode)**, and check whether a large amount of data is written to the top Znode.
- If yes, go to **Step 2**.
  - If no, go to **Step 4**.
- Step 2** Log in to FusionInsight Manager, choose **O&M** > **Alarm** > **Alarms**, select **Location** from the drop-down list box next to **ALM-13008 ZooKeeper Znode Quantity Usage Exceeds Threshold**, and obtain the Znode path in **ServiceDirectory**.
- Step 3** Log in to the ZooKeeper client as a cluster user and delete unnecessary data from the Znode corresponding to the alarm.
- Step 4** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** > **Configurations** > **All Configurations**, and search for **max.znode.count**, which is the maximum number of ZooKeeper directories. The alarm threshold is 80% of this parameter. Increase the value of this parameter, click **Save**, and restart the service for the configuration to take effect.

### NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

- Step 5** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

**Collect fault information.**

- Step 6** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.
- Step 7** Select **ZooKeeper** in the required cluster from the **Service**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.84 ALM-13009 ZooKeeper Znode Capacity Usage Exceeds the Threshold

### Alarm Description

The system checks the level-2 ZNode status in the ZooKeeper data directory every hour. This alarm is generated when the system detects that the capacity usage exceeds the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
13009	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
ServiceDirectory	Specifies the directory for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

ZooKeeper cannot provide services for external systems, and the services of upstream components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

### Possible Causes

- A large volume of data has been written to the ZooKeeper data directory.
- The threshold is improperly defined.

### Handling Procedure

**Check whether a large volume of data is written to the alarm directory.**

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. Click the drop-down list in the row containing **ALM-13009 ZooKeeper ZNode Capacity Usage Exceeds the Threshold**, and find the ZNode for which the alarm is generated in the **Location** area.
- Step 2** Choose **Cluster > Services > ZooKeeper**. On the page that is displayed, click the **Resource** tab. In the **Used Resources (By Second-Level ZNode)** area, click **By capacity** and check whether a large amount of data is written to the top-level ZNode directory.
- If yes, record the directory to which a large amount of data is written and go to **Step 3**.
  - If no, go to **Step 5**.
- Step 3** Check whether data in the directory can be deleted.

---

**NOTICE**

Deleting data from ZooKeeper is a high-risk operation. Exercise caution when performing this operation.

---

- If yes, go to **Step 4**.
  - If no, go to **Step 5**.
- Step 4** Log in to the ZooKeeper client and delete unnecessary data from the directory to which a large amount of data is written.
1. Log in to the ZooKeeper client installation directory, for example, **/opt/client**, and configure environment variables.  
**cd /opt/client**  
**source bigdata\_env**
  2. Run the following command to authenticate the user (skip this step for a cluster in normal mode):  
**kinit Component service user**
  3. Run the following command to log in to the client tool:  
**zkCli.sh -server <Service IP address of the node where any ZooKeeper instance resides>:<Client port>**
  4. Run the following command to delete unnecessary data:  
**delete Path of the file to be deleted**
- Step 5** Log in to FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > ZooKeeper > Configurations > All Configurations**, and search for **max.data.size**. The value of **max.data.size** is the maximum capacity quota of the ZooKeeper directory. The unit is byte. Search for the **GC\_OPTS** configuration item and check the value of **Xmx**.
- Step 6** Compare the values of **max.data.size** and **Xmx\*0.65**. The threshold is the smaller value multiplied by 80%. You can change the values of **max.data.size** and **Xmx\*0.65** to increase the threshold.
- Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect the fault information.**

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 9** Expand the **Service** drop-down list, and select **ZooKeeper** for the target cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.85 ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold

## Description

The system checks the Znode usage of all service directories with quota configured every hour. This alarm is generated when the system detects that the level-2 Znode usage exceeds the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
13010	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.

Name	Meaning
ServiceDirectory	Specifies the directory for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
Trigger Condition	Specifies the cause of the alarm.

## Impact on the System

When a large amount of data is written to the ZooKeeper data directory space, ZooKeeper cannot provide services for external systems. As a result, services of upstream components (such as Yarn, Flink, and Spark) that depend on the alarm directory are abnormal.

## Possible Causes

- A large amount of data is written to the ZooKeeper data directory.
- The user-defined threshold is inappropriate.

## Procedure

**Check whether a large amount of data is written into the directory for which the alarm is generated.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Confirm the Znode for which the alarm is generated in **Location** of this alarm.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > ZooKeeper** and click **Resource**. In **Used Resources (By Second-Level Znode)**, check whether a large amount of data is written into the top Znode.
  - If yes, go to **Step 3**.
  - If no, go to **Step 5**.
- Step 3** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select Location from the drop-down list box next to **ALM-13010 Znode Usage of a Directory with Quota Configured Exceeds the Threshold**, and obtain the Znode path in ServiceDirectory.
- Step 4** Log in to the ZooKeeper client as a cluster user and delete unwanted data in the Znode for which the alarm is generated.
- Step 5** Log in to FusionInsight Manager, and choose **Cluster > Name of the desired cluster > Services > Component of the top Znode for which the alarm is generated**. Choose **Configurations > All Configurations**, search for **zk.quota.number**, increase its value, click **Save**.

**NOTICE**

If the Component of the top Znode for which the alarm is generated is ClickHouse, change the value of **clickhouse.zookeeper.quota.node.count**.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **ZooKeeper** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.86 ALM-14000 HDFS Service Unavailable

### Description

The system checks the NameService service status every 60 seconds. This alarm is generated when all the NameService services are abnormal and the system considers that the HDFS service is unavailable.

This alarm is cleared when at least one NameService service is normal and the system considers that the HDFS service recovers.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14000	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

HDFS fails to provide services for HDFS service-based upper-layer components, such as HBase and MapReduce. As a result, users cannot read or write files.

## Possible Causes

- The ZooKeeper service is abnormal.
- All NameService services are abnormal.
- The number of service requests is too large, and the HDFS health check fails to read and write files.
- The health check fails due to HDFS FullGC.

## Procedure

### Check the ZooKeeper service status.

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarm page, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** See **ALM-13000 ZooKeeper Service Unavailable** to rectify the health status of ZooKeeper fault and check whether the **Running Status** of the ZooKeeper service restores to **Normal**.

- If yes, go to [Step 3](#).
- If no, go to [Step 13](#).

**Step 3** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Handle the NameService service exception alarm.

**Step 4** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14010 NameService Service Unavailable** is reported.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** See **ALM-14010 NameService Service Unavailable** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to [Step 6](#).
- If no, go to [Step 13](#).

**Step 6** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Check whether the HDFS health check fails to read or write files due to a large number of service requests.**

**Step 7** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** or **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold** is generated.

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

**Step 8** Rectify the abnormal NameServices by following the handling methods of **ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold** and **ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold**. Then, check whether the alarms are cleared.

- If yes, go to [Step 9](#).
- If no, go to [Step 13](#).

**Step 9** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check whether the health check fails due to HDFS FullGC.**

**Step 10** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the Alarms page, check whether **ALM-14014 NameNode GC Time Exceeds the Threshold** is reported.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** See **ALM-14014 NameNode GC Time Exceeds the Threshold** to handle the abnormal NameService services and check whether each NameService service exception alarm is cleared.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** On the **O&M > Alarm > Alarms** page, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collect fault information.**

**Step 13** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 14** Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.87 ALM-14001 HDFS Disk Usage Exceeds the Threshold

## Description

The system checks the HDFS disk usage every 30 seconds and compares the actual HDFS disk usage with the threshold. The HDFS disk usage indicator has a default threshold, this alarm is generated when the value of the disk usage of a Hadoop distributed file system (HDFS) indicator exceeds the threshold.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the value of the disk usage of HDFS cluster indicator is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14001	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Writing Hadoop distributed file system (HDFS) data is affected.

## Possible Causes

The disk space configured for the HDFS cluster is insufficient.

## Procedure

**Check the disk capacity and delete unnecessary files.**

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.
- Step 2** Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **Disk**, and select **Percentage of HDFS Capacity** to check whether the HDFS disk usage exceeds the threshold (80% by default).
  - If yes, go to [Step 3](#).
  - If no, go to [Step 11](#).
- Step 3** In the **Basic Information** area, click the **NameNode(Active)** of the failure NameService and the HDFS WebUI page is displayed.

### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 4** On the HDFS web user interface (WebUI), click **Datanodes** tab. In the **Block pool used** column, view the disk usage of all DataNodes to check whether the disk usage of any DataNode exceeds the threshold.

- If yes, go to **Step 6**.
- If no, go to **Step 11**.

**Step 5** Log in to the MRS client node as user **root**.

**Step 6** Run **cd /opt/client** to switch to the client installation directory, and run **source bigdata\_env**. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Please obtain the password from the administrator.

**Step 7** Run the **hdfs dfs -rm -r file or directory** command to delete unnecessary files.

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

**Expand the system.**

**Step 9** Expand the disk capacity.

**Step 10** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 11**.

**Collect fault information.**

**Step 11** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 12** Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.88 ALM-14002 DataNode Disk Usage Exceeds the Threshold

### Alarm Description

The system checks the DataNode disk usage every 30 seconds and compares the actual disk usage with the threshold. A default threshold range is provided for the DataNode disk usage. This alarm is generated when the DataNode disk usage exceeds the threshold.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the DataNode disk usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the DataNode disk usage is less than or equal to 80% of the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14002	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Insufficient disk space will impact data write to HDFS.

### Possible Causes

- The disk space configured for the HDFS cluster is insufficient.

- Data skew occurs among DataNodes.

## Handling Procedure

**Check whether the cluster disk capacity is insufficient.**

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether the **ALM-14001 HDFS Disk Usage Exceeds the Threshold** alarm exists.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** Handle the alarm by following the instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to [Step 3](#).
- If no, go to [Step 11](#).

**Step 3** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check the balance status of DataNodes.**

**Step 4** On FusionInsight Manager, choose **Hosts**. Check whether the number of DataNodes on each rack is almost the same. If the difference is large, adjust the racks to which DataNodes belong to ensure that the number of DataNodes on each rack is almost the same. Restart the HDFS service for the settings to take effect.

### NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 5** Choose **Cluster > Name of the desired cluster > Services > HDFS**.

**Step 6** In the **Basic Information** area, click **NameNode(Active)**. The HDFS web UI is displayed.

### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 7** In the **Summary** area of the HDFS web UI, check whether the value of **Max** is 10% greater than that of **Median** in **DataNodes usages**.

- If yes, go to [Step 8](#).
- If no, go to [Step 11](#).

**Step 8** Balance skewed data in the cluster. Log in to the MRS client as user **root**. If the cluster is in normal mode, run the **su - omm** command to switch to user **omm**. Run the **cd** command to go to the client installation directory and run the **source bigdata\_env** command. If the cluster uses the security mode, perform security authentication. Run **kinit hdfs** and enter the password as prompted. Obtain the password from the MRS cluster administrator.

**Step 9** Run the following command to balance data distribution:

```
hdfs balancer -threshold 10
```

**Step 10** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Collect the fault information.**

**Step 11** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 12** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.89 ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold

## Alarm Description

The system checks the lost blocks every 30 seconds and compares the actual lost blocks with the threshold. The lost blocks indicator has a default threshold. This alarm is generated when the number of lost HDFS blocks exceeds the threshold.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

If **Trigger Count** is **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the value of lost HDFS blocks is less than or equal to 90% of the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14003	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

## Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.

## Handling Procedure

### Check the DataNode instance.

**Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**.

**Step 2** Check whether the **Running Status** of all DataNode instance is **Normal**.

- If yes, go to **Step 11**.
- If no, go to **Step 3**.

**Step 3** Restart the DataNode instance and check whether the DataNode instance restarts successfully.

### NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

- If yes, go to **Step 4**.

- If no, go to [Step 5](#).

**Step 4** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Delete the damaged file.**

**Step 5** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HDFS > NameNode(Active)**. On the WebUI page of the HDFS, view the information about lost blocks.

 **NOTE**

- If a block is lost, a line in red is displayed on the WebUI.
- By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 6** The user checks whether the file containing the lost data block is useful.

 **NOTE**

Files generated in directories **/mr-history**, **/tmp/hadoop-yarn**, and **/tmp/logs** during MapReduce task execution are unnecessary.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 7** The user checks whether the file containing the lost data block is backed up.

- If yes, go to [Step 8](#).
- If no, go to [Step 11](#).

**Step 8** Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:  
**cd Client installation directory**  
**source bigdata\_env**  
**kinit hdfs**
- Normal mode:  
**su - omm**  
**cd Client installation directory**  
**source bigdata\_env**

**Step 9** On the node client, run **hdfs fsck / -delete** to delete the lost file. If the file where the lost block is located is a useful file, you need to write the file again to restore the data.

 **NOTE**

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

**Step 10** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Collect the fault information.**

**Step 11** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 12** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.90 ALM-14006 Number of HDFS Files Exceeds the Threshold

### Alarm Description

The system periodically checks the number of HDFS files every 30 seconds and compares the number of HDFS files with the threshold. This alarm is generated when the system detects that the number of HDFS files exceeds the threshold.

If **Trigger Count** is **1**, this alarm is cleared when the number of HDFS files is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of HDFS files is less than or equal to 90% of the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14006	Minor	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If there are too many HDFS files, the HDFS system may respond slowly or the disk space may be used up.

## Possible Causes

The number of HDFS files exceeds the threshold.

## Handling Procedure

**Check the number of files in the system.**

- Step 1** On FusionInsight Manager, check the number of HDFS files. Specifically, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize** > **File and Block**, and select **HDFS File** and **Total Blocks**.
- Step 2** Choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**, and search for the **GC\_OPTS** parameter under **NameNode**.
- Step 3** Configure the threshold of the number of configuration file objects. Specifically, change the value of **Xmx** (GB) in the **GC\_OPTS** parameter. The threshold (specified by *y*) is calculated as follows:  $y = 0.2007 \times Xmx - 0.6312$ , where *x* indicates the memory capacity *Xmx* (GB) and *y* indicates the number of files (unit: kW). Adjust the memory size as required.
- Step 4** Confirm that the value of **GC\_PROFILE** is **custom** so that the **GC\_OPTS** configuration takes effect. Click **Save** and choose **More** > **Restart Instance** to restart the service.

 NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether needless files exist in the system.**

**Step 6** Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata\_env** to configure the environment variables.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the MRS cluster administrator.

**Step 7** Run **hdfs dfs -ls file or directory** to check whether the files in the directory can be deleted.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 8** Run the **hdfs dfs -rm -r file or directory path** command. After deleting unnecessary files, wait until the files are retained in the recycle bin for a period longer than the value of **fs.trash.interval** on the NameNode. Then check whether the alarm is cleared.

 NOTE

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect the fault information.**

**Step 9** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 10** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

### Configuration rules of the NameNode JVM parameter

Default value of the NameNode JVM parameter **GC\_OPTS**:

```
-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -
XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -
XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -
XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -
Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFF -
Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFF -XX:-
OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation
-XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -
Djdk.tls.ephemeralDHKeySize=3072 -
Djdk.tls.rejectClientInitiatedRenegotiation=true -Djava.io.tmpdir=$
{Bigdata_tmp_dir}
```

The number of NameNode files is proportional to the used memory size of the NameNode. When file objects change, you need to change **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

**Table 12-89** NameNode JVM configuration

Number of File Objects	Reference Value
10,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
20,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
50,000,000	-Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
100,000,000	-Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
200,000,000	-Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
300,000,000	-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

## 12.13.91 ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold

### Description

The system checks the HDFS NameNode Heap Memory usage every 30 seconds and compares the actual Heap memory usage with the threshold. The HDFS

NameNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS NameNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS NameNode Heap memory usage is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14007	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

The HDFS NameNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

## Possible Causes

The HDFS NameNode Heap Memory is insufficient.

## Procedure

**Delete unnecessary files.**

**Step 1** Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata\_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the **hdfs dfs -rm -r file or directory** command to delete unnecessary files.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check the NameNode JVM memory usage and configuration.**

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**.

**Step 5** In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

 **NOTE**

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 6** On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in the HDFS.

**Step 7** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. In **Search**, enter **GC\_OPTS** to check the **GC\_OPTS** memory parameter of **HDFS->NameNode**.

**Adjust the configuration in the system.**

**Step 8** Check whether the memory is configured properly based on the number of files in [Step 6](#) and the NameNode Heap Memory parameters in [Step 7](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

 **NOTE**

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

**Step 9** Modify the heap memory parameters of the NameNode based on the mapping between the number of file objects and the memory. Click **Save** and choose **Dashboard > More > Restart Service**.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 10** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Collect fault information.**

**Step 11** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 12** Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.92 ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold

### Description

The system checks the HDFS DataNode Heap Memory usage every 30 seconds and compares the actual Heap Memory usage with the threshold. The HDFS DataNode Heap Memory usage has a default threshold. This alarm is generated when the HDFS DataNode Heap Memory usage exceeds the threshold.

You can change the threshold in **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the HDFS DataNode Heap Memory usage is less than or equal to 90% of the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14008	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

The HDFS DataNode Heap Memory usage is too high, which affects the data read/write performance of the HDFS.

## Possible Causes

The HDFS DataNode Heap Memory is insufficient.

## Procedure

### Delete unnecessary files.

**Step 1** Log in to the HDFS client as user **root**. Run **cd** to switch to the client installation directory, and run **source bigdata\_env**.

If the cluster uses the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the **hdfs dfs -rm -r file or directory** command to delete unnecessary files.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check the DataNode JVM memory usage and configuration.

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**.

**Step 5** In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

#### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 6** On the HDFS WebUI, click the **DataNodes** tab, and check the number of blocks of all DataNodes related to the alarm.

**Step 7** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. In **Search**, enter **GC\_OPTS** to check the GC\_OPTS memory parameter of **HDFS->DataNode**.

### Adjust the configuration in the system.

**Step 8** Check whether the memory is configured properly based on the number of block in [Step 6](#) and the DataNode Heap Memory parameters in [Step 7](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

 **NOTE**

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

**Step 9** Modify the heap memory parameters of the DataNode based on the mapping between the number of blocks and the memory. Click **Save** and choose **Dashboard > More > Restart Service**.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 10** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Collect fault information.**

**Step 11** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 12** Select **HDFS** in the required cluster from the **Service**.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.93 ALM-14009 Number of Dead DataNodes Exceeds the Threshold

### Description

The system periodically detects the number of dead DataNodes in the HDFS cluster every 30 seconds, and compares the number with the threshold. The number of DataNodes in the Dead state has a default threshold. This alarm is generated when the number exceeds the threshold.

You can change the threshold in **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**.

When the **Trigger Count** is 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the number of Dead DataNodes is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14009	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

DataNodes that are in the Dead state cannot provide HDFS services. As a result, users cannot read or write files.

## Possible Causes

- DataNodes are faulty or overloaded.
- The network between the NameNode and the DataNode is disconnected or busy.
- NameNodes are overloaded.
- The NameNodes are not restarted after the DataNode is deleted.

## Procedure

### Check whether DataNodes are faulty.

**Step 1** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. The **HDFS Status** page is displayed.

**Step 2** In the **Basic Information** area, click **NameNode(Active)** to go to the HDFS WebUI.

#### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 3** On the HDFS WebUI, click the **Datanodes** tab. In the **In operation** area, click **Filter** to check whether **down** is in the drop-down list.

- If yes, select **down**, record the information about the filtered DataNodes, and go to [Step 4](#).
- If no, go to [Step 8](#).

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** to check whether recorded DataNodes exist in the instance list.

- If all recorded DataNodes exist, go to [Step 5](#).
- If none of the recorded DataNodes exists, go to [Step 6](#).
- If some of the recorded DataNodes exist, go to [Step 7](#).

**Step 5** Locate the DataNode instance, click **More > Restart Instance** to restart it and check whether the alarm is cleared.

#### NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Step 6** Select all NameNode instances, choose **More > Instance Rolling Restart** to restart them and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

**Step 7** Select all NameNode instances, choose **More > Instance Rolling Restart** to restart them. Locate the DataNode instance, click **More > Restart Instance** to restart it and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

### Check the status of the network between the NameNode and the DataNode.

**Step 8** Log in to the faulty DataNode on the management page as user **root**, and run the **ping IP address of the NameNode** command to check whether the network between the DataNode and the NameNode is abnormal.

On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**. In the instance list, view the service plane IP address of the faulty DataNode.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

**Step 9** Rectify the network fault, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check whether the DataNode is overloaded.**

**Step 10** On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** See **ALM-14008 HDFS DataNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Check whether the NameNode is overloaded.**

**Step 13** On the FusionInsight Manager portal, choose **O&M** > **Alarm** > **Alarms** and check whether the alarm **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** exists.

- If yes, go to [Step 14](#).
- If no, go to [Step 16](#).

**Step 14** See **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** to handle the alarm and check whether the alarm is cleared.

- If yes, go to [Step 15](#).
- If no, go to [Step 16](#).

**Step 15** Check whether the alarm is cleared from the alarm list.

- If yes, no further action is required.
- If no, go to [Step 16](#).

**Collect fault information.**

**Step 16** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 17** Select **HDFS** in the required cluster from the **Service**.

**Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 19** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.94 ALM-14010 NameService Service Is Abnormal

## Alarm Description

The system checks the NameService service status every 180 seconds. This alarm is generated when the NameService service is unavailable.

This alarm is cleared when the NameService service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14010	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.

## Impact on the System

HDFS fails to provide services for upper-layer components based on the NameService service, such as HBase and MapReduce. As a result, users cannot read or write files.

## Possible Causes

- The KrbServer service is abnormal.
- The JournalNode is faulty.
- The DataNode is faulty.
- The disk capacity is insufficient.
- The NameNode enters safe mode.

## Handling Procedure

### Check the KrbServer service status.

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 2** Check whether the KrbServer service exists.
- If yes, go to [Step 3](#).
  - If no, go to [Step 6](#).
- Step 3** Click **KrbServer**.
- Step 4** Click **Instances**. On the KrbServer management page, select the faulty instance, and choose **More** > **Restart Instance**. Check whether the instance successfully restarts.
- If yes, go to [Step 5](#).
  - If no, go to [Step 24](#).
- Step 5** Choose **O&M** > **Alarm** > **Alarms** and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

### Check the JournalNode instance status.

- Step 6** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services**.
- Step 7** Choose **HDFS** > **Instances**.
- Step 8** Check whether the **Running Status** of the JournalNode is **Normal**.
- If yes, go to [Step 11](#).
  - If no, go to [Step 9](#).
- Step 9** Select the faulty JournalNode, and choose **More** > **Restart Instance**. Check whether the JournalNode successfully restarts.

### NOTE

If the number of JournalNode instances restarted exceeds one third of the total number of JournalNodes, the HDFS service may be faulty.

- If yes, go to [Step 10](#).
- If no, go to [Step 24](#).

**Step 10** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Check the DataNode instance status.**

**Step 11** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HDFS**.

**Step 12** Click **Instances** and check whether **Running Status** of all DataNodes is **Normal**.

- If yes, go to [Step 15](#).
- If no, go to [Step 13](#).

**Step 13** Click **Instances**. On the DataNode management page, select the faulty instance, and choose **More > Restart Instance**. Check whether the DataNode successfully restarts.

 **NOTE**

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

**Step 14** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Check disk status.**

**Step 15** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Host**.

**Step 16** In the **Disk** column, check whether the disk space is insufficient.

- If yes, go to [Step 17](#).
- If no, go to [Step 19](#).

**Step 17** Expand the disk capacity.

**Step 18** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 19](#).

**Check whether NameNode is in the safe mode.**

**Step 19** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click **NameNode(Active)** of the abnormal NameService. The NameNode web UI is displayed.

 **NOTE**

By default, the admin user does not have the management rights of other components. If the page cannot be opened or the content is not completely displayed due to insufficient permission when you access the native page of a component, you can manually create a user with the management rights of the corresponding component to log in to the component.

**Step 20** On the NameNode web UI, check whether "Safe mode is ON." is displayed.

Information behind **Safe mode is ON** is alarm information and is displayed based actual conditions.

- If yes, go to [Step 21](#).
- If no, go to [Step 24](#).

**Step 21** Log in to the client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata\_env** command. If the cluster uses the security mode, perform security authentication. Run the **kinit hdfs** command and enter the password as prompted. The password can be obtained from the MRS cluster administrator. If the cluster uses the non-security mode, log in as user **omm** and run the command. Ensure that user **omm** has the client execution permission.

**Step 22** Run **hdfs dfsadmin -safemode leave**.

**Step 23** Choose **O&M > Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 24](#).

**Collect the fault information.**

**Step 24** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 25** In the **Service** area, select the following nodes of the desired cluster.

- ZooKeeper
- HDFS

**Step 26** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 27** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.95 ALM-14011 DataNode Data Directory Is Not Configured Properly

### Description

The DataNode parameter **dfs.datanode.data.dir** specifies DataNode data directories. This alarm is generated when a configured data directory cannot be created, a data directory uses the same disk as other critical directories in the system, or multiple directories use the same disk immediately.

This alarm is cleared when the DataNode data directory is configured properly and this DataNode for which the alarm is generated is restarted.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14011	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

If the DataNode data directory is mounted to the root directory or a critical directory, the disk space of the root directory or critical directory will be used up after long time running and the system will be faulty.

If the DataNode data directory is not configured properly, HDFS performance will deteriorate.

### Possible Causes

- The DataNode data directory fails to be created.
- The DataNode data directory uses the same disk with critical directories, such as / or /boot.

- Multiple directories in the DataNode data directory use the same disk.

## Procedure

**Check the alarm cause and information about the DataNode for which the alarm is generated.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** In **HostName** of **Location**, obtain the host name of the DataNode for which the alarm is generated.

**Delete directories that do not comply with the disk plan from the DataNode data directory.**

- Step 3** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance**. In the instance list, click the DataNode instance on the node for which the alarm is generated.
- Step 4** Click **Instance Configurations** and view the value of the DataNode parameter **dfs.datanode.data.dir**.
- Step 5** Check whether all DataNode data directories are consistent with the disk plan.
- If yes, go to **Step 6**.
  - If no, go to **Step 9**.
- Step 6** Modify the DataNode parameter **dfs.datanode.data.dir** and delete the incorrect directories.
- Step 7** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** and restart the DataNode instance.

### NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

- Step 8** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 9**.
- Step 9** Log in to the DataNode for which the alarm is generated as user **root**.
- If the alarm cause is "The DataNode data directory fails to be created", go to **Step 10**.
  - If the alarm cause is "The DataNode data directory uses the same disk with critical directories, such / or /boot", go to **Step 17**.
  - If the alarm cause is "Multiple directories in the DataNode data directory uses the same disk", go to **Step 21**.

**Check whether the DataNode data directory fails to be created.**

- Step 10** Run the **su - omm** command to switch to user **omm**.
- Step 11** Run the **ls** command to check whether the directories exist in the DataNode data directory.

- If yes, go to [Step 26](#).
  - If no, go to [Step 12](#).
- Step 12** Run the `mkdir data directory` command to create the directory and check whether the directory can be successfully created.
- If yes, go to [Step 24](#).
  - If no, go to [Step 13](#).
- Step 13** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to check whether alarm **ALM-12017 Insufficient Disk Capacity** exists.
- If yes, go to [Step 14](#).
  - If no, go to [Step 15](#).
- Step 14** Adjust the disk capacity and check whether alarm **ALM-12017 Insufficient Disk Capacity** is cleared. For details, see **ALM-12017 Insufficient Disk Capacity**.
- If yes, go to [Step 12](#).
  - If no, go to [Step 15](#).
- Step 15** Check whether user **omm** has the **rw**x or **x** permission of all the upper-layer directories of the directory. (For example, for **/tmp/abc/**, user **omm** has the **x** permission for directory **tmp** and the **rw**x permission for directory **abc**.)
- If yes, go to [Step 24](#).
  - If no, go to [Step 16](#).
- Step 16** Run the `chmod u+rw path` or `chmod u+x path` command as user **root** to assign the **rw**x or **x** permission of these directories to user **omm**. Then go to [Step 12](#).
- Check whether the DataNode data directory use the same disk as other critical directories in the system.**
- Step 17** Run the `df` command to obtain the disk mounting information of each directory in the DataNode data directory.
- Step 18** Check whether the directories mounted to the disk are critical directories, such as **/** or **/boot**.
- If yes, go to [Step 19](#).
  - If no, go to [Step 24](#).
- Step 19** Change the value of the DataNode parameter **dfs.datanode.data.dir** and delete the directories that use the same disk as critical directories.
- Step 20** Go to [Step 24](#).
- Check whether multiple directories in the DataNode data directory use the same disk.**
- Step 21** Run the `df` command to obtain the disk mounting information of each directory in the DataNode data directory. Record the mounted directory in the command output.
- Step 22** Modify the DataNode node parameters **dfs.datanode.data.dir** to reserve only one directory among the directories that mounted to the same disk directory.
- Step 23** Go to [Step 24](#).

**Restart the DataNode and check whether the alarm is cleared.**

**Step 24** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance** and restart the DataNode instance.

 **NOTE**

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

**Step 25** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 26](#).

**Collect fault information.**

**Step 26** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 27** Select **HDFS** in the required cluster from the **Service**.

**Step 28** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 29** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.96 ALM-14012 JournalNode Is Out of Synchronization

### Description

On the active NameNode, the system checks the data consistency of all JournalNodes in the cluster every 5 minutes. This alarm is generated when the data on a JournalNode is inconsistent with the data on the other JournalNodes.

This alarm is cleared in 5 minutes after the data on JournalNodes is consistent.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14012	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

## Impact on the System

When a JournalNode is working incorrectly, the data on the node becomes inconsistent with that on the other JournalNodes. If data on more than half of JournalNodes is inconsistent, the NameNode cannot work correctly, making the HDFS service unavailable.

## Possible Causes

- The JournalNode instance does not exist (deleted or migrated).
- The JournalNode instance has not been started or has been stopped.
- The JournalNode instance is working incorrectly.
- The network of the JournalNode is unreachable.

## Procedure

**Check whether the JournalNode instance has been started up.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** Check **Location** and obtain the IP address of the JournalNode for which the alarm is generated.
- Step 3** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance**. In the instance list, check whether the JournalNode instance exists on the node for which the alarm is generated.
  - If yes, go to **Step 5**.
  - If no, go to **Step 4**.
- Step 4** Choose **O&M > Alarm > Alarms**. In the alarm list, click **Clear** in the **Operation** column of the alarm. In the dialog box that is displayed, click **OK**. No further action is needed.

**Step 5** Click the JournalNode instance and check whether its **Configuration Status** is **Synchronized**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** Select the JournalNode instance and choose **Start Instance** to start the instance.

**Step 7** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Check whether the JournalNode instance is working correctly.**

**Step 8** Check whether **Running Status** of the JournalNode instance is **Normal**.

- If yes, go to [Step 11](#).
- If no, go to [Step 9](#).

**Step 9** Select the JournalNode instance and choose **More > Restart Instance** to start the instance.

 **NOTE**

If the number of JournalNode instances restarted exceeds one third of the total number of JournalNodes, the HDFS service may be faulty.

**Step 10** After 5 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Check whether the network of the JournalNode is reachable.**

**Step 11** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** to check the service IP address of the active NameNode.

**Step 12** Log in to the active NameNode as user **root**.

**Step 13** Run the **ping** command to check whether a timeout occurs or the network is unreachable between the active NameNode and the JournalNode.

**ping** *service IP address of the JournalNode*

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

**Step 14** Contact the network administrator to rectify the network fault and check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Collect fault information.**

**Step 15** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 16** Select **HDFS** in the required cluster from the **Service**.

**Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 18** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.97 ALM-14013 Failed to Update the NameNode Fslmage File

## Description

HDFS metadata is stored in the Fslmage file of the NameNode data directory, which is specified by the **dfs.namenode.name.dir** configuration item. The standby NameNode periodically combines existing Fslmage files and Editlog files stored in the JournalNode to generate a new Fslmage file, and then pushes the new Fslmage file to the data directory of the active NameNode. This period is specified by the **dfs.namenode.checkpoint.period** configuration item of HDFS. The default value is 3600s, namely, one hour. If the Fslmage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification.

On the active NameNode, the system checks the Fslmage file information every five minutes. This alarm is generated when no Fslmage file is generated within three combination periods.

This alarm is cleared when a new Fslmage file is generated and pushed to the active NameNode, which indicates that the HDFS metadata combination function can be properly used.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14013	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService for which the alarm is generated.

## Impact on the System

If the Fslmage file in the data directory of the active NameNode is not updated, the HDFS metadata combination function is abnormal and requires rectification. If it is not rectified, the Editlog files increase continuously after HDFS runs for a period. In this case, HDFS restart is time-consuming because a large number of Editlog files need to be loaded. In addition, this alarm also indicates that the standby NameNode is abnormal and the NameNode high availability (HA) mechanism becomes invalid. When the active NameNode is faulty, the HDFS service becomes unavailable.

## Possible Causes

- The standby NameNode is stopped.
- The standby NameNode instance is working incorrectly.
- The standby NameNode fails to generate a new Fslmage file.
- Space of the data directory on the standby NameNode is insufficient.
- The standby NameNode fails to push the Fslmage file to the active NameNode.
- Space of the data directory on the active NameNode is insufficient.

## Procedure

**Check whether the standby NameNode is stopped.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** View **Location** and obtain the host name of the active NameNode for which the alarm is generated and name of the NameService where the active NameNode resides.
- Step 3** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance**, find the standby NameNode instance of the NameService in the instance list, and check whether its **Configuration Status** is **Synchronized**.
  - If yes, go to **Step 6**.
  - If no, go to **Step 4**.

**Step 4** Select the standby NameNode instance, choose **Start Instance**, and wait until the startup is complete.

**Step 5** Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether the NameNode instance is working correctly.**

**Step 6** Check whether **Running Status** of the standby NameNode instance is **Normal**.

- If yes, go to [Step 9](#).
- If no, go to [Step 7](#).

**Step 7** Select the standby NameNode instance, choose **More > Restart Instance**, and wait until the startup is complete.

 **NOTE**

Services are not affected after the standby NameNode is restarted.

**Step 8** Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 30](#).

**Check whether the standby NameNode fails to generate a new FsImage file.**

**Step 9** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**, and search and obtain the value of **dfs.namenode.checkpoint.period**. This value is the period of NameNode metadata combination.

**Step 10** Choose **Cluster > Name of the desired cluster > Services > HDFS > Instance** and obtain the service IP addresses of the active and standby NameNodes of the NameService for which the alarm is generated.

**Step 11** Click the **NameNode(XX,Standby)** and **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the FsImage storage directory of the standby NameNode.

**Step 12** Log in to the standby NameNode as user **root** or **omm**.

**Step 13** Go to the FsImage storage directory and check the generation time of the newest FsImage file.

**cd** *Storage directory of the standby NameNode/current*

```
stat -c %y $(ls -t | grep "fsimage_[0-9]*$" | head -1)
```

**Step 14** Run the **date** command to obtain the current system time.

**Step 15** Calculate the time difference between the generation time of the newest FsImage file and the current system time and check whether the time difference is greater than three times of the metadata combination period.

- If yes, go to [Step 16](#).

- If no, go to [Step 20](#).

**Step 16** The metadata combination function of the standby NameNode is faulty. Run the following command to check whether the fault is caused by insufficient storage space.

Go to the Fslmage storage directory and check the size of the newest Fslmage file (in MB).

```
cd Storage directory of the standby NameNode/current
```

```
du -m $(ls -t | grep "fsmage_[0-9]*$" | head -1) | awk '{print $1}'
```

**Step 17** Run the following command to check the available disk space of the standby NameNode (in MB).

```
df -m ./ | awk 'END{print $4}'
```

**Step 18** Compare the Fslmage file size and the available disk space and determine whether another Fslmage file can be stored on the disk.

- If yes, go to [Step 7](#).
- If no, go to [Step 19](#).

**Step 19** Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 20](#).

**Check whether the standby NameNode fails to push the Fslmage file to the active NameNode.**

**Step 20** Log in to the standby NameNode as user **root**.

**Step 21** Run the **su - omm** command to switch to user **omm**.

**Step 22** Run the following command to check whether the standby NameNode can push the file to the active NameNode.

```
tmpFile=/tmp/tmp_test_$(date +%s)
```

```
echo "test" > $tmpFile
```

```
scp $tmpFile Service IP address of the active NameNode:/tmp
```

- If yes, go to [Step 24](#).
- If no, go to [Step 23](#).

**Step 23** When the standby NameNode fails to push data to the active NameNode as user **omm**, contact the system administrator to handle the fault. Wait for a NameNode metadata combination period and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 24](#).

**Check whether space on the data directory of the active NameNode is insufficient.**

- Step 24** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Instance**, click the active NameNode of the NameService for which the alarm is generated, and then click **Instance Configurations** to obtain the value of **dfs.namenode.name.dir**. This value is the Fslmage storage directory of the active NameNode.
- Step 25** Log in to the active NameNode as user **root** or **omm**.
- Step 26** Go to the Fslmage storage directory and check the size of the newest Fslmage file (in MB).
- ```
cd Storage directory of the active NameNode/current  
du -m $(ls -t | grep "fsmage_[0-9]*$" | head -1) | awk '{print $1}'
```
- Step 27** Run the following command to check the available disk space of the active NameNode (in MB).
- ```
df -m ./ | awk 'END{print $4}'
```
- Step 28** Compare the Fslmage file size and the available disk space and determine whether another Fslmage file can be stored on the disk.
- If yes, go to **Step 30**.
  - If no, go to **Step 29**.
- Step 29** Clear the redundant files on the disk where the directory resides to reserve sufficient space for metadata. After the clearance, wait for a NameNode metadata combination period and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 30**.
- Collect fault information.**
- Step 30** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.
- Step 31** Select **NameNode** in the required cluster from the **Service**.
- Step 32** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 33** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.98 ALM-14014 NameNode GC Time Exceeds the Threshold

### Description

The system checks the garbage collection (GC) duration of the NameNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14014	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

A long GC duration of the NameNode process may interrupt the services and users cannot read or write files.

### Possible Causes

The heap memory of the NameNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ALM-14014 NameNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance > NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection**, and select **NameNode Garbage Collection (GC)** to check the GC duration statistics of the NameNode process collected every minute.
- Step 3** Check whether the GC duration of the NameNode process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 7**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations > NameNode > System** to increase the value of **GC\_OPTS** parameter as required.

#### NOTE

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: `-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M`
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: `-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G`
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: `-Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G`
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: `-Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G`
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: `-Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G`
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: `-Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G`

- Step 5** Save the configuration and restart the NameNode instance.

#### NOTE

- During the restart of the active NameNode, a NameNode active/standby switchover occurs. As a result, no active node is available in the system for a short period of time (in the transition period of the active/standby switchover), and an alarm indicating that the HDFS service is unavailable may be generated. In addition, an error is reported during the running read and write tasks, but services are not interrupted.
- Services are not affected after the standby NameNode is restarted.

- Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 8** Select **NameNode** in the required cluster from the **Service**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected logs.

----End

**Alarm Clearing**

After the fault is rectified, the system automatically clears this alarm.

**Related Information**

None

**12.13.99 ALM-14015 DataNode GC Time Exceeds the Threshold****Description**

The system checks the garbage collection (GC) duration of the DataNode process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

**Attribute**

Alarm ID	Alarm Severity	Automatically Cleared
14015	Major	Yes

**Parameters**

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

A long GC duration of the DataNode process may interrupt the services and users cannot read or write files.

## Possible Causes

The heap memory of the DataNode instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ALM-14015 DataNode GC Time Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance > DataNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection**, and select **DataNode Garbage Collection (GC)** to check the GC duration statistics of the DataNode process collected every minute.
- Step 3** Check whether the GC duration of the DataNode process collected every minute exceeds the threshold (12 seconds by default).
  - If yes, go to **Step 4**.
  - If no, go to **Step 7**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations > DataNode > System** to increase the value of **GC\_OPTS** parameter as required.

 **NOTE**

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

**Step 5** Save the configuration and restart the DataNode instance.

 **NOTE**

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **DataNode** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.100 ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the direct memory usage of HDFS every 30 seconds. This alarm is generated when the direct memory usage of DataNode instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14016	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the available direct memory of DataNode instances is insufficient, a memory overflow may occur and the service breaks down.

## Possible Causes

The direct memory of DataNode instances is overused or the direct memory is inappropriately allocated.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** On the **Home** page of FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the page that is displayed, click the drop-down list in the row containing **ALM-14016 DataNode Direct Memory Usage Exceeds the Threshold**, and view the role name and IP address of the instance for which the alarm is generated in the **Location** area.
- Step 2** On the **Home** page of FusionInsight Manager, choose **Cluster > Services > HDFS**. On the page that is displayed, click the **Instance** tab. In the instance list, select **DataNode** (IP address of the instance for which this alarm is generated). Click the drop-down list in the upper right corner of the chart, choose **Customize > Resource**, and select **DataNode Memory** to check the direct memory usage.

**Step 3** Check whether the used direct memory of a DataNode instance reaches 90% (default threshold) of the maximum direct memory allocated to it.

- If yes, go to [Step 4](#).
- If no, go to [Step 8](#).

**Step 4** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HDFS > Configurations > All Configurations > DataNode > System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC\_OPTS** parameter.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Adjust the value of **-XX:MaxDirectMemorySize**.

1. In **GC\_OPTS**, check the value of **-Xmx** and check whether the node memory is sufficient.

 **NOTE**

You can determine whether the node memory is sufficient based on the actual environment. For example, you can use the following method:

Use the IP address to log in to the instance for which the alarm is generated as user **root** and run the **free -g** command to check the value of **Mem** in the **free** column. The value indicates the available memory of the node. In the following example, the available memory of the node is 4 GB.

```

total      used      free     shared  buff/cache   available
Mem:      112      48        4         10         58         46
.....

```

If the value of **Mem** is at least that of **-Xmx**, the node memory is sufficient. If the value of **Mem** is less than that of **-Xmx**, the node memory is insufficient.

- If yes, change the value of **-XX:MaxDirectMemorySize** to that of **-Xmx**.
- If no, increase **-XX:MaxDirectMemorySize** to a value no larger than that of **Mem**.

2. Save the configuration and restart the DataNode instances.

 **NOTE**

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

**Step 6** Check whether **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, rectify the fault by referring to **ALM-14008 DataNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to [Step 7](#).

**Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect the fault information.**

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

- Step 9** Expand the **Service** drop-down list, and select **DataNode** for the target cluster.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.101 ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the HDFS service every 30 seconds. This alarm is generated when the direct memory usage of a NameNode instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14017	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the available direct memory of the HDFS service is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the NameNode instance is overused or the direct memory is inappropriately allocated.

## Procedure

**Check the direct memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. On the displayed interface, click the drop-down button of **ALM-14017 NameNode Direct Memory Usage Exceeds the Threshold**. Then check the role name in **Location** and confirm the IP address of the instance.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Instance > NameNode (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Resource**, and select **NameNode Memory** to check the direct memory usage.
- Step 3** Check whether the used direct memory of NameNode reaches 90% of the maximum direct memory specified for NameNode by default.
  - If yes, go to [Step 4](#).
  - If no, go to [Step 8](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations > NameNode > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC\_OPTS** parameter.
  - If yes, go to [Step 5](#).
  - If no, go to [Step 6](#).
- Step 5** In the **GC\_OPTS** parameter, delete "-XX:MaxDirectMemorySize". Save the configuration and restart the NameNode instance.

 NOTE

- During the restart of the active NameNode, a NameNode active/standby switchover occurs. As a result, no active node is available in the system for a short period of time (in the transition period of the active/standby switchover), and an alarm indicating that the HDFS service is unavailable may be generated. In addition, an error is reported during the running read and write tasks, but services are not interrupted.
- Services are not affected after the standby NameNode is restarted.

**Step 6** Check whether the **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-14007 NameNode Heap Memory Usage Exceeds the Threshold**.
- If no, go to [Step 7](#).

**Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 9** Select **NameNode** in the required cluster from the **Service**.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.102 ALM-14018 NameNode Non-heap Memory Usage Exceeds the Threshold

### Description

The system checks the non-heap memory usage of the HDFS NameNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS NameNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS NameNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS NameNode is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14018	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the memory usage of the HDFS NameNode is too high, data read/write performance of HDFS will be affected.

## Possible Causes

Non-heap memory of the HDFS NameNode is insufficient.

## Procedure

### Delete unnecessary files.

**Step 1** Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata\_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the **hdfs dfs -rm -r file or directory path** command to delete unnecessary files.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check the NameNode JVM non-heap memory usage and configuration.**

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**. The HDFS status page is displayed.

**Step 5** In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

 **NOTE**

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 6** On the HDFS WebUI, click the **Overview** tab. In **Summary**, check the numbers of files, directories, and blocks in HDFS.

**Step 7** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC\_OPTS** to check the **GC\_OPTS** non-heap memory parameter of **HDFS->NameNode**.

**Adjust system configurations.**

**Step 8** Check whether the non-heap memory is properly configured based on the number of file objects in [Step 6](#) and the non-heap parameters configured for NameNode in [Step 7](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 12](#).

 **NOTE**

The recommended mapping between the number of HDFS file objects (filesystem objects = files + blocks) and the JVM parameters configured for NameNode is as follows:

- If the number of file objects reaches 10,000,000, you are advised to set the JVM parameters as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the number of file objects reaches 20,000,000, you are advised to set the JVM parameters as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G
- If the number of file objects reaches 50,000,000, you are advised to set the JVM parameters as follows: -Xms32G -Xmx32G -XX:NewSize=3G -XX:MaxNewSize=3G
- If the number of file objects reaches 100,000,000, you are advised to set the JVM parameters as follows: -Xms64G -Xmx64G -XX:NewSize=6G -XX:MaxNewSize=6G
- If the number of file objects reaches 200,000,000, you are advised to set the JVM parameters as follows: -Xms96G -Xmx96G -XX:NewSize=9G -XX:MaxNewSize=9G
- If the number of file objects reaches 300,000,000, you are advised to set the JVM parameters as follows: -Xms164G -Xmx164G -XX:NewSize=12G -XX:MaxNewSize=12G

**Step 9** Modify the **GC\_OPTS** parameter of the NameNode based on the mapping between the number of file objects and non-heap memory.

**Step 10** Save the configuration and click **Dashboard** > **More** > **Restart Service**.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 11** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Collect fault information.**

**Step 12** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 13** Select the following services in the required cluster from the **Service**.

- ZooKeeper
- HDFS

**Step 14** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 15** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.103 ALM-14019 DataNode Non-heap Memory Usage Exceeds the Threshold

### Description

The system checks the non-heap memory usage of the HDFS DataNode every 30 seconds and compares the actual usage with the threshold. The non-heap memory usage of the HDFS DataNode has a default threshold. This alarm is generated when the non-heap memory usage of the HDFS DataNode exceeds the threshold.

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS** to change the threshold.

This alarm is cleared when the no-heap memory usage of the HDFS DataNode is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14019	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the memory usage of the HDFS DataNode is too high, data read/write performance of HDFS will be affected.

## Possible Causes

Non-heap memory of the HDFS DataNode is insufficient.

## Procedure

### Delete unnecessary files.

**Step 1** Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata\_env** command.

If the cluster adopts the security mode, perform security authentication.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the **hdfs dfs -rm -r file or directory path** command to delete unnecessary files.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

#### Check the DataNode JVM non-heap memory usage and configuration.

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS**.

**Step 5** In the **Basic Information** area, click **NameNode(Active)**. The HDFS WebUI is displayed.

#### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 6** On the HDFS WebUI, click the **Datanodes** tab to view the number of blocks of all DataNodes that report alarms.

**Step 7** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. In **Search**, enter **GC\_OPTS** to check the **GC\_OPTS** non-heap memory parameter of **HDFS->DataNode**.

#### Adjust system configurations.

**Step 8** Check whether the memory is properly configured based on the number of blocks in [Step 6](#) and the memory parameters configured for DataNode in [Step 7](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 12](#).

#### NOTE

The mapping between the average number of blocks of a DataNode instance and the DataNode memory is as follows:

- If the average number of blocks of a DataNode instance reaches 2,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
- If the average number of blocks of a DataNode instance reaches 5,000,000, the reference values of the JVM parameters of the DataNode are as follows: -Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

**Step 9** Modify the **GC\_OPTS** parameter of the DataNode based on the mapping between the number of blocks and memory.

**Step 10** Save the configuration and click **Dashboard** > **More** > **Restart Service**.

#### NOTE

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 11** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

#### Collect fault information.

- Step 12** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 13** Select the following services in the required cluster from the **Service**.
- ZooKeeper
  - HDFS
- Step 14** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 15** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.104 ALM-14020 Number of Entries in the HDFS Directory Exceeds the Threshold

### Description

The system obtains the number of subfiles and subdirectories in a specified directory every hour and checks whether it reaches the percentage of the threshold (the maximum number of subfiles and subdirectories in an HDFS directory, the threshold for triggering an alarm is **90%** by default). If it exceeds the percentage of the threshold, an alarm is triggered.

When the number of subfiles and subdirectories in the directory the alarm is lower than the percentage of the threshold, the alarm is automatically cleared. When the monitoring switch is disabled, alarms corresponding to all directories are cleared. If a directory is removed from the monitoring list, alarms corresponding to the directory are cleared.

#### NOTE

- The **dfs.namenode.fs-limits.max-directory-items** parameter specifies the maximum number of subfiles and subdirectories in the HDFS directory. Its default value is **1048576**. If the number of subfiles and subdirectories in a directory exceeds the parameter value, subfiles and subdirectories cannot be created in the directory.
- The **dfs.namenode.directory-items.monitor** parameter specifies the list of directories to be monitored. Its default value is **/tmp,/SparkJobHistory,/mr-history**.
- The **dfs.namenode.directory-items.monitor.enabled** parameter is used to enable or disable the monitoring switch. Its default value is **true**, which means the monitoring switch is enabled by default.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14020	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Directory	Specifies the directory for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

If the number of entries in the monitored directory exceeds 90% of the threshold, an alarm is triggered, but entries can be added to the directory. Once the maximum threshold is exceeded, entries will fail to be added to the directory.

## Possible Causes

The number of entries in the monitored directory exceeds 90% of the threshold.

## Procedure

**Check whether unnecessary files exist in the system.**

**Step 1** Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory, and run the **source bigdata\_env** command to set the environment variables.

If the cluster is in security mode, security authentication is required.

Run the **kinit hdfs** command and enter the password as prompted. Obtain the password from the administrator.

**Step 2** Run the following command to check whether files and directories in the directory with the alarm can be deleted:

```
hdfs dfs -ls Directory with the alarm
```

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Run the following command to delete unnecessary files.

```
hdfs dfs -rm -r -f File or directory path
```

 **NOTE**

Deleting a file or folder is a high-risk operation. Ensure that the file or folder is no longer required before performing this operation.

**Step 4** Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check whether the threshold is correctly configured.**

**Step 5** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HDFS** > **Configurations** > **All Configurations**. Search for the **dfs.namenode.fs-limits.max-directory-items** parameter and check whether the parameter value is appropriate.

- If yes, go to [Step 9](#).
- If no, go to [Step 6](#).

**Step 6** Increase the parameter value.

**Step 7** Save the configuration and click **Dashboard** > **More** > **Restart Service**.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 8** Wait 1 hour and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 10** Select **HDFS** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 12.13.105 ALM-14021 NameNode Average RPC Processing Time Exceeds the Threshold

## Description

The system checks the average RPC processing time of NameNode every 30 seconds, and compares the actual average RPC processing time with the threshold (default value: 100 ms). This alarm is generated when the system detects that the average RPC processing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC processing time of NameNode is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14021	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.

Name	Meaning
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

## Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.

## Procedure

### Obtain alarm information.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** Check the alarm. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

### Check whether the threshold is too small.

- Step 3** Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.
- If yes, go to **Step 8**.
  - If no, go to **Step 4**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > RPC**, and select **Average Time of Active NameNode RPC Processing** and click **OK**.
- Step 5** On the **Average Time of Active NameNode RPC Processing** monitoring page, obtain the value of the NameService node involved in this alarm.
- Step 6** On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**. Locate **Average Time of Active NameNode RPC Processing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the peak value

within one day before and after the alarm is generated. Click **OK** to save the new threshold.

**Step 7** Wait for 5 minutes and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Check whether the CPU performance of the NameNode node is sufficient.**

**Step 8** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-12016 CPU Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

**Step 9** Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

**Step 10** Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Check whether the memory of the NameNode node is too small.**

**Step 11** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** is generated for the NameNode node.

- If yes, go to [Step 12](#).
- If no, go to [Step 14](#).

**Step 12** Handle **ALM-14007 HDFS NameNode Heap Memory Usage Exceeds the Threshold** by taking recommended actions.

**Step 13** Wait for 10 minutes and check whether alarm 14021 is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Check whether NameNode parameters are configured properly.**

**Step 14** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

**Step 15** Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to **5**.

**Step 16** Click **Save** and click **OK**.

**Step 17** On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

 **NOTE**

Services are not affected after the standby NameNode is restarted.

**Step 18** On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

**Step 19** Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 20](#).

**Collect fault information.**

**Step 20** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 21** Select the following node in the required cluster from the **Service**.

- HDFS

**Step 22** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 23** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

## 12.13.106 ALM-14022 NameNode Average RPC Queuing Time Exceeds the Threshold

### Description

The system checks the average RPC queuing time of NameNode every 30 seconds, and compares the actual average RPC queuing time with the threshold (default value: 200 ms). This alarm is generated when the system detects that the average RPC queuing time exceeds the threshold for several consecutive times (10 times by default).

You can choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the average RPC queuing time of NameNode is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14022	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

NameNode cannot process the RPC requests from HDFS clients, upper-layer services that depend on HDFS, and DataNode in a timely manner. Specifically, the services that access HDFS run slowly or the HDFS service is unavailable.

## Possible Causes

- The CPU performance of NameNode nodes is insufficient and therefore NameNode nodes cannot process messages in a timely manner.
- The configured NameNode memory is too small and frame freezing occurs on the JVM due to frequent full garbage collection.
- NameNode parameters are not configured properly, so NameNode cannot make full use of system performance.
- The volume of services that access HDFS is too large and therefore NameNode is overloaded.

## Procedure

**Obtain alarm information.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. In the alarm list, click the alarm.
- Step 2** Check the alarm. Obtain the alarm generation time from **Generated**. Obtain the host name of the NameNode node involved in this alarm from the **HostName** information of **Location**. Then obtain the name of the NameService node involved in this alarm from the **NameServiceName** information of **Location**.

**Check whether the threshold is too small.**

- Step 3** Check the status of the services that depend on HDFS. Check whether the services run slowly or task execution times out.
- If yes, go to **Step 8**.
  - If no, go to **Step 4**.

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > RPC**, and select **Average Time of Active NameNode RPC Queuing** and click **OK**.

- Step 5** On the **Average Time of Active NameNode RPC Queuing** monitoring page, obtain the value of the NameService node involved in this alarm.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS**. Locate **Average Time of Active NameNode RPC Queuing** and click the **Modify** in the **Operation** column of the default rule. The **Modify Rule** page is displayed. Change **Threshold** to 150% of the monitored value. Click **OK** to save the new threshold.

- Step 7** Wait for 1 minute and then check whether the alarm is automatically cleared.
- If yes, no further action is required.
  - If no, go to **Step 8**.

**Check whether the CPU performance of the NameNode node is sufficient.**

- Step 8** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-12016 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.
- If yes, go to **Step 9**.
  - If no, go to **Step 11**.

- Step 9** Handle **ALM-12016 CPU Usage Exceeds the Threshold** by taking recommended actions.

- Step 10** Wait for 10 minutes and check whether alarm 14022 is automatically cleared.
- If yes, no further action is required.
  - If no, go to **Step 11**.

**Check whether the memory of the NameNode node is too small.**

- Step 11** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and check whether **ALM-14007 HDFS NameNode Memory Usage Exceeds the Threshold** is generated.
- If yes, go to **Step 12**.

- If no, go to [Step 14](#).

**Step 12** Handle **ALM-14007 CPU Usage Exceeds the Threshold** by taking recommended actions.

**Step 13** Wait for 10 minutes and check whether alarm 14022 is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Check whether NameNode parameters are configured properly.**

**Step 14** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS > Configurations > All Configurations**. Search for parameter **dfs.namenode.handler.count** and view its value. If the value is less than or equal to 128, change it to **128**. If the value is greater than 128 but less than 192, change it to **192**.

**Step 15** Search for parameter **ipc.server.read.threadpool.size** and view its value. If the value is less than 5, change it to 5.

**Step 16** Click **Save**, and click **OK**.

**Step 17** On the **Instance** page of HDFS, select the standby NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the standby NameNode is started up.

 **NOTE**

Services are not affected after the standby NameNode is restarted.

**Step 18** On the **Instance** page of HDFS, select the active NameNode of NameService involved in this alarm and choose **More > Restart Instance**. Enter the password and click **OK**. Wait until the active NameNode is started up.

**Step 19** Wait for 1 hour and then check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 20](#).

**Check whether the HDFS workload changes and reduce the workload properly.**

**Step 20** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HDFS**. Click the drop-down menu in the upper right corner of **Chart**, click **Customize**, select **Average Time of Active NameNode RPC Queuing** and click **OK**.

**Step 21** Click . The **Details** page is displayed.

**Step 22** Set the monitoring data display period, from 5 days before the alarm generation time to the alarm generation time. Click **OK**.

**Step 23** On the **Average RPC Queuing Time** monitoring page, check whether the point in time when the queuing time increases abruptly exists.

- If yes, go to [Step 24](#).
- If no, go to [Step 27](#).

- Step 24** Confirm and check the point in time. Check whether a new task frequently accesses HDFS and whether the access frequency can be reduced.
- Step 25** If a Balancer task starts at the point in time, stop the task or specify a node for the task to reduce the HDFS workload.
- Step 26** Wait for 1 hour and then check whether the alarm is automatically cleared.
- If yes, no further action is required.
  - If no, go to [Step 27](#).
- Collect fault information.**
- Step 27** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 28** Select **HDFS** in the required cluster from the **Service**.
- Step 29** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 30** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

# 12.13.107 ALM-14023 Percentage of Total Reserved Disk Space for Replicas Exceeds the Threshold

## Description

The system checks the percentage of total reserved disk space for replicas (Total reserved disk space for replicas/(Total reserved disk space for replicas + Total remaining disk space)) every 30 seconds and compares the actual percentage with the threshold (**90%** by default). This alarm is generated when the percentage of total reserved disk space for replicas exceeds the threshold for multiple consecutive times (**Trigger Count**).

The alarm is cleared in the following two scenarios: The value of **Trigger Count** is **1** and the percentage of total reserved disk space for replicas is less than or equal to the threshold; the value of **Trigger Count** is greater than **1** and the percentage of total reserved disk space for replicas is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14023	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
NameServiceName	Specifies the NameService service for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

The performance of writing data to HDFS is affected. If all remaining DataNode space is reserved for replicas, writing HDFS data fails.

## Possible Causes

- The alarm threshold is improperly configured.
- The disk space configured for the HDFS cluster is insufficient.
- The volume of services that access HDFS is too large and therefore DataNode is overloaded.

## Procedure

**Check whether the alarm threshold is appropriate.**

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS > Disk > Percentage of Reserved Space for Replicas of Unused Space** to check whether the alarm threshold is appropriate. (The default threshold is **90%**. Users can change it as required.)

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS > Disk > Percentage of Reserved Space for Replicas of Unused Space** and Click **Modify**, change the threshold based on the actual usage.

**Step 3** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether an alarm indicating insufficient disk space is generated.**

**Step 4** On the FusionInsight Manager portal, check whether **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** exists on the **O&M > Alarm > Alarms** page.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** Handle the alarm by referring to instructions in **ALM-14001 HDFS Disk Usage Exceeds the Threshold** or **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

**Step 6** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Expand the DataNode capacity.**

**Step 7** Expand the DataNode capacity.

**Step 8** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 10** Select **HDFS** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.108 ALM-14024 Tenant Space Usage Exceeds the Threshold

### Description

The system checks the space usage (used space of each directory/space allocated to each directory) of each directory associated with a tenant every hour and compares the space usage of each directory with the threshold set for the directory. This alarm is generated when the space usage exceeds the threshold.

This alarm is cleared when the space usage is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14024	Minor	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

### Impact on the System

This alarm is generated if the space usage of the tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the used space exceeds the maximum storage space allocated to the directory, the HDFS fails to write data to the directory.

## Possible Causes

- The alarm threshold is improperly configured.
- The space allocated to the tenant is improper.

## Procedure

### Check whether the alarm threshold is appropriate.

- Step 1** View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)
- If yes, go to **Step 5**.
  - If no, go to **Step 3**.
- Step 3** On the **Resources** page, click **Modify** to modify or delete the storage space threshold.
- Step 4** About one minute later, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 5**.

### Check whether the space allocated to the tenant is appropriate.

- Step 5** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the storage space quota of the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.
- If yes, go to **Step 8**.
  - If no, go to **Step 6**.
- Step 6** On the **Resources** page, click **Modify** to modify the storage space quota.
- Step 7** About one minute later, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 8**.

### Collect fault information.

- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 9** Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.109 ALM-14025 Tenant File Object Usage Exceeds the Threshold

## Description

The system checks the file object usage (used file objects of each directory/ number of file objects allocated to each directory) of each directory associated with a tenant every hour and compares the file object usage of each directory with the threshold set for the directory. This alarm is generated when the file object usage exceeds the threshold.

This alarm is cleared when the file object usage is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
14025	Minor	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
TenantName	Specifies the tenant for which the alarm is generated.
DirectoryName	Specifies the directory for which the alarm is generated.
Trigger condition	Specifies the threshold for triggering the alarm.

## Impact on the System

This alarm is generated if the usage of file objects in a tenant directory exceeds the custom threshold. File writing to the directory is not affected. If the number of used file objects exceeds the maximum number of file objects allocated to the directory, the HDFS fails to write data to the directory.

## Possible Causes

- The alarm threshold is improperly configured.
- The maximum number of file objects allocated to the tenant directory is inappropriate.

## Procedure

### Check whether the alarm threshold is appropriate.

- Step 1** View the alarm location information to obtain the tenant name and tenant directory for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the file object threshold configured for the tenant directory for which the alarm is generated is proper. (The default value 90% is a proper value. You can set it based on the site requirements.)
  - If yes, go to [Step 5](#).
  - If no, go to [Step 3](#).
- Step 3** On the **Resources** page, click **Modify** to modify or delete the file object threshold of the tenant directory for which the alarm is generated.
- Step 4** About one minute later, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

### Check whether the maximum number of file objects allocated to the tenant is appropriate.

- Step 5** On the FusionInsight Manager portal, choose the **Tenant Resources** page, select the tenant for which the alarm is generated, and click **Resources**. Check whether the maximum number of file objects configured for the tenant directory for which the alarm is generated is proper based on the actual service status of the tenant directory.
  - If yes, go to [Step 8](#).
  - If no, go to [Step 6](#).
- Step 6** On the **Resources** page, click **Modify** to modify or delete the maximum number of file objects configured for the tenant directory.
- Step 7** About one minute later, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 8](#).

### Collect fault information.

- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 9** Select **HDFS** in the required cluster and **NodeAgent** under **Manager** from the **Service**.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.110 ALM-14026 Blocks on DataNode Exceed the Threshold

### Alarm Description

The system checks the number of blocks on each DataNode every 30 seconds. This alarm is generated when the number of blocks on the DataNode exceeds the threshold.

If **Trigger Count** is **1** and the number of blocks on the DataNode is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks on the DataNode is less than or equal to 90% of the threshold, this alarm is cleared.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14026	Minor	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If this alarm is reported, there are too many blocks on the DataNode. In this case, data writing into the HDFS may fail due to insufficient disk space.

## Possible Causes

- The alarm threshold is improperly configured.
- Data skew occurs among DataNodes.
- The disk space configured for the HDFS cluster is insufficient.

## Handling Procedure

### Change the threshold.

- Step 1** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **HDFS**. Then choose **Configurations > All Configurations**. On the displayed page, find the **GC\_OPTS** parameter under **HDFS->DataNode**.
- Step 2** Set the threshold of the DataNode blocks. Specifically, change the value of **Xmx** of the **GC\_OPTS** parameter. **Xmx** specifies the memory, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required. Confirm that **GC\_PROFILE** is set to **custom** and save the configuration.
- Step 3** Choose **Cluster**, click the name of the desired cluster, and choose **HDFS > Instance**. Select the DataNode instance whose status is **Expired**, click **More**, and select **Restart Instance** to make the **GC\_OPTS** configuration take effect.

### NOTE

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

- Step 4** Check whether the alarm is cleared 5 minutes later.
  - If yes, no further action is required.
  - If no, go to [Step 5](#).

### Check whether associated alarms are reported.

- Step 5** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, and check whether the **ALM-14002 DataNode Disk Usage Exceeds the Threshold** alarm exists.
  - If yes, go to [Step 6](#).

- If no, go to [Step 8](#).

**Step 6** Handle the alarm by following the instructions in **ALM-14002 DataNode Disk Usage Exceeds the Threshold** and check whether the alarm is cleared.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 7** Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Expand the DataNode capacity.**

**Step 8** Expand the DataNode capacity.

**Step 9** On FusionInsight Manager, wait for 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect fault information.**

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

**Configuration rules of the DataNode JVM parameter.**

Default value of the DataNode JVM parameter **GC\_OPTS**:

```
-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M -  
XX:MetaspaceSize=128M -XX:MaxMetaspaceSize=128M -  
XX:+UseConcMarkSweepGC -XX:+CMSParallelRemarkEnabled -  
XX:CMSInitiatingOccupancyFraction=65 -XX:+PrintGCDetails -  
Dsun.rmi.dgc.client.gcInterval=0x7FFFFFFF -  
Dsun.rmi.dgc.server.gcInterval=0x7FFFFFFF -XX:-  
OmitStackTraceInFastThrow -XX:+PrintGCDateStamps -XX:+UseGCLogFileRotation  
-XX:NumberOfGCLogFiles=10 -XX:GCLogFileSize=1M -  
Djdk.tls.ephemeralDHKeySize=2048
```

Average number of saved blocks = Number of HDFS blocks x 3/Number of DataNodes

 **NOTE**

To obtain the number of HDFS blocks, log in to FusionInsight Manager, choose **Cluster > Services > HDFS**, click **NameNode(xxx,Active)** to the right of **NameNode Web UI** to go to the native HDFS web UI, and then view the information in the **Summary** area.

### Summary

Security is on.  
Safemode is off.  
1,580 files and directories, **1,183 blocks** (1,183 replicated blocks, 0 erasure coded block groups) = 2,763 total filesystem object(s).  
Heap Memory used 179.06 MB of 1.99 GB Heap Memory. Max Heap Memory is 3.98 GB.  
Non Heap Memory used 134 MB of 137.06 MB Committed Non Heap Memory. Max Non Heap Memory is 488 MB.

If the average number of blocks on a single DataNode has changed, modify **-Xms2G -Xmx4G -XX:NewSize=128M -XX:MaxNewSize=256M** in the default value. The following table lists the reference values.

**Table 12-90** DataNode JVM configuration

Average Number of Blocks in a DataNode Instance	Reference Value
2,000,000	-Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=512M
5,000,000	-Xms12G -Xmx12G -XX:NewSize=1G -XX:MaxNewSize=1G

**Xmx** specifies memory which corresponds to the threshold of the number of DataNode blocks, and each GB memory supports a maximum of 500,000 DataNode blocks. Set the memory as required.

## 12.13.111 ALM-14027 DataNode Disk Fault

### Alarm Description

The system checks the disk status on DataNodes every 60 seconds. This alarm is generated when a disk is faulty.

After all faulty disks on the DataNode are recovered, you need to manually clear the alarm and restart the DataNode.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14027	Major	No

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Failed Volumes	Specifies the list of faulty disks.

## Impact on the System

If this alarm is reported, there are abnormal disk partitions on the DataNode. This may cause the loss of written files.

## Possible Causes

- The hard disk is faulty.
- The disk permissions are configured improperly.

## Handling Procedure

**Check whether a disk alarm is generated.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and check whether **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault** exists.
- If yes, go to **Step 2**.
  - If no, go to **Step 4**.
- Step 2** Rectify the fault by referring to the handling procedure of **ALM-12014 Partition Lost** or **ALM-12033 Slow Disk Fault**. Then, check whether the alarm is cleared.
- If yes, go to **Step 3**.
  - If no, go to **Step 4**.
- Step 3** Wait 5 minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 4**.

**Modify disk permissions.**

- Step 4** Choose **O&M > Alarm > Alarms** and view **Location** and **Additional Information** of the alarm to obtain the location of the faulty disk.

**Step 5** Log in to the node for which the alarm is generated as user **root**. Go to the directory where the faulty disk is located, and run the **ll** command to check whether the permission of the faulty disk is **711** and whether the user is **omm**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** Modify the permission of the faulty disk. For example, if the faulty disk is **data1**, run the following commands:

```
chown omm:wheel data1
```

```
chmod 711 data1
```

**Step 7** In the alarm list on Manager, click **Clear** in the **Operation** column of the alarm to manually clear the alarm. Choose **Cluster > Services > HDFS > Instance**, select the DataNode, choose **More > Restart Instance**, wait for 5 minutes, and check whether a new alarm is reported.

 **NOTE**

Services may be affected or interrupted during the restart. You are advised to perform this operation during off-peak hours.

- If no, no further action is required.
- If yes, go to [Step 8](#).

**Collect the fault information.**

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 9** Expand the **Service** drop-down list, and select **HDFS** and **OMS** for the target cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 20 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault is rectified, the system does not automatically clear this alarm and you need to manually clear the alarm.

## Related Information

None

## 12.13.112 ALM-14028 Number of Blocks to Be Supplemented Exceeds the Threshold

### Alarm Description

The system checks the number of blocks to be supplemented every 30 seconds and compares the number with the threshold. The number of blocks to be supplemented has a default threshold. This alarm is generated when the number of blocks to be supplemented exceeds the threshold.

You can change the threshold specified by **Blocks Under Replicated (NameNode)** by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > HDFS > File and Block**.

If **Trigger Count** is set to **1** and the number of blocks to be supplemented is less than or equal to the threshold, this alarm is cleared. If **Trigger Count** is greater than **1** and the number of blocks to be supplemented is less than or equal to 90% of the threshold, this alarm is cleared.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14028	Minor	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

Data stored in HDFS is lost. HDFS may enter the security mode and cannot provide write services. Lost block data cannot be restored.

## Possible Causes

- The DataNode instance is abnormal.
- Data is deleted.
- The number of replicas written into the file is greater than the number of DataNodes.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.
- If yes, go to **Step 2**.
  - If no, go to **Step 3**.
- Step 2** Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. Five minutes later, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 3**.
- Step 3** Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:
- Security mode:  
`cd Client installation directory`  
`source bigdata_env`  
`kinit hdfs`
  - Normal mode:  
`su - omm`  
`cd Client installation directory`  
`source bigdata_env`
- Step 4** Run the `hdfs fsck / >> fsck.log` command to obtain the status of the current cluster.
- Step 5** Run the following command to count the number ( $M$ ) of blocks to be replicated:
- ```
cat fsck.log | grep "Under-replicated"
```
- Step 6** Run the following command to count the number ( $N$ ) of blocks to be replicated in the `/tmp/hadoop-yarn/staging/` directory:
- ```
cat fsck.log | grep "Under replicated" | grep "/tmp/hadoop-yarn/staging/" | wc -l
```

### NOTE

`/tmp/hadoop-yarn/staging/` is the default directory. If the directory is modified, obtain it from the configuration item `yarn.app.mapreduce.am.staging-dir` in the `mapred-site.xml` file.

**Step 7** Check whether the percentage of  $N$  is greater than 50% ( $N/M > 50\%$ ).

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 8** Run the following command to reconfigure the number of file replicas in the directory (set the number of file replicas to the number of DataNodes or the default number of file replicas):

```
hdfs dfs -setrep -w Number of file replicas/tmp/hadoop-yarn/staging/
```

 **NOTE**

To obtain the default number of file replicas:

Log in to FusionInsight Manager, choose **Cluster > Services > HDFS > Configurations > All Configurations**, and search for the **dfs.replication** parameter. The value of this parameter is the default number of file replicas.

Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect the fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.113 ALM-14029 Number of Blocks in a Replica Exceeds the Threshold

## Alarm Description

The system checks the number of blocks in a single replica every four hours and compares the number with the threshold. There is a threshold for the number of blocks in a single replica. This alarm is generated when the actual number of blocks in a single replica exceeds the threshold.

This alarm is cleared when the number of blocks to be supplemented is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14029	Minor	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
NameServiceName	Specifies the NameService for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Replica data is prone to be lost when a node is faulty. Too many files of a single replica affect the security of the HDFS file system.

## Possible Causes

- The DataNode is faulty.
- The disk is faulty.
- Files are written to a single replica.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, check whether alarm **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold** is generated.

- If yes, go to **Step 2**.
- If no, go to **Step 3**.

**Step 2** Rectify the fault according to the handling procedure of **ALM-14003 Number of Lost HDFS Blocks Exceeds the Threshold**. In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Step 3** Check whether files of a single replica have been written into the service.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

**Step 4** Log in to the HDFS client as user **root**. The user password is defined by the user before the installation. Contact the MRS cluster administrator to obtain the password. Run the following commands:

- Security mode:  
`cd Client installation directory`  
`source bigdata_env`  
`kinit hdfs`
- Normal mode:  
`su - omm`  
`cd Client installation directory`  
`source bigdata_env`

**Step 5** Run the following command on the client node to increase the number of replicas for a single replica file:

```
hdfs dfs -setrep -w file replica number file name or file path
```

**Step 6** In the next detection period, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

#### **Collect the fault information.**

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.114 ALM-14030 HDFS Allows Write of Single-Replica Data

### Alarm Description

This alarm is generated when **dfs.single.replication.enable** is set to **true**, indicating that HDFS is configured to allow write of single-replica data.

This alarm is cleared when this function is disabled on HDFS.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14030	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.

### Impact on the System

If this configuration is enabled on the server and the number of HDFS replicas configured on the client is 1, single-replica data can be written to HDFS. Data of a single replica may be lost. Therefore, the system does not allow write of single-replica data by default. If a service requires single-replica data write to a directory, modify the HDFS configuration item **dfs.single.replication.exclude.pattern**.

### Possible Causes

The HDFS configuration item **dfs.single.replication.enable** is set to **true**.

### Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > HDFS**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab.
- Step 2** Search for **dfs.single.replication.enable** in the search box, change the value of the configuration item to **false**, and click **Save**.

**Step 3** Wait for about 10 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Collect fault information.**

**Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 5** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.115 ALM-14031 DataNode Process Is Abnormal

## Alarm Description

The DataNode process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14031	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

## Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

## Handling Procedure

**Check whether the process is in the D, Z, or T state.**

**Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.

- If the alarm is not in the list, no further action is required.
- If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in [Step 2](#).

**Step 2** Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.

**Step 3** Run the following command to check the process state:

```
ps ww -eo stat,cmd| grep -w  
org.apache.hadoop.hdfs.server.datanode.DataNode | grep -v grep | awk '{print  
$1}'
```

**Step 4** Check whether the command output contains any abnormal state (D, Z, or T).

- If the output contains any abnormal state, go to [Step 5](#).
- If the output does not contain abnormal states, go to [Step 7](#).

**Step 5** Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)

**Step 6** Wait 5 minutes and check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm fails to be cleared, go to [Step 7](#).

**Collect fault information.**

- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

**Related Information**

None.

**12.13.116 ALM-14032 JournalNode Process Is Abnormal****Alarm Description**

- If the output contains any abnormal state, go to [Step 5](#).
  - If the output does not contain abnormal states, go to [Step 7](#).
- Step 5** Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)
- Step 6** Wait 5 minutes and check whether the alarm is cleared.
- If the alarm is cleared, no further action is required.
  - If the alarm fails to be cleared, go to [Step 7](#).
- Collect fault information.**
- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.119 ALM-14035 HttpFS Process Is Abnormal

### Alarm Description

The HttpFS process checks the process status every 20 seconds. This alarm is generated when the process status is abnormal and does not recover for a long time.

This alarm is cleared when the process status recovers.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
14035	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

If the process status is abnormal, the process cannot provide services properly. As a result, the entire service may become abnormal.

### Possible Causes

The host responds slowly to I/O (disk I/O and network I/O) requests and some processes are in the D state and Z state. The process may also be suspended and enter the T state.

### Handling Procedure

**Check whether the process is in the D, Z, or T state.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Wait for about 10 minutes and check whether the alarm is automatically cleared.
- If the alarm is not in the list, no further action is required.
  - If the alarm is in the list, view the alarm details and record the IP address of the host where the alarm is generated. Run the command in [Step 2](#).
- Step 2** Log in to the host where the alarm is generated as the **root** user and run the **su - omm** command to switch to the **omm** user.
- Step 3** Run the following command to check whether the process state is abnormal:
- ```
ps ww -eo stat,cmd| grep -w  
org.apache.hadoop.fs.http.server.HttpFSServerWebServer | grep -v grep | awk  
'{print$1}'
```
- Step 4** Check whether the command output contains any abnormal state (D, Z, or T).
- If the output contains any abnormal state, go to [Step 5](#).
  - If the output does not contain abnormal states, go to [Step 7](#).
- Step 5** Switch to user **root** and run the **reboot** command to restart the host for which the alarm is generated. (Restarting a host is risky. Ensure that the service process is normal after the restart.)
- Step 6** Wait 5 minutes and check whether the alarm is cleared.
- If the alarm is cleared, no further action is required.
  - If the alarm fails to be cleared, go to [Step 7](#).
- Collect fault information.**
- Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 8** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HDFS** for the target cluster.
- Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.120 ALM-16000 Percentage of Sessions Connected to the HiveServer to Maximum Number Allowed Exceeds the Threshold

### Description

The system detects the percentage of sessions connected to the HiveServer to the maximum number of allowed sessions every 30 seconds. This indicator can be viewed on the **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance** > *HiveServer instance*. This alarm is generated when the percentage exceeds the default value **90%**.

To change the threshold, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Hive** > **Percentage of Sessions Connected to the HiveServer to Maximum Number of Sessions Allowed by the HiveServer**.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16000    | Minor          | Yes                   |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If a connection number alarm is generated, the number of sessions connected to HiveServer is too large. As a result, new connections cannot be established, new tasks fail, or even services restart unexpectedly.

## Possible Causes

Too many clients are connected to HiveServer.

## Procedure

**Increase the maximum number of connections to Hive.**

**Step 1** On the FusionInsight Manager portal, Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**.

**Step 2** Search for **hive.server.session.control.maxconnections** and increase the value of this parameter. If the value of this parameter is **A**, the threshold is **B**, and the number of sessions connected to the HiveServer is **C**, adjust the value of this parameter according to  $A \times B > C$ . To view the number of sessions connected to the HiveServer, check the value of **Statistics for Sessions of the HiveServer** on the Hive monitoring page.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Collect fault information.**

**Step 4** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 5** Select **Hive** in the required cluster from the **Service**.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.121 ALM-16001 Hive Warehouse Space Usage Exceeds the Threshold

### Description

This alarm is generated when the Hive warehouse space usage exceeds the specified threshold (85% by default). The system checks the Hive data warehouse space usage every 30s. The indicator **Percentage of HDFS Space Used by Hive to the Available Space** can be viewed on the Hive service monitoring page.

To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive > Percentage of HDFS Space Used by Hive to the Available Space**.

When the **Trigger Count** is 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Hive warehouse space usage is less than or equal to 90% of the threshold.

#### NOTE

The administrator can reduce the warehouse space usage by expanding the warehouse capacity or releasing the used space.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16001    | Minor          | Yes                   |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

The system cannot write data properly. Some data may be lost.

## Possible Causes

- The upper limit of the HDFS capacity available for Hive is too small.
- The HDFS space is insufficient.
- Some data nodes break down.

## Procedure

### Expand the system configuration.

- Step 1** Analyze the cluster HDFS capacity usage and increase the upper limit of the HDFS capacity available for Hive.

Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Configurations** > **All Configurations**, find **hive.metastore.warehouse.size.percent**, and increase its value so that larger HDFS capacity will be available for Hive. Assume that the value of the configuration item is A, the total HDFS storage space is B, the threshold is C, and the HDFS space used by Hive is D. The adjustment policy is  $A \times B \times C > D$ . The total HDFS storage space can be viewed on the HDFS NameNode page. The HDFS space used by Hive can be viewed on the Hive monitoring page.

- Step 2** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 3](#).

### Expand the system.

- Step 3** Expand the system.

- Step 4** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).

### Check whether the data node is normal.

- Step 5** On the FusionInsight Manager portal, click **O&M** > **Alarm** > **Alarms**.

- Step 6** Check whether "ALM-12006 Node Fault", "ALM-12007 Process Fault", or "ALM-14002 DataNode Disk Usage Exceeds the Threshold" exist.
- If yes, go to [Step 7](#).
  - If no, go to [Step 9](#).

- Step 7** Clear the alarm by following the steps provided in "ALM-12006 Node Fault", "ALM-12007 Process Fault", and "ALM-14002 DataNode Disk Usage Exceeds the Threshold".

- Step 8** Check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 10** Select **Hive** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.122 ALM-16002 Hive SQL Execution Success Rate Is Lower Than the Threshold

### Description

The system checks the percentage of the HQL statements that are executed successfully in every 30 seconds. The formula is: Percentage of HQL statements that are executed successfully = Number of HQL statements that are executed successfully by Hive in a specified period/Total number of HQL statements that are executed by Hive. This indicator can be viewed on the **Cluster > Name of the desired cluster > Services > Hive > Instance > HiveServer instance**. The default threshold of the percentage of HQL statements that are executed successfully is **90%**. An alarm is reported when the percentage is lower than the **90%**. Users can view the name of the host where an alarm is generated in the location information about the alarm. The IP address of the host is the IP address of the HiveServer node.

Users can modify the threshold by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > Hive > Percentage of HQL Statements That Are Executed Successfully by Hive**.

This alarm is cleared when the execution success rate is higher than 110% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16002    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

The service execution capability of the system is too low and cannot properly respond to customer requests. The Hive service is not affected. You need to check HiveServer logs to locate the SQL failure cause.

## Possible Causes

- A syntax error occurs in HQL statements.
- The HBase service is abnormal when a Hive on HBase task is performed.
- The Spark service is abnormal when a Hive on Spark task is performed.
- The dependent basic services, such as HDFS, Yarn, and ZooKeeper, are abnormal.

## Procedure

### Check whether the HQL statements comply with syntax.

- Step 1** On the FusionInsight Manager page, choose **O&M > Alarm** to view the alarm details and obtain the node where the alarm is generated.
- Step 2** Use the Hive client to log in to the HiveServer node where an alarm is reported. Query the HQL syntax provided by Apache, and check whether the HQL commands are correct.
- If yes, go to [Step 4](#).
  - If no, go to [Step 3](#).

 **NOTE**

To view the user who runs an incorrect statement, you can download the hiveserver audit log file of the HiveServer node where this alarm is generated. **Start Data** and **End Data** are 10 minutes before and after the alarm generation time respectively. Open the log file and search for the **Result=FAIL** keyword to filter the log information about the incorrect statement, and then view the user who runs the incorrect statement according to **UserName** in the log information.

**Step 3** Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to [Step 12](#).
- If no, go to [Step 4](#).

**Check whether the HBase service is abnormal.**

**Step 4** Check whether an Hive on HBase task is performed with the user who runs the HQL command.

- If yes, go to [Step 5](#).
- If no, go to [Step 8](#).

**Step 5** On the FusionInsight Manager page, click **Cluster** > *Name of the desired cluster* > **Services**, check whether the HBase service is normal in the service list.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** Choose **O&M** > **Alarm**, check the related alarms displayed on the alarm page and clear them according to related alarm help.

**Step 7** Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to [Step 12](#).
- If no, go to [Step 8](#).

**Check whether the HDFS, Yarn, and ZooKeeper are normal.**

**Step 8** On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services**.

**Step 9** In the service list, check whether the services, such as HDFS, Yarn, and ZooKeeper are normal.

- If yes, go to [Step 12](#).
- If no, go to [Step 10](#).

**Step 10** Check the related alarms displayed on the alarm page and clear them according to related alarm help.

**Step 11** Enter the correct HQL statements, and check whether the command can be properly executed.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** After 1 minute, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to [Step 13](#).

**Collect fault information.**

**Step 13** On the FusionInsight Manager home page, choose **O&M > Log > Download**.

**Step 14** Select the following nodes in the required cluster from the **Service**:

- MapReduce
- Hive

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.123 ALM-16003 Background Thread Usage Exceeds the Threshold

### Description

The system checks the background thread usage in every 30 seconds. This alarm is generated when the usage of the background thread pool of Hive exceeds the threshold, 90% by default.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16003    | Major          | Yes        |

### Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

There are too many background threads, so the newly submitted task cannot run in time.

## Possible Causes

The usage of the background thread pool of Hive is excessively high when:

- There are many tasks executed in the background thread pool of HiveServer.
- The capacity of the background thread pool of HiveServer is too small.

## Procedure

**Check the number of tasks executed in the background thread pool of HiveServer.**

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of **Background Thread Count** and **Background Thread Usage**.
- Step 2** Check whether the number of background threads in the latest half an hour is excessively high. (By default, the queue number is 100, and the thread number is considered as high if it is 90 or larger.)
  - If it is, go to [Step 3](#).
  - If it is not, go to [Step 5](#).
- Step 3** Adjust the number of tasks submitted to the background thread pool. (For example, cancel some time-consuming tasks with low performance.)
- Step 4** Check whether the values of Background Thread Count and Background Thread Usage decrease.
  - If it is, go to [Step 7](#).
  - If it is not, go to [Step 5](#).

**Check the capacity of the HiveServer background thread pool.**

- Step 5** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive**. On the displayed page, click **HiveServer Instance** and check values of Background Thread Count and Background Thread Usage.

**Step 6** Increase the value of `hive.server2.async.exec.threads` in the `${BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_23_HiveServer/etc/hive-site.xml` file. For example, increase the value by 20%.

**Step 7** Save the modification.

**Step 8** Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 10** Select **Hive** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.124 ALM-16004 Hive Service Unavailable

## Description

This alarm is generated when the HiveServer service is unavailable. The system checks the HiveServer service status every 60 seconds.

This alarm is cleared when the HiveServer service is normal.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16004    | Critical       | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The system cannot provide data loading, query, and extraction services.

## Possible Causes

- Hive service unavailability may be related to the faults of the Hive process as well as basic services, such as ZooKeeper, Hadoop distributed file system (HDFS), Yarn, and DBService.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.
  - The Yarn service is abnormal.
  - The DBService service is abnormal.
  - The Hive service process is abnormal. If the alarm is caused by Hive process fault, the alarm report has a delay of about 5 minutes.
- The network communication between the Hive and basic services is interrupted.
- The permission on the HDFS temporary directory of Hive is abnormal.
- The local disk space of the Hive node is insufficient.

## Procedure

### Check the HiveServer/MetaStore process status.

- Step 1** On the FusionInsight Manager portal, click **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Instance**. In the Hive instance list, check whether the HiveServer or MetaStore instances are in the Unknown state.
- If yes, go to [Step 2](#).
  - If no, go to [Step 4](#).
- Step 2** In the Hive instance list, choose **More** > **Restart Instance** to restart the HiveServer/MetaStore process.

**NOTICE**

During HiveServer or MetaStore instance restart, the instance cannot provide services for external systems. SQL tasks that are being executed on the instance may fail.

**Step 3** In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check the ZooKeeper service status.**

**Step 4** On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.

- If yes, go to [Step 5](#).
- If no, go to [Step 8](#).

**Step 5** In the **Process Fault**, check whether **ServiceName** is **ZooKeeper**.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

**Step 6** Rectify the fault by following the steps provided in "ALM-12007 Process Fault".

**Step 7** In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Check the HDFS service status.**

**Step 8** On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

**Step 9** Rectify the fault by following the steps provided in "ALM-14000 HDFS Service Unavailable".

**Step 10** In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Check the Yarn service status.**

**Step 11** In FusionInsight Manager alarm list, check whether **Yarn Service Unavailable** is generated.

- If yes, go to [Step 12](#).
- If no, go to [Step 14](#).

**Step 12** Rectify the fault. For details, see "ALM-18000 Yarn Service Unavailable".

**Step 13** In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Check the DBService service status.**

**Step 14** In FusionInsight Manager alarm list, check whether **DBService Service Unavailable** is generated.

- If yes, go to [Step 15](#).
- If no, go to [Step 17](#).

**Step 15** Rectify the fault. For details, see "ALM-27001 DBService Service Unavailable".

**Step 16** In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 17](#).

**Check the network connection between the Hive and ZooKeeper, HDFS, Yarn, and DBService.**

**Step 17** On the FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Hive**.

**Step 18** Click **Instance**.

The HiveServer instance list is displayed.

**Step 19** Click **Host Name** in the row of **HiveServer**.

The active HiveServer host status page is displayed.

**Step 20** Record the IP address under **Basic Information**.

**Step 21** Use the IP address obtained in [Step 20](#) to log in to the host where the active HiveServer runs as user **omm**.

**Step 22** Run the **ping** command to check whether communication between the host that runs the active HiveServer and the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services is normal. (Obtain the IP addresses of the hosts that run the ZooKeeper, HDFS, Yarn, and DBService services in the same way as that for obtaining the IP address of the active HiveServer.)

- If yes, go to [Step 31](#).
- If no, go to [Step 23](#).

**Step 23** Contact the administrator to restore the network.

**Step 24** In the alarm list, check whether **Hive Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 31](#).

**Check the permission on the HDFS temporary directory.**

**Step 25** Log in to the node where the HDFS client is located and run the following command to go to the HDFS client installation directory:

```
cd Client installation directory  
source bigdata_env
```

**kinit** *user with the supergroup permission* (Skip this step for common clusters.)

**Step 26** Run the following command to check whether the permission on the data warehouse directory is 770:

```
hdfs dfs -ls /tmp | grep hive-scratch
```

- If yes, go to [Step 29](#).
- If no, go to [Step 27](#).

**Step 27** Run the following command to restore the default data warehouse permission:

```
hdfs dfs -chmod 770 /tmp/hive-scratch
```

**Step 28** Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 29](#).

**Check whether the local disk space is normal.**

**Step 29** Run the **df -h** command to check the root directory and check whether the disk usage of the **/srv**, **/var**, and **/opt** directories exceeds 95%.

- If yes, go to [Step 30](#).
- If no, go to [Step 31](#).

**Step 30** Clear unnecessary information in the corresponding directory to ensure that the available disk space is greater than 80%. Wait for several minutes and check whether the Hive Service Unavailable alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 31](#).

**Collect fault information.**

**Step 31** On the FusionInsight Manager, choose **O&M > Log > Download**.

**Step 32** Select the following nodes in the required cluster from the **Service**:

- ZooKeeper
- HDFS
- Yarn
- DBService
- Hive

**Step 33** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 34** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

# 12.13.125 ALM-16005 The Heap Memory Usage of the Hive Process Exceeds the Threshold

## Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16005    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                          |
|-------------|------------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.          |
| ServiceName | Specifies the service name for which the alarm is generated.     |
| RoleName    | Specifies the role name for which the alarm is generated.        |
| HostName    | Specifies the object (host ID) for which the alarm is generated. |

## Impact on the System

When the heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

## Possible Causes

The heap memory of the Hive instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

### Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16005**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
  - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum heap memory specified for HiveServer.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum heap memory specified for MetaStore.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore > JVM**. Adjust the value of **-Xmx** in **HIVE\_GC\_OPTS/METASTORE\_GC\_OPTS** as the following rules. Click **Save**.

 NOTE

Suggestions for GC parameter settings for the HiveServer:

- When the heap memory used by the HiveServer process reaches the threshold (default value: 95%) of the maximum heap memory set by the HiveServer process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically. On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive > CPU and Memory > HiveServer Heap Memory Usage Statistics (HiveServer)** to view **Threshold**.

Suggestions for GC parameter settings for the MetaServer:

- When the heap memory used by the MetaStore process reaches the threshold (default value: 95%) of the maximum heap memory set by the MetaStore process, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2GB by default, change the value of **-Xmx** to 4GB. On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive > CPU and Memory > MetaStore Heap Memory Usage Statistics (MetaStore)** to view **Threshold**.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

**Step 5** Click **More > Restart Service** to restart the service.

---

**NOTICE**

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

---

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Hive** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 12.13.126 ALM-16006 The Direct Memory Usage of the Hive Process Exceeds the Threshold

### Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the direct memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive** to change the threshold.

The alarm is cleared when the direct memory usage is less than or equal to the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16006    | Major          | Yes                   |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

When the direct memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

## Possible Causes

The direct memory of the Hive instance on the node is overused or the direct memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

### Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16006**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
  - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used direct memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum direct memory specified for HiveServer.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used direct memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum direct memory specified for MetaStore.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore > JVM**. Adjust the value of **-XX:MaxDirectMemorySize** in **HIVE\_GC\_OPTS/METASTORE\_GC\_OPTS** as the following rules. Click **Save**.

### NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxDirectMemorySize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 8 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

**Step 5** Click **More > Restart Service** to restart the service.

---

**NOTICE**

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

---

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Hive** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.127 ALM-16007 Hive GC Time Exceeds the Threshold

### Description

The system checks the garbage collection (GC) time of the Hive service every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 12 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive**. This alarm is cleared when the Hive GC time is shorter than or equal to the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16007    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the GC time exceeds the threshold, Hive data read and write are affected, task execution may slow down, or services may restart unexpectedly.

## Possible Causes

The memory of Hive instances is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC time.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16007**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
  - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > GC**, and select **Garbage Collection (GC) Time of HiveServer** and click **OK** to check whether the GC time is longer than 12 seconds.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the

**Chart** area and choose **Customize > GC**, and select **Garbage Collection (GC) Time of MetaStore** and click **OK** to check whether the GC time is longer than 12 seconds.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

**Check the current JVM configuration.**

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore > JVM**. Adjust the value of **-Xmx** in **HIVE\_GC\_OPTS/METASTORE\_GC\_OPTS** as the following rules. Click **Save**.

 **NOTE**

Suggestions for GC parameter settings for the HiveServer:

- When the Hive GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

Suggestions for GC parameter settings for the MetaServer:

- When the Meta GC time exceeds the threshold, change the value of **-Xmx** to twice the default value. For example, if **-Xmx** is set to 2 GB by default, change the value of **-Xmx** to 4 GB.
- You are advised to change the value of **-Xms** to set the ratio of **-Xms** and **-Xmx** to 1:2 to avoid performance problems when JVM dynamically.

**Step 5** Click **More > Restart Service** to restart the service.

---

**NOTICE**

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

---

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal of active and standby clusters, choose **O&M > Log > Download**.

**Step 8** In the **Service**, select **Hive** in the required cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 12.13.128 ALM-16008 Non-Heap Memory Usage of the Hive Process Exceeds the Threshold

## Description

The system checks the Hive service status every 30 seconds. The alarm is generated when the non-heap memory usage of an Hive service exceeds the threshold (95% of the maximum memory).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Hive** to change the threshold.

The alarm is cleared when the non-heap memory usage is less than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 16008    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                          |
|-------------|------------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.          |
| ServiceName | Specifies the service name for which the alarm is generated.     |
| RoleName    | Specifies the role name for which the alarm is generated.        |
| HostName    | Specifies the object (host ID) for which the alarm is generated. |

## Impact on the System

When the non-heap memory usage of Hive is overhigh, the performance of Hive task operation is affected. In addition, a memory overflow may occur so that the Hive service is unavailable.

## Possible Causes

The non-heap memory of the Hive instance on the node is overused or the non-heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

### Check non-heap memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **Alarm ID** is **16008**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HiveServer, go to [Step 2](#).
  - If the role for which the alarm is generated is MetaStore, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the HiveServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **HiveServer Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the HiveServer service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for HiveServer.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Instance** and click the MetaStore for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory**, and select **MetaStore Memory Usage Statistics** and click **OK**, check whether the used non-heap memory of the MetaStore service reaches the threshold(default value: 95%) of the maximum non-heap memory specified for MetaStore.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Hive > Configurations > All Configurations**. Choose **HiveServer/MetaStore > JVM**. Adjust the value of **-XX:MaxMetaspaceSize** in **HIVE\_GC\_OPTS/METASTORE\_GC\_OPTS** as the following rules. Click **Save**.

### NOTE

Suggestions for GC parameter settings for the HiveServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

Suggestions for GC parameter settings for the MetaServer:

- It is recommended that you set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

**Step 5** Click **More > Restart Service** to restart the service.

**NOTICE**

During Hive service restart, instances cannot provide services for external systems, and the SQL tasks that are being executed on the instances may fail.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Hive** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.129 ALM-16009 Map Number Exceeds the Threshold

### Description

The system checks the number of HQL maps in every 30 seconds. This alarm is generated if the number exceeds the threshold. By default, **Trigger Count** is set to 3, and the threshold is 5000.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16009    | Major          | Yes        |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the number of HQL maps executed by Hive is too large, a large number of Yarn queue resources are occupied, which may take a long time and affect other tasks running using this queue.

## Possible Causes

The HQL statements are not the optimal.

## Procedure

### Check the number of HQL maps.

**Step 1** On FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Hive** > **Resource**. Check the HQL statements with the excessively large number (5000 or more) of maps in **HQL Map Count**.

**Step 2** Locate the corresponding HQL statements, optimize them and execute them again.

**Step 3** Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to **Step 4**.

### Collect fault information.

**Step 4** On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

**Step 5** Select **Hive** in the required cluster from the **Service**.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.130 ALM-16045 Hive Data Warehouse Is Deleted

## Description

The system checks the Hive data warehouse in every 60 seconds. This alarm is generated when the Hive data warehouse is deleted.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16045    | Critical       | Yes        |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The default Hive data warehouse is deleted. As a result, creating databases or tables in the default data warehouse fails, and services are affected.

## Possible Causes

Hive periodically checks the status of the default data warehouse and finds that the default data warehouse is deleted.

## Procedure

### Check the default Hive data warehouse.

**Step 1** Log in to the node where the client is located as user **root**.

**Step 2** Run the following command to check whether the **warehouse** directory exists in **hdfs://hacluster/user/<username>/.Trash/Current/**.

```
hdfs dfs -ls hdfs://hacluster/user/<username>/.Trash/Current/
```

For example, if **user/hive/warehouse** exists:

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/  
Found 1 items  
drwx----- - test hadoop      0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** By default, there is an automatic recovery mechanism for the data warehouse. You can wait for 5 ~10s to check whether the default data warehouse is restored. If the data warehouse is not recovered, manually run the following command to restore the data warehouse.

```
hdfs dfs -mv hdfs://hacluster/user/<username>/.Trash/Current/user/hive/  
warehouse /user/hive/warehouse
```

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Collect fault information.

**Step 5** Collect related information in the **.Trash/Current/** directory on the client background.

**Step 6** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.131 ALM-16046 Hive Data Warehouse Permission Is Modified

### Description

The system checks the Hive data warehouse permission in every 60 seconds. This alarm is generated if the permission is modified.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16046    | Critical       | Yes        |

### Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

### Impact on the System

If the permission on the Hive default data warehouse is modified, the permission for users or user groups to create databases or tables in the default data warehouse is changed.

### Possible Causes

Hive periodically checks the status of the default data warehouse and finds that default data warehouse permission is changed.

### Procedure

**Check the Hive default data warehouse permission.**

**Step 1** Log in to the node where the client is located as user **root**.

**Step 2** Run the following command to go to the HDFS client installation directory:

```
cd Client installation directory
```

**source bigdata\_env**

**kinit** *User who has the supergroup permission* (Skip this step for a common cluster.)

**Step 3** Run the following command to restore the default data warehouse permission:

- Security mode: **hdfs dfs -chmod 770 hdfs://hacluster/user/hive/warehouse**
- Non-security mode: **hdfs dfs -chmod 777 hdfs://hacluster/user/hive/warehouse**

**Step 4** Check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 5](#).

**Collect fault information.**

**Step 5** Collect related information in the **hdfs://hacluster/user/hive/warehouse** directory on the client background.

**Step 6** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.132 ALM-16047 HiveServer Has Been Deregistered from ZooKeeper

## Alarm Description

The system checks the Hive service every 60 seconds. This alarm is generated when Hive registration information on ZooKeeper is lost or Hive cannot connect to ZooKeeper.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 16047    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

When a Hive client sets up a new connection, it cannot select the HiveServer node that has been deregistered from ZooKeeper. If all HiveServer nodes have been deregistered from ZooKeeper, the HiveServer service will be unavailable.

## Possible Causes

- The ZooKeeper instance is abnormal.
- Some Hive configurations are incorrect.

## Handling Procedure

**Check the ZooKeeper service status.**

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and check whether **ALM-12007 Process Fault** exists in the alarm list.

- If yes, go to **Step 2**.
- If no, go to **Step 5**.

**Step 2** In **Location** of **ALM-12007 Process Fault**, check whether the service name is **ZooKeeper**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

**Step 3** Rectify the fault by following steps provided in **ALM-12007 Process Fault**.

**Step 4** In the alarm list, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

**Check whether the Hive configurations are correctly modified.**

**Step 5** On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click  on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

**Step 6** In the search result, check the historical configurations of Hive- and ZooKeeper-related services in the **Service** column. **Table 12-91** lists some configurations that may affect the connection between Hive and ZooKeeper.

**Table 12-91** Configurations related to connection between Hive and ZooKeeper

| Service   | Parameter                             | Description                                                                                                                                                                        |
|-----------|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hive      | HIVE_GC_OPTS                          | HiveServer memory configuration. If the configuration is abnormal, HiveServer may restart repeatedly. In this case, you need to check the health status of the instance processes. |
|           | hive.zookeeper.quorum                 | IP address of the node accommodating ZooKeeper that is connected to Hive.                                                                                                          |
|           | hive.zookeeper.client.port            | Port of the ZooKeeper client connected to Hive.                                                                                                                                    |
|           | hive.zookeeper.session.timeout        | Timeout interval of the session set up between Hive and ZooKeeper.                                                                                                                 |
|           | hive.zookeeper.connection.timeout     | Timeout interval for Hive to connect to ZooKeeper.                                                                                                                                 |
|           | hive.zookeeper.connection.max.retries | Maximum number of retries for Hive to connect to ZooKeeper.                                                                                                                        |
| ZooKeeper | clientPort                            | Port number of the ZooKeeper client.                                                                                                                                               |
|           | ssl.enabled                           | Whether to enable SSL connections of ZooKeeper.                                                                                                                                    |

**Restart related instances.**

**Step 7** Log in to FusionInsight Manager. Choose **O&M > Alarm > Alarms**, click the dropdown list in the row that contains the alarm, and view the role and the IP address of the node for which the alarm is generated in **Location**.

**Step 8** Choose **Cluster**, click the name of the desired cluster, and choose **Services > Hive > Instance**. On the page that is displayed, select the instance at the IP address for which the alarm is generated, click **More**, and select **Restart Instance**.

**NOTICE**

During Hive instance restart, the instance cannot provide services for external systems. SQL tasks that are being executed on the instance may fail.

**Step 9** Wait 5 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Collect fault information.**

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Expand the **Service** drop-down list, and select **Hive** for the target cluster.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.133 ALM-16048 Tez or Spark Library Path Does Not Exist

## Description

The system checks the Tez and Spark library paths every 180 seconds. This alarm is generated when the Tez or Spark library path does not exist.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 16048    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |

| Name     | Meaning                                              |
|----------|------------------------------------------------------|
| HostName | Specifies the host for which the alarm is generated. |

## Impact on the System

The Hive on Tez and Hive on Spark functions are affected.

## Possible Causes

The Tez or Spark library path is deleted from the HDFS.

## Procedure

**Check the default Hive data warehouse.**

**Step 1** Log in to the node where the client is located as user **root**.

**Step 2** Run the following command to check whether the **tezlib** or **sparklib** directory exists in the **hdfs://hacluster/user/{User name}/.Trash/Current/** director:

```
hdfs dfs -ls hdfs://hacluster/user/<username>/.Trash/Current/
```

For example, the following information shows that **/user/hive/tezlib/8.1.0.1/** and **/user/hive/sparklib/8.1.0.1/** exist.

```
host01:/opt/client # hdfs dfs -ls hdfs://hacluster/user/test/.Trash/Current/  
Found 1 items  
drwx----- - test hadoop      0 2019-06-17 19:53 hdfs://hacluster/user/test/.Trash/Current/user
```

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

**Step 3** Run the following command to restore **tezlib** and **sparklib**.

```
hdfs dfs -mv hdfs://hacluster/user/<username>/.Trash/Current/user/hive/  
tezlib/8.1.0.1/tez.tar.gz /user/hive/tezlib/8.1.0.1/tez.tar.gz
```

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

**Collect fault information.**

**Step 5** Collect related information in the **.Trash/Current/** directory on the client background.

**Step 6** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

### 12.13.134 ALM-17003 Oozie Service Unavailable

#### Description

The system checks the Oozie service status in every 5 seconds. This alarm is generated when Oozie or a component on which Oozie depends cannot provide services properly.

This alarm is automatically cleared when the Oozie service recovers.

#### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17003    | Critical       | Yes                   |

#### Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

#### Impact on the System

Oozie cannot be used to schedule jobs.

#### Possible Causes

- The DBService service is abnormal or the data of Oozie stored in DBService is damaged.
- The HDFS service is abnormal or the data of Oozie stored in HDFS is damaged.
- The Yarn service is abnormal.
- The Nodeagent process is abnormal.

## Procedure

### Query the Oozie service health status code.

**Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Oozie**. Click **oozie** (any one is OK) on the **oozie WebUI**. to go to the Oozie WebUI.

 **NOTE**

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 2** Add **/servicehealth** to the URL in the address box of the browser and access again. The value of **statusCode** is the current Oozie service health status code.

For example, visit **https://10.10.0.117:20026/Oozie/oozie/130/oozie/servicehealth**. The result is as follows:

```
{"beans":[{"name":"serviceStatus","statusCode":0}]}
```

If the health status code cannot be displayed or the browser does not respond, the service may be unavailable due to Oozie process fault. See **Step 13** to rectify the fault.

**Step 3** Perform the operations based on the error code. For details, see **Table 12-92**.

**Table 12-92** Oozie service health status code

| Status Code | Description                        | Error Cause                                                                     | Solution             |
|-------------|------------------------------------|---------------------------------------------------------------------------------|----------------------|
| 0           | The service is running properly.   | None                                                                            | None                 |
| 18002       | The DBService service is abnormal. | Oozie fails to connect to DBService or the data stored in DBService is damaged. | See <b>Step 4</b> .  |
| 18003       | The HDFS service is abnormal.      | Oozie fails to connect to HDFS or the data stored in HDFS is damaged.           | See <b>Step 7</b> .  |
| 18005       | The MapReduce service is abnormal. | The Yarn service is abnormal.                                                   | See <b>Step 11</b> . |

### Check the DBService service.

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the DBService service is running properly.

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

**Step 5** Resolve the problem of DBService based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

**Step 6** Log in to the Oozie database to check whether the data is complete.

1. Log in to the active DBService node as user **root**.

On the FusionInsight Manager page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance** to view the IP address of the active DBService node.

2. Run the following command to log in to the Oozie database:

```
su - omm
```

```
source ${BIGDATA_HOME}/FusionInsight_BASE_8.1.0.1/install/  
FusionInsight-dbservice-2.7.0/.dbservice_profile
```

```
gsqll -U Username -W Oozie database password -p 20051 -d Database name
```

3. After the login is successful, enter `\d` to check whether there are 15 data tables.

The Oozie service has 15 data tables by default. If these data tables are deleted or the table structure is modified, the Oozie service may be unavailable. Contact the O&M personnel to back up the data and perform restoration.

#### Check the HDFS service.

**Step 7** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the HDFS service is running properly.

- If yes, go to [Step 9](#).
- If no, go to [Step 8](#).

**Step 8** Resolve the problem of HDFS based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

**Step 9** Log in to HDFS to check whether the Oozie file directory structure is complete.

1. Download and install an HDFS client..
2. Log in to the client node as user **root** and run the following commands to check whether `/user/oozie/share` exists.

If the cluster uses the security mode, perform security authentication.

```
kinit admin
```

```
hdfs dfs -ls /user/oozie/share
```

- If yes, go to [Step 18](#).
- If no, go to [Step 10](#).

**Step 10** In the Oozie client installation directory, manually upload the share directory to `/user/oozie` in HDFS, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

#### Check the Yarn and MapReduce service.

**Step 11** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**, and check whether the Yarn and MapReduce services are running properly.

- If yes, go to [Step 18](#).
- If no, go to [Step 12](#).

**Step 12** Resolve the problem of Yarn and MapReduce based on the alarm help and check whether the Oozie alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

#### Check the Oozie process.

**Step 13** Log in to each node of Oozie as user **root**.

**Step 14** Run the **ps -ef | grep oozie** command to check whether the Oozie process exists.

- If yes, go to [Step 15](#).
- If no, go to [Step 18](#).

**Step 15** Collect fault information in **prestartDetail.log**, **oozie.log**, and **catalina.out** in the Oozie log directory **/var/log/Bigdata/oozie**. If the alarm is not caused by manual misoperation, go to [Step 16](#).

#### Check the Nodeagent process.

**Step 16** Log in to each node of Oozie as user **root**. Run the **ps -ef | grep nodeagent** command to check whether the Nodeagent process exists.

- If yes, go to [Step 17](#).
- If no, go to [Step 18](#).

**Step 17** Run the **kill -9 *The process ID of nodeagent*** command, wait 10 minutes, and check whether alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 18](#).

**Step 18** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.135 ALM-17004 Oozie Heap Memory Usage Exceeds the Threshold

### Description

The system checks the heap memory usage of the Oozie service every 60 seconds. The alarm is generated when the heap memory usage of a Metadata instance exceeds the threshold (95% of the maximum memory). The alarm is cleared when the heap memory usage is less than the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17004    | Major          | Yes                   |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

The heap memory overflow may cause a service breakdown. After the service breaks down, the Oozie service cannot be used to schedule tasks.

### Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

### Procedure

**Check heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Oozie Heap Memory Usage Exceeds the Threshold > Location**. Check the IP address of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Oozie Heap Memory Resource Percentage**. Click **OK**.
- Step 3** Check whether the used heap memory of Oozie reaches the threshold (the default value is 95% of the maximum heap memory) specified for Oozie.
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Configurations > All Configurations**. Set Search **GC\_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save > OK**.

 **NOTE**

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

---

**NOTICE**

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

---

**Collect fault information.**

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Oozie** in the required cluster from the **Service**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.136 ALM-17005 Oozie Non Heap Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the non heap memory usage of Oozie every 30 seconds. This alarm is reported if the non heap memory usage of Oozie exceeds the threshold (80%). This alarm is cleared if the non heap memory usage is lower than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17005    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

The service may break down and the Oozie service cannot be used to schedule tasks.

## Possible Causes

The non-heap memory of the Oozie instance is overused or the non-heap memory is inappropriately allocated.

## Handling Procedure

### Check non-heap memory usage.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > Oozie Non Heap Memory Usage Exceeds the Threshold**. On the displayed page, check the location information of the alarm. Check the name of the instance host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Oozie** and click the **Instance** tab. On the displayed page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Memory** and select **Oozie Non Heap Memory Resource Percentage**. Click **OK**.
- Step 3** Check whether the non-heap memory used by Oozie reaches the threshold (80% of the maximum non-heap memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Oozie** and click the **Configurations** and then **All Configurations**. On the displayed page, search for the **GC\_OPTS** parameter in the search box and check whether it contains **-XX: MaxMetaspaceSize**. If yes, increase the value of **-XX: MaxMetaspaceSize** based on the site requirements. If no, manually add **-XX: MaxMetaspaceSize** and set its value to 1/8 of the value of **-Xmx**. Click **Save**, and then click **OK**

#### NOTE

JDK1.8 does not support the **MaxPermSize** parameter.

Suggestions on GC parameter settings for Oozie:

Set the value of **-XX:MaxMetaspaceSize** to 1/8 of the value of **-Xmx**. For example, if **-Xmx** is set to 2 GB, **-XX:MaxMetaspaceSize** is set to 256 MB. If **-Xmx** is set to 4 GB, **-XX:MaxMetaspaceSize** is set to 512 MB.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

---

#### NOTICE

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

---

### Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Oozie** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.137 ALM-17006 Oozie Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the Oozie service every 30 seconds. The alarm is generated when the direct memory usage of an Oozie instance exceeds the threshold (80% of the maximum memory). The alarm is cleared when the direct memory usage of Oozie is less than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17006    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

The direct memory overflow may cause a service breakdown. After the service breaks down, the Oozie service cannot be used to schedule tasks.

## Possible Causes

The direct memory of the Oozie instance is overused or the direct memory is inappropriately allocated.

## Procedure

**Check direct memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Oozie Direct Memory Usage Exceeds the Threshold > Location**. Check the IP address of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Oozie Direct Buffer Resource Percentage**. Click **OK**.
- Step 3** Check whether the used direct memory of Oozie reaches the threshold (the default value is 80% of the maximum direct memory) specified for Oozie.
  - If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Configurations**. Click **All Configurations**. Search **GC\_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

### NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set the value of **-XX:MaxDirectMemorySize** to 1/4 of the value of **-Xmx**. For example, if **-Xmx** is set to 4 GB, **-XX:MaxDirectMemorySize** is set to 1024 MB. If **-Xmx** is set to 2 GB, **-XX:MaxDirectMemorySize** is set to 512 MB. It is recommended that the value of **-XX:MaxDirectMemorySize** be greater than or equal to 512 MB.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 6**.

**NOTICE**

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

**Collect fault information.**

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Oozie** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.

----End

**Alarm Clearing**

After the fault is rectified, the system automatically clears this alarm.

**Related Information**

None

**12.13.138 ALM-17007 Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold**

**Description**

The system checks GC time of the Oozie process every 60 seconds. The alarm is generated when GC time of the Oozie process exceeds the threshold (default value: **12 seconds**). The alarm is cleared when GC time is less than the threshold.

**Attribute**

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 17007    | Major          | Yes                   |

**Parameters**

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

Oozie scheduling task responds slowly until the service is unavailable.

## Possible Causes

The heap memory of the Oozie instance is overused or the heap memory is inappropriately allocated.

## Procedure

### Check GC time.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Garbage Collection (GC) Time of the Oozie Process Exceeds the Threshold > Location**. Check the IP address of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > GC > Garbage Collection (GC) Time of Oozie**. Click **OK**.
- Step 3** Check whether GC time of the Oozie process every second exceeds the threshold (default value: **12 seconds**).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Oozie > Configurations**. Click **All Configurations**. Search **GC\_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

### NOTE

Suggestions on GC parameter settings for Oozie:

You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

---

**NOTICE**

During the service or instance restart, services are interrupted, but submitted jobs are not affected.

---

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select **Oozie** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.139 ALM-17008 Abnormal Connection Between Oozie and ZooKeeper

### Alarm Description

In HA mode, Oozie depends on ZooKeeper. This alarm is generated when the connection between Oozie and ZooKeeper is abnormal for three consecutive times.

This alarm is cleared when the connection between Oozie and ZooKeeper becomes normal.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17008    | Minor          | Yes          |

## Alarm Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted. In HA mode, the Oozie service will restart if this alarm is reported.

## Possible Causes

- The ZooKeeper service is abnormal.
- Oozie fails to connect to ZooKeeper.

## Handling Procedure

**Check the ZooKeeper service status.**

**Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

**Step 2** In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** is reported.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

**Step 4** Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check the connectivity between Oozie and ZooKeeper.**

**Step 5** Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement] [ZooKeeper]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and ZooKeeper** is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Select **Oozie** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 12.13.140 ALM-17009 Abnormal Connection Between Oozie and DBService

## Alarm Description

Oozie depends on DBService. After a task is submitted, the system checks DBService connectivity. This alarm is generated when the service fails the check for 10 consecutive times.

This alarm is cleared when the connection between Oozie and DBService becomes normal.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17009    | Minor          | Yes          |

## Alarm Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

## Possible Causes

- The DBService service is abnormal.
- Oozie fails to connect to DBService.

## Handling Procedure

**Check the DBService status.**

**Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of DBService is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

**Step 2** In the alarm list, check whether **ALM-27001 DBService Service Unavailable** is reported.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Rectify the fault by performing the operations provided for **ALM-27001 DBService Service Unavailable**.

**Step 4** Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check the connectivity between Oozie and DBService.**

**Step 5** Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][DB Service]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and DBService** is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Select **Oozie** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 12.13.141 ALM-17010 Abnormal Connection Between Oozie and HDFS

## Alarm Description

Oozie depends on HDFS. After a task is submitted, the system checks HDFS connectivity. This alarm is generated when the service fails the check for 3 consecutive times.

This alarm is cleared when the connection between Oozie and HDFS becomes normal.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17010    | Minor          | Yes          |

## Alarm Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

## Possible Causes

The HDFS service restarts, there is a fault, or the network connectivity is abnormal.

## Handling Procedure

**Check the HDFS service status.**

- Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of HDFS is **Normal**.
- If yes, go to [Step 5](#).
  - If no, go to [Step 2](#).
- Step 2** In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.
- If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.
- Step 4** Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).

**Check the connectivity between Oozie and HDFS.**

**Step 5** Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][HDFS]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and HDFS** is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Select **Oozie** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

# 12.13.142 ALM-17011 Abnormal Connection Between Oozie and Yarn

## Alarm Description

Oozie depends on Yarn. After a task is submitted, the system checks Yarn connectivity. This alarm is generated when the service fails the check for 5 consecutive times.

This alarm is cleared when the connection between Oozie and Yarn becomes normal.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 17011    | Minor          | Yes          |

## Alarm Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

Running scheduling tasks are blocked and new scheduling tasks cannot be submitted.

## Possible Causes

- The Yarn service is abnormal.
- The connection between Oozie and Yarn is abnormal.

## Handling Procedure

**Check the YARN service status.**

**Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of Yarn is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

**Step 2** In the alarm list, check whether **ALM-18000 YARN Service Unavailable** is generated.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Rectify the fault by performing the operations provided for **ALM-18000 Yarn Service Unavailable**.

**Step 4** Wait for several minutes and check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check the connectivity between Oozie and Yarn.**

**Step 5** Log in to FusionInsight Manager, choose **O&M > Log > Online Search**, select the Oozie service, and search for the keyword **[Oozie Alarm Enhancement][Yarn]** in the log. View the cause in the log, and rectify the fault. In the alarm list, check whether the alarm **Abnormal Connection Between Oozie and Yarn** is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Select **Oozie** for **Service** and click **OK**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.143 ALM-18000 Yarn Service Unavailable

### Description

This alarm is generated when the Yarn service is unavailable. The alarm module checks the Yarn service status every 60 seconds.

The alarm is cleared when the Yarn service recovers.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18000    | Critical       | Yes                   |

### Parameters

| Name   | Meaning                                                 |
|--------|---------------------------------------------------------|
| Source | Specifies the cluster for which the alarm is generated. |

| Name       | Meaning                                                 |
|------------|---------------------------------------------------------|
| ServiceNam | Specifies the service for which the alarm is generated. |
| RoleName   | Specifies the role for which the alarm is generated.    |
| HostName   | Specifies the host for which the alarm is generated.    |

## Impact on the System

The cluster cannot provide Yarn services. Users cannot run new applications. Submitted applications cannot be run.

## Possible Causes

- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- There is no active ResourceManager instance in the Yarn cluster.
- All the NodeManagers in the Yarn cluster are abnormal.

## Procedure

### Check ZooKeeper service status.

**Step 1** On the FusionInsight Manager, check whether the alarm list contains **ALM-13000 ZooKeeper Service Unavailable**.

- If yes, go to [Step 2](#).
- If no, go to [Step 3](#).

**Step 2** Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

### Check the HDFS service status.

**Step 3** On the FusionInsight Manager, check whether the alarm list contains the HDFS alarms.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Choose **O&M > Alarm > Alarms**, handle HDFS alarms based on the alarm help, and check whether the Yarn alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check the ResourceManager status in the Yarn cluster.

- Step 5** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**.
- Step 6** In **Dashboard**, check whether there is an active ResourceManager instance in the Yarn cluster.
- If yes, go to **Step 7**.
  - If no, go to **Step 10**.
- Check the NodeManager node status in the Yarn cluster.**
- Step 7** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Instance**.
- Step 8** Query NodeManager **Running Status**, and check whether there are unhealthy nodes.
- If yes, go to **Step 9**.
  - If no, go to **Step 10**.
- Step 9** Rectify the fault by following the steps provided in **ALM-18002 NodeManager Heartbeat Lost** or **ALM-18003 NodeManager Unhealthy**. After the fault is rectified, check whether the Yarn alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 10**.
- Collect fault information.**
- Step 10** On the FusionInsight Manager portal of the active cluster, choose **O&M** > **Log** > **Download**.
- Step 11** Select **Yarn** in the required cluster from the **Service**.
- Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 13** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.144 ALM-18002 NodeManager Heartbeat Lost

### Description

The system checks the number of lost NodeManager nodes every 30 seconds, and compares the number with the threshold. The Number of Lost Nodes indicator has a default threshold. The alarm is generated when the value of Number of Lost Nodes exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.lost.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of lost nodes exceeds the threshold, and is cleared when the number of lost nodes is less than the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18002    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |
| Lost Host   | Specifies the list of hosts with lost nodes.            |

## Impact on the System

- The lost NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

## Possible Causes

- NodeManager is forcibly deleted without decommission.
- All the NodeManager instances are stopped or the NodeManager process is faulty.
- The host where the NodeManager node resides is faulty.
- The network between the NodeManager and ResourceManager is disconnected or busy.

## Procedure

### Check the NodeManager status.

- Step 1** On the FusionInsight Manager, and choose **O&M > Alarm > Alarms**. Click  before the alarm and obtain lost nodes in **Additional Information**.
- Step 2** Check whether the lost nodes are hosts that have been manually deleted without decommission.
- If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** After the setting, Choose **Cluster > Name of the desired cluster > Services > Yarn**. On the displayed page, choose **Configurations > All Configurations**. Search for **yarn.nodemanager.lost.alarm.threshold** and change its value to the number of hosts that are not out of service and proactively deleted. After the setting, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 4](#).
- Step 4** Manually clear the alarm. Note that decommission must be performed before deleting hosts.
- Step 5** On the FusionInsight Manager portal, choose **Cluster > Hosts**, and check whether the nodes obtained in [Step 1](#) are healthy.
- If yes, go to [Step 7](#).
  - If no, go to [Step 6](#).
- Step 6** Rectify the node fault based on **ALM-12006 Node Fault** and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

### Check the process status.

- Step 7** On the FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance**, and check whether there are NodeManager instances whose status is not **Good**.
- If yes, go to [Step 10](#).
  - If no, go to [Step 8](#).
- Step 8** Check whether the NodeManager instance is deleted.
- If yes, go to [Step 9](#).
  - If no, go to [Step 11](#).
- Step 9** Restart the active and standby ResourceManager instances, and check whether the alarm is cleared.

 **NOTE**

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate temporary service unavailability alarms.
- Restart the standby ResourceManager instance. Services are not affected.
- If yes, no further action is required.
- If no, go to [Step 13](#).

**Check the instance status.**

**Step 10** Select NodeManager instances which running state is not **Normal** and restart them. Check whether the alarm is cleared.

 **NOTE**

During NodeManager restart, containers submitted to this node may be retried to other nodes.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Check the network status.**

**Step 11** Log in to the management node, **ping** the IP address of the lost NodeManager node to check whether the network is disconnected or busy.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** Rectify the network, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collect fault information.**

**Step 13** On the FusionInsight Manager in the active cluster, choose **O&M > Log > Download**.

**Step 14** Select **Yarn** in the required cluster from the **Service**.

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.145 ALM-18003 NodeManager Unhealthy

### Description

The system checks the number of unhealthy NodeManager nodes every 30 seconds, and compares the number with the threshold. The Unhealthy Nodes indicator has a default threshold. This alarm is generated when the value of the Unhealthy Nodes indicator exceeds the threshold.

To change the threshold, on FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn**. On the displayed page, choose **Configurations** > **All Configurations**, and change the value of **yarn.nodemanager.unhealthy.alarm.threshold**. You do not need to restart Yarn to make the change take effect.

The default threshold is 0. The alarm is generated when the number of unhealthy nodes exceeds the threshold, and is cleared when the number of unhealthy nodes is less than the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18003    | Major          | Yes                   |

### Parameters

| Name           | Meaning                                                 |
|----------------|---------------------------------------------------------|
| Source         | Specifies the cluster for which the alarm is generated. |
| ServiceName    | Specifies the service for which the alarm is generated. |
| RoleName       | Specifies the role for which the alarm is generated.    |
| HostName       | Specifies the host for which the alarm is generated.    |
| Unhealthy Host | Specifies the list of hosts with unhealthy nodes.       |

### Impact on the System

- The faulty NodeManager node cannot provide the Yarn service.
- The number of containers decreases, so the cluster performance deteriorates.

## Possible Causes

- The hard disk space of the host where the NodeManager node resides is insufficient.
- User **omm** does not have the permission to access a local directory on the NodeManager node.

## Procedure

### Check the hard disk space of the host.

- Step 1** On the FusionInsight Manager, and choose **O&M > Alarm > Alarms**. Click  before the alarm and obtain unhealthy nodes in **Additional Information**.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > Yarn > Instance**, select the NodeManager instance corresponding to the host, choose **Instance Configurations > All Configurations** and view disks corresponding to **yarn.nodemanager.local-dirs** and **yarn.nodemanager.log-dirs**.
- Step 3** Choose **O&M > Alarm > Alarms**. In the alarm list, check whether the related disk has the alarm **ALM-12017 Insufficient Disk Capacity**.
- If yes, go to **Step 4**.
  - If no, go to **Step 5**.
- Step 4** Rectify the disk fault based on **ALM-12017 Insufficient Disk Capacity** and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 7**.
- Step 5** Choose **Hosts > Name of the desired host**. On the **Dashboard** page, check the disk usage of the corresponding partition. Check whether the percentage of the used space of the mounted disk exceeds the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**
- If yes, go to **Step 6**.
  - If no, go to **Step 7**.
- Step 6** Reduce the disk usage to less than the value of **yarn.nodemanager.disk-health-checker.max-disk-utilization-per-disk-percentage**, wait for 10 to 20 minutes, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 7**.
- Check the access permission of the local directory on each NodeManager node.**
- Step 7** Obtain the NodeManager directory viewed in **Step 2**, log in to each NodeManager node as user **root**, and go to the obtained directory.
- Step 8** Run the **ll** command to check whether the permission of the **localdir** and **containerlogs** folders is **755** and whether **User:Group** is **omm:ficommon**.
- If yes, no further action is required.
  - If no, go to **Step 9**.

**Step 9** Run the following command to set the permission to **755** and **User:Group** to **omm:ficommon**:

```
chmod 755 <folder_name>
```

```
chown omm:ficommon <folder_name>
```

**Step 10** Wait for 10 to 20 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Collect fault information.**

**Step 11** On the FusionInsight Manager in the active cluster, choose **O&M > Log > Download**.

**Step 12** Select **Yarn** in the required cluster from the **Service**.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.146 ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold

### Description

The system checks the heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn ResourceManager exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of Yarn ResourceManager is less than or equal to 95% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18008    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

When the heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

## Possible Causes

The heap memory of the Yarn ResourceManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

**Check the heap memory usage.**

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.

**Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > ResourceManager** (Indicates the host name of the instance for which the alarm is generated). Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > ResourceManager**

> **Percentage of Used Memory of the ResourceManager.** Check the heap memory usage.

**Step 3** Check whether the used heap memory of ResourceManager reaches 95% of the maximum heap memory specified for ResourceManager.

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **ResourceManager** > **System**. Increase the value of **GC\_OPTS** parameter as required, click **Save**. Restart the role instance.

 **NOTE**

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate temporary service unavailability alarms.

Restart the standby ResourceManager instance. Services are not affected.

- The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:
  - If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

- Step 7** Select the following node in the required cluster from the **Service**.
- NodeAgent
  - Yarn
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.
- End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.147 ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold

## Description

The system checks the heap memory usage of Mapreduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Mapreduce JobHistoryServer exceeds the threshold (95% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Mapreduce** to change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage of MapReduce JobHistoryServer is less than or equal to 95% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18009    | Major          | Yes                   |

## Parameters

| Name   | Meaning                                                 |
|--------|---------------------------------------------------------|
| Source | Specifies the cluster for which the alarm is generated. |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

When the heap memory usage of Mapreduce JobHistoryServer is overhigh, the performance of Mapreduce log archiving is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

## Possible Causes

The heap memory of the Mapreduce JobHistoryServer instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

**Check the memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18009 Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Mapreduce > Instance > JobHistoryServer**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > JobHistoryServer heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the heap memory usage.
- Step 3** Check whether the used heap memory of JobHistoryServer reaches 95% of the maximum heap memory specified for JobHistoryServer.
  - If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Mapreduce > Configurations > All Configurations > JobHistoryServer > System**. Increase the value of **GC\_OPTS** parameter as required, click **Save**. Click **OK** and restart the role instance.

 **NOTE**

- The mapping between the number of historical tasks (10000) and the memory of JobHistoryServer is as follows:  
-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G
- During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select the following node in the required cluster from the **Service**.

- NodeAgent
- Mapreduce

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 12.13.148 ALM-18010 ResourceManager GC Time Exceeds the Threshold

### Description

The system checks the garbage collection (GC) duration of the ResourceManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18010    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

A long GC duration of the ResourceManager process may interrupt the services.

## Possible Causes

The heap memory of the ResourceManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18010 ResourceManager GC Time Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > ResourceManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection (GC) Time of ResourceManager** to check the GC duration statistics of the Broker process collected every minute.
- Step 3** Check whether the GC duration of the ResourceManager process collected every minute exceeds the threshold (12 seconds by default).
  - If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > ResourceManager > System** to increase the value of **GC\_OPTS** parameter as required.

 **NOTE**

The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
- If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
- If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

**Step 5** Save the configuration and restart the ResourceManager instance.

 **NOTE**

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate service unavailable alarms for a short period of time.
- Restart the standby ResourceManager instance. Services are not affected.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **ResourceManager** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 12.13.149 ALM-18011 NodeManager GC Time Exceeds the Threshold

## Description

The system checks the garbage collection (GC) duration of the NodeManager process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18011    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

A long GC duration of the NodeManager process may interrupt the services.

## Possible Causes

The heap memory of the NodeManager instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18011 NodeManager GC Time Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection (GC) Time of NodeManager** to check the GC duration statistics of the Broker process collected every minute.
- Step 3** Check whether the GC duration of the NodeManager process collected every minute exceeds the threshold (12 seconds by default).
  - If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > NodeManager > System** to increase the value of **GC\_OPTS** parameter as required.

### NOTE

The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:

- If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: `-Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G`
- If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: `-Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G`
- If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: `-Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G`

- Step 5** Save the configuration and restart the NodeManager instance.

### NOTE

During NodeManager restart, containers submitted to this node may be retried to other nodes.

- Step 6** Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 7](#).

### Collect fault information.

- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **NodeManager** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 12.13.150 ALM-18012 JobHistoryServer GC Time Exceeds the Threshold

## Description

The system checks the garbage collection (GC) duration of the JobHistoryServer process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default).

This alarm is cleared when the GC duration is less than the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18012    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

A long GC duration of the JobHistoryServer process may interrupt the services.

## Possible Causes

The heap memory of the JobHistoryServer instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

**Check the GC duration.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18012 JobHistoryServer GC Time Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Instance > JobHistoryServer (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Garbage Collection (GC) Time of the JobHistoryServer** to check the GC duration statistics of the Broker process collected every minute.
- Step 3** Check whether the GC duration of the JobHistoryServer process collected every minute exceeds the threshold (12 seconds by default).
  - If yes, go to **Step 4**.
  - If no, go to **Step 7**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Configurations > All Configurations > JobHistoryServer > System** to increase the value of **GC\_OPTS** parameter as required.

### NOTE

The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:

```
-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G
```

- Step 5** Save the configuration and restart the JobHistoryServer instance.

### NOTE

During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.

- Step 6** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **JobHistoryServer** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

# 12.13.151 ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the direct memory usage of ResourceManager every 30 seconds. This alarm is generated when the direct memory usage of ResourceManager instances exceeds the threshold (90% of the maximum memory).

This alarm is automatically cleared when the direct memory usage is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18013    | Major          | Yes          |

## Alarm Parameters

| Parameter | Description                                              |
|-----------|----------------------------------------------------------|
| Source    | Specifies the cluster for which the alarm was generated. |

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

If the available direct memory of ResourceManager is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of ResourceManager instances is overused or the direct memory is inappropriately allocated.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-18013 ResourceManager Direct Memory Usage Exceeds the Threshold > Location**. View the IP address of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Yarn**. On the page that is displayed, click the **Instances** tab and click the ResourceManager instance for which this alarm is generated. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Resource**, and select **Memory Usage Status of ResourceManager** to check the direct memory usage.
- Step 3** Check whether the used direct memory of a ResourceManager instance reaches 90% (default threshold) of the maximum direct memory allocated to it.
  - If yes, go to [Step 4](#).
  - If no, go to [Step 9](#).
- Step 4** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Yarn > Configurations > All Configurations > ResourceManager > System**. Check whether **-XX:MaxDirectMemorySize** exists in the **GC\_OPTS** parameter.
  - If yes, go to [Step 5](#).
  - If no, go to [Step 7](#).
- Step 5** Delete the **-XX:MaxDirectMemorySize** parameter from **GC\_OPTS** and save the configuration.

 NOTE

**MaxDirectMemorySize** indicates the maximum off-heap memory size. If the **MaxDirectMemorySize** parameter of ResourceManager is not specified, the memory of ResourceManager is not limited. By default, **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter is not set.

**Step 6** Perform the following steps to restart the ResourceManager instance:

---

**NOTICE**

- Restarting the standby ResourceManager instance does not affect services.
- During the ResourceManager switchover, new jobs cannot be submitted to Yarn, but submitted jobs are not affected.

- 
1. On the Yarn service page, click the **Instances** tab, select the **ResourceManager (Standby)** instance, choose **More**, select **Restart Instance**, and verify the password to restart the instance.
  2. After the standby instance is restarted, click the **Dashboard** tab of Yarn, choose **More**, select **Perform ResourceManager Switchover**, and verify the password to perform an active/standby switchover.
  3. After the active/standby switchover is complete, click the **Instances** tab on the Yarn service page, select the **ResourceManager (Standby)** instance, choose **More**, select **Restart Instance**, and verify the password to restart the instance. Wait until the instance is restarted.

**Step 7** Check whether **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold** exists.

- If yes, rectify the fault by referring to **ALM-18008 Heap Memory Usage of ResourceManager Exceeds the Threshold**.
- If no, go to [Step 8](#).

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the **Service** drop-down list, and select **ResourceManager** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 12.13.152 ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the Yarn service every 30 seconds. This alarm is generated when the direct memory usage of a NodeManager instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18014    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the available direct memory of the Yarn service is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the NodeManager instance is overused or the direct memory is inappropriately allocated.

## Procedure

### Check the direct memory usage.

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18014 NodeManager Direct Memory Usage Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.

**Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > NodeManager (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Resource > Percentage of Used Memory of the NodeManager** to check the direct memory usage.

**Step 3** Check whether the used direct memory of NodeManager reaches 90% of the maximum direct memory specified for NodeManager by default.

- If yes, go to [Step 4](#).
- If no, go to [Step 9](#).

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > NodeManager > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC\_OPTS** parameter.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** In the **GC\_OPTS** parameter, delete "-XX:MaxDirectMemorySize".

**Step 6** Save the configuration and restart the NodeManager instance.

### NOTE

During NodeManager restart, containers submitted to this node may be retried to other nodes.

**Step 7** Check whether the **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold**.
- If no, go to [Step 8](#).

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

### Collect fault information.

**Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 10** Select **NodeManager** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 12.13.153 ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the MapReduce service every 30 seconds. This alarm is generated when the direct memory usage of a JobHistoryServer instance exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18015    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the available direct memory of the MapReduce service is insufficient, a memory overflow occurs and the service breaks down.

## Possible Causes

The direct memory of the JobHistoryServer instance is overused or the direct memory is inappropriately allocated.

## Procedure

**Check the direct memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18015 JobHistoryServer Direct Memory Usage Exceeds the Threshold > Location** to check the IP address of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Instance > JobHistoryServer (IP address for which the alarm is generated)**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Memory Usage Status of JobHistoryServer** to check the direct memory usage.
- Step 3** Check whether the used direct memory of JobHistoryServer reaches 90% of the maximum direct memory specified for JobHistoryServer by default.
- If yes, go to **Step 4**.
  - If no, go to **Step 9**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Configurations > All Configurations > JobHistoryServer > System** to check whether "-XX:MaxDirectMemorySize" exists in the **GC\_OPTS** parameter.
- If yes, go to **Step 5**.
  - If no, go to **Step 7**.
- Step 5** In the **GC\_OPTS** parameter, delete "-XX:MaxDirectMemorySize".
- Step 6** Save the configuration and restart the JobHistoryServer instance.
-  **NOTE**
- During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.
- Step 7** Check whether the **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold** exists.

- If yes, handle the alarm by referring to **ALM-18009 Heap Memory Usage of JobHistoryServer Exceeds the Threshold**.
- If no, go to [Step 8](#).

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 10** Select **JobHistoryServer** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

None

# 12.13.154 ALM-18016 Non Heap Memory Usage of ResourceManager Exceeds the Threshold

## Description

The system checks the Non Heap memory usage of Yarn ResourceManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of Yarn ResourceManager exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18016    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

When the Non Heap memory usage of Yarn ResourceManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

## Possible Causes

The Non Heap memory of the Yarn ResourceManager instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

**Check the Non Heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18016 Non Heap Memory Usage of Yarn ResourceManager Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > ResourceManager**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > Percentage of Used Memory of the ResourceManager**. ResourceManager indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.
- Step 3** Check whether the used Non Heap memory of ResourceManager reaches 90% of the maximum Non Heap memory specified for ResourceManager by default.
  - If yes, go to **Step 4**.
  - If no, go to **Step 6**.

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations > ResourceManager > System**. Adjust the **GC\_OPTS** memory parameter of ResourceManager. Save the configuration and restart the ResourceManager instance.

 **NOTE**

- Restarting the active ResourceManager instance will trigger a active/standby switchover of the ResourceManager instance. During the switchover, Yarn cannot submit new jobs, but submitted jobs are not affected. The Yarn component and components that depend on Yarn generate service unavailable alarms for a short period of time.

Restart the standby ResourceManager instance. Services are not affected.

- The mapping between the number of NodeManager instances in a cluster and the memory size of ResourceManager is as follows:
  - If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms6G -Xmx6G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms10G -Xmx10G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 1000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms20G -Xmx20G -XX:NewSize=1G -XX:MaxNewSize=2G
  - If the number of NodeManager instances in the cluster reaches 2000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms40G -Xmx40G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 3000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms60G -Xmx60G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 4000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms80G -Xmx80G -XX:NewSize=2G -XX:MaxNewSize=4G
  - If the number of NodeManager instances in the cluster reaches 5000, the recommended JVM parameters of the ResourceManager instance are as follows: -Xms100G -Xmx100G -XX:NewSize=3G -XX:MaxNewSize=6G

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

# 12.13.156 ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold

## Description

The system checks the heap memory usage of Yarn NodeManager every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Yarn NodeManager exceeds the threshold (95% of the maximum memory by default).

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18018    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

When the heap memory usage of Yarn NodeManager is overhigh, the performance of Yarn task submission and operation is affected. In addition, a memory overflow may occur so that the Yarn service is unavailable.

## Possible Causes

The heap memory of the Yarn NodeManager instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

**Check the heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18018 NodeManager Heap Memory Usage Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Yarn > Instance > NodeManager**. Click the drop-down menu

in the upper right corner of **Chart**, choose **Customize** > **Resource** > **Percentage of Used Memory of the NodeManager** to check the heap memory usage.

**Step 3** Check whether the used heap memory of NodeManager reaches 95% of the maximum heap memory specified for NodeManager.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **Configurations** > **All Configurations** > **NodeManager** > **System**. Increase the value of **GC\_OPTS** parameter as required, click **Save**, and click **OK**, and restart the role instance.

#### NOTE

- During NodeManager restart, containers submitted to this node may be retried to other nodes.
- The mapping between the number of NodeManager instances in a cluster and the memory size of NodeManager is as follows:
  - If the number of NodeManager instances in the cluster reaches 100, the recommended JVM parameters for NodeManager instances are as follows: -Xms2G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 200, the recommended JVM parameters for NodeManager instances are as follows: -Xms4G -Xmx4G -XX:NewSize=512M -XX:MaxNewSize=1G
  - If the number of NodeManager instances in the cluster reaches 500, the recommended JVM parameters for NodeManager instances are as follows: -Xms8G -Xmx8G -XX:NewSize=1G -XX:MaxNewSize=2G

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

#### Collect fault information.

**Step 6** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 7** Select the following node in the required cluster from the **Service**.

- NodeAgent
- Yarn

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

## 12.13.157 ALM-18019 Non Heap Memory Usage of JobHistoryServer Exceeds the Threshold

### Description

The system checks the Non Heap memory usage of MapReduce JobHistoryServer every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the Non Heap memory usage of MapReduce JobHistoryServer exceeds the threshold (90% of the maximum memory by default).

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > MapReduce** to change the threshold.

The alarm is cleared when the Non Heap memory usage is less than or equal to the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18019    | Major          | Yes                   |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

When the Non Heap memory usage of MapReduce JobHistoryServer is overhigh, the performance of MapReduce task submission and operation is affected. In addition, a memory overflow may occur so that the MapReduce service is unavailable.

## Possible Causes

The Non Heap memory of the MapReduce JobHistoryServer instance on the node is overused or the Non Heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

### Check the Non Heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > ALM-18019 Non Heap Memory Usage of MapReduce JobHistoryServer Exceeds the Threshold > Location**. Check the HostName of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Instance > JobHistoryServer**. Click the drop-down menu in the upper right corner of **Chart**, choose **Customize > JobHistoryServer Non Heap memory usage statistics**. JobHistoryServer indicates the corresponding HostName of the instance for which the alarm is generated. Check the Non Heap memory usage.
- Step 3** Check whether the used Non Heap memory of JobHistoryServer reaches 90% of the maximum Non Heap memory specified for JobHistoryServer.
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > MapReduce > Configurations > All Configurations > JobHistoryServer > System**. Adjust the **GC\_OPTS** memory parameter of the NodeManager, click **Save**, and click **OK**, and restart the role instance.

### NOTE

- During the restart of JobHistoryServer, the status query of tasks such as Hive is affected, and the query result may be inaccurate.
- The mapping between the number of historical tasks (10000) and the memory of the JobHistoryServer is as follows:  
-Xms30G -Xmx30G -XX:NewSize=1G -XX:MaxNewSize=2G

- Step 5** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

### Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select the following node in the required cluster from the **Service**.
- NodeAgent
  - MapReduce
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.158 ALM-18020 Yarn Task Execution Timeout

### Alarm Description

The system checks MapReduce and Spark tasks (except for permanent JDBC tasks) submitted to Yarn every 15 minutes. This alarm is generated when the task execution time exceeds the timeout duration specified by the user. However, the task can be properly executed. The client timeout parameter of MapReduce is `mapreduce.application.timeout.alarm` and that of Spark is `spark.application.timeout.alarm`. The unit is ms.

This alarm is cleared when the task is finished or terminated.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18020    | Minor          | Yes          |

### Alarm Parameters

| Parameter         | Description                                                              |
|-------------------|--------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated.                 |
| ServiceName       | Specifies the service for which the alarm was generated.                 |
| RoleName          | Specifies the role for which the alarm was generated.                    |
| ApplicationName   | Specifies the object (application ID) for which the alarm was generated. |
| Trigger Condition | Specifies the threshold for triggering the alarm.                        |

## Impact on the System

The alarm persists after task execution times out. However, the task can still be properly executed, so this alarm does not exert any impact on the system.

## Possible Causes

- The specified timeout duration is shorter than the required execution time.
- The queue resources for task running are insufficient.
- Task data skew occurs. As a result, some tasks process a large amount of data and take a long time to execute.

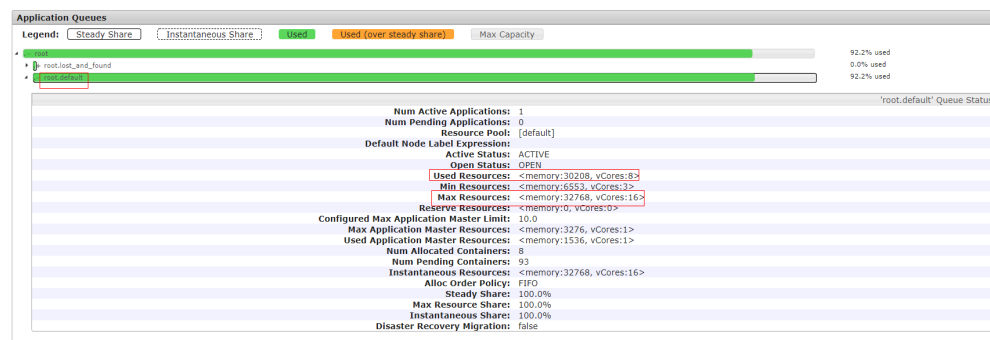

## Handling Procedure

**Check whether the timeout interval is correctly set.**

- Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. The **Alarms** page is displayed.
- Step 2** Select the alarm whose ID is **18020**. In the alarm details, view **Location** to obtain the timeout task name and timeout duration.
- Step 3** Based on the task name and timeout interval, choose **Cluster > Name of the desired cluster > Services > Yarn > ResourceManager (Active)** to log in to the native Yarn page. Then find the task on the native page, check its **StartTime** and calculate the task execution time based on the current system time. Check whether the task execution time exceeds the timeout duration.
  - If yes, go to **Step 4**.
  - If no, go to **Step 10**.
- Step 4** Evaluate the expected task execution time based on the service and compare it with the task timeout interval. If the timeout interval is too short, set the timeout interval (**mapreduce.application.timeout.alarm** or **spark.application.timeout.alarm**) of the client to the task expected execution time. Run the task again and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 5**.

**Check whether the queue resources are sufficient.**

- Step 5** Find the task on the native page and view the queue name of the task. Click **Scheduler** on the left of the native page. On the **Applications Queues** page, find the corresponding queue name and expand the queue details, as shown in the following figure.

**Step 6** Check whether the value of **Used Resources** in the queue details is approximately equal to the value of **Max Resources**, which indicates that the resources in the queue submitted by the task have been used up. If the queue resources are insufficient, choose **Tenant Resources > Dynamic Resource Plan > Resource Distribution Policy** on FusionInsight Manager and increase the value of **Max Resources** for the queue. Run the task again and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 7**.

**Check whether data skew occurs.**

**Step 7** On the native Yarn page, click *task ID* (for example, **application\_1565337919723\_0002**) > **Tracking URL:ApplicationMaster > job\_1565337919723\_0002**. The following page is displayed.

| Task Type | Progress | Total | Pending | Running | Complete |
|-----------|----------|-------|---------|---------|----------|
| Map       | 10       | 0     | 10      | 0       |          |
| Reduce    | 1        | 1     | 0       | 0       |          |

| Attempt Type | New | Running | Failed | Killed | Successful |
|--------------|-----|---------|--------|--------|------------|
| Maps         | 0   | 10      | 0      | 0      | 0          |
| Reduces      | 1   | 0       | 0      | 0      | 0          |

**Step 8** Choose **Job > Map tasks** or **Job > Reduce tasks** on the left and check whether the execution time of each Map or Reduce task differs greatly. If yes, task data skew occurs. In this case, you need to balance the task data.

**Step 9** Rectify the fault based on the preceding causes and perform the tasks again. Then, check whether the alarm persists.

- If yes, go to **Step 10**.
- If no, no further action is required.

**Collect the fault information.**

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.159 ALM-18021 Mapreduce Service Unavailable

### Description

The alarm module checks the MapReduce service status every 60 seconds. This alarm is generated when the system detects that the MapReduce service is unavailable.

The alarm is cleared when the MapReduce service recovers.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 18021    | Critical       | Yes                   |

### Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

### Impact on the System

The cluster cannot provide the MapReduce service. For example, MapReduce cannot be used to view task logs or the log archive function is unavailable.

### Possible Causes

- The JobHistoryServer instance is abnormal.
- The KrbServer service is abnormal.
- The ZooKeeper service abnormal.
- The HDFS service abnormal.
- The Yarn service is abnormal.

### Procedure

**Check MapReduce service JobHistoryServer instance status.**

**Step 1** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **MapReduce** > **Instance**.

**Step 2** Check whether the running status of JobHistoryServer is **Normal**.

- If yes, go to [Step 11](#).
- If no, go to [Step 3](#).

**Check the KrbServer service status.**

**Step 3** In the alarm list on FusionInsight Manager, check whether **ALM-25500 KrbServer Service Unavailable** exists.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check the ZooKeeper service.**

**Step 5** In the alarm list on FusionInsight Manager, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to [Step 6](#).
- If no, go to [Step 7](#).

**Step 6** Rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Check the HDFS service status.**

**Step 7** In the alarm list on FusionInsight Manager, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 8** Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Check the Yarn service status.**

**Step 9** In the alarm list on FusionInsight Manager, check whether **ALM-18000 Yarn Service Unavailable** exists.

- If yes, go to [Step 10](#)
- If no, go to [Step 11](#).

**Step 10** Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

**Collect fault information.**

**Step 11** On the FusionInsight Manager home page of the active cluster, choose **O&M > Log > Download**.

**Step 12** Select **MapReduce** in the required cluster from the **Service**.

**Step 13** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.160 ALM-18022 Insufficient Yarn Queue Resources

### Description

The alarm module checks Yarn queue resources every 60 seconds. This alarm is generated when available resources or ApplicationMaster (AM) resources of a queue are insufficient.

This alarm is cleared when available resources are sufficient.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18022    | Minor          | Yes        |

### Parameters

| Parameter Name | Description                                             |
|----------------|---------------------------------------------------------|
| Source         | Specifies the cluster for which the alarm is generated. |
| QueueName      | Specifies the queue for which the alarm is generated.   |

| Parameter Name    | Description                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| QueueMetric       | Specifies the metric of the queue for which the alarm is generated.                                                          |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

- An application being executed takes longer time.
- An application fails to be executed for a long time after being submitted.

## Possible Causes

- NodeManager node resources are insufficient.
- The configured maximum resource capacity of the queue is excessively small.
- The configured maximum AM resource percentage is excessively small.

## Procedure

### View alarm details.

**Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Alarms**.

**Step 2** View location information of this alarm and check whether **QueueName** is **root** and **QueueMetric** is **Memory** or **QueueName** is **root** and **QueueMetric** is **vCores**.

- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

**Step 3** The memory or CPU of the Yarn cluster is insufficient. In this case, log in to the node where NodeManager resides and run the **free -g** and **cat /proc/cpuinfo** commands to query the available memory and available CPU of the node, respectively. On FusionInsight Manager, increase the values of **yarn.nodemanager.resource.memory-mb** and **yarn.nodemanager.resource.cpu-vcores** for the Yarn NodeManager based on the query results. Then, restart the NodeManager instance. Check whether the alarm is cleared.

### NOTE

During NodeManager restart, containers submitted to this node may be retried to other nodes.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Step 4** View location information of this alarm and check whether **QueueName** is **<Tenant Queue>** and **QueueMetric** is **Memory**, or **QueueName** is **<Tenant Queue>** and **QueueMetric** is **vCores** in **Location**, check whether **available Memory** = or **available vCores** = are included in **Additional Information**.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** The memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources > Dynamic Resource Plan > Resource Distribution Policy** and increase the value of **Maximum Capacity**. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Step 6** Choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available Memory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available Memory =** in **Additional Information**.

If **Additional Information** contains **available vCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available vCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Step 7** If **available AmMemory =** or **available AmvCores =** is included in **Additional Information**, ApplicationMaster memory or CPU of the tenant queue is insufficient. In this case, choose **Tenant Resources > Dynamic Resource Plan > Queue Configuration** and increase the value of **Maximum Am Resource Percent**. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Step 8** Choose **Cluster > Name of the desired cluster > Services > Yarn > Configurations > All Configurations**. Enter the keyword "threshold" and click **ResourceManager**. Adjust the threshold values of the following parameters:

If **Additional Information** contains **available AmMemory =**, change the value of **yarn.queue.memory.alarm.threshold** to a value smaller than that of **available AmMemory =** in **Additional Information**.

If **Additional Information** contains **available AmvCores =**, change the value of **yarn.queue.vcore.alarm.threshold** to a value smaller than that of **available AmvCores =** in **Additional Information**.

Wait for five minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** Log in to FusionInsight Manager of the active cluster, and choose **O&M > Log > Download**.

**Step 10** Select **Yarn** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

## 12.13.161 ALM-18023 Number of Pending Yarn Tasks Exceeds the Threshold

### Alarm Description

The alarm module checks the number of pending applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 60.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18023    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated.      |
| QueueName   | Specifies the queue for which the alarm was generated.        |
| QueueMetric | Specifies the queue metric for which the alarm was generated. |

### Impact on the System

- It takes long time to end an application.
- A new application cannot run after submission.

## Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

## Handling Procedure

### Check NodeManager resources.

**Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

**Step 2** Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

**Step 3** Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

### Check the maximum queue resource capacity and the maximum AM resource percentage.

**Step 4** Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

### Adjust the monitoring thresholds.

**Step 6** On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **Applications** > **Pending Applications**, and increase the thresholds as required.

**Step 7** Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 8](#).

### Collect the fault information.

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

- Step 9** Expand the **Service** drop-down list, and select **Yarn** for the target cluster.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.162 ALM-18024 Pending Yarn Memory Usage Exceeds the Threshold

## Alarm Description

The alarm module checks the pending memory of Yarn every 60 seconds. The alarm is generated when the pending memory exceeds the threshold. Pending memory indicates the total memory that is not allocated to submitted Yarn applications.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 18024    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                                   |
|-------------|---------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated.      |
| QueueName   | Specifies the queue for which the alarm was generated.        |
| QueueMetric | Specifies the queue metric for which the alarm was generated. |

## Impact on the System

- It takes long time to end an application.

- A new application cannot run after submission.

## Possible Causes

- NodeManager node resources are insufficient.
- The maximum resource capacity of the queue and the maximum AM resource percentage are too small.
- The monitoring threshold is too small.

## Handling Procedure

### Check NodeManager resources.

**Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** > **ResourceManager (Active)** to access the ResourceManager web UI.

**Step 2** Click **Scheduler** and check whether the root queue resources are used up in **Application Queues**.

- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

**Step 3** Expand the capacity of the NodeManager instance of the Yarn service. After the capacity expansion, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

### Check the maximum queue resource capacity and the maximum AM resource percentage.

**Step 4** Check whether the resources of the queue corresponding to the pending task are used up.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** On FusionInsight Manager, choose **Tenant Resources** > **Dynamic Resource Plan** and add resources as required. Check whether the alarms are cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

### Adjust the monitoring thresholds.

**Step 6** On FusionInsight Manager, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **Yarn** > **CPU and Memory** > **Pending Memory**, and increase the threshold as required.

**Step 7** Check whether the alarm is cleared 5 minutes later.

- If yes, no further action is required.
- If no, go to [Step 8](#).

### Collect the fault information.

**Step 8** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 9** Expand the **Service** drop-down list, and select **Yarn** for the target cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.163 ALM-18025 Number of Terminated Yarn Tasks Exceeds the Threshold

## Description

The alarm module checks the number of terminated applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18025    | Major          | Yes        |

## Parameters

| Name         | Meaning                                                 |
|--------------|---------------------------------------------------------|
| Cluster Name | Specifies the cluster for which the alarm is generated. |
| Service Name | Specifies the service for which the alarm is generated. |
| Role Name    | Specifies the role for which the alarm is generated.    |
| HostName     | Specifies the host for which the alarm is generated.    |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

A large number of application tasks are forcibly terminated.

## Possible Causes

- The user forcibly terminates a large number of tasks.
- The system terminates tasks due to some error.

## Procedure

### Check the alarm details.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.
- Step 2** View **Additional Information** in the alarm details to check whether the alarm threshold is too small.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 4](#).
- Step 3** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn > Other > Terminated Applications of root queue** to modify the threshold. Go to [Step 6](#).
- Step 4** Choose **Cluster > Name of the desired cluster > Services > Yarn > ResourceManager(Active)** to access the ResourceManager web UI.
- Step 5** Click **KILLED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task termination details (for example, the task is terminated by a user).
- Step 6** Wait for 3 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to [Step 7](#).

### Collect the fault information.

- Step 7** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 8** Expand the **Service** drop-down list, and select **Yarn** for the target cluster.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.164 ALM-18026 Number of Failed Yarn Tasks Exceeds the Threshold

## Description

The alarm module checks the number of failed applications in the Yarn root queue every 60 seconds. The alarm is generated when the number exceeds 50 for three consecutive times.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 18026    | Major          | Yes        |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Cluster Name      | Specifies the cluster for which the alarm is generated.                                                                      |
| Service Name      | Specifies the service for which the alarm is generated.                                                                      |
| Role Name         | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

- A large number of application tasks fail to be executed.
- Failed tasks need to be submitted again.

## Possible Causes

The task fails to be executed due to some error.

## Procedure

### Check the alarm details.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** to go to the alarm page.
- Step 2** View **Additional Information** in the alarm details to check whether the alarm threshold is too small.
  - If yes, go to **Step 3**.
  - If no, go to **Step 4**.
- Step 3** Choose **O&M > Alarm > Thresholds > Name of the desired cluster > Yarn > Other > Failed Applications of root queue** to modify the threshold. Go to **Step 6**.
- Step 4** Choose **Cluster > Name of the desired cluster > Services > Yarn > ResourceManager(Active)** to access the ResourceManager web UI.
- Step 5** Click **FAILED** in **Applications** and click the task on the top. View the description of **Diagnostics** and rectify the fault based on the task failure causes.
- Step 6** Wait for 3 minutes and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 7**.

### Collect the fault information.

- Step 7** On the FusionInsight Manager, choose **O&M > Log > Download**.
- Step 8** Expand the **Service** drop-down list, and select **Yarn** for the target cluster.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.165 ALM-19000 HBase Service Unavailable

### Alarm Description

The alarm module checks the HBase service status every 120 seconds. This alarm is generated when the HBase service is unavailable.

This alarm is cleared when the HBase service recovers.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19000    | Critical       | Yes          |

### Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

### Impact on the System

Operations such as data read/write and table creation cannot be performed.

### Possible Causes

- ZooKeeper is abnormal.
- HDFS is abnormal.
- HBase is abnormal.
- The network connection is abnormal.
- The service configuration value is incorrect.

### Handling Procedure

**Check the ZooKeeper service status.**

- Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 2](#).

**Step 2** In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.

**Step 4** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check the HDFS service status.**

**Step 5** In the alarm list, check whether **ALM-14000 HDFS Service Unavailable** exists.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

**Step 6** Rectify the fault by performing the operations provided for **ALM-14000 HDFS Service Unavailable**.

**Step 7** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Step 8** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services > HDFS**, and check whether **Safe Mode** of HDFS is **ON**.

- If yes, go to [Step 9](#).
- If no, go to [Step 12](#).

**Step 9** Log in to the HDFS client as user **root**. Run the **cd** command to go to the client installation directory and run the **source bigdata\_env** command.

If the cluster uses the security mode, perform security authentication. Obtain the password of user **hdfs** from the MRS cluster administrator, run the **kinit hdfs** command, and enter the password as prompted.

**Step 10** Run the following command to manually exit the safe mode:

```
hdfs dfsadmin -safemode leave
```

**Step 11** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Check the HBase service status.**

**Step 12** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HBase**.

**Step 13** Check whether there is one active HMaster and one standby HMaster.

- If yes, go to [Step 15](#).
- If no, go to [Step 14](#).

**Step 14** Click **Instances** and select the HMaster instance whose status is not **Active**. Click **More** and select **Restart Instance** to restart HMaster. Then check whether there is one active HMaster and one standby HMaster.

- If yes, go to [Step 15](#).
- If no, go to [Step 21](#).

**NOTICE**

During the HMaster restart, table operations cannot be performed, and the HBase web UI is inaccessible. Data read and write operations are not affected.

**Step 15** Choose **Cluster**, click the name of the desired cluster, choose **Services > HBase**, and click **HMaster(Active)** to access the HMaster web UI.

**NOTE**

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

**Step 16** Check whether at least one RegionServer exists under **Region Servers**.

- If yes, go to [Step 17](#).
- If no, go to [Step 21](#).

**Step 17** Choose **Tables > System Tables** and check whether **hbase:meta**, **hbase:namespace**, and **hbase:acl** exist in the **Table Name** column, as shown in [Figure 12-33](#).

- If yes, go to [Step 18](#).
- If no, go to [Step 19](#).

**Figure 12-33** HBase system tables

| Table Name             | Description                                                      |
|------------------------|------------------------------------------------------------------|
| <b>hbase:acl</b>       | The hbase:acl table holds information about acl.                 |
| hbase:index            | The hbase:index table holds information about table indices.     |
| <b>hbase:meta</b>      | The hbase:meta table holds references to all User Table regions. |
| <b>hbase:namespace</b> | The hbase:namespace table holds information about namespaces.    |

**Step 18** Click **hbase:meta**, **hbase:namespace**, and **hbase:acl** to check whether all pages can be opened. If all of them can be opened, the tables are normal.

- If yes, go to [Step 19](#).
- If no, go to [Step 25](#).

 **NOTE**

In a normal cluster, ACL permission control is disabled for HBase by default. The **hbase:acl** table is generated only after ACL permission control is manually enabled. In this case, you need to check this table.

**Step 19** View the HMaster startup status.

On the **Tasks** page shown in [Figure 12-34](#), the **RUNNING** value in the **State** column indicates that HMaster is being started and provides how much time HMaster keeps in that state. As shown in [Figure 12-35](#), if the state is **COMPLETE**, HMaster has been started.

Check whether HMaster has been in the **RUNNING** state for a long time.

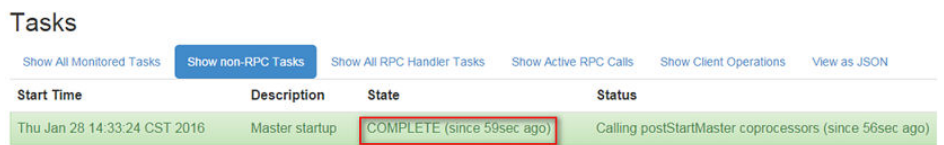

**Figure 12-34** HMaster being started

The screenshot shows the 'Tasks' page with a table of tasks. The 'Show non-RPC Tasks' button is selected. The table has columns: Start Time, Description, State, and Status. One task is listed: 'Master startup' with a state of 'RUNNING (since 1sec ago)' and status 'Initializing master service threads'. The 'RUNNING' state is highlighted with a red box.

| Start Time                   | Description    | State                    | Status                              |
|------------------------------|----------------|--------------------------|-------------------------------------|
| Thu Jan 28 14:43:12 CST 2016 | Master startup | RUNNING (since 1sec ago) | Initializing master service threads |

**Figure 12-35** HMaster startup completed

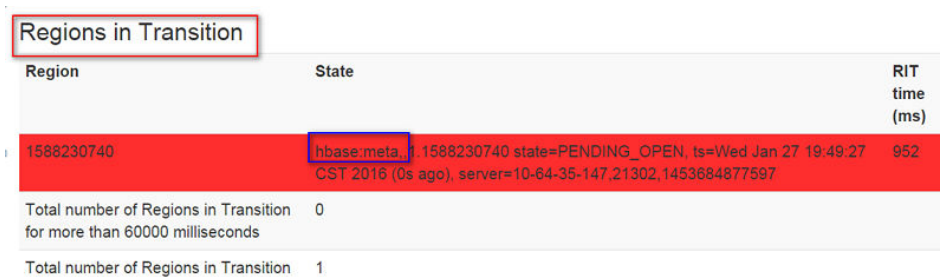

The screenshot shows the 'Tasks' page with a table of tasks. The 'Show non-RPC Tasks' button is selected. The table has columns: Start Time, Description, State, and Status. One task is listed: 'Master startup' with a state of 'COMPLETE (since 56sec ago)' and status 'Calling postStartMaster coprocessors (since 56sec ago)'. The 'COMPLETE' state is highlighted with a red box.

| Start Time                   | Description    | State                      | Status                                                 |
|------------------------------|----------------|----------------------------|--------------------------------------------------------|
| Thu Jan 28 14:33:24 CST 2016 | Master startup | COMPLETE (since 56sec ago) | Calling postStartMaster coprocessors (since 56sec ago) |

- If yes, go to [Step 20](#).
- If no, go to [Step 21](#).

**Step 20** On the HMaster web UI, check whether any **hbase:meta** is in the **Regions in Transition** state for a long time.

**Figure 12-36** Regions in Transition

The screenshot shows the 'Regions in Transition' page. The title 'Regions in Transition' is highlighted with a red box. Below is a table with columns: Region, State, and RIT time (ms). One region is listed: '1588230740' with state 'hbase:meta, 1588230740 state=PENDING\_OPEN, ts=Wed Jan 27 19:49:27 CST 2016 (0s ago), server=10-64-35-147.21302.1453684877597' and RIT time '952'. Below the table, there are two summary rows: 'Total number of Regions in Transition for more than 60000 milliseconds' with value '0', and 'Total number of Regions in Transition' with value '1'.

| Region     | State                                                                                                                        | RIT time (ms) |
|------------|------------------------------------------------------------------------------------------------------------------------------|---------------|
| 1588230740 | hbase:meta, 1588230740 state=PENDING_OPEN, ts=Wed Jan 27 19:49:27 CST 2016 (0s ago), server=10-64-35-147.21302.1453684877597 | 952           |

Total number of Regions in Transition for more than 60000 milliseconds: 0

Total number of Regions in Transition: 1

- If yes, go to [Step 21](#).
- If no, go to [Step 22](#).

**Step 21** After ensuring that services are not affected, log in to FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services** > **HBase**, click **More**, and select **Restart Service**. In the dialog box that is displayed, enter the password, and click **OK**.

- If yes, go to [Step 22](#).
- If no, go to [Step 25](#).

**NOTICE**

During HBase service restart, the service is unavailable. For example, data cannot be read or written, table operations cannot be performed, and the HBase web UI is inaccessible.

**Step 22** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 25](#).

**Check whether the HBase configurations are correctly modified.**

**Step 23** On FusionInsight Manager, choose **Audit**. On the **Audit** page, click **Advanced Search**, click **...** on the right of **Operation Type**, select **Save configuration**, click **OK**, and click **Search**.

**Step 24** In the search result, check whether the historical configurations of HBase-related services in the **Service** column, such as ZooKeeper, HDFS, and HBase, may affect the HBase service status. [Table 12-93](#) lists some configurations that may affect the HBase service status.

**Table 12-93** Configurations affecting the HBase service status

| Parameter                                  | Possible Impact                                                                                                                                                         |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GC_OPTS                                    | The memory configuration may be improper. You need to check the health status of instance processes.                                                                    |
| hbase.rpc.protection                       | If the HBase service is not restarted offline after the value of this parameter is changed, the connection authentication fails and the HBase service becomes abnormal. |
| hbase.regionserver.metahandler.count       | If there are too many regions in the cluster but this parameter is set to a small value, RIT may occur and regions cannot be brought online for a long time.            |
| hbase.regionserver.thread.compaction.large | If this parameter is set to a large value, the node CPU usage may be too high.                                                                                          |
| hbase.regionserver.thread.compaction.small | If this parameter is set to a large value, the node CPU usage may be too high.                                                                                          |
| hbase.coprocessor.master.classes           | If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.                                                            |

| Parameter                              | Possible Impact                                                                                                                                                                         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| hbase.coprocessor.region.classes       | If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.                                                                            |
| hbase.coprocessor.regionserver.classes | If a custom coprocessor is used in the configuration, a logic error may cause the service to be unavailable.                                                                            |
| zookeeper.session.timeout              | If this parameter is set to a small value, the connection between HBase and ZooKeeper times out too quickly. As a result, the HMaster instance and RegionServer may restart repeatedly. |

**Check the network connection between HMaster and dependent components.**

- Step 25** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HBase**.
- Step 26** Click **Instances**. In the HMaster instance list, record the management IP address of the active HMaster instance.
- Step 27** Log in to the active HMaster node as user **omm** through the IP address obtained in **Step 26**.
- Step 28** Run the **ping** command to check whether the network connection between the active HMaster node and the host where the dependent components reside is normal. (The dependent components include ZooKeeper, HDFS, and Yarn. The method of obtaining the IP address of the host where the dependent components reside is the same as that of obtaining the IP address of the active HMaster node.)
- If yes, go to **Step 31**.
  - If no, go to **Step 29**.
- Step 29** Contact the network administrator to restore the network.
- Step 30** In the alarm list, check whether this alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 31**.

**Collect fault information.**

- Step 31** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 32** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select the following services for the target cluster:
- ZooKeeper
  - HDFS
  - HBase

**Step 33** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 34** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.166 ALM-19006 HBase Replication Sync Failed

## Description

The alarm module checks the HBase DR data synchronization status every 30 seconds. When disaster recovery (DR) data fails to be synchronized to a standby cluster, the alarm is triggered.

When DR data synchronization succeeds, the alarm is cleared.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19006    | Critical       | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

HBase data in the cluster cannot be synchronized to the standby cluster. Synchronization data is stacked, causing a large amount of active/standby data inconsistency. As a result, the latest data cannot be read from the standby cluster after an active/standby DR switchover or dual-read. If the alarm persists, the storage space of the primary cluster and ZooKeeper nodes will be stacked, leading to service faults in the primary cluster.

## Possible Causes

- The HBase service on the standby cluster is abnormal.
- A network exception occurs.

## Procedure

**Observe whether the system automatically clears the alarm.**

- Step 1** On the FusionInsight Manager portal of the active cluster, click **O&M > Alarm > Alarms**.
- Step 2** In the alarm list, click the alarm to obtain alarm generation time from **Generated** of the alarm. Check whether the alarm has existed for five minutes.
- If yes, go to **Step 4**.
  - If no, go to **Step 3**.
- Step 3** Wait five minutes and check whether the system automatically clears the alarm.
- If yes, no further action is required.
  - If no, go to **Step 4**.

**Check the HBase service status of the standby cluster.**

- Step 4** Log in to the FusionInsight Manager portal of the active cluster, and click **O&M > Alarm > Alarms**.
- Step 5** In the alarm list, click the alarm to obtain **HostName** from **Location**.
- Step 6** Access the node where the HBase client of the active cluster resides as user **omm**.  
If the cluster uses a security mode, perform security authentication first and then access the **hbase shell** interface as user **hbase**.

```
cd /opt/client
```

```
source ./bigdata_env
```

```
kinit hbaseuser
```

- Step 7** Run the **status 'replication', 'source'** command to check the DR synchronization status of the faulty node.

The DR synchronization status of a node is as follows.

**10-10-10-153:**

```
SOURCE: PeerID=abc, SizeOfLogQueue=0, ShippedBatches=2, ShippedOps=2, ShippedBytes=320, LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0, TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=0, TimeStampsOfLastShippedOp=Mon Jul 18 09:53:28 CST 2016, Replication Lag=0,
```

```
FailedReplicationAttempts=0  
SOURCE: PeerID=abc1, SizeOfLogQueue=0, ShippedBatches=1, ShippedOps=1, ShippedBytes=160,  
LogReadInBytes=1636, LogEditsRead=5, LogEditsFiltered=3, SizeOfLogToReplicate=0,  
TimeForLogToReplicate=0, ShippedHFiles=0, SizeOfHFileRefsQueue=0, AgeOfLastShippedOp=16788,  
TimeStampsOfLastShippedOp=Sat Jul 16 13:19:00 CST 2016, Replication Lag=16788,  
FailedReplicationAttempts=5
```

**Step 8** Obtain **PeerID** corresponding to a record whose **FailedReplicationAttempts** value is greater than 0.

In the preceding step, data on the faulty node 10-10-10-153 fails to be synchronized to a standby cluster whose **PeerID** is **abc1**.

**Step 9** Run the **list\_peers** command to find the cluster and the HBase instance corresponding to the **PeerID** value.

```
PEER_ID CLUSTER_KEY STATE TABLE_CFS  
abc1 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase2 ENABLED  
abc 10.10.10.110,10.10.10.119,10.10.10.133:2181:/hbase ENABLED
```

In the preceding information, **/hbase2** indicates that data is synchronized to the HBase2 instance of the standby cluster.

**Step 10** In the service list of FusionInsight Manager of the standby cluster, check whether the running status of the HBase instance obtained by using **Step 9** is **Normal**.

- If yes, go to **Step 14**.
- If no, go to **Step 11**.

**Step 11** In the alarm list, check whether the **ALM-19000 HBase Service Unavailable** alarm is generated.

- If yes, go to **Step 12**.
- If no, go to **Step 14**.

**Step 12** Follow troubleshooting procedures in **ALM-19000 HBase Service Unavailable** to rectify the fault.

**Step 13** Wait for a few minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 14**.

**Check network connections between RegionServers on active and standby clusters.**

**Step 14** Log in to the FusionInsight Manager portal of the active cluster, and click **O&M > Alarm > Alarms**.

**Step 15** In the alarm list, click the alarm to obtain **HostName** from **Location**.

**Step 16** Use the IP address obtained in **Step 15** to log in to a faulty RegionServer node as user **omm**.

**Step 17** Run the **ping** command to check whether network connections between the faulty RegionServer node and the host where RegionServer of the standby cluster resides are in the normal state.

- If yes, go to **Step 20**.
- If no, go to **Step 18**.

**Step 18** Contact the network administrator to restore the network.

**Step 19** After the network is running properly, check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 20](#).

**Collect fault information.**

**Step 20** On the FusionInsight Manager interface of active and standby clusters, choose **O&M > Log > Download**.

**Step 21** In the **Service** drop-down list box, select **HBase** in the required cluster.

**Step 22** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 23** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.167 ALM-19007 HBase GC Time Exceeds the Threshold

## Description

The system checks the old generation garbage collection (GC) time of the HBase service every 60 seconds. This alarm is generated when the detected old generation GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks by default). To change the threshold, on the FusionInsight Manager portal, choose **O&M > Alarm > Thresholds > Name of the desired cluster > HBase > GC > GC time for old generation**. This alarm is cleared when the old generation GC time of the HBase service is shorter than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19007    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                          |
|-------------|------------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.          |
| ServiceName | Specifies the service name for which the alarm is generated.     |
| RoleName    | Specifies the role name for which the alarm is generated.        |
| HostName    | Specifies the object (host ID) for which the alarm is generated. |

## Impact on the System

If the GC time of the old generation exceeds the threshold, the read and write of HBase data will slow down. In severe cases, the request times out.

## Possible Causes

The memory of HBase instances is overused, the heap memory is inappropriately allocated, or a large number of I/O operations exist in HBase. As a result, GCs occur frequently.

## Procedure

### Check the GC time.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **ID** is **19007**. Then check the role name in **Location** and confirm the IP address of the instance.
  - If the role for which the alarm is generated is HMaster, go to [Step 2](#).
  - If the role for which the alarm is generated is RegionServer, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > GC > Garbage Collection (GC) Time of HMaster** and click **OK** to check whether the value of **GC time for old generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).
  - If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > GC > Garbage Collection (GC) Time of RegionServer** and click **OK** to check whether the value of **GC time for old**

**generation** is greater than the threshold (exceeds 5 seconds for three consecutive checks periods by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Check the current JVM configuration.**

**Step 4** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase** > **Configurations**, and click **All Configurations**. In Search, enter **GC\_OPTS** to check the **GC\_OPTS** memory parameter of role HMaster(HBase->HMaster), RegionServer(HBase->RegionServer). Adjust the values of **-Xmx** and **-XX:CMSInitiatingOccupancyFraction** of the GC\_OPTS parameter by referring to the Note.

 **NOTE**

1. Suggestions on GC parameter configurations for HMaster
  - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
  - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
  - For large-scale HBase clusters with a large number of regions, increase values of **GC\_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set **-Xmx** to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
  - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
  - Set **-XX:NewSize** to one eighth of **-Xmx**.
  - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
  - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.
  - **XX:CMSInitiatingOccupancyFraction** to be less than and equal to **85**, and it is calculated as follows:  $100 \times (\text{hfile.block.cache.size} + \text{hbase.regionserver.global.memstore.size})$

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager interface of active and standby clusters, choose **O&M** > **Log** > **Download**.

**Step 7** In the **Service** drop-down list box, select **HBase** in the required cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.168 ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold

## Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the heap memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19008    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                          |
|-------------|------------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.          |
| ServiceName | Specifies the service name for which the alarm is generated.     |
| RoleName    | Specifies the role name for which the alarm is generated.        |
| HostName    | Specifies the object (host ID) for which the alarm is generated. |

## Impact on the System

The available HBase memory is insufficient, which may cause node restart. During the node restart, the read/write request delay on the node increases or fails.

## Possible Causes

The heap memory of the HBase service is overused or the heap memory is inappropriately allocated.

## Procedure

### Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **ID** is **19008**. Then check the role name in **Location** and confirm the IP address of the instance.
- If the role for which the alarm is generated is HMaster, go to [Step 2](#).
  - If the role for which the alarm is generated is RegionServer, go to [Step 3](#).
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory > HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory > RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK**, check whether the used heap memory of the HBase service reaches 90% of the maximum heap memory specified for HBase.
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer > System**. Increase the value of **-Xmx** in **GC\_OPTS** by referring to the Note.

 NOTE

1. Suggestions on GC parameter configurations for HMaster
  - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
  - Set **-XX:NewSize** to the value of **-XX:MaxNewSize**, which is one eighth of **-Xmx**.
  - For large-scale HBase clusters with a large number of regions, increase values of **GC\_OPTS** parameters for HMaster. Specifically, set **-Xmx** to 4 GB if the number of regions is less than 100,000. If the number of regions is more than 100,000, set **-Xmx** to be greater than or equal to 6 GB. For each increased 35,000 regions, increase the value of **-Xmx** by 2 GB. The maximum value of **-Xmx** is 32 GB.
2. Suggestions on GC parameter configurations for RegionServer
  - Set **-Xms** and **-Xmx** to the same value to prevent JVM from dynamically adjusting the heap memory size and affecting performance.
  - Set **-XX:NewSize** to one eighth of **-Xmx**.
  - Set the memory for RegionServer to be greater than that for HMaster. If sufficient memory is available, increase the heap memory.
  - Set **-Xmx** based on the machine memory size. Specifically, set **-Xmx** to 32 GB if the machine memory is greater than 200 GB, to 16 GB if the machine memory is greater than 128 GB and less than 200 GB, and to 8 GB if the machine memory is less than 128 GB. When **-Xmx** is set to 32 GB, a RegionServer node supports 2000 regions and 200 hotspot regions.

**Step 5** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select **HBase** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.169 ALM-19009 Direct Memory Usage of the HBase Process Exceeds the Threshold

### Description

The system checks the HBase service status every 30 seconds. The alarm is generated when the direct memory usage of an HBase service exceeds the threshold (90% of the maximum memory).

The alarm is cleared when the direct memory usage is less than the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19009    | Major          | Yes                   |

### Parameters

| Name        | Meaning                                                          |
|-------------|------------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.          |
| ServiceName | Specifies the service name for which the alarm is generated.     |
| RoleName    | Specifies the role name for which the alarm is generated.        |
| HostName    | Specifies the object (host ID) for which the alarm is generated. |

### Impact on the System

The available HBase direct memory is insufficient, which may cause node restart. During the node restart, the read/write request delay on the node increases or fails.

### Possible Causes

The direct memory of the HBase service is overused or the direct memory is inappropriately allocated.

### Procedure

**Check direct memory usage.**

- Step 1** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** and select the alarm whose **ID** is **19009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- If the role for which the alarm is generated is HMaster, go to **Step 2**.
  - If the role for which the alarm is generated is RegionServer, go to **Step 3**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the HMaster for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory > HMaster Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.
- If yes, go to **Step 4**.
  - If no, go to **Step 8**.
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Instance** and click the RegionServer for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the **Chart** area and choose **Customize > CPU and Memory > RegionServer Heap Memory Usage and Direct Memory Usage Statistics** and click **OK** to check whether the used direct memory of the HBase service reaches 90% of the maximum direct memory specified for HBase.
- If yes, go to **Step 4**.
  - If no, go to **Step 8**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer > System** and check whether **XX:MaxDirectMemorySize** exists in **GC\_OPTS**.
- If yes, go to **Step 5**.
  - If no, go to **Step 6**.
- Step 5** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > HBase > Configurations**, and click **All Configurations**. Choose **HMaster/RegionServer > System** and delete **XX:MaxDirectMemorySize** from **GC\_OPTS**.
- Step 6** Check whether the **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold** alarm is generated.
- If yes, handle the alarm by referring to **ALM-19008 Heap Memory Usage of the HBase Process Exceeds the Threshold**.
- If no, go to **Step 8**.
- Step 7** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 8**.
- Collect fault information.**
- Step 8** On the FusionInsight Manager interface of active and standby clusters, choose **O&M > Log > Download**.

**Step 9** In the **Service** in the required cluster drop-down list box, select **HBase**.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.170 ALM-19011 RegionServer Region Number Exceeds the Threshold

## Description

The system checks the number of regions on each RegionServer in each HBase service instance every 30 seconds. The region number is displayed on the HBase service monitoring page and RegionServer role monitoring page. This alarm is generated when the number of regions on a RegionServer exceeds the threshold (default value: 2000) for 20 consecutive times. The threshold can be changed by choosing **O&M > Alarm > Thresholds > Name of the desired cluster > HBase**. This alarm is cleared when the number of regions is less than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 19011    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |

| Name     | Meaning                                              |
|----------|------------------------------------------------------|
| HostName | Specifies the host for which the alarm is generated. |

## Impact on the System

If the number of RegionServer regions exceeds the threshold, too many Regions increase the load of RegionServer, causing resource bottlenecks such as memory, disk I/O, and CPU. As a result, request response becomes slow or even times out.

## Possible Causes

- The RegionServer region distribution is unbalanced.
- The HBase cluster scale is too small.

## Procedure

### View alarm location information.

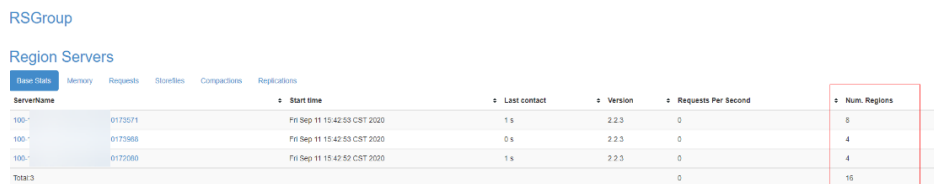

- Step 1** On the FusionInsight Manager home page, choose **O&M > Alarm > Alarms**, select this alarm, and view the service instance and host name in **Location**.
- Step 2** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, check whether the region distribution on the RegionServer is balanced.

### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- If yes, go to [Step 9](#).
- If no, go to [Step 3](#).

**Figure 12-37** WebUI of HBase instance

| ServerName  | Start time                   | Last contact | Version | Requests Per Second | Num. Regions |
|-------------|------------------------------|--------------|---------|---------------------|--------------|
| 100-0172071 | Fri Sep 11 15:42:53 CST 2020 | 1 s          | 2.2.3   | 0                   | 8            |
| 100-0172068 | Fri Sep 11 15:42:53 CST 2020 | 0 s          | 2.2.3   | 0                   | 4            |
| 100-0172069 | Fri Sep 11 15:42:52 CST 2020 | 1 s          | 2.2.3   | 0                   | 4            |
| Total:      |                              |              |         | 0                   | 16           |

### Enable load balancing.

- Step 3** Log in to the node where the HBase client is located as user **root**. Go to the client installation directory, and set environment variables.

```
cd client installation directory
```

```
source bigdata_env
```

If the cluster adopts the security mode, perform security authentication. Specifically, run the **kinit hbase** command and enter the password as prompted (obtain the password from the administrator).

- Step 4** Run the following commands to go to the HBase shell command window and check whether the load balancing function is enabled.

**hbase shell**

**balancer\_enabled**

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

- Step 5** On the HBase shell command window, run the following commands to enable the load balancing function and check whether the function is enabled.

**balance\_switch true**

**balancer\_enabled**

- Step 6** On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.

 **NOTE**

You are advised to enable and manually trigger the load balancing function during off-peak hours.

- Step 7** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.

- If yes, go to [Step 8](#).
- If no, go to [Step 21](#).

- Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Delete unwanted HBase tables.**

 **NOTE**

Exercise caution when deleting data to ensure data is deleted correctly.

- Step 9** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, view tables stored in the HBase service instance and record unwanted tables that can be deleted.

- Step 10** On the HBase shell command window, run the **disable** command and **drop** command to delete the table to decrease the number of regions.

**disable** '*name of the table to be deleted*'

**drop** '*name of the table to be deleted*'

- Step 11** On the HBase shell command window, run the following command to check whether the load balancing function is enabled.
- balancer\_enabled**
- If yes, go to [Step 13](#).
  - If no, go to [Step 12](#).
- Step 12** On the HBase shell command window, run the following commands to enable the load balancing function and confirm that the function is enabled.
- balance\_switch true**
- balancer\_enabled**
- Step 13** On the HBase shell command window, run the **balancer** command to manually trigger the load balancing function.
- Step 14** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.
- If yes, go to [Step 15](#).
  - If no, go to [Step 21](#).
- Step 15** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 16](#).
- Adjust the threshold.**
- Step 16** On the FusionInsight Manager home page, choose **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster* > **HBase** > **Regions(RegionServer)**, select the applied rule, and click **Modify** to check whether the threshold is proper.
- If it is excessively small, increase the threshold as required and go to [Step 17](#).
  - If it is proper, go to [Step 18](#).
- Step 17** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 18](#).
- Perform system capacity expansion.**
- Step 18** Add nodes to the HBase cluster and add RegionServer instances to the nodes. Then enable and manually trigger the load balancing function.
- Step 19** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**, click the HBase service instance for which the alarm is generated, and click **HMaster(Active)**. On the displayed WebUI of the HBase instance, refresh the page and check whether the region distribution is balanced.
- If yes, go to [Step 20](#).
  - If no, go to [Step 21](#).
- Step 20** Check whether the alarm is cleared.
- If yes, no further action is required.

- If no, go to [Step 21](#).

**Collect fault information.**

**Step 21** On the FusionInsight Manager home page of the active and standby clusters, choose **O&M> Log > Download**.

**Step 22** Select **HBase** in the required cluster from the **Service**.

**Step 23** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 24** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.171 ALM-19012 HBase System Table Directory or File Lost

### Description

The system checks whether HBase directories and files exist on the HDFS every 120 seconds. This alarm is generated when the system detects that the files or directories do not exist. This alarm is cleared when the files or directories are restored.

The HBase directories and files are as follows:

- Directory of the namespace **hbase** on the HDFS
- **hbase.version** file
- Directory of the table **hbase:meta** on the HDFS, **.tableinfo** file, and **.regioninfo** file
- Directory of the table **hbase:namespace** on the HDFS, **.tableinfo** file, and **.regioninfo** file
- Directory of the table **hbase:hindex** on the HDFS, **.tableinfo** file, and **.regioninfo** file
- Directory of the **hbase:acl** table on the HDFS, **.tableinfo**, and **.regioninfo** file (This table does not exist in the common mode cluster by default.)

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19012    | Critical       | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The HBase service fails to be restarted or started. As a result, all HBase service requests fail.

## Possible Causes

Files or directories on the HDFS are missing.

## Procedure

**Locate the alarm cause.**

**Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Alarms**. Click this alarm and check whether **Alarm Cause** indicates unknown errors.

- If yes, go to **Step 4**.
- If no, go to **Step 2**

**Step 2** On the FusionInsight Manager home page, choose **O&M > Backup and Restoration > Backup Management**. Check whether there are success records of the backup task named **default** or other HBase metadata backup tasks that have been successfully executed.

- If yes, go to **Step 3**.
- If no, go to **Step 4**.

**Step 3** Use the latest backup metadata to restore the metadata of the HBase service.

**Collect fault information.**

**Step 4** On the FusionInsight Manager page of the active and standby clusters, choose **O&M > Log > Download**.

**Step 5** In the **Service** area, select faulty HBase services in the required cluster.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.172 ALM-19013 Duration of Regions in transaction State Exceeds the Threshold

## Description

The system checks the number of regions in transaction state on HBase every 300 seconds. This alarm is generated when the system detects that the duration of regions in transaction state exceeds the threshold for two consecutive times. This alarm is cleared when all timeout regions are restored.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 19013    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

Some data in the table gets lost or becomes unavailable.

## Possible Causes

- Compaction is permanently blocked.
- The HDFS files are abnormal.

## Procedure

Locate the alarm cause.

- Step 1** On the FusionInsight Manager, choose **O&M > Alarm > Alarms**, select this alarm, and view the **HostName** and **RoleName** in **Location**.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > HBase**, Click the drop-down menu in the chart area and choose **Customize > Service >**
- Region in transaction count** to view **Region in transaction count over threshold**. Check whether the monitoring item detects a value in three consecutive detection periods. (The default threshold is 60 seconds.)
- If yes, go to **Step 3**.
  - If no, go to **Step 7**.
- Step 3** Choose **Cluster > Name of the desired cluster > Services > HBase > HMaster (Active) > Tables** to check whether the regions of only one table transaction status time out.
- If yes, go to **Step 4**.
  - If no, go to **Step 7**.
- Step 4** Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.
- If yes, go to **Step 5**.
  - If no, go to **Step 7**.
- Step 5** Log in to the client as user **root**. Run the following command:

```
cd client installation directory
```

```
source bigdata_env
```

If the cluster is in security mode, run the **kinit hbase** command

Log in to the HMaster WebUI, choose **Procedure & Locks** in the navigation tree, and check whether any process ID is in the **Waiting** state in **Procedures**. If yes, run the following command to release the procedure lock:

```
hbase hbck -j client installation directory/HBase/hbase/tools/hbase-hbck2-*.jar  
bypass -o pid
```

Check whether the state is in the **Bypass** state. If the procedure on the UI is always in **RUNNABLE(Bypass)** state, perform an active/standby switchover. Run the **assigms** command to bring the region online again.

```
hbase hbck -j client installation directory/HBase/hbase/tools/hbase-hbck2-*.jar  
assigns -o regionName
```

**Step 6** Repeat [Step 4](#). Run the **hbase hbck** command on the client and check whether the error message "No table descriptor file under hdfs://hacluster/hbase/data/default/table" is displayed.

- If yes, go to [Step 7](#).
- If no, no further action is required.

**Collect fault information.**

**Step 7** On the FusionInsight Manager page of the active and standby clusters, choose **O&M > Log > Download**.

**Step 8** In the **Service** area, select faulty HBase services in the required cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

## 12.13.173 ALM-19014 Capacity Quota Usage on ZooKeeper Exceeds the Threshold Severely

### Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the ZNode capacity usage of the HBase service exceeds the critical alarm threshold (90% by default).

This alarm is cleared when the ZNode capacity usage is less than the critical alarm threshold.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19014    | Critical       | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |
| Threshold   | Specifies the threshold for generating the alarm.        |

## Impact on the System

This alarm indicates that the capacity usage of the ZNode of HBase has exceeded the threshold severely. As a result, the write request of the HBase service fails.

## Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

## Handling Procedure

**Check the capacity configuration and usage of ZNodes.**

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, select the alarm whose ID is **19014**, and view the threshold in **Additional Information**.

**Step 2** Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

```
cd Client installation directory
```

Run the following command to set environment variables:

```
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

```
kinit hbase
```

Enter the password as prompted (obtain the password from the MRS cluster administrator).

**Step 3** Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode capacity quota of the HBase service. The ZNode root directory in the command is specified by the

**zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the capacity configuration of the root ZNode of the HBase service.

```
[zk: :24002, :24002, :24002(CONNECTED) 145] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=42,bytes=1601
```

**Step 4** Run the **getusage /hbase/splitWAL** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

**Step 5** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

**Step 6** Run the **getusage /hbase/replication** command to check the capacity usage of the ZNode. Check whether the ratio of **Data size** to the ZNode capacity quota is close to the alarm threshold.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

**Step 7** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 8**.
- If no, go to **Step 9**.

**Step 8** Check whether the alarm is cleared five minutes later.

- If yes, no further action is required.
- If no, go to **Step 9**.

**Collect the fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **HBase** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearing

This alarm is automatically cleared after the fault is rectified.

# 12.13.174 ALM-19015 Quantity Quota Usage on ZooKeeper Exceeds the Threshold

## Alarm Description

The system checks the ZNode usage of the HBase service every 120 seconds. This alarm is generated when the system detects that the ZNode quantity usage of the HBase service exceeds the alarm threshold (75% by default).

This alarm is cleared when the ZNode quantity usage is less than the alarm threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19015    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |
| Threshold   | Specifies the threshold for generating the alarm.        |

## Impact on the System

This alarm indicates that the ZNode quantity usage in the HBase service has exceeded the threshold. If this alarm is not handled in a timely manner, the problem severity may be escalated to **Critical** and data fails to be written.

## Possible Causes

- DR is configured for HBase, and data synchronization fails or is slow in DR.
- A large number of WAL files are being split in the HBase cluster.

## Handling Procedure

### Check the quantity quota and usage of ZNodes.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, select the alarm whose ID is **19015**, and view the threshold in **Additional Information**.

**Step 2** Log in to the HBase client as user **root**. Run the following command to go to the client installation directory:

```
cd Client installation directory
```

Run the following command to set environment variables:

```
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

```
kinit hbase
```

Enter the password as prompted (obtain the password from the MRS cluster administrator).

**Step 3** Run the **hbase zkcli** command to log in to the ZooKeeper client and run the **listquota /hbase** command to check the ZNode quantity quota of the HBase service. The ZNode root directory in the command is specified by the **zookeeper.znode.parent** parameter of the HBase service. The marked area in the following figure shows the quantity quota configuration of the root ZNode of the HBase service.

```
[zk: :24002, :24002, :24002(CONNECTED) 7] listquota /hbase
absolute path is /zookeeper/quota/hbase
Output quota for /hbase count=1500000,bytes=10240
Output stat for /hbase count=59,bytes=1902
```

**Step 4** Run the **getusage /hbase/splitWAL** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **12007**, **19000**, or **19013** and the **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 6** Run the **getusage /hbase/replication** command to check the ZNode quantity usage and check whether the ratio of **Node count** in the command output to the ZNode quantity quota is close to the alarm threshold.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

**Step 7** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Check whether the alarm whose ID is **19006** and **ServiceName** in **Location** is the current HBase service exists.

- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect the fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.177 ALM-19018 HBase Compaction Queue Size Exceeds the Threshold

## Alarm Description

The system checks the HBase compaction queue size every 30 seconds. This alarm is generated when the compaction queue size exceeds the alarm threshold (**100** by default) for three consecutive times. This alarm is cleared when the compaction queue size is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19018    | Minor          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

Write pressure on the HBase node continues going up, and the disk I/O and CPU may be overloaded. Read and write requests are responded slowly or even time out.

## Possible Causes

- The number of HBase RegionServers is too small.
- There are excessive regions on a single RegionServer of HBase.
- The HBase RegionServer heap size is small.
- Resources are insufficient.
- Related parameters are not configured properly.

## Handling Procedure

**Check whether related parameters are properly configured.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the page that is displayed, check whether the alarm whose **Alarm ID** is **19008** or **19011** exists.
- If yes, click **View Help** next to the alarm and rectify the fault by referring to the help document. Then, go to **Step 3**.
  - If no, go to **Step 2**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > HBase**. On the page that is displayed, click the **Configurations** tab then the **All Configurations** sub-tab, search for

**hbase.hstore.compaction.min**, **hbase.hstore.compaction.max**,  
**hbase.regionserver.thread.compaction.small**, and  
**hbase.regionserver.thread.compaction.throttle**, and set them to larger values.

**Step 3** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Collect the fault information.**

**Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 5** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.178 ALM-19019 Number of HBase HFiles to Be Synchronized Exceeds the Threshold

## Alarm Description

The system checks the number of HFiles to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of HFiles to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M > Alarm > Threshold Configuration > Name of the desired cluster > HBase**. This alarm is cleared when the number of HFiles to be synchronized is less than or equal to the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19019    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

A large number of HFile files are stacked. Data is inconsistent between the active and standby nodes, and the latest data cannot be read from the standby cluster during an active/standby switchover or during HBase dual-read. If the fault persists, the storage space of the active cluster and ZooKeeper nodes will be used up. As a result, the active cluster service will be interrupted.

## Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

## Handling Procedure

View alarm location information.

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19019**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

**Step 2** Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

**Step 3** Contact the network administrator to restore the network.

**Step 4** After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the RegionServer region distribution in the active cluster.

**Step 5** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

**Step 6** Log in to the faulty RegionServer node as user **omm**.

**Step 7** Run the following commands to go to the client installation directory and set the environment variable:

```
cd Client installation directory
```

```
source bigdata_env
```

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

**Step 8** Run the following commands to check whether the load balancing function is enabled.

```
hbase shell
```

```
balancer_enabled
```

- If yes, go to [Step 10](#).
- If no, go to [Step 9](#).

**Step 9** Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

```
balance_switch true
```

```
balancer_enabled
```

**Step 10** Run the **balancer** command to manually trigger the load balancing function.

 **NOTE**

You are advised to enable and manually trigger the load balancing function during off-peak hours.

**Step 11** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check the HBase service scale of the standby cluster.

**Step 12** Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform [Step 6](#) to [Step 10](#) to enable the load balancing function and manually trigger it.

**Step 13** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

**Step 14** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Collect the fault information.**

**Step 15** On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 16** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 18** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 12.13.179 ALM-19020 Number of HBase WAL Files to Be Synchronized Exceeds the Threshold

## Alarm Description

The system checks the number of WAL files to be synchronized by the RegionServer of each HBase service instance every 30 seconds. This indicator can be viewed on the RegionServer role monitoring page. This alarm is generated when the number of WAL files to be synchronized on a RegionServer exceeds the threshold (exceeding 128 for 20 consecutive times by default). To change the threshold, choose **O&M** > **Alarm** > **Threshold Configuration** > *Name of the desired cluster* > **HBase** . This alarm is cleared when the number of WAL files to be synchronized is less than or equal to the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19020    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

A large number of WAL files are stacked. Data is inconsistent between the active and standby nodes, and the latest data cannot be read from the standby cluster during an active/standby switchover or during HBase dual-read. If the fault persists, the storage space of the active cluster and ZooKeeper nodes will be used up. As a result, the active cluster service will be interrupted.

## Possible Causes

- The network is abnormal.
- The RegionServer region distribution is unbalanced.
- The HBase service scale of the standby cluster is too small.

## Handling Procedure

View alarm location information.

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19020**, and view the service instance and host name in **Location**.

Check the network connection between RegionServers on active and standby clusters.

**Step 2** Run the **ping** command to check whether the network connection between the faulty RegionServer node and the host where RegionServer of the standby cluster resides is normal.

- If yes, go to **Step 5**.
- If no, go to **Step 3**.

**Step 3** Contact the network administrator to restore the network.

**Step 4** After the network recovers, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

Check the RegionServer region distribution in the active cluster.

**Step 5** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance and check whether regions are evenly distributed on the Region Server.

**Step 6** Log in to the faulty RegionServer node as user **omm**.

**Step 7** Run the following commands to go to the client installation directory and set the environment variable:

```
cd Client installation directory
```

```
source bigdata_env
```

If the cluster uses the security mode, perform security authentication. Run the **kinit hbase** command and enter the password as prompted (obtain the password from the MRS cluster administrator).

**Step 8** Run the following commands to check whether the load balancing function is enabled.

```
hbase shell
```

```
balancer_enabled
```

- If yes, go to [Step 10](#).
- If no, go to [Step 9](#).

**Step 9** Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

```
balance_switch true
```

```
balancer_enabled
```

**Step 10** Run the **balancer** command to manually trigger the load balancing function.

 **NOTE**

You are advised to enable and manually trigger the load balancing function during off-peak hours.

**Step 11** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

Check the HBase service scale of the standby cluster.

**Step 12** Expand the HBase cluster, add a node, and add a RegionServer instance on the node. Then, perform [Step 6](#) to [Step 10](#) to enable the load balancing function and manually trigger it.

**Step 13** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HBase**. Click **HMaster(Active)** to go to the web UI of the HBase instance, refresh the page, and check whether regions are evenly distributed.

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

**Step 14** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Collect the fault information.**

**Step 15** On FusionInsight Manager of the standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 16** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 18** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.180 ALM-19021 Handler Usage of RegionServer Exceeds the Threshold

## Alarm Description

The system checks the RegionServer handler usage of each HBase service instance every 30 seconds. This alarm is generated when the handler usage of a RegionServer exceeds the threshold (90% for five consecutive times by default). This alarm is cleared if the handler usage is lower than or equal to the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19021    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

RegionServer may not be able to provide services externally. As a result, the concurrent read/write processing become slow, or requests fail.

## Possible Causes

- The value of a handler is too small.
- Hotspotting occurs.

## Handling Procedure

**View alarm location information.**

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**, locate the row that contains the alarm whose **Alarm ID** is **19021**, and view the service instance and host name in **Location**.

**Check the handler configuration.**

**Step 2** Choose **Cluster > Services > HBase** and click the **Configurations** tab. In the upper right corner of the page, search for **hbase.regionserver.handler.count** and check whether its value is too small. The default value is **200**.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Change the value of this parameter to a larger value and save the configuration. Choose **Cluster > Services > HBase**, click the **Instance** tab, select the affected RegionServer instances, and choose **More > Instance Rolling Restart**. In the displayed dialog box, enter the username and password. In the **Instance Rolling Restart** dialog box, click **OK** and wait until the rolling restart is complete.

**Step 4** After the configuration takes effect, check whether the alarm is cleared.

- If yes, no further action is required.

- If no, go to [Step 5](#).

**Check whether cluster hotspotting occurs.**

**Step 5** On FusionInsight Manager, choose **Cluster > Services > HBase** and click **HMaster(Active)** following **HMaster WebUI** to go to the web UI of the HBase instance. In the **Region Servers** area of the **Home** page, click **Requests** and check whether the requests in the **Filtered Read Request Count** and **Write Request Count** columns are evenly distributed.

Region Servers

| ServerName | Request Per Second | Read Request Count | Filtered Read Request Count | Write Request Count |
|------------|--------------------|--------------------|-----------------------------|---------------------|
|            | 0                  | 4591               | 0                           | 1460                |
|            | 0                  | 708601             | 1957                        | 1375                |
|            | 0                  | 3472032            | 685564                      | 1183                |

- If yes, go to [Step 13](#).
- If no, go to [Step 6](#).

**Step 6** Check whether regions are evenly distributed.

On FusionInsight Manager, choose **Cluster > Services > HBase** and click **HMaster(Active)** following **HMaster WebUI** to go to the web UI of the HBase instance. In the **Region Servers** area of the **Home** page, click **Base Stats** and check whether the regions in the **Num.Regions** column are evenly distributed.

Region Servers

| ServerName | Start time               | Last contact | Version | Requests Per Second | Num. Regions |
|------------|--------------------------|--------------|---------|---------------------|--------------|
|            | 2021-05-10T02:40:46.704Z | 1 s          |         | 13                  | 10           |
|            | 2021-05-10T02:39:21.509Z | 0 s          |         | 0                   | 12           |
|            | 2021-05-10T02:39:21.123Z | 2 s          |         | 0                   | 13           |
|            | 2021-05-10T11:40:21.456Z | 1 s          |         | 0                   | 6            |
| Total:4    |                          |              |         | 13                  | 43           |

- If yes, go to [Step 13](#).
- If no, go to [Step 7](#).

**Step 7** Log in to the faulty RegionServer node as user **omm**.

**Step 8** Run the following commands to go to the client installation directory and set the environment variable:

```
cd Client installation directory
source bigdata_env
```

If the cluster uses the security mode, run the following command to perform security authentication:

```
kinit hbase
```

Enter the password as prompted (obtain the password from the MRS cluster administrator).

**Step 9** Run the following commands to check whether the load balancing function is enabled. If the command output is **true**, the load balancing function is enabled.

```
hbase shell
```

```
balancer_enabled
```

```
hbase:004:0> balancer_enabled
true
```

```
Took 0.0165 seconds  
=> true
```

- If yes, go to [Step 13](#).
- If no, go to [Step 10](#).

**Step 10** Run the following commands in HBase Shell to enable the load balancing function and check whether the function is enabled.

```
balance_switch true
```

```
balancer_enabled
```

 **NOTE**

You are advised to enable and manually trigger the load balancing function during off-peak hours.

**Step 11** Run the following command to manually trigger the load balancing function:

```
balancer
```

**Step 12** After the load balancing is complete, log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms** and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collect the fault information.**

**Step 13** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 14** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 16** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.181 ALM-19022 HBase Hotspot Detection Is Unavailable

## Alarm Description

When the MetricController instance is installed for HBase, the alarm module checks the health status of the active HBase MetricController instance every 120

seconds. This alarm is generated when the active HBase MetricController instance does not exist or is unavailable and the hotspot detection function is unavailable.

This alarm is cleared when the active HBase MetricController instance recovers.

 **NOTE**

This alarm applies only to MRS 3.3.0 or later.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19022    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The HBase hotspot detection function is unavailable. Services are not affected. However, if request/data skew occurs, the system cannot report alarms and automatically recovers from hotspotting. Service requests may cause node overload, slow response, and request timeout.

## Possible Causes

- The ZooKeeper service is abnormal.
- The HBase service is abnormal.
- In the current HBase service, the MetricController instance on the same node as the active HMaster instance is not started.
- The network is abnormal.

## Handling Procedure

**Check the ZooKeeper service status.**

- Step 1** In the service list on FusionInsight Manager, check whether **Running Status** of ZooKeeper is **Normal**.
- If yes, go to [Step 5](#).
  - If no, go to [Step 2](#).
- Step 2** In the alarm list, check whether **ALM-13000 ZooKeeper Service Unavailable** exists.
- If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** Rectify the fault by performing the operations provided for **ALM-13000 ZooKeeper Service Unavailable**.
- Step 4** Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.
- If yes, no further action is required.
  - If no, go to [Step 5](#).
- Check the HBase service status.**
- Step 5** In the service list on FusionInsight Manager, check whether **Running Status** of HBase is **Normal**.
- If yes, go to [Step 9](#).
  - If no, go to [Step 6](#).
- Step 6** In the alarm list, check whether the alarm **ALM-19000 HBase Service Unavailable** exists.
- If yes, go to [Step 7](#).
  - If no, go to [Step 9](#).
- Step 7** Rectify the fault by following the steps provided for **ALM-19000 HBase Service Unavailable**.
- Step 8** Wait for several minutes and check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.
- If yes, no further action is required.
  - If no, go to [Step 9](#).
- Check whether the MetricController instance deployed on the same node as the active HMaster instance is started.**
- Step 9** On FusionInsight Manager, choose **Cluster > Service > HBase**, and click **Instances** to check whether the **MetricController(Active)** instance exists.
- If yes, go to [Step 12](#).
  - If no, go to [Step 10](#).
- Step 10** Select the MetricController instance whose management IP address is the same as that of the active HMaster instance, and click **Start Instance**.
- Step 11** After the MetricController instance is restarted, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.
- If yes, no further action is required.

- If no, go to [Step 12](#).

**Check the network connectivity between the started MetricController instances and the active HMaster node.**

**Step 12** Log in to the node where the active HMaster instance is deployed and run **ping** *IP address of the node where the standby MetricController instance is deployed* to check whether the network connection between the started MetricController instances and the host where the active HMaster instance is deployed is normal.

- If yes, go to [Step 15](#).
- If no, go to [Step 13](#).

**Step 13** Contact the network administrator to restore the network.

**Step 14** After the network recovers, check whether the alarm **HBase Hotspot Detection Is Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Collect fault information.**

**Step 15** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 16** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 17** In the **Host** area, select the host where the HMaster instance is deployed.

**Step 18** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 19** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.182 ALM-19023 Region Traffic Restriction for HBase

### Alarm Description

When the MetricController instance is installed for the HBase service, self-healing from hotspotting is automatically enabled. The alarm module checks whether there are regions whose request traffic is restricted due to hotspot issues in HBase every 120 seconds. This alarm is generated when the region where hotspot traffic is restricted is detected in HBase.

This alarm is cleared when the region is no longer a hotspot.

This alarm applies only to MRS 3.3.0 or later.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19023    | Critical       | Yes          |

## Alarm Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

If the traffic of a hotspot region is restricted, the number of handlers for processing the requests in the region is limited. As a result, services requesting the region may slow down or retry upon failure.

## Possible Causes

Too many requests are directed to a single region when the HBase service is accessed.

## Handling Procedure

**Check whether there are too many requests in a single region of HBase.**

- Step 1** Log in to FusionInsight Manager, and Choose **O&M > Alarm > Alarms**.
- Step 2** In **Additional Information** of **Region Traffic Restriction for HBase**, view the reported table name and region information.
- Step 3** On FusionInsight Manager, choose **Cluster > Service > HBase** and click the hyperlink on the right of HMaster web UI.
- Step 4** Click **Table Details** and adjust service configurations in the region where the table in **Step 2** is deployed.
- Step 5** Wait a moment and then check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 8** In the **Host** area, select the host where the HMaster instance is deployed.

**Step 9** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact O&M personnel and provide the collected logs.

----End

### Alarm Clearance

This alarm will be automatically cleared.

### Related Information

None.

## 12.13.183 ALM-19024 RPC Requests P99 Latency on RegionServer Exceeds the Threshold

### Alarm Description

The system checks P99 latency for RPC requests on each RegionServer instance of the HBase service every 30 seconds. This alarm is generated when P99 latency for RPC requests on a RegionServer exceeds the threshold for 10 consecutive times.

This alarm is cleared when P99 latency for RPC requests on a RegionServer instance is less than or equal to the threshold.

This alarm applies only to MRS 3.3.0 or later.

### Alarm Attributes

| Alarm ID | Alarm Severity                                                                                                                                                         | Auto Cleared |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|
| 19024    | <ul style="list-style-type: none"> <li>• <b>Critical:</b> The default threshold is 10 seconds.</li> <li>• <b>Major:</b> The default threshold is 5 seconds.</li> </ul> | Yes          |

## Alarm Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

If RPC requests P99 latency exceeds the threshold, the RegionServer cannot deliver normal service performance externally. For latency-sensitive services, a large number of service read and write requests may time out.

## Possible Causes

- RegionServer GC duration is too long.
- The HDFS RPC response is too slow.
- RegionServer request concurrency is too high.

## Handling Procedure

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19024**, and view the service instance and host name in **Location**.

**Check the GC duration of RegionServer.**

**Step 2** In the alarm list on FusionInsight Manager, check whether the "HBase GC Duration Exceeds the Threshold" alarm is generated for the service instance in **Step 1**.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

**Step 3** Rectify the fault by following the handling procedure of "ALM-19007 HBase GC Duration Exceeds the Threshold".

**Step 4** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

### Check HDFS RPC response time.

**Step 5** In the alarm list on FusionInsight Manager, check whether alarm "Average NameNode RPC Processing Time Exceeds the Threshold" is generated for the HDFS service on which the HBase service depends.

- If yes, go to [Step 6](#).
- If no, go to [Step 8](#).

**Step 6** Rectify the fault by following the handling procedure of "ALM-14021 Average NameNode RPC Processing Time Exceeds the Threshold".

**Step 7** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

### Check the number of concurrent processes on a RegionServer.

**Step 8** In the alarm list on FusionInsight Manager, check whether the "Handler Usage of RegionServer Exceeds the Threshold" alarm is generated for the service instance in [Step 1](#).

- If yes, go to [Step 9](#).
- If no, go to [Step 11](#).

**Step 9** Rectify the fault by following the handling procedure of "ALM-19021 Handler Usage of RegionServer Exceeds the Threshold".

**Step 10** Wait several minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 11](#).

### Collect fault information.

**Step 11** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 12** Expand the **Service** drop-down list, and select **HBase** for the target cluster.

**Step 13** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.184 ALM-19025 Damaged StoreFile in HBase

### Alarm Description

The system checks the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories on HDFS of each HBase service every 120 seconds. This alarm is generated when there are files in the directories.

This alarm is cleared when the **hdfs://hacluster/hbase/autocorrupt** and **hdfs://hacluster/hbase/MasterData/autocorrupt** directories do not exist or are empty.

This alarm applies only to MRS 3.3.0 or later.

#### NOTE

**hdfs://hacluster** indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster > Services > HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 19025    | Major          | Yes          |

### Alarm Parameters

| Parameter   | Description                                             |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

### Impact on the System

Data in the file may be lost, and data queried by the service may be inconsistent.

### Possible Causes

The StoreFile files are damaged.

## Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19025**, and view the service in **Location**.
- Step 2** Log in to the node where the HDFS and HBase clients are installed as the client installation user and run the following commands:
- ```
cd Client installation directory  
source bigdata_env  
kinit Component service user (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)
```
- Step 3** Check the damaged StoreFile file.
- Run the following command to check whether the **/hbase/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 4**.  
**hdfs dfs -ls -R hdfs://hacluster/hbase/autocorrupt**
  - Run the following command to check whether the **/hbase/MasterData/autocorrupt** directory of HDFS is empty. If it is not, go to **Step 9**.  
**hdfs dfs -ls -R hdfs://hacluster/hbase/MasterData/autocorrupt**
- Step 4** Run the following command to restore the StoreFile files in the **hdfs://hacluster/hbase/autocorrupt** directory:
- ```
hdfs debug recoverLease -path hdfs://hacluster/hbase/autocorrupt/Name space/Table/Region/Column family/StoreFile files
```
- Step 5** Check whether the damaged StoreFile files are restored. If the following information is displayed, the restoration is successful:
- ```
recoverLease SUCCEEDED on hdfs://hacluster/hbase/autocorrupt/  
default/h1/865665fe32db62dadada68b644359809/cf1/95f210f931ad44c99e4028470be7d292
```
- If yes, go to **Step 6**.  
If no, go to **Step 9**.
- Step 6** Run the following command to move the files back to the **hdfs://hacluster/hbase/data** directory:
- ```
hdfs dfs -mv hdfs://hacluster/hbase/autocorrupt/Name space/Table/Region/  
Column family/StoreFile fileshdfs://hacluster/hbase/data/Name space/Table/  
Region/Column family/StoreFile files
```
- Step 7** Run the following command on HBase Shell to bring the region online again:
- ```
hbase shell  
unassign'Region'  
assign'Region'
```
- Step 8** Wait several minutes and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 9**.
- Collect fault information.**

- Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 10** Expand the **Service** drop-down list, and select **HBase** for the target cluster.
- Step 11** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.185 ALM-19026 Damaged WAL Files in HBase

### Alarm Description

The system checks the **hdfs://hacluster/hbase/corrupt** directory on the HDFS of each HBase service every 120 seconds. This alarm is generated when there are WAL files in the **/hbase/corrupt** directory.

This alarm is cleared when the **/hbase/corrupt** directory does not exist or does not contain WAL files.

This alarm applies only to MRS 3.3.0 or later.

#### NOTE

**hdfs://hacluster** indicates the name of the file system used by HBase, and **/hbase** indicates the root directory of HBase in the file system. You can log in to FusionInsight Manager, choose **Cluster** > **Services** > **HBase** and click **Configuration**. Search for **fs.defaultFS** and **hbase.data.rootdir**.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
19026	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.

Parameter	Description
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

If the data in the damaged file is not flushed to disks, the data will be lost. As a result, some data queried by the service is inconsistent.

## Possible Causes

The WAL files are damaged.

## Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing the alarm whose **Alarm ID** is **19026**, and view the service in **Location**.
  - Step 2** Log in to the node where the HDFS clients are installed as the client installation user and run the following commands:  

```
cd Client installation directory  
source bigdata_env  
kinit Component service user (If Kerberos authentication is disabled for the cluster (the cluster is in normal mode), skip this step.)
```
  - Step 3** Run the following command to check the damaged WAL files and go to **Step 4**:  

```
hdfs dfs -ls hdfs://hacluster/hbase/corrupt/*%2C*
```

**Collect fault information.**
  - Step 4** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
  - Step 5** Expand the **Service** drop-down list, and select **HBase** for the target cluster.
  - Step 6** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
  - Step 7** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

# 12.13.186 ALM-20002 Hue Service Unavailable

## Description

This alarm is generated when the Hue service is unavailable. The system checks the Hue service status every 60 seconds.

This alarm is cleared when the Hue service is normal.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
20002	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

Users cannot perform interactive analysis and data processing with MRS on the Hue UI.

## Possible Causes

- The internal KrbServer service on which the Hue service depends is abnormal.
- The internal DBService service on which the Hue service depends is abnormal.
- The network connection to the DBService is abnormal.

## Procedure

### Check whether the KrbServer is abnormal.

**Step 1** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**. In the service list, check whether the **KrbServer** running status is **Normal**.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Restart the KrbServer service.

**Step 3** Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check whether the DBService is abnormal.

**Step 4** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 5** In the service list, check whether the **DBService** running status is **Normal**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** Restart the DBService.

---

#### NOTICE

When the service is rebooted, it becomes unavailable and can disrupt business operations.

---

**Step 7** Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

### Check whether the network connection to the DBService is normal.

**Step 8** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Hue** > **Instance**, record the IP address of the active Hue.

**Step 9** Log in to the active Hue.

**Step 10** Run the **ping** command to check whether communication between the host that runs the active Hue and the hosts that run the DBService is normal. (Obtain the IP addresses of the hosts that run the DBService in the same way as that for obtaining the IP address of the active Hue.)

- If yes, go to [Step 13](#).
- If no, go to [Step 11](#).

**Step 11** Contact the administrator to restore the network.

**Step 12** Wait several minutes, and check whether **Hue Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collect fault information.**

**Step 13** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 14** Select the following nodes in the required cluster from the **Service** drop-down list:

- Hue
- Controller

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.187 ALM-23001 Loader Service Unavailable

## Description

The system checks the Loader service availability every 60 seconds. This alarm is generated when the system detects that the Loader service is unavailable. This alarm is cleared when the Loader service is available.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23001	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.

Name	Meaning
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

When the Loader service is unavailable, the data loading, import, and conversion functions are unavailable.

## Possible Causes

- The internal service on which the Loader service depends is abnormal.
  - The ZooKeeper service is abnormal.
  - The HDFS service is abnormal.
  - The DBService service is abnormal.
  - The Yarn service is abnormal.
  - The Mapreduce service is abnormal.
- Environment fault: The network is abnormal, which the Loader service cannot communicate with the depended internal services and cannot provide services.
- Software fault: The Loader service cannot run properly.

## Procedure

### Check the ZooKeeper service status.

- Step 1** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **ZooKeeper** to check whether the ZooKeeper running status is **Normal**.
- If yes, go to [Step 3](#).
  - If no, go to [Step 2](#).
- Step 2** Choose **More** > **Restart Service** to restart the ZooKeeper service. In the alarm list, check whether **LoaderService Unavailable** is cleared.
- If yes, no further action is required.
  - If no, go to [Step 3](#).
- Step 3** On the FusionInsight Manager, check whether the alarm list contains **Process Fault**.
- If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).
- Step 4** In the **Location** area of **Process Fault**, check whether **ServiceName** is **ZooKeeper**.
- If yes, go to [Step 5](#).

- If no, go to [Step 7](#).

**Step 5** Rectify the fault by following the steps provided in **ALM-12007 Process Fault**.

**Step 6** In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Check the HDFS service status.**

**Step 7** On the FusionInsight Manager, check whether the alarm list contains **HDFS Service Unavailable**.

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

**Step 8** Rectify the fault by following the steps provided in **ALM-14000 HDFS Service Unavailable**.

**Step 9** In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check the DBService status.**

**Step 10** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** to check whether the DBService running status is **Normal**.

- If yes, go to [Step 12](#).
- If no, go to [Step 11](#).

**Step 11** Choose **More** > **Restart Service** to restart the DBService service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Check the Mapreduce status.**

**Step 12** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Mapreduce** to check whether the Mapreduce running status is **Normal**.

- If yes, go to [Step 16](#).
- If no, go to [Step 13](#).

**Step 13** Choose **More** > **Restart Service** to restart the Mapreduce service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

**Check the Yarn status.**

**Step 14** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Yarn** to check whether the Yarn running status is **Normal**.

- If yes, go to [Step 16](#).

- If no, go to [Step 15](#).

**Step 15** Choose **More > Restart Service** to restart the Yarn service. In the alarm list, check whether **LoaderService Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

**Step 16** On the FusionInsight Manager, check whether the alarm list contains **Yarn Service Unavailable**.

- If yes, go to [Step 17](#).
- If no, go to [Step 19](#).

**Step 17** Rectify the fault by following the steps provided in **ALM-18000 Yarn Service Unavailable**.

**Step 18** In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 19](#).

**Check the network connection between Loader and dependent components.**

**Step 19** On the FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Loader**.

**Step 20** Click **Instance** and the LoaderServer instance list is displayed.

**Step 21** Record the **Management IP Address** in the row of **LoaderServer(Active)**.

**Step 22** Log in to the host where the active LoaderServer runs as **omm** user using the IP address obtained in [Step 21](#).

**Step 23** Run the **ping** command to check whether communication between the host that runs the active LoaderServer and the hosts that run the dependent components. (The dependent components include ZooKeeper, DBService, HDFS, Mapreduce and Yarn. Obtain the IP addresses of the hosts that run these services in the same way as that for obtaining the IP address of the active LoaderServer.)

- If yes, go to [Step 26](#).
- If no, go to [Step 24](#).

**Step 24** Contact the administrator to restore the network.

**Step 25** In the alarm list, check whether **Loader Service Unavailable** is cleared.

- If yes, no further action is required.
- If no, go to [Step 26](#).

**Collect fault information.**

**Step 26** On the FusionInsight Manager, choose **O&M > Log > Download**.

**Step 27** Select the following nodes in the required cluster from the **Service** drop-down list:

- ZooKeeper
- HDFS
- DBService

- Yarn
- Mapreduce
- Loader

**Step 28** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 29** On the FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Loader**.

**Step 30** Choose **More** > **Restart Service**, and click **OK**.

**Step 31** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 32](#).

**Step 32** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.188 ALM-23003 Loader Task Execution Failure

## Description

This alarm is generated immediately when the system detects that the Loader job fails. This alarm is cleared when the failed job is manually handled by a user. This alarm must be manually cleared.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23003	Minor	No

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.

Name	Meaning
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
JobID	Specifies the ID of failed Loader job.
JobName	Specifies the failed Loader job.
UserName	Specifies the name of the user who submits the Loader job.
Details	Supplementary information for which the alarm is generated.

## Impact on the System

This is a job-level alarm for Loader. The job execution fails, and you need to view specific logs to locate the failure cause. No execution result is returned. After the fault is rectified, you need to execute the task again. No impact on the Loader service.

## Possible Causes

- Task parameters are incorrectly configured.
- Exceptions occur when Yarn is executing a job.

## Procedure

### Check whether task parameters are incorrectly configured.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms** and click the alarm drop-down list from the alarm list, obtain the **Alarm Cause**.
- Step 2** If the alarm cause is "Failure to submit job", view error details in **Additional Information**, and go to the Loader WebUI to view the execution history of the job.

#### NOTE

By default, the **admin** user does not have the permissions to manage other components. If the page cannot be opened or the displayed content is incomplete when you access the native UI of a component due to insufficient permissions, you can manually create a user with the permissions to manage that component.

- Step 3** Submit the task again.
- Step 4** Check whether the task executed successfully.
- If yes, go to [Step 9](#).

- If no, go to [Step 5](#).

**Check whether exceptions occur when Yarn is executing a job.**

**Step 5** On FusionInsight Manager, click the alarm drop-down list from the alarm list, obtain the **Alarm Cause**.

**Step 6** Check whether the Yarn activity is executed properly in the **Alarm Cause**. If the alarm cause is "Yarn execution failed", the Yarn activity is abnormal.

- If yes, go to [Step 7](#).
- If no, go to [Step 10](#).

**Step 7** Submit the task again.

**Step 8** Please check whether the task executed successfully.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

**Step 9** In the alarm list, click **Clear** from **Operation** to manually clear the alarm. No further action is required.

**Collect fault information.**

**Step 10** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 11** Select the following nodes in the required cluster from the **Service** drop-down list:

- DBService
- HDFS
- Loader
- Mapreduce
- Yarn
- ZooKeeper

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system does not automatically clear this alarm, and you need to manually clear the alarm.

## Related Information

None

## 12.13.189 ALM-23004 Loader Heap Memory Usage Exceeds the Threshold

### Description

The system checks the heap memory usage of the Loader service every 60 seconds. The alarm is generated when the heap memory usage of a Loader instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. The alarm is cleared when the heap memory usage is less than the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23004	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

Full GC occurs frequently in Loader. The performance deteriorates and page responses are slow. If the memory overflows, Loader may fail to provide services for external systems. The Loader page cannot be accessed, interfaces cannot be called, and active/standby switchover is frequently performed due to exceptions.

### Possible Causes

The heap memory of the Loader instance is overused or the heap memory is inappropriately allocated.

## Procedure

### Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Loader Heap Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Loader Heap Memory Resource Percentage**. Click **OK**.
- Step 3** Check whether the used heap memory of Loader reaches the threshold (the default value is 95% of the maximum heap memory) specified for Loader.
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Configurations**. Click **All Configurations**. Increase the value of **-Xmx** in **GC\_OPTS** as required, and click **Save**. Click **OK**.

#### NOTE

- If this alarm is generated, the heap memory configured for the current Loader instance is insufficient for data transmission. You are advised to open the instance monitoring page, display the Loader heap memory resource status monitoring chart, and observe the change trend of the heap memory used by Loader in the monitoring chart. Then change the value of **-Xmx** to twice the current heap memory usage or to another value to meet site requirements.
- When setting the heap memory, you can set **-Xms** and **-Xmx** to similar values to avoid performance deterioration caused by heap size adjustment after each GC.
- Ensure that the sum of **-Xmx** and **XX:MaxPermSize** is not greater than the physical memory of the node server.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

#### NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

### Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Loader** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.190 ALM-23005 Loader Non-Heap Memory Usage Exceeds the Threshold

## Description

The system checks the non-heap memory usage of the Loader service every 30 seconds. The alarm is generated when the non-heap memory usage of a Loader instance exceeds the threshold (80% of the maximum memory) for 5 consecutive times. The alarm is cleared when the non-heap memory usage is less than the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23005	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

The Loader page may fail to be accessed and cannot provide services for external systems.

## Possible Causes

The non-heap memory of the Loader instance is overused or the non-heap memory is inappropriately allocated.

## Procedure

### Check non-heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Loader Non-Heap Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Loader Non Heap Memory Resource Percentage**. Click **OK**.
- Step 3** Check whether the used non-heap memory of Loader reaches the threshold (the default value is 80% of the maximum non-heap memory) specified for Loader.
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Configurations**. Click **All Configurations** Search **LOADER\_GC\_OPTS** in the search box. If the **-XX: MaxPermSize** parameter is not configured, set the initial value to **-XX: MaxPermSize=256M** for the first time. (If the alarm persists after the first adjustment, perform the second adjustment by referring to the following note.) And click **Save**. Click **OK**.

### NOTE

If this alarm is generated, the non-heap memory configured for the current Loader instance is insufficient for the service scenario. You are advised to open the instance monitoring page, open the Loader non-heap memory resource status monitoring chart, and observe the change trend of the non-heap memory used by Loader in the monitoring chart. Then change the value of **-XX:MaxPermSize** to twice the current non-heap memory usage or to another value to meet site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

### NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

### Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Loader** in the required cluster from the **Service** drop-down list.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.191 ALM-23006 Loader Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the Loader service every 30 seconds. The alarm is generated when the direct memory usage of a Loader instance exceeds the threshold (80% of the maximum memory) for 5 consecutive times. The alarm is cleared when the direct memory usage of Loader is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23006	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Loader may fail to provide services for external systems. I/O or socket exceptions occur, and active/standby switchovers occur frequently.

## Possible Causes

The direct memory of the Loader instance is overused or the direct memory is inappropriately allocated.

## Procedure

### Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Loader Direct Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > Memory > Loader Memory Usage Statistics**. Click **OK**.
- Step 3** Check whether the used direct memory of Loader reaches the threshold (the default value is 80% of the maximum direct memory) specified for Loader.
  - If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Configurations**. Click **All Configurations**. Search **LOADER\_GC\_OPTS** in the search box. Increase the value of **-XX:MaxDirectMemorySize** as required, and click **Save**. Click **OK**.

### NOTE

If this alarm is generated, the direct memory configured for the current Loader instance is insufficient for the service scenario. You are advised to open the instance monitoring page, display the Loader direct memory resource status monitoring chart, and observe the change trend of the direct memory used by Loader in the monitoring chart. Then change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory usage or to another value to meet site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 6**.

### NOTE

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

### Collect fault information.

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select **Loader** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.192 ALM-23007 Garbage Collection (GC) Time of the Loader Process Exceeds the Threshold

## Description

The system checks GC time of the Loader process every 60 seconds. The alarm is generated when GC time of the Loader process exceeds the threshold (default value: **12 seconds**) for 5 consecutive times. The alarm is cleared when GC time is less than the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
23007	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Full GC occurs frequently, and the Loader service responds slowly. The Loader service may even break down and cannot provide services properly.

## Possible Causes

The heap memory of the Loader instance is overused or the heap memory is inappropriately allocated.

## Procedure

**Check GC time.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Garbage Collection (GC) Time of the Loader Process Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the chart area and choose **Customize > GC > Garbage Collection (GC) Time of Loader**. Click **OK**.
- Step 3** Check whether GC time of the Loader process every second exceeds the threshold (default value: **12 seconds**).
  - If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Loader > Configurations**. Click **All Configurations**. Search **LOADER\_GC\_OPTS** in the search box. Increase the value of **-Xmx** as required, and click **Save**. Click **OK**.

### NOTE

If this alarm is generated, the heap memory configured for the current Loader instance cannot meet the heap memory required for data transmission. You are advised to handle the problem by referring to **Step 4** in section [ALM-23004 Loader Heap Memory Usage Exceeds the Threshold](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 6**.

 **NOTE**

During service or instance restart, Loader cannot provide services to external systems. New jobs cannot be submitted, but jobs being executed are not affected.

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select **Loader** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.193 ALM-24000 Flume Service Unavailable

## Alarm Description

The alarm module checks the Flume service status every 180 seconds. This alarm is generated if the Flume service is abnormal.

This alarm is automatically cleared after the Flume service recovers.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24000	Critical	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.

Parameter	Description
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

Flume cannot work and data transmission is interrupted.

## Possible Causes

All Flume instances are faulty.

## Handling Procedure

**Step 1** Log in to a Flume node as user **omm** and run the **ps -ef|grep "flume.role=server"** command to check whether the Flume process exists on the node.

- If yes, go to [Step 3](#).
- If no, restart the faulty Flume node or Flume service and go to [Step 2](#).

**Step 2** In the alarm list, check whether alarm "Flume Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to [Step 3](#).

**Collect the fault information.**

**Step 3** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 4** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 5** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 6** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.194 ALM-24001 Flume Agent Exception

### Alarm Description

The Flume agent monitoring module monitors the Flume agent status. This alarm is generated when the Flume agent process is faulty (checked every 5 seconds) or the Flume agent fails to start (an alarm is reported immediately).

This alarm is cleared when the Flume agent process recovers, Flume agent starts successfully, and the alarm handling is completed.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24001	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
AgentId	Specifies the ID of the agent for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

### Impact on the System

The Flume agent instance for which the alarm is generated cannot provide services properly, and the data transmission tasks of the instance are temporarily interrupted. Real-time data is lost during real-time data transmission.

### Possible Causes

- The **JAVA\_HOME** directory does not exist, or the Java permission is incorrect.
- The Flume agent directory permission is incorrect.
- The Flume agent fails to start.

## Handling Procedure

**Check whether the JAVA\_HOME directory exists or whether the JAVA permission is correct.**

**Step 1** Log in to the host for which the alarm is generated as user **root**.

**Step 2** Obtain the installation directory of the Flume client for which the alarm is generated. (The value of **AgentId** can be obtained from **Location** of the alarm.)

```
ps -ef|grep AgentId | grep -v grep | awk -F 'conf-file ' '{print $2}' | awk -F 'fusioninsight' '{print $1}'
```

**Step 3** Run the `su - Flume installation user` command to switch to the Flume installation user and run the `cd Flume client installation directory/fusioninsight-flume-1.9.0/conf/` command to go to the Flume configuration directory.

**Step 4** Run the `cat ENV_VARS | grep JAVA_HOME` command.

**Step 5** Check whether the **JAVA\_HOME** directory exists. If both the command output in [Step 4](#) and `ll $JAVA_HOME/` are not empty, the **JAVA\_HOME** directory exists.

- If yes, go to [Step 7](#).
- If no, go to [Step 6](#).

**Step 6** Specify a correct **JAVA\_HOME** directory.

**Step 7** Run the `$JAVA_HOME/bin/java -version` command to check whether the Flume agent running user has the Java execution permission. If the Java version is displayed in the command output, the Java permission meets the requirement. Otherwise, the Java permission does not meet the requirement.

- If yes, go to [Step 9](#).
- If no, go to [Step 8](#).

### NOTE

**JAVA\_HOME** is the environment variable exported during Flume client installation. You can also go to `Flume client installation directory/fusioninsight-flume-1.9.0/conf` and run the `cat ENV_VARS | grep JAVA_HOME` command to view the variable value.

**Step 8** Run the `chmod 750 $JAVA_HOME/bin/java` command to grant the Java execution permission to the Flume agent running user.

**Check the directory permission of the Flume agent.**

**Step 9** Log in to the host for which the alarm is generated as user **root**.

**Step 10** Run the following command to switch to the Flume agent installation directory:

```
cd Flume client installation directory/fusioninsight-flume-1.9.0/conf/
```

**Step 11** Run the `ls -al * -R` command to check whether any file owner is the user running the Flume agent.

- If yes, go to [Step 12](#).
- If no, run the `chown` command to change the file owner to the user who runs the Flume agent.

**Check the Flume agent configuration.**

**Step 12** Run the `cat properties.properties | grep spoolDir` and `cat properties.properties | grep TAILDIR` commands to check whether the Flume source type is `spoolDir` or `tailDir`. If any command output is displayed, the Flume source type is `spoolDir` or `tailDir`.

- If yes, go to [Step 13](#).
- If no, go to [Step 17](#).

**Step 13** Check whether the data monitoring directory exists.

- If yes, go to [Step 15](#).
- If no, go to [Step 14](#).

 **NOTE**

Run the `cat properties.properties | grep spoolDir` command to view the `spoolDir` monitoring directory.

```
[root@fusioninsight-1.9.0]# cat properties.properties | grep spoolDir
client.sources.aal.spoolDir = /opt/liuxingcheng/flumeclient/sourcedata/flumesourcedata1
```

Run the `cat properties.properties | grep parentDir` command to view the `tailDir` monitoring directory.

```
[root@fusioninsight-1.9.0]# cat properties.properties | grep parentDir
server.sources.AAAA.filegroups.F1.parentDir = /tmp/flumetest/taildir_data
```

**Step 14** Specify a correct data monitoring directory.

**Step 15** Check whether the Flume agent user has the read, write, and execute permissions on the monitoring directory specified in [Step 13](#).

- If yes, go to [Step 17](#).
- If no, go to [Step 16](#).

 **NOTE**

Go to the monitoring directory as the Flume running user. If files can be created, the Flume running user has the read, write, and execute permissions on the monitoring directory.

**Step 16** Run the `chmod 777 Flume monitoring directory` command to grant the Flume agent running user the read, write, and execute permissions on the monitoring directory specified in [Step 13](#).

**Step 17** Check whether the components connected to the Flume sink are in safe mode.

- If yes, go to [Step 18](#).
- If no, go to [Step 23](#).

 **NOTE**

If the sinks in the `properties.properties` configuration file are the HDFS sink and HBase sink, and the configuration file contains a keytab file, the components connected to the Flume sink are in safe mode.

If the sink in the `properties.properties` configuration file is the Kafka sink and `*.security.protocol` is set to `SASL_PLAINTEXT` or `SASL_SSL`, Kafka connected to the Flume sink is in safe mode.

**Step 18** Run the `ll keytab path` command to check whether the keytab authentication path specified by the `*.kerberosKeytab` parameter in the configuration file exists.

- If yes, go to [Step 20](#).

- If no, go to [Step 19](#).

 **NOTE**

To view the keytab path, run the `cat properties.properties | grep keytab` command.

**Step 19** Change the value of `kerberosKeytab` in [Step 18](#) to the custom keytab path and go to [Step 21](#).

**Step 20** Go to [Step 18](#) and check whether the Flume agent running user has the permission to access the keytab authentication file. If the keytab path is returned, the user has the permission. Otherwise, the user does not have the permission.

- If yes, go to [Step 22](#).
- If no, go to [Step 21](#).

**Step 21** Run the `chmod 755 keytab file` command to grant the read permission on the keytab file specified in [Step 19](#), and restart the Flume process.

**Step 22** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 23](#).

**Collect fault information.**

**Step 23** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 24** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 25** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 26** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.195 ALM-24003 Flume Client Connection Interrupted

## Alarm Description

The alarm module monitors the port connection status on the Flume server. This alarm is generated if the Flume server fails to receive a connection message from the Flume client in three consecutive minutes.

This alarm is cleared after the Flume server receives a connection message from the Flume client.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24003	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
Client IP Address	Specifies the IP address of the Flume client.
Client Name	Specifies the agent name of the Flume client.
Sink Name	Specifies the sink name of Flume Agent.

## Impact on the System

The communication between the Flume client and the server fails. The Flume client cannot send data to the Flume server.

## Possible Causes

- The network connection between the Flume client and the server is faulty.
- The Flume client's process is abnormal.
- The Flume client is incorrectly configured.

## Handling Procedure

**Check the network connection between the Flume client and the server.**

**Step 1** Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

**Step 2** Run the **ping *Flume server IP address*** command to check whether the network connection between the Flume client and the server is normal.

- If yes, go to **Step 3**.
- If no, go to **Step 11**.

**Check whether the Flume client's process is normal.**

**Step 3** Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.

**Step 4** Run the **ps -ef|grep flume |grep client** command to check whether the Flume client process exists.

- If yes, go to [Step 5](#).
- If no, go to [Step 11](#).

#### Check the Flume client configuration.

- Step 5** Log in to the host whose IP address is specified by **Flume ClientIP** in the alarm information as user **root**.
- Step 6** Run the `cd Flume client installation directory/fusioninsight-flume-1.9.0/conf/` command to go to Flume's configuration directory.
- Step 7** Run the `cat properties.properties` command to query the current configuration file of the Flume client.
- Step 8** Check whether the **properties.properties** file is correctly configured according to the configuration description of the Flume agent.
- If yes, go to [Step 9](#).
  - If no, go to [Step 11](#).
- Step 9** Modify the **properties.properties** configuration file.

#### Check whether the alarm is cleared.

- Step 10** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 11](#).

#### Collect the fault information.

- Step 11** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 12** Expand the **Service** drop-down list, and select **Flume** for the target cluster.
- Step 13** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 14** Collect logs in the `/var/log/Bigdata/flume-client` directory on the Flume client using a transmission tool.
- Step 15** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.196 ALM-24004 Exception Occurs When Flume Reads Data

### Alarm Description

The alarm module monitors the Flume source status. This alarm is generated when the duration in which the source cannot read data exceeds the threshold.

The default threshold is **0**, indicating that this function is disabled. You can change the threshold by modifying the **properties.properties** file in the **conf** directory. Specifically, modify the **NoDatatime** parameter of required the source.

The alarm is cleared when the source reads the data and the alarm handling is complete.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24004	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
AgentId	Specifies the ID of the agent for which the alarm was generated.
ComponentType	Specifies the type of the component for which the alarm was generated.
ComponentName	Specifies the name of the component for which the alarm was generated.

### Impact on the System

If data is found in the data source but the Flume source continuously fails to read data, the collection is stopped.

## Possible Causes

- The Flume source is faulty, so data cannot be sent.
- The network is faulty, so the data cannot be sent.

## Handling Procedure

### Check whether the Flume source is faulty.

**Step 1** Open the **properties.properties** configuration file on the local PC, search for keyword **type = spoolDir** in the file, and check whether the Flume source type is spoolDir.

- If yes, go to [Step 2](#).
- If no, go to [Step 3](#).

**Step 2** View the spoolDir monitoring directory to check whether all files are already transferred.

- If yes, no further action is required.
- If no, go to [Step 5](#).

#### NOTE

The monitoring directory of spoolDir is specified by the **.spoolDir** parameter in the **properties.properties** configuration file. If all files in the monitoring directory have been transferred, the file name extension of all files in the monitoring directory is **.COMPLETED**.

**Step 3** Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.source.kafka.KafkaSource** in the file, and check whether the Flume source type is Kafka.

- If yes, go to [Step 4](#).
- If no, go to [Step 7](#).

**Step 4** Check whether the topic data configured by the Kafka source has been used up.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Step 5** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, and choose **Services > Flume > Instances**.

**Step 6** Go to the Flume instance page of the faulty node to check whether the **Source Speed Metrics** in the alarm is **0**.

- If yes, go to [Step 11](#).
- If no, go to [Step 7](#).

### Check the network connectivity between the node with the IP address configured for the Flume source and the faulty node.

**Step 7** Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume source type is Avro.

- If yes, go to [Step 8](#).
- If no, go to [Step 11](#).

**Step 8** Log in to the faulty node as user **root**, and run the **ping** *IP address of the Flume source* command to check whether the peer host can be pinged successfully.

- If yes, go to **Step 11**.
- If no, go to **Step 9**.

**Step 9** Contact the network administrator to restore the network.

**Step 10** Wait for a while and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 11**.

#### **Collect fault information.**

**Step 11** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 12** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 13** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 14** Contact O&M personnel and provide the collected logs.

----End

## **Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

## **Related Information**

None

# **12.13.197 ALM-24005 Exception Occurs When Flume Transmits Data**

## **Alarm Description**

The alarm module monitors the capacity status of Flume Channel. The alarm is generated immediately when the duration that Channel is fully occupied exceeds the threshold or the number of times that Source fails to send data to Channel exceeds the threshold.

The default threshold is **10**. You can change the threshold by modifying the **channelfullcount** parameter of the related channel in the **properties.properties** configuration file in the **conf** directory.

The alarm is cleared when the space of Flume Channel is released and the alarm handling is complete.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24005	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
AgentId	Specifies the ID of the agent for which the alarm was generated.
ComponentType	Specifies the type of the component for which the alarm was generated.
ComponentName	Specifies the name of the component for which the alarm was generated.

## Impact on the System

If the disk usage of Flume Channel increases continuously, the time required for importing data to a specified destination prolongs. When the disk usage of Flume Channel reaches 100%, the Flume agent process pauses.

## Possible Causes

- Flume Sink is faulty, so the data cannot be sent.
- The network is faulty, so the data cannot be sent.

## Handling Procedure

**Check whether Flume Sink is faulty.**

**Step 1** Open the **properties.properties** configuration file on the local PC, search for **type = hdfs** in the file, and check whether the Flume sink type is HDFS.

- If yes, go to [Step 2](#).
- If no, go to [Step 3](#).

**Step 2** On FusionInsight Manager, check whether **HDFS Service Unavailable** alarm is generated in the alarm list and whether the HDFS service is stopped in the service list.

- If the alarm is reported, clear it according to the handling suggestions of ALM-14000 HDFS Service Unavailable; if the HDFS service is stopped, start it. Then, go to [Step 7](#).
  - If no, go to [Step 7](#).
- Step 3** Open the **properties.properties** configuration file on the local PC, search for **type = hbase** in the file, and check whether the Flume sink type is HBase.
- If yes, go to [Step 4](#).
  - If no, go to [Step 5](#).
- Step 4** On FusionInsight Manager, check whether **HBase Service Unavailable** alarm is generated in the alarm list and whether the HBase service is stopped in the service list.
- If the alarm is reported, clear it according to the handling suggestions of ALM-19000 HBase Service Unavailable; if the HBase service is stopped, start it. Then, go to [Step 7](#).
  - If no, go to [Step 7](#).
- Step 5** Open the **properties.properties** configuration file on the local PC, search for **org.apache.flume.sink.kafka.KafkaSink** in the file, and check whether the Flume sink type is Kafka.
- If yes, go to [Step 6](#).
  - If no, go to [Step 9](#).
- Step 6** On FusionInsight Manager, check whether **Kafka Service Unavailable** alarm is generated in the alarm list and whether the Kafka service is stopped in the service list.
- If the alarm is reported, clear it according to the handling suggestions of ALM-38000 Kafka Service Unavailable; if the Kafka service is stopped, start it. Then, go to [Step 7](#).
  - If no, go to [Step 7](#).
- Step 7** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > Flume > Instance**.
- Step 8** Go to the Flume instance page of the faulty node to check whether the indicator **Sink Speed Metrics** is 0.
- If yes, go to [Step 13](#).
  - If no, go to [Step 9](#).
- Check the network connection between the faulty node and the node that corresponds to the Flume Sink IP address.**
- Step 9** Open the **properties.properties** configuration file on the local PC, search for **type = avro** in the file, and check whether the Flume sink type is Avro.
- If yes, go to [Step 10](#).
  - If no, go to [Step 13](#).
- Step 10** Log in to the faulty node as user **root**, and run the **ping IP address of the Flume sink** command to check whether the peer host can be pinged successfully.
- If yes, go to [Step 13](#).

- If no, go to [Step 11](#).

**Step 11** Contact the network administrator to restore the network.

**Step 12** In the alarm list, check whether the alarm is cleared after a period.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collect the fault information.**

**Step 13** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 14** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 15** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.198 ALM-24006 Heap Memory Usage of Flume Server Exceeds the Threshold

## Alarm Description

The system checks the heap memory usage of the Flume service every 60 seconds. This alarm is generated when the heap memory usage of the Flume instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24006	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the heap memory overflows, the service may break down and the Flume instance may be unavailable.

## Possible Causes

The heap memory of the Flume instance is overused or the heap memory is inappropriately allocated.

## Handling Procedure

**Check the heap memory usage.**

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **Flume Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Heap Memory Resource Percentage**. Then, click **OK**.
- Step 3** Check whether the heap memory used by Flume reaches the threshold (95% of the maximum heap memory by default).
  - If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > Flume > Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume > System**. Set **-Xmx** in the **GC\_OPTS**

parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

---

**NOTICE**

- During the restart, the Flume service is interrupted.
  - During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.
- 

**Collect the fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 12.13.199 ALM-24007 Flume Server Direct Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the direct memory usage of the Flume service every 60 seconds. This alarm is generated when the direct memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the Flume direct memory usage is less than or equal to the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24007	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

If the direct memory overflows, the service may break down and the Flume instance may be unavailable.

## Possible Causes

The direct memory of the Flume process is overused or the direct memory is inappropriately allocated.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **Flume Direct Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Direct Memory Resource Percentage**. Then, click **OK**.

- Step 3** Check whether the direct memory used by Flume reaches the threshold (80% of the maximum direct memory by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Service** > **Flume** > **Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume** > **System**. Set **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the direct memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxDirectMemorySize** to twice the current direct memory size or change the value based on site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

- During the restart, the Flume service is interrupted.
  - During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.
- 

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 7** Expand the **Service** drop-down list, and select **Flume** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

## 12.13.200 ALM-24008 Flume Server Non Heap Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the non-heap memory usage of the Flume service every 60 seconds. This alarm is generated when the non-heap memory usage of the Flume instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24008	Major	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

If the non-heap memory overflows, the service may break down and the Flume instance may be unavailable.

### Possible Causes

The non-heap memory of the Flume instance is overused or the non-heap memory is inappropriately allocated.

### Handling Procedure

**Check non-heap memory usage.**

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **Flume Non Heap Memory Usage Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Flume Non Heap Memory Resource Percentage**. Then, click **OK**.
- Step 3** Check whether the non-heap memory used by Flume reaches the threshold (80% of the maximum non-heap memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > Flume > Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume > System**. Set **-XX:MaxPermSize** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the non-heap memory size configured for the Flume server instance cannot meet service requirements. You are advised to change the value of **-XX:MaxPermSize** to twice the current non-heap memory size or change the value based on site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

---

**NOTICE**

- During the restart, the Flume service is interrupted.
  - During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.
- 

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Flume** for the target cluster.
- Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.201 ALM-24009 Flume Server Garbage Collection (GC) Time Exceeds the Threshold

## Alarm Description

The system checks the GC duration of the Flume process every 60 seconds. This alarm is generated when the GC duration of the Flume process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24009	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

Flume data transmission efficiency decreases.

## Possible Causes

The heap memory of the Flume process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Handling Procedure

### Check the GC duration.

- Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **GC Duration Exceeds the Threshold**, and view the **Location** information. Check the name of the host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Name of the target cluster > Services > Flume**. On the page that is displayed, click the **Instance** tab. On the displayed tab page, select the role corresponding to the host name for which the alarm is generated and select **Customize** from the drop-down list in the upper right corner of the chart area. Choose **Agent** and select **Garbage Collection (GC) Duration of Flume**. Then, click **OK**.
- Step 3** Check whether the GC duration of the Flume process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Service > Flume > Configuration**. On the page that is displayed, click **All Configurations** and choose **Flume > System**. Set **-Xmx** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

### NOTE

If this alarm is generated, the heap memory configured for the Flume server is insufficient for data transmission. You are advised to change the heap memory to: Channel capacity x Maximum size of a single data record x Number of channels. Note that the value of **xmx** cannot exceed the remaining memory of the node.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

---

### NOTICE

- During the restart, the Flume service is interrupted.
  - During the instance restart, if the failover mode of SinkGroup is configured and at least one instance is running properly, the Flume service is not interrupted. Otherwise, the Flume service is interrupted.
- 

### Collect fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 8** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

## 12.13.202 ALM-24010 Flume Certificate File Is Invalid or Damaged

This section applies to MRS 3.2.0 or later.

## Alarm Description

Flume checks whether the Flume certificate file is valid (whether the certificate exists and whether the certificate format is correct) every hour. This alarm is generated when the certificate file is invalid or damaged. This alarm is automatically cleared when the certificate file becomes valid again.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24010	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The Flume client cannot access the Flume server.

## Possible Causes

The Flume certificate file is invalid or damaged.

## Handling Procedure

**View alarm information.**

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **ALM-24010 Flume Certificate File Is Invalid or Damaged**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

**Check whether the certificate file in the system is valid. If it is not, generate a new one.**

**Step 2** Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

**Step 3** Run the following command to go to the Flume service certificate directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

**Step 4** Run the **ls -l** command to check whether the **flume\_sChat.crt** file exists.

- If yes, go to **Step 5**.
- If no, go to **Step 6**.

**Step 5** Run the **openssl x509 -in flume\_sChat.crt -text -noout** command to check whether certificate details are displayed properly.

- If yes, go to **Step 9**.
- If no, go to **Step 6**.

**Step 6** Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin
```

**Step 7** Run the following command to generate a new certificate file. Then check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -f Custom certificate password of the Flume role on the server -g Custom certificate password of the Flume role on the client
```

- If yes, go to **Step 8**.
- If no, go to **Step 9**.

 **NOTE**

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

**Step 8** Check whether this alarm is generated again during periodic system check.

- If yes, go to **Step 9**.
- If no, no further action is required.

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 11** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

## 12.13.203 ALM-24011 Flume Certificate File Is About to Expire

This section applies to MRS 3.2.0 or later.

### Alarm Description

Flume checks whether the Flume certificate file is about to expire every hour. This alarm is generated when the remaining validity period is at most 30 days. This alarm is automatically cleared when the remaining validity period is greater than 30 days.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24011	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

Currently, there is no impact on the system.

## Possible Causes

The Flume certificate file is about to expire.

## Handling Procedure

**View alarm information.**

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **ALM-24011 Flume Certificate Is About to Expire**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

**Check whether the certificate file in the system is valid. If it is not, generate a new one.**

**Step 2** Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

**Step 3** Run the following command to go to the Flume service certificate directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

**Step 4** Run the following command to check the effective time and expiration time of the Flume user certificate:

```
openssl x509 -noout -text -in flume_sChat.crt
```

**Step 5** Perform [Step 6](#) to [Step 7](#) during off-peak hours to update the certificate file as needed.

**Step 6** Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/  
flume/bin
```

**Step 7** Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -f Custom certificate password of the Flume role on the server -g  
Custom certificate password of the Flume role on the client
```

- If yes, go to [Step 9](#).
- If no, go to [Step 8](#).

 **NOTE**

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

**Step 8** Log in to the Flume node for which the alarm is generated as user **omm** and repeat [Step 6](#) to [Step 7](#). Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

**Step 9** Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 10](#).
- If no, no further action is required.

**Collect fault information.**

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 11** Expand the **Service** drop-down list, and select **Flume** for the target cluster.

**Step 12** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

## 12.13.204 ALM-24012 Flume Certificate File Has Expired

This section applies to MRS 3.2.0 or later.

## Alarm Description

Flume checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the certificate file becomes valid again.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24012	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The Flume client cannot access the Flume server.

## Possible Causes

The Flume certificate file has expired.

## Handling Procedure

**View alarm information.**

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **ALM-24012 Flume Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

**Check whether the certificate file in the system is valid. If it is not, generate a new one.**

**Step 2** Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

**Step 3** Run the following command to go to the Flume service certificate directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/  
flume/conf
```

**Step 4** Run the following command to check the effective time and expiration time of the HA user certificate to determine whether the certificate file is still in the validity period:

```
openssl x509 -noout -text -in flume_sChat.crt
```

- If yes, go to [Step 9](#).
- If no, go to [Step 5](#).

**Step 5** Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/  
flume/bin
```

**Step 6** Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -f Custom certificate password of the Flume role on the server -g  
Custom certificate password of the Flume role on the client
```

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

#### NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

**Step 7** Log in to the Flume node for which the alarm is generated as user **omm** and repeat [Step 5](#) to [Step 6](#). Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 8** Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 9](#).
- If no, no further action is required.

#### Collect fault information.

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

**Step 8** Log in to the Flume node for which the alarm is generated as user **omm** and repeat [Step 6](#) to [Step 7](#). Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to [Step 9](#).
- If no, go to [Step 10](#).

**Step 9** Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 10](#).
- If no, no further action is required.

**Collect fault information.**

**Step 10** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 11** Select **MonitorServer** in the required cluster for **Service**.

**Step 12** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

## 12.13.207 ALM-24015 Flume MonitorServer Certificate File Has Expired

This section applies to MRS 3.2.0 or later.

## Alarm Description

MonitorServer checks whether its certificate file in the system has expired every hour. This alarm is generated when the server certificate has expired. This alarm is automatically cleared when the MonitorServer certificate file becomes valid again.

## Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
24015	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
RoleName	Specifies the role for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The Flume client cannot access the Flume server.

## Possible Causes

The MonitorServer certificate file has expired.

## Handling Procedure

**View alarm information.**

**Step 1** Log in to FusionInsight Manager and choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**. On the page that is displayed, locate the row containing **ALM-24015 MonitorServer Certificate Has Expired**, and view the **Location** information. View the IP address of the instance for which the alarm is generated.

**Check whether the certificate file in the system is valid. If it is not, generate a new one.**

**Step 2** Log in to the node for which the alarm is generated as user **root** and run the **su - omm** command to switch to user **omm**.

**Step 3** Run the following command to go to the MonitorServer certificate file directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/conf
```

**Step 4** Run the following command to check the effective time and expiration time of the user certificate to determine whether the certificate file is still in the validity period:

```
openssl x509 -noout -text -in ms_sChat.crt
```

- If yes, go to [Step 9](#).
- If no, go to [Step 5](#).

**Step 5** Run the following command to go to the Flume script directory:

```
cd ${BIGDATA_HOME}/FusionInsight_Porter_*/install/FusionInsight-Flume-*/flume/bin
```

**Step 6** Run the following command to generate a new certificate file. Then, check whether the alarm is automatically cleared one hour later.

```
sh geneJKS.sh -m Custom password of the MonitorServer certificate on the server -n Custom password of the MonitorServer certificate on the client
```

- If yes, go to [Step 8](#).
- If no, go to [Step 7](#).

#### NOTE

The custom certificate passwords must meet the following complexity requirements:

- Contain at least four types of uppercase letters, lowercase letters, digits, and special characters.
- Contain 8 to 64 characters.
- Be changed periodically (for example, every three months), and certificates and trust lists are generated again to ensure security.

**Step 7** Log in to the Flume node for which the alarm is generated as user **omm** and repeat [Step 5](#) to [Step 6](#). Then, check whether the alarm is automatically cleared one hour later.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 8** Check whether this alarm is generated again during periodic system check.

- If yes, go to [Step 9](#).
- If no, no further action is required.

#### Collect fault information.

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 10** Select **MonitorServer** in the required cluster for **Service**.

**Step 11** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.208 ALM-25000 LdapServer Service Unavailable

## Description

The system checks the LdapServer service status every 30 seconds. This alarm is generated when the system detects that both the active and standby LdapServer services are abnormal.

This alarm is cleared when the system detects that one or two LdapServer services are normal.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
25000	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The running status of the component that depends on the LdapServer becomes faulty. As a result, Kerberos authentication fails in the cluster or OS user cache synchronization is abnormal, and component services are abnormal.

## Possible Causes

- The node where the LdapServer service locates is faulty.
- The LdapServer process is abnormal.

## Procedure

**Check whether the nodes where the two SlapdServer instances of the LdapServer service are located are faulty.**

**Step 1** On FusionInsight Manager, choose **Cluster > Name of the desired cluster > Services > LdapServer > Instance** to go to the LdapServer instance page to obtain the host name of the node where the two SlapdServer instances locates.

**Step 2** Choose **O&M > Alarm > Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

**Step 3** Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

**Step 4** Handle the alarm according to "ALM-12006 Node Fault".

**Step 5** Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

**Check whether the LdapServer process is normal.**

**Step 6** Choose **O&M > Alarm > Alarms**. On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Process Fault** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 10**.

**Step 7** Check whether the service and host name in the alarm are consistent with the LdapServer service and host name.

- If yes, go to **Step 8**.
- If no, go to **Step 10**.

**Step 8** Handle the alarm according to "ALM-12007 Process Fault".

**Step 9** Check whether **LdapServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 10**.

**Collect fault information.**

**Step 10** On the FusionInsight Manager, choose **O&M > Log > Download**.

**Step 11** Select **LdapServer** in the required cluster from the **Service**.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.209 ALM-25004 Abnormal LdapServer Data Synchronization

## Description

The system checks the LdapServer data every 30 seconds. This alarm is generated when the data on the active and standby LdapServers of Manager is inconsistent for 12 consecutive times. This alarm is cleared when the data on the active and standby LdapServers is consistent.

The system checks the LdapServer data every 30 seconds. This alarm is generated when the LdapServer data in the cluster is inconsistent with that on Manager for 12 consecutive times. This alarm is cleared when the data is consistent.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
25004	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

LdapServer data inconsistency occurs because the LdapServer data in Manager is damaged or the LdapServer data in the cluster is damaged. The LdapServer process with damaged data cannot provide services externally, and the authentication functions of Manager and the cluster are affected.

## Possible Causes

- The network of the node where the LdapServer process locates is faulty.
- The LdapServer process is abnormal.
- The OS restart damages data on LdapServer.
- The amount of Oldap data exceeds the threshold (10 MB by default).

## Procedure

**Check whether the network where the LdapServer nodes reside is faulty.**

**Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).

**Step 2** Contact O&M personnel and log in to the nodes corresponding to IP 1. Run the ping command to check whether the IP address of the management plane of the active OMS node can be pinged.

- If yes, go to [Step 4](#).
- If no, go to [Step 3](#).

**Step 3** Contact the network administrator to recover the network and check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the LdapServer processes are normal.**

**Step 4** On the **Alarm** page of FusionInsight Manager, check whether the **OLdap Resource Abnormal** exists.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** Clear the alarm by following the steps provided in "ALM-12004 OLdap Resource Abnormal".

**Step 6** Check whether **Abnormal LdapServer Data Synchronization** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Step 7** On the **Alarm** page of FusionInsight Manager, check whether **Process Fault** is generated for the LdapServer service.

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

**Step 8** Handle the alarm according to "ALM-12007 Process Fault".

**Step 9** Check whether **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

**Check whether the LdapServer processes are normal.**

**Step 10** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Record the IP address of HostName in the alarm locating information as "IP1" (if multiple alarms exist, record the IP addresses as "IP1", "IP2", and "IP3" respectively). Choose **Cluster > Name of the desired cluster > Services > LdapServer > Configurations**. Record the port number of LdapServer as "PORT". (If the IP address in the alarm locating information is the IP address of the standby management node, choose **System > OMS > oldap > Modify Configuration** and record the listening port number of LdapServer.)

**Step 11** Log in to the nodes corresponding to IP1 as user **omm**.

**Step 12** Run the following command to check whether errors are displayed in the queried information.

```
ldapsearch -H ldaps://IP1:PORT -LLL -x -D cn=root,dc=hadoop,dc=com -W -b ou=Peoples,dc=hadoop,dc=com
```

After running the command, enter the **LDAP** administrator password. Contact the system administrator to obtain the password.

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

**Step 13** Recover the LdapServer and OMS nodes using data backed up before the alarm is generated.

 **NOTE**

Use the OMS data and LdapServer data backed up at the same point in time to recover the data. Otherwise, the service and operation may fail. To recover data when services run properly, you are advised to manually back up the latest management data and then recover the data. Otherwise, Manager data produced between the backup point in time and the recovery point in time will be lost.

**Step 14** Check whether alarm **Abnormal LdapServer Data Synchronization** is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Check whether the data volume of the Oldap exceeds the threshold** (10 MB by default). (This step applies only to versions earlier than MRS 3.3.0. For MRS 3.3.0 and later versions, go to [Step 18](#).)

**Step 15** Log in to the active OMS node as user **omm**.

**Step 16** Run the following command to check whether the directory contains **.mdb** files.

```
ll /srv/BigData/ldapData/oldap/data/
```

- If yes, check and record the size of the **.mdb** file and go to [Step 17](#).

- If no, go to [Step 18](#).

**Step 17** Run the following command to view the Oldap configuration and record the value of **Map size** (the default value is **10485760** bytes, that is, 10 MB)

```
mdb_stat -e /srv/BigData/ldapData/oldap/data/
```

Check whether the size of the **.mdb** file with [Step 16](#) records reaches the value of **Map size**.

- If yes, contact the O&M personnel.
- If no, go to [Step 18](#).

**Collect fault information.**

**Step 18** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 19** Select **LdapServer** in the required cluster and **OmsLdapServer** from the **Service**.

**Step 20** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 21** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.210 ALM-25005 nscd Service Exception

### Alarm Description

The system checks the status of the nscd service every 60 seconds. This alarm is generated when the nscd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
25005	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm was generated.
ServiceName	Specifies the service for which the alarm was generated.
HostName	Specifies the host for which the alarm was generated.

## Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The **id** command may fail to obtain the LDAP data, affecting upper-layer services.

## Possible Causes

- The nscd service is not started.
- The network is faulty, and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

## Handling Procedure

**Check whether the nscd service is started.**

- Step 1** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. Record the IP address of **HostName** in **Location** of the alarm as **IP1** (if multiple alarms exist, record the IP addresses as **IP1**, **IP2**, and **IP3** respectively).
- Step 2** Contact the O&M personnel to access the node using IP1 as user **root**. Run the **ps -ef | grep nscd** command on the node and check whether the **/usr/sbin/nscd** process is started.
- If yes, go to **Step 5**.
  - If no, go to **Step 3**.
- Step 3** Run the **service nscd restart** command as user **root** to restart the nscd service. Then run the **ps -ef | grep nscd** command to check whether the nscd service is started.
- If yes, go to **Step 4**.
  - If no, go to **Step 15**.
- Step 4** Wait for 5 minutes and run the **ps -ef | grep nscd** command again as user **root**. Check whether the service exists.
- If yes, go to **Step 11**.
  - If no, go to **Step 15**.

**Check whether the network is faulty, and whether the LDAP server can be accessed.**

**Step 5** Log in to the alarmed node as user **root** and run the **ping** command to check whether the network connectivity between this node and the LdapServer node is normal.

- If yes, go to [Step 6](#).
- If no, contact network administrators to troubleshoot the fault.

**Check whether the NameService is normal.**

**Step 6** Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command to check whether the **passwd**, **group**, **services**, **netgroup**, and **aliases** of NameService are correctly configured.

The correct parameter configurations are as follows:

**passwd: compat ldap; group: compat ldap; services: files ldap; netgroup: files ldap; aliases: files ldap**

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

**Step 7** Log in to the alarmed node as user **root**. Run the **cat /etc/nscd.conf** command to check whether the **enable-cache passwd**, **positive-time-to-live passwd**, **enable-cache group**, and **positive-time-to-live group** in the configuration file are correctly configured.

The correct parameter configurations are as follows:

**enable-cache passwd: yes; positive-time-to-live passwd: 600; enable-cache group: yes; positive-time-to-live group: 3600**

- If yes, go to [Step 8](#).
- If no, go to [Step 10](#).

**Step 8** Run the **/usr/sbin/nscd -i group** and **/usr/sbin/nscd -i passwd** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to [Step 11](#).
- If no, go to [Step 15](#).

**Step 9** Run the **vi /etc/nsswitch.conf** command as user **root**. Correct the configurations in [Step 6](#) and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to [Step 11](#).
- If no, go to [Step 15](#).

**Step 10** Run the **vi /etc/nscd.conf** command as user **root**. Correct the configurations in [Step 7](#) and save the file. Run the **service nscd restart** command to restart the nscd service. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If yes, go to [Step 11](#).
- If no, go to [Step 15](#).

**Step 11** Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **nscd Service Exception** alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Check whether frame freezing occurs when running a command in the operating system.**

**Step 12** Log in to the faulty node as user **root**, run the **id admin** command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

**Step 13** Run the **cat /var/log/messages** command to check whether the nscd frequently restarts or the error information "Can't contact LDAP server" exists.

nscd exception example:

```
Feb 11 11:44:42 10-120-205-33 nscd: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:43 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.55:21780:
Can't contact LDAP server
Feb 11 11:44:44 10-120-205-33 ntpq: nss_ldap: failed to bind to LDAP server ldaps://10.120.205.92:21780:
Can't contact LDAP server
```

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

**Step 14** Run the **vi\$BIGDATA\_HOME/tmp/random\_ldap\_ip\_order** command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the **vi /etc/ldap.conf** command to enter the editing mode, press **Insert** to start editing, and then change the first two IP addresses of the URI configuration item.

After the modification is complete, press **Esc** to exit the editing mode and enter **:wq!** to save the settings and exit.

Run the **service nscd restart** command to restart the nscd service. Wait 5 minutes and run the **id admin** command again. Check whether the command execution is slow.

- If yes, go to [Step 15](#).
- If no, log in to other faulty nodes and repeat [Step 12](#) to [Step 14](#) to check whether the first LdapServer node in the URI before modifying **/etc/ldap.conf** is faulty. For example, check whether the service IP address is unreachable, the network delay is too long, or other abnormal software is deployed.

**Collect the fault information.**

**Step 15** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 16** Expand the drop-down list next to the **Service** field. In the **Services** dialog box that is displayed, select **LdapClient** for the target cluster.

**Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 18** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 12.13.211 ALM-25006 Sssd Service Exception

## Description

The system checks the status of the sssd service every 60 seconds. This alarm is generated when the sssd process fails to be queried for four consecutive times (three minutes) or users in LdapServer cannot be obtained.

This alarm is cleared when the process is restored and users in LdapServer can be obtained.

## Attribute

Alarm ID	Alarm Severity	Auto Clear
25006	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.

## Impact on the System

The alarmed node may not be able to synchronize data from LdapServer. The id command may fail to obtain the LDAP data, affecting upper-layer services.

## Possible Causes

- The sssd service is not started or is incorrectly started.

- The network is faulty and cannot access the LDAP server.
- NameService is abnormal.
- Users cannot be queried because the OS executes commands too slowly.

## Procedure

### Check whether the sssd service is correctly started.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms**. Find the IP address of **HostName** in **Location** of the alarm and record it as IP1 (if multiple alarms exist, record the IP addresses as IP1, IP2, and IP3 respectively).
- Step 2** Contact the O&M personnel to access the node using IP1 as user **root**. Run the **ps -ef | grep sssd** command and check whether the **/usr/sbin/sss**d process is started.
- If the process is started, go to **Step 3**.
  - If the process is not started, go to **Step 4**.
- Step 3** Check whether the sssd process queried in **Step 2** has three subprocesses.
- If yes, go to **Step 5**.
  - If no, go to **Step 4**.
- Step 4** Run the **service sssd restart** command as user **root** to restart the sssd service. Then run the **ps -ef | grep sssd** command to check whether the sssd process is normal.

In the normal state, the **/usr/sbin/sss**d process has three subprocesses: **/usr/libexec/sss/sss\_be**, **/usr/libexec/sss/sss\_nss**, and **/usr/libexec/sss/sss\_pam**.

- If it exists, go to **Step 9**.
- If it does not exist, go to **Step 13**.

### Check whether the LDAP server can be accessed.

- Step 5** Log in to the alarmed node as user **root**. Run the **ping** command to check the network connectivity between this node and the LdapServer node.
- If the network is normal, go to **Step 6**.
  - If the network is faulty, contact network administrators to troubleshoot the fault.

### Check whether NameService is normal.

- Step 6** Log in to the alarmed node as user **root**. Run the **cat /etc/nsswitch.conf** command and check the **passwd** and **group** configurations of NameService.
- The correct parameter configurations are as follows: **passwd: compat ldap** and **group: compat ldap**.
- If the configurations are correct, go to **Step 7**.
  - If the configurations are incorrect, go to **Step 8**.
- Step 7** Run the **/usr/sbin/sss\_cache -G** and **/usr/sbin/sss\_cache -U** commands as user **root**. Wait for 2 minutes and run the **id admin** and **id backup/manager** commands to check whether results can be queried.

- If results are queried, go to [Step 9](#).
- If no result is queried, go to [Step 13](#).

**Step 8** Run the `vi /etc/nsswitch.conf` command as user **root**. Correct the configurations in [Step 6](#) and save the file. Run the `service sssd restart` command to restart the sssd service. Wait for 2 minutes and run the `id admin` and `id backup/manager` commands to check whether results can be queried.

- If results are queried, go to [Step 9](#).
- If no result is queried, go to [Step 13](#).

**Step 9** Log in to the FusionInsight Manager portal. Wait for 5 minutes and check whether the **sssd Service Exception** alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm persists, go to [Step 10](#).

**Check whether frame freezing occurs when running a command in the operating system.**

**Step 10** Log in to the faulty node as user **root**, run the `id admin` command, and check whether the command execution takes a long time. If the command execution takes more than 3 seconds, the command execution is deemed to be slow.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** Run the `cat /var/log/messages` command to check whether the sssd frequently restarts or the error information **Can't contact LDAP server** exists.

sssd restart example:

```
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Shutting down
Feb 7 11:38:16 10-132-190-105 sssd: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[be[default]]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[nss]: Starting up
Feb 7 11:38:16 10-132-190-105 sssd[pam]: Starting up
```

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** Run the `vi $BIGDATA_HOME/tmp/random_ldap_ip_order` command to modify the number at the end. If the original number is an odd number, change it to an even number. If the number is an even number, change it to an odd number.

Run the `vi /etc/sss/sss.conf` command to reverse the first two IP addresses of the `ldap_uri` configuration item, save the settings, and exit.

Run the `ps -ef | grep sssd` command to query the ID of the sssd process, kill it, and run the `/usr/sbin/sss -D -f` command to restart the sssd service. Wait 5 minutes and run the `id admin` command again.

Check whether the command execution is slow.

- If yes, go to [Step 13](#).
- If no, log in to other faulty nodes and run [Step 10](#) to [Step 12](#). Collect logs and check whether the first ldapserver node in the `ldap_uri` before

modifying `/etc/sss/sss.conf` is faulty. For example, check whether the service IP address is unreachable, the network latency is too long, or other abnormal software is deployed.

#### Collect fault information.

- Step 13** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 14** Select **LdapClient** in the required cluster from the **Service**.
- Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 16** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.212 ALM-25007 Number of SlapdServer Connections Exceeds the Threshold

### Alarm Description

The system checks the number of process connections on the SlapdServer node every 30 seconds and compares the actual number with the threshold. This alarm is generated when the number of process connections exceeds the threshold (**1000** by default) for multiple times (**5** by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the number of process connections is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the number of process connections is less than or equal to 90% of the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
25007	Major	Yes

## Alarm Parameters

Parameter	Description
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

## Impact on the System

SlapdServer may respond slowly or become unavailable. Kerberos authentication times out or OS user caches cannot be synchronized. Component services are faulty.

## Possible Causes

- There are too many SlapdServer connections.
- The alarm threshold or alarm trigger count is improperly configured.

## Handling Procedure

**Check whether there are too many SlapdServer process connections.**

**Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > LdapServer**.

**Step 2** On the LdapServer dashboard page, observe the SlapdServer process connections and decrease the connections based on service requirements.

**Figure 12-38** SlapdServer process connections

**Step 3** Wait about 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the alarm threshold or alarm trigger count is properly configured.**

**Step 4** On FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, choose **LdapServer > Other > SlapdServer Service Connections**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to [Step 7](#).
- If no, go to [Step 5](#).

**Step 5** Change the trigger count and alarm threshold based on the actual number of process connections, and apply the changes.

**Step 6** Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 8** Expand the **Service** drop-down list, and select **LdapServer** for the target cluster.

**Step 9** Specify **Hosts** for collecting logs, which is optional. By default, all hosts are selected.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.213 ALM-25008 SlapdServer CPU Usage Exceeds the Threshold

### Alarm Description

The system checks the CPU usage of the SlapdServer node every 30 seconds and compares the actual usage with the threshold. This alarm is generated when the SlapdServer CPU usage exceeds the threshold for multiple times (5 by default).

Its **Trigger Count** is configurable. If **Trigger Count** is set to **1**, this alarm is cleared when the SlapdServer CPU usage is less than or equal to the threshold. If **Trigger Count** is greater than **1**, this alarm is cleared when the SlapdServer CPU usage is less than or equal to 90% of the threshold.

### Alarm Attributes

Alarm ID	Alarm Severity	Auto Cleared
25008	Critical (default threshold: 85%) Major (default threshold: 75%)	Yes

### Alarm Parameters

Parameter	Description
Source	Specifies the cluster or system for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold for triggering the alarm.

### Impact on the System

SlapdServer may respond slowly or become unavailable. Kerberos authentication times out or OS user caches cannot be synchronized. Component services are faulty.

## Possible Causes

- The alarm threshold or alarm trigger count is improperly configured.
- The CPU configuration cannot meet service requirements, and the CPU usage reaches the upper limit.

## Handling Procedure

**Check whether the alarm threshold or alarm trigger count is properly configured.**

**Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Thresholds**, click the name of the desired cluster, choose **LdapServer > Other > SlapdServer Service Total CPU Percentage**, and check whether the alarm trigger count and alarm threshold are set properly.

- If yes, go to [Step 4](#).
- If no, go to [Step 2](#).

**Step 2** Change the trigger count and alarm threshold based on the actual CPU usage, and apply the changes.

**Step 3** Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the CPU usage reaches the upper limit.**

**Step 4** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the right pane, click this alarm and obtain the host name in **Location**.

**Step 5** Choose **Cluster > Services > LdapServer**, click the **Instance** tab, and click the SlapdServer instance corresponding to the host name in [Step 4](#).

**Step 6** On the dashboard of the instance, observe the real-time data of the **CPU Usage of a Single SlapdServer Instance** chart for about 5 minutes and check whether the CPU usage exceeds the threshold (75% by default) for multiple times.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

**Step 7** Check whether the status of other SlapdServer instances is normal. For details, see [Step 5](#) to [Step 6](#).

- If yes, contact the MRS cluster administrator to evaluate whether to expand the capacity of SlapdServer instances. Then, go to [Step 8](#).
- If no, repair the faulty SlapdServer instance and go to [Step 8](#).

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the **Service** drop-down list, and select **LdapServer** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None.

## 12.13.214 ALM-25500 KrbServer Service Unavailable

### Description

The system checks the KrbServer service status every 30 seconds. This alarm is generated when the system detects that the KrbServer service is abnormal.

This alarm is cleared when the system detects that the KrbServer service is normal.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
25500	Critical	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The running status of the component that depends on the KrbServer becomes faulty. As a result, the Kerberos authentication of the cluster fails, and the component services are abnormal.

## Possible Causes

- The node where the KrbServer service locates is faulty.
- The OLdap service is abnormal.

## Procedure

### Check whether the node where the KrbServer service locates is faulty.

**Step 1** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer** > **Instance** to go to the KrbServer instance page to obtain the host name of the node where the KrbServer service locates.

**Step 2** On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **Node Fault** exists.

- If yes, go to **Step 3**.
- If no, go to **Step 6**.

**Step 3** Check whether the host name in the alarm is consistent with the **Step 1** host name.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

**Step 4** Handle the alarm according to "ALM-12006 Node Fault".

**Step 5** Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 6**.

### Check whether the OLdap service is normal.

**Step 6** On the **Alarm** page of the FusionInsight Manager system, check whether any alarm of **OLdap Resource Abnormal** exists.

- If yes, go to **Step 7**.
- If no, go to **Step 9**.

**Step 7** Handle the alarm according to "ALM-12004 OLdap Resource Abnormal".

**Step 8** Check whether **KrbServer Service Unavailable** is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to **Step 9**.

### Collect fault information.

**Step 9** On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

**Step 10** Select **KrbServer** in the required cluster from the **Service**.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.215 ALM-26051 Storm Service Unavailable

## Description

The system checks the Storm service status every 30 seconds. This alarm is generated when all Nimbus nodes in the cluster are abnormal and the Storm service is unavailable.

This alarm is cleared when the Storm service recovers.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26051	Critical	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

## Impact on the System

The cluster cannot provide the Storm service, and users cannot perform new Storm tasks.

## Possible Causes

- The Kerberos cluster is faulty.
- The ZooKeeper cluster is faulty or suspended.
- The active and standby Nimbus nodes in the Storm cluster are abnormal

## Procedure

**Check the status of the Kerberos cluster. (Skip this step if the normal mode is used.)**

**Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services**.

**Step 2** Check whether the running status of the Kerberos service is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** See the related maintenance information of **ALM-25500 KrbServer Service Unavailable**.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Check the status of the ZooKeeper cluster.**

**Step 5** Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** If ZooKeeper service is stopped, start it, else see the related maintenance information of **ALM-13000 ZooKeeper Service Unavailable**.

**Step 7** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Check the status of the active and standby Nimbus nodes.**

**Step 8** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to go to the Nimbus Instances page.

**Step 9** Check whether only one Nimbus node that is in the **Active** state in **Roles**.

- If yes, go to [Step 13](#).
- If no, go to [Step 10](#).

**Step 10** Select two Nimbus role instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** Log in to the FusionInsight Manager portal again, choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Nimbus** to check whether the running status is **Normal**.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

### Collecting Fault Information

**Step 13** On the FusionInsight Manager, choose **O&M** > **Log** > **Download**.

**Step 14** Select the following nodes in the required cluster from the **Service** drop-down list:

- KrbServer

#### NOTE

KrbServer logs do not need to be downloaded in normal mode.

- ZooKeeper
- Storm

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.216 ALM-26052 Number of Available Supervisors of the Storm Service Is Less Than the Threshold

### Description

The system periodically checks the number of available Supervisors every 60 seconds and compares the number of available Supervisors with the threshold. This alarm is generated when the number of available Supervisors is less than the threshold.

You can change the threshold in **O&M** > **Alarm** > **Thresholds** > *Name of the desired cluster*.

This alarm is cleared when the number of available Supervisors is greater than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26052	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Existing tasks in the cluster cannot be performed. The cluster can receive new Storm tasks, but cannot perform these tasks.

## Possible Causes

The status of some Supervisors in the cluster is abnormal.

## Procedure

### Check the Supervisor status.

- Step 1** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Supervisor** to go to the Storm service management page.
- Step 2** In **Roles**, check whether any instance whose status is **Faulty** or **Restoring** exists.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Wait for 30 seconds, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

 **NOTE**

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

**Collect fault information.**

**Step 5** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 6** Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.217 ALM-26053 Storm Slot Usage Exceeds the Threshold

### Description

The system checks the slot usage every 60 seconds and compares the actual slot usage with the threshold. This alarm is generated when the slot usage is greater than the threshold.

You can change the threshold in **O&M > Alarm > Thresholds**.

This alarm is cleared when the slot usage is less than or equal to the threshold.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26053	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

New Storm tasks cannot be performed.

## Possible Causes

- The status of some Supervisors in the cluster is abnormal.
- The status of all Supervisors is normal, but the processing capability is insufficient.

## Procedure

### Check the Supervisor status.

**Step 1** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Storm** > **Instance** to go to the Storm instance management page.

**Step 2** Check whether any instance whose status is **Faulty** or **Restoring** exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Select Supervisor role instances whose status is **Faulty** or **Restoring**, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

- If yes, go to [Step 4](#).
- If no, go to [Step 10](#).

**Step 4** Wait several minutes, and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Increase the number of slots in each Supervisor.

- Step 5** Log in to the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Storm > Configurations > All Configurations**.
- Step 6** Increase the number of ports in the **supervisor.slots.ports** parameter of each Supervisor role and restart the instance.
- Step 7** Wait several minutes, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 8**.
- Step 8** Perform capacity expansion for Supervisor.
- Step 9** Wait several minutes, and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 10**.

 **NOTE**

Services are interrupted when the Supervisor is being restarted. Then, services are restored after the restarting.

**Collect fault information.**

- Step 10** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 11** Select **Storm** and **ZooKeeper** in the required cluster from the **Service** drop-down list box.
- Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 13** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.218 ALM-26054 Nimbus Heap Memory Usage Exceeds the Threshold

## Description

The system checks the heap memory usage of Storm Nimbus every 30 seconds and compares the actual usage with the threshold. The alarm is generated when the heap memory usage of Storm Nimbus exceeds the threshold (80% of the maximum memory by default) for 5 consecutive times.

Users can choose **O&M > Alarm > Thresholds > Name of the desired cluster > Storm > Nimbus** to change the threshold.

The alarm is cleared when the heap memory usage is less than or equal to the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
26054	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service name for which the alarm is generated.
RoleName	Specifies the role name for which the alarm is generated.
HostName	Specifies the object (host ID) for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

When the heap memory usage of Storm Nimbus is overhigh, frequent GCs occur. In addition, a memory overflow may occur so that the Yarn service is unavailable.

## Possible Causes

The heap memory of the Storm Nimbus instance on the node is overused or the heap memory is inappropriately allocated. As a result, the usage exceeds the threshold.

## Procedure

**Check the heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Heap Memory Usage of Storm Nimbus Exceeds the Threshold > Location**. Check the host name of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Storm > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the

chart area and choose **Customize > Nimbus > Heap Memory Usage of Nimbus**. Click **OK**.

**Step 3** Check whether the used heap memory of Nimbus reaches the threshold (The default value is 80% of the maximum heap memory) specified for Nimbus.

- If yes, go to **Step 4**.
- If no, go to **Step 6**.

**Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Storm > Configurations > All Configurations > Nimbus > System**. Change the value of **-Xmx** in **NIMBUS\_GC\_OPTS** based on site requirements, and click **Save**. Click **OK**.

 **NOTE**

- You are advised to set **-Xms** and **-Xmx** to the same value to prevent adverse impact on performance when JVM dynamically adjusts the heap memory size.
- The number of Workers grows as the Storm cluster scale increases. You can increase the value of **GC\_OPTS** for Nimbus. The recommended value is as follows: If the number of Workers is 20, set **-Xmx** to a value greater than or equal to 1 GB. If the number of Workers exceeds 100, set **-Xmx** to a value greater than or equal to 5 GB.

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 6**.

 **NOTE**

During the restart of the service or instance, services are interrupted. After the service or instance is restarted, services are restored.

**Collect fault information.**

**Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 7** Select the following node in the required cluster from the **Service** drop-down list.

- NodeAgent
- Storm

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.219 ALM-27001 DBService Service Unavailable

### Description

The alarm module checks the DBService service status every 30 seconds. This alarm is generated when the system detects that DBService service is unavailable.

This alarm is cleared when DBService service recovers.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27001	Critical	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.

### Impact on the System

The database service is unavailable and cannot provide data import and query functions for upper-layer services, which results in some services exceptions.

### Possible Causes

- The floating IP address does not exist.
- There is no active DBServer instance.
- The active and standby DBServer processes are abnormal.

### Procedure

**Check whether the floating IP address exists in the cluster environment.**

**Step 1** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Instance**.

**Step 2** Check whether the active instance exists.

- If yes, go to [Step 3](#).
- If no, go to [Step 9](#).

**Step 3** Select the active DBServer instance and record the IP address.

**Step 4** Log in to the host that corresponds to the preceding IP address as user **root**, and run the **ifconfig** command to check whether the DBService floating IP address exists on the node.

- If yes, go to [Step 5](#).
- If no, go to [Step 9](#).

**Step 5** Run the **ping floatip** command to check whether the DBService floating IP address can be pinged successfully.

- If yes, go to [Step 6](#).
- If no, go to [Step 9](#).

**Step 6** Log in to the host that corresponds to the DBService floating IP address as user **root**, and run the command to delete the floating IP address.

**ifconfig interface down**

**Step 7** On the FusionInsight Manager home page, choose **Cluster > Services > DBService > More > Restart Service** to restart DBService, and check whether DBService is restarted successfully.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

**Step 8** Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 14](#).

**Check the status of the active DBServer instance.**

**Step 9** Select the DBServer instance whose role status is abnormal and record the IP address.

**Step 10** On the **Alarm** page, check whether **Process Fault** occurs in the DBServer instance on the host that corresponds to the IP address.

- If yes, go to [Step 11](#).
- If no, go to [Step 14](#).

**Step 11** Handle the alarm according to "ALM-12007 Process Fault".

**Step 12** Wait for about 5 minutes and check whether the alarm is cleared in the alarm list.

- If yes, no further action is required.
- If no, go to [Step 19](#).

**Check the status of the active and standby DBServers.**

- Step 13** Log in to the host that corresponds to the preceding IP address as user **root**, and run the **su - omm** command to switch to user **omm**.
- Step 14** Run the **cd \${DBSERVER\_HOME}** command to go to the installation directory of the DBService.
- Step 15** Run the **sh sbin/status-dbserver.sh** command to view the status of the active and standby HA processes of DBService. Determine whether the status can be viewed successfully.

10_5_89_66    gaussDB      Standby_normal Normal             Active_standby
```

- If yes, go to **Step 16**.
  - If no, go to **Step 19**.
- Step 16** Check whether the active and standby HA processes are in the abnormal state.
- If yes, go to **Step 17**.
  - If no, go to **Step 19**.
- Step 17** On FusionInsight Manager, choose **Cluster > Services > DBService > More > Restart Service** to restart DBService, and check whether the system displays a message indicating that the restart is successful.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

- If yes, go to **Step 18**.
  - If no, go to **Step 19**.
- Step 18** Wait for about 2 minutes and check whether the alarm is cleared in the alarm list.
- If yes, no further action is required.
  - If no, go to **Step 19**.

**Collect fault information.**

- Step 19** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 20** Select **DBService** in the required cluster and **NodeAgent** from the **Service**.
- Step 21** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 22** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.220 ALM-27003 DBService Heartbeat Interruption Between the Active and Standby Nodes

### Description

This alarm is generated when the active or standby DBService node does not receive heartbeat messages from the peer node for 7 seconds.

This alarm is cleared when the heartbeat recovers.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27003	Major	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies a local DBService HA.
Peer DBService HA Name	Specifies a peer DBService HA.

### Impact on the System

During the DBService heartbeat interruption, only one node can provide the service. If this node is faulty, no standby node is available for failover and the service is unavailable.

## Possible Causes

The link between the active and standby DBService nodes is abnormal.

## Procedure

**Check whether the network between the active DBService server and the standby DBService server is normal.**

- Step 1** In the alarm list on FusionInsight Manager, click  in the row where the alarm is located in the real-time alarm list and view the standby DBService server address.
- Step 2** Log in to the active DBService server as user **root**.
- Step 3** Run the **ping *standby DBService heartbeat IP address*** command to check whether the standby DBService server is reachable.
- If yes, go to **Step 6**.
  - If no, go to **Step 4**.
- Step 4** Contact the network administrator to check whether the network is faulty.
- If yes, go to **Step 5**.
  - If no, go to **Step 6**.
- Step 5** Rectify the network fault and check whether the alarm is cleared from the alarm list.
- If yes, no further action is required.
  - If no, go to **Step 6**.

**Collect fault information.**

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 7** Select the following nodes in the required cluster from the **Service**:
- DBService
  - Controller
  - NodeAgent
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.221 ALM-27004 Data Inconsistency Between Active and Standby DBServices

### Description

The system checks the data synchronization status between the active and standby DBService every 10 seconds. This alarm is generated when the synchronization status cannot be queried for six consecutive times or when the synchronization status is abnormal.

This alarm is cleared when the synchronization status becomes normal.

### Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27004	Critical	Yes

### Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Local DBService HA Name	Specifies the HA name of the local DBService.
Peer DBService HA Name	Specifies the HA name of the peer DBService.
SYNC_PERCENT	Specifies the synchronization percentage.

### Impact on the System

When data is not synchronized between the active and standby DBServices, data may be lost or abnormal if the active instance becomes abnormal.

## Possible Causes

- The network between the active and standby nodes is unstable.
- The standby DBService is abnormal.
- The standby node disk space is full.
- The CPU usage of the GaussDB process on the active DBService node is high. You need to locate the failure cause based on logs.

## Procedure

### Check whether the network between the active and standby nodes is normal.

- Step 1** On FusionInsight Manager, choose **Cluster > Services > DBService > Instance**, check the service IP address of the standby DBServer instance.
- Step 2** Log in to the active DBService node as user **root**.
- Step 3** Run the **ping Standby DBService heartbeat IP address** command to check whether the standby DBService node is reachable.
- If yes, go to **Step 6**.
  - If no, go to **Step 4**.
- Step 4** Contact the network administrator to check whether the network is faulty.
- If yes, go to **Step 5**.
  - If no, go to **Step 6**.
- Step 5** Rectify the network fault and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

### Check whether the standby DBService is normal.

- Step 6** Log in to the standby DBService node as user **root**.
- Step 7** Run the **su - omm** command to switch to user **omm**.
- Step 8** Go to the **`\${DBSERVER\_HOME}/sbin** directory and run the **./status-dbserver.sh** command to check whether the GaussDB resource status of the standby DBService is normal. In the command output, check whether the following information is displayed in the row where **ResName** is **gaussDB**:

For example:

```
10_10_10_231 gaussDB Standby_normal Normal Active_standby
```

- If yes, go to **Step 9**.
- If no, go to **Step 16**.

### Check whether the standby node disk space is full. (Skip this check for versions later than MRS 3.1.2.)

- Step 9** Log in to the standby DBService node as user **root**.
- Step 10** Run the **su - omm** command to switch to user **omm**.
- Step 11** Go to the **`\${DBSERVER\_HOME}** directory, and run the following commands to obtain the DBService data directory:

```
cd ${DBSERVER_HOME}
source .dbservice_profile
echo ${DBSERVICE_DATA_DIR}
```

**Step 12** Run the `df -h` command to view the system disk partition usage information.

**Step 13** Check whether the DBService data directory space is full.

- If yes, go to [Step 14](#).
- If no, go to [Step 16](#).

**Step 14** Expand the disk capacity.

**Step 15** After the disk capacity is expanded, wait 2 minutes and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 16](#).

**Collect fault information.**

**Step 16** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 17** In the **Service** area, select **DBService** of the target cluster and **OS, OS Statistics**, and **OS Performance** under **O&M**, and click **OK**.

**Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 19** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.222 ALM-27005 Database Connections Usage Exceeds the Threshold

### Description

The system checks the usage of the number of database connections of the nodes where DBServer instances are located every 30 seconds and compares the usage with the threshold. If the usage exceeds the threshold for five consecutive times (this number is configurable, and 5 is the default value), the system generates this alarm. The default usage threshold is 90%, and you can configure it based on site requirements.

The trigger count is configurable. This alarm is cleared in the following scenarios:

- The trigger count is 1, and the usage of the number of database connections is less than or equal to the threshold.
- The trigger count is greater than 1, and the usage of the number of database connections is less than or equal to 90% of the threshold.

## Attribute

Alarm ID	Alarm Severity	Automatically Cleared
27005	Major	Yes

## Parameters

Name	Meaning
Source	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

Upper-layer services may fail to connect to the DBService database, affecting services.

## Possible Causes

- Too many database connections are used.
- The maximum number of database connections is improperly configured.
- The alarm threshold or alarm trigger count is improperly configured.

## Procedure

### Checking whether too many data connections are used

- Step 1** On FusionInsight Manager, click DBService in the service list on the left navigation pane. The DBService monitoring page is displayed.

**Step 2** Observe the number of connections used by the database user, as shown in [Figure 12-39](#). Based on the service scenario, reduce the number of database user connections.

**Figure 12-39** Number of connections used by database users

**Step 3** Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to [Step 4](#).

**Checking whether the maximum number of database connections is properly configured**

**Step 4** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService** > **Configurations**. On the displayed page, select the **All Configurations** tab, and increase the maximum number of database connections based on service requirements, as shown in [Figure 12-40](#). Click **Save**. In the displayed **Save configuration** dialog box, click **OK**.

**Figure 12-40** Setting the maximum number of database connections

**Step 5** After the maximum number of database connections is changed, restart DBService (do not restart the upper-layer services).

**Procedure:** Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**. On the displayed page, choose **More** > **Restart Service**. Enter the password of the current login user and click **OK**. Do not select **Restart upper-layer services**., click **OK**.

 **NOTE**

The service will be unavailable during the restart. In addition, upper-layer services that depend on the service are affected.

**Step 6** After the service is restarted, wait for 2 minutes and check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

**Checking whether the alarm threshold or trigger count is properly configured**

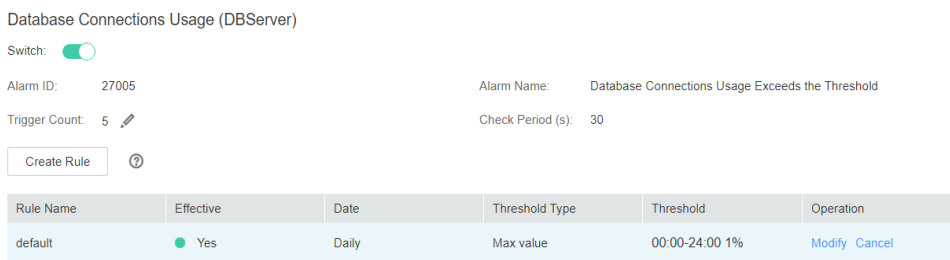

**Step 7** Log in to FusionInsight Manager and change the alarm threshold and alarm trigger count based on the actual database connection usage.

Choose **O&M > Alarm > Thresholds > Name of the desired cluster > DBService > Database > Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click the pencil icon next to **Trigger Count**. In the displayed dialog box, change the trigger count, as shown in [Figure 12-41](#).

 **NOTE**

**Trigger Count:** If the usage of the number of database connections exceeds the threshold consecutively for more than the value of this parameter, an alarm is generated.

**Figure 12-41** Setting alarm trigger count

Based on the actual database connection usage, choose **O&M > Alarm > Thresholds > Name of the desired cluster > DBService > Database > Database Connections Usage (DBServer)**. In the **Database Connections Usage (DBServer)** area, click **Modify** in the **Operation** column. In the **Modify Rule** dialog box, modify the required parameters and click **OK** as shown in [Figure 12-42](#).

**Figure 12-42** Set alarm threshold

Thresholds > **Modify Rule**

---

\* Rule Name:

\* Severity:

\* Threshold Type:  Max value  Min value

\* Date:  Daily  
 Weekly  
 Other

Thresholds:	Start and End Time	Threshold
	<input type="text" value="00:00"/> - <input type="text" value="23:59"/>	<input type="text" value="90"/>

**Step 8** Wait for 2 minutes and check whether the alarm is automatically cleared.

- If it is, no further action is required.
- If it is not, go to **Step 9**.

#### Collect fault information

**Step 9** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 10** Select **DBService** in the required cluster from the **Service**.

**Step 11** Specify the host for collecting logs by setting the **Host** parameter that is optional. By default, all hosts are selected.

**Step 12** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 13** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.223 ALM-27006 Disk Space Usage of the Data Directory Exceeds the Threshold

### Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds and compares the disk usage with the threshold. The alarm is generated when the disk space usage exceeds the threshold for five consecutive times (the default value). The number of consecutive times is configurable. The disk space usage threshold of the data directory is set to 80% by default, which is configurable as well.

The value of **hit number** is configurable. When the value is set to **1** and the disk space usage is lower than or equal to the threshold, the alarm is cleared. When the value is greater than 1 and the disk space usage is lower than 90% of the threshold, the alarm is cleared.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
27006	Major	Yes

### Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.
HostName	Specifies the host for which the alarm is generated.
PartitionName	Specifies the disk partition where the alarm is generated.
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

### Impact on the System

- The DBService service process cannot provide the API for data writing.

- When the disk space usage of the data directory exceeds 90%, the database enters the read-only mode and "Database Enters the Read-Only Mode" is generated. As a result, service data cannot be written to the database.

## Possible Causes

- The alarm threshold is improperly configured.
- The data volume of the database is too large or the disk configuration cannot meet service requirements, causing excessive disk usage.

## Procedure

### Check whether the threshold is set properly.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Name of the desired cluster > DBService > Database > Disk Space Usage of the Data Directory** to check whether the alarm threshold is proper (the default value 80% is a proper value).

- If yes, go to [Step 3](#).
- If no, go to [Step 2](#).

**Step 2** Change the alarm threshold based on the actual service situation.

**Step 3** Choose **Cluster > Name of the desired cluster > Services > DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory is lower than the threshold.

- If yes, go to [Step 4](#).
- If no, go to [Step 5](#).

**Step 4** Wait 2 minutes and check whether the alarm is automatically cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check whether large files are incorrectly written into the disk.

**Step 5** Log in to the active DBService node as user **omm**.

**Step 6** Run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

```
source $DBSERVER_HOME/.dbservice_profile
find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M
```

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 7** Handle the large files based on the actual scenario and check whether the alarm is cleared 2 minutes later.

- If yes, no further action is required.
- If no, go to [Step 8](#).

### Collect fault information.

- Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 9** Expand the **Service** drop-down list, and select **DBService** for the target cluster.
- Step 10** Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.
- Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.224 ALM-27007 Database Enters the Read-Only Mode

### Description

The system checks the disk space usage of the data directory on the active DBServer node every 30 seconds. The alarm is generated when the disk space usage exceeds 90%.

The alarm is cleared when the disk space usage is lower than 80%.

### Attribute

Alarm ID	Alarm Severity	Auto Clear
27007	Critical	Yes

### Parameters

Name	Meaning
ClusterName	Specifies the cluster for which the alarm is generated.
ServiceName	Specifies the service for which the alarm is generated.
RoleName	Specifies the role for which the alarm is generated.

Name	Meaning
Trigger Condition	Specifies the threshold triggering the alarm. If the actual indicator value exceeds this threshold, the alarm is generated.

## Impact on the System

- Service data is lost.
- Data cannot be written for upper-layer services and the data is lost.

## Possible Causes

The disk configuration cannot meet service requirements. The disk usage reaches the upper limit.

## Procedure

**Check whether the disk space usage reaches the upper limit.**

- Step 1** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **DBService**.
- Step 2** On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage of the data directory exceeds 90%.
- If yes, go to **Step 3**.
  - If no, go to **Step 13**.
- Step 3** Log in to the active management node of the DBServer as user **omm** and run the following commands to check whether the database enters the read-only mode:

```
source $DBSERVER_HOME/.dbservice_profile
gsql -U omm -W password -d postgres -p 20051
show default_transaction_read_only;
```

### NOTE

In the preceding commands, *password* indicates the password of user **omm** of the DBService database. You can run the `\q` command to exit the database.

Check whether the value of **default\_transaction\_read\_only** is **on**.

```
POSTGRES=# show default_transaction_read_only;
default_transaction_read_only
-----
on
(1 row)
```

- If yes, go to **Step 4**.
  - If no, go to **Step 13**.
- Step 4** Run the following commands to open the **dbservice.properties** file:
- ```
source $DBSERVER_HOME/.dbservice_profile
```

```
vi ${DBSERVICE_SOFTWARE_DIR}/tools/dbservice.properties
```

**Step 5** Change the value of **gaussdb\_readonly\_auto** to **OFF**.

**Step 6** Run the following command to open the **postgresql.conf** file:

```
vi ${DBSERVICE_DATA_DIR}/postgresql.conf
```

**Step 7** Delete **default\_transaction\_read\_only = on**.

**Step 8** Run the following command for the configuration to take effect:

```
gs_ctl reload -D ${DBSERVICE_DATA_DIR}
```

**Step 9** Log in to FusionInsight Manager and choose **O&M > Alarm > Alarms**. On the right of the alarm "Database Enters the Read-Only Mode", click **Clear** in the **Operation** column. In the dialog box that is displayed, click **OK** to manually clear the alarm.

**Step 10** Log in to the active management node of the DBServer as user **omm** and run the following commands to view the files whose size exceeds 500 MB in the data directory and check whether there are large files incorrectly written into the directory:

```
source $DBSERVER_HOME/.dbservice_profile
```

```
find "$DBSERVICE_DATA_DIR"/../ -type f -size +500M
```

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** Handle the files that are incorrectly written into the directory based on the actual scenario.

**Step 12** Log in to FusionInsight Manager and choose **Cluster > Name of the desired cluster > Services > DBService**. On the **Dashboard** page, view the **Disk Space Usage of the Data Directory** chart and check whether the disk space usage is lower than 80%.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collect fault information.**

**Step 13** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 14** Expand the **Service** drop-down list, and select **DBService** for the target cluster.

**Step 15** Specify the host for collecting logs by setting the **Host** parameter which is optional. By default, all hosts are selected.

**Step 16** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 17** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.225 ALM-29010 Number of Queries Being Submitted by Impalad Exceeds the Threshold

### Alarm Description

The system checks the total number of queries being submitted by the Impalad node every 60 seconds. This alarm is generated when the number of queries exceeds the customized threshold (150 by default).

This alarm is automatically cleared when the number of queries is less than the threshold.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 29010    | Major          | Yes          |

### Alarm Parameters

| Type                   | Parameter         | Description                                              |
|------------------------|-------------------|----------------------------------------------------------|
| Location Information   | Source            | Specifies the cluster for which the alarm was generated. |
|                        | ServiceName       | Specifies the service for which the alarm was generated. |
|                        | RoleName          | Specifies the role for which the alarm was generated.    |
|                        | HostName          | Specifies the host for which the alarm was generated.    |
| Additional Information | Trigger Condition | Specifies the threshold for triggering the alarm.        |

### Impact on the System

The queries may be blocked or even fail.

## Possible Causes

The Impalad service has maintained a large number of queries, or the threshold is too small.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > Query Task Sum Statistics > Total number of Queries Being Submitted (Impalad)** and check the threshold.

Total number of Queries Being Submitted (Impalad)

Switch:

Alarm ID: 29010 Alarm Name: Total number of queries being submitted to Impalad Exceeds the Threshold

Trigger Count: 1 Check Period (s): 60

Create Rule

| Rule Name | Effective                                | Date  | Threshold Type | Threshold             | Operation     |
|-----------|------------------------------------------|-------|----------------|-----------------------|---------------|
| default   | <span style="color: green;">●</span> Yes | Daily | Max value      | 00:00-24:00 <b>50</b> | Modify Cancel |

**Step 2** Change the threshold.

Thresholds > Modify Rule

Rule Name: default

Alarm Severity: Major

Threshold Type:  Max value  Min value

Date:  Daily  Weekly  Others

Thresholds: Start and End Time Threshold

00:00 - 23:59 **1**

OK Cancel

**Step 3** Click the **Instances** tab, select all Impalad instances, and restart them.

### NOTE

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

**Step 4** After the restart is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

**Collect fault information.**

- Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.
- Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 8** Contact O&M personnel and provide the collected logs.
- End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.226 ALM-29011 Number of Queries Being Executed by Impalad Exceeds the Threshold

## Alarm Description

The system checks the total number of queries being executed by the Impalad node every 60 seconds. This alarm is generated when the number of queries exceeds the customized threshold (150 by default).

This alarm is automatically cleared when the number of queries is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 29011    | Major          | Yes          |

## Alarm Parameters

| Type                 | Parameter   | Description                                              |
|----------------------|-------------|----------------------------------------------------------|
| Location Information | Source      | Specifies the cluster for which the alarm was generated. |
|                      | ServiceName | Specifies the service for which the alarm was generated. |
|                      | RoleName    | Specifies the role for which the alarm was generated.    |

| Type                   | Parameter         | Description                                           |
|------------------------|-------------------|-------------------------------------------------------|
|                        | HostName          | Specifies the host for which the alarm was generated. |
| Additional Information | Trigger Condition | Specifies the threshold for triggering the alarm.     |

## Impact on the System

The queries may be blocked or even fail.

## Possible Causes

The Impalad service has maintained a large number of queries, or the threshold is too small.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > Query Task Sum Statistics > Total number of Queries Being Executed (Impalad)** and check the threshold.

Total number of Queries Being Executed (Impalad)

Switch:

Alarm ID: 29011      Alarm Name: Total number of queries being executed to Impalad Exceeds the Threshold

Trigger Count: 1      Check Period (s): 60

Create Rule

| Rule Name | Effective                            | Date  | Threshold Type | Threshold              | Operation     |
|-----------|--------------------------------------|-------|----------------|------------------------|---------------|
| default   | <input checked="" type="radio"/> Yes | Daily | Max value      | 00:00-24:00 <b>150</b> | Modify Cancel |

**Step 2** Change the threshold.

Thresholds > **Modify Rule**

---

• Rule Name: default

• Alarm Severity: Major

• Threshold Type:  Max value  Min value

• Date:  Daily  
 Weekly  
 Others

Thresholds: Start and End Time      Threshold

00:00 - 23:59      **1**

OK      Cancel

**Step 3** Click the **Instances** tab, select all Impalad instances, and restart them.

### NOTE

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

**Step 4** After the restart is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Collect fault information.**

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.227 ALM-29012 Number of Queries Being Waited by Impalad Exceeds the Threshold

## Alarm Description

The system checks the total number of queries being waited by the Impalad node every 60 seconds. This alarm is generated when the number of queries exceeds the customized threshold (150 by default).

This alarm is automatically cleared when the number of queries is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 29012    | Major          | Yes          |

## Alarm Parameters

| Type                   | Parameter         | Description                                              |
|------------------------|-------------------|----------------------------------------------------------|
| Location Information   | Source            | Specifies the cluster for which the alarm was generated. |
|                        | ServiceName       | Specifies the service for which the alarm was generated. |
|                        | RoleName          | Specifies the role for which the alarm was generated.    |
|                        | HostName          | Specifies the host for which the alarm was generated.    |
| Additional Information | Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

The queries may be blocked or even fail.

## Possible Causes

The Impalad service has maintained a large number of queries, or the threshold is too small.

## Handling Procedure

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Thresholds > Impala > Query Task Sum Statistics > Total number of Waiting Queries (Impalad)** and check the threshold.

Total number of Waiting Queries (Impalad)

Switch:

Alarm ID: 29012      Alarm Name: Total number of waiting queries to Impalad Exceeds the Threshold

**Step 3** Click the **Instances** tab, select all Impalad instances, and restart them.

**NOTE**

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

**Step 4** After the restart is complete, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

**Collect fault information.**

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 7** Click the edit icon in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

**Related Information**

None

**12.13.228 ALM-29016 Impalad Instance in the Sub-healthy State**

**Alarm Description**

In MRS 3.1.5, the system checks every 60 seconds whether the Hive Server2 HTTP port (28000) of Impalad responds to cURL requests. This alarm is generated when the returned result has been incorrect for 20 seconds in two consecutive times. This alarm is cleared when the system correctly responds within 20 seconds.

In other MRS versions, the system checks every 60 seconds whether Impalad can execute **select 1**. This alarm is generated when the returned result has been incorrect for 20 seconds in two consecutive times. This alarm is cleared when the SQL statement is correctly executed within 20 seconds.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 29016    | Minor          | Yes          |

## Alarm Parameters

| Type                 | Parameter   | Description                                              |
|----------------------|-------------|----------------------------------------------------------|
| Location Information | Source      | Specifies the cluster for which the alarm was generated. |
|                      | ServiceName | Specifies the service for which the alarm was generated. |
|                      | RoleName    | Specifies the role for which the alarm was generated.    |
|                      | HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

Impalad cannot execute SQL statements or SQL statement execution times out, which affects data read and write.

## Possible Causes

The Impalad service maintains too many queries.

## Handling Procedure

- Step 1** Log in to FusionInsight Manager and choose **Cluster > Services > Impala > Impalad Web UI**. On the displayed page, click any node to go to the web UI.
- Step 2** On the web UI, click **/backends** to view the Impala instance list. Locate the instance for which the alarm is generated and click **Web UI**. After the web UI of the subhealthy node is displayed, click **/queries** to check the task execution status and check whether any task is executed slowly.
  - If yes, go to **Step 3**.
  - If no, go to **Step 4**.
- Step 3** After the task is complete, check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 4**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Impala > Instances**, select the Impala instance for which the alarm is generated, click **More**, and select **Restart Instance**. Then, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

 **NOTE**

The service will become unavailable when all instances are restarted. If a single instance is restarted, the tasks that are being executed on that instance will fail and the service will become available.

**Collect fault information.**

**Step 5** On FusionInsight Manager of the active or standby cluster, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** Expand the **Service** drop-down list, and select **Impala** for the target cluster.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.229 ALM-38000 Kafka Service Unavailable

## Description

The system checks the Kafka service status every 30 seconds. This alarm is generated when the Kafka service is unavailable.

This alarm is cleared when the Kafka service recovers.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38000    | Critical       | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

## Impact on the System

The cluster cannot provide the Kafka service, and users cannot perform new Kafka tasks.

## Possible Causes

- The KrbServer service is abnormal.(Skip this step if the normal mode is used.)
- The ZooKeeper service is abnormal or does not respond.
- The Broker instance in the Kafka cluster are abnormal.

## Procedure

**Check the status of the KrbServer service. (Skip this step if the normal mode is used.)**

**Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **KrbServer**.

**Step 2** Check whether the running status of the KrbServer service is **Normal**.

- If yes, go to [Step 5](#).
- If no, go to [Step 3](#).

**Step 3** Rectify the fault by following the steps provided in **ALM-25500 KrbServer Service Unavailable**.

**Step 4** Perform [Step 2](#) again.

**Check the status of the ZooKeeper cluster.**

**Step 5** Check whether the running status of the ZooKeeper service is **Normal**.

- If yes, go to [Step 8](#).
- If no, go to [Step 6](#).

**Step 6** If ZooKeeper service is stopped, start it, else rectify the fault by following the steps provided in **ALM-13000 ZooKeeper Service Unavailable**.

**Step 7** Perform [Step 5](#) again.

**Check the Broker status.**

**Step 8** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to go to the Kafka instances page.

**Step 9** Check whether all instances in **Roles** are running properly.

- If yes, go to [Step 11](#).
- If no, go to [Step 10](#).

**Step 10** Select all Broker instances, choose **More** > **Restart Instance**, and check whether the instances restart successfully.

 **NOTE**

During the restart of the Broker instance, if the current Topic is a single copy and is on the current Broker node, the Kafka service will be interrupted. Otherwise, the Kafka service will not be affected.

- If yes, go to [Step 11](#).
- If no, go to [Step 13](#).

**Step 11** Choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** to check whether the running status is **Normal**.

- If yes, go to [Step 12](#).
- If no, go to [Step 13](#).

**Step 12** Wait for 30 seconds and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 13](#).

**Collecting Fault Information**

**Step 13** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 14** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 15** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 16** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.230 ALM-38001 Insufficient Kafka Disk Capacity

### Description

The system checks the Kafka disk usage every 60 seconds and compares the actual disk usage with the threshold. The disk usage has a default threshold. This alarm is generated when the disk usage is greater than the threshold.

You can change the threshold in **O&M > Alarm > Thresholds**. Under the service list, choose **Kafka > Disk > Broker Disk Usage (Broker)** and change the threshold.

When the **Trigger Count** is 1, this alarm is cleared when the Kafka disk usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the Kafka disk usage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38001    | Major          | Yes                   |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| PartitionName     | Specifies the disk partition where the alarm is generated.                                                                   |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

Kafka data write operations are affected.

## Possible Causes

- The configuration (such as number and size) of the disks for storing Kafka data cannot meet the requirement of the current service traffic, due to which the disk usage reaches the upper limit.
- Data retention time is too long, due to which the data disk usage reaches the upper limit.
- The service plan does not distribute data evenly, due to which the usage of some disks reaches the upper limit.

## Procedure

### Check the disk configuration of Kafka data.

- Step 1** On the FusionInsight Manager portal and click **O&M > Alarm > Alarms**.
- Step 2** In the alarm list, locate the alarm and obtain **HostName** from **Location**.
- Step 3** Click **Cluster > Name of the desired cluster > Hosts**.
- Step 4** In the host list, click the host name obtained in [Step 2](#).
- Step 5** Check whether the **Disk** area contains the partition name in the alarm.
- If yes, go to [Step 6](#).
  - If no, manually clear the alarm and no further operation is required.
- Step 6** Check whether the disk partition usage contained in the alarm reaches 100% in the **Disk** area.
- If yes, handle the alarm by following the instructions in [Related Information](#).
  - If no, go to [Step 7](#).

### Check the Kafka data storage duration.

- Step 7** Choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations**.
- Step 8** Check whether the value of parameter **disk.adapter.enable** is set to **true**.
- If yes, go to [Step 10](#).
  - If no, go to [Step 9](#).
- Step 9** Set the value of **disk.adapter.enable** to **true**. Check whether the value of **adapter.topic.min.retention.hours** is properly set.
- If yes, go to [Step 10](#).
  - If no, adjust the data retention period based on service requirements.

---

### NOTICE

If the disk auto-adaptation function is enabled, some historical data of specified topics is deleted. If the retention period of some topics cannot be adjusted, click **All Configurations** and add the topics to the value of the **disk.adapter.topic.blacklist** parameter.

---

**Step 10** Wait 10 minutes and check whether the usage of faulty disks reduces.

- If yes, wait until the alarm is cleared.
- If no, go to [Step 11](#).

**Check the Kafka data plan.**

**Step 11** In the **Instance** area, click **Broker**. In the **Real Time** area of Broker, Click the drop-down menu in the Chart area and choose **Customize** to customize monitoring items.

**Step 12** In the dialog box, select **Disk > Broker Disk Usage** and click **OK**.

The Kafka disk usage information is displayed.

**Step 13** View the information in [Step 12](#) to check whether there is only the disk parathion for which the alarm is generated in [Step 2](#).

- If yes, go to [Step 14](#).
- If no, go to [Step 15](#).

**Step 14** Perform disk planning and mount a new disk again. Go to the **Instance Configurations** page of the node for which the alarm is generated, modify **log.dirs**, add other disk directories, and restart the Kafka instance.

 **NOTE**

During the restart of the Broker instance, if the current Topic is a single copy and is on the current Broker node, the Kafka service will be interrupted. Otherwise, the Kafka service will not be affected.

**Step 15** Determine whether to shorten the data retention time configured on Kafka based on service requirements and service traffic.

- If yes, go to [Step 16](#).
- If no, go to [Step 17](#).

**Step 16** Log in to FusionInsight Manager, select **Cluster > Name of the desired cluster > Services > Kafka > Configurations**, and click **All Configurations**. In the search box on the right, enter **log.retention.hours**. The value of the parameter indicates the default data retention time of the topic. You can change the value to a smaller one.

 **NOTE**

- For a topic whose data retention time is configured alone, the modification of the data retention time on the Kafka Service Configuration page does not take effect.
- To modify the data retention time for a topic, use the Kafka client command-line interface (CLI) to configure the topic.

Example: `kafka-topics.sh --zookeeper "ZooKeeper IP address:2181/kafka" --alter --topic "Topic bane" --config retention.ms= "retention time"`

**Step 17** Check whether the usage of some disks reaches the upper limit due to unreasonable configuration of the partitions of some topics. For example, the number of partitions configured for a topic with large data volume is smaller than the number of disks. In this case, the data is not evenly allocated to disks.

 NOTE

If you do not know which topics have a large amount of service data, perform the following steps:

1. Log in to an instance node based on the host node information obtained in [Step 2](#).
2. Go to the data directory (directory specified by **log.dirs** before the modification in [Step 14](#)).
3. Run the following command to check whether there is topic with partition that use large disk space.

```
du -h --max-depth=1 ./
```

- If yes, go to [Step 18](#).
- If no, go to [Step 19](#).

**Step 18** In the Kafka client CLI, run the following command to perform partition capacity expansion for the topic:

```
kafka-topics.sh --zookeeper "ZooKeeper IP address:2181/kafka" --alter --topic  
"Topic name" --partitions="New number of partitions"
```

 NOTE

- You are advised to set the new number of partitions to a multiple of the number of Kafka data disks.
- The step may not quickly clear the alarm, and you need to modify the data retention time in [Step 11](#) to gradually balance data allocation.

**Step 19** Determine whether to perform capacity expansion.

 NOTE

You are advised to perform capacity expansion for Kafka when the current disk usage exceeds 80%.

- If yes, go to [Step 20](#).
- If no, go to [Step 21](#).

**Step 20** Expand the disk capacity and check whether the alarm is cleared after capacity expansion.

- If yes, no further action is required.
- If no, go to [Step 22](#).

**Step 21** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 22](#).

**Collect fault information.**

**Step 22** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 23** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 24** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 25** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

- Step 1** Log in to FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**, stop the Broker instance whose status is **Restoring**, record the management IP address of the node where the Broker instance is located, and record **broker.id**. The value can be obtained by using the following method: Click the role name. On the **Configurations** page, select **All Configurations**, and search for the **broker.id** parameter.
- Step 2** Log in to the recorded management IP address as user **root**, and run the **df -lh** command to view the mounted directory whose disk usage is 100%, for example, **`\${BIGDATA\_DATA\_HOME}/kafka/data1**.
- Step 3** Go to the directory, run the **du -sh \*** command to view the size of each file in the directory, check whether files other than **kafka-logs** exist, and determine whether these files can be deleted or migrated.
- If yes, go to **Step 8**.
  - If no, go to **Step 4**.
- Step 4** Go to the **kafka-logs** directory, run the **du -sh \*** command, select a partition folder to be moved. The naming rule is **Topic name-Partition ID**. Record the topic and partition.
- Step 5** Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the **kafka-logs** directory in the same way.
1. Decrease the number in the second line in the file. (To remove multiple directories, the number deducted is equal to the number of files to be removed.)
  2. Delete the line of the to-be-removed partition. (The line structure is "Topic name Partition ID Offset". Save the data before deletion. Subsequently, the content must be added to the file of the same name in the destination directory.)
- Step 6** Modify the **recovery-point-offset-checkpoint** and **replication-offset-checkpoint** files in the destination data directory. For example, **`\${BIGDATA\_DATA\_HOME}/kafka/data2/kafka-logs** in the same way.
- Increase the number in the second line in the file. (To move multiple directories, the number added is equal to the number of files to be moved.)
  - Add the to-be moved partition to the end of the file. (The line structure is "Topic name Partition ID Offset". You can copy the line data saved in **Step 5**.)
- Step 7** Move the partition to the destination directory. After the partition is moved, run the **chown omm:wheel -R Partition directory** command to modify the directory owner group for the partition.

- Step 8** Log in to FusionInsight Manager and choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance** to start the Broker instance.
- Step 9** Wait for 5 to 10 minutes and check whether the health status of the Broker instance is **Normal**.
- If yes, resolve the disk capacity insufficiency problem according to the handling method of "ALM-38001 Insufficient Kafka Disk Space" after the alarm is cleared.
  - If no, contact the O&M personnel.
- End

## 12.13.231 ALM-38002 Kafka Heap Memory Usage Exceeds the Threshold

### Description

The system checks the Kafka service status every 30 seconds. The alarm is generated when the heap memory usage of a Kafka instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the heap memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the heap memory usage is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38002    | Major          | Yes                   |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the broker instance breaks down. As a result, the broker cannot provide read and write services properly.

## Possible Causes

The heap memory of the Kafka instance is overused or the heap memory is inappropriately allocated.

## Procedure

**Check heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Kafka Heap Memory Usage Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Process > Heap Memory Usage of Kafka**, and click **OK**.
- Step 3** Check whether the used heap memory of Kafka reaches 95% of the maximum heap memory specified for Kafka.
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).

**Check the heap memory size configured for Kafka.**

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations > All Configurations > Broker(Role) > Environment**. Increase the value of **KAFKA\_HEAP\_OPTS** by referring to the Note.

### NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Heap Memory Usage of Kafka** by referring to [Step 2](#), and set the value of **KAFKA\_HEAP\_OPTS** to twice the value of **Heap Memory Used by Kafka**.

- Step 5** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

**Collect fault information.**

- Step 6** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

- Step 7** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.232 ALM-38004 Kafka Direct Memory Usage Exceeds the Threshold

## Description

The system checks the direct memory usage of the Kafka service every 30 seconds. This alarm is generated when the direct memory usage of a Kafka instance exceeds the threshold (80% of the maximum memory) for 10 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the direct memory usage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the direct memory usage is less than or equal to 90% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38004    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                 |
|-------------|---------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated. |
| ServiceName | Specifies the service for which the alarm is generated. |
| RoleName    | Specifies the role for which the alarm is generated.    |
| HostName    | Specifies the host for which the alarm is generated.    |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the available direct memory of the Kafka service is insufficient, a memory overflow occurs and the broker instance breaks down. As a result, the broker cannot provide read and write services properly.

## Possible Causes

The direct memory of the Kafka instance is overused or the direct memory is inappropriately allocated.

## Procedure

### Check the direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Kafka Direct Memory Usage Exceeds the Threshold > Location** to check the host name of the instance for which the alarm is generated.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down menu in the Chart area and choose **Customize > Process > Kafka Direct Memory Usage**, and click **OK**.
- Step 3** Check whether the used direct memory of Kafka reaches 80% of the maximum direct memory specified for Kafka.
  - If yes, go to [Step 4](#).
  - If no, go to [Step 7](#).

### Check the direct memory size configured for the Kafka.

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations > All Configurations > Broker(Role) > Environment** to increase the value of **-Xmx** configured in the **KAFKA\_HEAP\_OPTS** parameter by referring to the Note.

#### NOTE

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to view **Kafka Direct Memory Usage** by referring to [Step 2](#), and set the value of **KAFKA\_HEAP\_OPTS** to twice the value of **Direct Memory Used by Kafka**.

- Step 5** Save the configuration and restart the Kafka service.

 **NOTE**

If rolling restart is performed and the current Topic has multiple copies, services are not affected. Otherwise, the Kafka service will be unavailable during the restart, and upper-layer services that depend on the Kafka service will be affected.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.233 ALM-38005 GC Duration of the Broker Process Exceeds the Threshold

### Description

The system checks the garbage collection (GC) duration of the Broker process every 60 seconds. This alarm is generated when the GC duration exceeds the threshold (12 seconds by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the GC duration is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the GC duration is less than or equal to 90% of the threshold.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38005    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| HostName          | Specifies the host for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

A long GC duration of the Broker process may interrupt the services.

## Possible Causes

The Kafka GC duration of the node is too long or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC duration.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > GC Duration of the Broker Process Exceeds the Threshold > Location**. Check the host name of the instance involved in this alarm.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Process > Broker GC Duration per Minute**, and click **OK**.
- Step 3** Check whether the GC duration of the Broker process collected every minute exceeds the threshold (12 seconds by default).
  - If yes, go to **Step 4**.
  - If no, go to **Step 7**.

### Check the direct memory size configured for the Kafka.

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations > All Configurations > Broker(Role)**

> **Environment** to increase the value of **-Xmx** configured in the **KAFKA\_HEAP\_OPTS** parameter by referring to the Note.

 **NOTE**

- It is recommended that **-Xmx** and **-Xms** be set to the same value.
- You are advised to set the value of **KAFKA\_HEAP\_OPTS** to twice the value of **Direct Memory Used by Kafka**.

On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area and choose **Customize** > **Process** > **Kafka Direct Memory Resource Status** to check the value of **Direct Memory Used by Kafka**.

**Step 5** Save the configuration and restart the Kafka service.

 **NOTE**

If rolling restart is performed and the current Topic has multiple copies, services are not affected. Otherwise, the Kafka service will be unavailable during the restart, and upper-layer services that depend on the Kafka service will be affected.

**Step 6** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M** > **Log** > **Download**.

**Step 8** Select **Kafka** in the required cluster from the **Service** drop-down list.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.234 ALM-38006 Percentage of Kafka Partitions That Are Not Completely Synchronized Exceeds the Threshold

### Description

The system checks the percentage of Kafka partitions that are not completely synchronized to the total number of partitions every 60 seconds. This alarm is generated when the percentage exceeds the threshold (50% by default) for 3 consecutive times.

When the **Trigger Count** is 1, this alarm is cleared when the percentage is less than or equal to the threshold. When the **Trigger Count** is greater than 1, this alarm is cleared when the percentage is less than or equal to 90% of the threshold.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38006    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service for which the alarm is generated.                                                                      |
| RoleName          | Specifies the role for which the alarm is generated.                                                                         |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

Too many Kafka partitions that are not completely synchronized affect service reliability. In addition, data may be lost when leaders are switched.

## Possible Causes

Some nodes where the Broker instance resides are abnormal or stop running. As a result, replicas of some partitions in Kafka are out of the in-sync replicas (ISR) set.

## Procedure

### Check Broker instances.

- Step 1** On the FusionInsight Manager portal, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Instance**. The Kafka instances page is displayed.
- Step 2** Check whether faulty nodes exist among all Broker nodes.
  - If yes, record the host name of the node and go to [Step 3](#).
  - If no, go to [Step 5](#).

- Step 3** On the FusionInsight Manager portal, click **O&M > Alarm > Alarms** to check whether the fault described in **Step 2** exists in the alarm information and handle the alarm based on corresponding methods.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. The Kafka instances page is displayed.
- Step 5** Check whether stopped nodes exist among all Broker instance.
- If yes, go to **Step 6**.
  - If no, go to **Step 7**.
- Step 6** Select all stopped Broker instances and click **Start Instance**.
- Step 7** Check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 8**.
- Collect fault information.**
- Step 8** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 9** Select **Kafka** in the required cluster from the **Service** drop-down list.
- Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.235 ALM-38007 Status of Kafka Default User Is Abnormal

### Description

The system checks the default user of Kafka every 60 seconds. This alarm is generated when the system detects that the user status is abnormal.

**Trigger Count** is set to **1**. This alarm is cleared when the user status becomes normal.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38007    | Critical       | Yes                   |

## Parameters

| Name              | Meaning                                                                 |
|-------------------|-------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                 |
| ServiceName       | Specifies the service for which the alarm is generated.                 |
| RoleName          | Specifies the role for which the alarm is generated.                    |
| HostName          | Specifies the host name for which the alarm is generated.               |
| Trigger Condition | Specifies the condition that the Kafka default user status is abnormal. |

## Impact on the System

If the Kafka default user status is abnormal, metadata synchronization between Brokers and interaction between Kafka and ZooKeeper will be affected, affecting service production, consumption, and topic creation and deletion.

## Possible Causes

- The Sssd service is abnormal.
- Some Broker instances stop running.

## Procedure

**Check whether the Sssd service is abnormal.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms > Status of Kafka Default User Is Abnormal > Location** to check the host name of the instance for which the alarm is generated.
- Step 2** Find the host information in the alarm information and log in to the host.
- Step 3** Run the `id -Gn kafka` command and check whether "No such user" is displayed in the command output.
  - If yes, record the host name of the node and go to [Step 4](#).
  - If no, go to [Step 6](#).

**Step 4** On the FusionInsight Manager home page, choose **O&M > Alarm > Alarms**. Check whether there is **Sssd Service Exception** in the alarm information. If there is, handle the alarm based on alarm information.

**Check the running status of the Broker instance.**

**Step 5** On the FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. The Kafka instance page is displayed.

**Step 6** Check whether there are stopped nodes on all Broker instances.

- If yes, go to **Step 7**.
- If no, go to **Step 8**.

**Step 7** Select all stopped Broker instances and click **Start Instance**.

**Step 8** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 10** In the **Service** area, select **Kafka** in the required cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.236 ALM-38008 Abnormal Kafka Data Directory Status

### Description

The system checks the Kafka data directory status every 60 seconds. This alarm is generated when the system detects that the status of a data directory is abnormal.

**Trigger Count** is set to **1**. This alarm is cleared when the data directory status becomes normal.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38008    | Major          | Yes                   |

## Parameters

| Name              | Meaning                                                                   |
|-------------------|---------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                   |
| ServiceName       | Specifies the service for which the alarm is generated.                   |
| RoleName          | Specifies the role for which the alarm is generated.                      |
| HostName          | Specifies the host name for which the alarm is generated.                 |
| DirName           | Specifies the directory name for which the alarm is generated.            |
| Trigger Condition | Specifies the condition that the Kafka data directory status is abnormal. |

## Impact on the System

If the Kafka data directory status is abnormal, the current replicas of all partitions in the data directory are brought offline, and the data directory status of multiple nodes is abnormal at the same time. As a result, some partitions may become unavailable.

## Possible Causes

- The data directory permission is tampered with.
- The disk where the data directory is located is faulty.

## Procedure

### Check the permission on the faulty data directory.

**Step 1** Find the host information in the alarm information and log in to the host.

**Step 2** In the alarm information, check whether the data directory and its subdirectories belong to the omm:wheel group.

- If yes, record the host name of the node and go to [Step 4](#).
- If no, go to [Step 3](#).

**Step 3** Restore the owner group of the data directory and its subdirectories to omm:wheel.

- If yes, go to [Step 6](#).
- If no, go to [Step 5](#).

**Check whether the disk where the data directory is located is faulty.**

**Step 4** In the upper-level directory of the data directory, create and delete files as user **omm**. Check whether data read/write on the disk is normal.

**Step 5** Replace or repair the disk where the data directory is located to ensure that data read/write on the disk is normal.

**Step 6** On the FusionInsight Manager home page, choose **Cluster > Services > Kafka > Instance**. On the Kafka instance page that is displayed, restart the Broker instance on the host recorded in [Step 2](#).

 **NOTE**

During the restart of the Broker instance, if the current Topic is a single copy and is on the current Broker node, the Kafka service will be interrupted. Otherwise, the Kafka service will not be affected.

**Step 7** After Broker is started, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 9** In the **Service** area, select **Kafka** in the required cluster.

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.237 ALM-38009 Busy Broker Disk I/Os (Applicable to Versions Later Than MRS 3.1.0)

### Alarm Description

The system checks the I/O status of each Kafka disk every 60 seconds. This alarm is generated when the disk I/O of a Kafka data directory on a broker exceeds the threshold (80% by default).

Its **Trigger Count** is **3**. This alarm is cleared when the disk I/O is lower than the threshold (80% by default).

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 38009    | Major          | Yes          |

### Alarm Parameters

| Parameter         | Description                                                             |
|-------------------|-------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated.                |
| ServiceName       | Specifies the service for which the alarm was generated.                |
| RoleName          | Specifies the role for which the alarm was generated.                   |
| HostName          | Specifies the host for which the alarm was generated.                   |
| DataDirectoryName | Specifies the name of the Kafka data directory with frequent disk I/Os. |

### Impact on the System

The disk partition has frequent I/Os. Data may fail to be written to the Kafka topic for which the alarm is generated.

### Possible Causes

- There are many replicas configured for the topic.
- The parameter for batch writing producer's messages is inappropriately configured. The service traffic of this topic is too heavy, and the current partition configuration is inappropriate.

## Handling Procedure

### Check the number of topic replicas.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. Locate the row that contains this alarm, click , and view the host name in **Location**.
- Step 2** On FusionInsight Manager, choose **Cluster**, click the name of the desired cluster, choose **Services > Kafka > KafkaTopic Monitor**, search for the topic for which the alarm is generated, and check the number of replicas.
- Step 3** Reduce the replication factors of the topic (for example, reduce to **3**) if the number of replicas is greater than 3.

Run the following command on the FusionInsight client to replan the replicas of Kafka topics:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}}kafka --reassignment-json-file {manual assignment json file path} --execute
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 10.149.0.90:2181,10.149.0.91:2181,10.149.0.92:2181/kafka --reassignment-json-file expand-cluster-reassignment.json --execute
```

### NOTE

In the `expand-cluster-reassignment.json` file, describe the brokers to which the partitions of the topic are migrated in the following format: `{"partitions":[{"topic": "topicName", "partition": 1, "replicas": [1,2,3] }], "version": 1}`

- Step 4** Observe for a period of time and check whether the alarm is cleared. If the alarm persists, go to [Step 5](#).

### Check the partition planning of the topic.

- Step 5** On the **KafkaTopic Monitor** page, view **Topic Input Traffic** in the **Topic Traffic** area of each topic, obtain the topic with the largest value, and check the partitions of this topic as well as information about the host of these partitions.
- Step 6** Log in to the host queried in [Step 5](#) and run the `iostat -d -x` command to check the `%util` value of each disk.

```
:/opt/R3/FusionInsight_Manager/software/packs # iostat -d -x
Linux 3.0.76-0.11-default (189-39-172-162) 06/26/19 _x86_64_
Device:            rrmq/s  wrqm/s    r/s     w/s   rsec/s   wsec/s  avgrq-sz  avgqu-sz   await  svctm  %util
xvda                0.04    44.44     1.26   21.94   43.62   531.02   24.78     0.03    1.44   0.56   1.30
xvde                0.16   431.84    13.78   82.51  284.32  4115.90   45.70     0.06    1.41   0.64   6.21
```

- If the `%util` value of each disk exceeds the threshold (**80%** by default), expand the Kafka disk capacity. After the capacity expansion, replan the topic partitions by referring to [Step 3](#).
- If the `%util` values of the disks vary greatly, check the disk partition configuration of Kafka. For example, check the value of `log.dirs` in the `{BIGDATA_HOME}/FusionInsight_HD_8.1.0.1/1_14_Broker/etc/server.properties` file.

Run the following command to view the **Filesystem** information:

```
df -h log.dirs value
```

The command output is as follows.

```
:/opt/R3/FusionInsight_Manager/software/packs # df -h /srv/BigData/kafka/data/kafka-logs/
filesystem      Size  Used Avail Use% Mounted on
/dev/xvda2      36G   21G   14G  62% /
```

- If the partition where Filesystem is located matches the partition with a high **%util** value, plan Kafka partitions on idle disks, configure **log.dirs** as an idle disk directory, and replan topic partitions by referring to **Step 3**. Ensure that the partitions of the topic are evenly distributed to each disk.

**Step 7** Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, repeat **Step 5** to **Step 6** three times. Then, go to **Step 8**.

**Step 8** Observe for a period of time and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to **Step 9**.

**Collect fault information.**

**Step 9** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 10** Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

**Step 11** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 12** Contact O&M personnel and provide the collected logs.

----End

### Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

### Related Information

None

## 12.13.238 ALM-38010 Topics with Single Replica

### Description

The system checks the number of replicas of each topic every 60 seconds on the node where the Kafka Controller resides. This alarm is generated when there is one replica for a topic.

### Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38010    | Major          | No                    |

## Parameters

| Name        | Meaning                                                        |
|-------------|----------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.        |
| ServiceName | Specifies the service for which the alarm is generated.        |
| RoleName    | Specifies the role for which the alarm is generated.           |
| TopicName   | Specifies the list of topics for which the alarm is generated. |

## Impact on the System

There is the single point of failure (SPOF) risk for topics with only one replica. When the node where the replica resides becomes abnormal, the partition does not have a leader, and services on the topic are affected.

## Possible Causes

- The number of replicas for the topic is incorrectly configured.

## Procedure

### Check the number of replicas for the topic.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**, click  of this alarm, and view the **TopicName** list in **Location**.

**Step 2** Check whether replicas need to be added for the topic for which the alarm is generated.

- If yes, go to **Step 3**.
- If no, go to **Step 5**.

**Step 3** On the FusionInsight client, re-plan topic replicas and describe the partition distribution of the topic in the **add-replicas-reassignment.json** file in the following format: {"partitions":[{"topic": "*topic name*","partition": 1,"replicas": [1,2] }],"version":1}. Then, run the following command to add replicas:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}/kafka --reassignment-json-file {manual assignment json file path} --execute
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --execute
```

**Step 4** Run the following command to check the task execution progress:

```
kafka-reassign-partitions.sh --zookeeper {zk_host}:{port}/kafka --reassignment-json-file {manual assignment json file path} --verify
```

For example:

```
/opt/client/Kafka/kafka/bin/kafka-reassign-partitions.sh --zookeeper 192.168.0.90:2181,192.168.0.91:2181,192.168.0.92:2181/kafka --reassignment-json-file add-replicas-reassignment.json --verify
```

**Step 5** After completing the handling operations or confirming that the alarm has no impact, manually clear the alarm on FusionInsight Manager.

**Step 6** After a period of time, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** In the **Service** area, select **Kafka** in the required cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

If the alarm has no impact, manually clear the alarm.

## Related Information

None

## 12.13.239 ALM-38011 User Connection Usage on Broker Exceeds the Threshold

### Description

The system checks the number of connections of each user on Broker every 30 seconds. This alarm is generated when the connection usage of a user on the Broker exceeds the threshold (80% by default) for 5 consecutive times.

The number of times that smoothing is performed is 5. This alarm is cleared when the connection usage of a user on the Broker is less than the threshold.

The alarm can be automatically cleared. However, if the number of connections of a user suddenly becomes 0 and no connection is created, the alarm cannot be automatically cleared. You need to manually clear it.

## Attribute

| Alarm ID | Alarm Severity | Automatically Cleared |
|----------|----------------|-----------------------|
| 38011    | Major          | Yes                   |

## Parameters

| Name        | Meaning                                                  |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.  |
| ServiceName | Specifies the service for which the alarm is generated.  |
| RoleName    | Specifies the role for which the alarm is generated.     |
| HostName    | Specifies the host for which the alarm is generated.     |
| UserName    | Specifies the username for which the alarm is generated. |

## Impact on the System

If the number of connections of a user is excessive, the user cannot create new connections to the Broker.

## Possible Causes

- The number of connections (created by a user) used by the client exceeds the preset threshold.
- The threshold for the connection usage does not meet service requirements.

## Procedure

**Check the number of connections established by the same user on the client.**

- Step 1** On the FusionInsight Manager home page, choose **O&M > Alarm > Alarms > User Connection Usage on Broker Exceeds the Threshold**. Check the host name and username of the Broker instance for which the alarm is generated in **Location**.
- Step 2** On FusionInsight Manager home page, choose **Cluster > Name of the desired cluster > Services > Kafka > Instance**. Click the instance for which the alarm is generated to go to the page for the instance. Click the drop-down list in the upper right corner of the chart area, choose **Customize > Other**, and select **User Connection Usage on Broker, Maximum Number of User Connections on Broker**, and **Number of User Connections on Broker** to view the number of the current user connections on the Broker.

- Step 3** Observe the number of real-time connections of the current alarm user and check whether the real-time monitoring data of the current user exists.
- If yes, go to [Step 4](#).
  - If no, the current user has disconnected all connections. You need to clear the alarm manually, and no further action is required.

 **NOTE**

After the alarm user disconnects all connections, the monitoring data of the user disappears. In this case, the alarm will not be automatically cleared. You need to manually clear it.

- Step 4** Check whether the user is authorized by the service side.

If yes, go to [Step 7](#).

If no, go to [Step 5](#).

- Step 5** Run the following command on the client to limit the number of connections of the user. There are two configuration rules based on the following commands:

1. For the specific Broker and user, run the following command:

```
kafka-configs.sh --bootstrap-server <broker ip:port> --alter --add-config 'max.connections.per.user.overrides=[<username>:<connection.number>]' --entity-type brokers --entity-name <broker.id> --command-config Kafka/kafka/config/producer.properties
```

 **NOTE**

For unauthorized users, confirm with the service side to reduce the maximum number of connections of an unauthorized user or set the maximum number of connections to 0.

In the command, you need to specify the IP address and port number of Broker, set values of configuration items, and specify the **brokerId** and **username**. Here, the user refers to the authorized Kerberos user.

The configuration updated using the command line tool can take effect dynamically. The configuration becomes invalid after the service is restarted. To make the configuration take effect after the restart, choose **Cluster > Name of the desired cluster > Services > Kafka > Configurations > All Configurations > Broker > Server** on the FusionInsight Manager home page and update the configuration to **max.connections.per.user.overrides**.

2. For the specific use and default Broker (that is, all Broker instances in the cluster), run the following command:

```
kafka-configs.sh --bootstrap-server <broker ip:port> --alter --add-config 'max.connections.per.user.overrides=[<username>:<connection.number>]' --entity-type brokers ---entity-default --command-config Kafka/kafka/config/client.properties
```

Example:

```
kafka-configs.sh --bootstrap-server 10.153.3.26:21007 --alter --add-config 'max.connections.per.user.overrides=[showcase:4]' --entity-type brokers --entity-name 1 --command-config Kafka/kafka/config/client.properties
```

- Step 6** Check whether the maximum number of connections is 0 and whether the number of connections of the current user decreases or remains unchanged according to [Step 2](#).

- If yes, manually clear the alarm and no further action is required.
- If no, go to [Step 7](#).

**Step 7** Check whether the number of real-time connections and connection usage of the current user are sharply increased when they are compared with historical data, and whether have exceeded the specified maximum number of connections.

- If yes, go to [Step 8](#).
- If no, go to [Step 9](#).

 **NOTE**

If there is an obvious increase after the comparison and the maximum number of connections has reached the preset value, the connections of the user may be abnormal. You need to confirm with the service party.

**Check whether the number of user connections meets service requirements.**

**Step 8** Check whether the number of connections of the user meets service requirements.

- If yes, go to [Step 9](#).
- If no, contact the service party to rectify the fault.

 **NOTE**

If the number of user connections is abnormal, contact the service party to rectify the fault from the following aspects:

- Check whether new services are added so that the number of user connections increases sharply.
- Check whether handle leakage occurs on the code at the service side.

**Step 9** Consider whether to increase the maximum number of connections of the user.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

**Step 10** Increase the maximum number of connections based on the service requirements. Set the number of connections of the user on the Kafka client. For details, see [Step 5](#).

**Step 11** Wait for several minutes and then check whether the alarm is automatically cleared.

- If yes, go to [Step 12](#).
- If no, go to [Step 2](#).

**Step 12** Determine whether to add the user to the whitelist based on service requirements on the service side.

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

 **NOTE**

To add a user to the whitelist, you need to restart the Kafka service. However, this operation will cause service interruption and affect service running. Therefore, you must confirm with the service side before performing this operation.

**Step 13** On the FusionInsight Manager home page, choose **Cluster** > *Name of the desired cluster* > **Services** > **Kafka** > **Configurations** > **All Configurations** > **Broker(Role)**

> **Server** to add the user to the **max.connections.per.user.whitelist** configuration item.

**Step 14** Restart the service for the modification to take effect. In addition, you need to manually clear the alarm, and no further action is required.

**Collect the fault information.**

**Step 15** On the FusionInsight Manager homepage, choose **O&M > Log > Download**.

**Step 16** Expand the **Service** drop-down list, and select **Kafka** for the target cluster.

**Step 17** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 18** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.240 ALM-43001 Spark2x Service Unavailable

### Alarm Description

The system checks the Spark2x service status every 300 seconds. This alarm is generated when the Spark2x service is unavailable.

This alarm is cleared when the Spark2x service recovers.

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 43001    | Critical       | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

The Spark tasks submitted by users fail to be executed.

## Possible Causes

- The KrbServer service is abnormal.
- The LdapServer service is abnormal.
- ZooKeeper is abnormal.
- HDFS is abnormal.
- Yarn is abnormal.
- The corresponding Hive service is abnormal.
- The Spark2x assembly package is abnormal.
- The NameNode memory is insufficient.
- The memory of the Spark process is insufficient.

## Handling Procedure

If the alarm is abnormal Spark2x assembly packet, the Spark packet is abnormal. Wait for about 10 minutes. The alarm is automatically cleared.

**Check whether service unavailability alarms exist in services that Spark2x depends on.**

**Step 1** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Alarm > Alarms**.

**Step 2** Check whether the following alarms exist in the alarm list:

- ALM-25500 KrbServer Service Unavailable
- ALM-25000 LdapServer Service Unavailable
- ALM-13000 ZooKeeper Service Unavailable
- ALM-14000 HDFS Service Unavailable
- ALM-18000 Yarn Service Unavailable

- ALM-16004 Hive Service Unavailable
- If yes, go to [Step 3](#).
- If no, go to [Step 4](#).

**Step 3** Handle the alarms based on the troubleshooting methods provided in the alarm help.

After the alarm is cleared, wait a few minutes and check whether the alarm GuardianService Unavailable is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Check whether the NameNode memory is insufficient.**

**Step 4** Check whether the NameNode memory is insufficient.

- If yes, go to [Step 5](#).
- If no, go to [Step 6](#).

**Step 5** Restart the NameNode to release the memory. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Check whether the memory of the Spark process is insufficient.**

**Step 6** Check whether the memory of the Spark process is insufficient due to memory-related modifications.

- If yes, go to [Step 7](#).
- If no, go to [Step 8](#).

**Step 7** Ensure that the memory of the Spark process is sufficient or expand the cluster capacity. Then, check whether this alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 8](#).

**Collect fault information.**

**Step 8** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 9** In the **Service** area, select the following nodes of the desired cluster. (Hive is the specific Hive service determined based on **ServiceName** in the alarm location information).

- KrbServer
- LdapServer
- ZooKeeper
- HDFS
- Yarn
- Hive

**Step 10** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 11** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.241 ALM-43006 Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

## Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43006    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                      |
|-------------|--------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.      |
| ServiceName | Specifies the service name for which the alarm is generated. |
| RoleName    | Specifies the role name for which the alarm is generated.    |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the direct memory usage of the JobHistory2x process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

## Possible Causes

The heap memory of the JobHistory2x Process is overused or the heap memory is inappropriately allocated.

## Procedure

### Check heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43006**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum heap memory specified for JobHistory2x.
  - If yes, go to **Step 3**.
  - If no, go to **Step 7**.
- Step 3** On the FusionInsight Manager home page, choose **Cluster > Services > Spark2x > Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Statistics for the heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JobHistory2x > Default**. The default value of **SPARK\_DAEMON\_MEMORY** is 4GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage

of the JobHistory2x to the **Threshold** of the **JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Spark2x > Memory > JobHistory2x Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

**Step 5** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 12.13.242 ALM-43007 Non-Heap Memory Usage of the JobHistory2x Process Exceeds the Threshold

### Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

 **NOTE**

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43007    | Major          | Yes        |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the non-heap memory usage of the JobHistory2x process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

## Possible Causes

The non-heap memory of the JobHistory2x Process is overused or the non-heap memory is inappropriately allocated.

## Procedure

**Check non-heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43007**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used non-heap memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum non-heap memory specified for JobHistory2x.
- If yes, go to **Step 3**.
  - If no, go to **Step 7**.
- Step 3** On the FusionInsight Manager home page, choose **Cluster > Services > Spark2x > Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Statistics for the non-heap memory of the JobHistory2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JobHistory2x process in the corresponding period and obtain the maximum value.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JobHistory2x > Default**. You can change the value of **-XX:MaxMetaspaceSize** in **SPARK\_DAEMON\_JAVA\_OPTS** according to the following rules: Ratio of the JobHistory2x non-heap memory usage to the **Threshold** of **JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** in the alarm period.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Spark2x > Memory > JobHistory2x Non-Heap Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

- Step 5** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 6** After 10 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 7**.

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.
- Step 8** Select **Spark2x** in the required cluster from the **Service**.
- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 12.13.243 ALM-43008 The Direct Memory Usage of the JobHistory2x Process Exceeds the Threshold

## Description

The system checks the JobHistory2x Process status every 30 seconds. The alarm is generated when the direct memory usage of a JobHistory2x Process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43008    | Major          | Yes        |

## Parameters

| Name        | Meaning                                                          |
|-------------|------------------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm is generated.          |
| ServiceName | Specifies the service name for which the alarm is generated.     |
| RoleName    | Specifies the role name for which the alarm is generated.        |
| HostName    | Specifies the object (host ID) for which the alarm is generated. |

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the direct memory usage of the JobHistory process is too high, the performance deteriorates, and the process even becomes unavailable due to memory overflow. When it is unavailable, execution records of Spark tasks cannot be queried.

## Possible Causes

The direct memory of the JobHistory2x Process is overused or the direct memory is inappropriately allocated.

## Procedure

### Check direct memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43008**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JobHistory2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct memory of the JobHistory2x Process reaches the threshold (default value is 95%) of the maximum direct memory specified for JobHistory2x.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 7](#).
- Step 3** On the FusionInsight Manager home page, choose **Cluster > Services > Spark2x > Instance**. Click **JobHistory2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Direct Memory of JobHistory2x**, and click **OK**. Based on the alarm generation time, check the values of the used direct memory of the JobHistory2x process in the corresponding period and obtain the maximum value.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JobHistory2x > Default**. The default value of **-XX:MaxDirectMemorySize** in **SPARK\_DAEMON\_JAVA\_OPTS** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JobHistory2x to the **Threshold** of the **JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after

the parameter value is adjusted, increase the value by 1 time. It is recommended that the value be less than or equal to the value of **SPARK\_DAEMON\_MEMORY**.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Spark2x > Memory > JobHistory2x Direct Memory Usage Statistics (JobHistory2x)** to view **Threshold**.

**Step 5** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 12.13.244 ALM-43009 JobHistory2x Process GC Time Exceeds the Threshold

### Description

The system checks the garbage collection (GC) time of the JobHistory2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds > Spark2x > GC Time > Total GC time in milliseconds (JobHistory2x)**. This alarm is cleared when the JobHistory2x GC time is shorter than or equal to the threshold.

 **NOTE**

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43009    | Major          | Yes        |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

The process performance deteriorates, and the process can even be unavailable. Historical execution records of Spark tasks cannot be queried.

## Possible Causes

The memory of JobHistory2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC time.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43009**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.

- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JobHistory2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > GC Time > Garbage Collection (GC) Time of JobHistory2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).
- If yes, go to **Step 3**.
  - If no, go to **Step 6**.
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JobHistory2x > Default**. The default value of **SPARK\_DAEMON\_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.
- Step 4** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 5** After 10 minutes, check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

**Collect fault information.**

- Step 6** On the FusionInsight Manager interface of active and standby clusters, choose **O&M > Log > Download**.
- Step 7** Select **Spark2x** in the required cluster from the **Service**.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

## 12.13.245 ALM-43010 Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

### Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43010    | Major          | Yes        |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

If the heap memory usage of the JDBCServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer2x process is unavailable, and Spark JDBC tasks are slow or fail to run.

## Possible Causes

The heap memory of the JDBCServer2x Process is overused or the heap memory is inappropriately allocated.

## Procedure

**Check heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43010**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used heap memory of the JDBCServer2x Process reaches the threshold (default value is 95%) of the maximum heap memory specified for JDBCServer2x.
- If yes, go to **Step 3**.
  - If no, go to **Step 7**.
- Step 3** On the FusionInsight Manager home page, choose **Cluster > Services > Spark2x > Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Statistics for the heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JDBCServer2x > Tuning**. The default value of **SPARK\_DRIVER\_MEMORY** is 4 GB. You can change the value according to the following rules: Ratio of the maximum heap memory usage of the JobHistory2x to the **Threshold** of the **JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

### NOTE

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Spark2x > Memory > JDBCServer2x Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

- Step 5** Restart all JDBCServer2x instances.

---

### NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

# 12.13.246 ALM-43011 Non-Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

## Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the non-heap memory usage of an JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43011    | Major          | Yes        |

## Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

## Impact on the System

If the non-heap memory usage of the JDBCServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer2x process is unavailable, and Spark JDBC tasks are slow or fail to run.

## Possible Causes

The non-heap memory of the JDBCServer2x Process is overused or the non-heap memory is inappropriately allocated.

## Procedure

**Check non-heap memory usage.**

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43011**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**, Check whether the used non-heap memory of the JDBCServer2x Process reaches the threshold(default value is 95%) of the maximum non-heap memory specified for JDBCServer2x.
  - If yes, go to **Step 3**.
  - If no, go to **Step 7**.
- Step 3** On the FusionInsight Manager home page, choose **Cluster > Services > Spark2x > Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart

area, choose **Customize > Memory > Statistics for the non-heap memory of the JDBCServer2x Process**, and click **OK**. Based on the alarm generation time, check the values of the used non-heap memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.

- Step 4** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JDBCServer2x > Tuning**. You can change the value of **-XX: MaxMetaspaceSize** in **spark.driver.extraJavaOptions** according to the following rules: Ratio of the JDBCServer2x non-heap memory usage to the **Threshold of JDBCServer2x Non-Heap Memory Usage Statistics ( JDBCServer2x)** in the alarm period.

 **NOTE**

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Spark2x > Memory > JDBCServer2x Non-Heap Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

- Step 5** Restart all JDBCServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

- Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

- Step 8** Select **Spark2x** in the required cluster from the **Service**.

- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

- Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## 12.13.247 ALM-43012 Direct Heap Memory Usage of the JDBCServer2x Process Exceeds the Threshold

### Description

The system checks the JDBCServer2x Process status every 30 seconds. The alarm is generated when the direct heap memory usage of a JDBCServer2x Process exceeds the threshold (95% of the maximum memory).

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43012    | Major          | Yes        |

### Parameters

| Name              | Meaning                                                                                                                      |
|-------------------|------------------------------------------------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                                                                      |
| ServiceName       | Specifies the service name for which the alarm is generated.                                                                 |
| RoleName          | Specifies the role name for which the alarm is generated.                                                                    |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                                                             |
| Trigger Condition | Specifies the threshold triggering the alarm. If the current indicator value exceeds this threshold, the alarm is generated. |

### Impact on the System

If the direct memory usage of the JDBCServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the JDBCServer2x process is unavailable, and Spark JDBC tasks are slow or fail to run.

## Possible Causes

The direct heap memory of the JDBCServer2x Process is overused or the direct heap memory is inappropriately allocated.

## Procedure

### Check direct heap memory usage.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43012**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > Memory > JDBCServer2x Memory Usage Statistics** from the drop-down list box in the upper right corner and click **OK**. Check whether the used direct heap memory of the JDBCServer2x Process reaches the threshold(default value is 95%) of the maximum direct heap memory specified for JDBCServer2x.
- If yes, go to **Step 3**.
  - If no, go to **Step 7**.
- Step 3** On the FusionInsight Manager home page, choose **Cluster > Services > Spark2x > Instance**. Click **JDBCServer2x** by which the alarm is reported to go to the **Dashboard** page, click the drop-down list in the upper right corner of the chart area, choose **Customize > Memory > Direct Memory of JDBCServer2x**, and click **OK**. Based on the alarm generation time, check the values of the used direct memory of the JDBCServer2x process in the corresponding period and obtain the maximum value.
- Step 4** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JDBCServer2x > Tuning**. The default value of **-XX:MaxDirectMemorySize** in **spark.driver.extraJavaOptions** is 512 MB. You can change the value according to the following rules: Ratio of the maximum direct memory usage of the JDBCServer2x to the **Threshold** of the **JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** in the alarm period. If this alarm is generated occasionally after the parameter value is adjusted, increase the value by 0.5 times. If the alarm is frequently reported after the parameter value is adjusted, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.

### NOTE

On the FusionInsight Manager home page, choose **O&M > Alarm > Thresholds > Spark2x > Memory > JDBCServer2x Direct Memory Usage Statistics (JDBCServer2x)** to view **Threshold**.

- Step 5** Restart all JDBCServer2x instances.

---

### NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 6** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

**Collect fault information.**

**Step 7** On the FusionInsight Manager portal, choose **O&M > Log > Download**.

**Step 8** Select **Spark2x** in the required cluster from the **Service**.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

None

# 12.13.248 ALM-43013 JDBCServer2x Process GC Time Exceeds the Threshold

## Description

The system checks the garbage collection (GC) time of the JDBCServer2x Process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (exceeds 5 seconds for three consecutive checks.) To change the threshold, choose **O&M > Alarm > Thresholds > Spark2x > GC Time > Total GC time in milliseconds (JDBCServer2x)**. This alarm is cleared when the JDBCServer2x GC time is shorter than or equal to the threshold.

### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43013    | Major          | Yes        |

## Parameters

| Name              | Meaning                                                                             |
|-------------------|-------------------------------------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated.                             |
| ServiceName       | Specifies the service name for which the alarm is generated.                        |
| RoleName          | Specifies the role name for which the alarm is generated.                           |
| HostName          | Specifies the object (host ID) for which the alarm is generated.                    |
| Trigger Condition | Generates an alarm when the actual indicator value exceeds the specified threshold. |

## Impact on the System

If the GC duration exceeds the threshold, the performance of the JDBCServer2x process deteriorates, and the process can even be unavailable. As a result, Spark JDBC tasks are slow or fail to run.

## Possible Causes

The memory of JDBCServer2x is overused, the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Procedure

### Check the GC time.

- Step 1** On the FusionInsight Manager portal, choose **O&M > Alarm > Alarms** and select the alarm whose **ID** is **43013**. Check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Instance** and click the JDBCServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > GC Time > Garbage Collection (GC) Time of JDBCServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold(default value: 12 seconds).
  - If yes, go to [Step 3](#).
  - If no, go to [Step 6](#).
- Step 3** On the FusionInsight Manager portal, choose **Cluster > Services > Spark2x > Configurations**, and click **All Configurations**. Choose **JDBCServer2x > Default**. The default value of **SPARK\_DRIVER\_MEMORY** is 4 GB. If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high service concurrency, you are advised to add instances.

**Step 4** Restart all JDBCServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

**Collect fault information.**

**Step 6** On the FusionInsight Manager interface of active and standby clusters, choose **O&M > Log > Download**.

**Step 7** Select **Spark2x** in the required cluster from the **Service**.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Related Information

## 12.13.249 ALM-43017 JDBCServer2x Process Full GC Number Exceeds the Threshold

### Description

The system checks the number of Full garbage collection (GC) times of the JDBCServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M > Alarm > Thresholds > Spark2x > GC number > Full GC Number of JDBCServer2x**. This alarm is cleared when the Full GC number of the JDBCServer2x process is less than or equal to the threshold.

 **NOTE**

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JDBCServer2x is changed to JDBCServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43017    | Major          | Yes        |

## Parameters

| Name              | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

If the full GC times exceeds the threshold, the performance of the JDBCServer2x process deteriorates, and the process can even be unavailable. As a result, Spark JDBC tasks are slow or fail to run.

## Possible Causes

The heap memory usage of the JDBCServer2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

## Procedure

### Check the number of Full GCs.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** Choose **Cluster > Services > Spark2x > Instance**. On the displayed page, click the JDBCServer2x for which the alarm is reported. On the **Dashboard** page that is displayed, click the drop-down menu in the Chart area and choose **Customize > GC Number > Full GC Number of JDBCServer2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JDBCServer2x process is greater than the threshold(default value: 12).
  - If it is, go to [Step 3](#).

- If it is not, go to [Step 6](#).

**Step 3** Choose **Cluster > Services > Spark2x > Configurations > All Configurations**. On the displayed page, choose **JDBCServer2x > Tuning**. The default value of **SPARK\_DRIVER\_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time. In the case of large service volume and high concurrency, add instances.

**Step 4** Restart all JDBCServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** Log in to FusionInsight Manager, and choose **O&M > Log > Download**.

**Step 7** Select **Spark2x** in the required cluster from the **Service** drop-down list.

**Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## 12.13.250 ALM-43018 JobHistory2x Process Full GC Number Exceeds the Threshold

### Description

The system checks the number of Full garbage collection (GC) times of the JobHistory2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (exceeds 12 for three consecutive checks.) You can change the threshold by choosing **O&M > Alarm > Thresholds > Spark2x > GC number > Full GC Number of JobHistory2x**. This alarm is cleared when the Full GC number of the JobHistory2x process is less than or equal to the threshold.

 **NOTE**

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, JobHistory2x is changed to JobHistory. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 43018    | Major          | Yes        |

## Parameters

| Name              | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

The process performance deteriorates, and the process can even be unavailable. Historical execution records of Spark tasks cannot be queried.

## Possible Causes

The heap memory usage of the JobHistory2x process is excessively large, or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

## Procedure

### Check the number of Full GCs.

- Step 1** Log in to FusionInsight Manager, choose **O&M > Alarm > Alarms**, select this alarm, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** Choose **Cluster > Services > Spark2x > Instance**. On the displayed page, click the JobHistory2x for which the alarm is reported. On the **Dashboard** page that is

displayed, click the drop-down menu in the Chart area and choose **Customize > GC Number > Full GC Number of JobHistory2x** in the upper right corner and click **OK**. Check whether the number of Full GCs of the JobHistory2x process is greater than the threshold(default value: 12).

- If it is, go to [Step 3](#).
- If it is not, go to [Step 6](#).

**Step 3** Choose **Cluster > Services > Spark2x > Configurations > All Configurations**. On the displayed page, choose **JobHistory2x > Default**. The default value of **SPARK\_DAEMON\_MEMORY** is 4GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. If the alarm is frequently reported, increase the value by 1 time.

**Step 4** Restart all JobHistory2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If it is, no further action is required.
- If it is not, go to [Step 6](#).

**Collect fault information.**

**Step 6** Log in to FusionInsight Manager, and choose **O&M > Log > Download**.

**Step 7** Select **Spark2x** in the required cluster from the **Service**.

**Step 8** Click  in the upper right corner. In the displayed dialog box, set **Start Date** and **End Date** to 10 minutes before and after the alarm generation time respectively and click **OK**. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected logs.

----End

## Alarm Clearing

This alarm will be automatically cleared after the fault is rectified.

## Related Information

## 12.13.251 ALM-43019 Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

### Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

| Alarm ID | Severity | Auto Clear |
|----------|----------|------------|
| 43019    | Major    | Yes        |

### Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

### Impact on the System

If the heap memory usage of the IndexServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer2x process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

## Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated.

## Procedure

**Check the heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43019**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > IndexServer2x Memory Usage Statistics > OK**. Check whether the heap memory used by the IndexServer2x process reaches the maximum heap memory threshold (95% by default).
- If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 7**.
- Step 3** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > Statistics for the heap memory of the IndexServer2x Process > OK**. Based on the alarm generation time, check the values of the used heap memory of the IndexServer2x process in the corresponding period and obtain the maximum value.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Configurations > All Configuration > IndexServer2x > Tuning**. The default value of the **SPARK\_DRIVER\_MEMORY** parameter is 4 GB. You can change the value based on the ratio of the maximum heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

### NOTE

On FusionInsight Manager, you can choose **O&M > Alarm > Thresholds > Spark2x > Memory > IndexServer2x Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

- Step 5** Restart all IndexServer2x instances.

---

### NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 6** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 7](#).

**Collect fault information.**

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and provide the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

# 12.13.252 ALM-43020 Non-Heap Memory Usage of the IndexServer2x Process Exceeds the Threshold

## Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the non-heap memory usage of the IndexServer2x process exceeds the threshold (95% of the maximum memory).

 **NOTE**

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Severity | Auto Clear |
|----------|----------|------------|
| 43020    | Major    | Yes        |

## Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

If the non-heap memory usage of the IndexServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer2x process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

## Possible Causes

The non-heap memory of the IndexServer2x process is overused or the non-heap memory is inappropriately allocated.

## Procedure

**Check non-heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43020**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > IndexServer2x Memory Usage Statistics > OK**. Check whether the non-heap memory used by the IndexServer2x process reaches the maximum non-heap memory threshold (95% by default).
  - If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 7**.
- Step 3** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > Statistics for the non-heap memory of the IndexServer2x Process > OK**. Based on the alarm generation time, check the values of the used non-heap

memory of the IndexServer2x process in the corresponding period and obtain the maximum value.

- Step 4** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Configurations > All Configurations > IndexServer2x > Tuning**. You can change the value of **XX:MaxMetaspaceSize** in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum non-heap memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** in the alarm period.

 **NOTE**

On FusionInsight Manager, you can choose **O&M > Alarm > Thresholds > Spark2x > Memory > IndexServer2x Non-Heap Memory Usage Statistics (IndexServer2x)** to view the threshold.

- Step 5** Restart all IndexServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

- Step 6** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 7](#).

**Collect fault information.**

- Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

- Step 8** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

- Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

- Step 10** Contact the O&M personnel and provide the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

## 12.13.253 ALM-43021 Direct Memory Usage of the IndexServer2x Process Exceeds the Threshold

### Description

The system checks the IndexServer2x process status every 30 seconds. The alarm is generated when the direct heap memory usage of a IndexServer2x process exceeds the threshold (95% of the maximum memory).

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

| Alarm ID | Severity | Auto Clear |
|----------|----------|------------|
| 43021    | Major    | Yes        |

### Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

### Impact on the System

If the direct memory usage of the IndexServer2x process is too high, the performance deteriorates, and even memory overflow occurs. As a result, the IndexServer2x process is unavailable, and Carbon tasks with indexing enabled are slow or fail to run.

## Possible Causes

The direct heap memory of the IndexServer2x process is overused or the direct heap memory is inappropriately allocated.

## Procedure

### Check direct heap memory usage.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm for which the ID is **43021**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > IndexServer2x Memory Usage Statistics > OK**. Check whether the direct memory used by the IndexServer2x process reaches the maximum direct memory threshold.
- If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 7**.
- Step 3** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance**. Click the IndexServer2x that reported the alarm to go to the **Dashboard** page. Click the drop-down list in the upper right corner of the chart area, and choose **Customize > Memory > Direct Memory of IndexServer2x > OK**. Based on the alarm generation time, check the values of the used direct memory of the IndexServer2x process in the corresponding period and obtain the maximum value.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Configurations > All Configurations > IndexServer2x > Tuning**. You can change the value of **XX:MaxDirectMemorySize** (the default value is 512 MB) in the **spark.driver.extraJavaOptions** parameter based on the ratio of the maximum direct memory used by the IndexServer2x process to the threshold specified by **IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** in the alarm period. If the alarm persists after the parameter value is changed, increase the value by 0.5 times. If the alarm is generated frequently, double the rate.

### NOTE

On FusionInsight Manager, you can choose **O&M > Alarm > Thresholds > Spark2x > Memory > IndexServer2x Direct Memory Usage Statistics (IndexServer2x)** to view the threshold.

- Step 5** Restart all IndexServer2x instances.

---

### NOTICE

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

- Step 6** After 10 minutes, check whether the alarm is cleared.
- If the alarm is cleared, no further action is required.

- If the alarm is not cleared, go to [Step 7](#).

#### Collect fault information.

**Step 7** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 8** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

**Step 9** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 10** Contact the O&M personnel and provide the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

## 12.13.254 ALM-43022 IndexServer2x Process GC Time Exceeds the Threshold

### Description

The system checks the GC time of the IndexServer2x process every 60 seconds. This alarm is generated when the detected GC time exceeds the threshold (12 seconds) for three consecutive times. To change the threshold, choose **O&M > Alarm > Thresholds > Spark2x > GC Time > Total GC time in milliseconds (IndexServer2x)**. This alarm is cleared when the IndexServer2x GC time is shorter than or equal to the threshold.

#### NOTE

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

### Attribute

| Alarm ID | Severity | Auto Clear |
|----------|----------|------------|
| 43022    | Major    | Yes        |

## Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

If the GC duration exceeds the threshold, the performance of the IndexServer2x process deteriorates, and the process can even be unavailable. As a result, Carbon tasks with indexing enabled are slow or fail to run.

## Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, GC occurs frequently.

## Procedure

### Check the GC time.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm with ID **43022**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the Chart area and choose **Customize > GC Time > Garbage Collection (GC) Time of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC time is longer than the threshold (default value: 12 seconds).
  - If the threshold is reached, go to **Step 3**.
  - If the threshold is not reached, go to **Step 6**.
- Step 3** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Configurations > All Configurations > IndexServer2x > Default**. The default value of the **SPARK\_DRIVER\_MEMORY** is 4 GB. You can change the value according to the following rules: Increase the value of the **SPARK\_DRIVER\_MEMORY** parameter 1.5 times to its default value. If this alarm is still generated occasionally after the adjustment, increase the value by 0.5 times. Double the value if the alarm is reported frequently.

**Step 4** Restart all IndexServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and provide the collected logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

## 12.13.255 ALM-43023 IndexServer2x Process Full GC Number Exceeds the Threshold

### Description

The system checks the Full GC number of the IndexServer2x process every 60 seconds. This alarm is generated when the detected Full GC number exceeds the threshold (12) for three consecutive times. You can change the threshold by choosing **O&M > Alarm > Thresholds > Spark2x > GC Number > Full GC Number of IndexServer2x**. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold. This alarm is cleared when the Full GC number of the IndexServer2x process is less than or equal to the threshold.

 **NOTE**

In MRS 3.3.0-LTS and later versions, the Spark2x component is renamed Spark, and the role names in the component are also changed. For example, IndexServer2x is changed to IndexServer. Refer to the descriptions and operations related to the component name and role names in the document based on your MRS version.

## Attribute

| Alarm ID | Severity | Auto Clear |
|----------|----------|------------|
| 43023    | Major    | Yes        |

## Parameters

| Parameter         | Description                                             |
|-------------------|---------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm is generated. |
| ServiceName       | Specifies the service for which the alarm is generated. |
| RoleName          | Specifies the role for which the alarm is generated.    |
| HostName          | Specifies the host for which the alarm is generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.       |

## Impact on the System

If the GC times exceeds the threshold, the performance of the IndexServer2x process deteriorates, and the process can even be unavailable. As a result, Carbon tasks with indexing enabled are slow or fail to run.

## Possible Causes

The heap memory of the IndexServer2x process is overused or the heap memory is inappropriately allocated. As a result, Full GC occurs frequently.

## Procedure

### Check the number of Full GCs.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. In the displayed alarm list, choose the alarm with the ID **43023**, and check the **RoleName** in **Location** and confirm the IP address of **HostName**.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Instance** and click the IndexServer2x for which the alarm is generated to go to the **Dashboard** page. Click the drop-down menu in the chart area and choose **Customize > GC Number > Full GC Number of IndexServer2x** from the drop-down list box in the upper right corner and click **OK** to check whether the GC number is larger than the threshold (default value: 12).
  - If the threshold is reached, go to [Step 3](#).

- If the threshold is not reached, go to [Step 6](#).

**Step 3** On FusionInsight Manager, choose **Cluster > Services > Spark2x > Configurations > All Configurations > IndexServer2x > Tuning**. The default value of the **SPARK\_DRIVER\_MEMORY** is 4 GB. You can change the value according to the following rules: If this alarm is generated occasionally, increase the value by 0.5 times. Double the value if the alarm is reported frequently. In the case of large service volume and high service concurrency, you are advised to add instances.

**Step 4** Restart all IndexServer2x instances.

---

**NOTICE**

When the instance is rebooted, it cannot be used and any tasks running on the current instance node will fail.

---

**Step 5** After 10 minutes, check whether the alarm is cleared.

- If the alarm is cleared, no further action is required.
- If the alarm is not cleared, go to [Step 6](#).

**Collect fault information.**

**Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Spark2x** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 9** Contact the O&M personnel and send the collected fault logs.

----End

## Alarm Clearing

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

## 12.13.256 ALM-44004 Presto Coordinator Resource Group Queuing Tasks Exceed the Threshold

### Alarm Description

This alarm is generated when the system detects that the number of queuing tasks in a resource group exceeds the threshold. The system queries the number of queuing tasks in a resource group through the JMX interface. You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) **> Presto > resource-groups** to configure a resource group. You can choose **Components >**

**Presto > Service Configuration** (switch **Basic** to **All**) > **Coordinator** > **Customize** > **resourceGroupAlarm** to configure the threshold of each resource group.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 44004    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

If the number of queuing tasks in a resource group exceeds the threshold, a large number of tasks may be in the queuing state. The Presto task time exceeds the expected value. When the number of queuing tasks in a resource group exceeds the maximum number (**maxQueued**) of queuing tasks in the resource group, new tasks cannot be executed.

## Possible Causes

The resource group configuration is improper or too many tasks in the resource group are submitted.

## Handling Procedure

- Step 1** Choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Presto > resource-groups** to adjust the resource group configuration.
- Step 2** You can choose **Components > Presto > Service Configuration** (switch **Basic** to **All**) > **Coordinator > Customize > resourceGroupAlarm** to modify the threshold of each resource group.
- Step 3** Collect the fault information.
  - Log in to the cluster node based on the host name in the fault information and query the number of queuing tasks based on **Resource Group** in the additional information on the Presto client.
  - Log in to the cluster node based on the host name in the fault information, view the **/var/log/Bigdata/nodeagent/monitorlog/monitor.log** file, and

search for resource group information to view the monitoring collection information of the resource group.

3. Contact O&M personnel and send the collected logs.

----End

## 12.13.257 ALM-44005 Presto Coordinator Process GC Time Exceeds the Threshold

### Description

The system collects GC time of the Presto Coordinator process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Presto > Coordinator > Presto Process Garbage Collection Time > Garbage Collection Time of the Coordinator Process** on MRS Manager. This alarm is cleared when the Coordinator process GC time is less than or equal to the threshold.

### Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 44005    | Major          | Yes        |

### Parameter

| Parameter   | Description                               |
|-------------|-------------------------------------------|
| ServiceName | Service for which the alarm is generated. |
| RoleName    | Role for which the alarm is generated.    |
| HostName    | Host for which the alarm is generated.    |

### Impact on the System

If the GC time of the Coordinator process is too long, the Coordinator process running performance will be affected and the Coordinator process will even be unavailable.

### Possible Causes

The heap memory of the Coordinator process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Procedure

### Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

#### NOTE

For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.

2. Select the alarm whose **Alarm ID** is **44005** and then check the role name in **Location** and confirm the IP address of the instance.
3. Choose **Components > Presto > Instances > Coordinator** (business IP address of the instance for which the alarm is generated) > **Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Coordinator process is longer than 5 seconds.
  - If yes, go to **Step 1.5**.
  - If no, go to **Step 2**.
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**. Choose **Presto > Coordinator**. Increase the value of **-Xmx** (maximum heap memory) in the **JAVA\_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.
  - If yes, no further action is required.
  - If no, go to **Step 2**.

### Step 2 Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## Reference

## 12.13.258 ALM-44006 Presto Worker Process GC Time Exceeds the Threshold

### Description

The system collects GC time of the Presto Worker process every 30 seconds. This alarm is generated when the GC time exceeds the threshold (exceeds 5 seconds for three consecutive times). You can change the threshold by choosing **System > Configure Alarm Threshold > Service > Presto > Worker > Presto Garbage Collection Time > Garbage Collection Time of the Worker Process** on MRS Manager. This alarm is cleared when the Worker process GC time is shorter than or equal to the threshold.

## Attribute

| Alarm ID | Alarm Severity | Auto Clear |
|----------|----------------|------------|
| 44006    | Major          | Yes        |

## Parameter

| Parameter   | Description                               |
|-------------|-------------------------------------------|
| ServiceName | Service for which the alarm is generated. |
| RoleName    | Role for which the alarm is generated.    |
| HostName    | Host for which the alarm is generated.    |

## Impact on the System

If the GC time of the Worker process is too long, the Worker process running performance will be affected and the Worker process will even be unavailable.

## Possible Causes

The heap memory of the Worker process is overused or inappropriately allocated, causing frequent occurrence of the GC process.

## Procedure

### Step 1 Check the GC time.

1. Go to the cluster details page and choose **Alarms**.

#### NOTE

- For MRS 1.8.10 or earlier, log in to MRS Manager and choose **Alarms**.
2. Select the alarm whose **Alarm ID** is **44006**. Then check the role name in **Location** and confirm the IP address of the instance.
3. Choose **Components > Presto > Instances > Worker** (business IP address of the instance for which the alarm is generated) **> Customize > Presto Garbage Collection Time**. Click **OK** to view the GC time.
4. Check whether the GC time of the Worker process is longer than 5 seconds.
  - If yes, go to [Step 1.5](#).
  - If no, go to [Step 2](#).
5. Choose **Components > Presto > Service Configuration**, and switch **Basic** to **All**, and choose **Presto > Worker** Increase the value of **-Xmx** (maximum heap memory) in the **JAVA\_OPTS** parameter based on the site requirements.
6. Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 2](#).

**Step 2** Collect fault information.

1. On MRS Manager, choose **System > Export Log**.
2. Contact the O&M personnel and send the collected logs.

----End

## 12.13.259 ALM-45000 HetuEngine Service Unavailable

### Alarm Description

The system checks the HetuEngine service status every 300 seconds. This alarm is generated when the HetuEngine service is unavailable.

This alarm is cleared when the HetuEngine service recovers.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45000    | Critical       | Yes          |

### Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

### Impact on the System

FusionInsight Manager cannot be used to perform operations on the HetuEngine cluster, and HetuEngine functions are unavailable.

## Possible Causes

- The KrbServer service is abnormal.
- The ZooKeeper service is abnormal.
- The HDFS service is abnormal.
- The Yarn service is abnormal.
- The DBService service is abnormal.
- The Hive service is abnormal.
- There are no HSBroker instances in HetuEngine.

## Handling Procedure

### Check the KrbServer service status.

**Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarm**.

**Step 2** In the alarm list, check whether the "ALM-25500 KrbServer Service Unavailable" alarm is generated.

- If yes, go to [Step 3](#).
- If no, go to [Step 5](#).

**Step 3** Clear "ALM-25500 KrbServer Service Unavailable" according to the alarm help.

**Step 4** In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

### Check the ZooKeeper service status.

**Step 5** In the alarm list, check whether the alarm "ALM-12007 Process Fault" is generated.

- If yes, go to [Step 6](#).
- If no, go to [Step 9](#).

**Step 6** In the alarm list, click  in the row that contains the "Process Fault" alarm. Check whether the name of the service for which the alarm is generated is ZooKeeper in **Location Information**.

- If yes, go to [Step 7](#).
- If no, go to [Step 9](#).

**Step 7** Clear "ALM-12007 Process Fault" according to the alarm help.

**Step 8** In the alarm list, check whether the alarm "ALM-45000 HetuEngine Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to [Step 9](#).

### Check the HDFS service status.

**Step 9** In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to [Step 10](#).
- If no, go to [Step 12](#).

**Step 10** Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

**Step 11** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 12](#).

**Check the YARN service status.**

**Step 12** In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to [Step 13](#).
- If no, go to [Step 15](#).

**Step 13** Clear "ALM-18000 YARN Service Unavailable" according to the alarm help.

**Step 14** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 15](#).

**Check the DBService service status.**

**Step 15** In the alarm list, check whether the "ALM-27001 DBService Service Unavailable" alarm is generated.

- If yes, go to [Step 16](#).
- If no, go to [20](#).

**Step 16** Clear "ALM-27001 DBService Service Unavailable" according to the alarm help.

**Step 17** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [20](#).

**Check the Hive service status.**

**Step 18** In the alarm list, check whether the "ALM-16004 Hive Service Unavailable" alarm is generated.

- If yes, go to [Step 19](#).
- If no, go to [20](#).

**Step 19** Clear "ALM-16004 Hive Service Unavailable" according to the alarm help.

**Step 20** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.

- If yes, no further action is required.
- If no, go to [20](#).

**Check whether there are no HSBroker instances in HetuEngine.**

- Step 21** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.
- Step 22** Check whether there are no HSBroker instances.
- If yes, click **Add Instance** to add one.
  - If no, go to [23](#).
- Step 23** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.
- If yes, no further action is required.
  - If no, go to [23](#).
- Check the network connection between HetuEngine and ZooKeeper, HDFS, YARN, DBService, and Hive.**
- Step 24** On FusionInsight Manager, choose **Cluster** > *Name of the desired cluster* > **Services** > **HetuEngine**. On the page that is displayed, click the **Instance** tab.
- Step 25** Click the host name in the **HSBroker** row and record the management IP address in the **Basic Information** area.
- Step 26** Log in to the host where HSBroker resides as user **omm** using the IP address obtained in [Step 25](#).
- Step 27** Run the **ping** command to check whether the network connection between the host where HSBroker resides and the hosts where ZooKeeper, HDFS, Yarn, DBService, and Hive reside is in the normal state.
- If yes, go to [Step 30](#).
  - If no, go to [Step 28](#).
- Step 28** Contact the network administrator to restore the network.
- Step 29** In the alarm list, check whether the "ALM-45000 HetuEngine Service Unavailable" alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 30](#).
- Collect fault information.**
- Step 30** On FusionInsight Manager, choose **O&M** > **Log** > **Download**.
- Step 31** Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.
- Step 32** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.
- Step 33** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 34** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault is rectified, the system automatically clears this alarm.

## Reference

None

## 12.13.260 ALM-45001 Faulty HetuEngine Compute Instances

This alarm applies only to MRS 3.2.0 or later.

## Alarm Description

The system checks the HetuEngine compute instance status every 60 seconds. This alarm is generated when a HetuEngine compute instance is faulty.

This alarm is cleared when all faulty HetuEngine compute instances are restored.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45001    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

SQL tasks submitted to the faulty compute instance of HetuEngine fail to be executed.

## Possible Causes

- The HDFS service is abnormal.
- The Yarn service is abnormal.

- Yarn queue resources are insufficient.
- The process of compute instances is faulty.

## Handling Procedure

### Check the HDFS service status.

**Step 1** In the alarm list, check whether the "ALM-14000 HDFS Service Unavailable" alarm is generated.

- If yes, go to [Step 2](#).
- If no, go to [Step 4](#).

**Step 2** Clear "ALM-14000 HDFS Service Unavailable" according to the alarm help.

**Step 3** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

### Check the YARN service status.

**Step 4** In the alarm list, check whether the "ALM-18000 YARN Service Unavailable" alarm is generated.

- If yes, go to [Step 5](#).
- If no, go to [Step 7](#).

**Step 5** Clear "ALM-18000 YARN Service Unavailable" according to the alarm help.

**Step 6** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 7](#).

### Check the YARN queue resource status.

**Step 7** In the alarm list, check whether the "ALM-18022 Insufficient YARN Queue Resources" alarm is generated.

- If yes, go to [8](#).
- If no, go to [Step 10](#).

**Step 8** Clear "ALM-18022 Insufficient YARN Queue Resources" according to the alarm help.

**Step 9** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 10](#).

### Check the HetuEngine compute instance status.

**Step 10** Log in to FusionInsight Manager as an administrator who can access the HetuEngine web UI and choose **Cluster > Services > HetuEngine**.

- Step 11** In the **Basic Information** area on the **Dashboard** tab page, click the link next to **HSConsole WebUI** to access the HSConsole page.
- Step 12** On the compute instance page, check whether any compute instances are in the **FAULT** state.
- If yes, go to **Step 13**.
  - If no, go to **Step 14**.
- Step 13** In the **Operation** column of the target compute instance, click **Start** and wait until the instance is started.
- Step 14** In the alarm list, check whether the "ALM-45001 Faulty HetuEngine Compute Instances" alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 15**.
- Collect fault information.**
- Step 15** On FusionInsight Manager, choose **O&M > Log > Download**.
- Step 16** Expand the **Service** drop-down list. In the **Services** dialog box that is displayed, select **HetuEngine** under the target cluster name, and click **OK**.
- Step 17** Expand the **Hosts** drop-down list. In the **Select Host** dialog box that is displayed, select the hosts to which the role belongs, and click **OK**.
- Step 18** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.
- Step 19** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

## 12.13.261 ALM-45175 Average Time for Calling OBS Metadata APIs Is Greater than the Threshold

### Alarm Description

The system checks whether the average duration for calling OBS metadata APIs is greater than the threshold every 30 seconds. This alarm is generated when the number of consecutive times that the average time exceeds the specified threshold is greater than the number of smoothing times.

This alarm is automatically cleared when the average duration for calling the OBS metadata APIs is lower than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45175    | Minor          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

If the average time for calling the OBS metadata APIs exceeds the threshold, the upper-layer big data computing services may be affected. To be more specific, the execution time of some computing tasks will exceed the threshold.

## Possible Causes

Frame freezing occurs on the OBS server, or the network between the OBS client and the OBS server is unstable.

## Handling Procedure

**Check the heap memory usage.**

- Step 1** On the **FusionInsight Manager** homepage, choose **O&M > Alarm > Alarms > Average Time for Calling the OBS Metadata API Exceeds the Threshold**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > meta > Instance > meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Average time of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.
  - If yes, go to **Step 3**.

- If no, go to [Step 5](#).

**Step 3** Choose **Cluster** > *Name of the desired cluster* > **O&M** > **Alarm** > **Thresholds** > **meta** > **Average Time for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.

**Step 4** Check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 5](#).

**Collect the fault information.**

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.

**Step 6** In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.262 ALM-45176 Success Rate of Calling OBS Metadata APIs Is Lower than the Threshold

## Alarm Description

The system checks whether the success rate of calling OBS metadata APIs is lower than the threshold every 30 seconds. This alarm is generated when the success rate is lower than the threshold.

This alarm is automatically cleared when the success rate of calling APIs for writing OBS data is greater than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45176    | Minor          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

If the success rate of calling the OBS metadata APIs is less than the threshold, the upper-layer big data computing services may be affected. To be more specific, some computing tasks may fail to be executed.

## Possible Causes

An execution exception or severe timeout occurs on the OBS server.

## Handling Procedure

**Check the heap memory usage.**

- Step 1** On the **FusionInsight Manager** homepage, choose **O&M > Alarm > Alarms > Success Rate for Calling the OBS Metadata API Is Lower Than the Threshold**, view the role name in **Location**, and check the instance IP address.
- Step 2** Choose **Cluster > Name of the desired cluster > Services > meta > Instance > meta** (IP address of the instance for which the alarm is generated). Click the drop-down list in the upper right corner of the chart area and choose **Customize**. In the dialog box that is displayed, select **Success percent of OBS interface calls** from **OBS Meta data Operations**, and click **OK**. Check whether the average time of OBS metadata API calls exceeds the threshold.
  - If yes, go to [Step 3](#).
  - If no, go to [Step 5](#).
- Step 3** Choose **Cluster > Name of the desired cluster > O&M > Alarm > Thresholds > meta > Success Rate for Calling the OBS Metadata API**. Increase the threshold or smoothing times as required.
- Step 4** Check whether the alarm is cleared.
  - If yes, no further action is required.

- If no, go to [Step 5](#).

**Collect the fault information.**

**Step 5** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 6** In the **Services** area, select **NodeAgent**, **NodeMetricAgent**, **OmmServer**, and **OmmAgent** under OMS.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 30 minutes ahead of and after the alarm generation time respectively. Then, click **Download**.

## 12.13.269 ALM-45275 Ranger Service Unavailable

### Alarm Description

The alarm module checks the Ranger service status every 180 seconds. This alarm is generated if the Ranger service is abnormal.

This alarm is cleared after the Ranger service recovers.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45275    | Critical       | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

When the Ranger service is unavailable, Ranger cannot work properly and the native Ranger UI cannot be accessed.

## Possible Causes

- The DBService service on which Ranger depends is abnormal.
- The RangerAdmin role instance is abnormal.

## Handling Procedure

**Check the DBService process status.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms**. On the displayed page, check whether the ALM-27001 DBService Service Unavailable alarm is reported.
- If yes, go to **Step 2**.
  - If no, go to **Step 3**.
- Step 2** Rectify the DBService service fault by following the handling procedure of ALM-27001 DBService Service Unavailable. After the DBService alarm is cleared, check whether Ranger Service Unavailable alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 3**.

**Check all RangerAdmin instances.**

**Step 3** Log in to the node where the RangerAdmin instance is located as user **omm** and run the **ps -ef|grep "proc\_rangeradmin"** command to check whether the RangerAdmin process exists on the current node.

- If yes, go to **Step 5**.
- If no, restart the faulty RangerAdmin instance or Ranger service and go to **Step 4**.

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Step 4** In the alarm list, check whether the alarm "Ranger Service Unavailable" is cleared.

- If yes, no further action is required.
- If no, go to **Step 5**.

**Collect the fault information.**

**Step 5** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 6** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 7** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 8** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

None

## 12.13.270 ALM-45276 Abnormal RangerAdmin Status

### Alarm Description

The alarm module checks the RangerAdmin service status every 60 seconds. This alarm is generated if RangerAdmin is unavailable.

This alarm is automatically cleared after the RangerAdmin service recovers.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45276    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Role for which the alarm is generated.                   |
| HostName    | Specifies the host for which the alarm was generated.    |

## Impact on the System

If the status of a RangerAdmin is abnormal, access to the Ranger native UI is not affected. If there are two abnormal RangerAdmin instances, the Ranger native UI cannot be accessed and operations such as creating, modifying, and deleting policies are unavailable.

## Possible Causes

The RangerAdmin port is not started.

## Handling Procedure

**Check the port process.**

- Step 1** In the alarm list on FusionInsight Manager, locate the row that contains the alarm, and click  to view the name of the host for which the alarm is generated.
- Step 2** Log in to the node where the RangerAdmin instance is located as user **omm**. Run the `ps -ef|grep "proc_rangeradmin" | grep -v grep | awk -F ' ' '{print $2}'` command to obtain *pid* of the RangerAdmin process, and run the `netstat -anp|grep pid | grep LISTEN` command to check whether the RangerAdmin process monitors port 21401 in a security cluster or port 21400 in a normal cluster.
  - If yes, go to [Step 4](#).
  - If no, restart the faulty RangerAdmin instance or Ranger service and go to [Step 3](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Step 3** In the alarm list, check whether the "Abnormal RangerAdmin Status" alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 4](#).

**Collect the fault information.**

**Step 4** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 5** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 6** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 1 hour ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 7** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

## Related Information

None

## 12.13.271 ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the RangerAdmin instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45277    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

Heap memory overflow may cause service breakdown.

## Possible Causes

The heap memory usage of the RangerAdmin instance is high or the heap memory is improperly allocated.

## Handling Procedure

**Check the heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45277 RangerAdmin Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > RangerAdmin Heap Memory Usage**. Click **OK**.
- Step 3** Check whether the heap memory used by RangerAdmin reaches the threshold (95% of the maximum heap memory by default).
  - If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC\_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see [Step 2](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log** > **Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 12.13.272 ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the direct memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the direct memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the direct memory usage of RangerAdmin is less than or equal to the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45278    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

Direct memory overflow may cause service breakdown.

## Possible Causes

The direct memory of the RangerAdmin instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45278 RangerAdmin Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > RangerAdmin Direct Memory Usage**. Click **OK**.
- Step 3** Check whether the direct memory used by RangerAdmin reaches the threshold (80% of the maximum direct memory by default).

- If yes, go to [Step 4](#).
- If no, go to [Step 6](#).

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the direct memory configured for RangerAdmin cannot meet the direct memory required by the RangerAdmin process. You are advised to check the direct memory usage of RangerAdmin and change the value of **-XX:MaxDirectMemorySize** in **GC\_OPTS** to the twice of the direct memory used by RangerAdmin. You can change the value based on the actual service scenario. For details, see [Step 2](#).

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

**Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## 12.13.273 ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the non-heap memory usage of the RangerAdmin service every 60 seconds. This alarm is generated when the non-heap memory usage of the RangerAdmin instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45279    | Major          | Yes          |

### Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

### Impact on the System

Non-heap memory overflow may cause service breakdown.

### Possible Causes

The non-heap memory usage of the RangerAdmin instance is high or the non-heap memory is improperly allocated.

### Handling Procedure

**Check non-heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45279 RangerAdmin Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > RangerAdmin Non Heap Memory Usage**. Click **OK**.
- Step 3** Check whether the non-heap memory used by RangerAdmin reaches the threshold (80% of the maximum non-heap memory by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Set **-XX:MaxPermSize** in the **GC\_OPTS** parameter to a larger value based on site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the non-heap memory size configured for the RangerAdmin instance cannot meet the non-heap memory required by the RangerAdmin process. You are advised to change the value of **-XX:MaxPermSize** in **GC\_OPTS** to the twice of the current non-heap memory usage or change the value based on the site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

None

# 12.13.274 ALM-45280 RangerAdmin GC Duration Exceeds the Threshold

## Alarm Description

The system checks the GC duration of the RangerAdmin process every 60 seconds. This alarm is generated when the GC duration of the RangerAdmin process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45280    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

The RangerAdmin responds slowly.

## Possible Causes

The heap memory of the RangerAdmin instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Handling Procedure

### Check the GC duration.

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45280 RangerAdmin GC Duration Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize > GC > RangerAdmin GC Duration**. Click **OK**.
- Step 3** Check whether the GC duration of the RangerAdmin process collected every minute exceeds the threshold (12 seconds by default).
- If yes, go to **Step 4**.
  - If no, go to **Step 6**.
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > RangerAdmin > Instance Configuration**. Click **All Configurations**, and choose **RangerAdmin > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

### NOTE

If this alarm is generated, the heap memory configured for RangerAdmin cannot meet the heap memory required by the RangerAdmin process. You are advised to check the heap memory usage of RangerAdmin and change the value of **-Xmx** in **GC\_OPTS** to the twice of the heap memory used by RangerAdmin. The value can be changed based on the actual service scenario. For details, see **Step 2**.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to **Step 6**.

---

### NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

### Collect the fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 12.13.275 ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the system detects that the heap memory usage of the UserSync instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45281    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

Heap memory overflow may cause service breakdown.

## Possible Causes

The heap memory usage of the UserSync instance is high or the heap memory is improperly allocated.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45281 UserSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > UserSync Heap Memory Usage**. Click **OK**.
- Step 3** Check whether the heap memory used by UserSync reaches the threshold (95% of the maximum heap memory by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > UserSync > Instance Configuration**. Click **All Configurations**, and choose **UserSync > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.
-  **NOTE**
- If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the **-Xmx** value of **GC\_OPTS** to twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see [Step 2](#).
- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

### NOTICE

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

### Collect the fault information.

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

# 12.13.276 ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the direct memory usage of the UserSync service every 60 seconds. This alarm is generated when the direct memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the UserSync direct memory usage is less than or equal to the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45282    | Major          | Yes          |

## Alarm Parameters

| Parameter   | Description                                              |
|-------------|----------------------------------------------------------|
| Source      | Specifies the cluster for which the alarm was generated. |
| ServiceName | Specifies the service for which the alarm was generated. |
| RoleName    | Specifies the role for which the alarm was generated.    |
| HostName    | Specifies the host for which the alarm was generated.    |

| Parameter         | Description                                       |
|-------------------|---------------------------------------------------|
| Trigger Condition | Specifies the threshold for triggering the alarm. |

## Impact on the System

Direct memory overflow may cause service breakdown.

## Possible Causes

The direct memory of the UserSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

## Handling Procedure

**Check the direct memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45282 UserSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm. Check the name of the instance host for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > UserSync Direct Memory Usage**. Click **OK**.
- Step 3** Check whether the direct memory used by the UserSync reaches the threshold (80% of the maximum direct memory by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > UserSync > Instance Configuration**. Click **All Configurations**, and choose **UserSync > System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

### NOTE

If this alarm is generated, the direct memory configured for UserSync cannot meet the direct memory required by the UserSync process. You are advised to check the direct memory usage of UserSync and change the value of **-XX:MaxDirectMemorySize** in **GC\_OPTS** to the twice of the direct memory used by UserSync. You can change the value based on the actual service scenario. For details, see [Step 2](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

**Alarm Clearance**

This alarm is automatically cleared after the fault is rectified.

**Related Information**

## 12.13.277 ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold

**Alarm Description**

The system checks the non-heap memory usage of the UserSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the UserSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

**Alarm Attributes**

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45283    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

Non-heap memory overflow may cause service breakdown.

## Possible Causes

The non-heap memory of the UserSync process is overused or the non-heap memory is inappropriately allocated.

## Handling Procedure

**Check non-heap memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45283 UserSync Non Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > UserSync Non Heap Memory Usage**. Click **OK**.
- Step 3** Check whether the non-heap memory used by UserSync reaches the threshold (80% of the maximum non-heap memory by default).
  - If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > UserSync > Instance Configuration**. Click **All Configurations**, and choose **UserSync > System**. Set **-XX: MaxPermSize** in the **GC\_OPTS** parameter to a larger value based on site requirements and click **Save** to save the configuration.

 NOTE

If this alarm is generated, the non-heap memory size configured for the UserSync instance cannot meet the non-heap memory required by the UserSync process. You are advised to change the **-XX:MaxPermSize** value of **GC\_OPTS** to twice that of the current non-heap memory size or change the value based on the site requirements.

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## Related Information

# 12.13.278 ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold

## Alarm Description

The system checks the GC duration of the UserSync process every 60 seconds. This alarm is generated when the GC duration of the UserSync process exceeds the threshold (12 seconds by default) for five consecutive times. This alarm is cleared when the GC duration is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45284    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Threshold for triggering the alarm.                      |

## Impact on the System

UserSync responds slowly.

## Possible Causes

The heap memory of the UserSync instance is overused or the heap memory is inappropriately allocated. As a result, GCs occur frequently.

## Handling Procedure

**Check the GC time.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45284 UserSync Garbage Collection (GC) Time Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated and click the drop-down list in the upper right corner of the chart area. Choose **Customize > GC > UserSync GC Duration**. Click **OK**.
- Step 3** Check whether the GC duration of the UserSync process collected every minute exceeds the threshold (12 seconds by default).
  - If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).

**Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > UserSync > Instance Configuration**. Click **All Configurations**, and choose **UserSync > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for UserSync cannot meet the heap memory required by the UserSync process. You are advised to change the value of **GC\_OPTS** to the twice that of the heap memory used by UserSync. You can change the value based on the actual service scenario. For details about how to check the UserSync heap memory usage, see [Step 2](#).

**Step 5** Restart the affected services or instances and check whether the alarm is cleared.

- If yes, no further action is required.
- If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

**Step 6** On FusionInsight Manager, choose **O&M > Log > Download**.

**Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.

**Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.

**Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

After the fault that triggers the alarm is rectified, the alarm is automatically cleared.

# 12.13.279 ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the heap memory usage of the TagSync

instance exceeds the threshold (95% of the maximum memory) for 10 consecutive times. This alarm is cleared when the heap memory usage is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45285    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

Heap memory overflow may cause service breakdown.

## Possible Causes

The heap memory usage of the TagSync instance is high or the heap memory is improperly allocated.

## Handling Procedure

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45285 TagSync Heap Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TagSync Heap Memory Usage**. Click **OK**.

- Step 3** Check whether the heap memory used by TagSync reaches the threshold (95% of the maximum heap memory by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).

- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > TagSync > Instance Configuration**. Click **All Configurations** and choose **TagSync > System**. Increase the value of **-Xmx** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the heap memory configured for TagSync cannot meet the heap memory required by the TagSync process. You are advised to change the **-Xmx** value of **GC\_OPTS** to twice that of the heap memory used by TagSync. You can change the value based on the actual service scenario. For details about how to check the TagSync heap memory usage, see [Step 2](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

## 12.13.280 ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold

### Alarm Description

The system checks the direct memory usage of the TagSync service every 60 seconds. This alarm is generated when the direct memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the TagSync direct memory usage is less than or equal to the threshold.

### Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45286    | Major          | Yes          |

### Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

### Impact on the System

Direct memory overflow may cause service breakdown.

### Possible Causes

The direct memory of the TagSync instance is overused or the direct memory is inappropriately allocated. As a result, the memory usage exceeds the threshold.

### Handling Procedure

**Check the direct memory usage.**

- Step 1** On FusionInsight Manager, choose **O&M > Alarm > Alarms > ALM-45286 TagSync Direct Memory Usage Exceeds the Threshold**. Check the location information of the alarm and view the host name of the instance for which the alarm is generated.
- Step 2** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance**. Select the role corresponding to the host name of the instance for which the alarm is generated. Click the drop-down list in the upper right corner of the chart area and choose **Customize > CPU and Memory > TagSync Direct Memory Usage**. Click **OK**.
- Step 3** Check whether the direct memory used by the TagSync reaches the threshold (80% of the maximum direct memory by default).
- If yes, go to [Step 4](#).
  - If no, go to [Step 6](#).
- Step 4** On FusionInsight Manager, choose **Cluster > Services > Ranger > Instance > TagSync > Instance Configuration**. Click **All Configurations** and choose **TagSync > System**. Increase the value of **-XX:MaxDirectMemorySize** in the **GC\_OPTS** parameter based on the site requirements and save the configuration.

 **NOTE**

If this alarm is generated, the direct memory configured for TagSync cannot meet the direct memory required by the TagSync process. You are advised to check the direct memory usage of TagSync and change the value of **-XX:MaxDirectMemorySize** in **GC\_OPTS** to the twice of the direct memory used by TagSync. You can change the value based on the actual service scenario. For details, see [Step 2](#).

- Step 5** Restart the affected services or instances and check whether the alarm is cleared.
- If yes, no further action is required.
  - If no, go to [Step 6](#).

---

**NOTICE**

During the service restart, the service is interrupted. During the instance restart, the instance is unavailable, and the task on that instance fails to be executed.

---

**Collect the fault information.**

- Step 6** On FusionInsight Manager, choose **O&M**. In the navigation pane on the left, choose **Log > Download**.
- Step 7** Expand the **Service** drop-down list, and select **Ranger** for the target cluster.
- Step 8** Click  in the upper right corner, and set **Start Date** and **End Date** for log collection to 10 minutes ahead of and after the alarm generation time, respectively. Then, click **Download**.
- Step 9** Contact O&M personnel and provide the collected logs.

----End

## Alarm Clearance

This alarm is automatically cleared after the fault is rectified.

# 12.13.281 ALM-45287 TagSync Non Heap Memory Usage Exceeds the Threshold

## Alarm Description

The system checks the non-heap memory usage of the TagSync service every 60 seconds. This alarm is generated when the non-heap memory usage of the TagSync instance exceeds the threshold (80% of the maximum memory) for five consecutive times. This alarm is cleared when the non-heap memory usage is less than the threshold.

## Alarm Attributes

| Alarm ID | Alarm Severity | Auto Cleared |
|----------|----------------|--------------|
| 45287    | Major          | Yes          |

## Alarm Parameters

| Parameter         | Description                                              |
|-------------------|----------------------------------------------------------|
| Source            | Specifies the cluster for which the alarm was generated. |
| ServiceName       | Specifies the service for which the alarm was generated. |
| RoleName          | Specifies the role for which the alarm was generated.    |
| HostName          | Specifies the host for which the alarm was generated.    |
| Trigger Condition | Specifies the threshold for triggering the alarm.        |

## Impact on the System

Non-heap memory overflow may cause service breakdown.

## Possible Causes
